1 Introduction

Beas Manufacturing

Beas Manufacturing 2026.04

With Beas you receive a comprehensive solution for small and mid-sized manufacturing enterprises, fully integrated into SAP Business One.
It does not only provide fast and easy access to all business information, but also the additional reports and documents that are required for decision making in all departments of your company, like sales and distribution, purchase, accounting, production, and so on.
The documentation reflects the structure of the Standard Beas menu.

1.1 Documentation structure

The documentation is organized according to the menu structure.

For each menu item there is an introduction with description of the main processes. You find links to detailed training materials on the respective issue.

Subsequent, all the fields, settings and screens are described.

The initial icon shows which information is given in the respective chapter.

Basics	Basic process descriptions. Links to training materials.
Field description	Only descriptions of fields and switches.
Concepts	Ideas and connections which go beyond a basic understanding. Often several different topics involved.

beas-Version	The Documentation refers to a single Beas version. The indicated version number marks the version from which the function has been available.
Variable	Definition of the internally used variable.
Windowname	Internally used window name

© 2026 Boyum IT Solutions A/S

beas-Version	The Documentation refers to a single Beas version. The indicated version number marks the version from which the function has been available.
`Script`	Scripts are displayed in this font
see	Links. Click the underlined word for direct jump.
link	Program path
Common fields	The content of some fields is shared with another window
Button	Button/function names are displayed in bold font.
Note	Important notes
PATH	Screen path to show where you can find the described window in the system
Example	Example
(+) Toggle	To keep the documentation clear, many parts are hidden. Click the plus symbol to expand extended information ⊟ Click the plus icon to expand and you can read the detailed explanation.
	Link to a Powerpoint presentation
/	Link to a video

1.2 Beas for SAP Business One

Integration into SAP B1

Beas is fully integrated in SAP Business One. There is no data held twice and no interface files are necessary. All changes carried out in Beas, are available immediately in SAP Business One.
On Compatibility with SAP Business One versions, please ***see***: Support Portal

© 2026 Boyum IT Solutions A/S

Multilingualism

Beas is fully multilingual.

- Notes:

Officially supported languages:

German
English
French
Italian
Simplified Chinese (P.R. China)
Spanish (Spain)
Portuguese (Brazil)

A number of other languages are available and supported by Partners.
In case there is a problem with a language or you need a new language, please inform our support.

Adaptation

Beas can be adapted easily. New windows, lists and reports which can be created using Crystal (R) or InfoMaker (R) and can be easily integrated. All major selection and list boxes can be set up without additional products or knowledge.

Certification, Guidelines, GMP

See notes Certification

1.3 Copyrights

Copyright, Trademarks, Disclaimers

Any documentation materials are subject to change without notice. These materials are provided by Boyum IT Solutions GmbH for informational purposes only, without representation or warranty of any kind, and beas group shall not be liable for errors or omissions with respect to the materials. The only warranties for beas group products and services are those that are set forth in the express warranty statements accompanying such products and services, if any. Nothing herein should be construed as constituting an additional warranty.

1.4 GDPR Notes

The General Data Protection Regulation (GDPR) is a regulation by which the European Parliament, the Council of the European Union, and the European Commission intend to strengthen and unify data protection for all individuals within the European Union (EU). It also addresses the export of personal data outside the EU.

The GDPR aims primarily to give control back to citizens and residents over their personal data and to simplify the regulatory environment for international business by unifying the regulation within the EU.

It becomes enforceable from 25 May 2018.

It is to the best of Boyum IT Solutions A/S ability that Beas adhere to privacy by design as the add-on do not store any personal data beyond the SAP Business One database itself but below are references to how beas manufacturing handles its data.

General

All configured data are stored in the SAP Business One database itself and will not leave the customers system. It is the people responsible for the SAP Business One environment that is responsible for this data.

We have a few features/modules that communicate with online services and these are listed below but none of these contains personal information.

License System

Our online license check will at start-up of the add-in communicate with https://portal.boyum-it.com. During this call, we send the following information in order to verify you have a valid license
Installation + System Number
DB Name
Number of SAP Users and assigned Beas users
Database server name

Feedback System

The add-on has an optional Feedback system that on add-in shutdown and in case of errors send anonymous data to Boyum's internal Feedback servers. It sends the following data to us:
Add-on Version
SAP Version
OS Version
SAP User name
SAP Database name
Stats for each module (number of configurations etc. - nothing customer specific)

You choose on initial install if you want to participate or not and can at any time turn it off.
More information about the Feedback System can be seen here: http://www.boyum-it.com/sbo/uip

Personnel master data

© 2026 Boyum IT Solutions A/S

The operators of the shop floor are represented on Beas as “Personnel”; this information is collected at the Personnel master data table BEAS_PERS, the mandatory personal data collected here are: Fist name and Last name.

Other fields of the table as part of Beas attendance module like (shift definition and rules), terminal module (as card_id to identify to the terminal, language and user rights) and cost calculations and accounting module (cost rates and cost centers related)

Beas has its own personnel table separate from SAP Business One employee table, however we could connect the SAP Business One employees data with Beas Personnel data, but this is not mandatory, personnel master data may exist in a Beas table which is not in an SAP Business One table.

When a Beas Manufacturing add-on is installed in a SAP database which already have employees created, the “data check” function provides an optional tool to copy SAP employees data to Beas personnel table. SAP Business One employee ID, name and last names will be copied to a Beas table.

See Personal data management

Time recording

As part of the factory data collection functionality, we record the time effort of the production operations. This information could be reported directly by personnel when they connect to the terminal and report a time receipt or could be reported by a responsible from the company to manage it through the time administration screen or directly at the work order. In any case a personnel ID is linked to a time receipt.

Terminal tracking

When stock transactions are reported using a terminal app, each terminal has an associated sap user, however, the personnel ID is also saved in the SAP Business One document in order to identify who created the SAP Business One document as additional information for tracking purpose.

Attendance module

If the attendance module is activated, Beas allows recording employee attendance information, absence, holidays and shift details by employee.

Quality control

For the electronic signing when a sample is approved to release, the personnel Name and last name is saved at the quality control order.

© 2026 Boyum IT Solutions A/S

A quality control order can contain a business partner ID, the name of the business partner name will be also saved.

Interruptions

When an interruption is reported, the personnel name and last name is saved when the user starts or ends the interruption additionally to the personnel ID.

Work order, Maintenance Order and complaint

The business partner name is also saved when a Beas document is created for work orders, maintenance order and complaint system.

1.5 Certification

Information on

System-based inspection approach

ERES Requirements from global regulatory agencies

FDA Approval process:

- Stage 1: Process design
- Stage 2: Process qualification
- Stage 3: Continued process verification
- Audits and audit trails
- System validations
- Electronic signatures
- Documentation

EU GMP Annex 11: Computerized Systems

ANVISA (Brazil): ANVISA Resolution – RDC n. 17

PFSB/ELD Notification No. 0401022 of Japan

PHARMACEUTICAL CGMPS: A RISK-BASED APPROACH

OTHER INTERNATIONAL GMP GUIDELINES:

- PIC/S Guidance
- ICH Guideline
- Chinese State Food and Drug Administration

Functionality in Beas Manufacturing that may be regulated:

- Materials management

© 2026 Boyum IT Solutions A/S

- Plant maintenance
- Production planning
- Production planning for process industries
- Quality management
- Sales and distribution
- Logistics execution
- Environment, health, and safety
- Human resources and training information
- Warehouse management

Central functions include:

- Batch management
- Handling unit management
- Document management

Cross-application components include:

- Engineering change management
- Classification
- Document management
- Electronic records (audit trail)
- Digital signature
- Notifications
- Records and case management
- Master data governance

Electronic records:

- Configuration within the implementation guide
- Transports and business configuration sets used to migrate configuration from one software system to another
- Master data such as the material master, vendor, resource, recipe, and customer
- Business processing objects such as purchase orders, process orders, and inspection lots
- Electronic records for business processes or transaction execution, such as material documents
- Electronic or digital signatures

Table Logging

Audit Trail

Date and time stamp

Electronic and digital signatures in Beas Manufacturing

Beas quality control, release and support process of patch levels – synchronized with SAP

GAMP5 – Software Category 4 (Configured Product)

Validation approach to achieve compliance:

- Conducting system compliance assessment
- Defining Part 11 requirements
- Defining the overall strategy in the validation master plan and determine how the system will be deployed as per software development life cycle (SDLC) methodology
- Conducting good practice assessments at the business process level
- Developing security authorizations according to SDLC. Establish functional requirements specifications for job
roles
- Configuring software to activate complete audit trail reporting and electronic signatures
- Testing the system
- Training users for all transactions within their profiles

Supported business processes:

- Make-to-stock, make-to-order, engineer-to-order / projects
- Assembly / configure-to-order / variant production
- Supply chain management process integration
- All mixed-mode types

Benefits of Beas Manufacturing:

- Above-average functional industry coverage and process support
- Quick, effortless and cost-effective implementation. Industry specifics are considered, integrated and available from the very outset.
- Best-practice process, including options for easily and flexibly modifying or adding integrated business scenarios to meet your individual business requirements/typologies across all process chains.
- Transparent process analyses (“inside views”) support companies in continuously reviewing the effects of optimization projects (such as lean manufacturing, improving product margins, etc.) using defined KPIs
- Use and integration of the latest technologies and innovations, from SAP ERP certified integration to SAP HANA and analysis applications, as well as SAP cloud and mobile solutions.

See examples to industry benefits and best practices in the Beas Manufacturing industrial regulations document:

© 2026 Boyum IT Solutions A/S

Beas White Paper for regulated industries

1.6 Product life cycle management

General information on Lifecycle Management

- Version number configuration

Since 2020, Beas Manufacturing has applied the following Version number concept:

Beas Manufacturing yyyy.mm[.rr[.bb]] [Database Type][BETA]

Part	Description
yyyy	Release Year
mm	Release Month
rr	Sub Release (Hotfix) Only visible if Release > 0 or BETA Mode
bb	Build (compilation) number Only visible if Release > 0 or BETA Mode
Database	MSSQL or HANA
BETA	"BETA" only displayed if this patch level is still in development

Example:

Beas Manufacturing 2020.02 for MSSQL > Version from February 2020

Beas Manufacturing 2020.05.01 for HANA > Version from May 2020, Release 1 for HANA

Beas Manufacturing 2020.02.00.05 for MSSQL (Beta) > Beta Version from February 2020, Build 5 (compilation number)

In **Help > "About Beas"** you can always see the complete Beas Version number.
In the Debug log the system always inserts the complete Beas Version number.

- Version – Status: Beta-Version, Released Version, Supported Version, Unsupported Version, Customer Version

Version

A version defines a certain patch level, e.g. `Beas manufacturing 2020.02`
A version may be subdivided into sub release (Hotfix), which do not contain program extensions e.g. `Beas manufacturing 2020.02.01`

© 2026 Boyum IT Solutions A/S

BETA – Version (During development)
From start of development, quality is checked based on tickets. You may request a BETA Version, but it is not allowed to run it in productive environment.
One week before a release the development is finished, and a one-week extended quality check is performed. At this point, the development of the next version starts.

Released – Version: Release
After the successful completion of quality checks, the version is released.
Then it receives then version number: `Beas 2020.02`

Hotfix Release / Subsequent corrections
If severe errors are found after the release, a Hotfix is created and released.
The found errors are always fixed based on the latest version. Therefore, when a Hotfix is required, it is provided based on the latest release.
Characteristics of severe errors:
- reproducible at several clients
- cannot be avoided using workaround
- productive use is impossible for several clients

Supported Version
As soon as a new version receives the status "Released Version", the preceding patch level receives the status "Supported Version". This means, for this version, full support is provided.

Unsupported Version
A Beas - version is always compatible with a SAP Business One version (***see*** Compatibility of Beas with SAP Business One). If SAP terminates the support of a SAP Business One - version, the Beas - version receives the status "*unsupported Version*". At that point, the claim of free support expires.

- Roadmap of releases

As the flowchart below indicates, 5 new Beas Manufacturing versions are scheduled for 2026.

Quarter 1
2026.02 - end of February
See Roadmap 2026.02

© 2026 Boyum IT Solutions A/S

Quarter 2

2026.04 - end of April

See Roadmap 2026.04

2026.06 - end of June

See Roadmap 2026.06

Quarter 3

2026.09 - end of September

See Roadmap 2026.09

Quarter 4

2026.11 - end of November

See Roadmap 2026.11

1.7 Customizing

Beas is customizable and flexible. For more on Customizing ***see:***

Beas Script / Customizing Documentation 2026.04.0

Note: Customization is not always the best way to adapt the program exactly to customer needs. Customization might lead to increased maintenance requirements. Beas offers many settings and possibilities. Always check first for standard alternatives in Beas before making any adjustments.

Maintenance

© 2026 Boyum IT Solutions A/S

The customization does not form the part of maintenance package. Use our \ & A Forum or premium support, if you need help with your customization.

Update or Upgrade

It is not possible to deliver a completely backward compatible solution. SAP Business One and Beas deliver new functions and old functionality must be deleted after some years. New tables might be available and some tables columns might not be supported in the upcoming versions.

See Compatibility.

Note: Any customized solution and the main work-flows must be tested before updating or upgrading.

The following all fall into the customization area:

- Any Beas script solution
- Beas usability package and macro script
- Crystal reports
- Dashboards
- Variant system formulas
- SQL formulas, SQL queries
- Product configurator solutions
- Templates
- Macros
- Any other tool that changes the front-end or functionality

© 2026 Boyum IT Solutions A/S

1.8 Compatibility

General functions

Area	Description
Database compatibility	All MSSQL and HANA Versions are supported, which are supported by current Versions of SAP Business One **MSSQL 2008** and older: Not supported. **MSSQL 2017**: with Beas 9.3 PL 0 Build 31, Beas 9.3 PL 1 and higher. **MSSQL 2019**: with Beas 2020.08 (Note: you need SAP 10.2 or later) **MSSQL 2022:** with Beas 2025.02 (Note: you need SAP 10 FP 2405 or later) Connection to the database is possible with different database drivers. The selection of the driver is done automatically and needs no manual change by the user.
Windows OS	By server and client, all Windows versions are supported which are supported by SAP Business One. Currently supported version: Windows 11. Windows 7,8,10: Not supported
64 Bit	The 64 Bit version of Beas Manufacturing is delivered with 2020.03.
SAP Business One WEB ACCESS	⊟ Not supported SAP will Stop to deliver this functionality. Read more in this article: https://blogs.sap.com/2019/06/13/sap-business-one-the-future-of-browser-access/
SAP 10.0 WEB Client	Supported from Beas 2026.04 ***See*** Beas Web Client documentation.
SAP hosted Cloud	⊟ No support **Q: Have you guys written poor code since you can't run on SAP Cloud?**

© 2026 Boyum IT Solutions A/S

Area	Description
	A: No. In fact, all of Boyum's products are successfully running in the Cloud, with various 3rd-party hosting providers. SAP has set certain restrictions on what they will allow on their platform for maintainability reasons. SAP and Boyum IT are working together toward the goal of having all Boyum IT solutions eventually run on the SAP-hosted Cloud. **Q: Why have SAP set such high restrictions?** A: SAP is striving for a high level of automation and standardization, which will ultimately ensure that the SAP-hosted Cloud is affordable, reliable, and meets the highest standards for security. **Q: Will Beas be available for SAP hosted cloud** A: We strive to keep Beas compatible with all previous installations. As a result, we are unable to comply with the restrictions of the SAP hosted cloud. However, we will provide alternative hosted cloud solutions.
Hosted Cloud	Beas 2020.02: Lightweight installer supported (installation via Cloud Control Center CCC) Note: We do not support SAP Hosted cloud.
Cloud "On Premise"	Fully supported.

Compatibility with SAP Business One Versions

SAP Version	Beas Version
SAP Business One 9.3 all Patch Levels (out of maintenance: 2021/12/31)	Beas 9.3 - out of maintenance -, all Patch Levels up to Beas 2023.06.

© 2026 Boyum IT Solutions A/S

SAP Version	Beas Version
SAP Business One 10.0	Beas 2023.06 and following versions. Note: ONLY Beas 64bit version is working with SAP10.
SAP Business One 2508	Only compatible with Beas 2025.09 and later. ***See*** more information in the following article.

Functional Compatibility

New Functions available in SAP Business One since

Function	Compatibility information
Material requirement planning (MRP)	This function is overridden by Beas MRP because this provides an extended functionality.
Inventory	The SAP Business one inventory is overridden by Beas inventory, because offers and extended functionality.
Human resources	Personnel administration with SAP Business One 7 was synchronized with Beas personnel administration.
Key fields	In key fields (item code, card code and so on) not all characters allowed. ***See*** key fields.
Cancellation of sales documents	SAP Business One introduced the feature "cancellation" for sales documents. It is important to always enter positive quantities (field "quantity") even if the actual quantity is negative. Customized extensions need adaptation. Various sales reports delivered until version Beas 2009 need to be reviewed as they are no longer supported.
Relationship MAP	Not supported.
Alternative keyboard usage	No support of General Settings – Display – Alternative Keyboard settings.
Accounting Enhancements According to IRFS	Not supported.
Reopen purchase order	No support in the area "External process".
UoM Groups UoM Price List	Beas does not support UoM Price List in precalculation. Plan is to integrate this functionality in next versions.

© 2026 Boyum IT Solutions A/S

Function	Compatibility information
IT VAT	Note 2775566 IT Localization. Tax Summary – VAT Date You need Beas 9.3 PL 2 Hotfix 2 or higher if you intend to use this SAP Version in Italy.
PTICode	Argentina PTICode not supported, but it is possible to insert support by customization. ***See*** BeasScript Customization by window.
SAP period end closing	Manufacturing transaction documents (WO issue and receipts) ignore SAP period end closing.

1.9 Performance recommendations

A summary of performance recommendations is detailed in the table below.
"Maximum" means: If you have more entries, you may try working with other alternatives described in the "Area" section.
If this is not possible, check if SAP Business One / Beas has the correct solution for the requirement.

Recommended Screen Resolution:

The overall, tested minimum recommended monitor screen resolution is 1366x768.

Area	Good performance	Maximum *1)
Bill of Materials positions per assembly. Maximum of Bill of Materials Entries by Position or work order **Attention:** If you work with Phantom items, the count of BoM Entries is the sum of all BoM Positions of all Phantom items.	< 500	5 000
Routing positions per assembly or Work order	< 500	5 000
Sub structure: max. Levels	< 20	20
Count of sub positions in work order or calculation. TIP: If you need more Positions, you can split them to several work orders.	< 50	500
Count of BoM/Routing total in work order.	< 10 000	50 000

© 2026 Boyum IT Solutions A/S

Area	Good performance	Maximum *1)
The number is related to "active" Bill of Materials Position. This number is related to "per MRP Scenario". ***Example:*** If you have 1 000 000 open BoM Entries for the next 12 months, but in your scenario you must calculate only next 2 weeks ~50 000 entries, it runs without problems. If you have too many entries, MRP can crash. In this case you can change activate the calculation by block, example read next 10 000 entries, calculate, read next 10 000 entries. You can activate this for existing MRP scenarios with the following command: `update "BEAS_MRP_PLANUNG" set FTSTLBlock = 10000` If you create new MRP scenarios, you must execute the SQL statement again.		
Count active work order positions APS Calculation / Scenario: Max 2000 Work order position and max. 10 000 active routing positions and bill of material positions. Workaround: Create different scenarios	< 1 000	10 000
Count actual running routing position	< 50	500
Count of open sales order	< 500	5 000
Count of Demands / MRP Scenario Sum of all Demands (Work order, Sales order, Purchase order)	< 50 000	500 000

© 2026 Boyum IT Solutions A/S

Area	Good performance	Maximum *1)
TIP: You can reduce the count with - Split between long- and short time planning. - Activate the summary function for the complete scenario or for all items that do not need detailed information.		
Count of Items Check if you need a new item for every Variant. In Beas it is possible to create a work order from a Calculation, by Variant or by Configuration without creating master data previously. Work with Item Version: You can define Versions of an item without creating a new Item Master Data.	< 10 000	100 000
Count of Warehouses If you need a warehouse by customer or external warehouse, you can work with Bin Management and can define a Bin Location for every Customer.	< 20	100
Count of Business Partners	< 10 000	200 000
Count of parallel users	< 100	500
Price list in SAP Currently max. 99 price lists are supported. If you have more then 99 price lists, use only price list 1–99 inside Beas valuation.	99	99
Count of WEB Clients/Service Version 2.1 Web Performance: We recommend to split the Web service for each group of 10 concurrent users to ensure better performance. TIP: This ensures the parallel availability of several services. If several web services are configured and one of them stops working, the users connected to	< 20	50

© 2026 Boyum IT Solutions A/S

Area	Good performance	Maximum *1)
that particular service can manually connect to another available service and continue working without waiting for the service to be restored.		
Count of Transaction / Min With an extensive number of transactions inside SAP Business One or in SAP Business One over Beas, SAP Business One may lose performance. This may cause database locks for up to some minutes.	< 10	20
Count of Transaction / Day Recommendation based on the internal functioning of SAP Business One: As the high number of transactions may cause the system to slow down gradually, it is important to clean up the database every year with the SAP Business One Tools.	< 1 000	10 000
Max. lines per Transaction document Beas use SAP Business One for every transaction (receipt, issue, purchase order and so on) SAP Business One allows for handling a maximum of 10 000 rows.	< 1000	10 000
Max. Database Size	< 20 GB	100 GB
MRP Calculation time • Hardware: Where calculation is performed, the computer should meet the following minimum requirement: o Adequate processing power o At least 4GBs of main memory. ***See*** 32 Bit with 4 GB Memory		

© 2026 Boyum IT Solutions A/S

Area	Good performance	Maximum *1)
o Make sure that a minimum number of parallel services are running. A parallel running database service. for example may block the memory. • Large number of items in the database: If the database contains a large number of items, the number of items to be displayed should be limited. o Display only purchase products, only in-house production, or only some of the items properties. o Display only items with planned inflow or outflow, or inventory shortfall (check for minimum inventory). This is set up in the scheduling scenario – planning. • A lot of peggings: A lot of peggings create a lot of records. This may adversely affect the calculation time. To speed up the calculation, try to summarize daily, weekly or monthly. This can be defined in the MRP scenario, but also on item level. • The calculation of lead time for assemblies is computationally intensive. Work with the replenishment lead time instead. This might be a little more inaccurate, but it reduces the computation time significantly. ***See*** Detail – calculate lead time for assemblies. • Forecasts: Forecasts can be calculated using gross calculation. This computation is less exact, but faster and is sufficiently accurate for long-term planning. ***See*** Detail – gross calculation • Overnight calculation: Use a server services to compute the list automatically overnight. ***See*** Automatic calculation. • Check Count of entries in BoM. ***See*** Count of Bill of Materials • MSSQL: Defragment the database.		

© 2026 Boyum IT Solutions A/S

1.9.1 MSSQL-Defragmentation and Renidexing

If the program is slow, Defragmentation can help.

> Note: NOT FOR HANA Database

SAP Note1241422 from 2016/12/4, Version 11 from 2021/02/07
Related to SAP Note , 1376447, 2258305, 1564494

Symptom

During operation, databases of SAP Business One become fragmented due to insertions, updates, and deletions of data. Fragmentation exists when indexes have pages in which the logical ordering, based on the key value, does not match the physical ordering inside the data file. Heavily fragmented indexes can degrade performance.

Solution

We recommend running the RSP task on a monthly basis to perform a database re-index on your customer's database. Please refer to RSP Task 1469218 for the task details. Alternatively you can run the script below from SQL Server Management Studio:

```
/*Reindex procedure. Will execute dbcc dbreindex on each table in db*/
DECLARE @tableName as sysname
DECLARE @strExec as varchar(1000)-- Cursor declaration
DECLARE tableNameCursor CURSOR READ_ONLY FAST_FORWARD FOR
-- Take all user table
        SELECT [name] FROM sysobjects WHERE xtype = 'U'
        OPEN tableNameCursor
        FETCH NEXT FROM tableNameCursor INTO @tableName

        WHILE @@FETCH_STATUS = 0
        BEGIN
        -- Create the statement
                SET @strExec = 'dbcc dbreindex (''' + @tableName + ''','''',0 )'
                -- Execute the procedure
                exec (@strExec)
                FETCH NEXT FROM tableNameCursor INTO @tableName
        END
        CLOSE tableNameCursor
DEALLOCATE tableNameCursor
```

1.10 End of support functions

Function	Start "in maintenance" from	Function canceled
		

Beas Script and objects

Changes in workordermanagement / stockmanagement and other user events Most events from workordermanagement / stockmanagement were not working on WEB / BeasServiceLayer side. Reason: The operation was based on a completely different logic. With Beas 2020.05 we created documentation for the functionality.		

© 2026 Boyum IT Solutions A/S

	Additionally, support will be added to this in all transactions with a defined concept.
	
	Problem:
	It is not possible to deliver 100% compatibility.
	The system will check the "old" event name, as well, and try to deliver all old variable names.
	
	Example
	Old syntax:
	workordermanagement.src
	`fucntion receipt`
	`// Variable e_belnr_id,e_belpos_id,e_pos_id`
	`end function`
	
	New syntax
	workordermanagement.src
	`function ReceiptLine`
	`// Variable`
	`WoDocEntry,WoLineNumber,WoLineNumber2`
	`// BUT function receipt with e_belnr_id and so on is working too`
	`end function`
	
	What is changed:
	- the script is executed in a sandbox
	- all changed variables are only visible inside the sandbox, but you can see all variables outside it
	- userevents have the exact same functionality in all different booking processes
	(before: different functionality always causing errors)
	
	Compatibility to old variant is > 95%		

object ue_materialwirtschaft	Please use BeasServiceLayer for all transactions. Follow functions/objects will be deleted: - wareneingang, receipt	2/2019	6/2021

1.11 Hardware requirement

Database Version and Server Sizing

Hosted Enviroments

Device / Client requirement

© 2026 Boyum IT Solutions A/S

Requirement for a Demo

1.11.1 Server sizing

When installing the SAP Business One system together with Beas solutions, both the hardware recommendations of SAP and Beas should be taken into account.

Note:

This document describes the additional hardware recommendations that should be considered besides SAP hardware recommendations.

Any deviation from these recommendations can lead to heavy performance issues.
All the recommendations in this document are minimum recommendations.

General recommendations

The general recommendations are independent from the product or components. Specific product-related recommendations are additions to the general recommendations.

Latency and bandwidth requirements for SAP Business One and Beas

All SAP Business One components must be installed in the same LAN (local area network).
Putting client and server into two different locations (e.g. VPN) will have an impact on the performance of SAP Business One. Thus, latency should be as low as possible (< 1 ms).
Same LAN means:

- Sufficient bandwidth > 100M.
- Small latency < 1 ms.
- Same WINS server.
- Same local DNS server – if configured.
- Same AD server – if AD is being used

Database server (MSSQL)

Supported MSSQL Versions: 2012 SP 4, 2014 SP 3, 2016 SP 2 and 2017.

Note:

- Always use the last upgrade of the MSSQL Version.
- Beas is always optimized for the newest MSSQL Version.

Memory

© 2026 Boyum IT Solutions A/S

The amount of memory allocated to the MSSQL process should be at least equal to the total size of the production databases on the server. Only the size of the MDF files should be taken into account. The size of the log (LDF) files should be ignored.
The maximum server memory allocated to the MSSQL process should be set by leaving a sufficient amount of memory free for the operating system. The amount of memory to be left free depends on the operating system. Efficient setting: Iteratively, by monitoring the amount of free memory.

Note:

- It is recommended to use the archiving functionality whenever possible in order to decrease the size of the production databases, and thus also the amount of memory needed on the database server.
- The database growth should be taken into account when calculating the size of the databases.
- For Minimum Memory information ***see*** additional SAP Hardware Requirement Guide.

Example:

3 production databases of 65GB, 20GB and 5GB: total 90GB.
The operating system requires 8GB to operate.
At least 98GB of memory should be present on the server, out of which 90GB should be allocated to the MSSQL process.

Database server (HANA)

- HANA

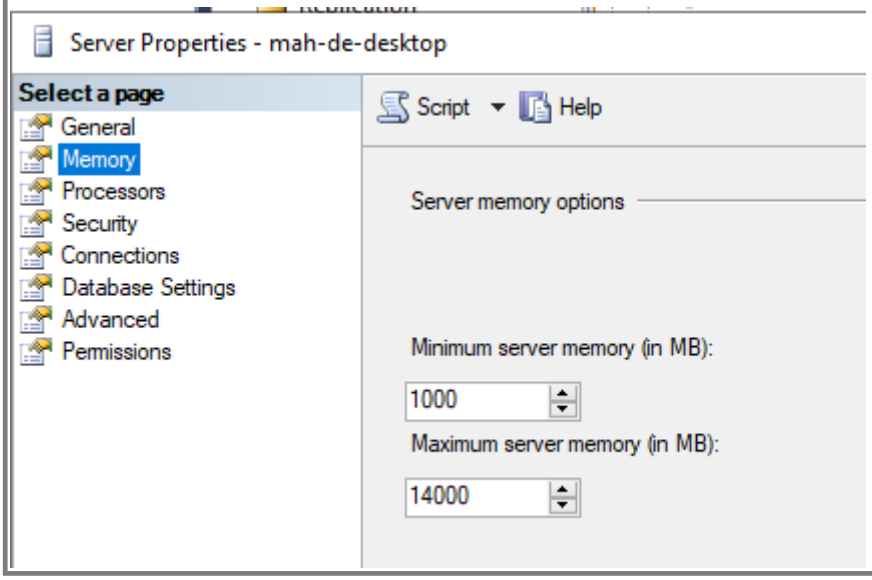
Memory A strict minimum of 128GB of memory should be present on the server. The amount of memory should be at least equal to the total size of the production databases on the HANA server. Note: the database growth should be taken into account when calculating the size of the databases.

- MSSQL

Memory Minimal 32 GB on server For Demo installation 8 GB Server Properties - Memory

© 2026 Boyum IT Solutions A/S

Minimum Server memory = 1000 MByte. If you don't define this, the program will be slow. For DEMO machine the same.
On SQL server define 4000 MByte and more. Maximum must be the available memory



Example:

3 production databases of 65GB, 20GB and 5GB: total 90GB.
90GB < 128GB → A minimum of 128GB is required.

Summary

Database	MSSQL	HANA
	Minimum 32 GB memory Minimum memory size = DB size +30 GB memory / 1000 transaction lines CPU = 4 + users x 0.25	Minimum 128GB memory Minimum memory size = DB size +50GB memory / 1000 transaction lines CPU = 8 + users x 0.5
Scale service	2 GB memory by Beas Service 1 CPU / 4 scales	
Other services	Requires specific analysis.	

Combination with additional AddOns

AddOn	Description
Boyum B1UP	No additional requirements.

© 2026 Boyum IT Solutions A/S

AddOn	Description
Boyum WMS	Minimal requirement defined in the Boyum WMS documentation.

1.11.2 Hosted Environment

Citrix XenApp Edition

or

Windows Terminal Services hardware requirements, as stipulated by the manufacturer.

Recommendation

For WAN connections, use the Remote Desktop Protocol (RDP).

Per concurrent user:

SAP Business One application > 1 GB

Beas > 0.5 GB

Citrix or WTS Client Sessions – For recommended requirements, refer to Citrix or WTS documentation.

For other applications like partner add-ons or e-mail clients , contact your solution provider for recommended requirements.

Example:

Your system is required to run:

Windows Server and Citrix Server 8 GB *(For details, refer to the Microsoft Windows system requirements and the respective Citrix document.)*

10 SAP Business One concurrent users

10 Beas AddOn > 0.5 GB

Calculate the required memory as follows:

For SAP Business One / Beas User

Each concurrent user requires

1 GB for SAP Business One

+ 0.25 GB for Citrix session and partner add-ons

+ 0.5 GB for Beas

1.75 GB

© 2026 Boyum IT Solutions A/S

Total memory required is
8 GB for Windows and Citrix server
+ 10 concurrent users x 1.75 GB for each user
= 27.5 GB

For Terminal Clients (Beas Terminal)
0.5 GB for Beas +
0.25 GB for SAP Business One DI API
0.25 GB for Citrix Session
= 1 GB per User

Note:
Beas saves all local settings in the directory.
`%programdata%\beas`
This directory is not allowed to be deleted after ending the logoff, because the server connection information are stored there, as well.
Consider that the station name is unique at terminal server.

- See notes on determination of station name.

  All Beas sessions need a unique station name. The BIOS name of the current computer is read out when Beas is installed locally.

  The `clientname` environment variable is read and used if it is a terminal server.
  The current Windows user (`username` Environment variable) is used as the station name if the `sessionname` environment variable begins with `rdp` or `ica`.

  The optimal setup for a remote server is the following:
  - The `sessionname` environment variable begins with `rdp` or `ica.`
  - The Windows user must be unique and stored in the `username` environment variable.

A distinct client name for each client is necessary, otherwise problems may occur during the license checking. This is defined in the environment variable "`clientname`".

1.11.3 Device requirements

This chapter describes the optimal device requirements.

Desktop normal user

© 2026 Boyum IT Solutions A/S

Property	Value
OS	Windows 7, 8 or 10, 32 and 64 Bit.
Memory	2 GB.
CPU	Core i3 or better, min 2 GHz.

Desktop heavy user (APS, MRP calculation, Pre calculation)

Property	Value
OS	Windows 7, 8 or 10, 32 and 64 Bit.
Memory	4 GB Note: Beas is a 32 Bit solution and can address only 2 GB (Limitation from Windows). ***See*** 32 Bit with 4 GB Memory.
CPU	Core i5 or better, min 2 GHz.

Terminal Application

Property	Value
Windows OS	Windows 7, 8 or 10, 32 and 64 Bit.
Memory	2 GB.
CPU	Core i3 or better, min 1.5 GHz.

Note: The terminal application is optimized for Mouse/Keyboard and not touchscreen.

WebApp Terminal 1

Property	Value
OS	Windows ME, Windows 7,8 or 10, iOS, Linux, Android all versions, 32 and 64 Bit
Memory	64 MByte
Browser	All Note: Windows CE: Not all Apps supported. Example Inventory counting
Screen resolution	240 x 240

WebApp Terminal Version 2.1

Property	Value
OS	Android, iOS, Windows XP or newer

© 2026 Boyum IT Solutions A/S

Property	Value
Memory	2 GB
Browser	All modern browsers (for example: Edge, Chrome, Firefox, Safari).
Screen resolution	640 x 400
Bar code Support	The system must send the Bar code to the Keyboard.

1.11.4 Demo solution

For the presentation of the Beas product you can use a Notebook as Server and Client. Only MSSQL Version.

Desktop normal user

Property	Value
OS	Windows 8 or 10, 64 Bit
Memory	16 GB
CPU	Core i5 or better, 4 Cores, min 2 GHz
HDD	SSD, 64 GB or more

Software requirements

Software	Version
SAP Business One	Latest version of SAP Business One.
MSSQL	Min. Memory = 16 GB In SQL Server properties define "1000 MB" as "Minimum server space. Otherwise the program will be slow. 
© 2026 Boyum IT Solutions A/S

Software	Version
Beas	Last Beas version from https://download.boyum-it.com

1.12 Beas user interface

Beas is completely integrated into SAP Business One but it can be started outside of SAP Business One as well.

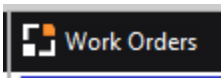
All Beas-windows are marked with the Beas logo at the bottom right corner:
In **Boyum Style**, the (inverse) Beas logo is located in the top right corner of Beas windows:



Each window has a uniform basic layout:

- Top: Tab
- Center section: List, data display or data entry
- Bottom: Button, search field

There are different types of windows

Browser	Lists and column/grid structure where the user can define the sequence and width of particular information items. - **Tool tip** assists at the column headers to display long field names that are only partially visible in the header if you downsize columns. ***Click to see*** Tool tips for special icons/characters. - **Single left-click on the line number** opens the the related edit window - **(...) Three dots** appear at the end of the "Description" field when only a truncated part of the description is visible. Edit	Detailed data entry window with a fixed layout.
Structure	Convenient structure view with fixed layout.

Customer-specific windows have a blue square in the center of the Beas icon.
Windows containing customized extensions have a small red square in the center of the Beas icon:
.

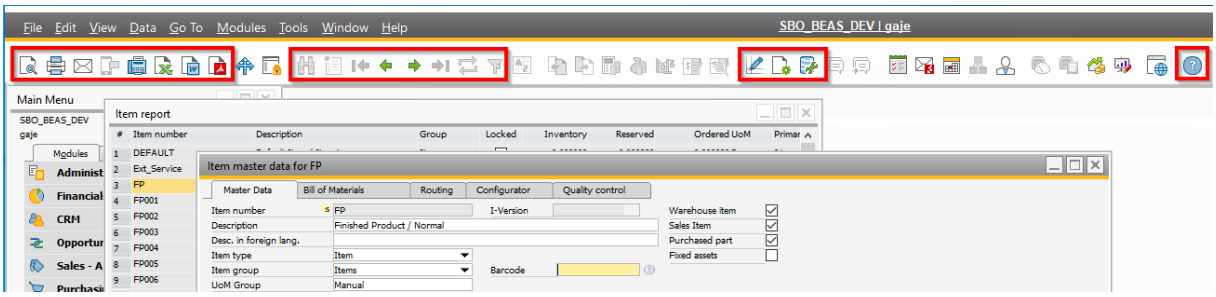
In **Boyum Style**, the bottom right corner has these functions separately: Click on the orange dot to access customizations, and the bottom corner icon to manage Templates:

© 2026 Boyum IT Solutions A/S

In some windows binoculars, spyglasses are shown in the right bottom corner, indicating that the list contains more entries than it is currently displayed. A filter has been applied.

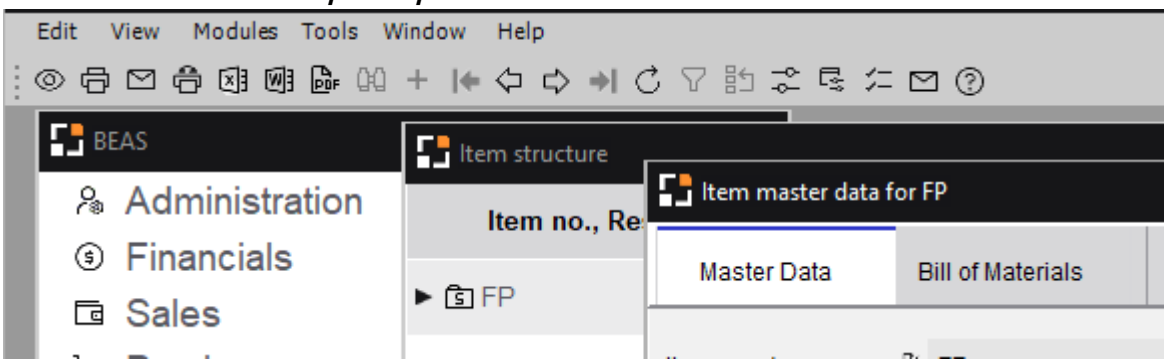
Tool bar - SAP

The SAP toolbar is supported in Beas. All marked icons can be used:



Note: The Beas standalone also has the toolbar with the SAP icons, but only icons supported by Beas are available.

Tool bar - Standalone "Boyum Style"



In the tool bar the main functions are available (move the cursor on the icon, the function is displayed)

Most of the functions can also be accessed via right-click menu.

- Tool bar icon descriptions

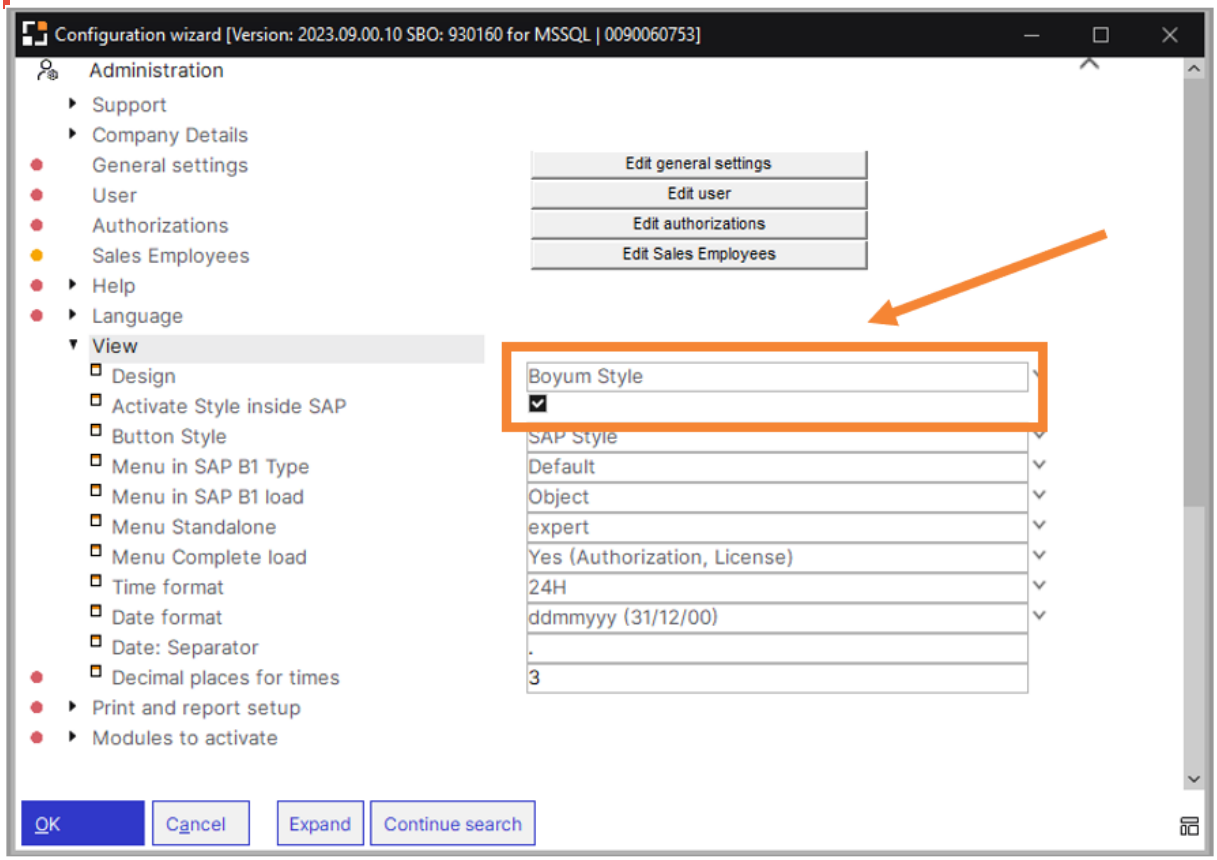
1.12.1.1 Boyum Style

This chapter contains important details of the streamlined, flat Boyum Style that was officially introduced with Beas Manufacturing 2023.09.
The conventional UI of the software was transformed into a more user-friendly working interface featuring brand new icons, button style and window structure.

The "Boyum Style" theme design - VIDEO introduction:

Activating "Boyum Style":
Select the "Boyum Style" design in the Configuration wizard:
You can also activate the style in SAP by enabling the check box underneath the "Design" setting field (***see*** below).

PATH: Configuration wizard > Administration > View > Design > "Boyum Style"



© 2026 Boyum IT Solutions A/S

Features:

▪ Improved look and feel for a more modern and professional experience.

▪ Simplified interface: unnecessary elements were removed; a simple and clean appearance for improved usability and user experience.

▪ Navigation optimization: easy and clear navigation within Beas.

- New icons in the the entirety of the software: menus, top and bottom bars, buttons, right-click menus, status markers, tool tips
- More spacious structure view and right-click menu
- Tool tips
- Enhanced browse windows
- Edit and tab windows with a scroll bar
- Renewed Terminal user interface
- Automatic window adjustment
- Universal font type for all buttons

Select the type of Boyum Theme:

- Efficiency Mode (regular space):

  - setting is active by default.

  Browse windows show more lines, edit windows feature fields closer together. Reduced column width and tab height. *Beas 2025.04*

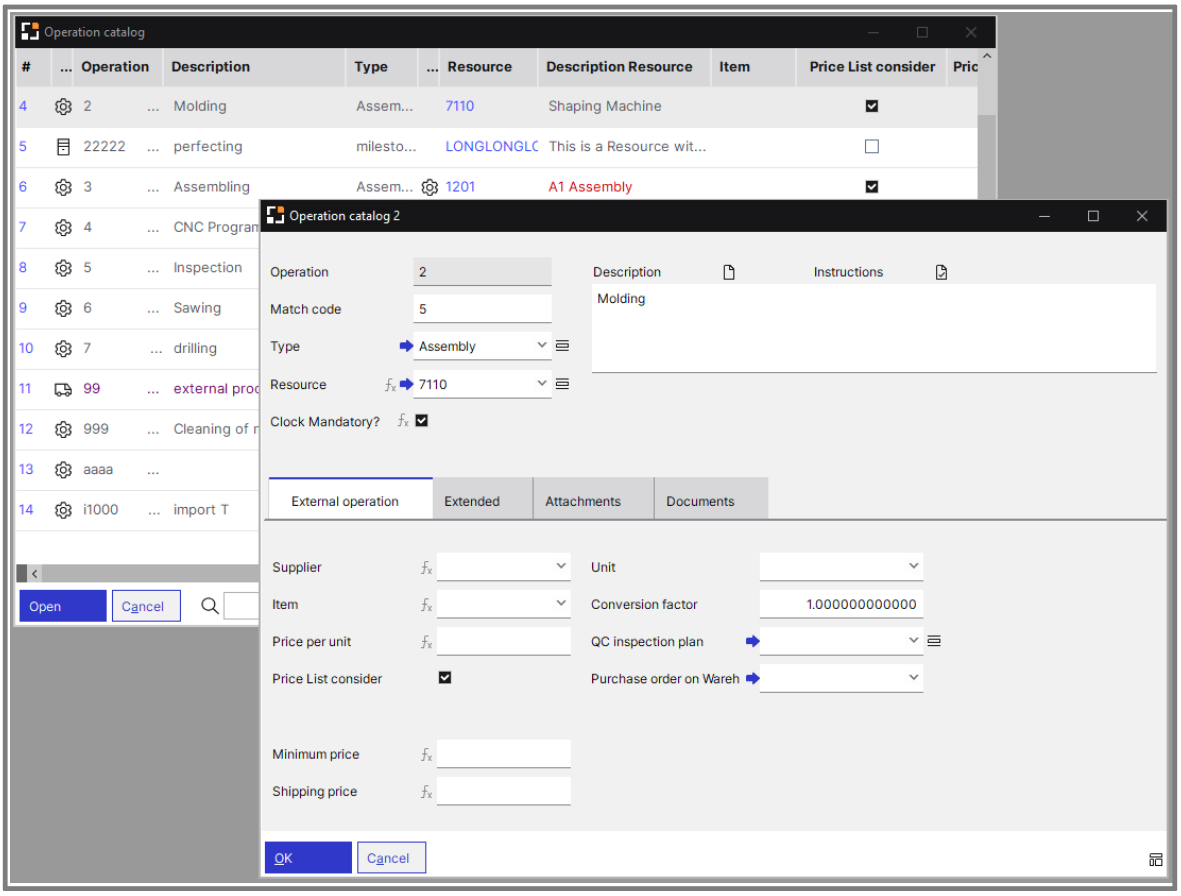
- Comfort Mode (wide space - original style):

  Original, wide-spaced Boyum Theme Style officially available as of version 2023.09.

© 2026 Boyum IT Solutions A/S

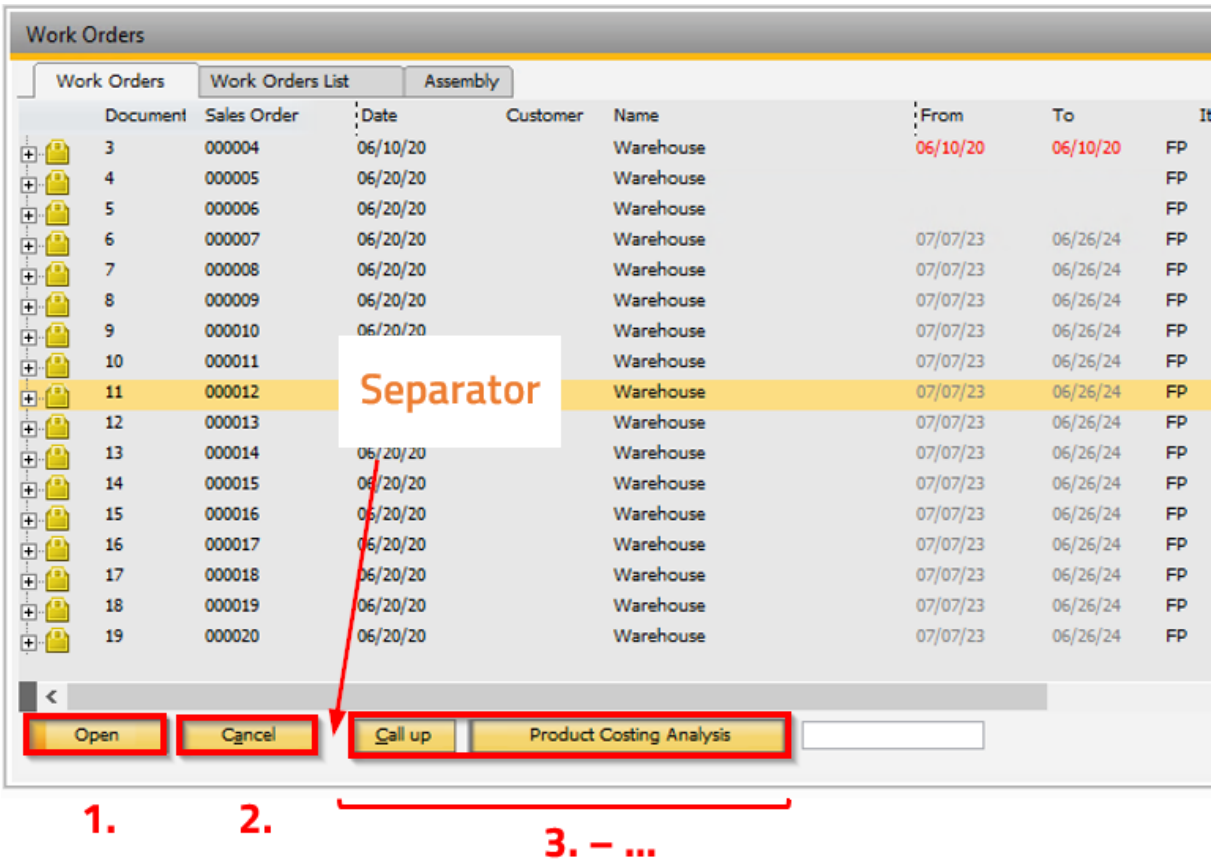


1.12.1.2 Buttons and functions layout

The layout of bottom buttons in Beas windows follows the SAP Business One style.
Beas versions before *2020.09* feature different button names and layout. If you wish to change the default SAP Style to the old Beas feel, modify the settings.

1st BUTTON: The first button in the bottom window section contains the main function of the screen (**Edit, OK/Update, Start** etc.)
2nd BUTTON: The second button is the **Cancel** button as the logic is to always have the possibility to cancel modifications and close the form.
SEPARATOR: After the first two buttons there is a break in the continuous line of all buttons.
3rd - ... BUTTON(s): From the third button (if any) onwards there are additional functions:

© 2026 Boyum IT Solutions A/S

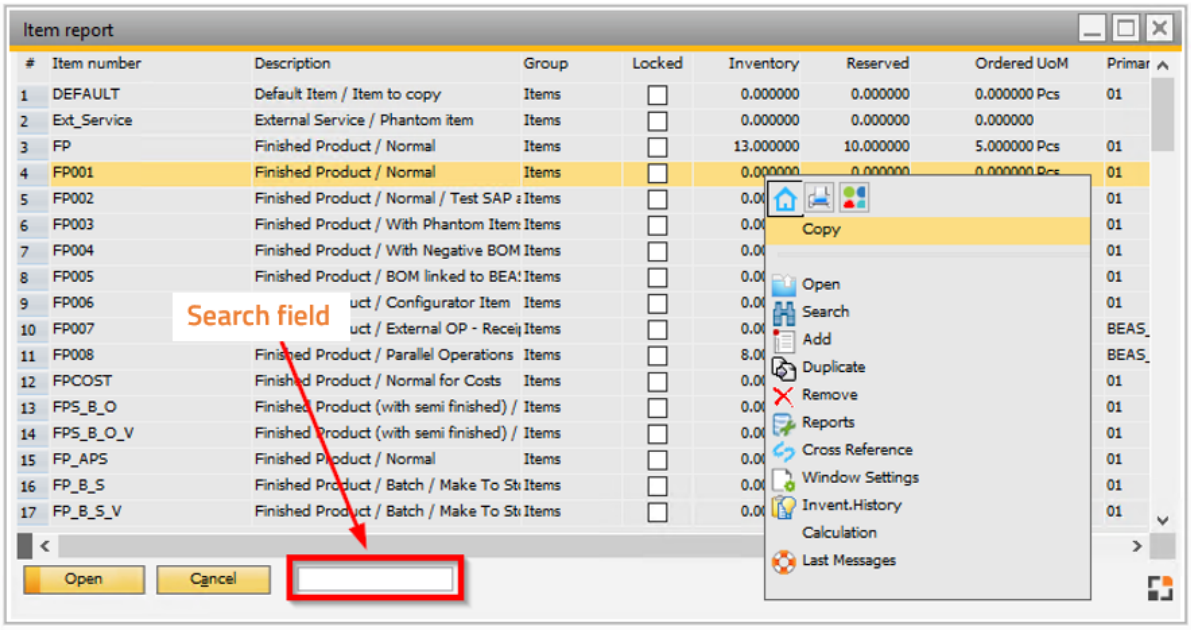


Browse forms listing a list of records do not exist in SAP. Here, the mentioned order is followed by a text box with quick search field function and custom buttons at the end.

The buttons **Search**, **Filter**, **New**, **Duplicate** and **Remove** can be found in the right-click (context) menu with the same icons as in the toolbar area (***see*** image below).

These functions can be found as individual buttons in Beas window with the Old System (Deprecated) view setting.

© 2026 Boyum IT Solutions A/S



- Difference between namings of general buttons

Old Beas style (Deprecated)	SAP Style
End	Cancel
Copy	Duplicate
Delete	Remove
Edit	Open
OK (in item search)	Choose
OK (in multiple search)	Choose
View	Open
Save	Update

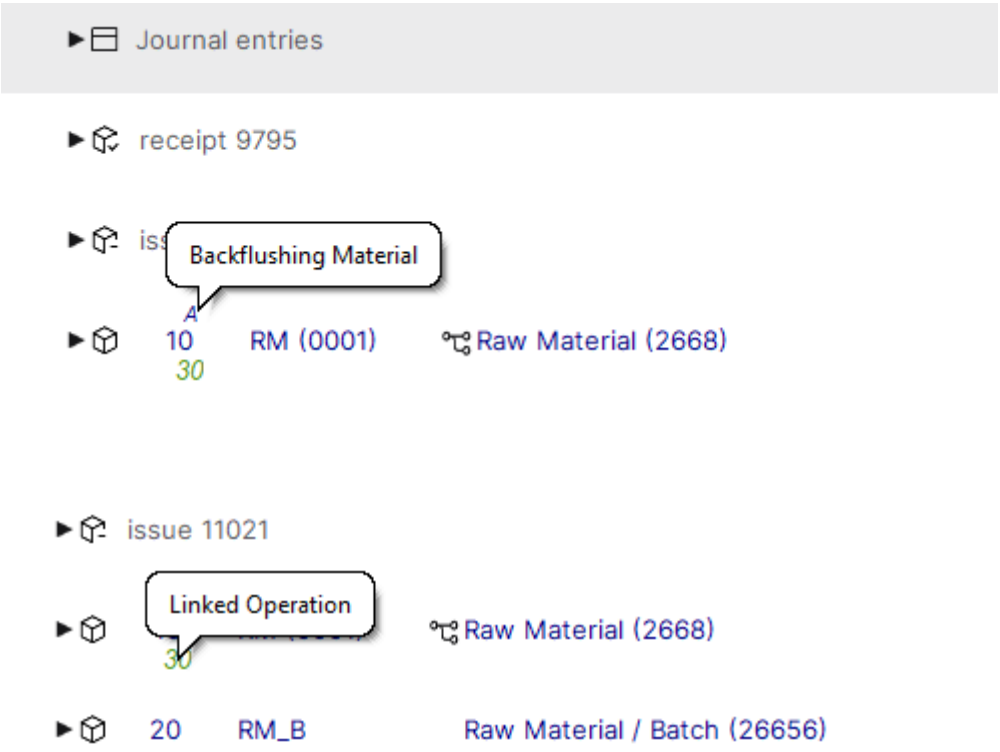
1.12.1.3 Tool Tip

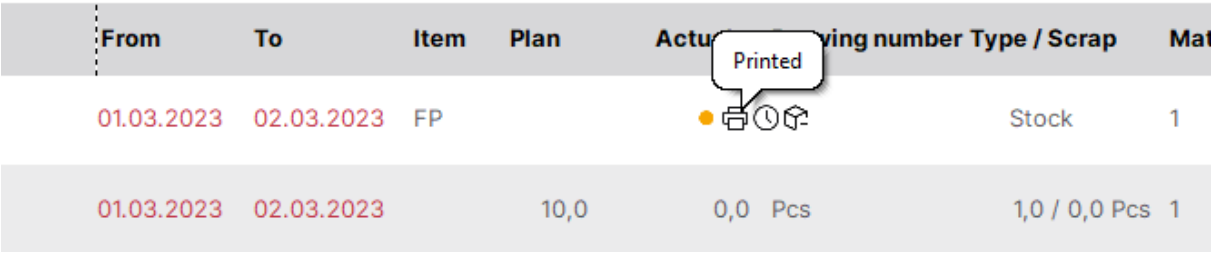
Work order tree view:

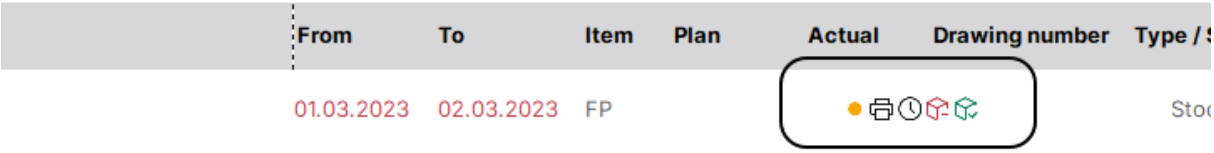
1. Status
2. WO was printed
3. Time receipt was created
4. Materials were issued

© 2026 Boyum IT Solutions A/S

5. Receipts were created

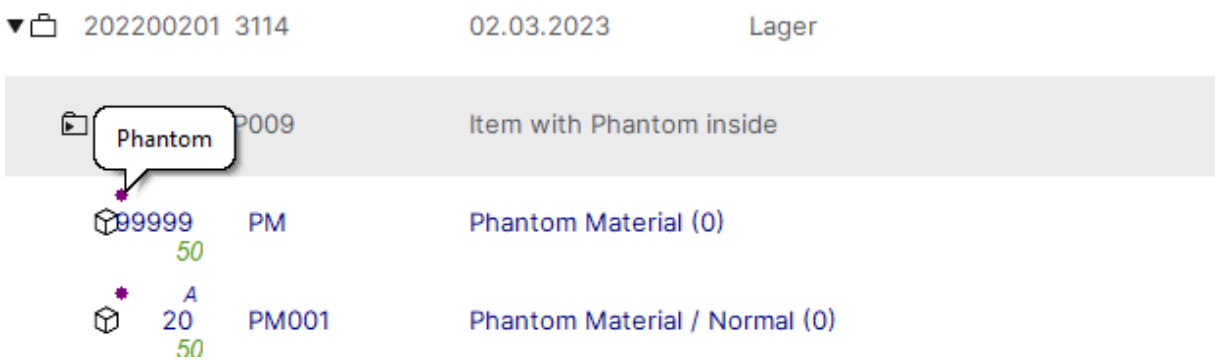




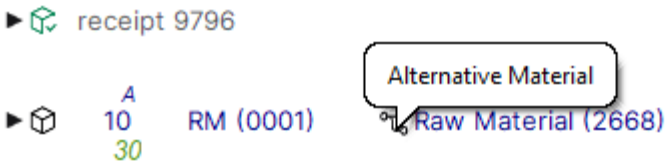


© 2026 Boyum IT Solutions A/S

6. Phantom assembly:



7. Alternative material



Item structure

© 2026 Boyum IT Solutions A/S

1.12.1.4 Main menu

All Beas system functions are controlled in the main menu.
Only the menu items with user authorizations are displayed. ***See*** User rights

If Beas is started without SAP Business One only Beas - functions are displayed. Use right-click to switch between menu types. ***See*** Configuration wizard > View > Menu
If Beas is started within SAP Business One as Add On, the Beas - menu is integrated into the SAP Business One – menu.

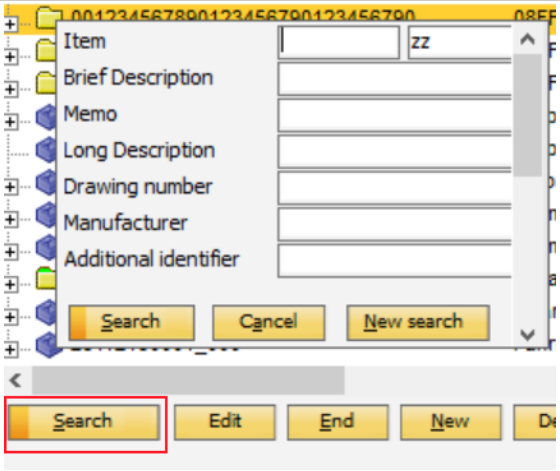
Note:
The documentation always refers to the menu-setting "default"
Customized menu items ans entries made by Beas – AddOns are available in the Add-Ons menu cluster.

1.12.1.5 Data selection

Finding data records
When a list of data records is available on the screen, for example, in item structure, the search function can be used to find a set of records.
In a window the search function can be available as:

- A Search window

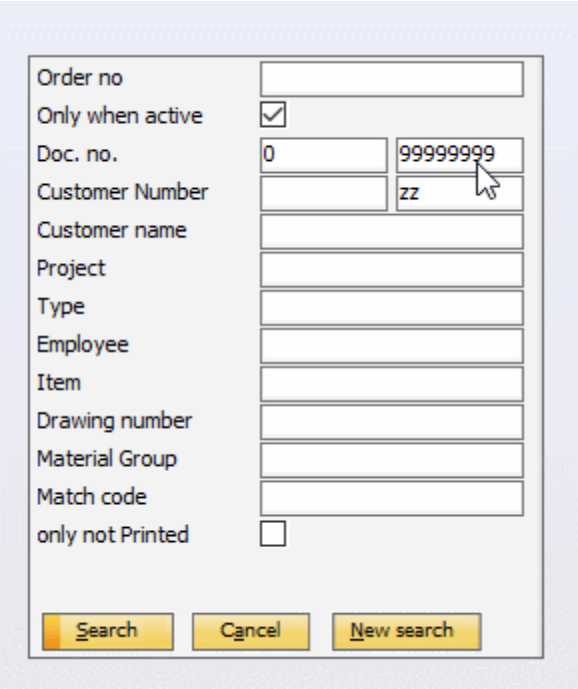
© 2026 Boyum IT Solutions A/S



Important:

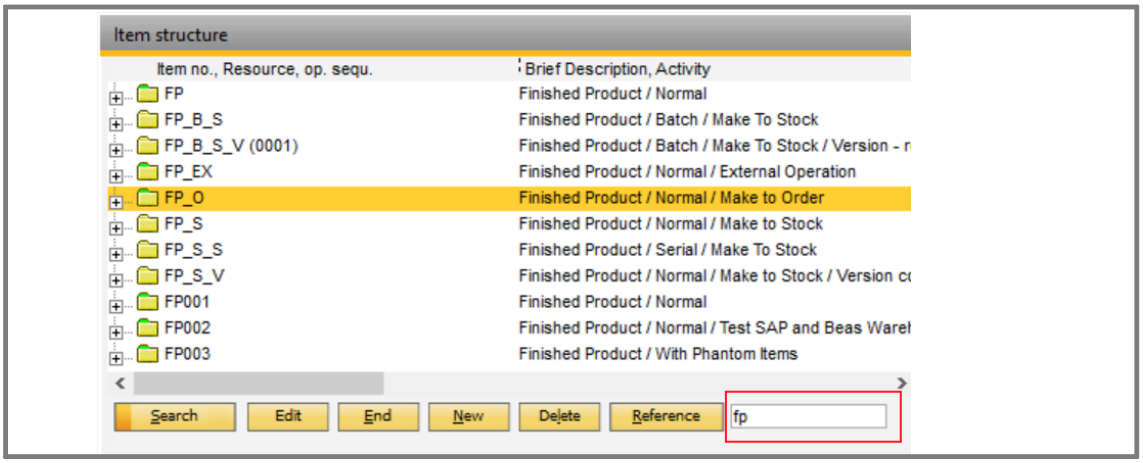
Fields that contain default and numeric values cannot be emptied. If a default value is defined, you cannot delete or overwrite it.

Enter your values inside the field before the default ones which, then, you can delete. ***See*** GIF image below:

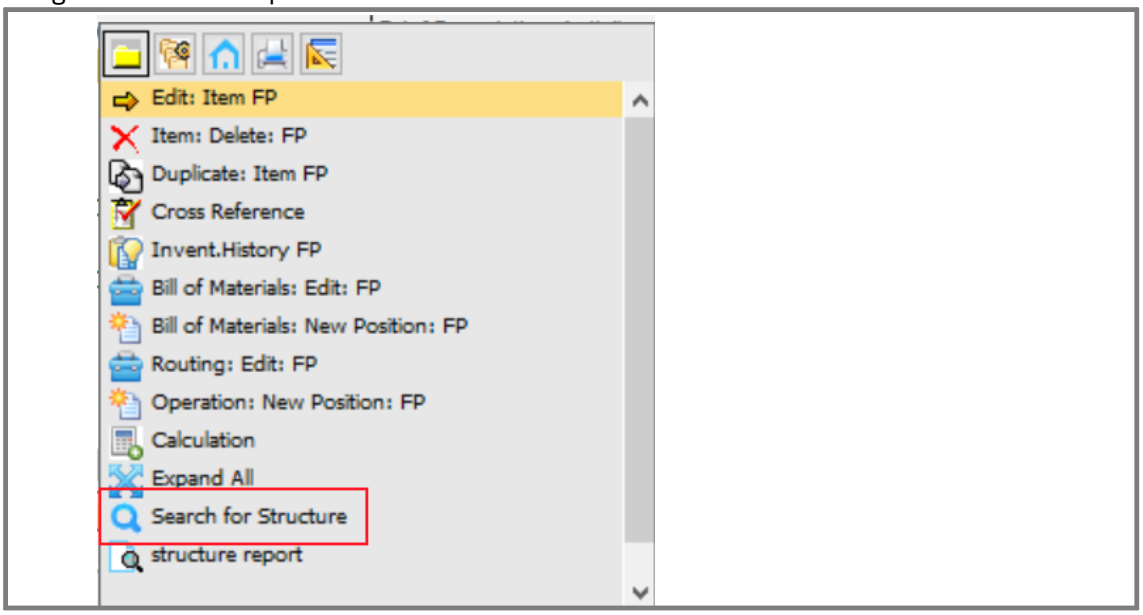


- A Search field

© 2026 Boyum IT Solutions A/S



- Right-mouse click option on a column header



To open a data record use one of the following options:

- Double-click on the item
- Click the **Edit** button, while the item is selected
- Click **Open data record** on the toolbar

Copy and paste

Various data sets, for exmaple, calculation schemas or templates can be transferred between instances of Beas or between data bases using copy and paste.

A text string is copied to the clipboard which can be sent via Email.

Video: copy paste function for data sets.

© 2026 Boyum IT Solutions A/S

Drop-down fields

The selected data set is marked by default. Colors, images and format are supported. Title is displayed in various drop-down fields.

Drop-down fields have a uniform view for all windows, for example standard warehouse view.

New functions and properties are available immediately in all windows, including all rules, icons and color controls.

A customized drop-down can be easily formatted. For further information ***see*** BeasScript documentation.

1.12.1.5.1 Multi selection

In some windows several rows can be selected at once. Some functions in these windows support multi-selection, multi-deletion.

The current row is always selected.

Note: Not all functions in a screen with multiple selection support this feature.

This function is not available in all windows. Only entries of the same type can be selected in structure view. Some entries cannot be selected.

Key	Meaning
Shift+click	Select all rows from currently selected row up to and including the clicked row.
Shift+cursor up or down	Select all rows from current row including each row that you step through, adding one row at a time.
Ctrl+click	Add clicked entry to selection (previous selection is kept).
Ctrl+A	Select all.
Click on entry or change row with cursor	Selection removed, only the current entry is selected.

1.12.1.6 Decimals: separator character behavior

Beas displays all numeric fields with the decimal separator defined in the Windows regional settings of the actual system.

Therefore, the SAP decimal separator is ignored.

The "Decimal Separator Key" defined on the NumPad of the computer keyboard also applies the Windows regional settings. For this logic, the system also reads the Keyboard definition of the user.

© 2026 Boyum IT Solutions A/S

Generally, Beas uses the decimal separator similar to MS Excel: Windows settings in combination with the Keyboard of the user.

IMPORTANT: When connecting to remote systems, Windows may read the regional settings of the local machine, and therefore, the information input of the remote machine is then displayed based on the local machine's windows settings.

Examples:

Configuration 1 (English keyboard):

- Keyboard Decimal Separator: "." (period)
- Windows Decimal Separator: "." (period)

- Result when the key is pressed in Beas: "." (period)
- Result when the key is pressed in the Notepad application: "." (period)
- Result when the key is pressed in Excel: "." (period)

Configuration 2 (Spanish Keyboard):

- Keyboard Decimal Separator: "." (period)
- Windows Decimal Separator: "," (comma)

- Result when the key is pressed in Beas: "," (comma)
- Result when the key is pressed in Notepad: "." (period)
- Result when the key is pressed in Excel: "," (comma)

Configuration 3 (German Keyboard):

- Keyboard Decimal Separator: "," (comma)
- Windows Decimal Separator: "," (comma)

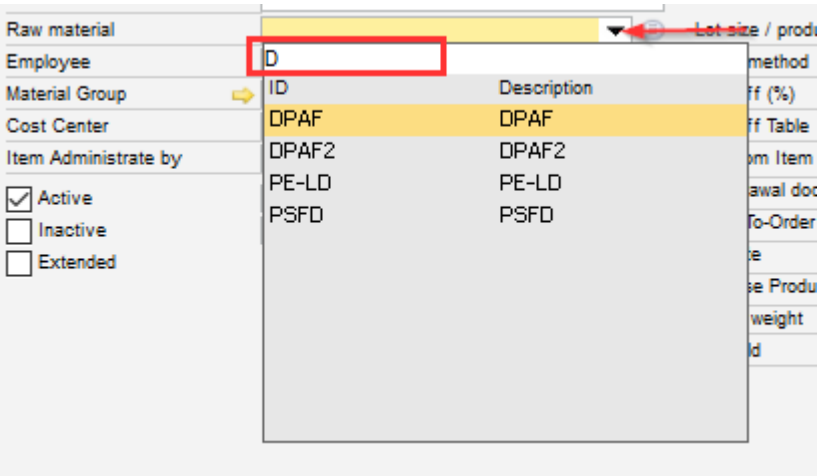
- Result when the key is pressed in Beas: "," (comma)
- Result when the key is pressed in Notepad: "," (comma)
- Result when the key is pressed in Excel: "," (comma)

© 2026 Boyum IT Solutions A/S

1.12.1.7 Drop-down

You can select data in a number of fields.

Click on the drop down icon to see the complete list.



Page Up / Down and scrolling:

A key press of page up / down scrolls one page.

For example, one pressing of the Page down button shows the list from the first row that is not displayed in the list presently.

Search inside the drop-down list:

Start typing the entry and the auto-complete function filters the information.

The Drop-down window searches this text in every column (Full text search) and displays the result.

UTF8 characters are fully supported *(beas 2020.02)*

1.12.1.8 Right-click menu

The **right-click menu** is available in almost all windows in Beas, providing general and context sensitive functions. These options are grouped into the following tabs in the context menu:

1. Context-sensitive basic functions
2. Context-sensitive extended functions
3. Context-sensitive expand functions
4. General functions
5. Export functions
6. Template Administration
7. B1 Usability Package*

© 2026 Boyum IT Solutions A/S

*available to B1UP users

Boyum Style:

Context-independent functions are generic and available in all windows.

Context sensitive functions

Description of the context sensitive functions is available at the relevant function:

Work order right-click options

Work order position right-click options

Order recommendation right-click options

General functions

Functions - Right-click menu		Option	Description
Traditional style: 	**Boyum Style:** 	Copy	Copy the current content to the clipboard.
		Insert	Insert the clipboard content into the selected field. Only visible, if: • The clipboard has content • The selected field is writable • The field length is <100 characters
		Open/Edit	Opens the selected entry.
		Search	Opens the search screen.
		Reports	Opens a selection of reports.
		Window settings	Opens window settings.

© 2026 Boyum IT Solutions A/S

Functions - Right-click menu		Option	Description
		Last messages	Opens list of last error messages.
		Change log	Opens the list of latest changes in Beas.
		Some context-sensitive options are also available.	
		Add	Depending on the screen, it opens a create new item window for the selected item type. For example, a new QC order in the QC order window.
		Remove	Deletes the selected line.

Export menu

Output of current view or a stored Macro.

Functions - Right-click menu		Option	Description
Traditional styles: 	Boyum Style: 	Preview	Preview for macro export.
		Fax	Opens macro menu for email.
		Email	Opens macro menu for email export.
		Word	Opens macro menu for export to Word.
		Excel	Opens macro menu for export to Excel. In some windows an export is possible only to a limited extent.
		PDF	Opens macro menu for export as PDF.

© 2026 Boyum IT Solutions A/S

Functions - Right-click menu		Option	Description
			Note: to export Beas views, a printer driver needs to be installed. ***See***: Output
		Layout	Opens macro administration.

In SAP Business One windows the Beas-Macro-feature can also be used. For additional information ***see***, Deactivate macros, Macro definition, Output.

Limitation on printing Work Order Report:

Work order structure view reports are designed to display 6 sub levels, therefore the system does not print information over 6 sub levels.

Template menu

Traditional styles: Left-click the Beas icon at the right bottom corner to call the template system.

Boyum Style (Beta): Select the Template tab by clicking: / in the right-click menu or (when available) in the right bottom corner of the screen.

Function		Option	Description
Traditional styles: 	Boyum Style: 	Default	The current template is set as default for this list.
		Templates administrate	Opens the template administration menu.

B1UP menu

- Available only with a valid Beas usability package license.

See B1UP documentation.

Right-click in text fields

The Windows-default window for editing of texts opens by right-click on the text field (fields with more then 100 characters).

The text area can be copied or inserted or can be switched to other fonts.

© 2026 Boyum IT Solutions A/S

This window opens in the language of the Windows-language settings.

1.12.1.9 Ctrl + DoubleClick

The Ctrl + Double-Click on an object has different functions.

Note: Ctrl+Double Click is not working on Buttons or Tab elements. Only Text columns and Text fields.

Function	B1UP Installed	Description
Edit Window Ctrl + Double-Click on a column	No	Open field customizing window Beas Usability extension not installed: Via Ctrl + Double-Click on a Beas object you can change its desig or behavior of columns.  *Window: system_form_column* The system saves every change in the project folder as BeasScri If you open this form for a field again, the system will read the s this BeasScript. Note: Not all columns can be changed. Exceptions: objects, generate tabs, data-dependent fields. **Field description**

© 2026 Boyum IT Solutions A/S

Function	B1UP Installed	Description

Field	Description
Original text	Original text.
New text	New text, which is to be displayed instead

Format tab

Function	Description
bold / italic / invisible / protected	Set check mark to select a format.
Color	Select font color. ***See*** Color selection.
Tooltip	The entered text will be displayed when mo cursor over the respective object.

Condition tab

With the background condition you can define the background

Function	Description
Background: normal / error / empty	Set background color according to selected Click on drop down field to select color.
Input mandatory	Set check mark to make this field mandato
Error message	Error message, in case the entry is not C Display the text in an error case. ***Example***: Field is defined as mandatory and if you click on update, the system v the error message.

Content changed tab

Input window for scripts. As long nothing was entered, the exan displayed.

Example:

© 2026 Boyum IT Solutions A/S

Function	B1UP Installed	Description

		JBScript
		`#jbs`
		`// Check length of field`
		`if (items.frgnname.value.len  < 10) {`
		`  messagebox("error","Insert minimal 10 letters");`
		`  items.frgnname.status="error";`
		`  }`
		`else`
		`  items.frgnname.status="ok";`
		`dw_1.items.redraw();`
		
		BeasScript
		`// Check length of field`
		`if <dw_1.item.frgnname.value,len>  n< 10 then`
		`  messagebox=error$$Insert minimal 10 letters`
		`  dw_1.item.frgnname.status=error`
		`else`
		`  dw_1.item.frgnname.status=ok`
		`end if`
		`dw_1.item.frgnname.redraw`

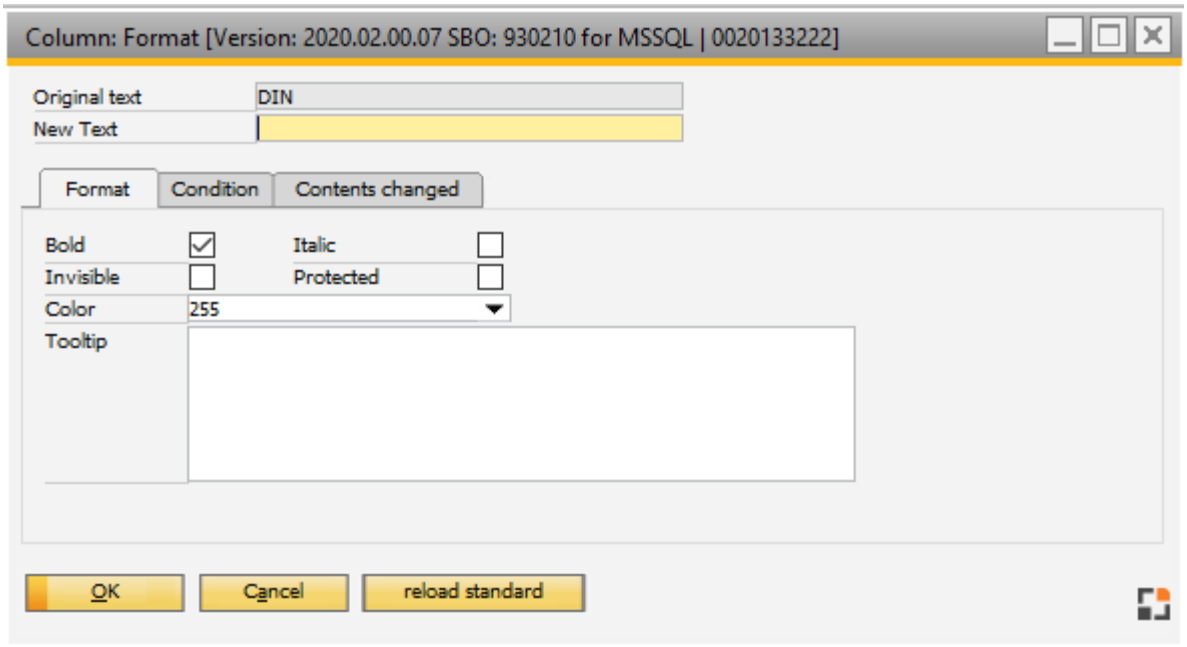
Edit Window Ctrl-DClick on UDF Field	all variants	Opens the UDF extended setting window
Edit Window Ctrl-DClick on a column	yes	Opens Beas Usability Edit window
Browse Window Ctrl-DClick	all variants	Opens the window settings
Edit Window Script window is open	all variants	Jumps to the column on which you clicked

1.12.1.9.1 Change objects

Beas Usability extension not installed:

Via Ctrl + Double-Click on a Beas object you can change its designation, color or behavior of columns.

© 2026 Boyum IT Solutions A/S



Window: system_form_column

The system saves every change in the project folder as BeasScript.
If you open this form for a field again, the system will read the settings from this BeasScript.

> Note:
>
> Not all columns can be changed. Exceptions: objects, generated at runtime, tabs, data-dependent fields.

Field description

Field	Description
Original text	Original text.
New text	New text, which is to be displayed instead of the old one.

Format tab

Function	Description
bold / italic / invisible / protected	Set check mark to select a format.
Color	Select font color. ***See*** Color selection.
Tooltip	The entered text will be displayed when moving the cursor over the respective object.

© 2026 Boyum IT Solutions A/S

Condition tab

With the background condition you can define the background related to

Function	Description
Background: normal / error / empty	Set background color according to selected condition. Click on drop down field to select color.
Input mandatory	Set check mark to make this field mandatory.
Error message	Error message, in case the entry is not OK Display the text in an error case. ***Example***: Field is defined as mandatory but not filled, and if you click on update, the system will display the error message.

Content changed tab

Input window for scripts. As long nothing was entered, the example code is displayed.

Example:

JBScript

```
#jbs
// Check length of field
if (items.frgnname.value.len  < 10) {
  messagebox("error","Insert minimal 10 letters");
  items.frgnname.status="error";
  }
else
  items.frgnname.status="ok";
dw_1.items.redraw();
```

BeasScript

```
// Check length of field
if <dw_1.item.frgnname.value,len>  n< 10 then
  messagebox=error$$Insert minimal 10 letters
  dw_1.item.frgnname.status=error
else
  dw_1.item.frgnname.status=ok
end if
dw_1.item.frgnname.redraw
```

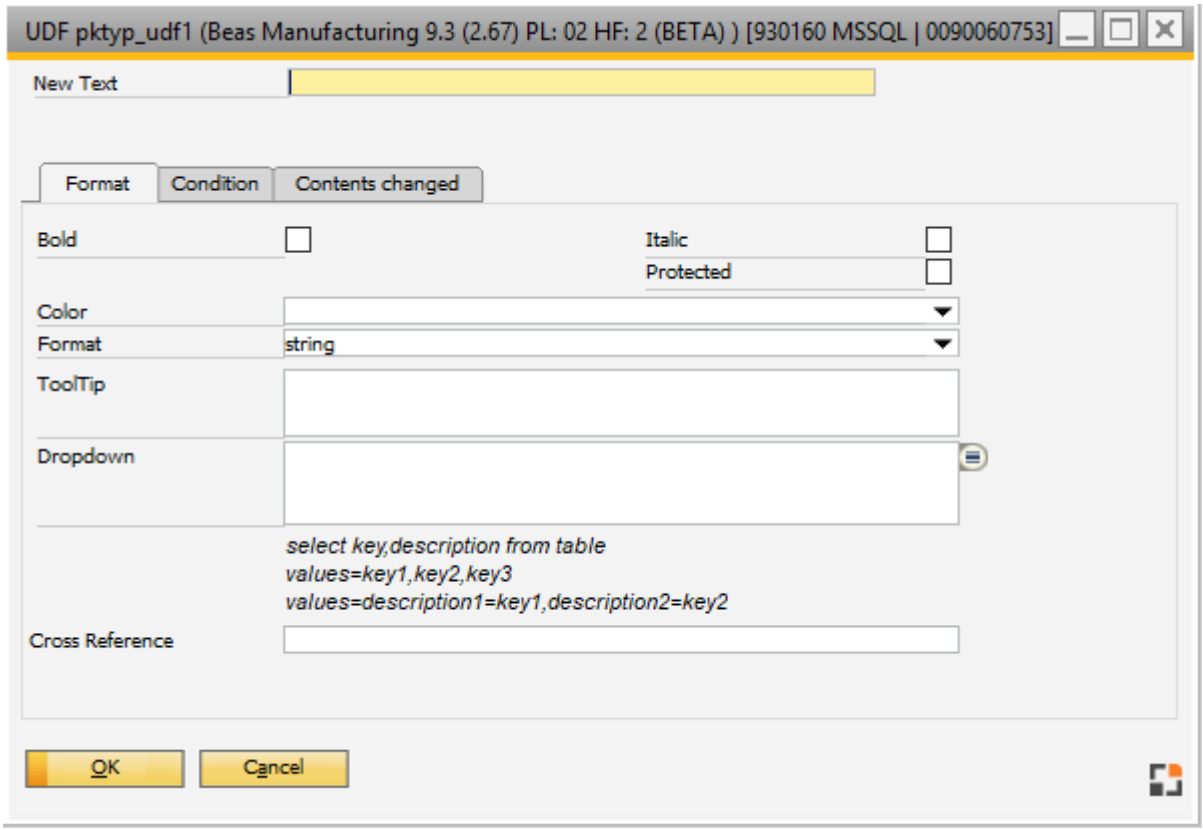
1.12.1.9.2 UDF - Extended settings

Up to 4 UDF's can be stored in the Configuration wizard in certain areas. Use the cogwheel icon to set up additional properties.

If you select a UDF using Ctrl + double-click in a window, this window opens.

© 2026 Boyum IT Solutions A/S

UDF–field information is saved to the database.



Window: system_option_udf

Available settings:

Function	Description
bold / italic / invisible / protected	Set check mark to select format.
Color	Select font color ***See*** Color selection.
Format	Defines the format of the input. A UDF Field is always an alphanumeric character string. If a format is stored, the input will be formatted respectively. **Possible formats:** - Numeric (0 decimal places) - Decimal 1–6 decimal places - Date

© 2026 Boyum IT Solutions A/S

	Faulty numeric inputs are turned to 0, faulty date inputs in 1.1.1900, and readable values are formatted respectively. The system uses the current windows regional settings for date and numbers. NOTE: The field itself always stays alphanumeric. In the background the system automatically generates a small script which is executed if you change the value.
Quick help	Text entered here will be displayed if you move the cursor over the respective object.

Drop-down	A Drop-down can be stored.
	Variants are possible:
	`select key,description from table where rule`
	`values=key1,key2,key3`
	`values=display1=key1,display2=key2`
	`activateascalendar`
	
	Example
	Shows all items:
	`select "ItemCode","Description" from "OITM" order by "ItemCode"`
	
	Color selection
	`values=red,blue,green`
	
	Color selection, only the first letter will be saved
	`value=red=r,blue=b,green=g`
	
	Calendar
	`activateascalendar`

Reference	Create a yellow arrow left of the entry field Insert a yellow arrow left to the field. Click on it to execute the script defined here.

© 2026 Boyum IT Solutions A/S

	Example Open item window (udf1) `openwindow=artikel_edit.psr<tab>s_parm1=<udf1>`

Tab Condition

Function	Description
Background: normal / Error / empty	The background be colored depending on chosen condition. To open the color selection, click on the drop-down button .
Input mandatory	Set check mark, to make the field mandatory. After the window will be re-opened, the Only when the window will be reopened, the setting will be activated.
Error message	Error message if the input is not okay The status of the field can be set to "error" `dw_1.item.udf1.status=error` If the field has this status and you try to save the changes, this error message is returned.

Tab content changed

Input window for scripts. This is executed after changing the field.

Use this to check the input or for direct change.

1.12.1.10 Lists

Lists can be freely set up (***see*** Window settings). Various views can be managed in parallel and you can add own columns. (***see*** Templates)

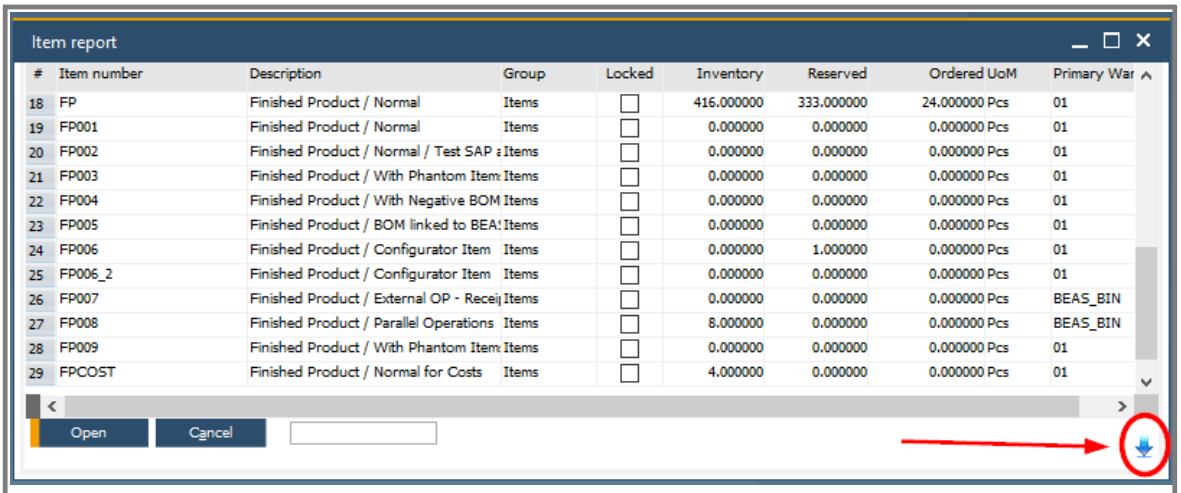
Lists can be filtered and sorted via right-click on column title.

Display completely

Only the number of entries set in the Configuration wizard are displayed.

A short blinking symbol appears right below if not all entries have been loaded. When clicking on it, the function "Display completely" is provided in the pop-up menu. If enabled, all entries are reloaded.

© 2026 Boyum IT Solutions A/S



Boyum Style:

Performance note: showing only the first "x" rows provides for faster operation in case of exceptionally large databases.

Note: This feature is supported by the window templates. Thus, the quantity of the rows to be displayed can also be defined in the template. The setting in the template here has a higher priority.

1.12.1.11 Structure view

Beas supports special structure views.

On the left, the structure is displayed and on the right the property of the current line is shown. In each line of the structure another object with various properties can be located; that is why the right side of the display may be very different.
Thus, there are no fixed columns, and no universal column header.

Structure windows are: Item structure, Precalculation, Work order structure, Post-calculation

Column width

There are two vertical bars in the column header row which can be shifted to change the width of the columns. Column width is stored by station.

© 2026 Boyum IT Solutions A/S

Export

An export of tree views in a column-oriented format such as Excel is not possible because there are no fixed columns. At an export of the current view the error report "(lockedfunc) Function is locked" will be issued. For most views a Crystal Report is available. This can be exported or adapted to own-made needs. Furthermore, objects providing the structure in an exportable view are available.

Window settings

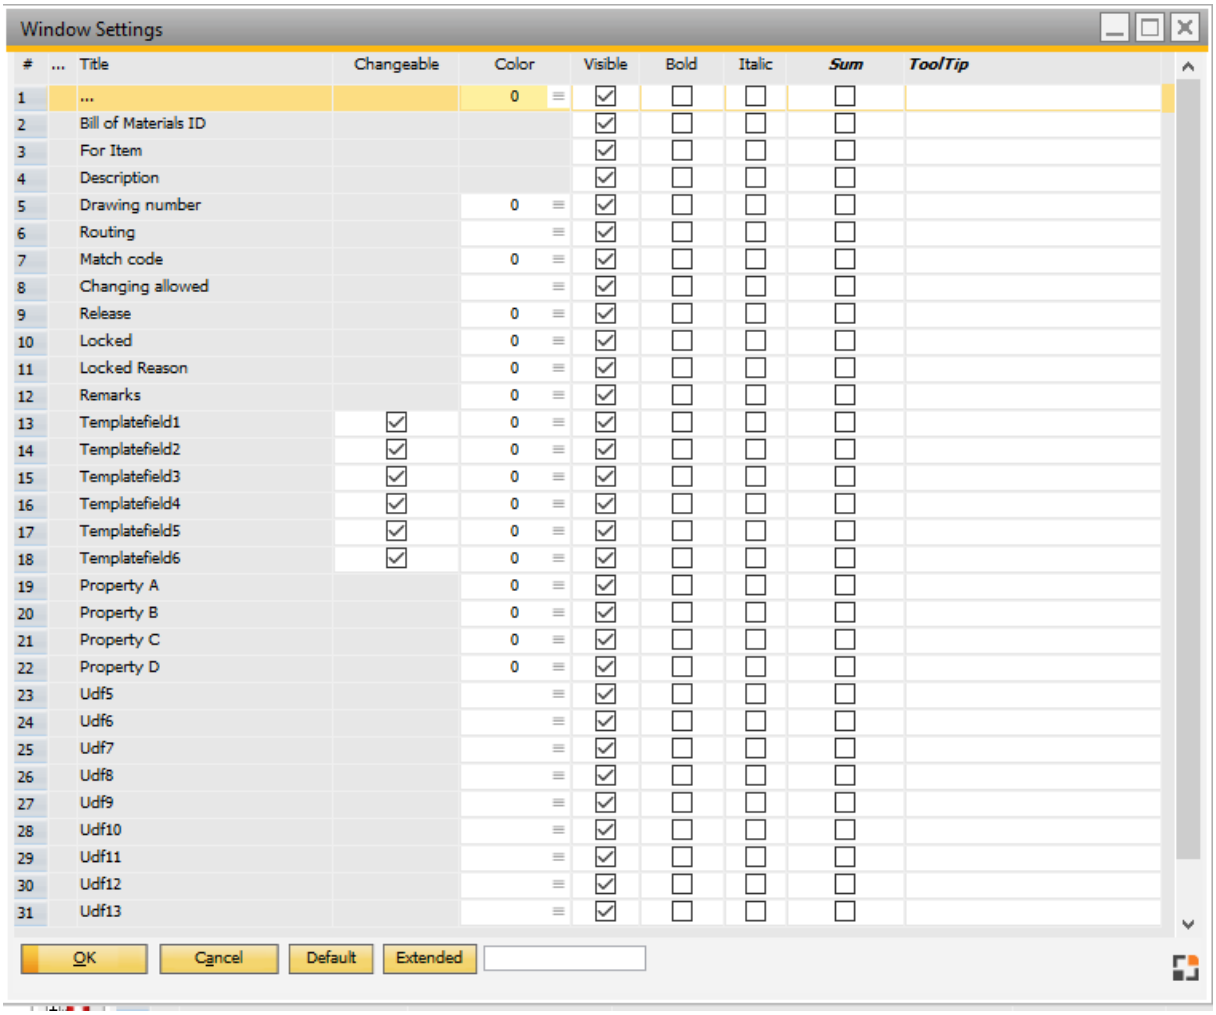
Window settings are partially available. However, this is not where columns are set up; The settings of other properties are accessible here.

1.12.1.12 Window settings

In many lists the width and visibility of columns and the order of display can be set up. This is made in window settings which are available via **right-click > Window settings**.
Click on the a list if there are multiple in a window.

Window settings are not possible in windows with a structure view.
The authorization Template is required for window settings.

© 2026 Boyum IT Solutions A/S



Window system_col_browse.psr

Assignment Window settings

- SAP / Beas normal:

  Windows settings are always applied to the currently logged user only.

- Terminal mode

  Terminal: The Terminal – Program will be started with an SAP user. The window settings are assigned to this user.

  Change window settings:
  Login with this Terminal user in SAP Business One and change window settings.
  It is recommended to work with the templates.

- Templates

© 2026 Boyum IT Solutions A/S

When changing window settings and creating a template afterwards, the window settings are transferred to this template.
Changes in the window settings will be saved in the template if it is active.

Note:
It is recommended to assign the window settings to a template and to assign the terminal user to this template if window settings are required for a terminal user.

For windows settings the authorization Template is required.
If changing window settings and creating a template afterwards, the window settings are transferred to this template.

- Change column width

1. Move mouse to the edge of a column in header row. The mouse icon changes. Click and hold the mouse. Adapt width (move while keeping the button pressed). If the desired width has been set up, release the button.
2. Right-click and select window settings.
3. A list of all columns is displayed. Click only on **Update** and close the window again.
4. Now the new column width is saved.

- Change column order

1. Right-click and select window settings
2. A list of all columns is displayed.
3. Select the column to be moved by left click and keep the button pressed. The mouse icon changes.
4. Move column to desired location and release the button.
5. Click on **Update**.

- Add or hide columns

1. Right-click and select window settings
2. Select column
3. Turn on or off the check box "visible"
4. Click on **Update.**

- Note on program update:

If a window was adapted, changes in the standard are not transferred to the own customization. New fields or adaptations are only displayed after selecting "reset standard".

© 2026 Boyum IT Solutions A/S

Window settings

The following columns are displayed here:

Heading	Field name
Visible	Determines if field is visible.
Changeable	Determines if field is changeable. Not every field is changeable. if you make fields changeable, which not changeable in standard, then the system don't save the changes.
Color	Select field font color.
Bold	Field font is displayed bold.
Italic	Field font is displayed italic.
Icon	Some specialties are displayed here. Icon "NEW": column has been added after program update. Icon "Lock": column was changed using extended settings, standard settings have been overwritten.
Sum	Activating this setting for a field provides a summary below the listed values of that field in the main window. Details It is possible to summarize fields from type Number/Decimal and String, for example UDF or template fields, but not Date fields. ***Example:*** Item report – sum for "Inventory"  *Window artikel_browse.psr* Note: The system converts the Text/String to a number. Comma and Point are allowed as decimal delimiter. If it is not a number or the field is null, the system ignores the line.

© 2026 Boyum IT Solutions A/S

Heading	Field name
	LIMITATION: Formulas are not supported.
Tooltip	Here you can enter a tooltip to appear above a field in the main window.

Functions

Heading	Field name
Change order	Click the title, keep mouse button pressed and move.
Change width	Close the window, set up the field width in the list, re-open window settings and click **Update**.
Reset defaults	Right click – Button "Standard" window is reset to default values. This may be necessary after update, or, if the customized settings do not fit the original settings.
Further properties	Right-click – details: customized details can be set up (***see*** below).
Save form in template	If a template is created, current window settings are saved. ***See*** Templates.
Distribute window settings	Window settings cannot be distributed but templates can.

Extended button: Access extended window settings for the current window.

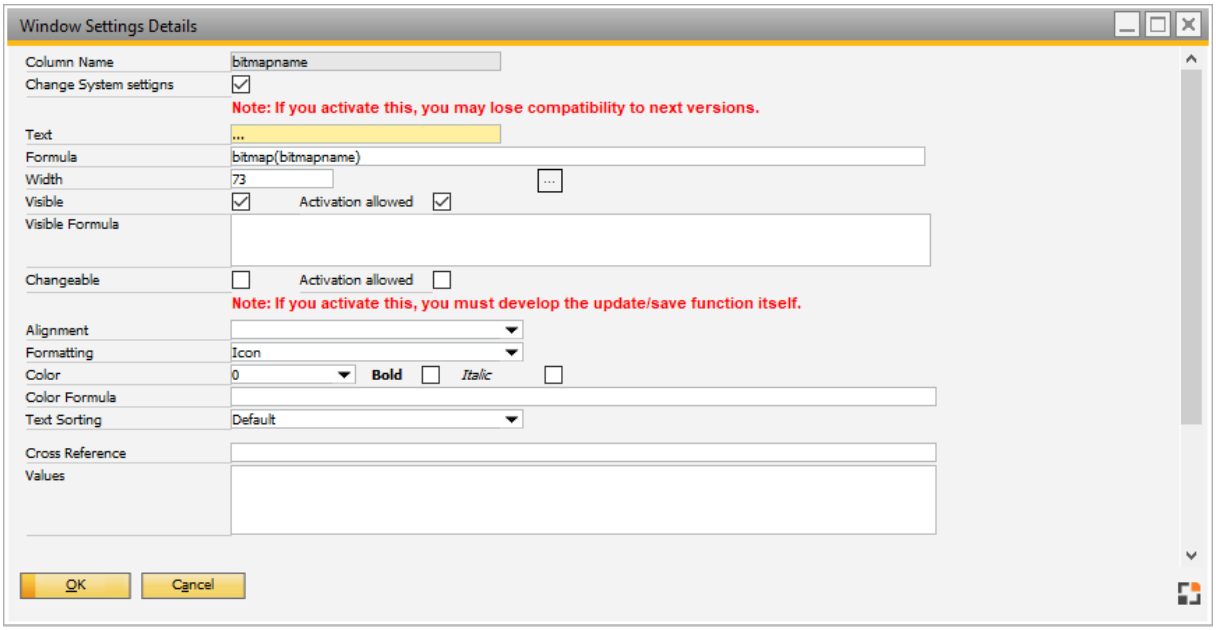
back to Window control

1.12.1.12.1 Window settings - Details

You can make further window settings in this editing window.

PATH: Window settings > "**Extended**" button

© 2026 Boyum IT Solutions A/S



Window system_col_detail.psr

If "Change System settings" is enabled, detailed settings can be overwritten.

Column Name	Name of column (usually table name and table field)
Change System settings	Overwrite Standard field definitions. Enable this field to overwrite all default settings (e.g. description, color etc.). All changes, extensions and corrections will be available after program update. There may be some restrictions in upward compatibility. The respective fields are marked with a "LOCK" – Icon. If this field is disabled, (default) no fields in this screen can be changed.
Text	Word ID for Display Define the word ID for Display. Note: The system tries to translate the text to the current language. For an overview of all Word-ID's ***see*** Beas-Translation.
Formula	Formulas can be stored (DataWindow-Syntax) for calculations e.g. `oitm_itemcode + oitm_itemname` or `oitm_itemcode+case (left(oitm_itemname,1) when 'A' then ' A-Group' else '')`.

© 2026 Boyum IT Solutions A/S

	See Datawindow-Syntax Insert formula fields in pool report
Width	Direct entry of width. The result is displayed on the right.
Visible	Field visible? Can only be activated if "activation allowed" was enabled.
Visible Formula	Enter a formula to be displayed.
Changeable	The field is changeable, and can only be activated if "activation allowed" was enabled. **Attention:** When active, the system does not save the changes, and it can impact other functions severely if you change the value of this field. Warning messages are prompted before saving changes for this parameter *Beas2020.03*. The Beas Standard solution does not check the changes and does not update the database.
Activation allowed	Determines whether the field "changeable" may be activated. Note: This does not mean the change is saved – only entries without functions are allowed.
Alignment	Determines the alignment.
Formatting	Determines the format. For further information ***see*** BeasScript-Documentation.
Color, Bold, Italic	Color, Bold, Italic

Color Formula	With DataWindow-Syntax the color can be returned directly:
	Example: Red if stock is negative, otherwise green:
	`if (oitm_onhand<0,rgb(255,0,0),rgb(0,128,0))`
	To hide a text field, use an invisible font color.
	Example: invisible, in case of stock=0
	`if (oitm_onhand=0,unvisible,0)`
	See datawindow-syntax

Text Sorting	Determines whether this column may be searched or sorted. affects the behavior after right-click on the column header: **Standard**: column firmly linked to data base. Filter and sorting via SQL statements possible.

© 2026 Boyum IT Solutions A/S

	DW-Sort: column is not firmly linked to data base. Sorting and filtering is allowed using the Data window-Sort/Filter-Function. Only displayed values are considered. **Only Text**: no sorting or filtering
Cross Reference	An orange arrow is displayed. By clicking on it, the entered script is executed. ***Example***: open item window `openchild=artikel_edit.psr<tab>s_parm1=<oitm_itemcode>`

Values	A selection list can be stored which opens with right-click
	Configuration:
	`select valuecolumn,displaycolumn from table ..`
	All values need to be of type "Char"
	or
	`value=display,value=display ...`

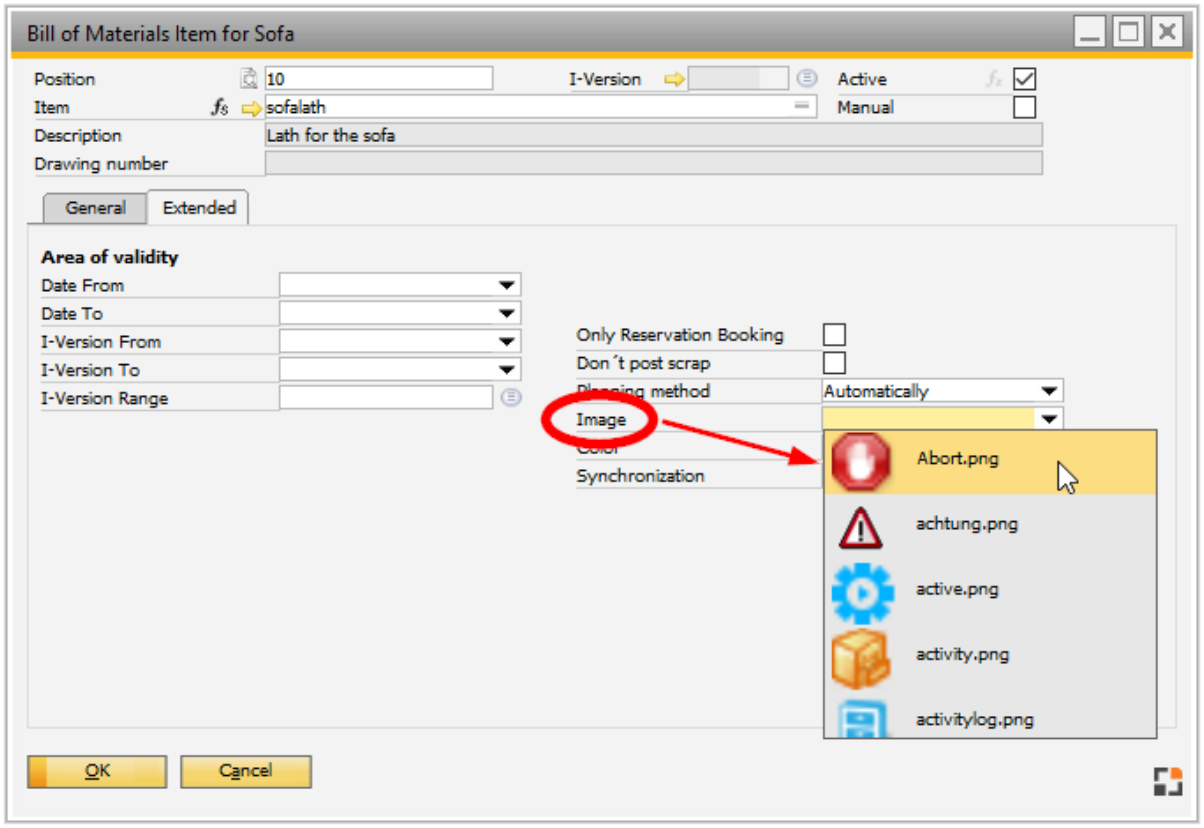
Insert formula field in pool report

back to Windows
back to Window settings

© 2026 Boyum IT Solutions A/S

1.12.1.13 Icon selection

In many areas an icon selection is available, for example in Bill of Materials:



Window artikel_stlpos_edit.psr

Only the name is saved in the database.

All available images are saved in :

C:\program files(x86)\beas software\beas\bmp

If you need additional images, you can save them in this folder.

Note: Save additional images on all work stations.

Supported formats: `jpg, bmp, png`

1.12.1.14 Color selection

A color can be assigned to various data sets, and entries will be displayed in that color in all lists.
If a drop-down field "Color" is available, clicking the window 3 color bars open with red, green and blue.

© 2026 Boyum IT Solutions A/S

Click and move the bars to change the font color of the selected entry. Click **OK** to save the color.

Color defaults

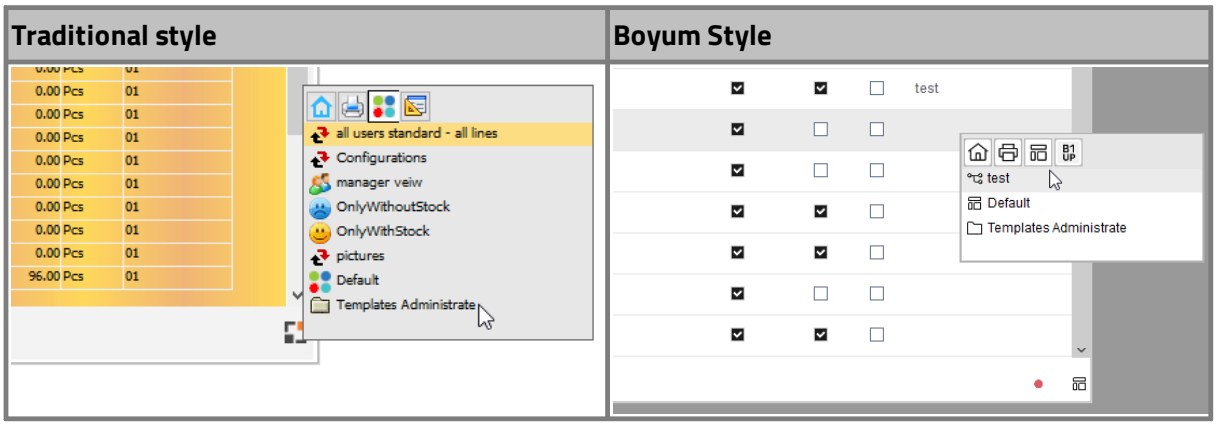
The 4 circles below save slots for colors:

Set the color:
1. Select color with the help of the 3 sliding bars
2. Double right-click in the circle to save a color to

Use left-click to select the saved color.

1.12.1.15 Templates

Many windows of type "lists" support templates. With these, various settings can be summarized and stored. The templates are accessible via the Beas icon at the bottom right corner of the window:



Affected settings:

- Sorting
- Filtering
- Columns settings (***see*** Window settings)
- Number of max. rows (not in HANA)

© 2026 Boyum IT Solutions A/S

- Title-row for print-out
- Design (background color, font size)
- Definition of up to 6 additional fields from any table

Various lists and evaluations can be created in a window by using templates. It is very simple to switch between templates and the program always opens the last used template.
To manage templates, the authorization "template" is required.

See Authorizations

Authorization control

With templates, you can also create authorizations. First, create a standard template which is available for every employee who can open the respective window.
1. Define visible fields via right-click – Window settings
2. Create New Template and set up filters and sorting if needed
3. Save template and switch to Standard – ***see*** Template administration

Now, you can create additional templates and enter the users with permission to execute the template in Template – Authorization.
Clicking on the template selection list will only display the templates that the user is authorized to manage.

> Note: Users with administration rights can access all templates.

Terminal mode

A authorization control per employee can be defined in the terminal mode. For further information ***see*** Template administration

Training unit Templates (Right-click > "Save link as...")

How to create Beas Template button
New fields in production times report
AddOn login to work order with additional fields
Improvement Report with templates
Pool list sort by aps definition with template function
MRP with templates

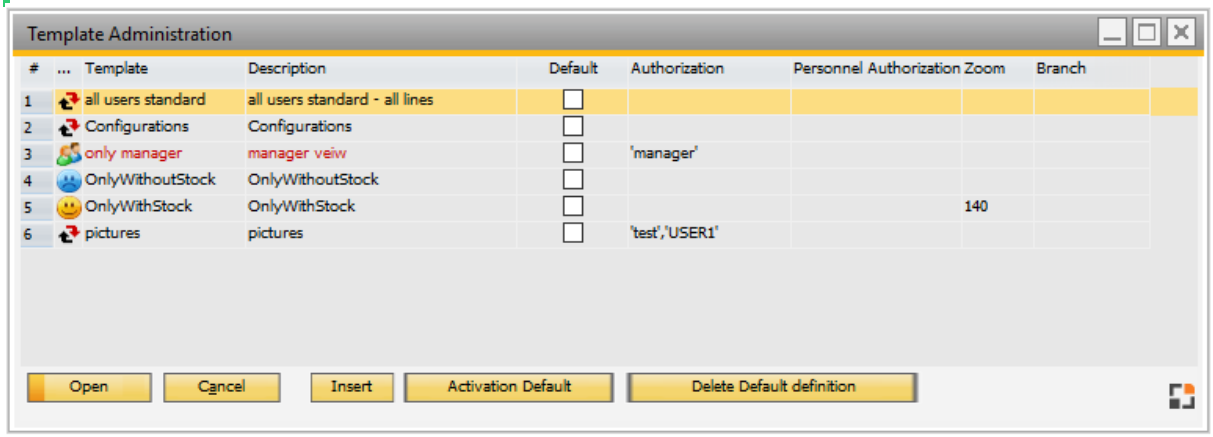
© 2026 Boyum IT Solutions A/S

1.12.1.15.1 Template Administration

In Template administration you can create new templates, edit or delete existing ones. It is accessible via all windows which have the Beas-icon in the right bottom corner.

See Templates

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate"



Button/right-click function	Description
Open	Open an existing template. ***See*** Edit template.
Add	Create new template. ***See*** Edit template. **IMPORTANT**: Existing window settings are copied to the template. ***See*** Window settings Existing filters and settings can be used.
Remove	Delete the selected template.
Copy	Copy template settings to the clipboard. Then it can be copied to the same data base or sent via Email.
Activation Default Delete Default definition	The selected template is set as default. The "Standard" template (without filter) cannot be selected anymore. With "Delete Default" it is possible to delete the setting. In this case the Standard Template is available again.

© 2026 Boyum IT Solutions A/S

Button/right-click function	Description
	Example: Item list You can use the template to define which items the user can see but this is only possible if the user does not have access to the Beas default template. You can set a new template with Filter and can define this as Default. The user can only choose the templates that he/she is authorized to manage. Otherwise, the default template is available.
Insert	Insert template settings from clipboard.

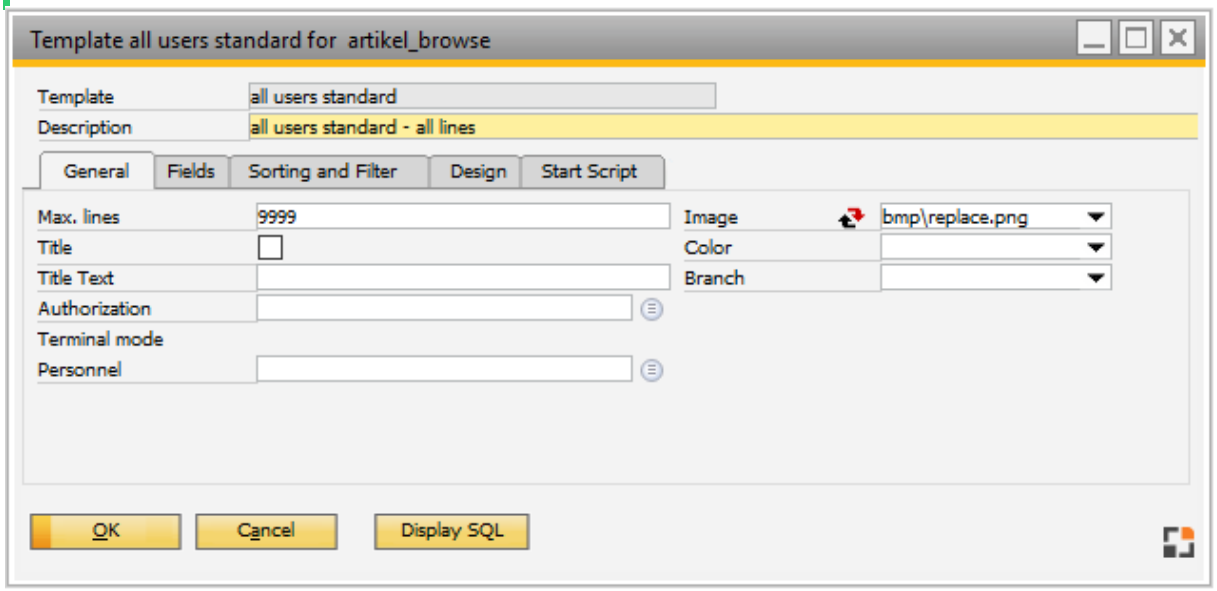
1.12.1.15.1.1 Edit templates

In this screen templates can be created and managed. It is accessible on the right bottom corner of the screen via the Beas **icon > Template administration.**

See Templates, Template administration

Many settings are available and distributed under several tabs. Depending on the window type, only the selected tabs are available.

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate" > **Open** an entry.



© 2026 Boyum IT Solutions A/S

Tabs:

General

Fields

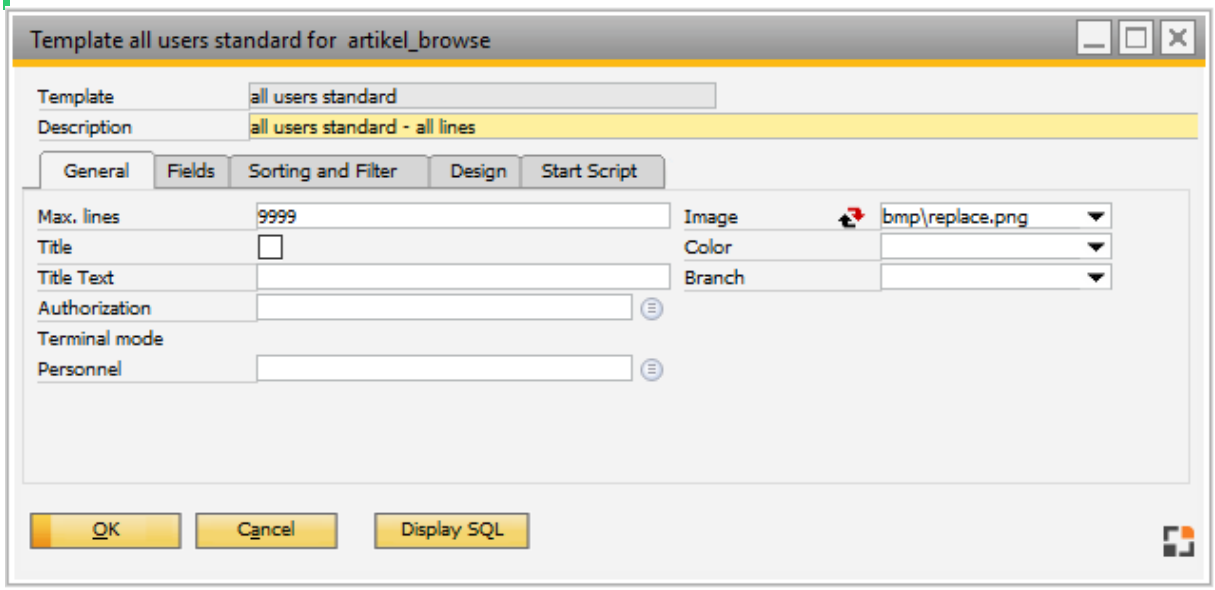
Sorting and Filter

Design

Start Script

In this tab you can perform the basic template settings.

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate" > **Open** an entry.



Window system_template_edit_page1.psr

Field Descriptions

Field	Descriptions
Max. lines	The number of rows to be displayed. If empty, settings from Configuration wizard – System are applied. By default, only the first 200 entries are displayed. If you want to have all rows displayed, enter a large number e.g. 1.000.000

© 2026 Boyum IT Solutions A/S

Field	Descriptions
	Note: This function is not available in the HANA version.
Title	If active, you can insert a title.
Text	Title (only available if field above "Title" was activated. In contrast to window header the title is printed.
Authorization	If only dedicated users shall have access to some template, you can select them here. ***See*** Templates - Authorizations
Terminal mode - Personnel	Controls the authorizations on Personnel level. Note: if you log in with superuser to the terminal, the system does not check this filter. Details: **Beas standard:** This filter is considered additionally if the current user is connected with a Personnel-Entry. "Authorization" and "Employee" will be checked if the terminal window is opened. ***A Special example***: User "A" logged on in SAP Business One. This user is connected to personnel entry "A". Personnel "B" opens the Terminal window (not Beas in terminal mode) In this case: Authorization according to user "A" + condition from "Terminal Mode - Personnel" for Personal "B" The user has access generally if no entry is deposited. **Beas Terminal mode** In terminal mode, only the field "Personnel" is checked instead of authorization.

© 2026 Boyum IT Solutions A/S

Field	Descriptions
	The employee has access to all templates if the field is empty in all template definitions. The employee has only access to the templates in which he is deposited in this list, if at least one field in a template is filled. If an employee opens a window for the first time, not the default template is used but the first one to which the employee has access. The standard template is used if no template was found. **Standard Template** The employee has always access to the Standard Template. This has to be deposited. ***See*** Templates – Authorizations

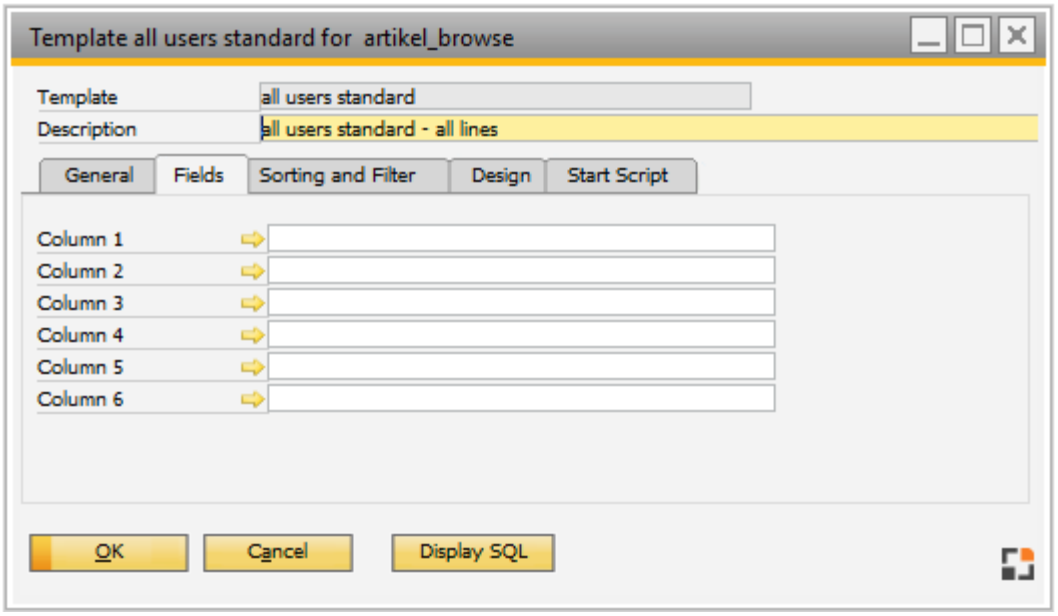
In this tab you can define up to 6 additional fields. On SQL-level you can define which information is displayed.

Enter title in the "Column" lines.
Below the yellow arrow an additional definition is stored. ***See*** Definition of fields

Note: The defined fields are displayed right in the list, and by using window settings they can be moved to the desired position. ***See*** Window setting.

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate" > **Open** an entry > "Fields" tab.

© 2026 Boyum IT Solutions A/S



Window system_template_edit_page1.psr

An additional field for a template is defined here. This is done on SQL level. Return must always be of type varchar, max. Length: 50 characters.

All other data types must be converted to varchar, ***Example***: via `cast(<sql-feldname> as varchar(50))`

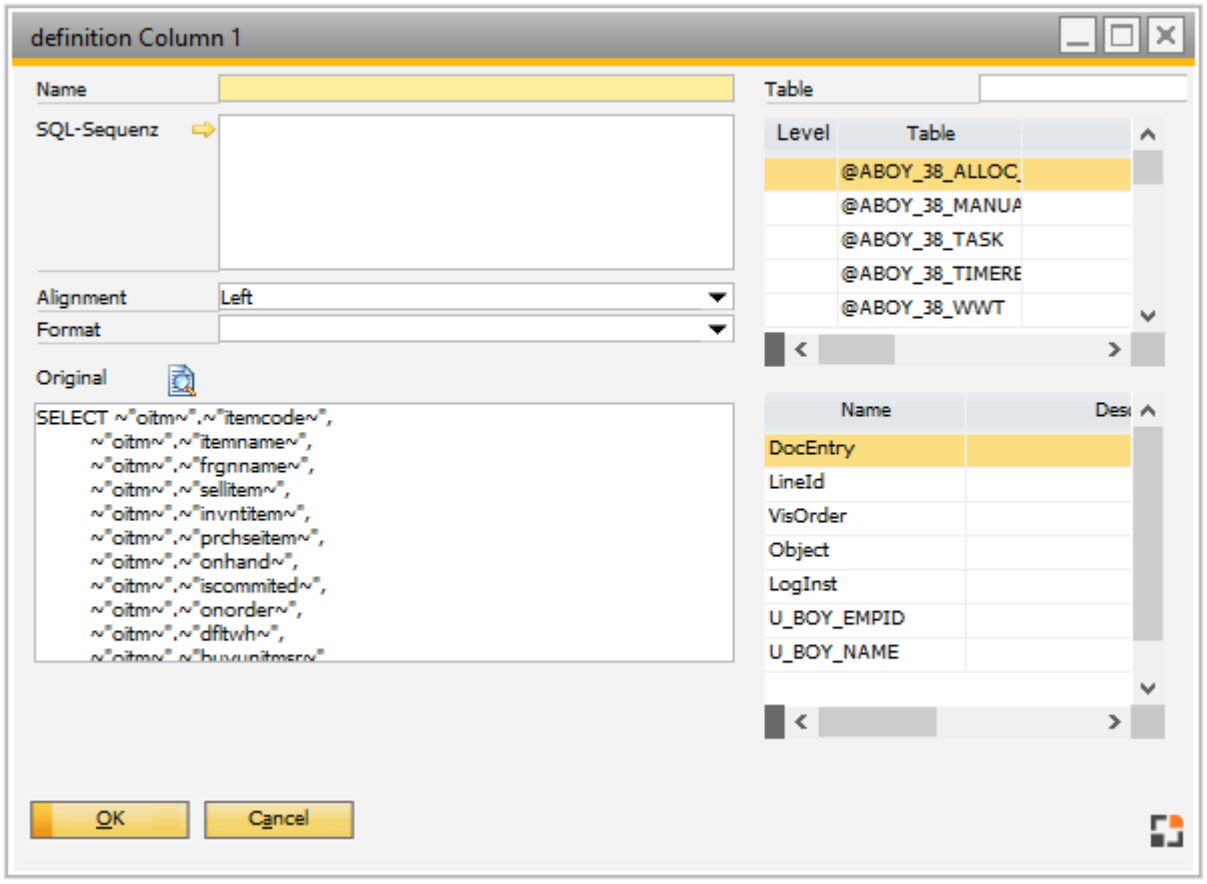
This SQL fragment is inserted into the existing SQL statement which is executed in this list by Beas.

If this value is located in another table, use a sub-select statement:

```
(select max(1) t1."MyDescription" from "U_MyTable" t1 where
t1."ItemCode"="OITM"."ItemCode")
```

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate" > **Open** an entry > "Fields" tab > Double-click yellow arrow.

© 2026 Boyum IT Solutions A/S



Window system_ template_ sql.psr

Field descriptions

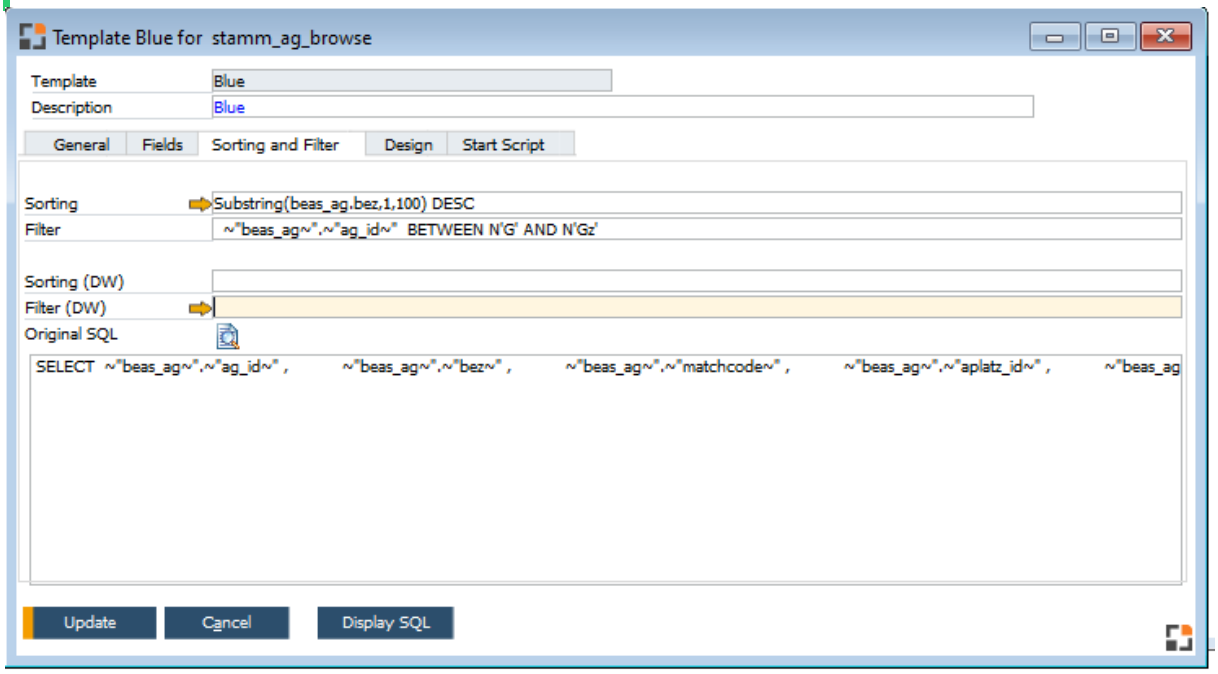
Field	Descriptions
SQL-Sequence	SQL-fragment or Sub-Select-Statement ***Example***: Item list: display image (the second of the stored images) "OITM"."U_picture2"
Alignment	Aligment (left, right, centered)
Format	Output format Formatting as Bitmap is possible, as well as the display of images stored in SAP B1 (Format: SAP B1 Bitmap)

© 2026 Boyum IT Solutions A/S

A new sorting/filter is available on SQL-level and on window level (DW). Click the orange arrow to transfer the current sorting/filter from the window. That means the list can be sorted clicking on the field header and then this setting can be read and transferred out as SQL- or DW-syntax.

NOTE: If you switch from a template with sorting to a template without sorting, the filter and sorting are not removed.

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate" > **Open** an entry > "Sorting and filter" tab.



Window system_template_edit_page1.psr

Field Descriptions

Field	Descriptions
Sorting	Sorting on SQL-level **Yellow arrow**: Clicking on it automatically copies the default sorting and filter definition of the window. Enter/edit the SQL-fragment following the "ORDER"-statement of the SQL-command ***Example:*** Item list, sort item descending OITM.ItemCode desc

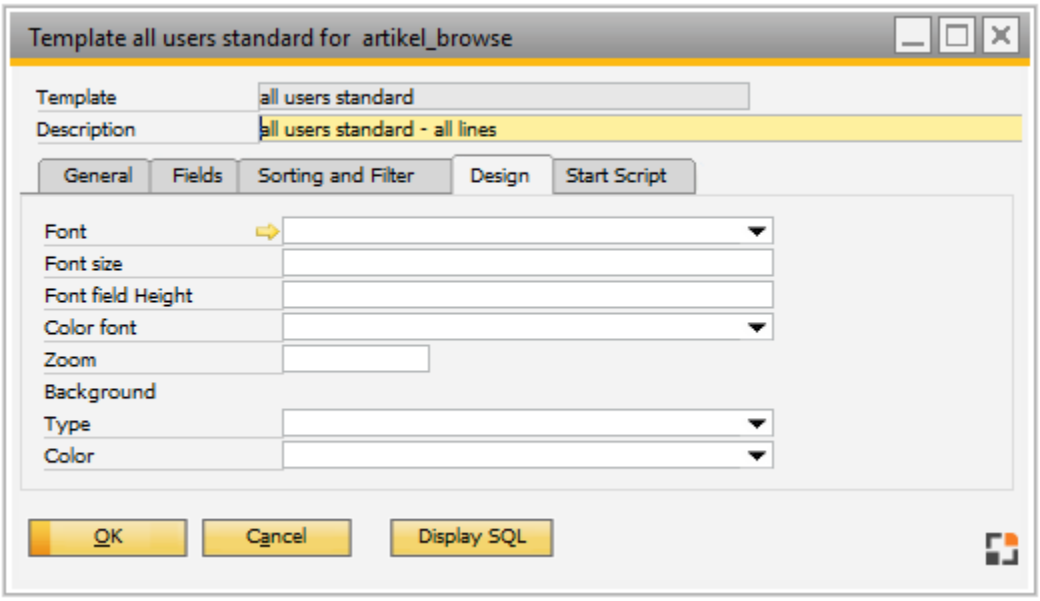
© 2026 Boyum IT Solutions A/S

Filter	Filter on SQL-level **Yellow arrow** (right of the Sorting field): Clicking on it automatically copies the default filter definition of the window. Enter/Edit the SQL-fragment following "WHERE" ***Example***: item list, only items beginning with A substring(OITM.ItemCode,1,1)='A'
Sorting (DW)	You can sort within the display after the list was loaded from SQL-server Use this option if a sorting on SQL-level is not possible, e.g. if lists are filled using an object or if a SQL-statement was used with "union all" Sorting is entered in DW-Syntax. ***See*** Datawindow-Syntax Enter ascending sorting with "asc", descending with "desc". Field names are entered in the screen (see Debug-Fenster) and not the SQL-name ***Example:*** sort item number descending, but items of item group "material" first. if(oitm_u_gruppe='material',1,2) , oitm_itemcode desc
Filter (DW)	Set filter on existing list Sorting is entered in DW-Syntax. ***See*** Datawindow-Syntax ***See*** notes above.

Many parameters can be set for design to make templates more distinguishable.

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate" > **Open** an entry > "Design" tab.

© 2026 Boyum IT Solutions A/S



Window system_template_edit_page1.psr

Field Descriptions

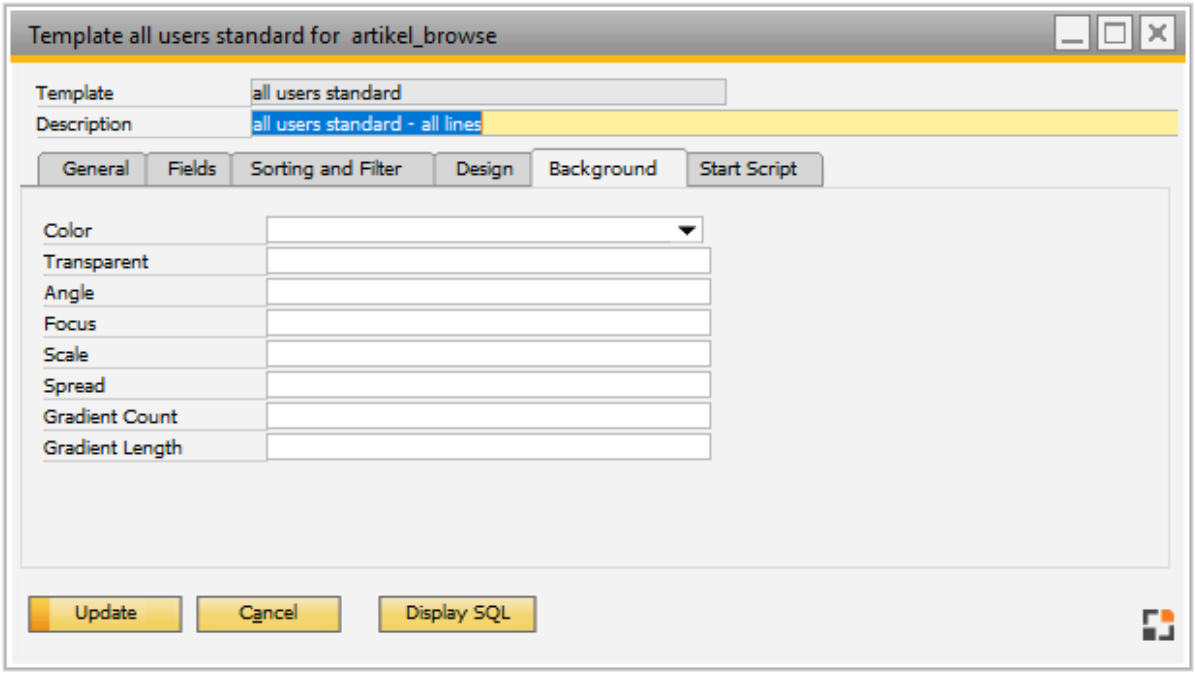
Field	Descriptions
Font	Font Note: Only use fonts which are available at all clients.
Font size	Font size in PowerUnits (usually between 30 and 100)
Font field height	Determines the number of PowerUnits in a list row
Color	Determines font color Note: several fields have a fixed color rule or have assigned color from window settings. These settings have a higher priority.
Zoom	The whole view can be magnified or scaled down. Default view is 100% (with default font 10 SAP Business One – general settings)
Background type	Background setting; dependent fields are displayed. Picture: a tab is displayed to define the background. Solid: In field "Color" a background color can be defined. xxx-Gradient (= color gradient): the first color is defined under "color". All other properties can be set under "Design" tab.

© 2026 Boyum IT Solutions A/S

Color	Only visible if "type" was set to "solid" or "xxx-gradient" determines background color.

Tab is only visible if "xxx - gradient" was selected in Design – background type.
All additional settings are made here. Every change can be viewed immediately.

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate" > **Open** an entry > "Background" tab.



Window system_template_edit_page1.psr

Only visible if "Image" was selected in Design – Background type.
A background image and the type of display can be defined.

Field descriptions

Field	Description
Type	Type of display: original size, distorted, repetition etc.
File	Select image file. NOTE: The file must be located on a network drive, accessible from all clients.
Transparent	Transparency in % (0 –100%)

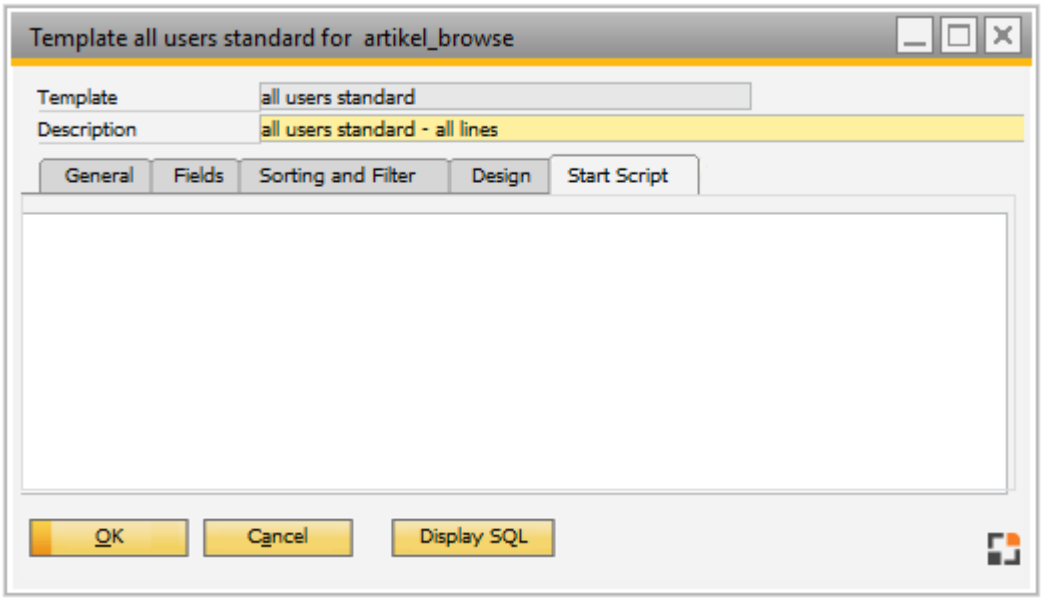
© 2026 Boyum IT Solutions A/S

Beas – Script is executed after the view was built up. Additional properties can be defined.

Example: Change field and row height for displaying a picture

```
dw.datawindow.detail.height=180
dw.templatefield1_c.height=180
```

PATH: Open list window > right-click Beas logo in the bottom right corner > select "Template Administrate" > **Open** an entry > "Start Script" tab.



Window system_template_edit_page1.psr

1.12.1.15.2 Icons

Beas uses a lot of icons of its own.

see

Window: system_aenderung_browse

All changes of master data and movement data are saved to one table, separated by types. Changes are saved on field level, i.e. a new entry will be generated for every changed column.
Changes logged in SAP Business One are not logged in Beas – change log. For example Item master data.

There is no automatic deletion of the entries, but you can use the Archive data function for manual removal.

Field	Description
Range	Main area e.g. "Work order" for manufacturing
Range 2	Sub-category
ID 1	ID (Item ID, Document number etc)
ID 2	Sub-ID (BOM position, Manufacturing position etc)
ID 3	Additional sub-ID (Production BOM position, Production Routing position)
Type (of change)	**Type of change** **Change** – **Field change** Delete – Deletion New – New entry Info – Information

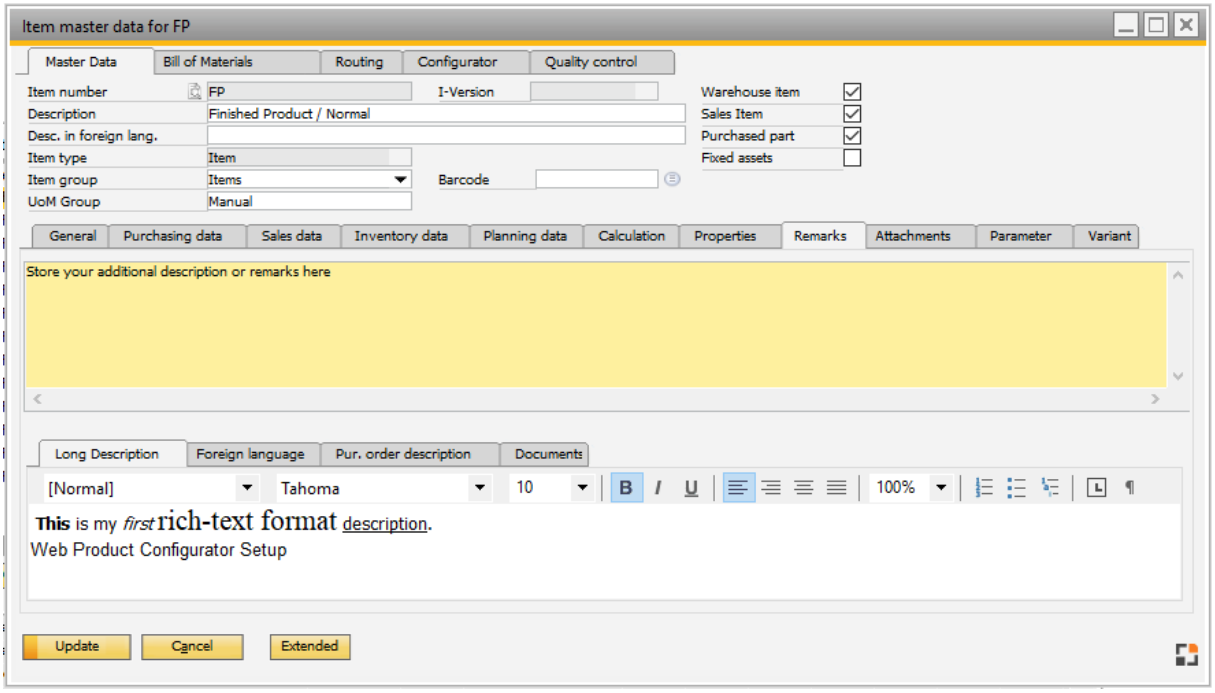
© 2026 Boyum IT Solutions A/S

Field	Description
Column	Name of changed column
Old content	Old, previous content
New content	New content
Changed	Date and time of change
Reason	Change reason In the configuration wizard you can activate a basic entry for changes in different areas. This is displayed here.
Program	Used Program (WEB, Desktop, BSL and so on)
Application	Desktop: The name of window (PSR-Name) or WEB APP Name
Work station name	work station ID
Beas version	Beas version
Personnel ID	User ID to execute the change
Personnel Name	Name of user
Key 1	Database – field name of changed column
Key 2...8	Various meanings, depending on the data type. ***Example***: Order time receipt

1.12.3 Text Editor

The text editor can be opened from various windows, for example the Item Master Data.

© 2026 Boyum IT Solutions A/S



Window artikel_ edit.psr

[View entered text](#)

[Edit text](#)

[Create RTF text](#)

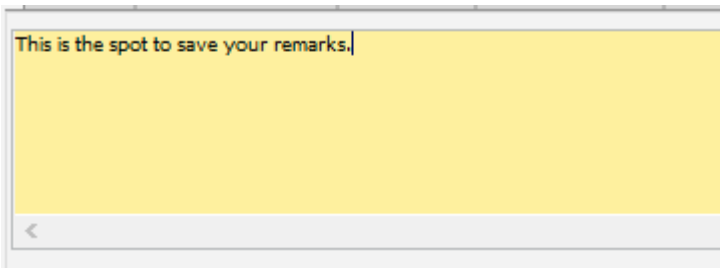
1.12.3.1 View entered text

The previously entered text appears non-formatted in a separate window, for information.

1.12.3.2 Text editor

This text editor serves as a basic text input interface without formatting.

It only supports **Ctrl+C**, **Ctrl+V** keystrokes and right-mouse click options Select All, Undo, Cut, Copy, Paste and Delete.

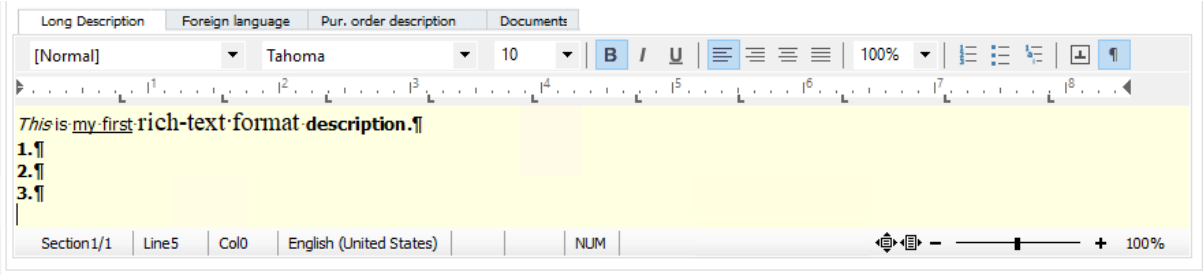


Window system_ textedit.psr

© 2026 Boyum IT Solutions A/S

1.12.3.3 RTF Control

Rich-text format control can be called from various Beas windows.
Enable RTF for master data in the Configuration wizard.



The RTF format can be controlled with:

Toolbar

The following toolbar functions are available:

Tool bar function	Description
[Normal]	Set paragraph formatting style: "Normal" or "Default paragraph font"
Tahoma 10	Set font type and point size from the drop-downs.
B I U	**Bold**, *italics* and underlined effects.
	Align text to the left, center, right or justified.
100% – + 100%	Adjust text view with pre-defined aspect ratio, or the sliding bar in the bottom right window section.
	Create an ordered or unordered list by clicking their respective buttons.
	Set left-, right-, centered-, or fixed tabs for the text.
¶	Show paragraph marks and other hidden formatting text symbols.
Section1/1	Displays the current text section number.
Line xxx	Displays the number of the document line being currently edited.
English (United States)	Displays the language defined in the regional settings.
NUM	Information displayed when "NumLock" key is active on keyboard.
	Switch between layout types.

See other standard toolbar functions.

© 2026 Boyum IT Solutions A/S

Right-click

The right-click menu of the RTF editor contains further settings.

Function	Description
Insert File...	Insert a file into the RichTextEdit control.
Cut/Copy/Paste/Delete	Basic text editing options to manage selected text.
Find...	Enter a word and set various options to find it: 
Function	Description
Find what	Enter a word/part of word to find in the text.
Search	Select the section of text to search in: - All: Search the whole text. - up: Search text above current cursor position. - down: Search text under current cursor position.
Match Case	Find words/parts of words according to the exact lower-uppercase format of your word. ***Example***: 1. If you enter "SYSTEM", the search function will ignore "system" or "System". 2. If you enter "SY", the search function will ignore "sy" or "Sy".

2 Installation Instructions

Overview on installation of Beas license administration and creating databases. The installation is the same for MSSQL and HANA.

> Note:
>
> Sometimes it is referred to as a shared folder **<Servername>.\b1_shr**. This is the shared folder when using the MSSQL-version.
>
> For HANA the name is **<Servername>.\b1_shf**

- Installation requirements

  Consider compatibility with Windows, HANA or SQL-Server and SAP Business One.
  See: Compatibility: current Windows program library is required (activate automatic updates)

- Hardware requirements

  Database Version and Server Sizing
  Hosted Enviroments
  Device / Client requirement
  Requirement for a Demo

- Required SAP B1 License

  SAP Business One has to be licensed. The license server has to be installed and activated.
  PC-Terminal-Solution: SAP Business One Indirect License per Station (***See*** Terminal)
  SAP Business One Integrated Solution: Limited or professional per User
  Beas as service: An indirect license per server (***See*** Service)

  > **DISCLAIMER**: This chapter links all technical requirements for installing Beas with required SAP Business One license. **Please review SAP license rules before installing Beas**.

- Required Beas license

  Beas has to be licensed previously on https://portal.boyum-it.com.
  As an alternative, you can request a demo license: https://portal.boyum-it.com/TryBeas/TryCustomer

  For more information ***see*** License.

- Beas 32 Bit or 64 Bit version?

  Starting with Beas 2020.03 there are, as usual, a 32 Bit application, along with a 64 Bit version.

© 2026 Boyum IT Solutions A/S

If SAP Business One is installed as 32 Bit version, Beas also has to be installed in the 32 Bit version.
If SAP Business One 64 Bit is running, both 32- an 64-Bit version of Beas can be installed.

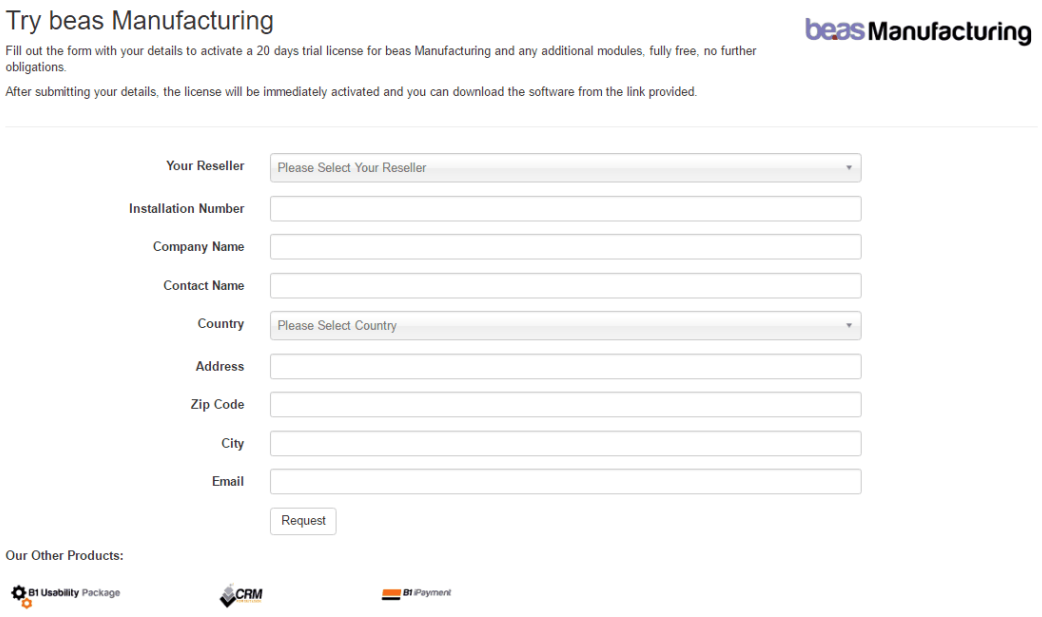
The installation process is the same for both versions.
The difference is the default path where Beas is installed. The 32-Bit application will be installed in **C:\program files (x86)**, the 64-Bit application in **C:\program files**.

Limitations:
Each module of Beas is available in 32- and 64-Bit, except the GANTT-Viewer for the APS.
If APS is used, it is recommended to install the 32 Bit version. If you still want to use the 64 bit application together with APS,
you have to install the 32 bit version additionally. Then, when the GANTT-Viewer is called, it is opened with the 32-bit version.

IMPORTANT: SAP 10 is only compatible with Beas 64Bits. ***See*** Compatibility.

Download Beas

Current versions of Beas are available at Beas news.
1. Register Beas license at https://portal.boyum-it.com.



2. Download current version at Beas news and read the relevant notes.

© 2026 Boyum IT Solutions A/S

- Installation on a server (or demo-installation on notebook)

Required steps:
1. Download
2. Start Installation
3. SAP Server directory: Select ...\b1_shr if default is not correct
4. AddOn registration in SAP Business one

The required files are copied to b1_shr – Server folder of SAP. To install the the program itself, (Client installation) Administration rights are required.
Installation in a minute

Installation without SAP Business One – Client (e.g Terminal):

```
.....\b1_shr\beas_software\client\ClientSetup.exe
```

for 32-Bit or for 64-Bit

```
.....\b1_shr\beas_software\client_x64\ClientSetup_x64.exe
```

- Installation on a client system

Preparation:
The installation on a client is only necessary if this is not the server at the same time.

All further steps are only necessary if
- update of older versions as beas 9.2 PL: 04
- first installation

If using Beas 32-Bit, the current DI-API 32 Bit has to be installed. The DI-API 32 Bit has to be installed even if a SAP Business One 64-Bit-Client is installed

if running the 64-Bit Beas, then the 64-Bit of the DI-API is needed, and if APS is used in 64 Blt version, also the 32-Bit DI-API is needed.

Note:

Often the DI-API will not be updated automatically at an SAP B1 update. In this case please uninstall and reinstall the DI-API.

© 2026 Boyum IT Solutions A/S

DI API precondition: ODBC driver must be installed.

Beas has to be licensed. ***See*** https://portal.boyum-it.com

Start Windows with a user with administrative rights.

Start installer

SAP Business One - AddOn Administration - register AddOn

Select and install AddOn at `b1_shr\beas software\AddOn_x32 oder AddOn_X64\installer.ard`

Note:

If there are any problems

- UAC (User Account Control Settings) set to "Never"
- Login as administrator

Beas updates:

There is an automatic installation of an update if one is available on the server. Administration rights are not required.

Important setting in the SAP Add-On-Administration window:

The Beas AddOn has to be at first place to ensure that other functions will not be disabled by Beas.

Note: The AddOn installed here is only a connector to Beas This means that the AddOn normaly does not have to be updated at an upgrade of Beas. Sometimes it can be, that the AddOn Connector gets some new functionality, then the release notes will point out, that an update of the addon has to be installed.

Note for 64-Bit-SAP Business One Clients:

Beas 32-Bit requires additionally the installation of the 32-Bit DI-API. But the SAP Business One – Client 32-Bit and 64-Bit may never be installed at the same time.

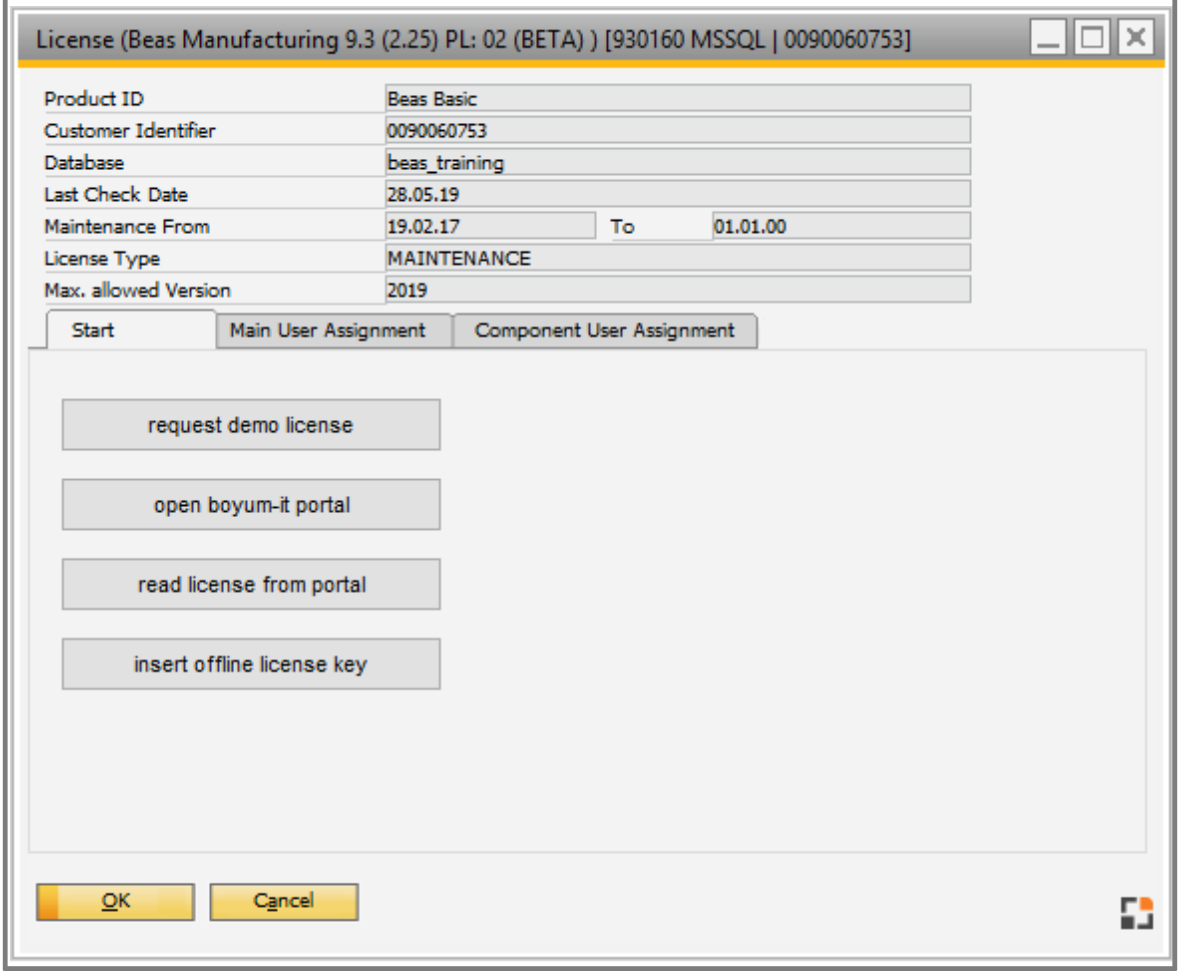
Note for 32-Bit SAP Business One Clients:

Beas must also be installed in 32-Bit mode. In this constellation the installation of 64-Bit Beas is not supported.

- Activation

© 2026 Boyum IT Solutions A/S

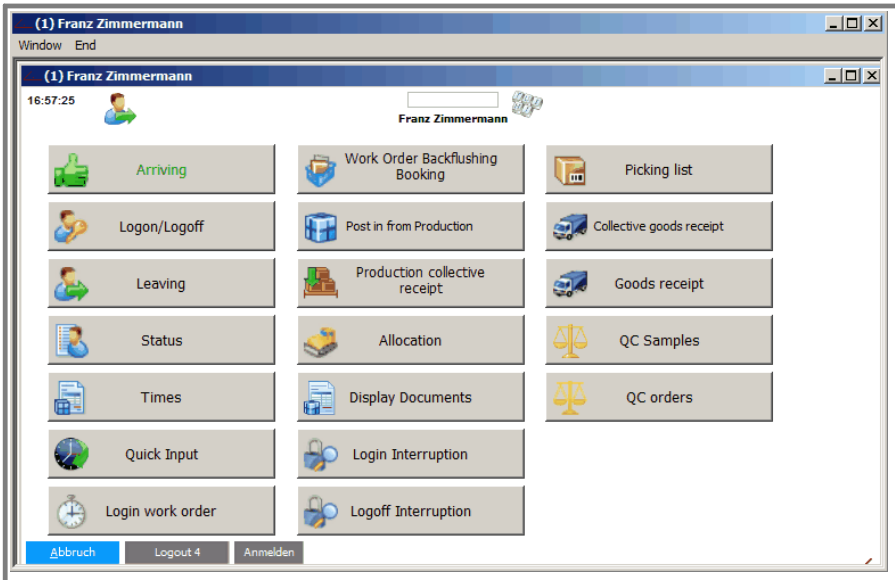
Basic license is assigned automatically, but you can assign it manually under License. For more information on license administration ***see*** License.



Installation Terminal Mode

Beas can be run in Terminal Mode.

© 2026 Boyum IT Solutions A/S



This is commonly used in shop floors.

Installation preconditions:

If SAP Business One is not installed on this work station, you must install the SAP Business One DI API 32 or 64 Bit from `\\B1_SHR\DIAPI` or `\\B1_SHR\DIAPI.x64`

DI API precondition: ODBC driver must be installed.

SAP Business One Crystal Viewer from folder `\\B1_SHR\Client\CRRuntime` or `\\B1_SHR\Client.x64\CRRuntime`

Terminal installation steps:

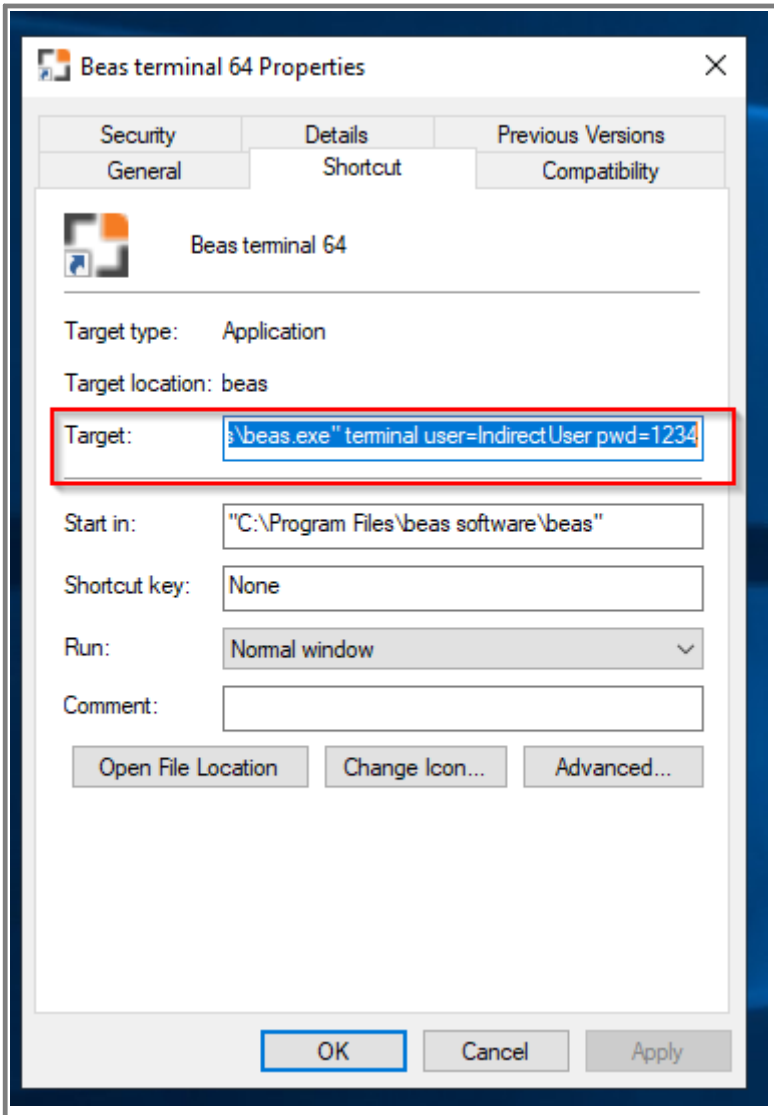
1. Install Beas from **Program ...\b1_shr\beas software\Client\ClientSetup**
2. Start Beas on this station and insert settings for Server
3. Log in to Beas with the Terminal user and close. With this all settings are saved.
4. Go to **C:\Program Files (x86)\beas software\beas** this is for Beas 32bit,

or **C:\Program Files\beas software\beas** for Beas 64bit.

5. Right-click beas.exe and create a shortcut
6. Move shortcut to desktop
7. Rename shortcut to Beas terminal
8. Open Shortcut properties
9. Insert "terminal" after the link:

"**C:\Program Files (x86)\beas software\beas\beas.exe" terminal**"

© 2026 Boyum IT Solutions A/S



See Terminal Client Server based

- Cloud solution, SAP Business One Cloud

Beas can be used as a "Cloud solution on promise"

Concept:

SQL Server + Terminal server are in the Cloud.
Install SAP and Beas on the SQL Server and on Terminal server.
Per Remote Session you can connect to the Client.

WEB APPs and other web-based services:

© 2026 Boyum IT Solutions A/S

1. Install WEB Services.
2. Install XAMPP and use this as Proxi Server for WEB Services .
3. Define a port for which you have access from outside of the Proxi Server.

Now you can use all WEB APPs and Services.

SAP Business One Cloud

The SAP Business One Cloud solution has many limitations.

Example: It is not allowed to use own services. But for using the complete functionality, especially all automatic processes or WEB Frontend, you need the services.

This is one of the reason why we do not deliver a Beas solution that is compatible with SAP Business One cloud.

It is possible, but only when you can access the machine (workstation) directly.

Beas needs to be installed on the workstation with BeasSetup.exe and registered in SAP in the standard way with an .ard file.

Using Beas is only possible from the direct connection (Remote Access solution), not with the cloud SAP application.

- Program Update

Server: Installation is performed the same way as initial installation

Client with SAP Business One: automated update.

Terminal (without SAP Business One): Start b1_shr\beas_software\client\ClientSetup.exe, if automated update is not working

Server: Runs the installation in the same way as the initial installation

Client with SAP Business One: An update runs automatically. No further steps are required.

Terminal (without SAP Business One): start b1_shr\beas_software\client\ClientSetup.exe, if there is no automatic update.

Important: you can use the current version only:

- if it is a demo version
- if you paid maintenance for the current year

Older versions can be installed for the year you paid the maintenance for.

When you receive a hotfix for an older version, you can run the program only with paid maintenance.

© 2026 Boyum IT Solutions A/S

Note: If Beas cannot connect to the license server https://portal.boyum-it.com, you have to update the license yearly using the offline license-function.

Topics:

Installation and administration of the virtual machine

2.1 Lightweight installation

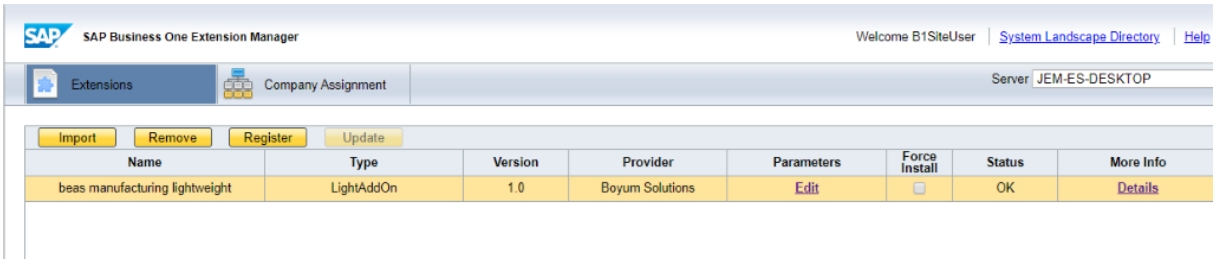
Beas Manufacturing in a Cloud environment

Although Beas Manufacturing is not a native cloud solution, it can be turned into a cloud solution by creating your own hosted cloud server or through a public or private provider.
As of Beas Manufacturing 2020.02 and 2020.03, Beas is made compatible with Public (and private) cloud environments of SAP Business One.

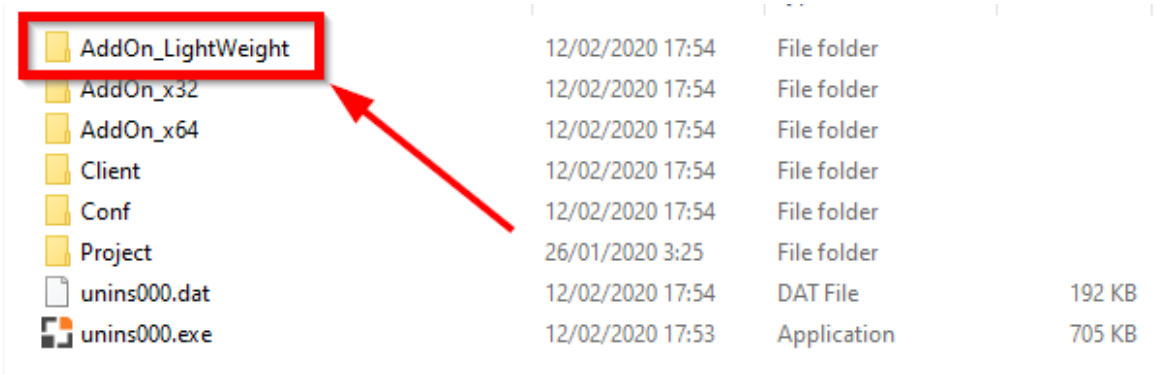
The following functions are available:

Installer

Lightweight installer is now included into 2020.02 version

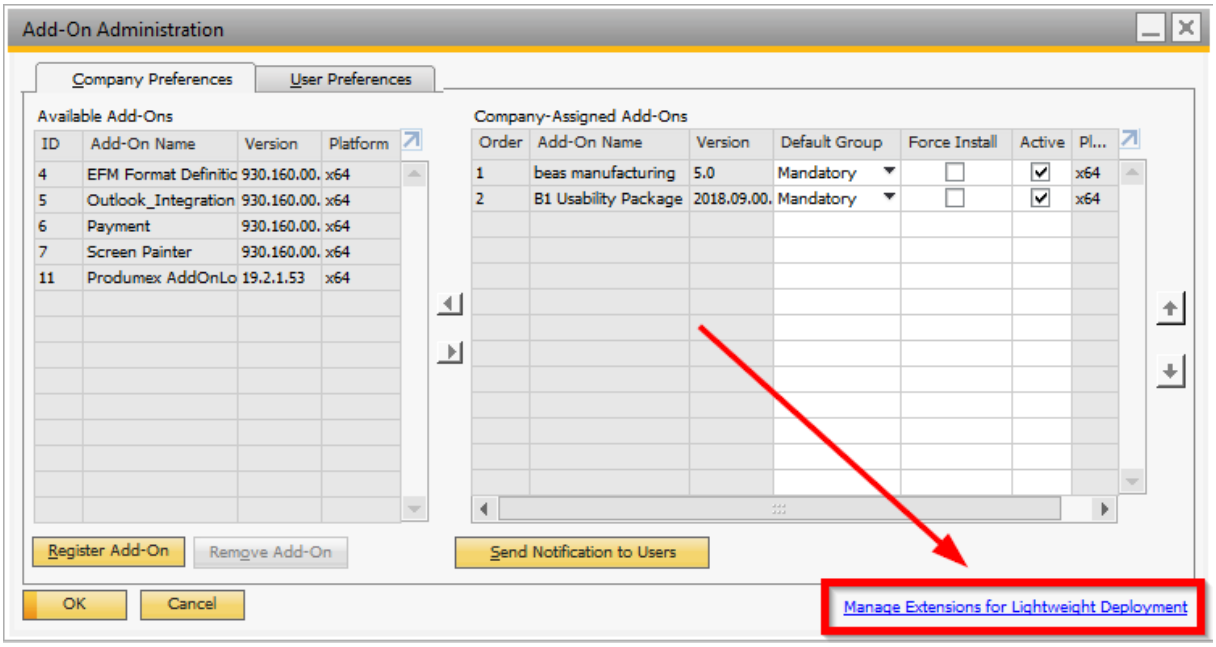


The version 2020.02 has Lightweight Installation files.



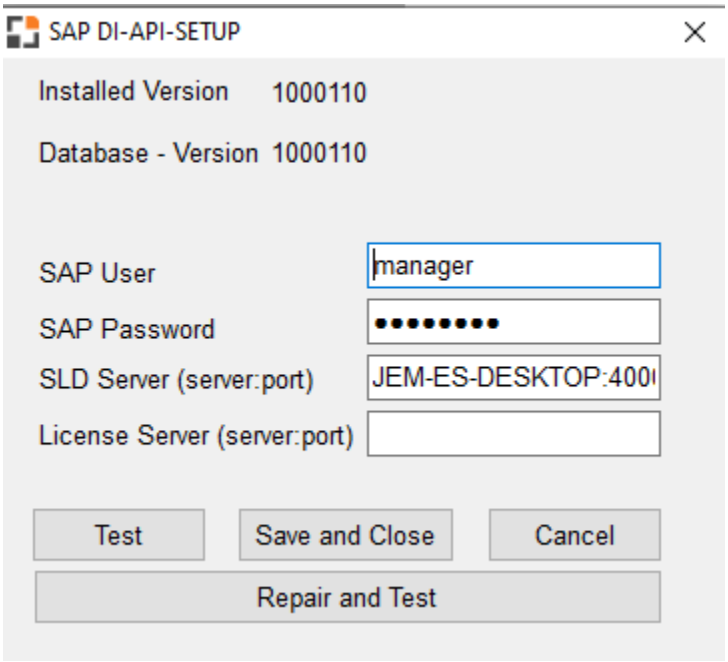
© 2026 Boyum IT Solutions A/S

To install Beas as a lightweight Add-On, login to the "**Manage extensions for lightweight deployment**" portal of SAP, and follow the steps described by SAP to install and activate the Add-On:



SLD compatibility to DI-API connections

As of Beas Manufacturing 2020.02 and 2020.03, we support DI-API connections based on SLD server. Beas supports the old License server connection and also the new SLD server connection. SLD connection always has more priority than License Server connection.



© 2026 Boyum IT Solutions A/S

Single Sign-On login process in SAP

Beas supports Single Sign-On login process in SAP. You can login in SAP using standard Single Sign-On login process and Beas will work as a normal add-on. Available in version 2020.03.

Single Sign-On login process in Beas Standalone version

Currently, Beas does not support Single Sign-On login process in the Beas Standalone Application. To log into Beas Standalone, only SAP user/Password is allowed. This functionality will be implemented in the following version of Beas.

2.2 Installing a Beas Update

ATTENTION:

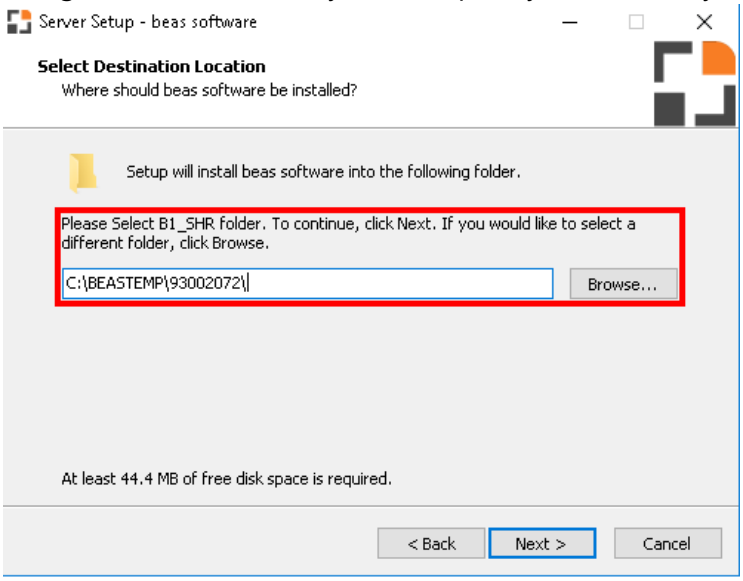
Before you install a new version on the customer system, you have to test all customizations, reports and main processes with the new Beas version with a copy of customer database together with the new SAP Version, which you need to install on a parallel test machine.

If you only want to update Beas, no test machine is necessary.

- Test new Beas version on the customer live machine.

It is possible to install different Beas version on one machine.

1. Create a copy of the customer database on your test machine.
2. Rename the *c:\program folders\beas software\beas* folder to *c:\program folders\beas software\backup* folder.
3. Change the server directory to a temporary local directoy, for example *C:\BEASTEMP\xxx*



4. Install the new Beas version with the installation file on your local computer.
5. Rename the *c:\program folders\beas software\beas* folder to the *c:\program folders\beas software\newversion* folder

© 2026 Boyum IT Solutions A/S

and the *c:\program folders\beas software\backup* back to *c:\program folders\beas software\beas*

Now you have 2 installations:

- Standard: The current version.
- In the "*newversion*" folder: the new version is installed.

Start beas.exe from the "*newversion*" folder and connect to the copy of database. **Important:** Do not connect to the live database.

After the database upgrade, you can check the new version.

Update process

Beas is updated in the same way as it is installed.

The Beas installer browses the directory and only installs the files that have changed.

Every time the client is launched, it checks whether a new version is available.

Before upgrading or updating:

1. Read the Patch information
2. Check the hardware requirements.
3. Test the new version with its database on a test system.

Note:

If you have customization inside the installation, test it on a test system before installing the version on a live system.

Check compatibility list.

Procedure:

1. Download installation file.
2. Start installation file.
3. Follow the instructions.

see

Server management – service

License

© 2026 Boyum IT Solutions A/S

2.3 Uninstalling Beas

From *9.2 PL: 04* Beas can be uninstalled like any other Windows program via Windows – "Uninstall programs".

2.4 Beas startup options

Beas Standalone Options

Beas Access Parameters

Beas.ini

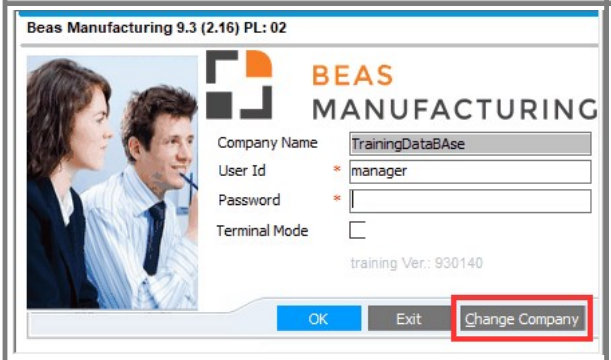
2.4.1 beas standalone options

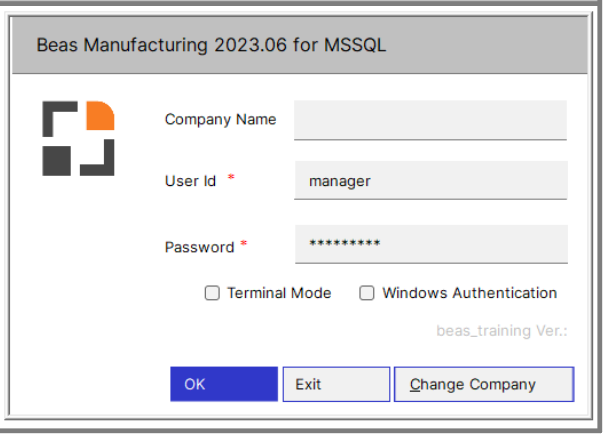
Beas logon

The logon process to Beas is as follows:
If you start Beas outside SAP Business One (e.g. as Desktop Terminal), you need to enter login information.

This is required at
- initial installation
- changing server settings

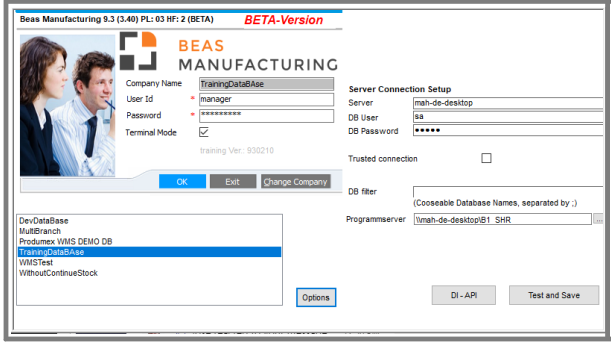
In the login screen, select "**Change Company**"

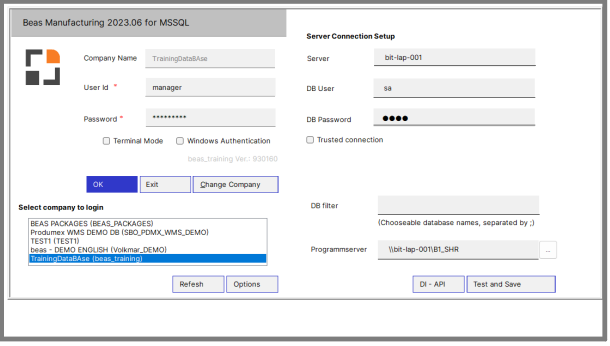
Traditional style	Boyum Style
	




Select "**Options**" in the right below:
Settings are not available for connecting Beas to the database server:

© 2026 Boyum IT Solutions A/S

Traditional style	Boyum Style
	




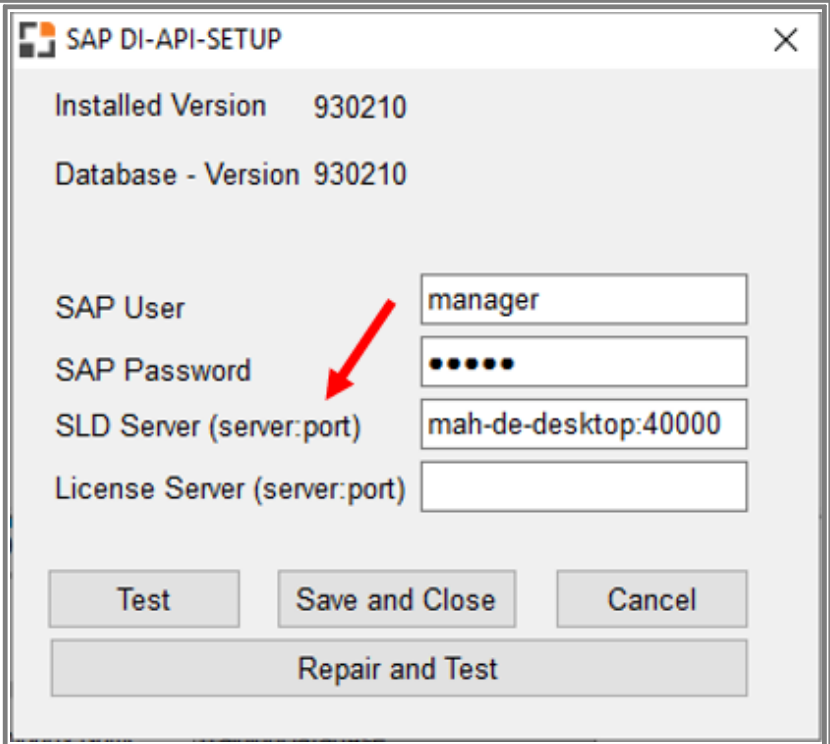
Field descriptions

Field	Description
Server area settings	
Server	Server name or IP-address need to match the entry in System Landscape Directory (SLD). MSSQL: Enter Name/IP-address HANA: Enter Name/IP-address and Port ***Example***: HANAB2:30015
DB User	Database User
DB Password	Database User Password **Attention**: This field does not support the "," (comma) character!
Trusted connection	Use trusted connection to SQL Server. In this case DB User and DB Password is protected. Use this if all windows users have access to the SQL Server.

Buttons

Button	Description
DI-API	Settings for access of Data-API:

© 2026 Boyum IT Solutions A/S

Button	Description
	


Field/Function	Description
SAP User	Define the Standard user, e.g. for Database Test.
SAP Password	Define the Password for Standard user. **Attention**: This field does not support the "," (comma) character!
SDL Server	Define the License server and port *Beas 2020.02*
License Server	Only for compatibility. Use it only if SDL connection is not working.
Database Driver	Define the specific SQL or HANA driver to connect to retrieve the Company list in the login screen, when connection type is set to "DI-API". When the parameter to retrieve the Company list is set to "db", this parameter is ignored.

Note Beas 9.2 02 and older
Test settings and try to access. Reading and writing access needs to be granted to folder C:\Program Files (x86)\beas software\beas\beas.ini and \\B1_SHR\beas\beas.ini
For more information on beas.ini see beas.ini

The settings will be saved in <code>%programdata%\beas\beas.ini</code> from Beas 9.2 PL: 03. Extended authorizations are no more necessary.</td></tr>
</table>

see "What's New" window

2.4.1.1 beas Access parameters

Beas can be directly integrated from SAP Business One via an Add-on or through "Accessing external programs".

Each Beas – function can be started using parameters. Separator for parameters is a blank character. If the parameter contains a space, please replace by AltGr-3 (= ³).

Beas may only be started in home directory "`%programfiles(x86)%\beas software\beas`". Change directory before calling.

Beas can also be started via Windows-task planner. ***See*** tasks

See Start Beas in different ways

Available parameters:

© 2026 Boyum IT Solutions A/S

Parameter	Description

`mrp=x`	Calculates the MRP x
	Example: Calculating the MRP2
	`beas.exe db=yyy server=zzz user=aaa pw=bbb mrp=2`
	The line can be entered as follows in the Beas server:
	`tools=beasrun=mrp=2`

`batchcalc=x`	Performs the corresponding batch calculation
	`beas.exe db=yyy server=zzz user=aaa pw=bbb batchcalc=2`
	The line can be entered as follows in the Beas server:
	`tools=beasrun=batchcalc=2`

`Terminal`	⊟ Beas is started in a FDC terminal mode The application "terminal" is started. Note: it has to be set up first in Program group Administration 1. Create a link on the desktop to **C:\program files\beas software\beas\beas.exe** 2. Beas start using the link and register once to ensure that the credentials are stored correctly. 3. End Beas. 4. Edit link (right-click) 5. Enter in target box: "**C:\Program files\beas software\beas\beas.exe" terminal db=trainingdb**" (the appropriate directory name and the correct database name need to be specified) A logon with username "terminal" is executed. This user may not be registered as SAP Business One- or Beas-user, because he has special authorizations (license and program). SAP Business One-transactions are executed for the user who is entered in **Configuration wizard > System > DI-API**. On the terminal SAP Business One this is not required, only in the SAP Business One-DI-API. Note: Login is executed with the user name "terminal". This user may not be created as a SAP Business One- or Beas-User, as he has special authorizations.

© 2026 Boyum IT Solutions A/S

Parameter	Description
	SAP Business One-Transactions are executed with the user set up in **Configuration wizard > System > DI-API**. On the PC-Terminal no SAP Business One needs to be installed. But the SAP Business One-DI-API is required. One SAP Business One - Indirect – License is required per work station. ***See*** Licenses. Note: The parameter "USER" may not be used. If this is used, the actual user needs to have a Beas – Basic-License. Note: One DI-API-user per terminal needs to be defined and called up: `(x86)\beas software\beas\beas.exe" terminal user=TERM1 pw=XXXXXX server = SAP9-2016 db=SBO_XXXXXXX_PROD` Please consider SAP licensing conditions! ***see*** Program group Administration ***see*** also Authorization control DI-API User
`/shortdebug`	Open the debug window at program start Allows to analyze the program at start a) Beas directly opens the debug window b) Beas creates a debug log in the file %temp%\beas\beas.log e An error message is displayed at the program start because the debug window has no access to the database. The first error message.
`/debug`	Generate a debug file on assembly level. You can use this for deep analysis. The debug file beas.dbg is located in the same folder as the program itself. It only works if you start Beas with Admin Rights.

© 2026 Boyum IT Solutions A/S

Parameter	Description
task=x	Executes a script which is stored in planned activities. Executed in server mode., Once finished, the Beas instance is closed. Note: When planning a task to be executed, only types "Script" and "Import" are allowed. Other types are not supported. ***see*** Planned activities Tasks
form=<formname.psr>	Opens a form (PSR File) directly. If started with SingleMode (/ms), the program will close when closing the form.
server=<servername>	Name of server. Replace spaces with letter "³" If no servername is defined, Beas uses the last used server.
db=<database>	Database index (n-th entry in database list) or database description or client description. Replace space by _
user=<User-Id>	Login using which Beas-Usee Enter the SAP-User-Id which the program uses for logging on. If a user is entered, the Parameter "pw" is required. Terminal-Mode: The entered user needs the respective Beas – License and Authorizations. The terminal license is not applied here.
pw=<User-Pwd>	The associated user password
dw=<PSR-File>	Opens corresponding window at program start
befehl=<Command>	Submit command to a window. Several command parameters can be specified
/ms	The master window is not opened. Program works in "Single window mode"
/pn	No pop-up window at program start
/f	No footer window
/tb	Do not display toolbar
/ws	Do not load user window settings
/st	Do not load language table

© 2026 Boyum IT Solutions A/S

Parameter	Description
/sw	Single window. If the window specified at start is closed, the whole application is closed.
/sm	"Small menu". Only the menu items "Edit", "Window" and "Help" are available
s_parm1=<value>	Set variable s_parm1 (...4)
c_parm1=<value>	Set variable c_parm1 (...4)
script=<file>	Executes the Beas script. If this contains **<cr_lf>** , it is executed as a batch routine. Blank spaces must be replaced with ³ **Important**: If only one function (Object) is called, the program needs to be closed afterwards with "app=close" Examples ***Example 1***: beas.exe db=yyy server=zzz user=aaa pw=bbb script=messagebox=hello³world Alternatively, the Beas script can be stored in a file beas.exe db=yyy server=zzz user=aaa pw=bbb script=$c:documents ³and³settings\user\myscript.src**<cr_lf>**app=close (Note: the character ³ is accessible via ALT+3) To call an object directly, put in quotation marks, otherwise it would be incorrectly interpreted. ***Example 2***: Post-calculation beas.exe db=yyy server=zzz /inservermode script="<cr_lf>setstr=c_parm3=3<cr_lf>object=ue_fert_naka=batchnaka=3<cr_lf>app=close<cr_lf>" Alternatively a task can be created and the stored script can be executed with "task=x" ***see*** Tasks.

© 2026 Boyum IT Solutions A/S

Parameter	Description
`/language=<language>`	Defines the user language (only if the standard behavior has been disabled under Extra/Options/General)
`servermodus`	Beas starts as "server" Alternative to the server service in local mode
`/inservermode`	Beas starts in server mode. This means that all messages are blocked. Use this to execute scripts.
`/debug2file`	Activates the debug to file mode at Beas Startup. ***See*** topic **System Information > Settings > "Debug to file"**. Available from *2020.05.*

Examples of Beas call up

Examples: Enter correct values for user, password and database.

Terminal on "Demo" database,

```
beas.exe db=demo terminal /pn
```

Report currently present

```
beas.exe user=manager pwd=manager db=mustermann
dw=bde_anwesenheit_aktuell.psr /sw /pn /ms s_parm1=onlypresent
```

Report on client "Mustermann", prevent popup

```
beas.exe db=mustermann report projekt\mustermann\reports\meinReport.rpt /pn
```

Report item_description.rpt for item 100.344

```
beas.exe report artikel_edit_beschreibung /pn /dv=Artikelnummer:=100.344
```

Open item processing for 100.344 with User Manager, end program, when window is closed, use small menu and no popup

```
beas.exe db=mustermann dw=artikel_edit s_parm1=100.344 user=manager
pw=manager /pn /sw /sm
```

Call only order time receipt, close the program immediately afterwards

```
beas.exe dw=fert_arbzeit_erfassen.psr user=manager pw=manager
db=trainingdb /sw /ns /ms
```

Note: `.rpt` or `.psr` NO longer need to be specified.

© 2026 Boyum IT Solutions A/S

Calling up several instances in parallel, (eg. multiple terminal users) the name of the currently logged on user can be displayed in program title.

AddOn Administration - Develoement - Program logic - AddOn - Program Start

Insert "`app=title=beas: <currentuser>`"

Concept: call up via windows task planner

See: tasks

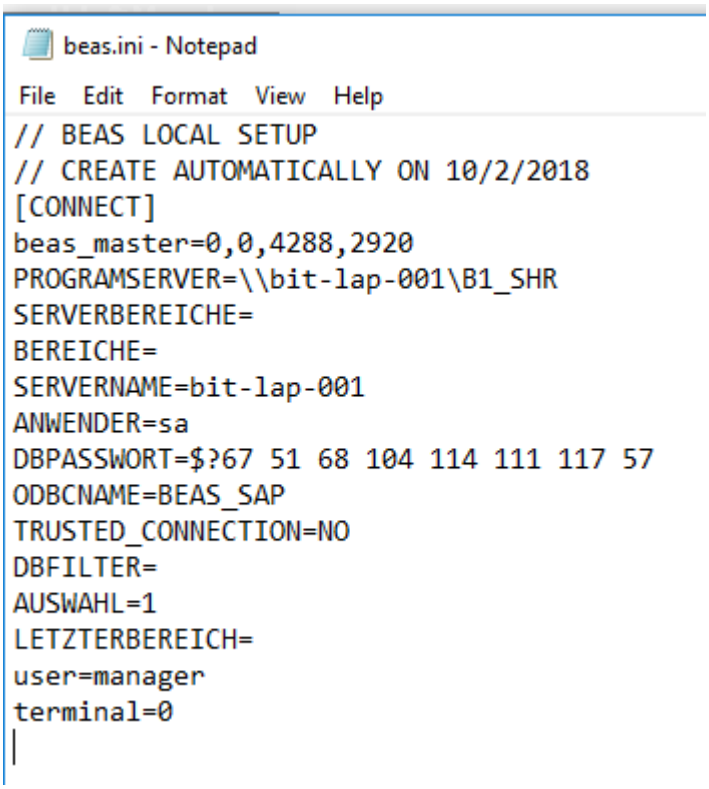
2.4.2 beas.ini

The parameters for database connection and the start-up configuration of Beas are defined in the beas.ini file. All parameters to define in Beas are accessible in the Configuration Wizard, but to connect to this database, specific information are required to be read from a file. The system can read information directly from this file.

During the first start-up of Beas, the system is trying to locate the beas.ini file to access starting parameters. If it does not exist, the system checks the server and copies the file on the local computer. The parameters are only to be defined at first start-up when the file does not exist in the system.

PATH: C:\\Windows\ProgramData\beas

© 2026 Boyum IT Solutions A/S



Modify parameters of beas.ini with beas.exe

Additionally to the beas.ini, we can save parameters in the Command line arguments of beas.exe For example in the beas.ini we can set Beas to start in Terminal mode, service mode etc. But in the command line arguments we can send parameters, as well. ***See*** Beas Access parameters.

Follow the procedure below to modify parameters of beas.ini with the beas.exe file:

1. Run beas.exe from **C:\\Program Files (x86)\beas software\beas** ***See*** image in beas standalone options
2. Click the "Change Company" button and the screen is extended with Global Settings on the right.
3. The editable fields in the screen are information called from beas.ini

Here you can modify standard parameters in beas.ini directly.

beas.ini parameters

Parameter	Description
StartDelay + DebugToFile:	These parameters have to be modified manually in the file. (*Beas version 9.3 PL1 HF 5* or above)

© 2026 Boyum IT Solutions A/S

Parameter	Description
StartDelay	(0..X) – default 0; This parameter will delay SAP connection process. Due to an increased number of SAP add-ons, users may experience problem when starting SAP: too many add ons are started simultaneously. To solve the situation, this parameter delays Beas (e.g. with 5s) in the start-up process. Consequently, Beas will wait for the other add-ons to initiate and will start once these add-ons have finished loading.
MenuDelay	Delay the menu load process. Beas establishes connection with SAP and stays waiting for a defined time before loading the Menu. This parameter only affects SAP Business One – in Beas standalone mode, this parameter is ignored.
DebugToFile	(Y/N) – default NO; This parameter assists the process of opening the program; everything created in the debug is saved in the file that is stored in the Temp folder: **%temp%/beas/beas.log**
DIRECTSERVER	(YES/NO) Default NO: Start Beas in server mode. Internally the system is executing the following script: `setglobal=withoutservice=true~r~nsystemwindow=opennewwindow=system_server_start.psr=s_parm1:local~r~nopennewwindow=webprogram_browse.psr`
CommandString	Script located in this parameter will be executed at the start-up process.
QualityControl	
DIAPI	(TRUE/FALSE) Default value = True. By default the system uses the parameter to ignore DI API Connection.
Database Parameters to connect	
GetCompanyListBy	Configure to load company list by: Load Company list by DI-API (default) or by query to SBO-COMMON database. If Beas (Standalone) returns an empty Company database list and an error message, follow this workaround solution: • Go to C:\ProgramData\beas

© 2026 Boyum IT Solutions A/S

Parameter	Description
	• open file - beas.ini • insert this line between [CONNECT] ..... []: GetCompanyListBy=db
SERVERNAME	The Database Server to connect
DATABASE	Database name
DIAPISQLDRIVER	Define the specific SQL or HANA driver to connect to retrieve the Company list in the login screen, when connection type is set to "DI-API". When the parameter to retrieve the Company list is set to "db", this parameter is ignored.
ANWENDER	Database User
DBPASSWORT	Database password
TRUSTED_CONNECTION	(YES/NO): Check box option. Default value = NO; Apply database trusted connection.
DBFILTER	Filter to show only database defined in this list
BUTTON_FIX_WIDTH	To apply fix width to buttons
WorkWith SupportVersions	(Y/N) Default value = N. Enable or disable the functionality to work with support versions. In versions older than 2025.02, the system always allowed to work with support versions. Note: When the value of this flag is "Y", ensure that the parameter **SAP > General Settings > Services tab > "Enable Default connection String"** is active.

2.5 BETA Version

Beas publishes BETA-Versions before releasing a new version.
A BETA-version has no restrictions, but a note is issued at program start informing the user that this is a BETA-Version.

The BETA-Version may be used only for tests and presentation purposes, not for productive use.
Beas offers no warranty for BETA versions.

(beas9.0-000-003-002)

© 2026 Boyum IT Solutions A/S

2.6 What's New Window

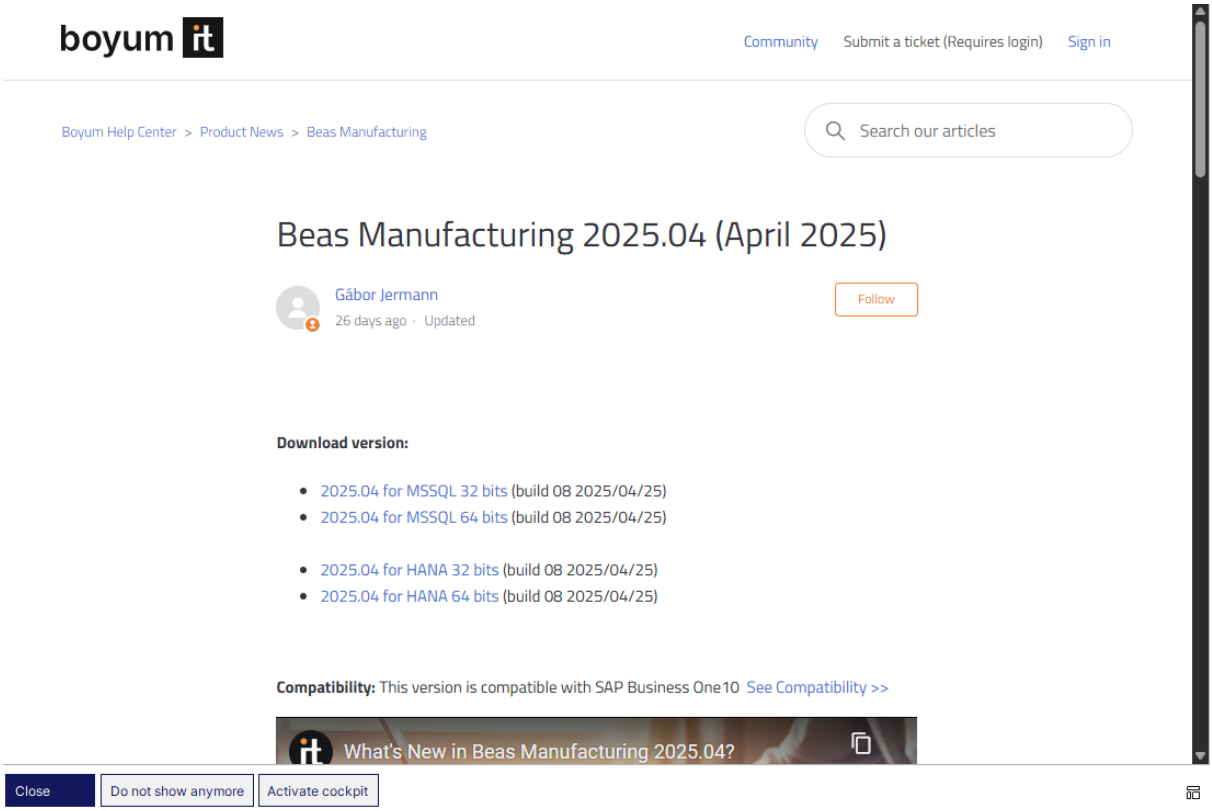
This window is opened every time a user logs into Beas. *(Beas 2025.06)*

It shows the new features implemented by the actual, downloaded version.

In case you wish this information window not to pop up upon each login, click 'Do not show anymore'.

Activate Cockpit button: Activate the Beas Production Cockpit for the current user. Pressing the button automatically assigns the cockpit for the user in the Beas User Extended management window by setting the field Cockpit "Type" to Production.

See more about Cockpit setup and activation.



2.7 Production Cockpit

The Production Cockpit window is a centralized interface that displays an overview of the current production status and allows users to quickly access key information, track the status of work orders, and efficiently manage their daily tasks. *(Beas 2025.06)*

© 2026 Boyum IT Solutions A/S

What can you do with the Production Cockpit?

- View the current status of all your Work Orders (WOs): new, delayed, pending, or missing materials.
- Check which resources are in use, available, or interrupted.
- Monitor real-time production progress, with detailed information by operation.
- Access the most up-to-date list of material requirements.

Immediate benefits:

- Instant Information: Quickly access real-time work order status, eliminating time-consuming searches.
- Efficient Planning: Easily identify and prioritize the latest orders, enhancing production scheduling.
- Timely Issue Resolution: Swiftly spot delays and material conflicts, enabling prompt decision-making.
- Streamlined Navigation: Directly access main tasks, reducing menu navigation for faster actions.

Initial setup:

1. Run the Beas Service.

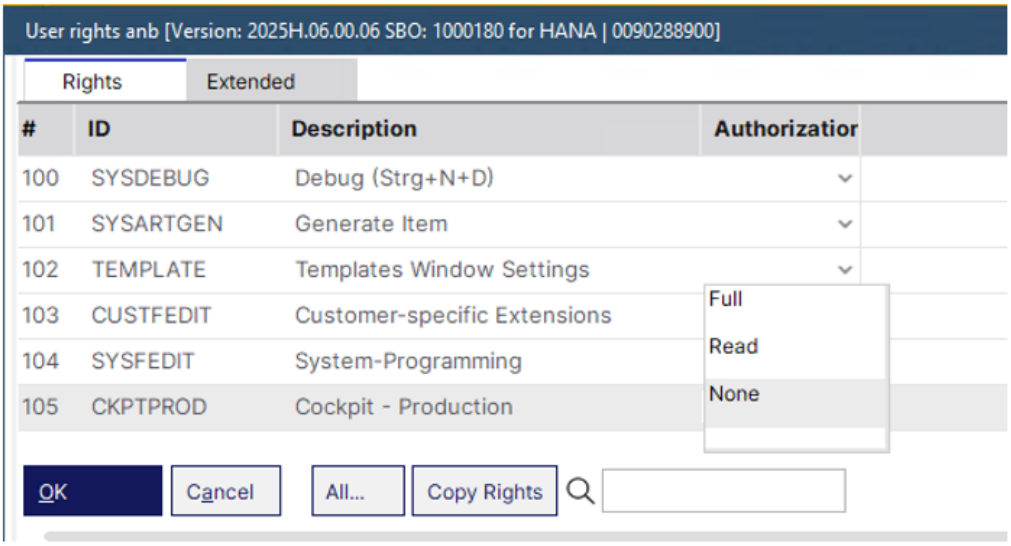
2. Activate "Calculate Material requirements for Cockpit" planned activity in the Beas Manage Server. **IMPORTANT:** Make sure that Beas Service is running; planned activities do not run without the Beas Service.

3. Edit and customize this planned activity to your needs: running the calculation on the selected days of the week, with the custom frequency (e.g. hourly).
Default setting: Daily, Monday to Sunday, from 8:00AM to 11:00PM on an hourly basis.

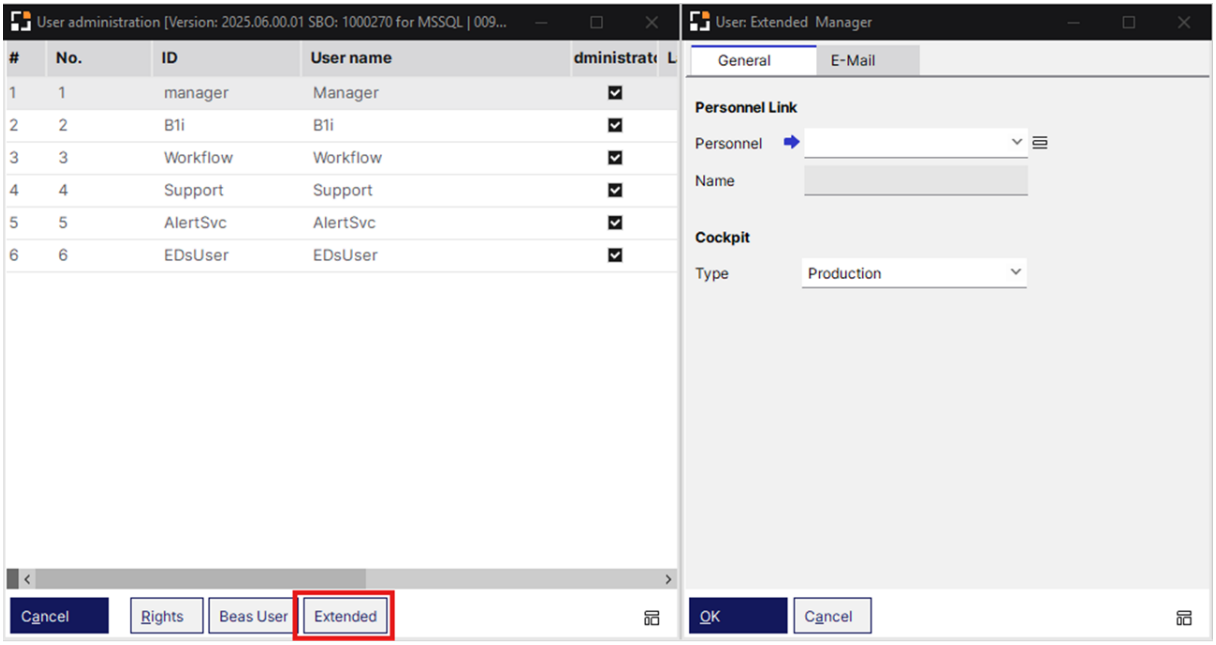
Rights activation for the Beas user:

1. Rights for the Production Cockpit must be set up by the system administrator in the User administration rights extended option:

© 2026 Boyum IT Solutions A/S



2. When user rights have been set up, the cockpit window can automatically be activated for the user when clicking the "Activate Cockpit" button in the "What's new window" upon Beas startup. Or the System administrator can change the Cockpit Type manually in the User administration extended setting:



Open the Production Cockpit:

PATH:

Beas: Tools > Cockpit > Production

OR

SAP B1: Tools > Cockpit > Production

Product costing	Open calculation related functions: - Calculation schema - Batch calculation - Post calculation - Cost elements
Quality Control	Open QC modules: - Quality Control orders - Inspection plans
	Click this button to refresh cockpit information.
	Click this button to access the Beas AI Assistant.

Filter buttons

The total amount of WOs grouped in different statuses. You can open the WOs list filtered by one of these statuses.

Total:	**New:**	**Delayed:**
The number under the filter represents the count of all work orders. Click the filter to open the Work orders window displaying all WOs.	The number under the filter represents the count of new work orders. Click the filter to open the Work orders window displaying only the new WOs.	The number under the filter represents the count of delayed work orders. Click the filter to open the Work orders window displaying only the delayed WOs.
Finished today:	**To start:**	**Material shortage:**
The number under the filter represents the count of work orders finished today. Click the filter to open the Work orders window displaying only the WOs finished today.	The number under the filter represents the count of work orders that have not been started yet. Click the filter to open the Work orders window displaying the list of WOs that need to be started.	The number under the filter represents the count delayed work orders with material shortage. Click the filter to open the Work orders window displaying a list of WOs with material shortage.

© 2026 Boyum IT Solutions A/S

Resources (X days)

A table with all the resources. It shows a list of WO operations that are using these resources (in a predefined period of days) and if it is currently not in use, working or interrupted.

Resource	Name of the used resource. Sorting by this field is supported. Sorting by this field is supported.
Work order operations	The linked operation sequences listed, separated with a comma. Sorting by this field is supported.
Status	The status of the resource in the WO operation: • *Not in use* (gray) • *In progress* (green) • *Interrupted* (red) Sorting by this field is supported.
Capacity	Displays planned capacity in gray (according to resource scheduling) and currently dispatched capacity in green. The covered time period in utilization column is set up in: **Configuration wizard > Production > Display > Structure view > Dispatching index: number of days to be considered.**

In progress: XX

The table shows all the opened work orders that have at least one operation already started or done. When scrolling to the end of the first 30 entries of the list, the system loads the next 30 entries.

Work order	Linked work order. Sorting by this field is supported.
Item	Linked item. Sorting by this field is supported.
Start date	Start date of the work order. Sorting by this field is available.
Delivery date	Delivery date of the work order. Sorting by this field is available.
Quantity	Work order quantity
Production progress	Shows the status of production progress of each operational sequence with a colored dot: - GRAY: Not started - YELLOW: Already started - BLUE: In progress - GREEN: Completed

© 2026 Boyum IT Solutions A/S

Work order	Linked work order. Sorting by this field is supported.
	Hovering over the colored dots (representing the individual operation sequences of a work order) opens a pop-up screen with information on the date, the Start date, the clocked-in employee and the quantity produced by that employee: 
Material requirements: (dd.mm.yyyy hh:mm)

A table with the last calculated material requirements list. The dd.mm.yyyy hh:mm information shows the exact time of the last calculation for material requirements.

Item	Linked item. Sorting by this field is supported.
Balance	Total balance of stock for all work orders. Sorting by this field is supported.
Warehouse	Warehouse code. Sorting by this field is supported.
Version	Item Version number. Sorting by this field is supported.

3 Administration

Here you can specify system setup and system parameters.

Change Company
System Initialization
Setup
Data Integration Hub
Utility programs
License
Add-Ons
Events

3.1 System Initialization

Use the system initialization functions to customize all the required areas and define the default settings.
General settings
Document settings
Configuration Wizard
Station Settings Wizard
Factory Calendar
Report settings

3.1.1 General settings

The SAP Business One – window "General settings" has been extended.
There are certain restrictions which need to be taken into account.

See the following chapters:

BP
Services
View
Fonts and background
Stock

© 2026 Boyum IT Solutions A/S

3.1.1.1 BP

Enable Approval Procedures	Approval procedures are not supported by Beas.
Enable Approval Procedures in DI	By enabling this option, drafted documents are always created. NOTE: Do not enable this option when working with Beas

3.1.1.2 Services

Beas provides an extended message system. The following settings are considered:

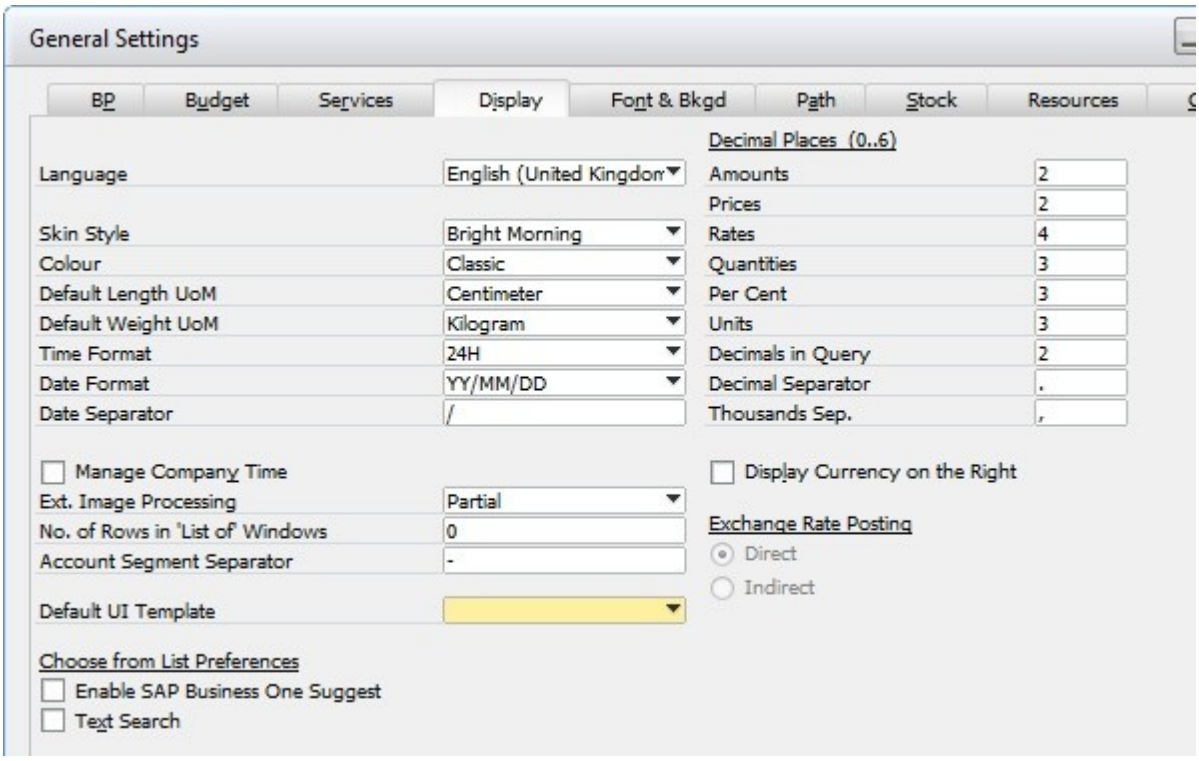
At each logon

Send alert for activities scheduled for today	No support
Display inbox when new message arrives	If active, the Beas – message system is opened if a message is received. ***See*** messages

Update messages (minutes)	Interval is considered by Beas – message system. After data check, the message window is not opened immediately. It will appear as set here e.g. 1 or 5 minutes following the data check. Note: The lowest minimum value is 1. ***See*** messages
Screen locking time (Min.)	Only supported within SAP Business One – environment. If Beas is started without SAP Business One this option is ignored. Workaround: use Windows screen saver.

© 2026 Boyum IT Solutions A/S

3.1.1.3 Display



Window beasgui_sbo.psr

Beas does not support every setting of SAP Business One.

You can find all display-related information in **Administration > System Initialization > General Settings > Display.**

Setting	Description
Language	Beas does not support all SAP Business One languages. ***See*** the language table of Beas to set up which language is to be used. ***See*** Languages For document printing there are extended features available. ***See*** Date- and time format
Skin Style	⊟ Define the Skin Style Define Skinstyle for SAP Business One and Beas if Beas started inside SAP Business One If you want to define the skin style for Beas standalone, use : Skin style Configuration wizard **Beas inside SAP Business One**

© 2026 Boyum IT Solutions A/S

Beas will always use the Skin style (Design) which was defined in SAP Business One General settings.
All Skin styles are supported (*SAP 10.0, Beas 2020.03*)

Beas outside SAP Business One

In the Configuration wizard you can choose one of all available skin styles of MSSQL and HANA Version.

Available Skin styles:

Style	Example Beas Standalone
Boyum Style Type	Select the type of Boyum Theme: Efficiency Mode (regular space): - setting is active by default. Browse windows show more lines, edit windows feature fields closer together. Reduced column width and tab height. *Beas 2025.04*  Comfort Mode (wide space - original style): Original, wide-spaced Boyum Theme Style officially available as of version 2023.09.

© 2026 Boyum IT Solutions A/S

Style	Example Beas Standalone
	Conventional	SAP Signature	
© 2026 Boyum IT Solutions A/S

Style	Example Beas Standalone
Golden Thread	Fiori	
IMPORTANT:

If you change the Local client Display settings to > 100% in Fiori style, buttons disappear in all Beas windows.

This is a known limitation from SAP side and affects all apps. Due to the change in the internal zoom factor of SAP, the position calculations cause wrong results.

Workaround: Go to Station settings > Hardware tab and perform the necessary adjustments for Button Position Correction.

© 2026 Boyum IT Solutions A/S

Style	Example Beas Standalone
Belize Deep	
Note:

Outside SAP Business One Beas cannot use the framework of SAP Business One. The Fiori Dashboard and B1UP Dashboard are not available.

Beas only uses the color schema.

Icons are not the same as in SAP Business One

Beas uses its own User interface and not SAP Business One components.

See Skin style Configuration wizard

Color	Currently not supported.
Default Length UoM	Currently not supported.
Default LWeight UoM	Currently not supported.
Time Format	Supported. **Attention:** Beas does not support time fields, only date time fields. If a date time field has the focus, Beas always uses the Windows Regional setting.
Date Format	Supported settings:

© 2026 Boyum IT Solutions A/S

	Internal Dap Date Id: 1 = dd/mm/yyyy 2 = mm/dd/yy 3 = mm/dd/yyyy 4 = yyyy/mm/dd 5 = dd/mmmm/yyyy >5 = dd/mm/yy dd = Day of month with 2 digits mm = Month 01 – 12 mmmm = January/February yy = Year 2 digits yyyyy = Year 4 digits Attention: if a date field has the focus, beas always uses the Windows regional settings.
Date Separator	Supported. **Attention:** if a date field has the focus, Beas always uses the Windows regional settings.
No. of Character in Month	If you define "DD/Month/YYYY", you can define count of Character. **Attention:** Beas supports 3 Characters or complete name of Month. 4 or other count of Characters is not supported.
Ext. Image Processing	Not supported.
No. of Rows in "List of" Windows	Not supported. You can set this in Configuration Wizard – System.
Account segment separator	Account segment separator is not supported in Beas – view. The "-" (hyphen) is always used as a separator.
Default UI Template	Not supported.

© 2026 Boyum IT Solutions A/S

Choose from List Preferences

Setting	Description
Enable SAP Business One Suggest	Not supported
Text search	Not supported. ***See*** Configuration Wizard – System

Setting	Description
Decimal places (0...6)	Beas supports own units of measure. The number of decimals per unit can be set up separately. "quantity" units are affected but this only refers to display, not to rounding. Beas always works with 6 digits. All units except quantities are displayed with the number of digits set up in SAP Business One. It is always calculated with 6 digits. All values, transferred to SAP Business One are rounded by SAP Business One – rules. ***See*** units of measure
Decimal Separator	Option not supported by Beas. Windows regional settings are used. For document printing the separator can be set up per country. ***See*** Date- and time format
Thousands Sep.	Thousands separator. Option not supported. ***See*** "separators".
Display currency on the right side	Option not supported in Beas – views.
Exchange Rate Posting	Supported. Determines the display of exchange rates in SAP Business One. The exchange rate values are always saved in the system according to the direct rate. The indirect rate is for display use only.

© 2026 Boyum IT Solutions A/S

	This setting affects the calculation that you use to enter the exchange rates in the "Exchange Rates and Indexes" window. • Select "Direct" to display the exchange rate according to the local currency (that is, the local currency price of one unit of a foreign currency). • Select "Indirect" to display the exchange rate according to the foreign currency (that is, the foreign currency price of one unit of a local currency).
Search Preferences Enable Case Sensitive Search	Only Hana **SAP Business One windows:** Select this checkbox to take letter cases into account for all search criteria. For example, if you specify "c01" as the selection criterion, the system will search only for "c01", but not "C01". For more information, **Beas Service Layer:** Does not support this. It is always disabled. **Beas WEB APPs 2.1:** Use Beas Service Layer. It is always disabled. **Beas Desktop front end:** Ignore flag. It is always disabled. Most fields ignore Case sensitive. But not all fields.

3.1.1.4 Font and background

Notes on settings

Font	Selected fonts are supported. Only scripts "from left to write" are supported. Mirrored screens are not supported.
Font size	Changing fonts does not only change the font size. Also the width of screens is adapted. Beas renders the screens with fix augmentation factors. If an other font size then default is selected, rounding differences may occur which looks like dead pixels. For example, table frames may be drawn incorrectly.
Background	Not supported.
Picture view	Not supported.

© 2026 Boyum IT Solutions A/S

3.1.1.5 Inventory

Notes on settings:

Serial numbers and batches

Management method	Only the option "On Every Transaction" is supported. Important: If selecting "only at issue", many Beas – modules may not be working correctly, as bin location management, reservation system etc.
Unique serial numbers by	Only "serial number" is supported. Important: If selecting something else, many Beas – modules may not be working correctly, as bin location management, reservation system etc.
Display inactive items in ... reports	Setting affects Beas – Item report and Item structure not in other selection lists. *Beas9.1-004-055-000*

Default item values

If an item is created in SAP Business One, the settings are supported. If an item is created in Beas, a copy of an item is created in general. Template items can be used as default.

See

Configuration wizard – master data – item

Generate items

Create new

3.1.2 Document settings

Additional notes on SAP Business One – documents settings.

© 2026 Boyum IT Solutions A/S

3.1.2.1 General

Response to release/receipt of inventory outside defined range	Supported. Note: Beas works using SAP Business One – Standard-Transactions, negative effect is possible: for example if a minimum stock is defined, and you try to correct the inventory to 0 during stocktaking, the process may be blocked due to this setting.
Block negative inventory by	Supported, because Beas works with SAP Business One – Standard-Transactions. Note: Beas requires correct inventory. Many functions like order recommendation, bin location management, batch administration, reservation system etc. can only work correctly if there is no negative stock. Consequently, negative inventory needs to be blocked.
Use warehouse address	Function supported.
Inventory control by warehouse	Function supported.

3.1.2.2 Per document

Production area

Document	Use for component transactions. All options are supported. This option can also be set up in the Configuration wizard. ***See***: Valuation and posting the assembly – account determination Concept Work in progress
Booking schema for production	Option is not supported. Beas allows the adaptation of journal entries in the calculations schema and via script. ***See*** Account determination Concept Work in progress

3.1.3 Configuration Wizard

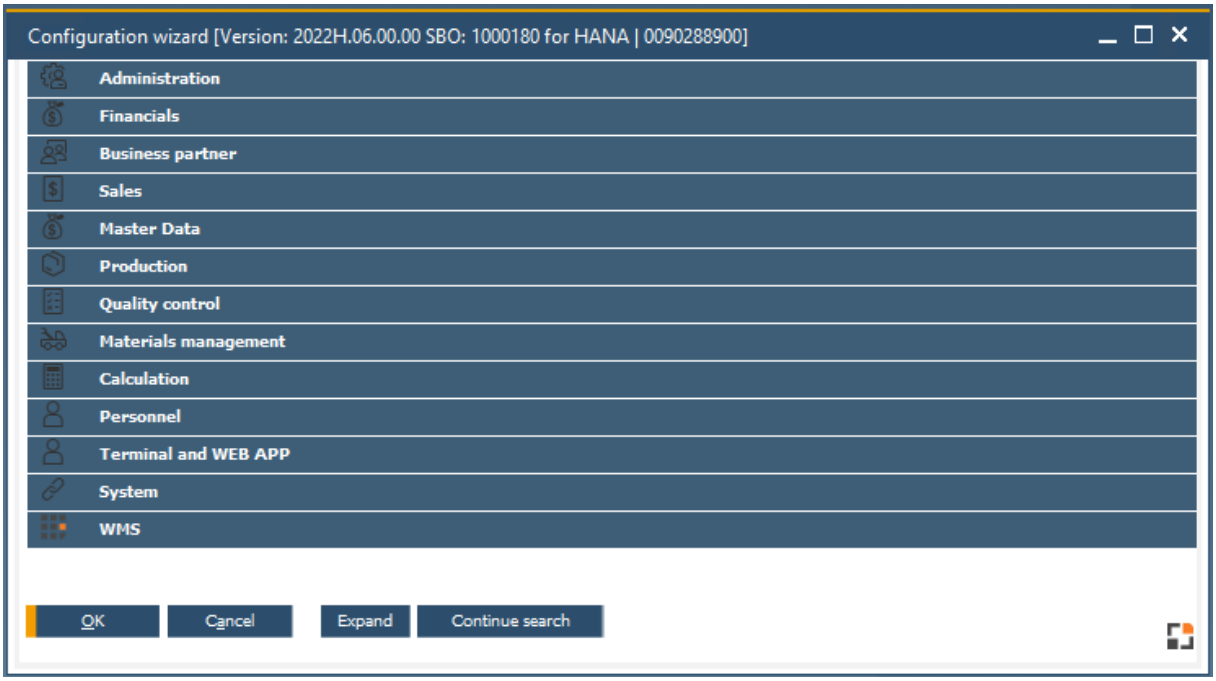
Configuration wizard General information

Administration
Financials
Business Partners
Sales
Master Data
Production
Quality Control
Materials Management
Calculation
Personnel
Terminal and WEB APPS
Business Performance
System
WMS

Beas includes a Configuration Wizard. This greatly simplifies the commissioning of SAP Business One and Beas.
The wizard helps project managers to configure the parameters in SAP Business One and Beas.

PATH: Adminsitration > System Initialization > Configuration wizard.

© 2026 Boyum IT Solutions A/S



Window system_option_struktur.psr

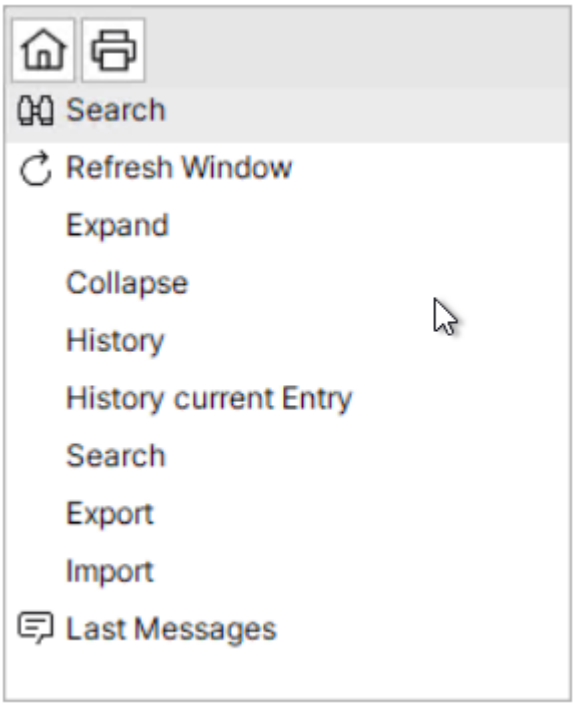
The Setup Wizard is divided into different sub-menu items. Once each sub-menu item has been processed using the wizard, Beas is fully configured and ready for use.

The Configuration wizard uses flags to show which parameters still have to be configured. There are three different flags, and a flag is set to red by default. Once you specify settings, you must manually set the flag to orange or green.

- **Red** flag: Settings not yet configured.
- **orange** flag: Settings partially configured. Further settings must still be configured.
- **Green** flag: Settings complete.

Functions

© 2026 Boyum IT Solutions A/S



Function	Description
Refresh Window	Refresh the Configuration wizard to reflect latest changes
Expand	Expand the setting groups to see all parameters within.
Collapse	Collapse setting groups.
History	Select this option to open the Change log displaying all changes.
History current Entry	Select this option to open the Change log displaying changes for the current entry. Note: changes are also logged on import.
Search	The settings text and help text is searched. **Search:** New search with a new keyword. **Continue search**: Resume searching with the same keyword from last position.
Export / Import	Import / export the entered settings, which then are stored in the customer-specific project directory. Save the Setup.ini file there. This file can then be imported later, therefore these settings only have to be configured once.
Info	Click this button to store a comment to each setting. See the blue bar at the bottom of the Setup Wizard for this.
Last Messages	Last messages

© 2026 Boyum IT Solutions A/S

- Each parameter is described in the last line.
- Complex parameters have extended documentation which is displayed directly. Some descriptions are dependent on the stored option.
- To avoid incorrect settings, warning messages are displayed where applicable.
- Unnecessary settings are automatically hidden.
- Add-ons and customer-specific extensions can also be integrated into the Setup Wizard. For example: WMS.
- Print preview function. For this, you have the option of using the symbol in the upper menu bar or the second option of right-clicking and selecting the "Preview" option.

3.1.3.1 Administration

Administration

System

Support

The contact address of the company supported the installation of Beas is entered here.
This address is displayed under HELP / SUPPORT and also under HELP / INFO.

Company Details

This section describes the configuration options for the Configuration Wizard in the "Administration" tab. For most settings, Beas accesses proprietary SAP entries. These are populated in the Configuration Wizard and automatically copied to the SAP fields.

Name	Description
Company Name	These are the standard fields in SAP Business One. To enable a complete basic initialization from the Configuration Wizard, these fields were included. Fields that are populated in the Configuration Wizard are automatically copied to the SAP Business One fields.
Street	
Block	
City	

© 2026 Boyum IT Solutions A/S

Zip code	
Web Address	
Country	
Telephone 1	
Telephone 2	
Fax	
E-mail	
Active manager	
Custom Cargo Declaration (only Ukraine customers)	Activate this check box for Custom Cargo Declaration (CCD) module users (only Ukraine and Russian customers). In these databases, SAP converts the field "FreeTxt" of document lines, and saves the information into a "CCD" specific field, named "U_beas_freetxt" instead of saving it in the standard SAP field.
Company Details	Click on the "Edit Company Details" button to configure the company details.
General settings	Click on the "Edit General Settings" button to access the general SAP Business One settings.
User	Click on the "Edit Users" button to access user administration. From there, you can create new users or edit existing users.
Authorizations	Click on the "Edit Authorization" button to configure the authorization. This allows you to edit user rights that were assigned previously. New users cannot be created from here. You must first create a new user using the "Edit User" button.
Sales employees	Click on the "Edit Sales Employees" button to define / edit sales employees.

3.1.3.1.1 Help

In this area you can define alternative help system if you cannot use the standard online help.

Parameters

Name	Description
Help system	Context related help is always available: call up by pressing F1. Select here: **Online help:**

© 2026 Boyum IT Solutions A/S

	WEB-files accessed from the Beas-Server or any local server. If you want to use a local server, you must define the address in "URL for English help". **Online help (external browser)** If you set this option, the key F1 will open the documentation outside of Beas in an external browser. The system sends the link of the specific topic to the web page to open it, and the default browser of the system will open the link. **Additional value of this option:** Various external browsers (e.g. Google Chrome) feature integrated translation tools. With this option, the users can turn on their browser-powered translation system, and read the documentation in their own language.
Directory help files	Directory in which the help file is stored. Copy beas_help.exe to this directory. Leaving blank, Beas uses the default setting: **c:\program files\beas software\beas**
URL for English help	URL for English version of help. Requesting an up-to-date OFFLINE version of the English help 1. Ask our support for a current version of the English help in a zip file. 2. You can expand this zip file on a local folder or network folder. In case you need the search function, the server has to be a PHP HTTP Server. 3. Insert the correct folder or IP Address in the Configuration wizard (***see*** image below).  If file based: Insert folder name in URI style / Linux format. ***Example:*** c:\docu **WRONG** c:/docu **CORRECT**

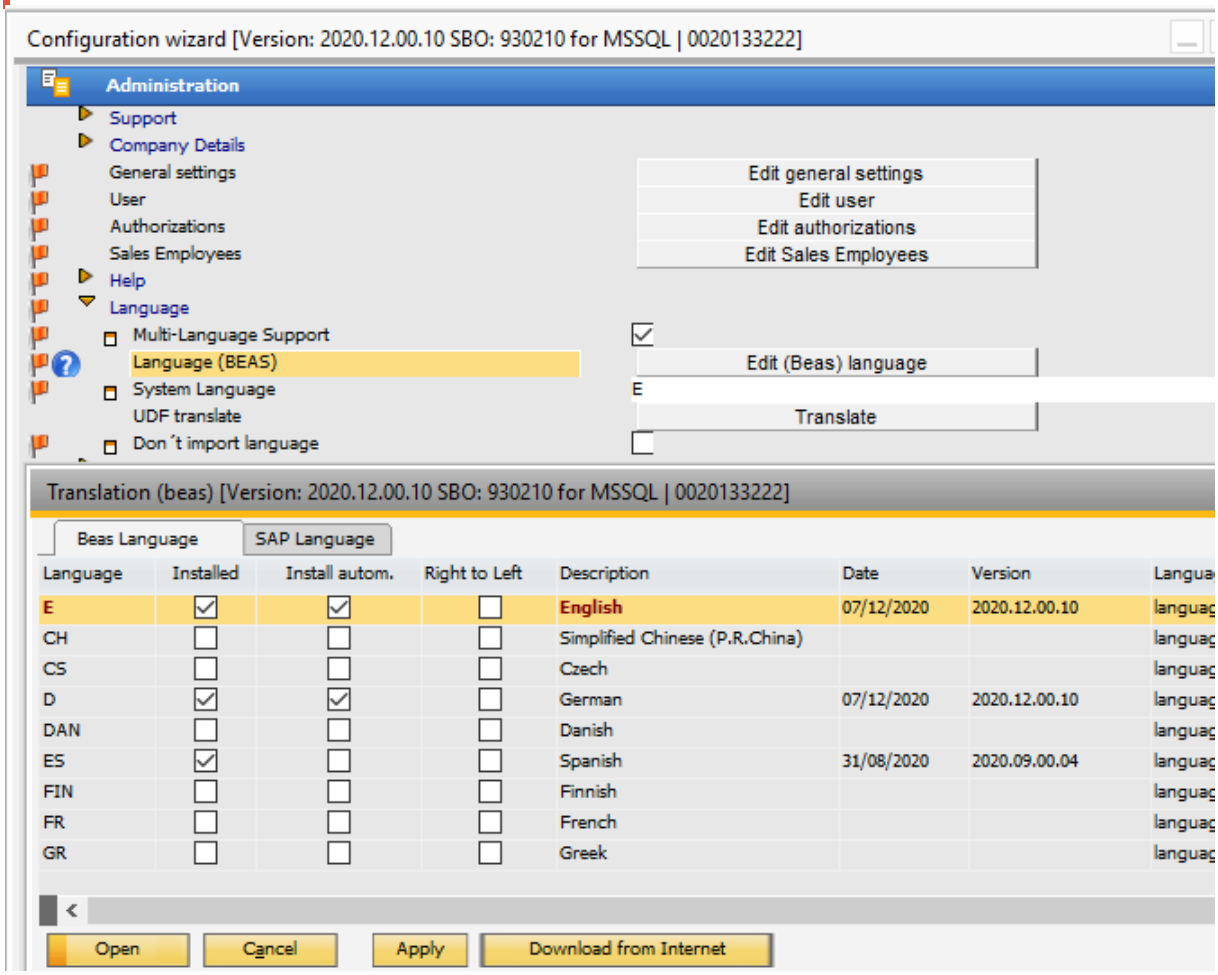
© 2026 Boyum IT Solutions A/S

	4. You can test this directly by pressing F1.

3.1.3.1.2 Language

Language settings

PATH: Administration > System Initialization > Configuration wizard > Administration > Language



Window system_spr_browse.psr

Parameters

Name	Description
Multi-language support	Activates the multi-language support This setting is identical to SAP B1 >Company Details > Basic Initialization > Multi-Language support. If this is active, you can see an earth symbol in many fields if the field has the focus.

© 2026 Boyum IT Solutions A/S

	By clicking on this icon it is possible to insert text for different languages.  If a sales / purchase document is printed, the system displays the text in the defined language.
Language (Beas)	The window for editing languages in Beas opens when you click on the "Edit Language (BEAS)" button. There you can select all the languages available in Beas.
System Language	Specifies which language will be stored on the system by default. Diverse settings are imported or translated at the moment of installation or upgraded, e.g. absence types, calculation schema, standard reports. After a change of the system, a data check should be performed. ***See*** Data check.
UDF Translate	UDF's are translated into the selected system language. Beas creates UDF in SAP Business One. The language used is the one selected at the initial installation of Beas. ***See*** UDF
Do not import language	Deactivates automatic installation of languages for updates.

3.1.3.1.3 View

View

PATH: Administration > System Initialization > Configuration wizard > Administration > View.

Parameters

Name	Description
Design	Define the Skin style if program is running outside Beas

© 2026 Boyum IT Solutions A/S

The Design can define in SAP Business One – General settings and in here in Configuration wizard.
In Configuration wizard the definition is for the current client (Database). This defines the skin style for using Beas outside SAP Business One.
If you want to change the SAP Skin style, you can define this in in General settings - Display - Skin style

Beas inside SAP Business One

Beas will always use the Skin style (Design) which was defined in SAP Business One General settings.
All Skin styles are supported (*SAP 10.0, Beas 2020.03*)

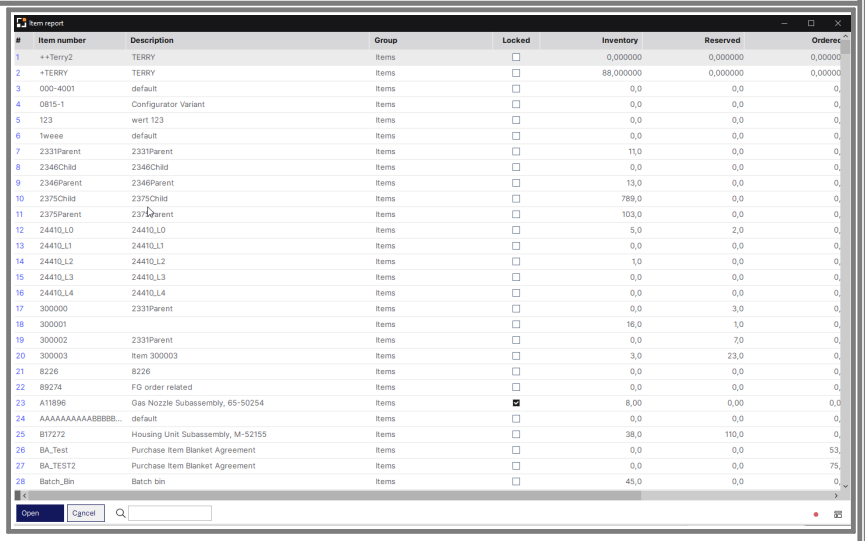
Beas outside SAP Business One

In the Configuration wizard you can choose one of all available skin styles of MSSQL and HANA Version.
Available Skin styles:

Style	Example Beas Standalone
Boyum Style Type	Select the type of Boyum Theme: Efficiency Mode (regular space): - setting is active by default. Browse windows show more lines, edit windows feature fields closer together. Reduced column width and tab height. *Beas 2025.04*

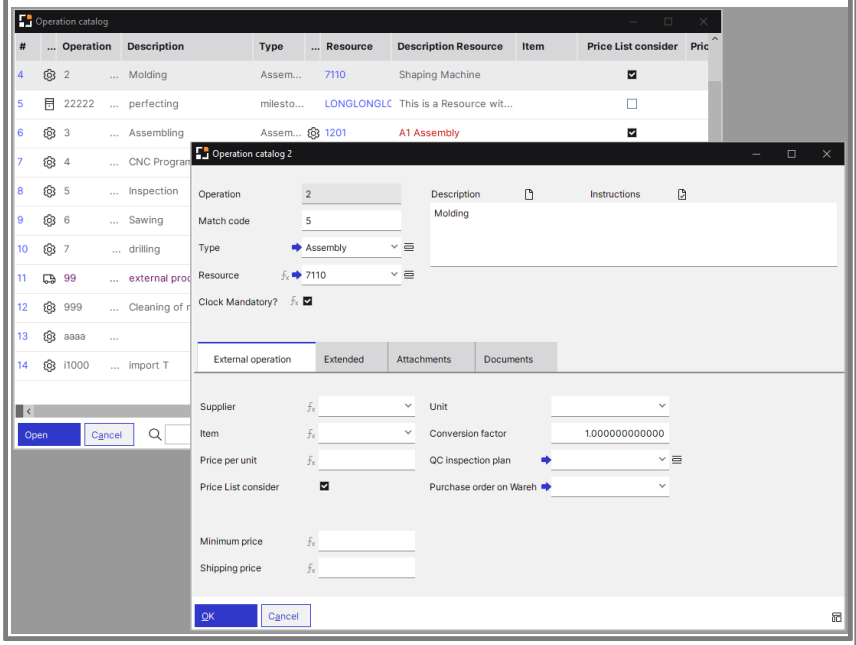
© 2026 Boyum IT Solutions A/S

Style	Example Beas Standalone



Comfort Mode (wide space - original style):

Original, wide-spaced Boyum Theme Style officially available as of version 2023.09.



© 2026 Boyum IT Solutions A/S

Style	Example Beas Standalone
Conventional	SAP Signature	Golden Thread	
© 2026 Boyum IT Solutions A/S

Style	Example Beas Standalone
Fiori	 **IMPORTANT:** If you change the Local client Display settings to > 100% in Fiori style, buttons disappear in all Beas windows. This is a known limitation from SAP side and affects all apps. Due to the change in the internal zoom factor of SAP, the position calculations cause wrong results. **Workaround:** Go to Station settings > Hardware tab and perform the necessary adjustments for Button Position Correction.
Belize Deep	
Note:

Outside SAP Business One Beas cannot use the framework of SAP Business One.

The Fiori Dashboard and B1UP Dashboard are not available.

Beas only uses the color schema.

Icons are not the same as in SAP Business One

© 2026 Boyum IT Solutions A/S

	Beas uses its own User interface and not SAP Business One components.
Activate Style inside SAP	Enable this check box to activate the selected "Design" in SAP.

Button Style	Choose between two types of button style:
	- Old System (Deprecated): select this to return to the old Beas button layout.
	- SAP Style: (default) Beas forms gain layout with SAP design of button names.
	NOTE: most buttons of the Old System (Deprecated) style are not visible in this style (moved to the right-click menu).
	
	Note:
	If there are a lot of customizations in your system, and you changed the functionality with the script command:
	
	`windowevent click b1`
	`end event`
	
	, not every customization will run with the SAP style. In this situation you can switch (setting: `buttonstyle 0=old, 1=SAP Style`)

Menu in SAP B1 Type Menu Standalone	Define which menu structure is used Selectable menu structure: beas2009: All Beas functions under the upper menu level Beas are summed up and separated from all SAP Business One functions. This menu can be extended via an AddOn or via an "customer-specific extensions". ***See***: AddOns Standard: Integrated menu; all Beas functions are sorted under the upper menu level of SAP Business One. Expert: The most important functions (selectable) are on the top level between the upper menu level of SAP Business One. From *Beas 9.2 PL: 02* extended settings are possible This setting can be used separately, if Beas is started integrated in SAP B1 (Menu in SAP B1) and if Beas is started without SAP B1 (Menu as Beas standalone).

© 2026 Boyum IT Solutions A/S

	Customization
	The function "initmenu" can be stored in the file "beasmenu" to overwrite the setting.
	
	You can set the following variables:
	
	`e_menu` = define the menu 0=beas 2009, 1=standard, 2=Experte
	`e_completeload` = 2=load all, 1 = load all with access, 0=load only licensed entries
	
	Example:
	for user "manager" use beas2009-Menu
	`function initmenu`
	`if <currentuser> = manager then`
	`  setvar=e_menu=0`
	`end if`
	`end function`

Menu in SAP B1 load	Define in which way the Menu inside SAP B1 should be loaded: - **Object**: Loads every Menu point. In error case the system continues to load next Menu point - **XML (fast)** **IMPORTANT:** To load all menu entries using the XML (fast) setting, you must activate "Enable Personal Data Management" in SAP "Company Details". ***See:*** **SAP > Administration > System initialization > Company Details > Basic Initialization tab**
Menu complete load	Define which menu entries are loaded The following settings are available: **No** = Only licensed menu entries and user-authorized menu entries are displayed. Advantage: Faster start process and better overview. Disadvantage: After a change in authorizations or licenses a restart of the program is necessary. **Yes (License)** = All entries the user is authorized for are displayed. Menu entries the user has no license for are also displayed. Only menu entries for which the user has no authorization are hidden.

© 2026 Boyum IT Solutions A/S

	Yes (Completely) = All menu entries are displayed. Advantage: At initial configuration it is useful to test access rights, because no restart of the program is necessary after changing license or authorization. This setting can also be changed via custom specific adjustment. ***See*** "Menu beas standalone"
Time format	24 or 12 hours (am/pm).
Date format	Choose between different formats (dd/mm/yy ; dd;Month/yyyy) etc.
Date: separator	Select the separator (default: /).
Decimal places for times	The number of decimal places in times (e.g. 3.34 hrs.) cannot be configured in SAP. The setting is not available here for this reason. It is not necessary to restart Beas if any changes are made.

3.1.3.1.4 Print and report settings

Print and Report Setup

PATH: Administration > System Initialization > Configuration wizard > Administration > Print and report setup.

Parameters

Name	Description
Microsoft Word directory for templates	Specifies the path where Word documents are filed. If emails and faxes are created using the SAP Business One messaging system, this must be a released directory accessible by all.
Microsoft Excel directory for templates	Specifies the path where Excel documents are filed. If emails and faxes are created using the SAP Business One messaging system, this must be a released directory accessible by all.
Directory for images	Enter path to pictures folder.
Directory for attachments	Enter path to attachments folder.
Header	Free text field: enter a header.
Report template	The window for editing reports opens when you click on the "Edit" button.

Printing CrystalReports

Beas supports printing documents with Crystal. For further information ***see*** Crystal.

© 2026 Boyum IT Solutions A/S

Parameters

Name	Description
Print B1 documents with Crystal	Document can be viewed in a separate Beas program task which may increase run time stability. Documents are printed via <%PFAD BENUTZERVERWALTUNG%> – function using Crystal. Advantage: simple creation of complex, multi-language reports using the available API. ***See*** Report settings, Macros, Crystal, b1documentgenerate
Do not delete beas_document_xxx	If you enable this option, entries in beas_document_header/line are deleted after 3 days. **Important**: in this case, in the Crystal-document BEAS_DOCUMENT_HEADER.ID needs to be indicated as parameter. ***See*** Crystal, b1documentgenerate
Use Internal CrystalReport viewer	Documents that are generated in Crystal Reports open in a separate viewer. Beas support Crystal Reports 11 and actual Crystal Reports, which delivered by SAP. Note: Beas can use this product, but is not part of Beas.

Setting	Description
Crystal report viewer	This setting uses the original Crystal engine installed by SAP Business One (Standard). This allows you to use all new functionalities that were delivered by the last Version of Crystal Report. Note: If old reports customization is not working, use "Old internal viewer" **Translation concept:** The system translates the reports automatically to the correct language. This is only working if all keywords in the reports are German words (the system uses Beas internal translation system) Report settings > "Translation" is not supported.

© 2026 Boyum IT Solutions A/S

Setting	Description
	Terminal Installation If SAP Business One is not installed on this client, you must install the SAP Business One Crystal viewer from folder `\\B1_SHR\Client\CRRuntime` or `\\B1_SHR\Client.x64\CRRuntime`
Old internal viewer	This setting uses Crystal Viewer Version 11. Use this, if old customized report cannot run with the new Crystal report viewer. For this the Crystal Viewer Version 11 must be installed on the client. You can download this from: http://beascloud.com/download/beas/reportviewer/reportviewer_11.zip Note: In actual crystal version there are new functions for example, examples extended Bar codes. These are not running on the old internal viewer. **Only 32 Bit variant**
Export to PDF	Use this setting if the "Crystal report Viewer" and "Old internal viewer"are not working. The setting uses the old Crystal Version 11. ***See*** "old internal viewer". Note: It displays the Report as a PDF file and it is not in an internal viewer. Only 32 Bit variant

E-mail

Name	Description
Standard e-mail sending	Indicates the technology used to send emails. ***See*** Email-Client-Types

© 2026 Boyum IT Solutions A/S

	User EMail Setup Printing and report settings
Default e-mail account	Opens settings for e-mail account: address, SMTP-port, SSL, password etc.

3.1.3.1.5 Modules to be activated

Modules can be activated with these settings.

PATH: Administration > System Initialization > Configuration wizard > Administration > Modules to activate.

Name	Description
Quality control	Releases the management of inspection plans for goods receipt and production.
Business performance	Activates the Business performance module.
Expert mode	Activates options requiring advanced Beas knowledge. Enable only after consultation with Beas support. ***see*** Expert mode.
Beta mode	Enable to get access to new, previously unreleased functions. For testing purpose in the current session it can be turned on and off by pressing Ctrl+B Crtl+M.

3.1.3.2 Financials

Administration
Financials
Business Partners
Sales
Master Data
Production
Quality Control
Materials Management
Calculation
Personnel
Business Performance
System

This section describes the setting options of the Setup Wizard in the "Financials" tab. For most settings, Beas accesses the proprietary SAP entries. These are populated in the Configuration Wizard and automatically transferred to the proprietary SAP fields.

© 2026 Boyum IT Solutions A/S

PATH: Administration > System Initialization > Configuration wizard > Financials.

Accounting data

Name	Description
Tax office	These are the default fields of SAP Business One. To enable a complete basic initialization of the Configuration Wizard, these fields were included. Fields that are populated in the Configuration Wizard are automatically copied to the SAP Business One fields.
UID number 1	
UID number 2	
UID number 3	
Tax number 1	
Tax number 2	
Banks	Click the "Edit Banks" button to define the banks.
Default accounts	Click the "Edit Default Accounts" button to define the default accounts.
Edit Chart of Accounts	Click the "Edit Chart of Accounts" button to edit the chart of accounts.
G/L Accounts Determination	Click the "Edit Account Determination" button to define the account determination.
Currency	Click the "Edit Currency" button to define the currencies.

3.1.3.2.1 Account allocation

Chart of accounts

The chart of accounts includes all general ledger accounts. In the financial accounting each company code is allocated with a chart of accounts. This allocation is binding for the investment accounting, as well.

Accounting location key

The key for accounting location is stored in the general section of the master data of the asset class. It defines the financial accounting reconciliation accounts that are to be entered for each chart of accounts and each automatic entry of the depreciation area (see below) in a chart of depreciation. The chart of depreciation is not a key criterion for account determination. This means that no reconciliation accounts specific to the depreciation area can be stored in one single accounting location for company codes which refer to different charts of depreciation but use the same chart of accounts.

You must store an accounting location key in each asset class. In this way a class-based allocation of accounts is ensured. SAP provides accounting location keys for the standard reconciliation accounts and standard charts of accounts.

3.1.3.3 Business partners

Administration
Financials
Business Partners
Sales
Master Data
Production
Quality Control
Materials Management
Calculation
Attendance
Business Performance
System

PATH: Administration > System Initialization > Configuration wizard > Business partner.

The characteristics of business partners are defined in this area. SAP forms are accessed for this.

Name	Description
Customer groups	Click the "Edit Customer Groups" button to define customer groups.
Vendor groups	Click the "Edit Vendor Groups" button to define supplier groups.
Business partner properties	Click the "Business Partner Properties" button to define business partner properties.
Payment Conditions	Click the "Edit Payment Conditions" button to define payment conditions.
Terms of delivery	Click the "Edit Terms of Delivery" button to define the terms of delivery.
Types of packaging	Click the "Edit Types of Packaging" button to define types of packaging.

3.1.3.4 Sales

Administration
Financials
Business Partners
Sales
Master Data
Production
Quality Control
Materials Management
Calculation
Personnel

Business Performance

System

PATH: Administration > System Initialization > Configuration wizard > Sales.

Parameters

Name	Description
Create work orders	If enabled, you can create a work order directly from a sales document using right-click. ***See*** Sales order.
Edit work orders	If enabled, you can edit work orders directly from a sales document using right-click. ***See*** Sales order.
Capable-to-promise	Expand additional settings for CTP/ATP

3.1.3.4.1 Capable-to-Promise

Parameters

Name	Description
Capable-to-Promise / Available-to-Promise	Group of settings for CTP and ATP.
Menu item Available	Activate the Capable-to-Promise function in sales order and sales quotation. Activate CTP / ATP. Note: ATP can only be activated with an active APS License. Using ATP is available with all basic licenses and a Default Material Resource Planning definition is mandatory.
Default Order Recommendation	Define the related Order Recommendation. CTP uses the result of the last MRP calculation for material planning. Here you specify which MRP is to be used for this.
Working days before start of production	This determines the number of working days between today and the earliest possible start of production. This only has an effect on the ATP display. It is based on the Beas factory basic calendar

© 2026 Boyum IT Solutions A/S

Only Workdays	Displays only workdays related to the company calendar. If activated, it is possible to see more workdays.

See CTP.

3.1.3.5 Master data

Administration
Financials
Business Partners
Sales
Master Data
Production
Quality Control
Materials Management
Calculation
Personnel
Business Performance
System

PATH: Administration > System Initialization > Configuration wizard.

Parameters

Name	Description
Item Group	Click the "Edit Item Group" button to define the item groups.
Item properties	Click the "Edit Item Properties" button to define the item properties.
Length and Width UoM	Click the "Edit Length and Width Unit" button to define the length and width units.

© 2026 Boyum IT Solutions A/S

Weight UoM	Click the "Edit Weight UoM" button to define the weight UoM.
Units of measure	Click the "Edit UoM" button to define the UoMs.
Manufacturer	Click the "Edit Manufacturer" button to define the manufacturer.
Cut-off	Click the "Edit cut-off" button to define the scrap.
Raw Material	Click the "Edit Raw Materials" button to define the raw materials.

3.1.3.5.1 Item

PATH: Administration > System Initialization > Configuration wizard > Master data > Item.

Parameters

Name	Description
Default Item	To create a new item, an existing one is copied. Indicate which source item to use as default for creating new items. **Important**: all relevant fields are copied. The default item needs to be without postings and valuations. Depending on further options or call up: Item version Routing head and routing BoM head and BoM positions Quality control references Parameters Not used or transferred: Change log Documents Price list Extended price list BoM / Routing – if in Item - Management "separate BoM" was stored and the BoM has another ID than the item. Note on function "Item import": With this function, all fields are used, including valuation prices. That why it is important, the default item has no prices and valuations or stock data.
Display	Setup display and administration for Item structure and Item master.

© 2026 Boyum IT Solutions A/S

I-Version Administration	Setup I-Version – administration.
Variant	Setup Variant administration.

back to master data

3.1.3.5.1.1 Display

This option controls the view and administration for

Item structure,

Item master.

PATH: Administration > System Initialization > Configuration wizard > Master data.

back to item

Settings for Item structure – View.

PATH: Administration > System Initialization > Configuration wizard > Master data > Item > Item structure.

Parameters

Name	Description
Expand max. levels	Determines to which level to expand the item structure. Refers to the function "expand completely" in the item structure. This is computationally extensive and can take long for large structures. Use the structure report as an alternative. The maximum number levels to be expanded has been limited to 5. It can be changed here. *(Beas 9.1 PL: 08,Variable itemstrmaxlevel)*
Support SAP Bill of Materials	Activate this radio box to display SAP Bill of Materials in the Item structure. If activated, the system displays linked Bill of Materials entries which were defined in **SAP Business One: Production > Sales Set-Bill of Materials.**

© 2026 Boyum IT Solutions A/S

<table>
<tr><td></td><td>Note: If you change this setting for the item structure view level, the system changes the identical setting in the precalculation area, as well.</td></tr>
<tr><td>Allow Item copy</td><td>Define access to copy function.
In Beas, the proprietary function for copying items slightly differs from the SAP Business One function. Use this setting to decide whether the copy function should be available.

See
Item generation
Create new</td></tr>
<tr><td>Extension Step
- Item
- Bill of Materials
- Routing</td><td>Adjust column "Short description, activity".
The item structure can be adjusted. As in all structure views, templates are not supported because different data sources are read (Tables) depending on type (Item, BoM, routing).

Available options with this view:
1. Definition of which SQL-Fields should be loaded with (<code>SQLField1, SQLField2</code>)
2. Setup of the short description or activity. (Use DataWindow-Syntax!)

See Video

At the definition of the to be loaded fields, it is indicated which SQL-sequence should be imported in the column "SQLField1".
Note: The return value must always be from the type "varchar(x)". You can access the fields of the following tables:

Linkage SQL-Fields – Table

<table>
<tr><th>Area</th><th>Tables</th></tr>
<tr><td>Item</td><td>OITM, BEAS_ITEM_VERSION, BEAS_STL_HEADER

Note:
Always check return on ZERO. Return must always be of type "varchar(x)".</td></tr>
</table>
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

	e.g. coalesce("OITM"."FrgnName",'')
BoM	BEAS_STL, BEAS_ITEM_VERSION, BEAS_STL_HEADER, BEAS_ME, BEAS_APL Note: Return must always be of type "varchar(x)". A NULL-Check is not necessary.
Routing	BEAS_APL, BEAS_APLATZ, BEAS_AGTYP Note: Return must always be of type "varchar(x)". A NULL-Check is not necessary.

At the definition of the output an expression-object is filled with one of the available formula fields:

Area	Expression Object Name	Default
Item	citemname	itemname
BoM	cbezstl	bez
Routing	cbezapl	bez

Example:

Foreign language name FrgnName + Item description is to be displayed additionally.

SqlField 1 (SQL)= `coalesce("OITM"."FrgnName")`

SqlField 1 (SQL)= `coalesce("OITM"."ItemName")`

Setup item description: (DW-Syntax): `sqlfield1 +' ' + sqlfield2`

PATH: Administration > System Initialization > Configuration wizard > Master data > Item > Display > Item Master.

Parameters

Name	Description
Item Window	Select the default view of item master data

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Name</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Beas window</td><td>With this setting, SAP integration is active, but you can view and manage item master data in the separate, Beas window with all functions gathered in its various tabs.
When you open the Item Master from a Beas form, the system opens the Beas item master data window.</td></tr>
<tr><td>SAP window</td><td>With this default setting you can view and manage item master data in the SAP BusinessOne Item master window with the integrated Beas functions. When you open the Item Master from a Beas form, the system opens the SAP item master data window.</td></tr>
<tr><td>None integration</td><td>No integration is activated, and you can open and manage item master data as in the previous Beas versions.</td></tr>
</table>
Note: If you start Beas outside SAP Environment, only the Beas Item Master Data is available.

See Item Master Data
</td></tr>
<tr><td>Manage parameter</td><td>The "Parameters" tab is displayed. Any additional information on the item can be stored in the parameters, for example UDF. When a work order is created, the parameters are copied there. Variant production can also access these parameters.</td></tr>
<tr><td>Specific weight by item</td><td>If active, the specific weight is managed per item in master data, otherwise it is stored in raw material. This field can be very useful for calculating conversions</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Name	Description
	between warehouse unit and consumption unit. ***See*** also: Item master – specific weight Units of measurement.
QC Extended rules	Extended determination of QC-inspection plans If enabled, determination of inspection plans provides an extended functionality but it is also more complex to operate. Settings refers to **Item master > QC tab.** Additional functions (if **enabled**): 1. List of entries can be sorted by Drag&Drop 2. In editing window the "Rules" tab is inserted 3. No automatic sorting by priorities! If **disabled**: 1. List is automatically sorted 2. "Rules" tab is hidden in editing window We recommend to disable this option, unless it is really needed. *qsextentedrule*
Use RTF-Fields	Activate RTF support in Item Master Data - Description fields When activated, long descriptions can be entered in the item master as RTF text. **Warning**: SAP Business One cannot display RTF texts. ***See*** also: Master data
Name UDF 1–4	Define up to 4 UDF fields in Beas Item Master Data window Item master is saved in an SAP Table and SAP has its an own UDF concept. UDF1-4 do not exist. Beas windows support only UDF1-4. In item master data it is possible to link a Beas UDF with SAP UDF. 1. Define UDF field in **SAP > Tools >Customization tools > User-Defined-Fields > Master Data > Items > Items**

© 2026 Boyum IT Solutions A/S

Name	Description
	2. Go to **Configuration wizard > Item > View > Item Master Data > UDF** 3. Click on the tool box right of the UDF field. 4. Select the UDF field where you want to save the data. The field must be from type "Char", otherwise the system cannot save the information.  Note: In SAP Item Window - Extended Production the UDF's are not integrated because the SAP window has its own UDF concept. All UDF's are on the right side and it is possible to move these fields in any place.

Name	Description
Item management	Determines type of item management Supported options: simple: BoM and routing are always firmly linked to the item. In item master, the tabs BoM and Routing are displayed.

© 2026 Boyum IT Solutions A/S

	The field "I-version" can be used freely, it has no function.
separate BoM management	BoM and routing are managed separated from item master. In item master a BoM and optionally a routing can be linked to an item. By creating a work order manually, you can replace the BoM and routing. The field "I-version" can be used freely, it has no function.
Version control	Item version control is active. Per item, any number of versions can be stored. Per version the description, drawing number and link to BoM and routing can be defined separately. The field "I-version" in item master displays the currently active version. Use this field to select other versions if necessary.
Variants	The same function as "Version control" but in this case variants are used, which can be selected already in a sales order. In this case, the field "I-version" indicates the variant.

Item version control is disabled by default.

Note

Item version control is available from beas9.1 Patch4 in combination with SAP B1 9.1.

(beas9.1-004-000, versioncontrol)

Routing directly selectable	Determines whether the routing is selectable This option is visible only if item version control is enabled.

© 2026 Boyum IT Solutions A/S

	If the option is disabled, (default) the routing is stored in the BoM. If the option is enabled, the routing is linked to the item or item version independent of the selected BoM. NOTE: BoM items can be linked to routing items. If the routing is not firmly linked to the BoM, it is not possible to check the linkage. Beas does not block linking BoM item and routing position, but the user needs to make sure that the links are correct. ***Example*** of use: Enable if you want to work with alternative routings. *tem_routing_choose*
Supporting SAP Business One Bill of Materials	Activate the SAP Bill of Materials support If this option is activated, the SAP Business One Bill of materials is displayed in the item structure and the calculation, or included in the calculation. This option is for users, who use calculation exclusively. Enabled: SAP Business One BoM is displayed in master data, in calculation and in work orders (if created via calculation). The SAP Business One BoM is not considered in MRP.

3.1.3.5.1.2 I-Version administration

PATH: Administration > System Initialization > Configuration wizard > Master data.

Settings for Item version (I-version) control.

See Item Edit I-Version

Parameters

Name	Description
I-Version: Release	Determine the release of new I-versions Switch only active if item management was set to "Version control" or "Variant".

© 2026 Boyum IT Solutions A/S

When can a new version/variant be used?

At new creation	0	Release immediately after creation (Default)
Manually	1	Entry needs to be released manually

Beas9.0-004-035-000, item_newrelease

I-Version: Numbering

Numbering template for creating new I-Versions

If a new I-Version is created, the next number can be determined. Here you can define the template for numbering.

xxx is replaced by a continuous number. Number of x determines the number of leading 0.

Example:

xxx = 001, 002, 003...

xxxx = 0001, 0002, 0003...

V-xxx = V001, V002, V003...

IV(xxxx) = IV(0001),IV(0002)...

x = 1,2,3,4 5,6,7,8,9,0 (max. 10 versions)

There is no counter. The following number is determined by the last existing number for that item. Changing the template subsequently can lead to problems, because it is also used for determination of the last number.

Determine numbers via BeasScript

You can define numbers using script. Store a script by clicking on the cogwheel icon.

Available variables:

<e_itemcode>

In variable "<value>" the version number is returned

Example

Continuous number over all items

© 2026 Boyum IT Solutions A/S

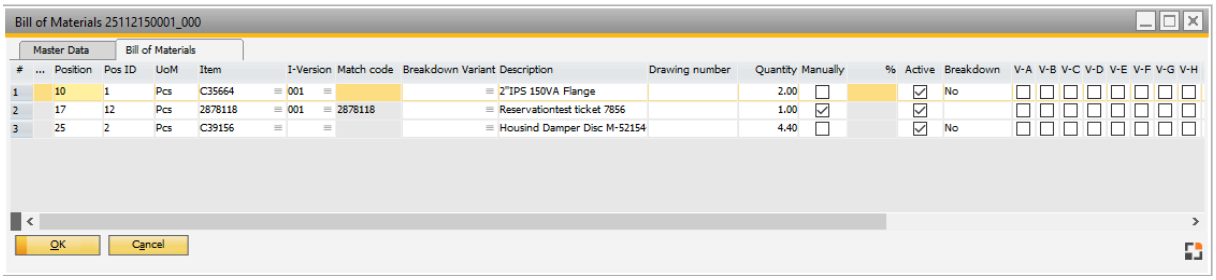
	``` setvar=ll_counter=<setup:myaversion> setvar=ll_counter=%numadd(ll_counter,1) setsetup=myaversion=<ll_counter> setvar=value=000000<ll_counter> setvar=value=<value,right 6> return <value> ``` Note: I-Version is alphanumeric, it is counted: 1,10,11,2,3,4,5,6,7,8,9 For this reason it is recommended to use numbers beginning with 00. 001, 002, 003, ... 010, 011
Default Version Status	Item version status to be used as default at new creation or copying a version.
UDF 1...4	Free definable fields.

3.1.3.5.1.3 Variants

PATH: Administration > System Initialization > Configuration wizard > Master data.

Simple variant administration (Variant A-Z). ***See*** variants

Inventory > Bill of Materials > Open selected item.



Window artikel_stlpos_edit.psr

Parameters

Name	Description
Variants per item	If active, you can define variants per item. If disabled, the menu item "Variants" is displayed, along with a button to edit simple variants variants, item master.

3.1.3.5.2 Bill of Materials

Determines basic settings of Bills of materials. Sub-chapters:

© 2026 Boyum IT Solutions A/S

BoM

BoM head

BoM position

Parameters

Name	Description
Change with Reason	Activate the entry of a change reason For changes in a position or BoM positions, a change reason after each change is queried if this is activated here. Affected: **Item > BoM** tab. Open BoM Not at import, mass changes. *beas9.0-004-011, Variable changelogstl*

See BoM

3.1.3.5.2.1 BOM head

Settings for the BOM head.

PATH: Administration > System Initialization > Configuration wizard > Master data > Bill of materials > Bill of materials Header.

Parameters

Name	Description
Release	Determines the release of a BoM At new creation: BoM is immediately released. Manually: BoM is not released after new creation or copy. ***See*** BoM – Release *Beas9.0-004-035, Variable bom_newrelease*
UDF1..4	Freely definable fields; visible only if a name was entered. ***See*** UDF.

See BoM

3.1.3.5.2.2 BOM position

PATH: Administration > System Initialization > Configuration wizard > Master data > Bill of materials > Bill of materials Position.

© 2026 Boyum IT Solutions A/S

Parameters

Name	Description
Material per	Determines the number of finished parts the quantity specification refers to in the BoM position. For "each 1000" and a quantity of 5 pieces in the BoM position, 5 pieces are required per 1000 finished parts.
Accept Changes	"Material per" is entered in the master data and current production. This function must not be carried out in running operation.
Position Increment	During the creation of Bill of materials, the position numbers are generated automatically. The increments are entered here – Default is 10.
Name Info Field	There is a freely usable field available in the Bill of materials, called "Info". It can be renamed here.
Name UDF 1 .. UDF4	Additional freely usable field. Only visible when a name was issued. ***See*** UDF.
Item, if unknown	Used item code if for BoM position no other item is available If no item was created for a BoM position or no item shall be created, you can use a replacement item. Description and drawing number can be entered manually. Running the import program, this item is used automatically. If no item was defined, the BoM cannot be imported. If a new BoM position is registered and the item defined here was inserted, the switch "manually" will be displayed. *Beas 9.1 PL:08, Variable st_bomtemplate*
Scrap Calculation procedure	The formula to be used for the Material Scrap in Bill of Materials can be selected here. You can select between two methods to calculate the BoM Scrap. Scrap = Quantity * (Scrap %) Scrap = Quantity / (1 - Scrap%/100) Default is first option (same function as in the past). In this way you will not lose compatibility to older versions. For more information ***see*** Scrap field in Bill of Materials.

See BoM

© 2026 Boyum IT Solutions A/S

3.1.3.5.3 Routing

Determines basic settings of routings. Sub-chapters:

PATH: Administration > System Initialization > Configuration wizard > Master data > Routing.

Routing
Routing head
Routing position

Parameters

Name	Description
Change with Reason	Activate the entry of a change reason If active, a reason is queried after each change. Affected: Item - BoM tab Open BoM Not at import, mass changes. No effect on operation catalog, parallel tools or parallel resources. *Beas9.0-004-011, Variable changelogstl*

back to master data

3.1.3.5.3.1 Routing head

Settings for routing.

PATH: Administration > System Initialization > Configuration wizard > Master data > Routing > Routing Header.

Parameters

Name	Description
Release	Determines the release of a routing. At new creation: Routing is immediately released. Manually: Routing is not released after new creation or copy. ***See*** Routing – Release *beas9.0-004-035, Variable routing_newrelease*
UDF1..4	Freely definable fields ***See*** UDF.

© 2026 Boyum IT Solutions A/S

See Routing

3.1.3.5.3.2 Routing position

PATH: Administration > System Initialization > Configuration wizard > Master data > Routing > Routing Position.

Parameters

Name	Description
Quantity per time	Default 1: Determines which assembly quantity the time specifications refer to. In case of 100 and a time of 10 minutes, this corresponds to 10 minutes of effort per 100 pieces. A subsequent change implies a complete revision of the already entered data.
Accept Changes	The "Quantity per time" specification is written in all existing entries (operation, routing, production routing) but not calculation.) **Warning**: No change log is created. The process cannot be undone. It has a direct influence on all analyses, including closed work orders and assembly valuations.
Time Unit	Minutes / hours: Defines whether the stored times are stored as hours or minutes.
Accept Changes	The "Time Unit" specification is written in all existing entries (operation, routing, production routing) but not calculation. **Warning:** No change log is created. The process cannot be undone. Has a direct influence on all analyses, including closed work orders and assembly valuations.
Scrap related to a certain operation	Determines whether a material scrap factor can be specified in the routing. If this option is activated, a corresponding field is available in the routing. This scrap factor is generally deactivated and should only be activated if the other scrap factors are insufficient. ***see:*** Scrap / Cut-off On activation, the calculation time in MRP may increase.
Behavior of Routing Scrap Material % affects	Define how to calculate Material scrap by Routing position Drop-down parameter with 3 types of behavior: - "Linked material only": Only linked materials are affected by the scrap % - "From first to the last linked material": All materials below any linked material are affected.

© 2026 Boyum IT Solutions A/S

	- "All materials are affected". ***See*** Concept Scrap of Material Routing position Extended
Operation: Column "Active" show	Determines whether the "active" field in the operation should be displayed. You can activate / deactivate an operation in dependencies here. If this function is not required, we recommend that you deactivate it. If enabled, the calculation time can be significantly longer for large amounts of data. ***See*** Edit routing position.
Position Increment	When Routings are created, the position numbers are generated automatically. The increments are entered here – Default is 10.
Default Cost Center	A default cost center can be defined for faster input.
Default Resource	A default resource can be defined for faster input.
First Field	For faster input you can define the field in which the cursor should be positioned when recording the positions.
Format instructions	Determines the format of "instructions" field. Available: "Text" and "RTF". ***See*** Edit routing. Note: Changing format settings does not affect existing entries. *(beas 9.1 PL: 07)*
UDF1 .. UDF4	User-definable fields. ***See*** UDF

See

Routing

Configuration wizard - Routing

3.1.3.5.4 Resource

PATH: Administration > System Initialization > Configuration wizard > Master data > Resource.

Parameters

Name	Description
Time types: administrate times by	This determines whether times are calculated in parallel or summed up for lead time calculation.

© 2026 Boyum IT Solutions A/S

Up to three times can be specified. Each time type can have its own costs and its own lead time.

Available settings:

- Sum

  Lead time + capacity = Sum of all time types.
  Costs = Sum of all time types.

  Example:
  Processing = 3 Min
  Rework = 5 Min
  Quality Control = 2 Min

  Lead time = 10 Min
  Costs = 10 Min *cost rate

  timetype_sp=S = Standard

- Parallel

  Lead time + capacity = largest time.
  Costs = Sum of all time types.

  Example:
  Processing = 3 Min
  Rework = 5 Min
  Quality Control = 2 Min

  Lead time = 5 Min
  Costs = 10 Min *cost rate

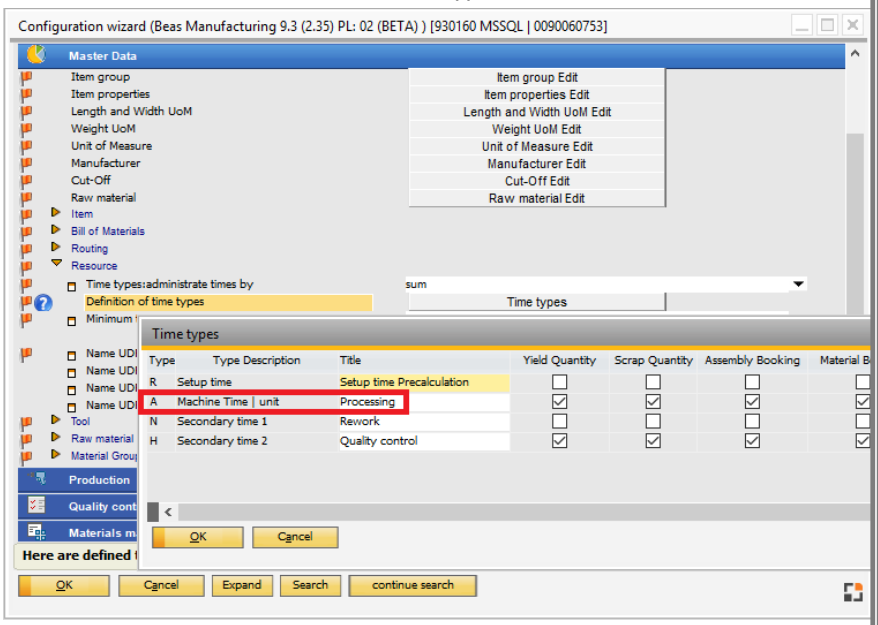
  timetype_sp=P

- Processing time

  Costs = Sum of all time types.
  Capacity + Resource time = Processing time.

© 2026 Boyum IT Solutions A/S

The naming can be stored in the Configuration wizard. The processing time here is considered as the row "Type A"



Example:

Processing = 3 Min

Rework = 5 Min

Quality Control = 2 Min

Lead time = 3 Min

Costs = 10 Min *cost rate

besa9.0-004-011, timetype_sp=E

Determination of Secondary time

For determination of secondary time, all time types need to be active. Only main time (TH) can be entered.

The processing time is calculated:

TE = main time (TH) * personal allowance % from resource * recovery time % from resource

Secondary time (TN) is calculated:

© 2026 Boyum IT Solutions A/S

TN = Processing time (TN) - main time (TH)

Costs = Sum of all time types
lead time and capacity = Processing time (TE)

- Explanation of terms
  - What is a secondary time (TE)

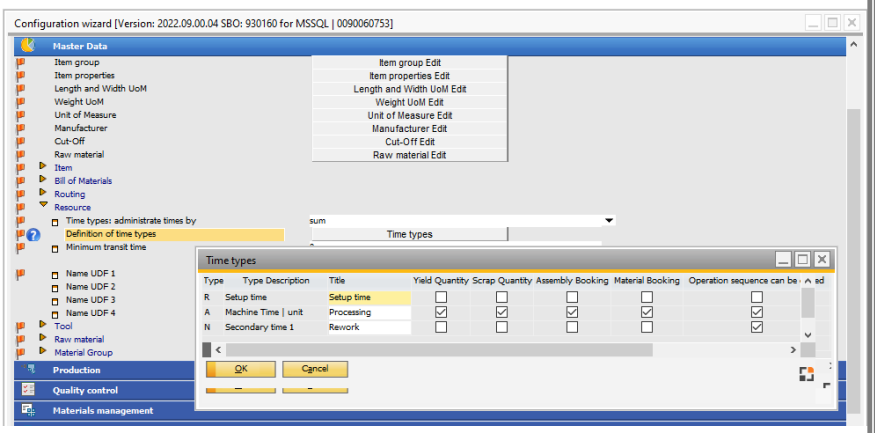
    In every single process there are secondary times "TN". These proportions of times are required to enable a process sequence as a whole. Thus, all Handling-operations are considered as secondary times e.g. conditioning of the grinding-wheel, dressing tool change or preparation-operations etc.

  - What is a primary time (TH)

    The total time required for the operation process is called primary time (TH). This contains all the proportions of times that occur from process start to the end of the process.

The time types can be set in the Configuration wizard.

Primary time TH is stored in row with type "H"
Secondary time TN is stored in row with type "N"
Processing time TE is stored in row with type "A"



© 2026 Boyum IT Solutions A/S

	timetype_sp=N ***See*** Operation - Processing time Resource - Extended tab timetype_sp=N ***See*** Concept time types Resource costs Time types Configuration wizard - Time types Variable timetyp_sp, Standard=S
Definition of time types	The 4 time types can be managed here. ***See*** time types
Cost per	This defines whether the arising resource costs are stored "per minute" or "per hour" In Resources > Master data costs can be defined which accrue during the usage of the resource. In Resources > Master data, you can define the costs incurred when using the resources. **Attention:** The information whether the costs per minute or hour are stored is not stored in the resource. Therefore, if this switch is changed, all stored costs correspond to the new setting. ***Example:*** You have stored 1, You have stored 1,60€/Min. If you change the switcher to hour, the cost rate will be changed to 1,60€/Hour. Therefore, the cost rates will be recalculated after the change. You have deposited 1,60€/minute. If you change this switcher to hour now, you get the cost rate of 1.60€/hour. You must, therefore, make certain that the cost rates are revised after the changeover. **Attention:** As soon as a work order has been created, this setting cannot be changed and will be hidden. Otherwise, the change would affect existing work

© 2026 Boyum IT Solutions A/S

	orders which would cause the evaluation to be false. As soon as a production order has been generated, the switch conversion would also affect existing production orders – the valuation would, then, be incorrect.
	
	Subsequent Change
	If a subsequent change is required, it must be made as follows:
	
	1. Finalize all running work orders.
	2. Open debug window, Script tab.
	For change per minute:
	`setsetup=arbplatz_kstje=1`
	For change per hour:
	`setsetup=arbplatz_kstje=60`
	Run Script – Execute
	3. Adjust cost rates in resources.
	Do not use existing Precalculations and do not open work orders.
	
	As soon as a work order has been created, this setting cannot be changed and it will be hidden.
	
	Warning:
	A change has an immediate effect on every calculation and valuation function. If cost rates were entered to resources, and the time unit is changed here, make sure to adapt costs to the new time unit. This is not executed automatically.

Minimum Transit Time	Defines the minimum transfer times between 2 resources. ***See*** Resource - Transit time
Set Minimum Transit Time	The "Transit time" specification is entered in all existing resources. **Warning:** No change log is created. Process cannot be undone.
UDF1 .. UDF4	User-definable fields ***See*** UDF.

Example of use with Secondary time

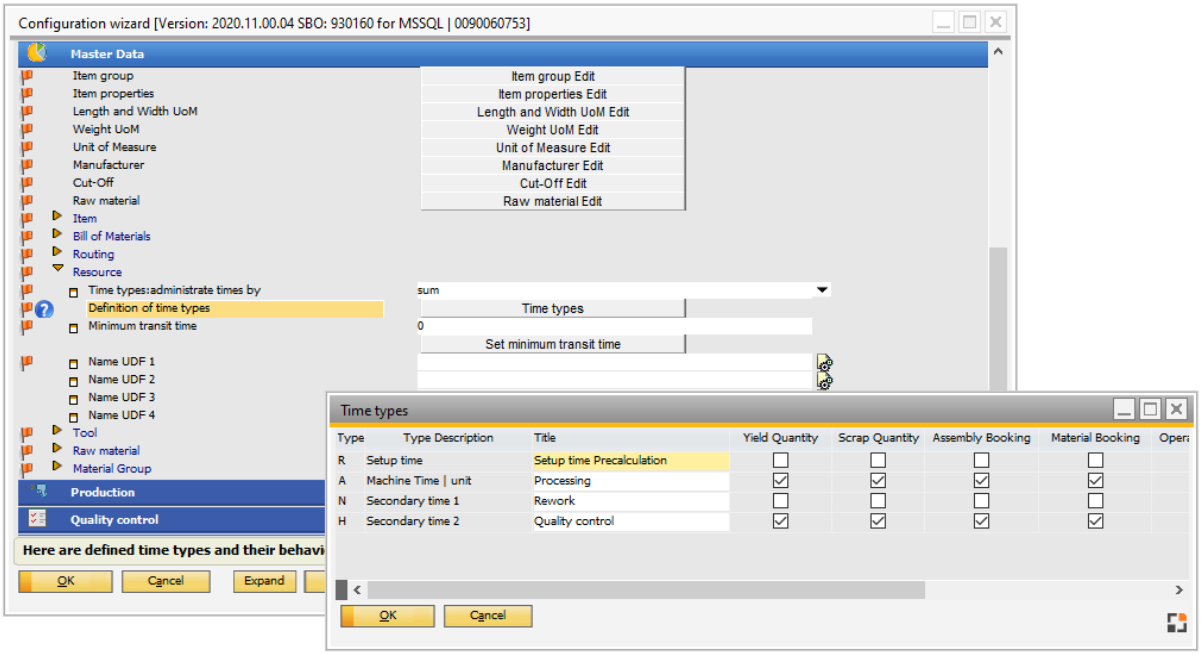
back to master data

© 2026 Boyum IT Solutions A/S

3.1.3.5.4.1 Time Types

PATH: Administration > System Initialization > Configuration wizard > Master data > Resource > Time Types.

For each operation, up to 4 time types can be stored which can be valued with a proprietary cost rate, and to which feedback on costs and times can be reported separately.
The time types are fixed, but their names and behavior can be changed here.



Time types

Name	Description
Type	Time type R: Setup time type with corresponding behavior in valuation and calculation. It may only be used for setup purposes. A: Editing time (machine time/unit). This corresponds to the main editing time which is always active. N: Secondary time/unit 1 for free use ***See*** Secondary time H: Secondary time/unit 2 for free use ***See*** Secondary time In Personnel master - FDC you can set up which time types the employee can select at Work order login-

© 2026 Boyum IT Solutions A/S

	See Time types - Administrate times
Description	Description field for the catego.ry
Designation	Designation of time type Displayed in routing position, operation. Note: Enter the designation in German – it will be translated to other languages. Entries without available translations will be displayed as entered. When creating a new database, the selected database language is used as default. ***See*** Rounding
Yield Quantity	Activate to allow inserting Yield Quantity If not allowed, an error message pops up upon inserting a quantity. *(AE_checkqty) At the time type <name of time type> 'no Yield Quantity' must be specified. Set value to 0 (**See Configuration Wizard > Master Data > resources > time types**)*
Scrap Quantity	Activate to allow inserting Scrap quantity If not allowed, an error message pops up upon inserting a quantity *(AE_checkqty) At the time type <name of time type> 'no Yield Quantity' must be specified . Set value to 0 (**See Configuration Wizard > Master Data > resources > time types**)*
Post Assembly	Should it be posted in the finished part when creating a time receipt for this time type, according to the settings (e.g. last operation)?
Post Material	Should the material belonging to the routing position be backflushed in case of a time receipt for this time type?
Position Closeable	Should it be permitted to close the routing position if doing a time receipt for this time type? ***See*** Order time – Logoff.

© 2026 Boyum IT Solutions A/S

Release next work sequence	Should the next work sequence be released after time receipt for this time type? (***Example:*** the following work sequence may not be released after setup)

See: concepts time types

3.1.3.5.5 Tool

PATH: Administration > System Initialization > Configuration wizard > Master data > Tool.

Parameters

Name	Description
Tool booking on Warehouse	When entered, the tool item will be transferred to the store when the operation is registered.
Default cost element for tool costs	Default cost type to which the proportional tool costs are posted.
Default cost type for maintenance costs	Default cost type to which the proportional maintenance costs are posted.
Set cost type	The selected cost types are recorded in all tool entries. **Warning:** Existing entries are overwritten without warning. No change log is created, the change cannot be undone, and calculations and existing work orders are not affected.
Name UDF1...UDF4	User-definable fields ***See*** UDF

back to master data

3.1.3.5.6 Raw material

PATH: Administration > System Initialization > Configuration wizard > Master data > Raw material.

Parameters

back to master data

© 2026 Boyum IT Solutions A/S

3.1.3.5.7 Material group

Extended settings for material group.

PATH: Administration > System Initialization > Configuration wizard > Master data > Material group.

Parameters

Name	Description
Material group	Use this button to edit material groups. ***See*** Material group
UDF1 .. UDF4	Up to 4 additional fields can be defined. Extended format settings, colors and images are supported. ***See*** UDF

3.1.3.6 Production

Administration
Financials
Business Partners
Sales
Master Data
Production
Quality Control
Materials Management
Calculation
Personnel
Business Performance
System

This section describes the setting options of the Configuration Wizard in the "Production" tab.

PATH: Administration > System Initialization > Configuration wizard > Production.

3.1.3.6.1 Master data

PATH: Administration > System Initialization > Configuration wizard > Production.

Parameters

© 2026 Boyum IT Solutions A/S

Field	Description
Production types	Any number of production types can be created, e.g. "sales order", "make to warehouse", "repair order", etc. ***See*** Production types Additionally, you can set up to 4 UDFs for production types. For details of configuration ***see*** UDF configuration for Scrap reasons below.  *Window system_option_struktur.psr*
Priorities	This method can be used to set up priorities. ***see*** Priorities
Scrap reasons	Define scrap reasons with the help of UDFs. ***See*** Scrap reasons for a detailed description on available settings.
UDF1 – 4	Define Name of up to 4 UDF's for Scrap Definition.. For description on UDFs ***see*** Configuration wizard – UDFs

3.1.3.6.2 Create

Define settings for the creation of a new work order.

See Number creation

PATH: Administration > System Initialization > Configuration wizard > Production

Parameters

Name	Description
Production type for warehouse related order	Determines the specification of the production type when creating a new work order, if it is not an order-related work order. Production types are set up in **Configuration Wizard > Production > Master Data > Production Types**.

© 2026 Boyum IT Solutions A/S

Production type for sales order	Determines the specification of the production type when creating a new order-related work order. Production types are set up in **Configuration Wizard > Production > Master Data > Production Types** .
Default Actual Precalculation	Determines if the pre-calculation is used as the default for creating work orders **Enabled** (Default): A work order is created from the Precalculation if a work order was created from a sales order in which a Precalculation is stored. **Disabled**: A stored Precalculation is not considered. The master data is always used as a reference. *beas 9.2 PL: 06 workorderfromcalculation J/N*
Automatic Numbering	Define automatic numbering A work order has two document numbers: There is a consecutive counter that cannot be influenced and a counter that can be freely defined. The second counter can be allocated during a new manual creation if this option has been activated. **Note**: If a work order was created from a sales order, this setting has no effect. ***See*** Number creation Make to stock Work order number template	Determines the configuration of the order number if it is a "make to stock"

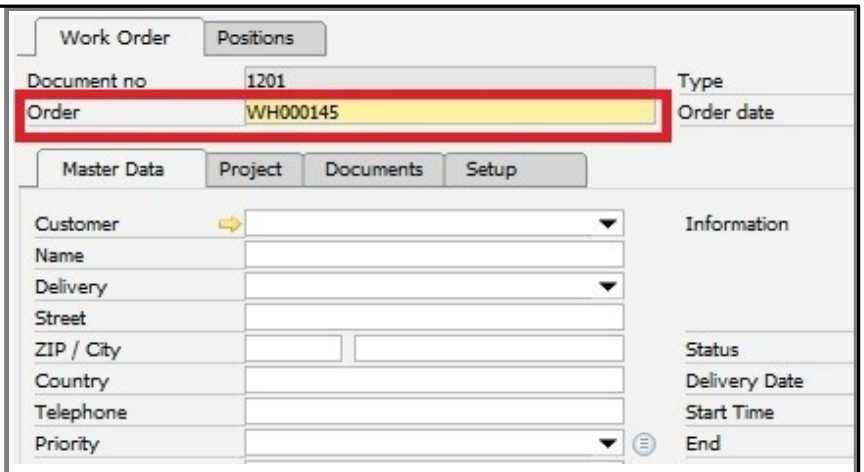
© 2026 Boyum IT Solutions A/S



Option is only visible if "Automatic Numbering" was activated. The current counter is defined in Current counter status.

In the template the lower case "x" is replaced by the current counter. Number of x equals the number of initial 0. Other placeholders (e.g. uppercase X) are not supported.

Note: If the work order was created from sales order, this setting has no effect.

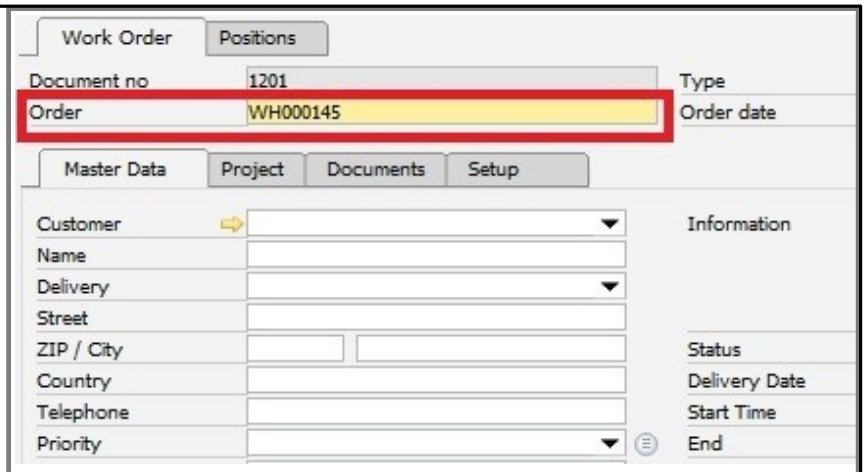
Example:

A-xxxx: A-0001, A-0002 etc.

See Number creation

Current counter status	Current counter reading for WO number for stock related work orders or for sales order related work orders, if you defined a counter "[xxx]" inside the "sales order call up work order number template".
Sales Order Call up Work order number template	Determines the structure of the production order number when it is retrieved from a sales order or pre-invoice. If a production order is created from a sales order or pre-invoice, the production order number can be generated from a reference number of the sales order. For this purpose it is possible to define an SQL template.

© 2026 Boyum IT Solutions A/S



You can define the following settings:

Counter	The numbering "current counter" is used. This is the same counter as in the case of warehouse-related work orders.
	
	If you choose "Counter", Beas inserts "xxxx" as a "template" in this field.
	It uses the same counter (= option current counter) as for warehouse-related work orders.
	See Option "Make to stock Work order number template" above.
	If you want the same counter structure as in warehouse-related work orders, insert the same template, e.g. "WHxxxx" for counter WH0001,WH0002, and so on.
	
	Info:
	Warehouse-related and sales order-related work order is used in this same counter.
	
	Example
	`xxxxx`
	the x = the counter, count of x = the length of the number
	
	`xxx = 001,002,003`
	`xxxx = 0001,0002,0003`

© 2026 Boyum IT Solutions A/S

	`SalesOrder-xxxx` generate `SalesOrder-0001,SalesOrder-0002 ...` You cannot combine SQL Sequence with the counter. If you want the same counter as warehouse-related work order, then insert the same template in this option as in the warehouse template.
Standard	Uses sales order number " - " Line number. For example, sales order 3000 Line 2 returns 3000-2 as order number. Note: For pre-invoices the corresponding pre-invoice document number is used.
Sales Order - Line	Like "Standard" (not removed for compatibility reasons)
Sales Order / Line	Same es "Standard", but using "/" as delimiter (z.B. 3000/2)
[SQL Sequence]	You can access all fields of table ORDR and RDR1. If it is a pre-invoice, all ORDR and RDR1 will be replaced by OINV and INV1. template. (***Example***: `"ORDR"."CardCode"` = Customer order). The placeholders `[docnum]` and `[visline]` are replaced by the order number and line number (already correctly formatted). An SQL string must always return the type "String". Type "`[counter]`" uses the production standard counter. Max. lenth = 50 chars, If the result > 50 chars, the program create an error. ***Example: Docnum and ItemCode***

© 2026 Boyum IT Solutions A/S

	`[docnum]||'-'||"RDR1"."ItemCode"`
	
	Would return order number+article number.
	
	***Example*: Docnum and Line num as SQL String**
	
	`rtrim(CAST(~"ORDR~".~"DocNum~" AS char(30))||'-'|| +rtrim(CAST(~"RDR1~".~"VisOrder~"+1 AS char(30)))`
	
	See Edit work order
	See Number creation
	Variable: auftr_abruf

Approved	Determines whether the switch approved is enabled when a WO position is created The approved switch is located in the Work order position. The underlying assembly structure receives the sames status. *beas9.0-004-044-000, woconfirmed*
Approved at Sales Order	Determines whether the approved switch is enabled when creating a WO via Sales order to Work order The approved switch is located in the Work order position. The underlying assembly structure receives the sames status. Select: **Yes** **No** **Like sales order** = status of switch is taken from **Sales order - Logistics - Approved** **Note**: Setting is only taken into account, if the work order is created directly from sales order (using the function SO to WO), not if it is manually created. *beas9.0-004-044-000, wo2orderconfirmed*

© 2026 Boyum IT Solutions A/S

Default Priority	A priority can be defined here that is entered by default when creating a new work order. ***See*** Priority
Default Name	The default name when the work order is created manually.
Assembly Position Increments	Increments for numbering the assembly position. The value is 10 by default.
Bill of Materials Increments	Increments for numbering the bill of materials position. The value is 10 by default.
Work Order Increments	Increments for numbering the routing item. The value is 10 by default.
Warning if no BOM	An error message is issued if no Bill of materials is stored when the work order is created. Error Text: *No bill of material exists for item xxx Work order y/z was created without (..) (faufstl05)* A message is created (extended error message) at the same time (***see* Configuration Wizard > System > Extended Error Message**).
Warning if no Routing	An error message is issued if no routing is stored when the work order is created. A message is created (extended error message) at the same time (***see* Configuration > System > Extended Error Message**).
Renumber BOM	Normally, the numbering used is according to the master data. If, for some reason, a new numbering is provided, this option must be activated.
Renumber routing	If active, routing is automatically renumbered at when a new work order is created.
Summarize phantom assemblies by item numbers	⊟ Summary by the same item number If this option is active, phantom assemblies are summarized by item numbers. If this function is enabled, a comparison between work order and original item is no longer possible and the Work order update does not function. Error message: auftrs340: "Material summary is enabled..." is issued regardless of the use of phantom assemblies. ***See*** Work order update
Apply inactive work sequence	If enabled, inactive operation sequences are also transferred to the work order and are set to inactive. The inactive operation is visible in the work order structure but is crossed out with a black line. ⊟ Control the behavior of inactive operations during the WO structure refresh process

© 2026 Boyum IT Solutions A/S

	1. When **active**, and the operation in the WO master data is set to inactive: a) In case of Work orders without documents (time receipt), the operation is deactivated by this setting. b) In case of Work orders with documents (time receipt), the operation is closed. 2. When **inactive**, and the operation in the WO master data is set to inactive: a) In case of Work orders without documents (time receipt), the operation is deleted by this setting. b) In case of Work orders with documents (time receipt), the operation is closed. If a previously inactive operation is activated in the WO Master Data, it will be activated in the WO, or if it does not exist in the WO, it will be inserted. ***See*** Work order structure refresh. ***See*** Active Flag in Routing Position.
Merge phantom assembly	Determines which assembly times and material are posted to in case of merging. An empty, not storage-related assembly (without BoM and routing) can be selected.

Sub-assemblies: consider lot size	If active, lot sizes are considered in sub-assemblies
	
	Example
	Assembly A contains 1 x order related assembly B
	Assembly B has a lot size of 10
	35 pieces of A are produced
	
	If the option is **active**, the following structure is created:
	
	`35 * A`
	`|_ BOM 35 * B`
	`|___ Assembly 10 * B`
	`|___ Assembly 10 * B`
	`|___ Assembly 10 * B`
	`|___ Assemblye 5 * B`
	
	If the option is **disabled**:

© 2026 Boyum IT Solutions A/S

	35 * A |_ BOM 35 * B |___ Assembly 35 * B **Attention:** Disabled: There is a 1:1 link between BoM and Sub Assembly Enabled: There is a 1:n link between BoM and Sub Assembly If you change the setting from "Enable" to "Disable" and Work orders with 1:n link exist, Beas always considers the first position only and ignores all other sub-assemblies. **Notes on disabling the option:** Close all work orders that have more than 1 sub-assembly per Bill of materials position. **Note**: This option affects Precalculation. ***See*** Precalculation - Display and lot size ***See*** Item master lot size Production *beas9.1-004-056 auftr_lotsize (Default N = not activ)*
Precalculation material pricing	Specifies the pricing of materials when valuating assemblies.
WO refresh behavior	Specifies the behavior of Work order refresh: WO Structure refresh behavior settings **- only if no documents exist:** Refreshing of the Work order is only possible if there are no related documents (including reservations, issue or receipt documents). **IMPORTANT:** Refreshing is also not possible if the Work order has been printed. **- only add new information:** Refreshing the work order only displays new information on new material positions or operations added to the master data in the work order. Information is added at the end of the actual WO structure. **- disabled**: Refreshing a work order is not possible, and the function does not appear in the right-click menu. - **refresh:** Changes in existing WO BoM and routing are possible (***see*** also "WO refresh action" below).

© 2026 Boyum IT Solutions A/S

	Note: If reservations exist, the system will remove all the reservations during the Work Order Refreshing process.
WO refresh action	Specifies what the Work order refresh updates: **- BoM:** The refresh function updates newly added BoM information. **- Routing:** The refresh function updates newly added Routing information. **- All:** The refresh function updates all newly added information. NOTE: If in the WO there are links between the BoM and routing positions, we recommend to use option "All". The "BoM" and "Routing" options do not delete the links if the refresh process needs to close a Routing/BoM position. Attention: If no documents have been created for the WO, the WO will be completely recreated upon the refresh action. BoM and Routing settings are ignored in this case.
Fast copy for lot size	If enabled, the creation of lot size WO's can be faster, by using an alternative way for "duplicating" the WO positions. Setting details This setting only has impact on items with a defined lot size. The activation also has some limitations: - all settings are only done for the first WO position. - the following lot positions are a 1:1 copy of the first lot. - the last lot can be different if the quantity is different from the previous one. Therefore, if you have e.g. a custom script, that applies some values that are different for each lot, it is recommended, **not** to activate this setting. If the WO creation process has to create different positions (e.g. positions are created by script or SO to WO combines more than one position to one WO), the "fast copy" process will be automatically disabled for this WO.

© 2026 Boyum IT Solutions A/S

3.1.3.6.3 Display

Controls the view in the following areas.

Structure view
Work order
Production - Position
Production - BOM
Production - Routing
Material requirement lists, Reservation, Allocation and Material issue

PATH: Administration > System Initialization > Configuration wizard > Production.

Structure View

Determines display behavior in **Production > Structure View**

Parameters

Name	Description
Structure view times per (hours/minutes/automatic)	Determines how times are displayed **Available untis:** Minutes Hours Automatic At automatic are following rules **Duration to** / **Unit** 1 minute — Seconds 200 Minutes — Minutes 2 Days — Hours From 2 Tage — Days (***see*** Resource - Planning Capacity in hours / day) The next bigger value of the default time or reported time will be used as reference for the duration.

© 2026 Boyum IT Solutions A/S

	Note: Definition 1 Tag corresponds the number of hours, which are stored in the Resource - Planning Capacity in hours / day. The shift calender will not be considered.
Open search window first	If this option is activated, the search window is displayed before the work orders are displayed.
Activate dispatch index	If this option is activated, the utilization level of the affected is displayed as a utilization bar to the right of the operations for a period that can be defined below. This setting can also be changed in the Work orders window > window settings.
Dispatching index: number of days to consider	Number of days in the utilization display. Calculation Planned capacity = today until "today + number of days" Actual capacity = dispatched from the past until "today + number of days" This setting affects also other windows containing a dispatch or utilization display: ***See*** Resources Resources Group administration Edit resource groups All resources
Max.. Lines Assembly	Define the maximum number of positions displayed per work order in the Work Orders window.

Work order

Name	Description
Name UDF 1	User-defined field
Name UDF 2	User-defined field
Name UDF 3	User-defined field
Name UDF 4	User-defined field

Position

© 2026 Boyum IT Solutions A/S

Name	Description
Manually Input Complete	Normally, the number of finished assemblies is the total for the postings. If the assemblies are not posted, the finished assemblies can also be entered manually. This option must be activated to do this. In this case, the "Manually finished" field is then available in Production - Position.
Name UDF 1	User-defined field
Name UDF 2	User-defined field
Name UDF 3	User-defined field
Name UDF 4	User-defined field

Bill of Materials

Name	Description
Prices Changeable	Determines whether the planned prices are displayed in the BoM window and can be changed. ***See*** Production – BoM position

Routing

Name	Description
Scheduling by Personnel	If active, routing positions are assigned to employees
Prices Changeable	Determines whether the planned prices are displayed in the routing screen and can be changed.

3.1.3.6.3.1 Material requirement

PATH: Administration > System Initialization > Configuration wizard > Production > Display.

Parameters

Name	Description
Multi-level display for assemblies	⊟ Multi-level display Affects Work order structure - right-click on assembly -Reservation function -Material requirement list (Standard) -Material issue -Allocation (Standard) If this option is enabled, the material requirement of the currently selected assembly plus all sub-assemblies will be taken into account.

© 2026 Boyum IT Solutions A/S

	Only visible if default material requirement list is used. *(Variable ftstr_listmulti)*
Material requirement with purchase	Order directly from material requirement list Only visible, if "beas2009" is used. This option is only available for compatibility reasons. If enabled, from material requirement list a purchase order can be created directly. *(Variable ftstr_purchase)*
Material requirement, Extended display	Display of information from inventory history **Enabled:** If extended view is enabled, additional information is displayed, and the system reads more information. **The following additional information is available:** Planned production inflow Planned production outflow Stock on blocked warehouses Reservations on sales orders Stock: blocked batches are presented as "blocked stock" Minimum stock Maximum stock Balance For additional information on these fields ***see*** Inventory history Performance: This extended view is computationally extensive. With large amounts of data calculation may take considerably long. **Disabled:** If disabled, the above mentioned fields cannot be selected. Stock: all stock of all warehouses (except the blocked ones) are

© 2026 Boyum IT Solutions A/S

	displayed. Batch status is not considered. Note: In window settings all fields are available, but these described fields are not visible in the list itself. By default, Extended view is enabled. ***See*** Reservation window - Columns

3.1.3.6.4 FDC

Factory Data Capture (FDC) is a functionality to register production time and quantities.

PATH: Administration > System Initialization > Configuration wizard > Production.

Parameters

Parameter	Description
Time Linking	Determines consideration of regular working hours Depending on settings, the duration is computed when a Time receipt is created. **Notes on order time receipt** If working with attendance, set the option "Time linking" to "Shift definition + Attendance". In this case, the employee does not have to logoff from his ongoing work orders when he leaves.

Setting	Meaning
none	The total time of order logon and order logoff is taken. Breaks or attendance times are not considered.
Shift definition	The Shift definition stored in Personnel master is taken into account, including breaks. Rounding rules are not considered. ***Example:*** Shift definition 7:00–17:00, Break from 12:00–13:00. Order logon Start: 6:50, end 7:30, computed duration: 30 minutes.

© 2026 Boyum IT Solutions A/S

	Order start: 6:50, end 14:00, computed duration = 7:00–14:00 minus the break 12:00–13:00 = 6 hours. Order start 16:00 yesterday, end today 10:00. Computed: 16:00–17:00 and 7:00–10:00 = 4 hours.
Shift definition + Attendance	Next to Shift definition, stored in Personnel master the actual attendance is considered. Computing order time, the rounding rules stored in period rule are considered under certain conditions. Note: The attendances can only be considered if the capture is done via the BEAS system. Attendances which were imported via Integration HUB will not be considered at the time accounting of the order time. ***Example:*** Shift definition 7:00-17:00, break 12:00-13:00. Attendance: Arrival 6:50, Break from 8:00–9:00. Logon work order 6:55, logoff work order 14:00. Calculated duration: 7:00–8:00 = 1 hr. , after the employee was absent. 9:00–12:00 = 3 hrs, followed by lunch break. 13:00 –14:00 = 1 hr. Total: 5 hours.

© 2026 Boyum IT Solutions A/S

	For open attendance time (if not yet left) rounding rules are not taken into account at work order logoff. ***Example:*** Rounding rule 30 minutes. Order time receipt 15:00–15:45. Calculated 15:00–15:45 = 45 minutes. Note for setting up rounding rules: If the employee leaves differences may occur, as according to the rules, attendance ends at 15:30. When computing the start time, the rounding rule is considered only if this is the first logon of the day. ***Example:*** First arrival 07:05, work order logon 7:19. Calculated from 7:30. Arrival 7:05, Leaving 8:00, arrival 8:25, order logon 8:27. Calculated from 8:27.
	Note: Settings on parallel calculation are taken into account for all combinations. ***See*** Order time receipt, Shift definition; App Arriving /Leaving
Attendance linking	Linking FDC and attendance If active, the employee logs on automatically in attendance when registering to the first work order. He can also log off from attendance when creating a time receipt.

© 2026 Boyum IT Solutions A/S

	Note: This option links the attendance to an order time. This means that only those order times are considered when the employee was on duty. If you want to link the order times to attendance, use setting "Time-linkage" – "Shift definition + Attendance". This setting refers to the function Terminal – logon order and logoff work order. If active App "logon work order": The employee is logged on automatically in attendance, if he was not before. If the attendance logon is not possible, the work order cannot be started. App "logoff work order": A checkbox "logoff from attendance" is displayed. If it is disabled, after logging off from the work order the employee is logged off from attendance automatically (in case he was logged on.) *Variable: timebdekop, 1=on, 2=off*
Parallel calculation	Determines processing of parallel registered times If this option is activated (default), the work order times which have been reported parallel are split appropriately. If this is deactivated, each report gets the total time. NOTE: This parameter is only considered in Desktop Terminal WO Logon / WOLogoff and Web Terminal WO Start / WO Stop apps. Examples ***Example 1***: Logon working sequence A+B at 11 o'clock, logoff at 12 o'clock = total 1 hour Because they run parallel, only half is assigned (that is 30 minutes) to each working sequence. ***Example 2***: Logon working sequence A+B at 11 o'clock, logoff at 12 o'clock and B at 1 p.m.

© 2026 Boyum IT Solutions A/S

	Each working sequence gets 30 minutes between 11–12 o'clock, from 12 o'clock to sequence B are assigned 60 minutes. As a result, working sequence A gets 30 minutes and B gets 90 minutes. If the option is deactivated, the behavior changes. In example 1: A and B each get 60 minutes, in example 2: A = 60 minutes, B = 120 minutes. **Important:** Automatic distribution of reported times to resources does not work at quick input in lists. At parallel calculation for master-slave operations only the master operations are taken into account, because the part times are distributed to the slave operations.
Allow closing of operation sequences	If yes, the employee can close a work order via a terminal – even if there are quantity shortfalls.
Close operation sequence automatically	A position is closed automatically if the planned quantity is reported. **If activated** The system always closes the routing position automatically if the total time receipt quantity + scrap quantity >= planned quantity. If you clock in time receipt window on "F2 Partial complete", the system ignores this when this setting is activated. The system does not close automatically if a user is working on this routing position. **if not activated** The System only closes the routing position: - if you close this manually - if you click in time receipt window on F3 completion confirmation. ***See*** Production time Receipt - Partial complete
Security query at last working position	Activate security query if last operation has been received and assembly is posted in.

© 2026 Boyum IT Solutions A/S

	See Report production times
Login to work order: multiple login	Allows logon of multiple operation sequences in succession This setting relates to the window Login Work Order (not WEB-App) Instead of closing the window at a order logon, the window returns back to the operation sequence selection and the next operation sequence can be selected directly if this option is active. Time distribution Master-Slave	Determines time distribution for master-slave time receipts Default percentage Percentage of default time (default setting): The complete time is distributed on operations. Each operation receives a percentage part of the default time. ***Example***: Slave Pos 10 60 Minutes. Slave Pos 20 120 Minutes. Master Pos 30 20 Minutes. perceptual ratio : Pos 10 30% ; Pos 20 60%; Pos 30 10%. Note:

© 2026 Boyum IT Solutions A/S

Reported quantity is used as reference for calculating the planned time. For this reason, a quantity needs to be entered.

With time receipts for Pos 30 (Master-operation) of 10 minutes 2 time receipts are created.
Pos 10 30% of 10 Minutes = 3 Minutes.
Pos 20 60% of 10 Minutes = 6 Minutes.
Pos 30 10% of 10 Minutes = 1 Minute.
Total = 10 Minutes.

Note:
To work properly, this function requires a plan time and posted quantities.
With plan time 0 or without a quantity you will get incorrect results.

If no quantity was reported, the new reported quantity is posted to the master only. If a quantity had been posted before, the result will be a percentage of 0, thus no distribution.

Note:
If the Master operation has 0 time, the system can generate problems related with time receipts and material consumption.

- No distribution

Each operation gets the same time. Default time is not considered.
In the upper example with time receipt on Pos 30 with 10 Minute1, the following time receipts would be created.

Pos 10 10 Minutes; Pos 20 10 Minutes; Pos 30 10 Minutes.
Total: 30 Minutes. This concept is used in production lines.

- Planned time

© 2026 Boyum IT Solutions A/S

	Reported time for master operation, planned time for slave operation. Planned time is calculated: ((job time * planned quantity)+setup time) / planned quantity * reported quantity. Note: The smallest unit of a time receipt is the minute. Due to conversion rounding differences may occur. Parallel operations are not considered for slave operations. *Setup-Variable: timemasterslave P=percentual default time, E=no distribution*
Master-Slave not at Manual Message	Determines whether to create a time receipt by the Master for manually reported Slave-operations If a time receipt was created for a slave-operation, a second time reporting can be blocked by the Master, by enabling this option. ***Example*** with enabled option: Operation 10 = Master. Operation 20 = Slave. a) Reporting for 10: time receipt created for 10 and 20. b) Reporting for 20: time receipt created for 20. c) Reporting for 10: time receipt created only for 10, as there was already a manually reporting for 20. With disabled option, for c) time receipts would be created for both 10 and 20. Default: Option disabled. *setup-Variable: masterslaveman J/N beas9.0-004-000-000*
Order time receipt: Protocol	If enabled, at new creation, change or deletion (in this case a cancellation) a protocol is always created, even if there are no costs to be booked.
Material tracing based on operation	Material entries are linked to the registered production positions Material entries are mapped to the position currently registered.

© 2026 Boyum IT Solutions A/S

	This option also allows material tracing for partial notifications. For this purpose a temporary batch is created for each partial receipt to which the material is linked. **Attention:** This function requires an extended terminal which must be customized. Activate this option only if the according extensions have been installed and the concept has been developed completely. This option is only available in expert mode. Further effects: If a value > 0 is entered in the operation and the use factor and a batch number is entered in the order time receipt, the order time receipt is split. ***Example:*** Use factor = 10. Order time receipt = Quantity 5, time 10. 10 order time receipts are created each with 0.5 pieces each and a time of 1. *setup-variable ftaplcharge j/n*
Preliminary test entry in journal	Check whether journal entry is possible Upon the generation of a time receipt, a journal entry is created in the background by Beas using the SAP DI-API. Several problems may occur here. For example: blocked number range, no authorization, network overload, etc. In protocol, errors such as "DI API of _getbusinessobject 30: Error calling external object function getbusinessobject" are logged. These errors require a manual correction. With this option, a journal entry is simulated in advance. If no posting is possible, also no work order time is registered. This reduces the risk of differences in financial accounting significantly.

© 2026 Boyum IT Solutions A/S

	If the option is enabled, an account must be specified to which a test booking should be done. Note: By executing test postings, the network and the overall system is more stressed. In case of an "overload", proper measures must be taken.
Cost center determine by	Select how to determine cost center Define default cost center for time receipts. Beas uses this in the time receipt view as default. **Assembly/Material**: Determination via item from "Profit center" field. **Personnel:** Determination at time receipt via employee record.

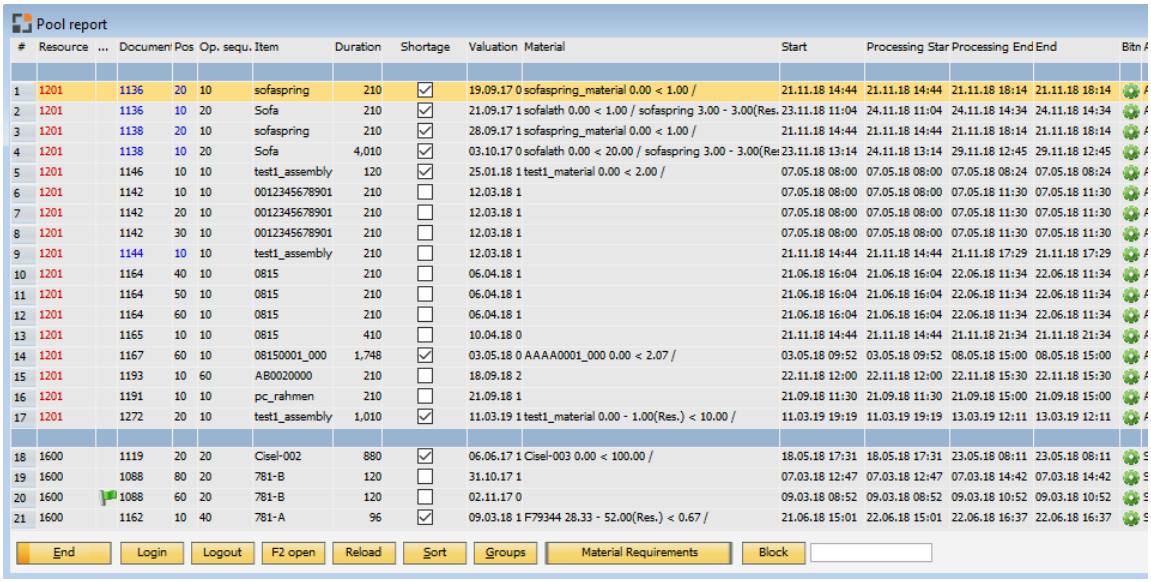
3.1.3.6.4.1 Pool report

PATH: Administration > System Initialization > Configuration wizard > Production > FDC

In the pool list you can see all fields of the routing positions of an assembly and the work order. Window settings and Templates are supported.

Configuration for Pool List

Production > Factory data capture > Terminal > Pool Report



Window bde_terminal_poolinfo.psr

© 2026 Boyum IT Solutions A/S

Parameters

Parameter	Description
Pool report with material check	☐ Activate / Disable Material check in Pool List A material control is performed simultaneously by default. The operations that cannot be processed due to missing material are indicated with an active checkbox in the "Shortage" column and grayed out.  *Window bde_terminal_poolinfo.psr* The calculation is performed online and delays the display accordingly. If the calculation is not required, this can be deactivated here. Performance notes Disable this function if Beas requires longer time to open this list.
Pool list: show only planned WO	☐ Only display work orders set to APS planned in the pool list. Use this setting if you work with the APS Plan Flag. ***See*** Work order - Settings - APS Planned
Direct logon logoff	If this option is enabled, one or more parallel work sequences are logged on and off in the pool list. The multiple selection feature is activated hereby. Multiple logon is only possible if permitted by the stored rules.
Dispatching index: Consider number of days	The default value is 99. Limits the number of days displayed in the pool report. Note: If you do not work with APS, insert a number between 10-99, otherwise you will not be able to see all Routing positions.

See:

Pool Control

Capacity planning

Priorities

3.1.3.6.4.2 Logon/Logoff rules

PATH: Administration > System Initialization > Configuration wizard > Production > FDC.

Parameters

Name	Description
Work order must be set to planned	Logon via pool report or terminal is possible only if work order has been set to planned.
Operation may not be closed	Time receipt on completed work sequences is blocked by default. If you deactivate this option, it has the following effects: Work Orders - Expand, right mouse-click on a work sequence (green line): Selection "Time Receipt" is also displayed if the work sequence is completed. **Production Time Administration - new Message:** No Time Receipt but a blocking message appears at selection of a completed work sequence. Time receipt through "**new receipt > bar code**"or by Production Time Administration – Quick Input: The Input is possible without a further error message. Through **Logon/Logoff – Open Work Order**: It is generally not possible to register completed work sequences.
Material Inventory Test at Login	**Info:** If the inventory is insufficient, a message is displayed. **Required**: If the inventory is insufficient, the operation cannot be logged on. **No** (default): No inventory check is performed. For setup reporting, no inventory check is normally performed.
Time receipt only during presence	Enabled: It is only possible to log on and off when the attendee does not apply for activity tracking. As long as work orders are logged on, the employee cannot leave. ***See*** App "Leaving" *Variable: bde_nur_anwesend, Default=N*

© 2026 Boyum IT Solutions A/S

Attendance logoff: automatic logoff Work order	After attendance logoff from terminal, all work orders of the current user are automatically logged off, as well.
Previous op.sequ. must be completed	Logon to the operation is possible only if the preceding reportable operation was closed Note: Only the preceding reportable operation is checked. Affected: App "Logon order" and all extensions using this logon-object. **Not affected:** function "Report time receipt" ***Example*** 10 mandatory 20 not mandatory 30 mandatory <- if you want to make a receipt, the position checks Pos 10 10 not mandatory 20 mandatory <- if you want to make a receipt, the system does not check previous positions
Previous routing position with quantity confirmation	Enabled: Logon is only possible if a quantity was reported in the preceding routing position **IMPORTANT:** The system allows to do the login only if the quantity of the current position is less than the quantity reported by the previous operation. If the quantity is equal or more, the system will not allow to do the login. This parameter takes effect only when "clock mandatory" is active for the previous operation; in other case the parameter is ignored. ***Example*** 10 mandatory 20 not mandatory 30 mandatory <- if you want to make a receipt, the position checks Pos 10

© 2026 Boyum IT Solutions A/S

	10 not mandatory 20 mandatory <- if you want to make a receipt, the system does not check previous positions
Previous QC must be OK	If the previous reportable position has a QC plan, the following is checked: 1. Does the inspection plan exist for this position? 2. Are all samples okay? If the answer to both is not Yes, you cannot log on to the subsequent position. In this case, an error message is displayed: Error message ID: **afoanmqs9435** *'(afoanmqs9435) In work sequence 20 the QC-inspection has not yet started. Registration is not possible!'* ***Example*** 10 mandatory 20 not mandatory 30 mandatory <- if you want to make a receipt, the position checks Pos 10 10 not mandatory 20 mandatory <- if you want to make a receipt, the system does not check the previous positions. ***See*** Configuration wizard – QC-create new Quality control – Concept Routing
Confirm at least previous quantity	At least the amount of the previous operation sequence needs to be reported. The rule takes effect only from the second operation sequence. ***Example 1***: Operation sequence 1: reported 10 yield, 5 scrap.

© 2026 Boyum IT Solutions A/S

	Confirmation on the second operation with option enabled. Report 5 yield-> blocked. At least 10 need to be confirmed. Report 5 yield, 5 scrap -> : OK, minimum quantity of 10 is reached. ***Example 2***: Operation sequence 1: report 5 yield, 0 scrap. operation sequence 2: report yield 4, 1 scrap -> OK. operation sequence 1: another 3 reported, 0 scrap. Confirmation on the second operation with option enabled: Minimum quantity according to operation sequence: 8. Already posted to 2nd operation: 5 (4 yield, 1 scrap). Minimum quantity for the next posting to the operation sequence 2 : 3 pieces. It is recommended to combine this option with "maximum previous quantity reportable".
Confirm at most previous quantity	At most, only the quantity of the previous reportable position can be reported. If nothing has yet been reported in the previous position or if the corresponding quantity was already reported in this position, the yield quantity input field is blocked. This check does not refer to the first confirmable operation sequence, but only to the subsequent one. It determines whether not more than the quantity of previous operation sequence may be confirmed. Yield and scrap quantity is taken into account. ***Example***: Operation sequence 1: confirmed 10 yield, 3 scrap. Operation sequence 2: confirmed 5 yield, 3 scrap. For operation sequence 2 only 2 remaining pieces may be confirmed. Affected: work order time registration and external operation - collective purchase. Note: If the previous routing position is an external resource, the quantity is the sum of purchase-order goods-receipt quantity, minus the quantity reported in the purchase goods returns.

© 2026 Boyum IT Solutions A/S

	Attention: If the maximum quantity is exceeded, an error message is issued: *'(maxqty0243) Maximum purchase quantity exceeded! (Max. quantity due to time receipt of preceding operation)'*
Max. planned quantity reportable	No more than the planned quantity can be reported This refers only to the first confirm able operation and determines whether as maximum only the planned quantity may be produced. Scrap is not taken into account. ***Example***: planned operation sequence of 10 pieces. 1st confirmation: 8 yield, 2 scrap. 2nd confirmation: only 2 additional pieces are permitted. This check is only performed when creating a new order-related time receipt, not when changing an existing receipt. It takes place at the moment the time receipt is saved.

Important: The rules only apply to time reports, not to purchase orders on external operations.

3.1.3.6.4.3 Window: Work order logon

PATH: Administration > System Initialization > Configuration wizard > Production > FDC.
Settings here affect Terminal (PC) – "WO logon". ***See*** WO logon

Note: This setting does not affect WebApps.

Parameters

Parameter	Description
Only current Pool	Logon work order: Enabled (Default): Only production routings of the current pool are shown. ***See*** Pool administration. Disable this option if the display is too slow and the pool function is not required. *(beas 9.2 PL: 04, pool)*
Resource manually changeable	If enabled, after WO selection the resource can be selected per bar code or scanner manually. In other cases: make selection from the list. Only resources which are allocated to the employee and to the operation are displayed. Default: Disabled.

© 2026 Boyum IT Solutions A/S

	(*Variable fdclogonresource*
Work order logon: Multiple logon	Enabled: After work order logon you can register the next work order without logging in again. This option is not considered if you log in via Pool report. (Note: Until beas 9.1 PL:08 this option was in the "FDC" and has been moved to this area)

3.1.3.6.4.4 View time receipts

PATH: Administration > System Initialization > Configuration wizard > Production > FDC.

These options relate to **Terminal > Order logoff.**

Parameters

Parameter	Description
Manual input complete	Permits the entry of assembly quantities that should be reported as finished without being posted (***see*** Work order item – master data tab).
Time entry mandatory	If enabled, duration is required.
Logoff order by	Determines who may logoff a running work order

who logged on	0	Only the person who logged on the order may logoff. (= Default)
all, order time for person who logged on	1	Anyone can logoff the order. The order time is assigned to the person, who logged on. Note: You cannot determine who logged on the order.
all, order time for person who logged off	2	Anyone can logoff the order. The order time is assigned to the person who logged off.

beas9.0-004-044-000, bde_logoffuser

Field "Duration" blocked	If enabled, the calculated duration cannot be modified. Default setting: Disabled. If "clocking mandatory" is enabled in parallel, an immediate time receipt may not be possible.

© 2026 Boyum IT Solutions A/S

<table>
<tr><td>Suggest Residue</td><td>Should the remaining quantity be suggested automatically at confirmation reporting? For further information see Production Time Receipt.</td></tr>

<tr><td>Name UDF 4</td><td>User-defined field.</td></tr>
</table>

In the logoff screen there is a button called "intermediate report". The behavior can be set here.

PATH: Administration > System Initialization > Configuration wizard > Production > FDC > View time receipts.

© 2026 Boyum IT Solutions A/S

Parameters

Name	Description
Deactivate Intermediate report	When **unchecked** (default), it is possible to create an Intermediate report in the Production Time receipt. The current production receipt with time and quantity specifications is completed and automatically restarted, using the same user, without having to log off/on again. When **checked**, this parameter closes the time receipt for the active production, and the system operates as in the case of a partial receipt. Intermediate report is not possible.
Quantity entry mandatory for partial receipt	Here you can specify separately whether a quantity input is mandatory for this button.

3.1.3.6.5 Material posting

Settings for manual postings and for backflushing of BOM items.

PATH: Administration > System Initialization > Configuration wizard > Production.

Parameters

Name	Description
Material valuation	Select pricing. Setting is visible only if continuous stocktaking was disabled. **Like manual posting Pricing** according to **Materials management > Manual postings > purchase parts/in house production > pricing posting.** **Price list per warehouse** In **warehouse definition > extended** for issuing material a price list can be stored. The price list is used when selecting this option. If no price is entered, pricing according to materials management is used. General note: pricing according to price list for production issue: extended price lists or special price lists are not considered.
Automatic Material posting	Specifies how the material is backflushed. Note: Check settings also under backflushing.

© 2026 Boyum IT Solutions A/S

Important: This option does not affect the reservation window and allocation window.

Not Automatically	No automatic issue.
Work order Backflushing	Backflushing issue and automatic posting of the assembly is executed using the function Work order backflushing. Note: No issue at reporting operations. No posting of assembly at confirmation of the last operation. With Goods receipt the option Work order backflushing – book times automatically is considered.
Last operation	Issue takes place when reporting the last operation with "clocking mandatory". All items are posted which have "Backflushing" as posting option in the inventory entry and which are not allocated to a position. If an item is allocated to another position, it is entered when the corresponding position is reported. The function "**Materials management > backflushing**" is blocked in this case.
First Operation	Same as "Last operation" but at the moment reporting the first operation.

Note: These settings only affect Beas (standard PC Version). WebApps can have a different behavior.

This setting can be overridden by production types.
Exception: If the second option "work order backflushing" was selected.

See: Production types, Backflushing

© 2026 Boyum IT Solutions A/S

	Variable: fert_buchung_typ
Enable Reservation or allocation at the first operation	Enables the calling of the allocation or reservation window at the first operation. With this feature you can define if the system should call the reservation window or allocation window. If set to inactive (or no setting), no reservation/allocation is done and the subsequent two options are not visible. **Reservation**: This option calls the reservation window. **Allocation**: This option calls the allocation window. **inactive**: This option does not call any of these windows at the first operation.
Pre-assign quantity automatically	If this option is checked, the quantities for all Items will be pre-assigned automatically. Otherwise, the window is only opened without any assignment.
Enable function at the Work order login	Defines the time that the reservation / allocation window is opened.  *Window system_option_struktur.psr* **No**: Nothing is defined, so the corresponding window is opened at the end at: - logging off from a WO, - a quick input, - a production time receipt.

© 2026 Boyum IT Solutions A/S

	only at the work order login: Window is only called when logging in to a WO. **work order login or time receipt:** Window is called when logging in to a WO or doing a manual production time receipt. This feature is supported in Terminal apps: Login work order , Logoff work order, Production Time Receipt and Quick Input.
Exceeding of planned quantity allowed	Determines whether more or less than the planned quantity may be issued. Planned quantity is as given in work order +/- percentage of next setting below. **Select mode of exceeding planned quantity:**

Setting	Meaning
Yes (default)	Allowed, without check (I).
Yes, with protocol (I)	Allowed. Errors are logged, and the work order is marked red in that case (IP).
No	Not allowed. Issue is canceled (B).
Query	Security query (Q). Note: Not supported in WebApps. The system uses "No" automatically.
Query with protocol	Security query (Q). If no material is issued a protocol entry is created for the work order, and its marked red. Note: Not supported in WebApps. The system uses "No" automatically.

Provide percentage:

Setting	Meaning
Maximum in Percent	The permitted overshoot of WO planned quantity. Maximum = planned quantity + (planned quantity * %)

© 2026 Boyum IT Solutions A/S

Setting	Meaning
Minimum in Percent	The permitted undershoot of WO planned quantity. Minimum = planned quantity - (planned quantity * %)

Percentage values: 1-99
0 = planned quantity
100 = no validation

Example:
Maximum in Percent = 50
Minimum in Percent = 50

Work order with 10 Pcs, Bill of Materials position 1 Pcs
Max. Material = 10 + (10/50*100) = 15 Pcs
Min. Material = 10 - (10/50*100) = 5 Pcs

The Minimum/Maximum percentage is calculated based on TOTAL quantity in:
- BoM position - conversion UoM
- BoM position - material scrap
- Scrap reported quantity for a produced item
- Operation factor

Parameter application per Apps/Functions

App/Function	Desktop	WebApp
Work order single issue	No	n.a.
Work order material Issue (multiple)	Yes	No
Work order Receipt – check material	No	No
Work order Time receipt	Yes	Yes
Work order Start/Stop	Yes	Yes

© 2026 Boyum IT Solutions A/S

App/Function	Desktop	WebApp
Work order Backflushing	Yes	Yes
External: Issue Provision parts	Yes	Yes
Data Integration Hub	No	n.a.

IMPORTANT:

- This setting is ignored by the Manual issue window.
- In WO Material Issue the system checks the maximum allowed quantity based on the total planned quantity.
- In Production Time receipt and material backflushing, partial receipts are supported and the Max/Min values are related to receipt quantity.
- Allocation and Reservation rules are not applied.

Using the parameter over Object or BSL:

The rules of this parameter are not applied over BSL or BeasScript.

Maximum in percent

Enter percentage by which planned quantity may be exceeded.

The permitted overshoot of WO planned quantity. Maximum = planned quantity + (planned quantity * %)

Value range: 0–99%. No validation in case of 100%.

Option is visible only if "**Exceeding of planned quantity allowed**" was not set to "Yes"

See "Exceeding of planned quantity allowed" above.

Variable: fert_permorpostmat, Default: 100 (in Percent, 100 = no check)

Minimum in percent

Enter percentage by which planned quantity may be underrun.

The permitted undershoot of WO planned quantity. Minimum = planned quantity - (planned quantity * %)

Option is visible only if "**Exceeding of planned quantity allowed**" was not set to "Yes".

See "Exceeding of planned quantity allowed" above.

beas9.0-004-000-000, Variable: fert_perminpostmat, Default: 100 (in Percent, 100 = no check)

© 2026 Boyum IT Solutions A/S

Closed positions bookable	If enabled, you can issue closed material positions. Affected only window "post manually" - Type "production" and only, if the position was selected by direct input or via barcode, the logged in user is a Superuser or he has the respective Rights. 3.1.3.6.5.1 Backflushing

The attitude for backflushing or pre-allocation functions in reservation or allocation window can be defined here.

PATH: Administration > System Initialization > Configuration wizard > Production > Material posting > Backflushing.

See

Display - Material requirement

Reservation requirement report

Reservation

Material issue

Allocation

Parameters

Name	Description
Issue quantity changeable	Determines how material is backflushed. Backflushing is performed according to settings "Material issue automatically at" via backflush work order or at the moment of time receipt (confirming an operation). Possible settings:

© 2026 Boyum IT Solutions A/S

Set.	Description
No	The quantity to be issued is automatically pre-allocated. ***See*** Material issue – pre-allcoate marked entries). Batches, Serial number, bin locations, reservations and all rules are taken into account. Negative BoM items are posted in automatically if: - it is a normal item, - it is not in a bin location warehouse, - automatic number determination was activated for batches and serial numbers. ***See*** Edit BoM position – Quantities In case of quantity differences there is a query, ***see*** Behavior at quantity discrepancy. Note: If option "Posting from allocation warehouse" a warehouse was stored, only this will be considered. When working with batches and disabled automatic batch determination, but the BoM contains batch-related items, the following scenarios are possible: WEB-Service/Server mode: batch items are not issued. Normal mode: The Standard issue window is opened, where the batches can be selected.
Yes	The Standard issue window is opened (issue material). Material to be issued will be pre-allocated. Pre-allocation for batches and serial numbers is also supported. For bin location items the stored sorting of withdrawal (priority) is considered. The reservation system is fully supported.

© 2026 Boyum IT Solutions A/S

Set.	Description
	Reservation system is fully supported. Scanners are supported. Assignment Serial number – Serial number is possible. Negative BoM items are posted in. ***See*** above setting "NO" and Edit BoM position – Quantity.

beas 2009 Variants

Yes beas 2009, no beas 2009

With Beas 9.3 PL 3 you cannot use this settings. If defined in a previous version, it does not work in newer ones.

Note: This posting function is disabled as of early 2020 and is not available any more.

Behavior at discrepancy of quantity

Setup scenario in case a different quantity is indicated than planned at material backflushing.

Setting refers to window "quantity changeable" but it is also visible of quantities are not changeable, because this window opens for example then, if batches or serial numbers could not be withdrawn automatically.

Setting	Description
Query	Query whether backflushing is to be performed with the indicated quantities
Allow	Book immediately, no query
Block	Selected quantity and default quantity have to match, otherwise the procedure cannot be completed.

Note:

© 2026 Boyum IT Solutions A/S

	Refers only to backflushing processes WEB-applications may have different behavior *fert_retrabchk, N=Allow;A=Query;L=Block, Standard=A*
Issue only from default warehouse / Bin	☐ Activate to restrict warehouse selection If option is enabled, only the warehouse/Bin location set up in BoM is displayed for selection at backflushing. No issue from other warehouses (e.g. allocation warehouse) is available. Exception: At automatic allocation, in case goods are located in another warehouse/bin, they are used from there.
Accept Function "Adjust and Enter"	At shortfall of stock: Allow "posting with adjusted quantity ? If not, the process is canceled.
Consider cut-off quantity	☐ At time receipt: shall the cut-off quantity be considered calculating the charge-off quantity? **YES**: Generally at reservation, material posting etc. **NO**: only at planning, not at reservation, allocation, issue **Not at backflushing**: affects only the function "backflushing" (eg. time receipt with last operation) *(from beas9.0-000-003-002).* scrap quantity is ignored. This option is not available at "Quantity changeable = beas2009-Version" **IMPORTANT:** If material is posted with the time receipt and in field "scrap" a quantity is entered, select setting: "**only at backflushing**" as otherwise too much material could be issued ***Example*** Production quantity 10 pcs, planned cut off for assembly Reported: 10 pcs If the option was enabled, the planned 5 pieces off-cut are taken into account issue quantity = 15 * BoM quantity

© 2026 Boyum IT Solutions A/S

	If the option was disabled, only the material of the reported order quantity is posted, in this case: issue quantity = 10 * BoM quantity Note: Settings have no effect on the cut-off stored in the BoM. ***See*** Cut-off Work order position - Assembly tab - Cut-off
Scrap consider	Select "Yes" to consider scrap, and "not at backflushing issue" to omit the consideration of scrap at backflushing issue.
Scrap at reporting negative BOM	**Yes:** scrap quantity can be entered reporting negative BoM quantity **No:** no scrap can be entered reporting negative BoM quantity
Also post batches	⊟ Should batchnumber managed items are also backflushed? Pre-allocation function (reservation, allocation) and backflushing function affected For batch-managed items, the inventory posting cannot be set to backflushing (***see*** Item Master Data - Issue method). The backflushing function of Beas allows the automatic booking of batch-managed items as well. This option can be activated if its booking is generally desired. Batches can be received and issued using "backflushing". **Setting** / **Description** Yes – Batches are pre-allocated and backflushed (issued). No – Batches are not made available for backflushing. In this case only a Goods issue is possible. ⊟ The setting can be defined via script at the automatic pre-assign

© 2026 Boyum IT Solutions A/S

Click on the cogwheel symbol right next to the selection to enter a script.

Available variables:

`e_backflush_itemcode` = the Material number
`e_backflush_belnr_id` = the Work order number
`e_backflush_belpos_id` = the Work order position number
`e_backflush_pos_id` = the Bill of Materials position

Return:
`return failure`: no automatic pre-assignment
`return success`: Charge (or serial) will be pre-assigned automatically

Example:

```
// backflush only if Item udf "u_backflush"=Y
select "U_backflush" into ls_backflush from "OITM" wher
    "ItemCode"=<e_backflush_itemcode,dbstring>
if <ls_backflush> = Y then
    return success
end if
return failure
```

fert_rserie (N=No, J=Yes)

Automatic batch/serial issue by

Which criterion applies for automatic withdrawal of batches/serials for reservation, allocation or charge-off

When active, batches/serials are assigned automatically.

Possible selection:

Type	Description
No	no automatic selection
Batch Number	Withdrawal by batch/serial number
Batch Attribute	Withdrawal according to certain attributes
Release Date	withdrawal by date, FIFO type (First in, first out)

© 2026 Boyum IT Solutions A/S

	<table><tr><th>Type</th><th>Description</th></tr><tr><td>Manufacturing Date</td><td>withdrawal by date, FIFO type (First in, first out)</td></tr><tr><td>Expir. Date</td><td>withdrawal by date, FIFO type (First expired, first out)</td></tr></table> Note: The combination "No" with also post batches set to Yes" and issue quantity changeable set to "No" will lead to errors, as batches are to be posted, but quantities may not be changed. Sorting affects inventory list in material issue screen, in reservation and allocation window. ***See*** Reservation window Inventory list If the batch quantity is not sufficient, (for example due to blocked batches) only the available quantity will be posted. ***See*** Reservation window – pre-allocate Material posting – pre-allocate marked Pre-allocation – extended rules
Issue blocked batches	What to do with blocked batches during backflushing <table><tr><th>Selection</th><th>Description</th></tr><tr><td>blocked batches not selectable</td><td>blocked batches are not displayed for selection *(fert_apoblockbatch=H=Standard setting)*</td></tr><tr><td>manually</td><td>blocked batches can be selected after a warning message *(fert_apoblockbatch=M)*</td></tr></table>

© 2026 Boyum IT Solutions A/S

	Selection / **Description** allowed — blocked batches can be selected without query *(fert_apoblockbatch=J)*
Batch Balance issue (issue remaining batches)	Determines in which case remains of batches are charged-off: At final posting (order time receipt – completion confirmation) or at any other backflushing process. ***See*** Edit bill of materials – issue remaining batches *Variable fert_restchargeoff, (A)llways, (C)lose-Message, default A*
Also post serial numbers	Should serial managed items are also backflushed? For serial number-managed items, the inventory posting cannot be set to backflushing (***see*** Item Master Data - Issue method). The backflushing function of beas allows the automatic booking of serial number-managed items as well. This option can be activated if its booking is generally desired. This option then automatically applies to all serial number-managed items. **Important:** Serial numbers can only be issued using "backflush".

Set.	Description
Yes	Serial numbers are pre-allocated and backflushed (issued).
No	Serial number items are not made available for backflushing. In this case only a manual issue is possible.

The setting can be defined via script at the automatic pre-assign

Click on the cogwheel symbol right next to the selection to enter a script.

Available variables:

`e_backflush_itemcode` = the Material number
`e_backflush_belnr_id` = the Work order number

© 2026 Boyum IT Solutions A/S

	`e_backflush_belpos_id` = the Work order position number
	`e_backflush_pos_id` = the Bill of Materials position
	
	Return:
	`return failure`: no automatic pre-assignment
	`return success`: Charge (or serial) will be pre-assigned automatically
	
	Example:
	
	`// backflush only if Item udf "u_backflush"=Y`
	`select "U_backflush" into ls_backflush from "OITM" wher`
	`"ItemCode"=<e_backflush_itemcode,dbstring>`
	`if <ls_backflush> = Y then`
	`return success`
	`end if`
	`return failure`
	
	fert_rserie (N=No, J=Yes)

Posting from allocation warehouse	⊞ Backflushing: issue from which warehouse? If a warehouse is entered here, at Issue - automatic pre-assignment only this warehouse will be taken into consideration. In case of automatic backflushing without query only this warehouse will be used. If the quantity is set to "changeable" other warehouses can be selected. Note: An allocation warehouse can be set up per work station. In contrast to this setting, such setup has only effect on withdrawal sorting. See: Allocation window Edit warehouse master data to define allocation warehouses. This effects the warehouse selection field in Allocation window.
Material posting with scanner	⊟ Determine scanner support in reservation / allocation / charge-off screen

© 2026 Boyum IT Solutions A/S

	The active field is always the entry field in the lowest line. This can be used for registration via scanner. There are two settings: **Production > Material posting > Backflushing >** Material posting with scanner. **Active:** A matching batch or serial number is searched. If an entry is found, it is used and the required quantity is accepted. If no entry is found, an error message is issued: no entry found. If the entry is blocked, (batch status, blocked bin location) the entry is not accepted, a message is issued. **Inactive:** Beas searches for the following entries: Batch number: field is selected, the cursor is set to quantity field. Serial number: quantity is accepted immediately. Item: entry selected, cursor is set to quantity field. If no matching entry was found and the entry is numeric, the current entry is accepted including the quantity. Error messages are issued in no case. ***See*** Configuration wizard – Material posting with scanner Reservation Material issue Allocation External operation Allocation External operation issue *fert_scanbatchqty (J)*
Required quantity 0 display	⊟ Display BoM items with requirement quantity 0 Setting affects Reservation / allocation / provision and issue window as well as material requirement list. Active by default: BoM items with requirement quantity less or equal 0 are displayed.

© 2026 Boyum IT Solutions A/S

	Inactive: BoM items with requirement quantity 0 are displayed only, if in **list - right-click Filter "all"** was selected. ***See*** Reservation requirements list Reservation Material issue Allocation *beas9.0-000-0033-008*, *fert_viewplan0qty*
Reservation, Material issue - extended display	Determines whether to show inventory history information Setting affects reservation window, allocation window, provision and material issue window. **Enabled:** If extended view is enabled, additional information is displayed, and the system reads more information. **The following additional information is available:** Planned production inflow Planned production outflow Stock on blocked warehouses Reservations on sales orders Stock: blocked batches are presented as "blocked stock" Minimum stock Maximum stock Balance For additional information on these fields ***see*** Inventory history Performance: This extended view is computationally extensive. With large amounts of data calculation may take considerably long.

© 2026 Boyum IT Solutions A/S

	Disabled: If disabled, the above mentioned fields cannot be selected. Stock: all stock of all warehouses (except the blocked ones) are displayed. Batch status is not considered. Note: In window settings all fields are available, but these described fields are not visible in the list itself. By default, Extended view is enabled. ***See*** Reservation window - Columns Display - Materials requirement Reservation Requirement list Reservation Material issue Allocation *reswinext*

3.1.3.6.6 Work order backflushing booking

These settings affect the following functions:

- Desktop version Work order backflushing
- WebApp WO Backflushing
- Manual receipt window.

They are visible only if in Configuration wizard > Production > Material posting > Material posting automatically at "Work order backflushing" was selected.

PATH: Administration > System Initialization > Configuration wizard > Production.

Parameters

Name	Description
Selection warehouse location issue Selection warehouse location at receipt	Activate the warehouse fields for issue and receipt process in backflush window Standard: use default warehouse defined in work order or in issue process related to issue rules. If you activate this setting, the user as additional fields: "Issue from warehouse" and "Enter to stock"

© 2026 Boyum IT Solutions A/S

Name	Description
	 Note for receipt: If the receipt warehouse is changed, problems may arise with the WIP account. That is why this option should not be activated when working with different warehouse-dependent WIP accounts.
Book times automatically	When active, planned times are reported as actual times confirming the last position. If this option is activated, the times are also automatically booked in the backflushing process. 
© 2026 Boyum IT Solutions A/S

Name	Description
	This function is available in Work order backflushing WebApp WO Backflushing Manual receipt for work order (only if ".. to employee" is defined !) It creates time receipts for the following routing position: - Clock mandatory is activated - Routing position is active - Duration time is defined - Routing position - Extended - "Block login" is disabled. **The default time is computed as follows:** First confirmation: `(planned processing time per unit * reported quantity) + setup time` Second confirmation: `(planned processing time per unit * reported quantity)`  Setup Time: field "`Setting up Capacity`" Planned processing time: field "`Processing`" For correct calculation, the system checks Quantity per, Time Unit, Use factor and Work steps. "`Personnel`", "`Quality Control`" Parallel resources are supported.

© 2026 Boyum IT Solutions A/S

Name	Description
	Fix times (Quantity per time=-1): The system calculates `Processing time / reported quantity` Only Cost type for processing is supported. Master Slave settings are ignored. The system creates the time receipt for all routing positions. Quality control orders in Routing positions are supported. Start/End Date for time receipt is Current or the Date defined in the receipt/backflushing window. Employee in time receipts is the currently logged in employee. For more information ***see*** setting "..to employee no" below. **ALTERNATIVE METHOD** As an alternative, use the option in **Configuration wizard > Calculation > Post-calculation > "Plan=Actual if no time receipts"**, or use the valuation method in **Configuration wizard > Production > Valuation and Posting of assembly - Valuation -** planned costs.
... To employee no	Only displayed if option above "Enter times automatically" was enabled. Define t the employee number can be entered here for automated booking, if no employee is connected. **Terminal / WEB APP**: The system use always the current logged in Employee and ignore this setting **Beas Desktop**: If an Employee is linked to current use, it use the linked Employee, otherwise this setting.

Parameters

Valuation Method	Description
Valuation Assembly	Determines at which price the assembly is posted in

Option	Which costs are used?
As Manual transfer	It is posted at a fixed price. ***See*** Pricing types.
Production planned cost	Partial and final posting at planned costs Problems related to valuation at planned production costs With this method, items are valued at the Precalculation price. The Precalculation (single step, based on the production assembly) is performed at the moment the

© 2026 Boyum IT Solutions A/S

Valuation Method	Description

Option	Which costs are used?

assembly is posted in. This way it is ensured that the Precalculation is up-to-date.
Which price to be used from Precalculation can be set up in **Pricing > Valuation.**
Precalculation is performed via concurrent post-calculation. Accordingly, post-calculation settings apply.

Valuation of material
In the **Configuration wizard > Calculation > Post-calculation > "value planned costs"** the valuation of material can be set up.

Precalculation price (Standard): In this case the price is used from Precalculation, from which the work order was created. Or as per Precalculation pricing at the moment of work order creation.

Note:
Depending on how much time passed between Precalculation and creation of the work order, the price may be outdated.
Setup in **Calculation > Precalculation > Material pricing**.
If in **Manufacturing > View > BoM** the option **"Prices changeable"** is enabled, the determined price can be viewed and changed in the production BoM item.

Posting price:This option is reasonable for selection if the value of the assembly is dependent on the material value. In this case, the price is determined based on the material price of the last issue on the respective material. Here, not the sum of the posted values is determined, but the price per unit is multiplied with the planned quantity. Then, the value of the assembly is not affected by scrap postings.

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Valuation Method</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Option</th><th>Which costs are used?</th></tr>
<tr><td></td><td>Last purchase price, calculation price, moving average, etc.: Depending on the settings, the current entry at the date of valuation is used for valuing the material. Unlike the valuation at post-calculation price not the actual costs are used for the valuation but the planned cost, with appropriate current material prices. This valuation method is recommended, but requires correct planning data (production times, quantities of material, etc.).</td></tr>
<tr><td>Standard costs method</td><td>The production order is firmly connected to the batch-Precalculation. For this reason, the batch-calculation and the pricing procedure (item valuation method - item at standard cost) are mandatory.
See standard cost method
Concept:assembly valuation
WO items</td></tr>
</table>
Note: For standard cost items, postings are always performed at standard costs regardless of which valuation is selected.

In Work order a production type can be stored. In the production type a valuation method can be entered. This valuation method has a higher priority than the method selected here.
See Production types
Additional valuation methods are available in expert mode only.
</td></tr>
<tr><td>Conversion to posting quantity</td><td>Activates conversion to posting quantity
(Active by default, only visible in expert mode)
This calculation allows a very exact valuation for partial postings.

Active:
For partial posting:
Posted material and work order times are converted to the completed quantity.
This serves as reference for assembly valuation.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Valuation Method</th><th>Description</th></tr>
<tr><td></td><td>
At final posting: post-calculation of accrued costs minus the already posted values.

Inactive:
Post-calculation of accrued costs minus the already posted values.
Note:
If the option is disabled and goods are posted at post-calculation price, the actual post-calculation price is used for valuation. This only affects partial postings. Because significant valuation errors can arise due to an incorrect operation, we strongly recommend not to disable this option.

Projection:
Post-calculation offers a function to calculate the expected costs of a given quantity based on the previously reported quantities. Costs for material, operations and quantity with depending surcharges are calculated.

Example:
Operation with costs of 2€/Minute
Planned quantity: 10 pcs
<table>
<tr><th></th><th>without projection</th><th>with projection for 1 piece</th><th>with projection for 10 pieces</th></tr>
<tr><td>1 minute, 0 pieces reported</td><td>2 €</td><td>0 €</td><td>0 €</td></tr>
<tr><td>1 minute, 1 piece reported</td><td>2 €</td><td>2 €</td><td>20 €</td></tr>
<tr><td>5 minutes, 2 pieces reported</td><td>10 €</td><td>5 €</td><td>50 €</td></tr>
</table>
This function is useful for actual costs evaluation methods with partial postings.

Example:
1. Operation planned: 10 minutes, costs 2€/minute
2. Operation planned: 10 minutes, costs 2€/minute
Planned 10 pieces, Partial completion 5 pieces
Planned costs: 1. operation 20 €, 2. operation 20 € = 40 = 4 € per piece
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Valuation Method	Description

	without projection	with projection
1. operation: 10 minutes, 10 pieces reported 2. operation: 10 minutes, 5 pieces reported	20 € + 20 € = 40 € : 5 = 8 €/Piece	10 € + 10 € = 20 € : 5 = 4 €/piece
1. operation: 10 minutes, 10 pieces reported 2. operation: 10 minutes, 10 pieces reported	20 € + 20 € = 40 € - 40 € (of first posting) = 10 € : 5 = 2 €/pieces	20 € + 20 € = 40 € : 10 = 4 €/piece

This example shows the difficulties of partial postings without projection. The first 5 pieces are valued at 6€, the next 5 pieces at 2€. In certain configurations even negative evaluations are possible.

Material evaluation example:
A BoM item has a requirement of 1 per 1 assembly and a value of 3€
Production quantity = 10

	Without projection	With projection
Material issue total 10 pcs	10 * 3 = 30€	10 * 3 = 30€
first partial posting 1 Pc	Posting 30€	Conversion to planned quantity, in this case 1/10 = Factor 0,1 30€ * 0,1 = 3€
second partial posting 1 Pc	Posting 30€ - already posted = 30€ = 0€ !	Conversion to planned quantity, in this case 1/10 = Factor 0,1

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Valuation Method</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td></td><td>30€ * 0,1 = 3€</td></tr>
<tr><td>last posting and order completion</td><td>Posting 30€ - already posted= 30€ = 0€ !</td><td>Not the projection but the accrued costs are used.

30 € - already posted = (3€ + 3€ = 6€) 24 €</td></tr>

Post-calculation – Concepts

Example: Projection of actual costs
</td></tr>
<tr><td>max. time since last calculation</td><td>Define the max. time from last calculation
This option is only available if you work with Standard costs method.

Using the standard cost method, the total value and the value of the parts of an assembly can be identified, such as materials, manufacturing costs, tool costs, or other surcharge costs. Standard cost means, that these values are not dependent on the volume of the production, only the budget figures are taken into account.

The standard cost method involves an entire workflow:
• Pre-calculation via batch pre-calculation
• Pricing based on the pre-calculation
• Copy of evaluation into the work order, including the calculation scheme. The Work order is properly linked to the pre-calculation
• Postings are performed with the current standard cost rate

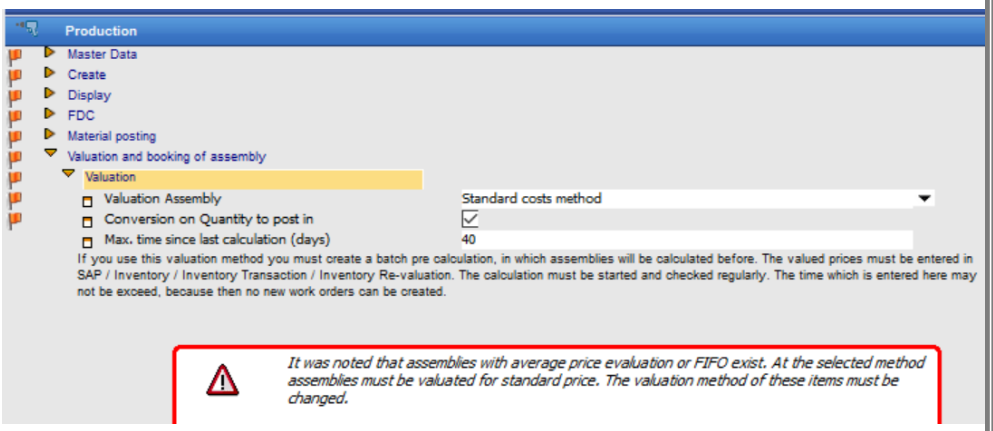
Configuration Wizard > Production > Valuation and booking of the assembly</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Valuation Method	Description

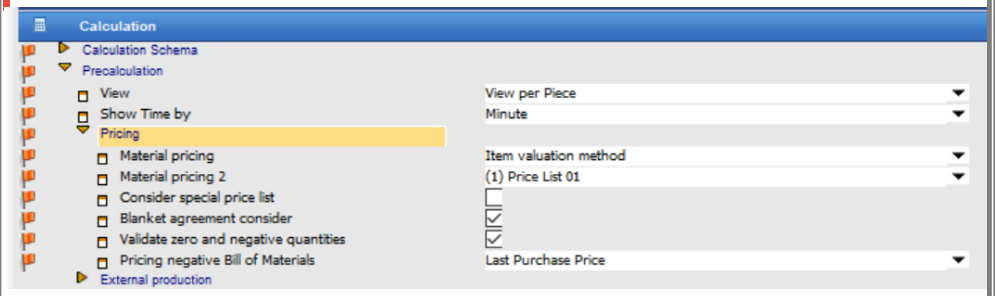
> Valuation > Valuation of the assembly by "standard cost method"

The *Max time for last calculation* field is displayed. This is the update interval for batch calculations. If the entered time is exceeded, no work orders can be created.



A correctly set pre-calculation valuation method is crucial. Set to "Item valuation". Set all items to "standard price".

Configuration Wizard > Calculation > Precalculation > Material pricing to "Item valuation method"



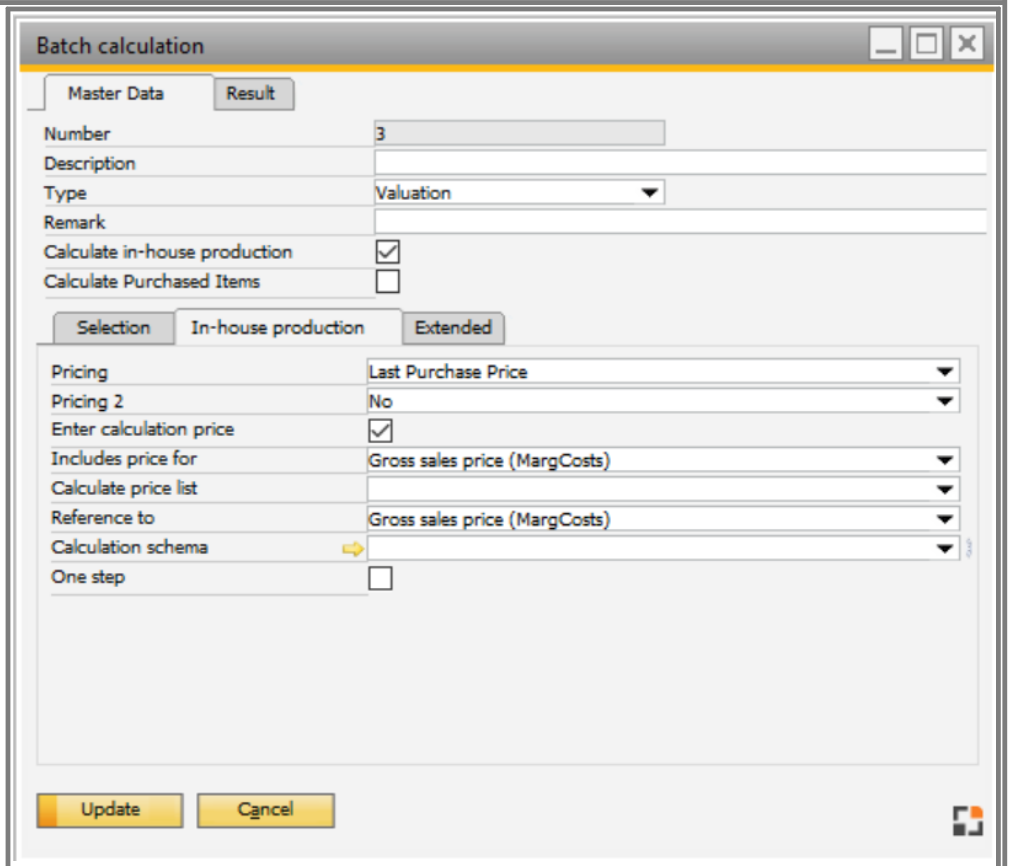
Inventory> Inventory Transactions > Batch calculation

Setup a calculation for calculating standard costs

The price list or price calculation does not need to be filled. Select the desired evaluation method in *Pricing* and *Enter calculation price*, and the type of pricing procedure. One step evaluation can be enabled for standard cost.

© 2026 Boyum IT Solutions A/S

Valuation Method	Description



The defined calculation should be performed regularly and the update interval can be set in the Configuration Wizard. After calculating, change to the results tab and perform an inventory revaluation.

Note: If the price per warehouse is set, the batch calculation needs to be performed per warehouse. ***See*** Batch-calculation.

Connecting to a work order

All the work orders that are being created for the items, refer to the calculated standard costs. The connection to the standard costs calculation is available in: **Production assembly > Assembly tab > Extended >Standard price evaluation**.

</table>

Note: Valuation by post calculation price

At valuations by post calculation price the actually accumulated costs are used for valuing the assembly. This is generally problematic since it depends on the correct behavior of all users. If, for example, order times are not reported correctly, the assembly is valued incorrectly. Subsequent correction is not possible. It is recommended to use the valuation by standard price or the valuation

© 2026 Boyum IT Solutions A/S

of assembly in advance (via batch Precalculation) and to use the result as a reference price. (valuation price "like manual posting"). Alternatively, the valuation method "by planned production costs" can be used.

Depending on the settings conversion to posting quantity the valuation at post calculation price is done as follows:

First partial entry: post-calculation, broken down to the reported quantity
Second partial entry: post-calculation, broken down to the reported quantity minus the already booked costs of the first entry
Closing entry: post-calculation of accrued costs minus already booked costs of the partial entries.

If there is no final posting, a difference in the WIP account arises! Depending on the valuation, there could be a different valuation form than in other postings at final posting. Accordingly, the valuation of the last posting can lead to other results. In the worst case, the calculated amount is less than 0. Then, a 0-booking is performed.

Example:
First partial entry: post-calculation planned costs 100 €, one piece posted in for 100 €
Second partial entry: post-calculation planned costs 200 € minus preceding 100 € = 100 €, one piece posted in for 100 €
Closing entry with different valuation: Actual costs 180€ less already booked 200 € = -20€

Problem with cancellations
Calculation works as follows: calculated value minus already posted values after a partial delivery. If a partial delivery is canceled, the value "already posted" is not changed. That is why no cancellations may be done using this valuation method.
Canceling an assembly: The amount of previously booked values are stored directly in the work order item - split into material costs, manufacturing costs and additional costs. When the assembly is canceled, this amount in the work order item is not canceled because a recalculation is not possible. As a result, subsequent bookings are incorrectly valued.

Example #1:
First partial entry: post-calculation planned costs 100 €, one piece posted in for 100 €
Cancellation of one piece
Repeated posting: post-calculation planned costs 100 € less preceding 100€ = 0, 1 piece posted in at 0 €

© 2026 Boyum IT Solutions A/S

Example #2:

Planned qty 10
Post-calculation: 1000€
First partial posting 5 pcs: 1000 € : 5 = posting price 200€

Continue production, post-calculation 1200 €
Second partial posting 2 pcs: 1200 € - previously posted 1000 € = 200 € : 2 pcs = posting price 100€

Production finished. Post-calculation 1200 €
Last partial posting 3 pcs: 1200 € - previously posted 1000 € = 0 € : 3 pcs = posting price 0 €

Problem with last posting

The last partial posting is defined with the fact that by posting the parts, the manufacturing position is completed.
If you do not specify with the last posting, that the manufacturing position is completed, at valuation method "planned costs at partial delivery" or "partial delivery at material / manufacturing plan costs," is used even for the last posting. A subsequent correction is not possible.

Subsequent BoM correction

If the BoM changes after a receipt, the received part must be re-valued AND the material movement corrected in the production position (previously received material - calculated at target costs).
Right-click on "Finish" in the production position to do this.

see Projection of actual costs, Post-calculation

Standard cost method	Z	-	-	-	-
Booking Price	S	-	-	-	-

- Calculation type

Plan:
The system creates a post calculation for the quantity of the current receipt for Plan costs (not Real costs).

Real:
The system creates a post calculation for the current receipt quantity and all receipt quantities in the past. It calculates the Plan- and Real costs for the total of all receipts.

Note on Lot size costs:
The lot size cost is not related to the quantity. It is always related to the actual work order position.

Due to the risks the following valuation methods are only available in Expert mode

© 2026 Boyum IT Solutions A/S

Field	Which costs are used?
Post calculation price (planned material costs for partial delivery)	**Partial posting** accumulated production cost as per post-calculation + planned material costs as per Precalculation + surcharges as per post-calculation minus the already posted values. **Final posting**: accumulated material and production costs and surcharges as per post-calculation minus the already posted values. Note: In this valuation form pre- and post-calculation is used. If at "pricing at valuation" cost at goods sold or costs of sales are indicated, the post-calculation value is used here. This is calculated from the post-calculation value minus material costs, as per Precalculation L-M costs according to post-calculation. This scenario can, therefore, lead to erroneous results. For this reason, "material and production costs" should be selected for this configuration. With this valuation method, at partial posting the option Conversion to posting quantity is considered. Note: The use of this valuation method can lead to valuation problems in certain configurations.
Post calculation (actual material costs for partial delivery	**Partial posting and final posting** Cost for material and production and surcharges according to post-calculation. With this valuation method, the option Conversion to posting quantity is considered at partial posting. Note: The use of this valuation method can lead to valuation problems in several configurations.
Post calculation (partial delivery at material / planned production costs)	**Partial posting** Costs for material and production costs and surcharges according to Precalculation, ***See*** Valuation Planned production costs **Final posting** Cost for material and production and surcharges according to post-calculation,

© 2026 Boyum IT Solutions A/S

Field	Which costs are used?
	minus the already posted values. With this valuation method, at partial posting the option Conversion to posting quantity is considered, which may lead to problems when another quantity than the planned quantity is posted. Note: The use of this valuation method can lead to valuation problems in several configurations.
L + M costs (Planned) + Material costs (Actual)	**Partial posting and final posting** Material cost: - Partial costs to actual costs (possibly with Conversion to quantity to post in) minus the already posted material costs - Final posting to actual costs minus the already posted material costs Production costs according - always to Precalculation minus already posted production costs. Costs of goods sold (Surcharges): - always according planned costs. Example Usage of these valuation method

see Projection of actual costs, Post-calculation

back to Valuation and posting assembly

3.1.3.6.7.2 Account determination

Beas uses the same account determination as SAP Business One. Depending on the setting, accounts are determined by warehouse, item group or item warehouse.

PATH: Administration > System Initialization > Configuration wizard > Production > Valuation and Posting of Assembly.

⊞Extended Account Determination

© 2026 Boyum IT Solutions A/S

From *beas9.0-000-002-000* extended account determination is supported. The following parameters are considered: item, warehouse and valuation date.
For more information for account setting ***see*** SAP Business One-documentation.

Because Beas offers advanced functionality, the further settings are available:

Name	Description
Define WIP account	Press Start to run the automated determination of WIP accounts The **Start** button opens the Define WIP Account window.
Use for component transactions	Only visible if continuous stock keeping is activated. Determines the "WIP account" to which the material positions should be posted. **WIP accounts for components** For material posting, the value is posted to the WIP account of the material. **WIP accounts for superordinate items** For material posting, the value is posted to the WIP account of the assembly. Corresponds to SAP Business One - **Document setting - Per document** ***See*** Document settings.
Calculation schema	Determines the calculation schema to be used for valuation of the assembly or for account definition. This may only be specified here if the calculation schema stored in the item should not be used. Note: If you define a schema in this option, the system ignores the schema setting in the Item Master data. This option is not available if standard price valuation has been activated. ***See*** standard cost method . ***See*** Production - Schema Calculation Schema

© 2026 Boyum IT Solutions A/S

	Item master - Calculation schema
Account the costs on WIP depending on the schema	If activated, all costs specified in the calculation schema and where an account is stored are booked from the account indicated in the schema to the WIP account **On assembly receipt** The values are posted to the WIP account at the time of assembly receipt. **On closing production position** The values are only transferred when the production position is closed. This option makes it possible to book not just the material costs but also production costs (machine costs, wage costs, etc.) from separate accounts. If you reopen a work order position and close again, Beas does not transfer the values again. ***See*** Calculation Schema
Balance WIP Account	All costs are booked to the WIP accounts In turn, the assembly receipt debits the WIP account. If this option is activated, the remaining amount is transferred from the WIP account (or accounts) to the difference account of the assembly and the WIP account (or accounts) thereby debited without any remainder. **Setup options:** No — WIP accounts are not automatically balanced. Upon closing — WIP accounts are balanced, as soon production has been completed. In general, this is the best option. at posting-in assembly — WIP accounts are balanced after every posting. We do not recommend this option, because

© 2026 Boyum IT Solutions A/S

	a) many journal entries are created b) incorrect values may arise when you work with partial production When to use this option: - for very long cycle times - if partial production does not overlap, meaning the first assembly will be completed before starting the next one.

Note:

In the production types (***see*** Production / Master Data) you can specify that the WIP accounts should not be balanced if the type is stored in the work order.

If a posting should nevertheless be performed, this can be carried out by Beas script:

```
object=ue_api_wo=wipclear=<workorder-number
belnr_id>=<workorder-position belpos_id>=manuell
```

Account setting WIP variance account	Enter BeasScript to modify account determination. Variables: **Read variables:** "ll_belnr_id" "ll_belpos_id" "ls_itemcode" "ls_whscode" **Write variables:** "ls_account_from" "ls_account_to"
Cost center determine by	Setting to determine cost center. **Available settings:**

No	No cost center determination
Assembly	Cost center as per superordinate assembly. ***See*** Item master- General- Cost center

© 2026 Boyum IT Solutions A/S

	Note: Use extensions in work order management to manipulate or extend the cost center. **IMPORTANT:** At variance journal entries there is no cost center assignment. However, the user can add a cost center applying their own business rules to detect the event that allows to assign the cost center, even from dimensions 1 to 5. ***See*** **BeasScript documentation > User events > wip - Work in Process > workordermanagement > WIPClearVariance.** *Variable: ftpos_profitcenter*

see

Concept work in progress

Account setting

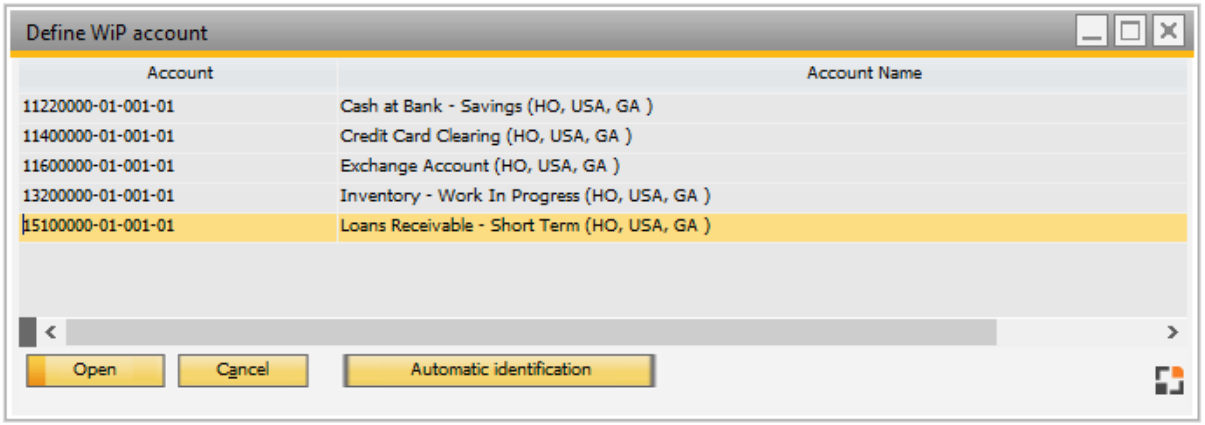
Examples for WIP settings

Webinar: Financial accounting in beas Manufacturing

back to Valuation and posting assembly

In this window you can define Work in Progress (WIP) accounts.

PATH: Administration > System Initialization > Configuration wizard > Production > Valuation and Posting of Assembly > Account Setting > Define WIP Account.



Window fert_wip_accounts.psr

© 2026 Boyum IT Solutions A/S

For this the system checks
- all WIP accounts defined in the work order
- all WIP accounts defined in the cost elements
if not extended accounting, the system checks
- all WIP accounts defined in item groups
- all WIP accounts defined in Warehouses
if extended accounting is activated, the system checks
- all WIP accounts defined in the extended accounting system

Functions

Field	Description
Automatic identification	Click this button to identify WIP accounts automatically.
Add	Select **Add** in the right-click menu, then right-click the empty field to select an account from the drop-down list.
Remove	Delete selected WIP account.
Cancel	Close the window without saving changes.
Change Log	Opens the change log for the selected entry.

Note: If any account setting was incorrect in the past, the system inserts the wrong account in this list. You must delete it manually.

back to Valuation and posting assembly

© 2026 Boyum IT Solutions A/S

3.1.3.6.7.3 Booking

PATH: Administration > System Initialization > Configuration wizard > Production > Valuation and Posting of Assembly.

These settings affect material postings in the posting/reservation window.

Name	Description
Post finished parts when	Defines the time of the receipt of the item. This setting affects only the order time receipt. Depends on the setting Material posting - Automatic material posting. **Available settings:** Like Material (Last Operation i.e. Backflushing) Entry of the assembly is made with the material, depending on the settings. Material posting - Automatic material posting - First position or last routing position: It is posted in the **last** reportable position. - for all other settings: The assembly is not posted. Note: The assembly will always post in with the last operation. Like Material (only backflushing assemblies) Automatic entry is made only when: - setting Material posting - Automatic material posting is set at the "first" or "last" position. The Assembly will post in always with last operation. - the option "Output method" is set to "backflushing" in the item master of the assembly. Note: The assembly will always post in with last operation. Not Automatically: If this option is active, there is no automatic entry for the finished item. Always after the last operation

© 2026 Boyum IT Solutions A/S

	Finished parts are always posted in after the last operation, independent of other settings. Note: No automatic entry posting is made if the Material posting - Automatic material posting is set to "Not automatically" or to "backflush post production order".
Post finished parts to warehouse	Defines the target warehouse of the item to be produced Normally, the assembly is stored in primary warehouse defined in item master data. If a store is selected in this setting, each assembly on main level is automatically entered into this warehouse. Note: This setting is only for main items, not for sub-assemblies. Selection is also possible via **Warehouse > Extended > Master data tab - "Production inflow"**. You can define additional rules in Warehouse rules. Warehouse rules have higher priority than this setting. ***See*** Edit warehouse master data. Planning scenarios - Detail - Production inflow.
Allow Booking without prices	Defines whether an entry with price 0 is allowed **Enabled:** If the option is enabled, it is possible to post in the assembly with 0 price. **Disabled:** If the price valuation returns 0 and this option is disabled, the following error message appears: *(faeinb9345311) Assembly has no price. Booking not possible*
Behavior if finished part has no price	Determines further behavior if pricing is not possible. Note: This function is only available in - Desktop solution / Terminal - Time receipt

© 2026 Boyum IT Solutions A/S

	- Desktop solution / Terminal - Backflush - Desktop solution / Terminal - Goods receipt function Since the option is "Pricing according to cost analysis", the assembly can be received only when the Bill of materials is issued and valued. If the price is specified here as 0, the transaction can no longer be rolled back. For this reason, it must be updated. The behavior can be set here. **Force price entry**: The price must be entered manually. Cancellation is not possible. **Info and book with 0**: Information is given and the assembly is entered with the price 0. Note: In the backflushing process (for example time receipt) the system must create the time receipt entry, the Issue document and then the calculation. The price is only available after these processes. But if the price is zero, the system cannot make a rollback of all preview processes (Rollback system from SAP Business one is case nut running). This is the reason why the system cannot check this in WEB Services / WEB Application. If "Force price entry" is activated, the user MUST insert a price. A cancellation is not possible.
Item check before booking	Checks the item to be booked before the backflushing booking process is started When backflushing, the material is issued, the price is valued and the assembly is received in one process. If the receipt is not possible, the partial process cannot be undone. A number of checks is performed before the issue resulting in the low likelihood of such event. If this option is active, the item to be received is temporarily changed to ensure access rights and data integrity as much as possible. This check may delay the overall process in certain circumstances.

© 2026 Boyum IT Solutions A/S

back to Valuation and posting assembly

3.1.3.6.7.4 Work order position closing

PATH: Administration > System Initialization > Configuration wizard > Production > Valuation and Posting of Assembly.

Setup rules which apply for closing work orders.

Parameters

Name	Description
Behavior at closing	Determines the behavior on closing if the assembly contains a sub-assembly. If an assembly is closed manually (***see*** Edit work order position - Close) or closed automatically via time receipt, it will be checked for open sub-assemblies. **Setup the behavior in this case:** Only if sub-assembly closed (1) — Closing the assembly is only possible if all sub-assemblies are closed, as well. Message, if sub-assembly is open (2) — A message is issued, telling the sub-assembly is open. You can still close the assembly, but the sub-assembly will remain open. Default option. Message: `fertabgkert943` *'The sub-assemblies ... for the work order ... are not closed. Close the position for the assembly ... anyway?* Close sub-assembly as well (3) — Message if sub-assemblies are open. After confirmation, sub-assemblies are closed. Message: `fertabgkert944` *'Sub-assemblies ...for work order*

© 2026 Boyum IT Solutions A/S

	Only if sub-assembly closed (1)	Closing the assembly is only possible if all sub-assemblies are closed, as well.
		document ... are not closed. Close the sub-assemblies ? Note: It is checked in advance, whether or not sub-assemblies can be closed. If not, the following message is issued: `ftstmp3244332` *'There are open time receipts for sub-assembly .... Sub-assemblies cannot be closed. Close the assembly anyway?* Answering with Yes, the current assembly will be closed, but not the sub-assembly.
	Variable: fert_abgkzsub, 1,2,3 see brackes in table. Default= 2	
Close assembly automatically	Determines whether the assembly is closed automatically	
	The system can close the work order position automatically. **No**: The system does not close sub-assemblies. **By Query**: The system asks if you want to close the sub-assembly. For more information, ***see*** setting "Yes" below. **Yes**: The behavior depends on the switch Material posting automatically at: **Last operation:** Assembly is closed when the last reportable operation is closed. If the last operation is an external routing position with provision, the system does not close the assembly automatically.	

© 2026 Boyum IT Solutions A/S

	(Supported by all time receipt windows, Data Integration HUB / Beas service layer: Time receipt) **Work order backflushing:** Assembly is closed when the work order is closed by "Work order backflushing" or when the full planned quantity is reached. **Collective Receipt:** Activates close flag atomically if full quantity is defined *beas 2020.02* **Post-in assembly manually:** At posting a check box "Close" is displayed which is controlled by this parameter. **Data Integration Hub:** Material receipt import: no effect. **Beas Service Layer:** Receipt function: no effect. You can define this with property CloseID. Note: When dealing with an overhead order or project order and if a non-storage related item was stored as assembly, the work order will not be closed automatically. ***See*** Production types. Note: The option has no effect on upper option "Behavior on closing". *fert_abg N=No, J=Yes, A=Query, Default =N*
Work order close	Define if work order is closed automatically If active (default) then the work order is closed when all assemblies have been closed. If you deactivate this option, you need to close the work order manually. *fthaupt_abg J/N* Support all time receipt functions.. **Last operation:** Assembly is closed when all work order positions are closed.

© 2026 Boyum IT Solutions A/S

	Work order backflushing: Assembly is closed when all work order positions are closed **Post-in assembly manually:** At posting a check box "Close" is displayed, which is controlled by this parameter *(beas 9.1 PL: 08)* **Collective Receipt:** no effect **Data Integration Hub:** no effect **Beas Service Layer:** Receipt function: no effect.
Only if order is closed	Determines whether the work order position may be closed if open purchase orders exist **enabled** (default): The work order position may only be closed if there is no open purchase order created from an external operation. **disabled:** Work order position may be closed, as well, if there are still open purchase orders from external operation. **Important:** For correct cost determination it is necessary to register deliveries of open purchase orders. If valuation of the assembly or bookings depend on it, and purchase orders are not closed, differences may arise on accounts. There may be values on the WIP account, which are no more moved to the difference account. *ftpos_orderclose J/N*

back to Valuation and posting assembly

3.1.3.6.7.5 Serial Number

PATH: Administration > System Initialization > Configuration wizard > Production > Valuation and Posting of Assembly.

Parameters

Name	Description
Form to create (xxx = serial no.)	Specifies the template for the structure of the serial numbers. For more information ***see*** Batch Generation.

© 2026 Boyum IT Solutions A/S

Counter reading	Current Counter Status. For alphanumeric counting systems, this counter retains the numeric counter status and it is only converted when the numbers are generated.
Serial Number reservations	Pre-define serial numbers Yes Serial numbers are generated and therefore also reserved when the work orders are created. If the number in the work order is subsequently increased or decreased, the reservations are automatically adjusted. On receipt, a selection from the list of reserved serial numbers must be made. **Important**: serial number reservation works only with automatic determination of serial numbers. If in the item the determination is set to "manual" – there is no reservation of serial numbers. No Serial number reservation is disabled. Beas does not create any reservation when WO is created. Manually Beas does not create the reservation when the WO is created, but adds the possibility to create new Serial reservation in the material issue window. Additional information If serial numbers are pre-defined, for batch or serial number items the material to be issued can be pre-assigned to the serial number to be posted-in. **Important**: it is a reservation of future serial numbers. It is NO receipt reservation – it is not connected to material reservation. This function does not support negative amounts of material. In batch or serial number tracing, only successor batches are displayed, which are directly linked.

© 2026 Boyum IT Solutions A/S

	To make possible the assignment of material-serial number to batches, at **Material posting > backflushing** the option "**also post batches/serial numbers**" needs to be set to "**manually**" . ***See*** Configuration wizard – backflushing *Fields: oitm.u_batchroh* *Variable: fertserres (J/N/M), Standard: nicht aktiv (N)* For more information ***see*:** Serial Number Reservation WO structure – serial number reservation Configuration wizard – Material – backflushing – serial numbers Serial number tracing *Affected data fields: oitm.u_batchroh* *Variable: fertserres (J/N), Default: inactive (N)*
Display serial numbers selection screen	Defines if the Serial numbers selection window should be opened when "Serial Number Reservations" was activated. - **Yes**: Default setting. When this parameter value is selected, the Serial numbers selection window is displayed when a receipt is generated during the Time receipt process. - **No**: When selected, the Serial numbers selection window is not displayed in the above scenario.

back to Valuation and posting assembly

3.1.3.6.7.6 Batch Management

PATH: Administration > System Initialization > Configuration wizard > Production > Valuation and Posting of Assembly.

Parameters

Name	Description
Basic settings for batch status of material receipt	Determines the default batch status on goods issue (goods receipt, goods issue or issue via Production or cancellation of sales documents) This switch corresponds to the setting in SAP.

© 2026 Boyum IT Solutions A/S

Batch status without QC order	Batch status on production receipt if no quality control is stored in the item for this transaction. For the "Default" setting, the status "Basic setting of batch status" is used.
Batch status with QC order	Batch status on production receipt if quality control is stored in the item for this transaction. For the "Default" setting, the status "Basic setting of batch status" is used. Note: If "Default" is not set, the definition cannot be influenced by script.
Number Assignment xxx = current no	For settings, ***see*** Materials Management - Batches - Batch Generation
Unique batch	If this option is activated, the batch number will be checked for uniqueness. The batch is checked for previous use. If the batch is already existing, the batch generation function will be used. The check will be repeated 5 times. If then, no unique batch was generated, an error message will be issued and the work order will be marked as faulty. Note: Automatic batch determination must be selected and the batch determination returns an continuous batch number.Otherwise a next automatic batch number cannot be generated. **Affected posting processes:** Time receipt via last operation sequence Backflushing (post-in) Goods receipt of a production position **Not affected:** Post-in of negative Bill of materials positions Collective receipt *Variable: fert_charge_eind (J/N), Vorgabe = N* If this option is activated, the batch number is checked for uniqueness.

© 2026 Boyum IT Solutions A/S

Batch Counter	Reference to a counter 1, 2 or 3 that is stored in Materials Management.

back to Valuation and posting assembly

3.1.3.6.8 Reservation

PATH: Administration > System Initialization > Configuration wizard > Production.

Beas allows automatic reservation of normal items, batch and serial number managed items.
You can reserve material for Work orders and Sales orders (Pick and pack process).
The reserved quantities are fixed for each Work order or Sales order and are not available for other documents.

The reservation is later used as a pre-assignment for material issue from stock or for creating Sales delivery documents.

The reservation can be made with automatic pre-allocation by several techniques, including FIFO, Manufacturing date or serial number custom attributes.
Eventually, a WIP stock transfer can be performed in SAP Business One via the Beas Allocation function for accurate tracking of stock quantities and values.

See Concept Reservation

Note:

After changing reservation settings, Beas needs to be restarted!

A subsequent change of reservation settings can lead to problems.

Beas does not allow reservations with negative stock. The item must have stock in order to move it.

Parameters

Name	Description
Receipt reservation only at	Select under which conditions a "receipt reservation" is created followed by a "warehouse reservation" Selection:

© 2026 Boyum IT Solutions A/S

always: if there is a reference to a customer order, independent of the scheduling ID of the assembly, always a receipt reservation is created.

only for order related items: receipt reservation is only created, if the assembly got the scheduling ID "order related"

disabled: default setting. Receipt reservation is disabled.

Note: The MRP and Sales order to work order do not work correct with this setting, because the system does not have enough information for the correct calculation.

- Requirement calculation with activated receipt reservation (for order related items):

  Open quantity from customer order
  - open receipt reservations according to work order
  - warehouse reservation for customer order
  = remaining quantity

  Summary of multiple customer orders into one work order is possible.

- Requirement calculation with de-activated receipt reservation (default setting):

  Total quantity from customer order
  - Withdrawal from warehouse (column rdr1.u_vonlag)
  - Total quantity from all assigned open work orders
  - Posted quantity from all assigned completed work orders
  = Remaining quantity

  Only a 1:n - relation is possible. No summation of multiple customer orders into one work order. If the order reference is changed subsequently or the material is consumed for another customer order, which was not linked to the work order, errors can occur. Usually, this option is the best choice. The manufacturing assembly is linked to the customer order in a 1:n-relation. The reference screen for multiple references (receipt reservation) is disabled.

Notes

© 2026 Boyum IT Solutions A/S

	If the receipt reservation is disabled, existing reservation entries are not deleted. At a subsequent activation, missing reservations are not created. If the option is activated subsequently, missing links are not entered. Further information ***see*** Disable reservation – subsequent activation/de-activation Note: If you disable this setting, the MRP cannot calculate a correct balance. ***See*** Disable reservation – subsequent activation/de-activation Work order – link Order recommendation – produce
Sub-assemblies reserve	Define Reservation concept for sub-assemblies If posting in a sub-assembly, create a warehouse reservation for the superordinate assembly? **always:** For all postings a warehouse reservation is created for the upper assembly **no:** no warehouse reservations are created **not on QC-/blocked warehouse:** posting in to a QC-warehouse or to a blocked or an external warehouse, no reservation is created Notes on breakdown Order-related assemblies are not covered by the inventory or unassigned work orders. If there is no associated production order, the assembly is broken down.
Disable reservation	Activating the check mark deactivates the reservation system completely. Effects of a disabled reservation system: **Order recommendation report:** no correct balance calculation for order related items, because this is based on reservations **Customer order:** no reservations

© 2026 Boyum IT Solutions A/S

Work order (structure view): no reservations, no allocations
Customer order to work order: it is not possible to link several customer orders to one work order
Pick&pack: no pick&pack and delivery possible with Beas

Subsequent activation / deactivation

Notes on subsequent activation / deactivation of receipt reservations
If the receipt reservation is activated subsequently, only existing reservations are considered. Usually there are no reservations in such a case.
IMPACT: The MRP will display a material requirement which is too high. For this reason, after activation, reservations for existing work orders need to be deposited manually. For partially finished work orders the stock needs to be assigned to the customer orders.

Using the following script command the reservation can be entered automatically into the work order.
object=ue_reservation=addreservation_for_workorder
This function creates the receipt reservation between the sales order and work order. However, the created reservations must be edited manually if there are partial postings for work orders. These need to be reduced from the reserved amount and the item must be reserved manually for the customer order.

Important: Deactivating reservations, it is queried, whether to delete existing reservations. Selecting "YES", all entries are deleted. There is no way to recover deleted entries.

3.1.3.6.9 Internal and external maintenance

Administrate internal and external maintenance

PATH: Administration > System Initialization > Configuration wizard > Production.

For the following areas you can setup UDF's.

© 2026 Boyum IT Solutions A/S

Master data

Maintenance plan

3.1.3.6.10 External production

PATH: Administration > System Initialization > Configuration wizard > Production.

Purchase order and provision

External operation goods receipt

3.1.3.6.10.1 Purchase order and provision

PATH: Administration > System Initialization > Configuration wizard > Production > External production.

Parameters

Name	Description
Default item for purchase order	Specify for external operations which service items are to be used for purchase of external service If no item is specified, an item can be predefined here. This item must be a service item without inventory management. It should generally not have any price or pricing - ***See*** entry: **Pricing for order** If working with special prices, a separate item with its own pricing must be created for each service. Prices which are stored in the operation are ignored.
Pricing for purchase order	Pricing external operation **There are two variants:** 1. Price is stored in operation and used for the service. 2. Pricing using the service item. Use this variant, if "Price list" (or in operation: consider price list) was selected. Following priority applies: - Blanket orders - Special price list (if Consider special price list was activated in the Configuration wizard) - Pricing as per **Configuration wizard > set up here** - Price according to operation

© 2026 Boyum IT Solutions A/S

	Special case Precalculation If special price lists are considered, scale prices (max. 4) are copied to the calculation. Foreign currencies are converted to system currency. Note: Gross price lists are not supported. Purchase units are not supported, warehouse unit needs to be the same as the purchase unit. Conversion price units Prices are stored in warehouse units of the service item. The purchase order is created respectively with the unit of the service item. In operation under "conversion" you can define the conversion factor from assembly unit to warehouse unit. *(Variable ext_preisfindung)*
Choose supplier	Which suppliers can be selected for purchasing external operations external in an order recommendation list. **All**: all suppliers **Catalog**: only suppliers with entries in business partner catalog numbers, related to service item **Catalog assembly:** only suppliers with entries in business partner catalog numbers, related to the assembly to be produced. No effect on pricing **Price list**: (only suppliers with special price lists) This setting affects: - Purchase and Provision - Edit Routing – external operation
Consider special price list	Consider **supplier's** special price lists. Enabled by default. ***See*** Pricing for purchase order Note: In Precalculation scale prices are not supported. *(Variable fagspecialprice)*

© 2026 Boyum IT Solutions A/S

Warehouse = production warehouse	Determines the target warehouse for a purchase order If enabled (=default) for **External operation > purchase** always the warehouse from work order will be used for the purchase order, in case that no provision material was stored. If option was disabled, the warehouse assigned to the supplier will be used. Disable the option if you want to summarize purchase orders with and without provision material. *Variable: fagwhscode*
Consider login rules	Determines whether login rules are taken into account If enabled, (=default) all login rules are considered. If disabled, rules are not considered. Affected rules: - preceding operation needs to be completed - preceding operation with reported quantity - preceding operation needs to be OK - report at least preceding quantity - report at most preceding quantity - max. planned quantity may be reported ***See*** Configuration wizard - FDC - Login- and Logoff rules *Variable fagcheckrules*
Number range for "provision of material"	Select between primary or external: Normal purchase orders are created, currently in „primary"-range of numbers. As for purchase you can select a different range of numbers. To use this feature, an additional number range must be set up for purchase orders in SAP. This number range can then be selected here.
Open provision parts window?	Determine whether to open the provision parts window automatically after creating the purchase order **Yes:** after purchase, the screen for provision parts is opened automatically **No**: provision parts screen needs to be opened manually **No provision**: no provision at all. Required goods need to be posted to the external warehouse manually. ***Example***: transfer of goods not related to an order. The provision process is immediately marked as finished, the next step - goods receipt - can follow.
Provision address	Determines, whether to use in provision document (SAP transfer document) the address and name of supplier or the address and name

© 2026 Boyum IT Solutions A/S

	of the warehouse *(beas 9.1 PL: 08, ext_adr=S)*
UDF1 - UDF4	Free Fields 1-4 without Data Source. It is only an empty string field, which you can fill with own data with script. Note: It is recommended to use template fields.

see

External operation

Provision

Issue / Reservation window

3.1.3.6.10.2 External operation goods receipt

PATH: Administration > System Initialization > Configuration wizard > Production > External production.

Parameters

Name	Description
Stock undercut	Defines behavior if the inventory quantity is insufficient. The quantity stored on the external warehouse of the supplier will be checked here. Settings: **Allow:** you can create purchase orders in case there are not enough provision parts **Block:** PO-Goods receipt is blocked if there are not enough goods At the setting "Block", no purchase - goods receipt is possible if the the stored goods are insufficient. Note: Not assigned material is backflushed at the same time if it is the last operation. *(beas 9.1 PL: 08 ext_retrabchk, Default "L=Lock")* **IMPORTANT:** Beas checks the current stock and also existing reservations for other work orders. If something is reserved for a different work order, the system generates an error message. WebApp Ext. GRPO is supported.
Provision Issue	Defines if the provision parts should be issued automatically. **Open issue screen manually:** manual issue via menu item: "**issue provision parts**"

© 2026 Boyum IT Solutions A/S

	Open issue screen immediately: the issue window is opened immediately. If several documents are opened at once, the following order applies: goods receipt – issue – goods receipt – issue. If the process is canceled, an open process will be available under menu item: "**issue provision parts**" **Issue automatically:** goods are backflushed immediately after goods receipt following the rules defined in **Configuration wizard > Material posting > backflushing**. Use this option if working without batches, serial numbers, bin locations and reservation. If the process is canceled, it is available as open process under menu item "**Issue provision parts"** Note: External operation - goods receipt and Material issue are separate processes, executed independently of each other, even if they are executed automatically one followed by the other . If the Issue process is canceled, the goods receipt cannot be deleted automatically or undone. ***See*** Goods receipt external operation Production – Material issue*(ext_issuewindow, default=N=manually)*
Max. purchase order quantity?	Defines which quantity can be posted-in in External production – Goods receipt. **Active:** (Standard): No more than the purchase order quantity can be received. **Inactive:** Any quantity can be posted in. Note: Once the default quantity has been exceeded, the purchase order will be closed automatically. Another partial receipt is then not possible. *(ext_checkmaxorderqty, default=J =Yes)*

3.1.3.6.11 Project administration

Definitions for project administration.

PATH: Administration > System Initialization > Configuration wizard > Production.

Item – configurations

Product configurator

Create new variant

© 2026 Boyum IT Solutions A/S

3.1.3.6.13.1 Item Creation

These are the configuration settings for item creation inside the Product Configurator.

PATH: Administration > System Initialization > Configuration wizard > Production > Product Configurator.

Parameters

Name	Description
Item creation	If active, new items can be created from a configuration.
Create items with the same configuration	Item creation: Check whether items with the same configuration are to be created At new creation, the system checks whether to create a new item for the sub-assembly. **Always for order-related items** (Default) If there is an item with the same configuration, the new item will still be created if its scheduling ID was set to "order-related" or "phantom assembly" **Automatically** Independent of the scheduling ID, a new item is not created if an existing configuration was found in the system. Instead, this item is used. Entries in the configuration tab are checked: If there was no entry stored, nothing is checked, and no item is created. If parameters are stored, they will be checked.
Recognize double entries	Setup that happens if a second entry with the same configuration is found: If you save a configuration (Button Update in Product Configurator window), Beas can check if this configuration exists. **Available options:** Note: Only a note is issued.

© 2026 Boyum IT Solutions A/S

	Question: Question whether the existing configuration shall be loaded. **Automatically**: The existing configuration is loaded automatically. **No:** No recognition. A new configuration is always created. Note: if a configuration is firmly assigned to a project, the system does not check whether the configuration exists already. *config_double: 0=Note;1=Question;2=Automatic (default);3=No*
Apply inactive work sequence	Item Generation: If active, the system inserts a non-active Routing position. ***See*** Routing Position *(beas 9.3 PL 2)*

3.1.3.6.13.2 Desktop Product Configurator

The Desktop Product Configurator UDF settings can be performed in this area.

PATH: Administration > System Initialization > Configuration wizard > Production > Product Configurator.

Parameters

Name	Description
UDF1...4	Define up to 4 UDF Fields These UDF fields are visible in Configurator – Page "Definitions" ***Example:*** UDF1 = Color  *Window prd_links2.psr*

3.1.3.6.13.3 WEB Product Configurator

Here you can find filtering and document related settings for the Web Product Configurator.

List of Products

Documents

PATH: Administration > System Initialization > Configuration wizard > Production > Product Configurator

Here you can perform display and filtering settings for Web Configurator apps.

Note: The Web Product Configurator must be reloaded after you modify a parameter to apply the changes.

PATH: Administration > System Initialization > Configuration wizard > Production > Product Configurator > WEB Product Configurator

Parameters

Name	Description
List of Products	
Display non-configurable items also	Define if the Web Configurator should also display items without a configuration. If this parameter is set to "Yes", all items are available for the Sales Order. Default value = No.
Customer can select	Determine which items can be selected for the logged in customer with the following parameters:

Parameter	Description
All	All items can be selected.
Catalog	Only items defined for the customer in the SAP form Business Partner Catalog can be selected.

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Name</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Parameter</th><th>Description</th></tr>
<tr><td>Price list</td><td>Customer can only select items that are defined in the SAP Business partner Master Data > Payment terms with a price.</td></tr>
</table>
</td></tr>
<tr><td>Display Filter by Item Group</td><td>Enable the Filter item list by item group.
- Yes
- No</td></tr>
<tr><td>Display Filter by Property (Start)</td><td>Display items with a numeric range of properties. Define the starting property for the range.</td></tr>
<tr><td>Display Filter by Property (End)</td><td>Display items with a numeric range of properties. Define the ending property for the range.</td></tr>
<tr><td>Filter items with Property Number</td><td>Only display items that have the property number you enter here.
Example:
Activate a property in the Item Master data:
 and filter Web Product Configurator to display items with this property:</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Name	Description
	Allow to copy Configurations from documents	If this parameter is set to "Yes", you can edit an existing configuration to add it again to the cart. The configuration number appears as a link in the description of a Sales order or quotation. Tap on the link to open and edit the existing configuration.

See Documents settings for the Web Product Configurator

Here you can perform document related settings for Web Configurator apps.

Note: The Web Product Configurator must be reloaded after you modify a parameter to apply the changes.

PATH: Administration > System Initialization > Configuration wizard > Production > Product Configurator > WEB Product Configurator

Parameters

Name	Description
Documents	
Allow to create Sales orders	Define if the Web Product Configurator can create Sales orders. If "Yes" is set, the **Create the order** button appears in the Cart view. - Yes - No

© 2026 Boyum IT Solutions A/S

Name	Description
	Note: If the parameter selection in "Allow to create Sales quotations" is "No", this setting is activated.
Allow to create Sales quotations	Define if the Web Product Configurator can create Sales quotations. If "Yes" is set, the **Create the quotation** button appears in the Cart view. - Yes - No
Display WEB orders only	List sales orders and quotations created with the Web Product Configurator: - Yes - No
Sales employee can select customer list of	Define the customer list that can be selected. - All customers: Sales employee can select all customers - Only linked customers: Sales employee can only select customers lists where customers are linked to Sales employees. ***See*** SAP documentation. Note: This parameter only affects operation when logged in as an employee.
Sales Employee can see sales Documents	- All Sales documents: Sales employee can see all documents. - Own sales documents: Display orders where the "Owner" is the same as the Sales employee. Note: This parameter only affects operation when logged in as an employee.
Allow to cancel a document	Define if the user can cancel a sales document in the Web Product Configurator: - Yes - No
Write Description to UDF	Add linked UDF name from the Sales document: This setting adds the description in the previously created UDF of the Sales document.
Write Variant Digest to UDF	Add linked UDF name from the Sales document: This setting adds the parameter string (parameters with prices) in the previously created UDF of the Sales document.

© 2026 Boyum IT Solutions A/S

Name	Description
Allow to modify the Requirement date	Define if the user can modify the requirement date in sales documents in the Web Product Configurator. - Yes - No Note: In Sales orders, this setting is reflected "Delivery date" field, and in Sales quotations, this is indicated in the "Valid until".
Display currency	Display currency according to one of these settings: - **Local**: the main, locally defined currency. - **System**: the currency used by the system. (default) - **Business Partner**: the currency set in the SAP Business Partner data.

See List of Products

3.1.3.6.13.4 External configurator

PATH: Administration > System Initialization > Configuration wizard > Production > Product configurator

An external configurator can be connected to Beas. These are the most important settings.

Parameters

Name	Description
External configurator activate	Enable external configurator. ***See*** External configurator.
Replace BoM completely	If enabled (default), BoM from master data is completely replaced in case that entries are found in external table beas_config_stl

see External configurator

go back to Product Configurator settings

3.1.3.6.14 Capacity Planning

PATH: Administration > System Initialization > Configuration wizard > Production.

Parameters

© 2026 Boyum IT Solutions A/S

Name	Description
Activate Capacity planning	Function for cycle time scheduling and resource planning If this option is activated, all following options and all capacity-calculation functions are activated in the program . If this function is deactivated, newly created work orders are not scheduled backwards. In the Work Order structure view all related functions (Pool calculation) are hidden.
Default calculation method	Define the calculation method at creation or change of a work order Changing a work order, times are automatically re-calculated. Here, you can define to define the method.

Backwards	With backwards calculation starting from delivery date, the start date of the work order is calculated. Required times are reserved. Existing reservation are not considered. The time of day of production end is not considered. (Default setting)
Item lead time	The item lead time (in work days) is used. Start date = delivery date - lead time (work days). All work orders get the start date and the delivery date as end date. Time of day is not considered. Use this method if in operations no times are stored. Note: With this setting, no dispatches are displayed in resource overview. **Consideration of validity date in BoM positions and routings:**

© 2026 Boyum IT Solutions A/S

	A validity period can be stored in the BoM position and routing position. If "Item lead time" is activated, the date of completion is used as check date. Otherwise the delivery date is used as reference date. ***See*** BoM – Validity period *(beas 9.1 PL: 08)*. Additional calculation methods are supported, but these are available only in APS module. *beas9.0-004-046-000 calcstdmtd 0=Backwards calculation, 1=Item duration time*
Priority	Click on the "Edit Priorities" button to configure the priorities
Production Start from time	Determines from which time of day the forward scheduling starts its calculation. ***Example***: planned start is March 3rd, 8:00. Forward scheduling calculates starting with March 3rd, 8:00. This setting is only considered by forward scheduling. **Important:** This settings has no further effect - it does not determine a shifts end. The shift is determined or calculated in the resource. ***See*** Resource – Scheduling – Planned capacity Resource shift schedule
Production End till time	Determines from which time of day backward scheduling starts its calculation. ***Example***: The scheduled completion date is March 13rd, 15:00. The backward scheduling calculates starting with March 3rd, 15:00. **Important:**

© 2026 Boyum IT Solutions A/S

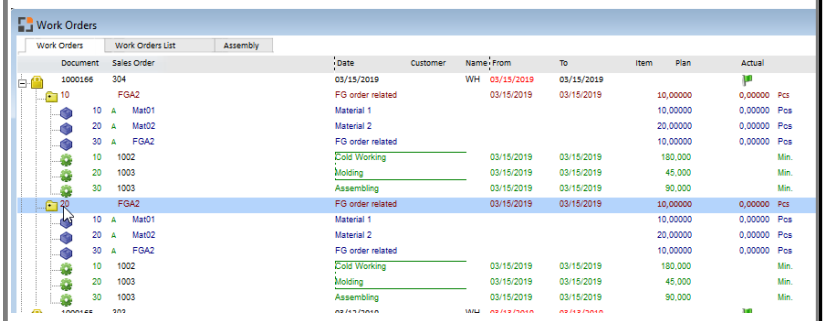
	This settings has no further effect, it does not determine a shifts end. The shift is determined or calculated in the resource. ***See*** Resource calculation video Resource – Scheduling – Planned capacity Resource shift schedule
Consider factory calendar for transit time	If enabled, calculating transit time, the factory calendar (basis calendar) is considered. **Important:** The resource calendar is not considered. Independent of the available time, the resource calendar always has a time slot of 24 hours. By default, option is disabled. ***See*** Resource – Transit time Concept transit time and idle time *beas9.0-000-003-006*, *kapahandovertimecal (N)*
Consider factory calendar for idle time	If enabled, calculating idle time, the factory calendar (basis calendar) is considered. **Important:** The resource calendar is not considered. Independent of the available time, the resource calendar always has a time slot of 24 hours. By default, option is disabled. ***See*** Routing – Idle time Resource – Transit time *beas9.0-000-003-006*, *kapalaytimecal (N)*
Activate pool administration	**Enable**: Pool management is available to control the sequence in which operations are processed. **Disabled**: Pool management and pool list are not available.
Pool calculation multiplier	A factor can be set in the production priorities. This factor is multiplied by the number of days defined here. The value is used to "age" a position, allowing its priority to increase. ***See*** Introduction Pooling Function Pooling, Scheduling

© 2026 Boyum IT Solutions A/S

	Priorities
Overlap limit fix (only Forward Scheduling)	Overlap limit fix parameter This setting is related to Overlap function If checked, the overlapping time is fixed. Therefore, the subsequent operation will start exactly at the defined time. Normally, if an overlapping time is defined in an operation, the subsequent operation can start after the defined time. It can also start later if the resource is not available at this time. This behavior can be changed with the "limit fix" global setting. In this sense, the system will find a starting time for the two operations where the starting of the 2nd operation exactly corresponds with the defined overlapping. Do the following setting in the Configuration wizard: activate "Overlap limit fix" (only Forward Scheduling):  *Window system_option_struktur.psr* ***Example*** for Planning:

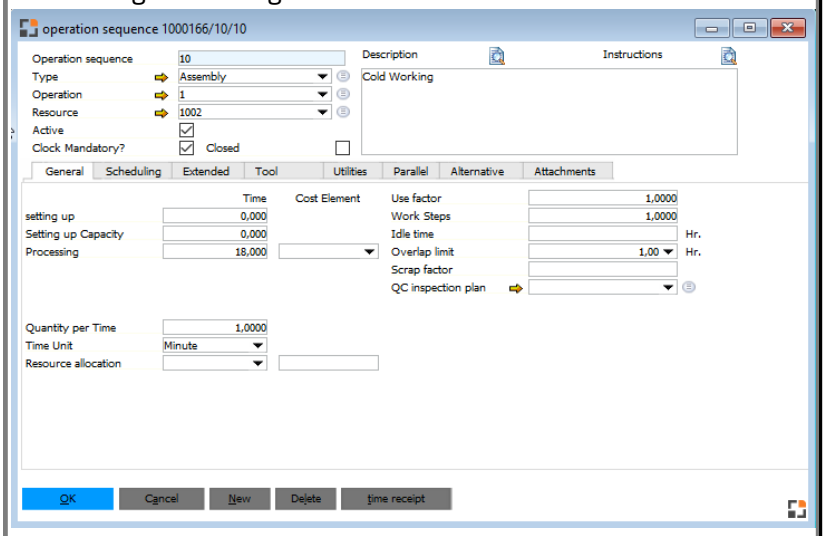
© 2026 Boyum IT Solutions A/S

The WO used in the Gantt viewer below:

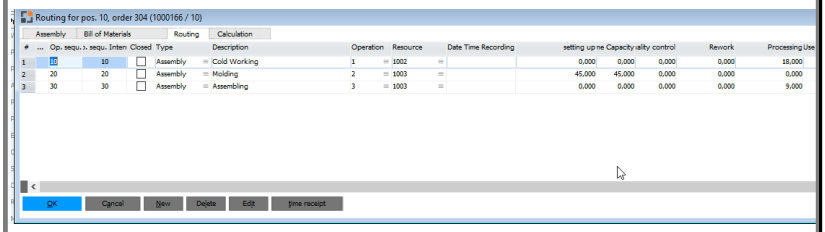


Window fert_struktur_browse.psr

The settings in routing:



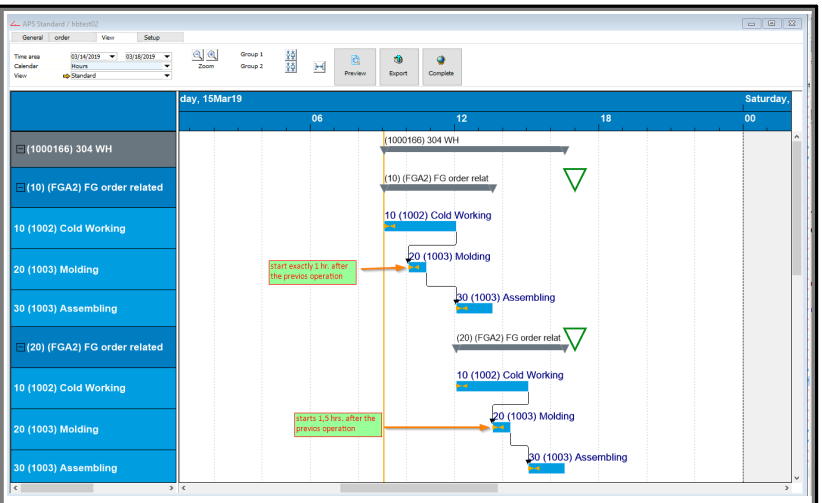
Window fert_arbplanos_edit.psr



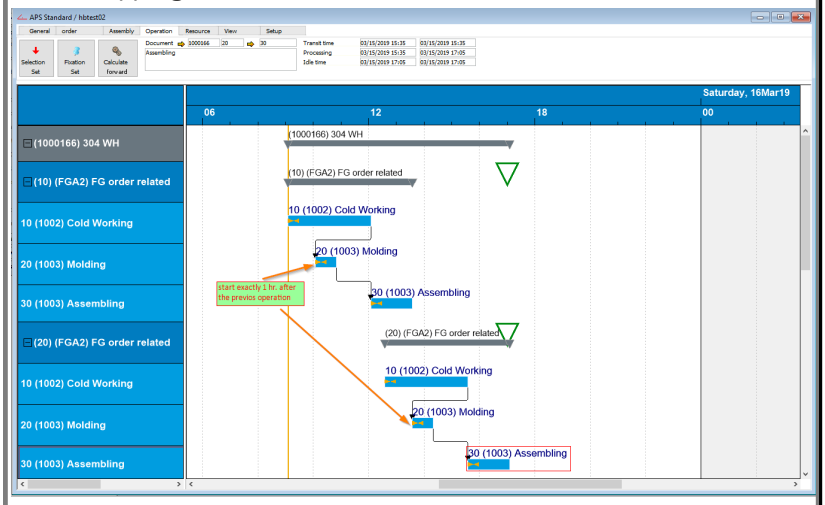
Comparison of the two results: without and with the Overlap limit fix settings:

1) Overlapping not fixed (the default behavior):

© 2026 Boyum IT Solutions A/S



2. Overlapping set to fixed:



Limitation: Max. 2 parallel / overlapped operations

Two consecutive operations are not allowed. This means that if overlapping is defined for an operation, the next operation cannot overlap.

The second following operation may be overlapped again.

WRONG:

© 2026 Boyum IT Solutions A/S

	CORRECT: **Note: Not possible with same resource** It is not possible to use same resource in parallel / overlapped operation. In this case the system ignore the overlap / parallel setting Example: Pos 10 use Resource a, Overlap =1, Pos 20 use same Resource a In this case the system ignore the Overlap information.
Activate APS	This setting activates APS and disables MS Project support.
Overwrite planning indicator	Scheduling options in beas, if work orders are marked as planned. Choice: Yes / Yes, after query / No Additional information ***see*** Work order.
Pool list: shown only planned WO	If the option is activated only work orders which are set to planned are displayed in the pool list.

Item master - Quality control

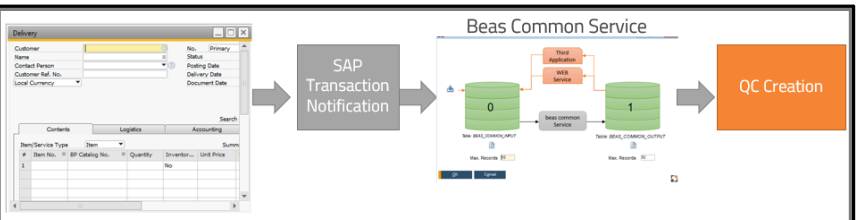
3.1.3.7.1 Create new QC

PATH: Administration > System Initialization > Configuration wizard > Quality control.

Parameters

Name	Description
Enable QC Orders from SAP transactions	Allows to create QC orders without running Beas Define concept of creation of Quality control orders If Beas creates a transaction, the system generally creates the QC order directly. If you create an SAP Transaction with running Beas application, Beas creates the QC order, as well. **Enabled:** If this setting is activated, it is possible to create QC Orders without running Beas Application, for example when creating a Sales Delivery document. Concept: If the document is not created by Beas, the transaction notification sends a command to Beas Common Service and this service creates the QC Order.

© 2026 Boyum IT Solutions A/S



For this you must start a Beas Common Service. ***See*** Beas Common Service

Note:

If a Service creates a QC order, some functions are not available. ***See*** Notes in QC Inspection Plan.

Conditions of QC orders - pop-up question from the inspection plan - are not available in Service mode.

As the QC order is not created directly, completion may take up to a couple of seconds.

Beas 2020.05 qcbytransaction, default N

Create QC Order at booking

Determines under which prerequisites a QC-order should be created

On each warehouse:
Irrespective of the storage location, a QC order is generally created where the goods are received if a QC plan for the receipt of the goods is stored for each item.

Only to QC warehouses:
A QC order is created only when goods are received at a QC store and a QC plan is stored with each item.

This relates to all kinds of goods receipt (production, manual, purchase)
See Goods receipt

Note: A QC order is only created if the posting was made in Beas, or via Beas-WEB-Terminal, or using Beas-interfaces (e.g. Beas-common).

Creating a QC-order from outside, for example via B1iF or data import, then no QC-order will be created.

© 2026 Boyum IT Solutions A/S

	Note: This switch has no effect if the order is to release batches, or if the QC order is order-related. ***See*** Batches to be verified
QC Order create per	For all kinds of postings: for what QC order are created: posting in (document) / Item and batch / Batch **Per document:** For each line of the posting document a new QC order is created. The QC order receives the order number, origin type + docentry + linenum If more than one batch was posted in the posting document, only one QC order is created. For batches it is possible to release each batch separately, but it is not mandatory to check each batch. Origin type is indicated with a letter: W= goods receipt from purchase, F=work order, E=posting in manufactured assembly, C=generated by batch check R=return, M=manual posting **Per item-batch / per batch:** Per item and batch or only per batch a QC order is created. The ID is: "B:" + batch number The QC-order is created only, if no active QC order for this batch or item exist. If more than one batch is defined in Goods receipt or the posting line, a separate QC order is created for each batch entry. The following columns establish a link to the goods receipt document Basis-Type, Basis-Order and Invisible, Basis-Docentry, Basis-linenum. In case of goods issue for production there is an additional basis reference: secondary reference is the posting document, primary reference is the work order. This is displayed in the field „reference“. If there is no primary reference, the secondary reference is displayed there. Furthermore, the project code, employee number, the station, BEAS-version and the program user (ousr.internal_k) who created the QC order, are deposited. Thus, everything can be traced if the order was registered via terminal or WEB Apps. For existing QC orders, this

© 2026 Boyum IT Solutions A/S

	information is not added, because it cannot be subsequently determined. ***See*** Quality control order
Security query from 200 entries	At new creation of a QC order, a recommendation is issued in case that more than 200 samples would be generated. By default this setting is enabled. If disabled, there is no more recommendation given.
Directory for Copy documents	Target folder for saved copies **From Beas9.0-000 Patch 3** If in **QC-inspection plan > Files** the option "Copy" is selected, the respective file is copied to this folder when creating an inspection plan. The target file name is the source file name + an internal counter with 6 digits. ***Example:*** Source file name: Summary0104.xlsx Copied file name: Summary0104_000001.xlsx **Until beas9.0-000 Patch 2** If a folder is selected here, all attachments stored in the inspection plan and needed for the generated quality control order are copied to the specified folder with a unique name. ***Example*** of use: store Excel-files for additional registration which are filled later during processing the QC order. **Important**: Select a folder which has been released for all users. ***see*** Edit QC-order *Variable: qsdoctree*

see

Quality control

Goods receipt

© 2026 Boyum IT Solutions A/S

3.1.3.7.2 PO Goods receipt

PATH: Administration > System Initialization > Configuration wizard > Quality control.

Parameters

Name	Description
PO Goods receipt post to warehouse	Define the purchase warehouse to which goods are posted, if "only QC-warehouse" is set at "create QC-order at posting". Only warehouses of goods receipt type can be selected. **Administration > Setup > Inventory > Warehouses- Button Extended** > create new warehouse, select goods receipt type and save. This settings affects Beas PO goods receipt. Note: In warehouse management, a goods receipt warehouse can also be defined. That one has a higher priority. ***See*** Edit warehouse master data Goods receipt – Field description
Only book to QC inspection plan if	Define the behavior of BEAS Goods receipt PO **Only if QC plan exists:** A posting on a QC-warehouse is made only if the affected item has deposited a QC plan, otherwise a goods receipt is posted to the warehouse which is stored in the order. **Always:** Independent of whether a QC-plan exists or not: goods are always posted to the incoming goods warehouse which was defined at "Incoming goods at warehouse" *Variable mw_wareneingang_qsy i=allways, n=only if qc plan existing, default i*

3.1.3.7.3 Production

PATH: Administration > System Initialization > Configuration wizard > Quality control.

Parameters

Name	Description
Create QC Order automatically when	A QC plan can be stored in a work sequence. Choose at which moment the QC order should be created:

© 2026 Boyum IT Solutions A/S

	Manually: Only manual creation **At time receipt**: Creating during the first "Time receipt" **At login to work order**: Creating during the first logon (not the first time receipt) **WO creation:** At new creation of a work order *(beas9.0-000-003-001)* **WO creation (Background):** If the Beas Common Service is active, the creation process is moved to the service. *(Beas 2025.06)* **External operations** If dealing with an external operation, the option is supported. **At order logon**: Creating a purchase order. **At time receipt**: Creating goods receipt. Note: for external operations, there is no link from the QC order to purchase or goods receipt. Only a link to operation. That means there is always only one QC order per operation with any number of samples. A dependency from external operation-goods receipt cannot be created. ***See*** Routing Production – operation sequence Quality control order *(Variable fert_qsanlage, m (default) = manually, r = at time receipt, s = at order logon, c=at new creation)*

3.1.3.7.4 View QC inspection plan

Setting for QC Inspection plan ***See*** Edit QC-order

PATH: Administration > System Initialization > Configuration wizard > Quality control.

Parameters

Name	Description
Change with reason	Activates the entry of a reason for a change If enabled, always a query for the reason of a change is performed This happens at: QC-inspection plan QC-Measurement position

© 2026 Boyum IT Solutions A/S

	QC-attachments (images) Not at import, mass changes, change of documents *beas9.0-004-011, Variable changelogqc*
Name UDF 1...4	User-defined fields 1 to 4 for - QC Inspection Plan - QC Order

3.1.3.7.5 View Item QC Order

UDF for Link between Item Master Data and Quality Control.

PATH: Administration > System Initialization > Configuration wizard > Quality control.

Parameters

Name	Description
Name UDF 1 – 4	Free available fields. Window Item Master Data Tab Quality Control

3.1.3.7.6 View Samples

UDF for QC-Samples

PATH: Administration > System Initialization > Configuration wizard > Quality control.

Parameters

Name UDF 1 – 4	Freely available field User-defined field for Window QC Order -> Input per Sample

3.1.3.7.7 View Measurment Positions

UDF for QC-measurement positions

PATH: Administration > System Initialization > Configuration wizard > Quality control.

Parameters

© 2026 Boyum IT Solutions A/S

Name	Description
Name UDF 1 – 4	User-defined fields for QC Plan – Measurement Position QC Order – Measurement Position

3.1.3.7.8 Batches

PATH: Administration > System Initialization > Configuration wizard > Quality control.

Parameters

Name	Description
Release: Date of Production	Setup manufacturing date. **Date of release:** Production date is set to release date **Not edit**: Manufacturing date of the batch is not changed if there is a manufacturing date. Otherwise the release date is used.
Release: Date of entry	Setup date of receipt **Date of release:** Date of receipt is set to release date. **Not edit**: Receipt date of the batch is not changed if there is one. Otherwise the release date is used.
Release: Expiration date	Update the expiration when batches are released ? **No edit**: the existing expiration date is not modified **Date of release + Item shelf in life days**: the existing expiration date is updated. If the field "shelf life in days" is set to 0, the date will not be changed.

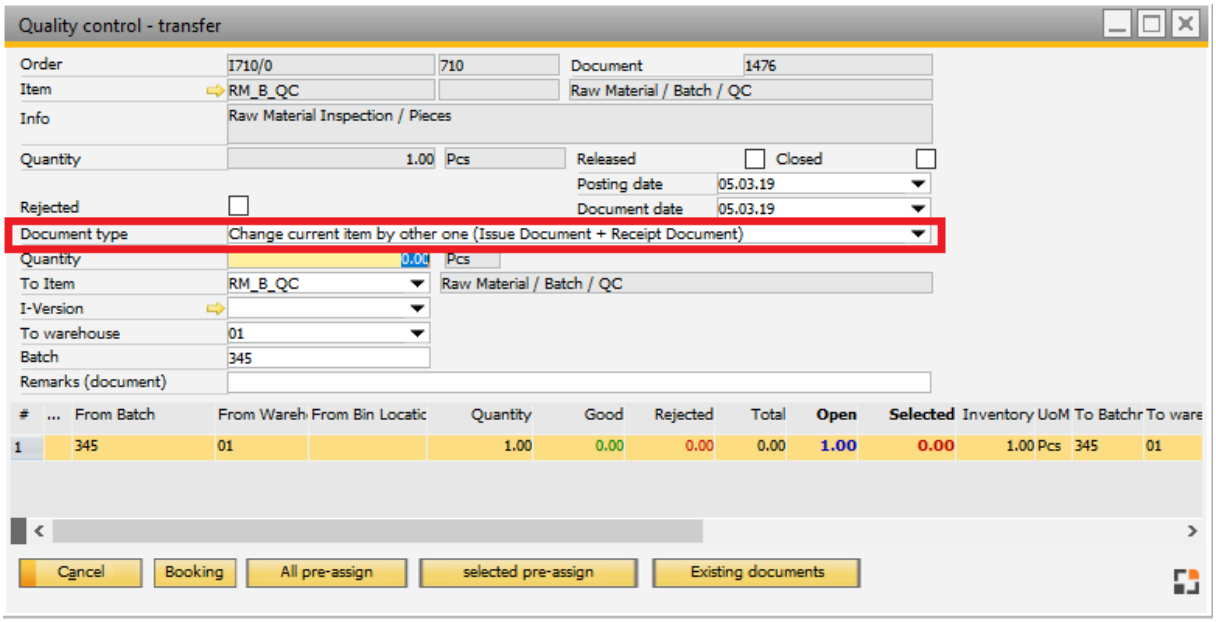
3.1.3.7.9 Transfer

In QC Transfer goods to be checked can be transferred from the QC warehouse to the release warehouse.

PATH: Administration > System Initialization > Configuration wizard > Quality control.

This parameter is used when "Issue Document + Receipt Document" was selected in the Quality control – transfer window:

© 2026 Boyum IT Solutions A/S



See Concept Work with QC-warehouse

- Further price descriptions:

Various pricing types can be set up in the Configuration wizard, in Pre-calculation and Post-calculation.

Valuation method	Area	Description
Posting price	Post-calculation	The actual posted price is summarized. If a foreign currency was used, it is converted at the moment of posting. If another item was posted than what is specified in the BoM, its posting price will not be considered for pricing. In Planned costs, the last posted price of the BoM is used.
Precalculation	Pre-calculation	Corresponds to the price entered in the production BoM item. This is to the price of the pre-calculation from which the work order was generated or according to the pricing, which was set up in **Configuration Wizard > Calcualtion > Precalcualtion**. The price is determined at the moment that the work order is created. In a production BoM item, the price is visible only if **Production > View > BOM > Prices changeable** is enabled.
Last purchase	all	Corresponds to the price according to SAP Business One – last

© 2026 Boyum IT Solutions A/S

price		purchase price. All types of inflow are considered (credit vouchers, manual postings). If the price is stored in foreign currency, it is converted at the rate of the last goods movement.
Last valued price	all	In SAP Business One **> Report selection > Warehouse management > Stock valuation Simulation** a price can be calculated with different methods. The valuation method refers to the price determined there.
Calculation price	all	Corresponds to the price in Beas **Item master > Calculation > Calculation price**. It can be calculated regularly using batch precalculation, and then can be used as template.
Source Item - Actual cost	QC Transfer	The system reads the price from the issue document of the original Item. **Note:** this price only applies when QC Transfer > document type "Issue + Receipt" was selected.
Source Item - Price from Entry	QC Transfer	The system applies the price of the last entry of the original. **Note:** this price only applies when QC Transfer > document type "Issue + Receipt" was selected.
Item valuation method	all	Valued at the item valuation price. **Note**: With the FiFo or Serial / Batch valuation method, an average price valuation of all goods on stock is performed. Fore more information ***see***: Item master – Valuation method. When applying Batch split with serial/batch valuation method, consider that Goods issues will be created according to the SAP serial/batch valuation method. However, Goods receipts are generated according to average price valuation. ***Example:*** An Item has 2 batches BN001 - 10 units x 10€ = 100€ BN002 - 10 units x 5€ = 50€ **Using the Batch split function:** Split 5 units of BN001 to BN002 (the system issues 5 units of BN001, then receipts 5 units of BN002)

© 2026 Boyum IT Solutions A/S

		Cost of the goods issues of BN001 is calculated by SAP (using batch/serial valuation) as 5 units x 10€ = 50€ Cost of the goods receipt of BN002 is calculated as average price of all batches in stock at the moment the goods receipt is going to be created. BN001 5 units x 10€ = 50€ BN002 10 units x 5€ = 50€ Cost average at the goods receipt is = (50 + 50) / 15 = 6.66666666€
Price list	all	The price is according to the selected price list. Price list extensions are considered. Details: If the price is stored in a foreign currency, it is converted at the daily exchange rate to the local currency. A gross price list is considered only in the goods receipt, as well as for posting transactions. In pre-calculation and post-calculation items may not be valued with a gross price list. **Note**: Beas only supports price list with numbers 1–99. Price lists with internal id > 99 are not supported. Note: Beas supports Item Unit Groups in the following way: **Price list: last purchase price** *(Beas 2022.09)* Item without Unit Groups always takes price in Inventory UoM. Item with Unit Groups: In the Item Master data you can define the Purchase Unit,

© 2026 Boyum IT Solutions A/S

		Pricing unit and Inventory unit. You can create a purchase order in many different UoMs and SAP saves the last purchase price for every UoM separately. This means: You can have many different last purchase prices. Beas supports price definition in a different unit of measure than the inventory unit. *(Beas 2025.04)* If a last purchase price exists in the pricing unit of this item, it has higher priority. Beas converts this price automatically to price in Inventory unit. **Other price lists, special price lists** Beas does not support property "Pricing Unit". The system ignores all special price lists if the pricing Unit is not the stock unit. Beas reads a price from a price list or special price list only if Item-Pricing Unit, Item-UoM Code and Price list UoM Code are the same. Last price from goods receipt	all	Relates to Purchase – Goods receipt. If there is no goods receipt, the last purchase price is used as reference (conversion at daily rate). If there is no price, the item is valued at 0.

Special case: Precalculation – consider special price lists

If the *consider special price lists* option is enabled in the Configuration Wizard, the pricing is extended:

- If there is a special price list for a supplier, it is used as a reference.

© 2026 Boyum IT Solutions A/S

- If there is no special price list for a supplier, then if the supplier has their own standard price list, it is used as a reference.
- If none of the above is true, the pricing is done according to the settings.

This refers to the Precalculation and creating the work order, which uses the same default as a reference.

3.1.3.8 Materials management

PATH: Administration > System Initialization > Configuration wizard.

Parameters

Name	Description
Batches Administrate	Activate when working with batch-managed items. All other settings related to batch management are only displayed if this option is activated.
Serial numbers Administrate	Activate when working with items managed by serial numbers. Settings for serial number management are displayed only if this option has been activated.

3.1.3.8.1 MRP Wizard

PATH: Administration > System Initialization > Configuration wizard > Materials management.

Calculation

Forecast

View

Parameters

Name	Description
Default Order recommendation	If an inventory history is displayed for an item, the result of the last MRP calculation is also displayed. You can determine here which order recommendation should be considered for the inventory history.

3.1.3.8.1.1 Calculation

PATH: Administration > System Initialization > Configuration wizard > Materials management > MRP Wizard.

Parameters

© 2026 Boyum IT Solutions A/S

Name	Description
Average lead time	If a delivery date is specified in the customer order or in the reserve invoice, the requirement is somewhat earlier as the delivery date must be considered. Here you can specify in work days how many work days the average delivery takes. The MRP run always displays the required date calculated in this way, not the delivery date. This setting is also considered when creating work orders from sales orders.
Lead time assurance	In addition to the lead time, the number of calendar days which should be subtracted. ***See*** Calculate Order recommendation date
Goods receipt PO idle time in workdays (Purchased items)	☐ Consider idle times of purchase parts If purchase parts should be acquired earlier than the replenishment times indicates, you can enter the number if days to be subtracted from the computed purchase date. Purchase date is computed as follows: Requirement date - delivery time as per item master - goods receipt idle time = Purchase date Note: The requirement date is not changed. If a purchase order is created, the requirement date is stored. "Goods receipt idle time" is then not taken into account. ***See*** Calculate Order recommendation date
Priority control	Defines the order of priority control In the item master data, a priority can be stored for each item. In the MRP view, items can then be sorted by priority. This defines whether a higher number has a higher priority or the other way around. Assemblies pass on their priority to the necessary materials. The priority stored in customer order overrides the priority in master data. ***See*** Customer order – Priority Order recommendation list
External operation calculate	☐ Calculates the external service required for sales orders

© 2026 Boyum IT Solutions A/S

	Only Expert mode. This option is deactivated by default. **Warning:** The function is provided for compatibility reasons and should not be activated. If active, you can call up the List of external services in the list of planning scenarios.

3.1.3.8.1.2 Forecast

This area contains options for computing forecasts. Affects the order recommendation report.

PATH: Administration > System Initialization > Configuration wizard > Materials management > MRP Wizard.

Also see:

Forecast (SAP)

Planning scenarios – Planning

Planning scenarios – Detail – Forecasts

MPS

Parameters

Name	Description
Forecast consider	**Based on SAP Business One standard** Low priority in requirement coverage calculation, customer orders are subtracted. • Offset against existing customer orders • Requirement coverage is calculated with lower priority than customer orders **Like planned customer order** The same priority is given for the forecast in requirement coverage calculation as for the customer orders. Issues of customer orders are not subtracted, forecasts from the past are always considered. • Offset against existing customer orders, if "Consume Forecast" is set to 'Yes' on sales order line • Requirement coverage is calculated with the same priority as customer orders Choosing this option hides all additional options for the forecast calculation, because these have no consequence anymore. If in

© 2026 Boyum IT Solutions A/S

	an older version of beas at special forecasts "all" was entered, this is now interpreted as "like customer order". Note: If , the "*consume forecast quantity*" switch was disabled in a Sales order, there is no offset against existing customer orders.
Pre call time for forecasts	An average delivery time can also be specified in work days for forecasts.
Requirement in the period	**Descending:** Apply a percentage of the requirement on the remaining days. **Constant:** Requirement is always the total quantity. **Ignore past:** Requirement is applied to the first day of period. ***Example:*** Today is 25th November of 2016 and there are 2 forecasts, one by week and second one by month. Quantity for both forecast are 100 Pieces. An MRP executed today provides the following results. **Calculation By Week** Descending: Quantity = 42,85. We apply a % of pending days. Complete week days are 7, pending days are 3 (Today is Friday 25) then 3(days) * 100(Pieces) / 7(days) Constant: Quantity = 100. We can execute the MRP each day of the week, the result is the full quantity. Ignore past: Quantity = 0. Quantity is considered only on the first day of period (In our example day 21 of November, first day of the week). **Calculation By Month** Descending: Quantity = 20. We apply a % of pending days. Complete month days are 30, pending days are 6 (Today is friday 25) then 6(days) * 100(Pieces) / 30(days)

© 2026 Boyum IT Solutions A/S

	Constant: Quantity = 100. We can execute the MRP each day of the week, result is the full quantity. Ignore past: Quantity = 0. Quantity is considered only on the first day of period (In our example day 1 of November, first day of the month).
Consider past	Open sales orders in the past are offset against forecasts.
Consider delivered customer orders	Consider partially delivered or fully delivered sales orders in the current period.
Consumption method	The customer orders are deducted from the forecasts. The behavior is configured here. Settings **Total time range:** The planned requirement is first deducted from the oldest forecast (backward – forward) The entire time range applies. **Definable time range:** The behavior can be further configured. The options "Direction", "Days Backward" and "Days Forward" are shown for this purpose. Depending on the direction specified, the customer order quantity is deducted from either the first or last forecast. Only the "Customer order delivery date" period less the number of calendar days (forward and backward) is considered. For the time range, an average delivery time is not deducted from the delivery date or the forecast requirement date. The setting is configured using **SAP > Administration > System Initialization > General Settings > Inventory > Planning** Activated "*Consumption forecast*" means "*Definable time range*". Deactivated "*Consumption forecast*" means "*Entire time range*". This behavior can be deactivated by specifying the forecasts, and therefore solved in a different way than in SAP. Differences between SAP - and Beas forecast consumption methods Example Environment: • Forecast defined by months and MRP period defined by months. • Sales order in the specific date 16/02 • Days Backwards/Forward defined as 3/3

© 2026 Boyum IT Solutions A/S

	Beas: When the February period is processed, the system searches for a forecast in the period + days forward and backwards. In this example: • Period: 1/02 - 28/02 • Days backwards: 3 • Days forward: 3 **Result: 29/01 - 3/03** *SAP:* • Result to searching the forecast is: **13/02 - 19/02** This difference can affect the results in SAP and Beas to obtain a different result for the forecast consumption.
Direction	Specifies the direction in which the forecasts should be reduced. Only visible if consumption method was activated as "*Definable time range*".
Days forward, days backward	Specifies the period from the delivery date of the customer order during which the forecasts should be reduced. Only visible if consumption method was activated as "*Definable time range*".

.

3.1.3.8.1.3 View

PATH: Administration > System Initialization > Configuration wizard > Materials management > MRP Wizard.

Parameters

Name	Description
Choose Supplier	Defines which suppliers can be selected This setting is considered in: • MRP wizard • Precalculation • Purchase request

© 2026 Boyum IT Solutions A/S

	<table><tr><th>Selection</th><th>Setting</th><th>Description</th></tr><tr><td>All</td><td>A</td><td>All vendors are displayed in a drop-down list  </td></tr><tr><td>Catalog</td><td>K</td><td>Only vendors with a catalog list for this item are displayed</td></tr><tr><td>Price List</td><td>P</td><td>Only vendors who have a price list for this item are displayed</td></tr></table> Attention: For external processes the view can be defined in External production. *Variable: mrplieferant*
Update directly	Affects the function in **Order recommendation view > Calculation update**: If this option is activated, orders to cover requirements (e.g. work orders) are inserted directly. When a work order or purchase order is created and this option is activated, the system executes an MRP recalculation **only** for the selected item. There is no calculation of the associated material positions. Calculation is very memory intensive, meaning the process takes longer when this setting is active. *Variable: mrpaktualisieren*
WO Summary	Allows multiple assemblies to be consolidated into a work order. *Variable: mrpfasammel*
Filter 1 Filter2, Filter 3 (Text#SQL-Filter)	Additional filter for Order recommendation view Up to 3 additional filters can be set up, and can be selected in **Configuration Wizard > MRP wizard > View: "Filter 1-3"**

© 2026 Boyum IT Solutions A/S

	Configuration:
	`Description#SQL-Fragment`
	Linked tables: `OITM, BEAS_MRP, OCRD`
	
	Example:
	Display only items with property 1 active.
	`Property 1#"OITM"."QryGroup1"='Y'`
	See Order recommendation – View – Filter
	Variable: mrpfilter1, mrpfilter2, mrpfilter3

3.1.3.8.2 Purchase request

Settings for purchase request.

See Purchase request

PATH: Administration > System Initialization > Configuration wizard > Materials management.

Parameters

Name	Description
Purchase request type	Define which Purchase request system should be used in MRP This is related to MRP – Order recommendation  *Window mrp_view_masterrahmen.psr* **Purchase request** (= create Purchase request) button **Report Purchase request** button

© 2026 Boyum IT Solutions A/S

SAP Variant settings -> use Standard SAP Variant

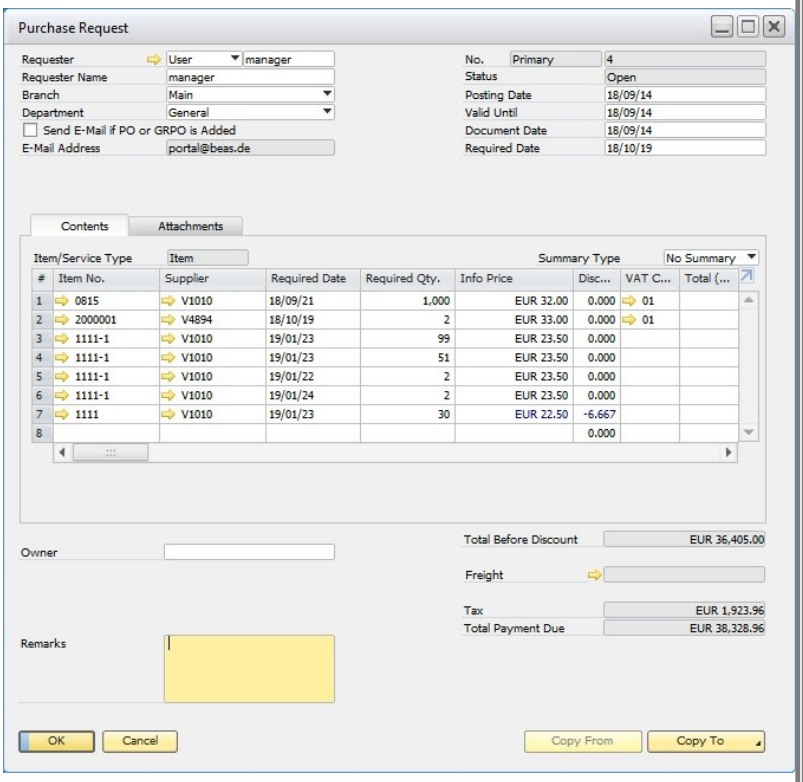
From 2020 versions we split the SAP Variant settings to:
- SAP Variant - Add to existing (Default)
- SAP Variant - New Purchase Request

Setting	Description
SAP Variant - Add to existing (Default)	The system searches for an existing open document for the same requester, and the dates are the same in which it adds the request. If no purchase exists, it creates a new one with "Valid to" = today + 30 days. Note: - Requester must be the same - Purchase request must be open - Valid to Date from Purchase request must be tomorrow or later - will always use the latest existing purchase request - "Valid to" must be smaller as the defined delivery date.
SAP Variant - New Purchase Request	It always creates a new SAP purchase request document. Note: Purchase requests are generated per line regardless of how many lines are using the same supplier.

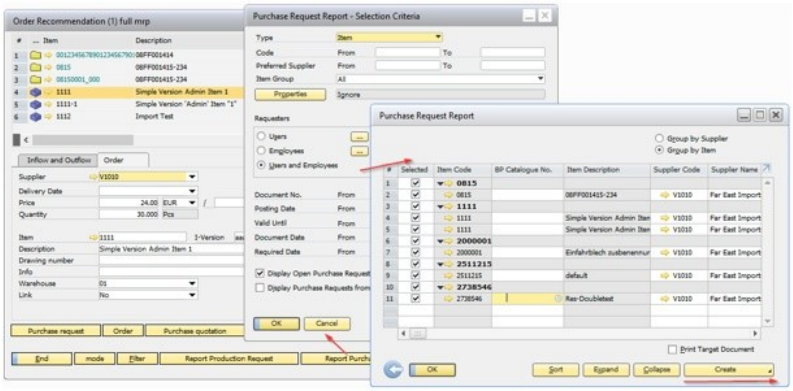
The **Purchase request** button directly creates a new SAP Purchase request document.

© 2026 Boyum IT Solutions A/S

If an open Purchase request for the current user is existing, Beas inserts the request in the existing document.



The **Purchase request** button opens the related SAP Report window. From this you can create a Purchase quotation and Purchase order.



Beas Variant -> use Beas integrated purchase request

© 2026 Boyum IT Solutions A/S

	 The Default Variant is the SAP Variant. If you make an update and used Beas Variant in an older Beas Version, then the Beas Version is the default Variant. If you do not require a special functionality, which is only inside the Beas Variant, you can simply use the SAP Variant. *beas 9.3 PL 2*
udf1 ... udf4	Free available fields for Purchase request window. Only available if Beas purchase request variant is active. How to use: ***See*** Order recommendation – work with UDF. *Variable: poreq_udf1 ..4*

3.1.3.8.3 PO Goods Receipt

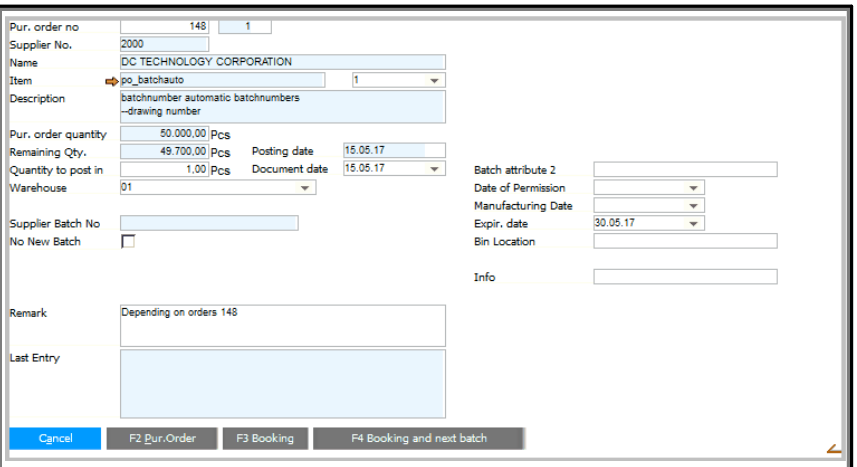
Setup options of the Configuration Wizard in **Materials Management > Goods Receipt** which have effect on the function materials management – goods receipt.

PATH: Administration > System Initialization > Configuration wizard > Materials management.

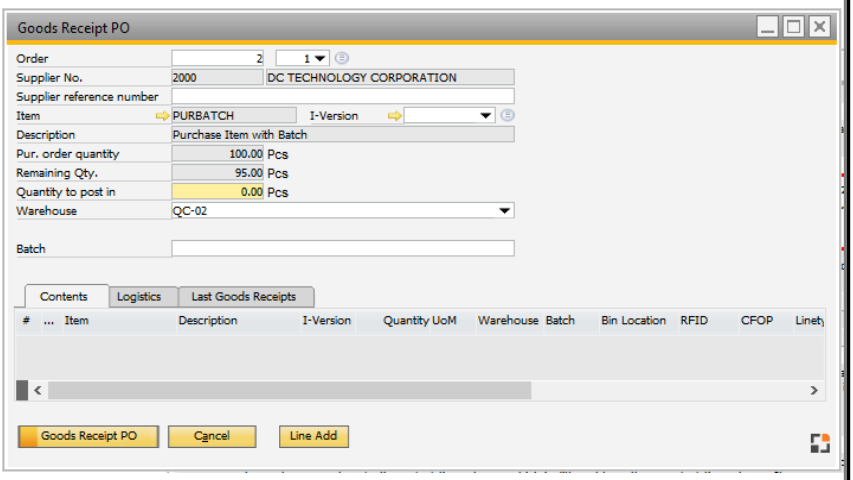
PO Goods receipt type

Name	Description
Goods Receipt PO type: Single / Multiple	Determines which Goods receipt functions are called **Single**: Per purchase order row one goods receipt is created.

© 2026 Boyum IT Solutions A/S



Multiple: (Default setting) several purchase order rows can be posted in with one goods receipt document.



Window mwgoodsreceiptpo_edit.psr

For further details: ***see*** Purchase – Goods receipts

Batch Management

Field	Description
Number Assignment	This entry determines the layout of the batch number. For settings, ***see*** batch generation
Batch Counter	This option defines which batch counter should be used.
Batch status without QC Order	Batch status on production receipt if no quality control is stored in the item for this transaction. Choice: **Unlocked / Access denied / Blocked / Default**

© 2026 Boyum IT Solutions A/S

	For the "Default" setting, the status "Basic setting of batch status" is used. Note: This status can be overwritten in the script "workordermanagement:receipt" with the variable `e_status` e.g. `setvar=e_status=2` blocks the batch.
Batch status with QC Order	Batch status on production receipt if quality control is stored in the item for this transaction. Choice: **Unlocked / Access denied / Blocked / Default** For the "Default" setting, the status "Basic setting of batch status" is used. Note: If "Default" is not set, the definition cannot be influenced by script.

Serial Number

Field	Description
Form to create xxx = serial no.	Specifies the template for the structure of the serial numbers. For more information ***See*** Batch Management, Goods receipt
Counter reading	Counter reading for serial number generation.

Pricing

Field	Description
Pricing	Defines which price should be used for goods receipts. Choice: "**Like Purchase Order**" (Default) / **like selection**.

Quality control

Field	Description
QC order Open	If enabled, in purchase - goods receipt the registration screen is opened after the creation of a quality control order. Settings **No** (default): registration screen is not opened **Yes**: master data sheet of the QC order is opened

© 2026 Boyum IT Solutions A/S

	Yes, by piece: tab "by piece" is opened. Note: switching to master data sheet is not possible! **Yes, by test**: tab "by test" is opened. Note: switching to master data sheet is not possible! **Yes, by test - last sample**: the registration for the last sample is opened Note: Option has effect only in Beas Goods receipt - Single Process, because at most one item can be registered. In WEB-App, "Multi Goods receipt" or "SAP-GRPO" this option cannot be used.

3.1.3.8.4 Manual Entries

PATH: Administration > System Initialization > Configuration wizard > Materials management.

Parameters

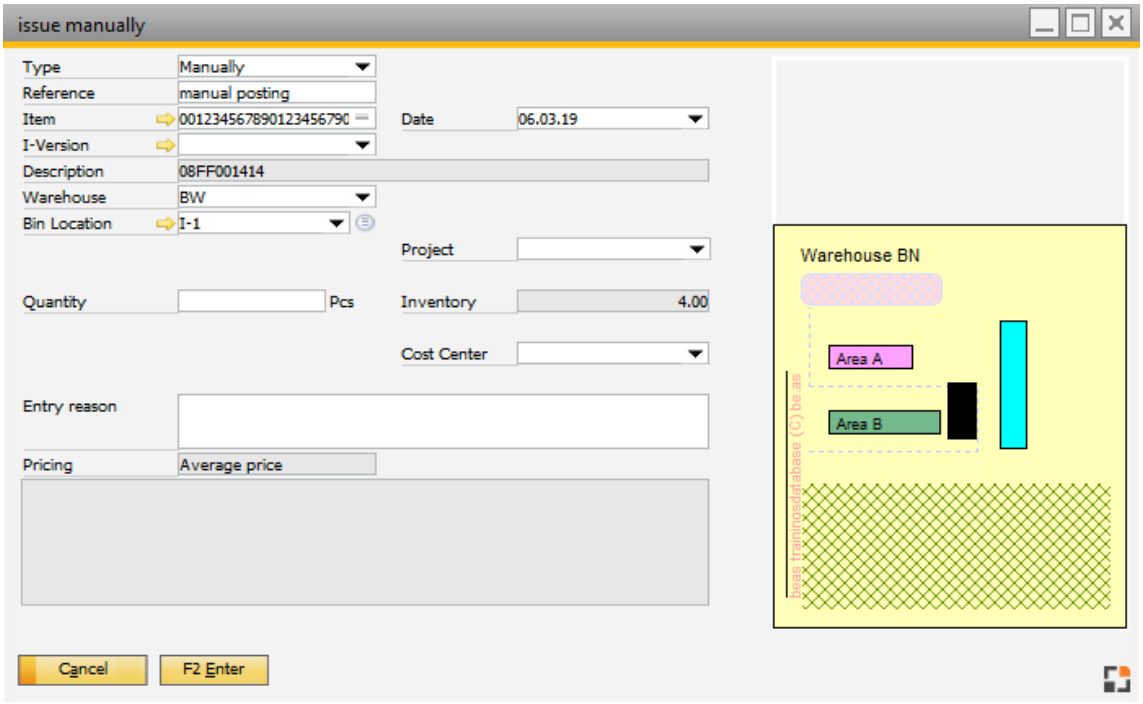
Name	Description
Purchased Items Pricing Booking	Defines the pricing on receipt of purchased items. (Not configurable for standard costs method) If Basic Initialization - Use Perpetual Inventory is disabled: The price for issue documents.
In-house Production Pricing Booking	Defines the pricing on receipt of assemblies. This pricing is used at Goods receipt of assemblies If Basic Initialization - Use Perpetual Inventory is disabled: The price for issue documents too Note: If the receipt occurs with type "Production", the valuation form stored in Configuration wizard – Production is used. The pricing defined here is also used there if the option "book like manual" is stored there. ***See:*** Pricing – Types, Concept: Valuation of assemblies Not configurable for standard costs method.
Allow Booking without prices	This option determines whether receipts with 0 price are allowed.

© 2026 Boyum IT Solutions A/S

At shortfall below minimum stock	This option determines what happens at shortfall below the minimum. Choice: **Without warning / Only warning / Block release**
Inventory Management by Warehouse No.	This option determines whether inventory management (minimal inventory, maximum inventory) should be done by warehouse. This is only for a template for creating new items, as this option can be changed again separately in the item master.
Transfer postings on business partners	Optional: Select a business partner (default: empty).

Account setting

Relates to materials management – goods issue and goods receipt column "Type"



Window mw_manuell_buchen.psr

Reference "Correction" or "manual". Following selections are possible

manual
Production
Correction
Inventory

(For production postings, the WIP account is always used)

Following account assignments are configurable:

© 2026 Boyum IT Solutions A/S

Name	Description
Manual receipt	Relates to postings with the reference "Manual" and "Inventory". G/L account for material credit. Default: "Inventory offset - Increase account.
Manual outflow	Relates to postings with the reference "Manual" and "Inventory". G/L account for material debit. Default: Inventory offset - Decrease.
Correction inflow	Relates to postings with the reference "Correction". G/L account for material receipt. Default: "Inventory offset - Increase account.
Correction outflow	Relates to postings with the reference "Correction". G/L account for material issue. Default: "Inventory offset - Decrease.

Valuation of assemblies (Concepts)

3.1.3.8.5 Complaint

PATH: Administration > System Initialization > Configuration wizard > Materials management.

Parameters

Name	Description
Counter Customer complaints	Current counter status for customer complaints
Counter Supplier complaints	Current counter status for supplier complaints
Counter Internal complaints	Current counter status for internal complaints
Use RTF fields	Enable this to allow input (remarks) in RTF format (uses internal editor) If a RTF-text has been deposited already, it is switched automatically to RTF-editing, even of the RTF option is disabled.
Name UDF 1	User-defined field
Name UDF 2	User-defined field
Name UDF 3	User-defined field
Name UDF 4	User-defined field

© 2026 Boyum IT Solutions A/S

3.1.3.8.6 Inventory

Settings in Inventory are as follows.

PATH: Administration > System Initialization > Configuration wizard > Materials management.

Parameters

Name	Description
SAP inventory posting	Determines the SAP Object to execute with the stocktaking posting Disabled (Standard): Differences are posted using material issue and material receipt. This is the secure way. Disadvantage: There is no "real" inventory posting, but only stock corrections. Enabled: stocktaking is posted using SAP Business One Inventory function. Stock corrections are stored in SAP Business One Inventory. If problems arise, disable the option. ***See*** Difference posting
Use original SBO inventory	By default Beas overwrites the SAP Business One inventory functions with the own inventory solution and adds inventory functions additionally. If enabled, the original SAP B1 inventory function will not be overwritten, means own inventory functions in SAP Business One are also available. The inventory functions added from Beas, e.g. Annual inventory count will not be hidden. These can be hidden via the SAP Business One - Menu settings. ***See*** Inventory

3.1.3.8.7 Warehouse management

PATH: Administration > System Initialization > Configuration wizard > Materials management.

Parameters

Name	Description
Locations (deprecated)	Click on the **Edit locations** button to edit the locations. Only Beas

© 2026 Boyum IT Solutions A/S

	Attention: This option disappears in 9.3 PL2 version of BEAS
Warehouse (deprecated)	Click on the **Edit warehouse** button to edit the warehouse. **Attention**: This option disappears in 9.3 PL2 version of BEAS
Activate bin location management (deprecated)	Activation of this option allows the entry of items at the inventory locations. **Attention**: This option disappears in 9.3 PL2 version of BEAS
Bin Locations (deprecated)	Click on the "Edit bin location" button to edit individual bin location. **Attention**: This option disappears in 9.3 PL2 version of BEAS
Warehouse areas (expanding symbol)	Expand this option to open 4 UDF. By entering a name, the UDF is activated. ***See*** UDF
SAP B1 Bin location management to use (deprecated)	Usually, SAP B1 bin location management features are hidden, when starting Beas. Enabling this option, the original SAP B1 bin location features are available. ***See*** Bin location management **Attention**: This option disappears in 9.3 PL2 version of BEAS

Bin Locations

Bin Location management with RFID	If this option is activated, you can manage the RFID fields of each warehouse. This pertains to an additional sub-division of a storage location. RFID in Beas Bin ManagementIn Beas Bin Management a field "RFID" is available. You can use this field for working with Bin Management with additional Identifier for every single product via RFID.It is also possible to use this RFID field for other Identifiers. Here it is recommended to use a serial number for identification and not the separate RFID field inside Beas Bin Management. For more information ***see*** RFID. Limitations: - Supports only Beas bin management

© 2026 Boyum IT Solutions A/S

	- No support for WEB Applications - No support for SAP Bin Warehouse
Post in: select bin locations	You can define the storage method for a warehouse here

Define which drop-down is displayed during the receipt process at warehouse selection.

Example: Goods receipt, Transfer – To bin location, Work order receipt, Goods Receipt PO -
The WebApps ignore this setting.

Available settings:

By warehouse sorting	The sorting defined in the bin locations are used.  - Bin Location - Warehouse Area - First item (Alphanumeric) in this bin location - Stock of the first item in this bin location
By item and filling degree (Volume)	First the bin locations already containing this item are shown. Then, they are displayed by warehouse sorting. The volume – filling degree will be shown in % **Attention**: WMS and SAP Bin Warehouses are currently not supported. ***See*** Bin Location field.
By item and filling degree (Weight)	First the bin locations already containing this item will be shown. Then, they are displayed by warehouse sorting. The volume – filling degree will be shown in %

© 2026 Boyum IT Solutions A/S

	Attention: WMS and SAP Bin Warehouses are currently not supported. ***See*** Bin Location field.
UDF 1-4	Define up to 4 UDF fields for Beas Bin Location.

3.1.3.8.8 Batch Management

PATH: Administration > System Initialization > Configuration wizard > Materials management.

Parameters

Name	Description
Basic settings for batch status of material receipt	Determines the default batch status on goods issue (goods receipt, goods issue or issue via Production or cancellation of sales documents) This switch corresponds to the setting in SAP. This switch can be overridden for the production receipt (see Production area, Batch management) **Warning**: If "blocked" is set as default, these batches are not displayed in Quality Control. Blocked batches cannot be checked.
Counters 1 – 3	In production and goods receipt, batches can be generated automatically. When defining them, the user can specify which counter should be used. The relevant counters can be set here.

Batch details

Settings for the Batch details – Window

Up to 4 UDF's can be defined here, which has to be shown. UDF's can be assigned from the batch table OBTN via the cog wheel symbol.

3.1.3.8.8.1 Batch transfer

Settings related to the function: Batch transfer.

PATH: Administration > System Initialization > Configuration wizard > Materials management > Batch management.

© 2026 Boyum IT Solutions A/S

Available parameters:

Name	Description
Transfer several batches	Enabled by default. Several batches / items can be transferred to one batch. If disabled, a batch can only be transferred to another batch.
Batch change in customer order	Disabled by default. If this function is activated, in a customer order the batch may be changed.
Posting to other item number	Enabled by default. Both the batch and item number can be changed.
Numbers for Issue / Receipt	For the posting documents created in the background a separate number range can be chosen. Activate in **Administration > System Initialization**
Batch number assignment	Define the behavior if the arrow at the target batch is clicked and thus a batch must be created Purchase: The batch is used according to purchase definition Production: The batch is used according to production definition Procurement Method: The batch is used depending on the procurement method of the currently selected item. (*beas 9.2 PL: 00*, *btransformat, default=P*)

If you set that the target item number cannot be changed, the change in the quantity of the target batch is now also blocked. In this case, we have a pure batch-transfer with same item and same number.

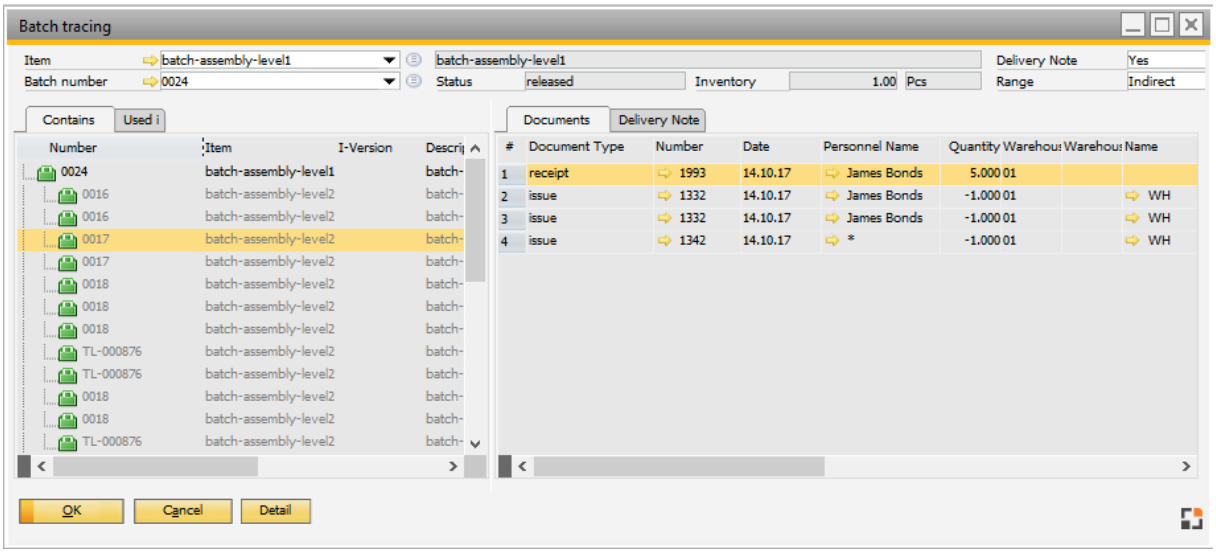
3.1.3.8.8.2 Batch and serial number tracing

All settings refer to the batch and serial number tracing function.

PATH: Administration > System Initialization > Configuration wizard > Materials management > Batch management.

See Batch- and serial tracing

© 2026 Boyum IT Solutions A/S



Window mw_tracing_master.psr

Parameters

Name	Description

Each batch only once	Prevents recursive resolutions
	
	If this option has been enabled (Default), each batch is displayed only once in batch determination. Thus, recursive resolutions are prevented.
	
	Example:
	Includes B, B includes A
	This would lead to a recursive display
	
	A -> B -> A -> B
	
	This could occur at cancellations, incorrect bookings etc.
	
	This option has to be disabled if a batch has to be actually used multiple times.
	
	Example:
	
	`Assembly A`
	`  subassembly B1`
	`  subassembly B2`

© 2026 Boyum IT Solutions A/S

	Here the same could be used in the sub-assembly B1 and B2. So the batch is used twice and will only be displayed shown only if the option "Each batch only" has been disabled. Issues may occur at partial postings if this option is enabled, so that a batch can be displayed multiple times if this partial posting includes always in the batch. In this case "batch-assembly-level2" has been issued two times for item "batch-assembly-level1". The batch will be broken down twice, accordingly. Setting every batch number only one time *beas 9.2 (5.13) PL: 05 Variable tracer_unique (J/N), default J*
Max. allowed steps	Defines the max. resolution depth The max. allowed levels in structure can be defined here. This is set to 15 by default. Minimal value is 5 (beas 9.3 PL 3: 1) ***Example:*** A includes B B includes C C includes D Would require 3 steps in total: A |-B | |-C | | | -D An upper limit has to be set, so that it does not fall into a permanent loop in a recursive case (A includes B and B includes A). The higher the upper limit, the slower the program becomes at a recursive case.

© 2026 Boyum IT Solutions A/S

	It is recommended to set the limit as low as possible for performance reasons. ***Example:*** An upper limit of 10 is optimal if it is ensured that a batch moves not more than 10 times from one assembly to another. *beas 9.2 (5.13) PL: 05 Variable: tracer_maxlevel, default 15*
Max. allowed steps	Defines the max. number of displayed rows in the result At incorrect postings the calculated result grows extensive and the calculation takes long, accordingly. This limit has to correspond to reality, so that the calculation would not take too long in case of incorrect postings. This is set to 200 rows by default. In most cases however 20 lines are sufficient. Minimal value is 50 (beas 9.3 PL 3: 10) *beas 9.2 (5.13) PL: 05 Variable: tracer_maxrows default 200*

Precalculation - Calculation Schema

Calculation per assembly webinar

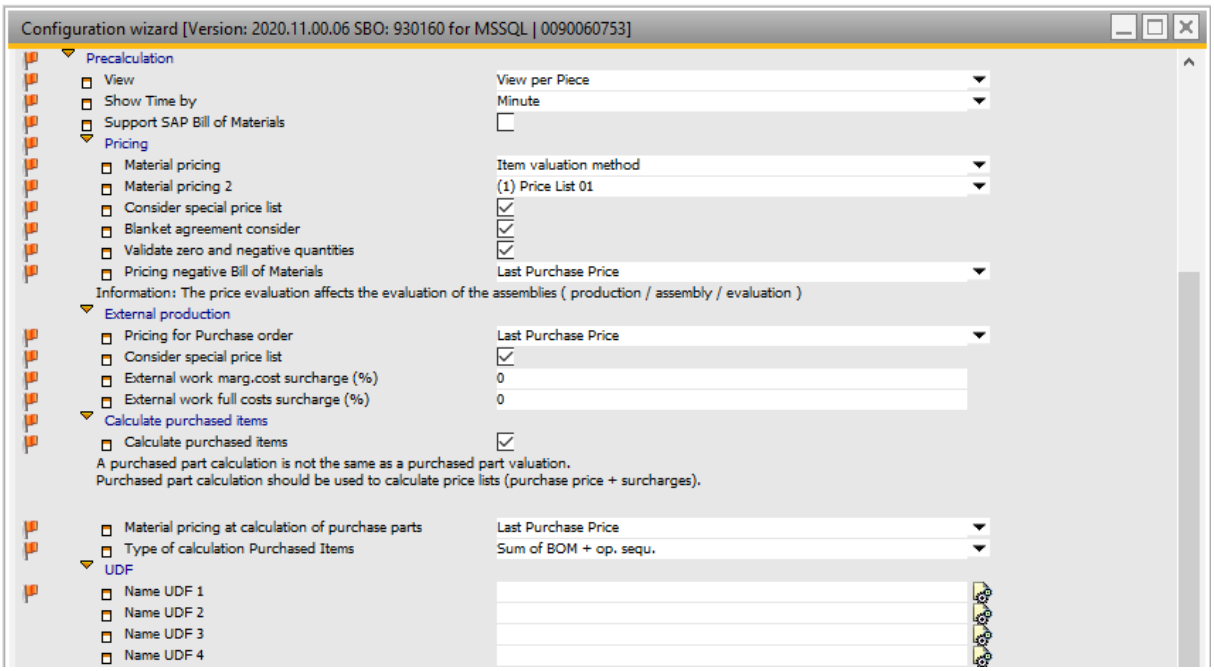
3.1.3.9.2 Pre-calculation

In this section we describe the setup options of the Configuration wizard on Calculation view as well as for valuation methods for batch calculation and assembly valuation at planned costs.

Some settings can be found elsewhere, as well. Many options can be changed in Precalculation. Once changed, the settings made here serve only as default values.

PATH: Administration > System Initialization > Configuration wizard > Calculation.

© 2026 Boyum IT Solutions A/S



Window system_option_struktur

Parameters

Name	Description
View	Determines whether the values should be shown per unit, per lot size or per fixed amount in Precalculation. For a fixed amount, the amount (e.g. 1000) can be specified in the next line. The view setting can be changed in the calculation.
Show Time by	Displays times in Precalculation in hours or minutes.
Support SAP Bill of Materials	Activate this check box to display SAP Bill of Materials in PreCalculation. If the option is activated, in PreCalculation you can see the SAP BoM (all types) as normal Bill of Materials Position. No numbering is visible, but you can do this with the Renumber function. If you create a work order from Precalculation, the system creates a 1:1 copy of the precalculation, and there are no apparent differences between SAP- and Beas Bill of Materials positions. Note: This setting is automatically activated when you activate Item structure > Support SAP Bill of Materials.

© 2026 Boyum IT Solutions A/S

Name	Description

Pricing

Name	Description
Material Pricing	Select the pricing to be used for valuing the material. (Refers to the material positions) ***See*** Pricing types Precalculation – Material – Purchase price **Note**: Beas only supports price list with numbers 1-99. Price lists with internal ID > 99 are not supported.
Material pricing 2	If material pricing does not return a price, material pricing 2 is used. By default, set to "No" as in material pricing 1 all pricing types can be defined and extended rules can be stored. If this option is activated, and in Precalculation no price was found, the row will be marked red and a message will be issued: "no price stored for one or more material items". ***See*** Pricing types
Consider special price list	If active, the special price list is considered at material pricing Serves as default for existing calculations and batch-calculations, as long as the switch in the calculation is not changed. If a preferred vendor is stored in the item master and the supplier has a special price list and this option is activated, the price stored there is used. This has higher priority than the "Material pricing" option, and relates only to the Precalculation or batch calculation. In other areas, this option has no effect. A change of the switch affects only calculations if the switch in the calculation itself was not changed manually. When active, the system searches for the price using SAP DI-API. If special price was not defined in the system, Beas continues searching the price in other tables.

© 2026 Boyum IT Solutions A/S

Name	Description
	Note: Affects only material pricing, not service pricing (external operations). **Attention:** If this setting is active, only the first 8 values of Customer definition are stored in Precalculation - Material - Purchase price! All other prices defined in the customer are ignored. If you want to work with more prices, you can activate flag "Always determine Current material Price" ***See*** Pricing types Precalculation – Material – Purchase price
Consider blanket agreement	_Determines whether existing blanket agreements are considered at pricing. If enabled (default), blanket agreements of type "specific" are considered at pricing. If disabled, only default pricing is used. **Attention**: If this is activated, MRP considers blanket agreements for pricing, as well! ***See*** Precalculation - Edit material
Validate zero and negative quantities	If activated, BoM entries with planned negative or zero quantities are valuated. Define if Beas should valuate Bill of Materials Position with Zero or negative planned quantity. This selection affects Pre- and Postcalculation. ***See*** Edit BoM – Quantity
Pricing negative Bill of Materials	Determines pricing of material for negative BoM items. This setting has global effect, and cannot be changed in Precalculation. If special price lists exist, they have higher priority. ***See*** Pricing types Precalculation – Material – Purchase price

© 2026 Boyum IT Solutions A/S

Name	Description
	Edit BoM – Quantity Collective receipt

External operation

Pricing for purchase order	***See*** External operation Purchase.
Consider special price list	***See*** External operation Purchase.
External work marg.costs surcharge (%) External work full costs surcharge (%)	Specifies the full cost and overhead surcharge on external work. Only provided for compatibility reasons. It is better to use cost types. The surcharge can also be defined here.

Calculation of purchased items

Calculate purchased items	If activated, purchased items are calculated. A purchased part calculation should not be confused with a purchased part valuation. A purchased part calculation should be used to calculate price lists (purchase price + surcharges).
Material pricing at calculation of purchase items*	Specifies the pricing of the materials when valuing purchased items, for example batch-calculation. ***See*** Edit batch calculation – pricing purchase parts
Type of Calculation purchased items*	Specifies the calculation type for purchased items "Make or Buy calculation": Only the costs of the item itself are considered. "Sum BoM + WO": The stored BoM and routing position is valued. If there is no BoM or routing position, the item itself is calculated as for "Make or Buy".

*displayed only if "Calculate Purchased Items" is activated.

3.1.3.9.3 Post calculation

This section describes the setup options for post-calculation.

PATH: Administration > System Initialization > Configuration wizard > Calculation.

Setup view and format for WO-post calculation

Name	Description
Show times per	Setup in which time unit to display the duration

Possible setup:

hh:mm	Displayed in normal time format hh = hours. Display of more than 24 hrs is possible, ***Example:*** 300 hours, 20 minutes are displayed as 300:20
Hours 0 digits	Displayed in hours without digits
Hours 2 digits	Displayed in hours with 2 digits
Minutes	Displayed in minutes without digits
Automatically 24 hrs.	Automatic display If time is less than 2 hours, minutes are displayed. If time is less than 2 days, the time is displayed in hours, otherwise in days, 24 hours=1 day *In versions prior to beas 2022.06 the limits were*

© 2026 Boyum IT Solutions A/S

	<table><tr><td></td><td>*if < 100 in minutes and if < 4000 in hours* Right of the number, the unit is displayed (independent from language settings.) m = minute h = hour d = day</td></tr><tr><td>Automatic 8 hrs</td><td>Like "automatic 24 hrs", but 8 hours =1 day.</td></tr></table> ***See***: WO-post-calculation *beas 9.1 PL: 08*
Decimals: Quantity, price	Because in post calculation summed values are displayed, the number of decimals can be set up separately for the post-calculation. Enter decimals separately for the display of quantities and prices. ***See***: WO-post-calculation

Name	Description
Valuation to	Purchasing price for material valuation ***See*** Pricing types This option is deactivated if "Material costs always at planned costs" was activated. *(Variable naka_bewertung, Standard B)*
Value planned costs to	When making a planned/actual comparison, the planned price reference (= planned costs) can be specified, i.e. this does not necessarily have to correspond to the preliminary costing price. It is reasonable to change, for example, to “entry price” if the evaluation of an assembly is supposed to value the current entry price, not only of the actual entered material, but also the planned material. This option has a direct effect on the assembly valuation if this is set to costing analysis price to target value. ***See*** Pricing types *(Variable matsollbewertung, Standard V=Vorkalkulation)*

© 2026 Boyum IT Solutions A/S

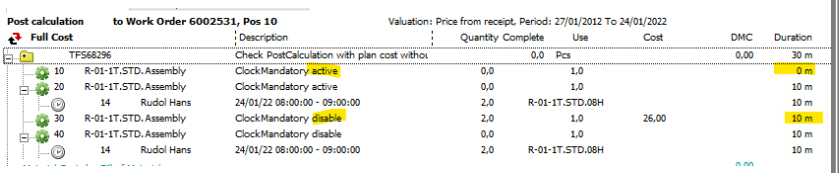
Value assemblies	If active, all receipts and issues of assemblies are fully valued. Since these are normally received and issued in the same quantity, thus behaving neutrally in terms of valuation, they do not necessarily have to be valued. *(Variable naka_baugruppe_bewertung J/N, Standard N)* Explanation With a multilevel work order, a Bill of material position has an associated assembly. The assembly is normally produced and entered and the associated bill of material position is issued. To avoid valuation problems, these entries are not valued. ***Example***: Assembly A Bill of material Pos 10 Assembly B Bill of material Pos 20 Material C Assembly B for bill of material Pos 10 Bill of materials 10 Material D All entries on "Assembly B" or "Bill of materials Pos 10 Assembly B" are not valued here since they offset each other as long as the valuation reference is the same. On the other hand, entries on "Bill of materials Pos 10 Material C" are valued. Only actual costs actually occurring are totaled. **Special case Stock withdrawal:** If assembly B is posts only 5 receipts and the "Bill of material Pos 10 Assembly B" posts 8 issues, then it must be assumed that 3 pieces were removed from stock since they were not generated through this work order. In this case, these 3 pieces are valued as regular material. ***Example***: Assembly A Bill of material Pos 10 Assembly B

© 2026 Boyum IT Solutions A/S

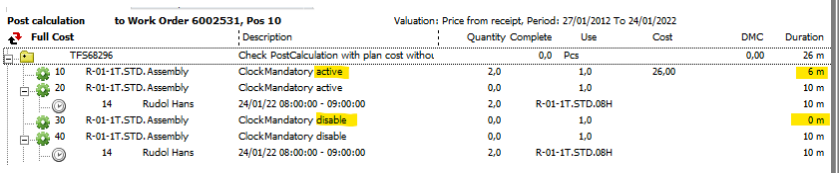
	Issue 8 pieces @ €500 Valued at 3 * €500 = €1500 Assembly B for bill of material Pos 10 Receipt 5 pieces @ €500 **Special case "Valuation of assembly postings"** The valuation of assembly entries can be activated through options / calculation. All entries are valued in this case. If the valuation default for receipt and issue is the same, then the entries neutralize each other. ***see*** Post-calculation
Plan = actual, if no confirmation	⊟ Allow to use plan costs if no time receipt exists in the system This setting allows to define Planned costs as Real costs if there is no Time receipt. PATH: Administration > System initialization > Configuration wizard > Calculation > Post Calculation > Plan = actual if no confirmation In the following example, there are 4 Routing positions, 10 + 20 with "Clock mandatory" active and 30 + 40 with "Clock mandatory" = disabled For Position 20 and 40 there are time receipts booked. Post calculation returns the following result: Duration (and costs) for Position 10 and 30 = 0  Post calculation to Work Order 6002531, Pos 10 Valuation: Price from receipt, Period: 27/01/2012 To 24/01/2022 Full Cost / Description / Quantity Complete / Use / Cost / DMC / Duration TFS68296 Check PostCalculation with plan cost withou 0,0 Pcs 0,00 20 m 10 R-01-1T.STD. Assembly ClockMandatory active 0,0 1,0 0 m 20 R-01-1T.STD. Assembly ClockMandatory active 0,0 1,0 10 m 14 Rudol Hans 24/01/22 08:00:00 - 09:00:00 2,0 R-01-1T.STD.08H 10 m 30 R-01-1T.STD. Assembly ClockMandatory disable 0,0 1,0 0 m 40 R-01-1T.STD. Assembly ClockMandatory disable 0,0 1,0 10 m 14 Rudol Hans 24/01/22 08:00:00 - 09:00:00 2,0 R-01-1T.STD.08H 10 m With definition "only not Clock in/Clock out Mandatory" the system

© 2026 Boyum IT Solutions A/S

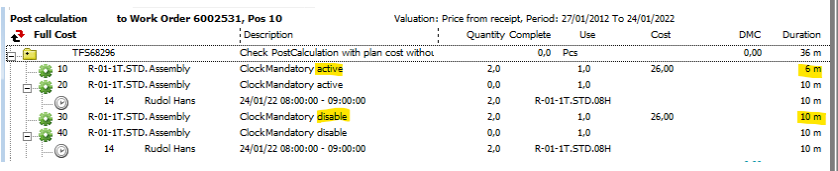
uses Planned Time for all routing positions without time receipts, if Clock Mandatory is disabled in this Routing position. In the following example you can see the planned time as real time in line 30 with no time receipt.



With definition "only Clock in/Clock out Mandatory" the system uses Planned Time for all routing positions without time receipts, if Clock Mandatory is enabled in this Routing position. In the following example you can see the planned time as real time in line 10 and no time receipt.



with Option "All" the system ignores "Clock in/Clock out Mandatory" and checks all routing positions without time receipts.

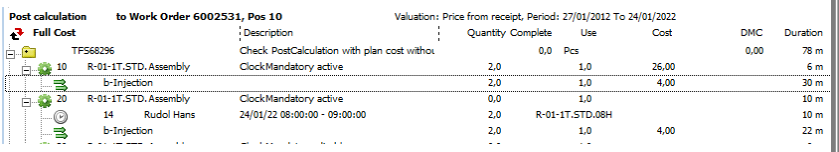


This setting is used for Post calculation and assembly valuation.

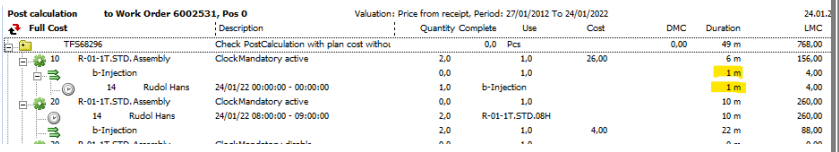
Parallel routing position is calculated too in case there is no time receipt booked for the parallel position. It uses the "Clock in/Clock out mandatory" flag from main routing position.
Example with setting "All":

Parallel position for main Position 10 and 20 do not have a time receipt. Beas uses Planned Duration/Costs for the parallel positions.

© 2026 Boyum IT Solutions A/S



if there is time receipt for the parallel resource, the system takes the sum of time receipt:



(Variable bdeohnezwangbewertung J/J2/J3/N Standard=N)

Material costs always to planned costs

If this option is enabled, when calculating the actual costs, the planned costs are always taken as reference.

The value from column "planned material costs " is taken, which was multiplied by the total planned quantity. Already posted material, as well as, any actual values are ignored. Pricing is always set to planned costs. This option is reasonable only if the production costs, but not the material costs are recognized, i.e. if the material is not posted.

Example

Producing amount of 10, single price of material 5 € / piece

Post in: 1: Planned value as per post-calculation is 10 * 5 ie 50 €

Assembly of 1 is posted in at 50 €

The second assembly would be posted in at 0 € (50 planned value - less the already posted 50 = 0)

(Variable nakamatplan J/N, Standard = N)

Sub-assemblies valuation

Determines the valuation of sub-assemblies at post-calculations

Affects only single stage post-calculations and sub-assemblies (single stage) or storage related sub-assemblies (multi-stage valuation)

Standard	How is the material valued (***see*** above Valuation to) This is standard setting (S)

© 2026 Boyum IT Solutions A/S

Last Precalculation	Uses the result of the last batch-calculation, for which "Standard price" was activated. Material price, L+M costs, and material surcharges are taken into account separately. Other surcharges or values from calculation schema are not used. Costs of external operation, work order times and costs types are not taken into account. Note: If the valuation method "Planned costs" or "Post-calculation costs" was selected at assembly posting, this can have effects, for example if L+M costs according to calculation schema are posted to the WIP account. In this case, a double posting can arise. Then, this valuation method may not be used. If no Precalculation is found, the standard valuation method is used. ***See*** Batch-calculation Batch-calculation – Standard costs Batch-calculation – single step

(beas900-000-002-005) *(Variable onelevelcalc, Standard=S)*

Business Performance

System

Options of the Configuration Wizard in the "Personnel" tab.

PATH: Administration > System Initialization > Configuration wizard.

Parameters

Name	Description
Activate attendance	Allows attendance times to be entered and managed.
Personnel view	Allows to edit the view of employee data.
Terminal	Extended settings for Beas terminal. ***See*** Terminal.
Time Evaluation	Enables the entry and management of data for time evaluation.
Day templates	Click on the **Edit Day Templates** button to access the form for defining day templates.
Calendar	Click on the **Set up Calendar** button to access the form for defining the calendar.
Absence Types	Click on the **Edit Absence Times** button to access the form for defining absence times.
Period Rule	Click on the **Edit Period Rule** button to access the form for defining period rules.
Shift Definition	Click on the **Edit Shift Definition** button to access the form for defining the individual shift models.
Wage types	Click on the **Edit Wage types** button to define individual wage types.
Time Evaluation reports	Opens the report definition for time evaluation .

3.1.3.10.1 Human resources

Settings for personnel master data view.

PATH: Administration > System Initialization > Configuration wizard > Personnel.

Parameters

Name	Description

© 2026 Boyum IT Solutions A/S

Numeric personnel number	Personnel (employee) numbers can be alphanumeric or numeric. By selecting this option, only numeric numbers are allowed. The parameter has the following effect: 1. Basic sorting in SAP Employee ID and not Personnel ID 2. Personnel number cannot be selected; it is assigned automatically The System attempts to use same number as in SAP Employee Master Data. If the number is not available, the system uses the next number. If this is not possible, you must insert the Personnel ID manually.  ***See*** Personnel *Variable: persnumeric* *beas9.2 PL 2*

View

Parameter name	Description
UDF1 – UDF4	Four user-defined fields displayed in personnel master data and personnel list. ***See*** Personnel

3.1.3.10.2 Time evaluation

PATH: Administration > System Initialization > Configuration wizard > Personnel.

Parameters

Name	Description
Display times	Specifies whether times are displayed in time minutes (1/60) or industrial minutes (1/100). Note: The setting affects only time evaluation, not other program features.

© 2026 Boyum IT Solutions A/S

Automatically log out	Behavior in case of "forgot to logoff" If an employee logs on and stays more than 22 hours without logging off, this is interpreted as if he forgot to logoff. In this case, a new logon is blocked. The behavior for this case can be set up: **Enable automatic logoff:** The employee can logon again. Then: - an error message is issued "too long present" - a log entry is created, the employee is marked with an error - the attendance entry gets a mark "incorrect entry" Note: to logoff correctly, the employee needs to press the **Leave** button. **Disable automatic logoff:** The employee can neither logon nor logoff To correct the entry: **Personnel master > Edit** Button - open clocking/clockout - delete entry Attendance times: enter attendance of previous day manually *beas 9.5 PL:06 Variable automaticlogoff*
Total by Week	If this option is activated, the time analysis produces a total per week.
Account Overflow	This option determines whether account overruns are only checked at month-end or every day.
Carry fwd negative balance?	If this option is activated, minus hours is carried forward to the next month.

Time evaluation

Configuration Time evaluation

3.1.3.10.3 Attendance

PATH: Administration > System Initialization > Configuration wizard > Personnel.

Parameters

© 2026 Boyum IT Solutions A/S

Name	Meaning
UDF1 – UDF4	Four freely defineable fields, displayed with attendance records.

3.1.3.10.4 Absence types

PATH: Administration > System Initialization > Configuration wizard > Personnel.

Parameters

Name	Description
Absence types	Edit Absence types.
UDF1 – UDF4	four freely definable fields, displayed with attendance records.

3.1.3.10.5 Wage types

PATH: Administration > System Initialization > Configuration wizard > Personnel.

Parameters

Name	Description
Absence types	Edit Wage types.
UDF1 – UDF4	four freely defineable fields, displayed with wage types.

3.1.3.11 Terminal and WEB APP

In this section you can configure settings for the Desktop Terminal and WebApps 2.1.

PATH: Administration > System Initialization > Configuration wizard.
Authorization Groups: The **Details** button opens the Administration terminal window.

Desktop Terminal
Beas Web Terminal 2.1

3.1.3.11.1 Desktop Terminal

Additional settings for the Terminal solution.
see Terminal – Client-Server based

© 2026 Boyum IT Solutions A/S

PATH: Administration > System Initialization > Configuration wizard > Terminal and WEB APP.

Parameters

Name	Description
Login	**Card number (default)**: Terminal login using card number **Name + Password:** Login with name and password stored in: Personnel administration > Login tab – Name / Password. Title	Define the title displayed in the Terminal Screen.
App Setup	Open Apps administration window for all apps.
Fast disconnect Attendance App	If enabled, the quick logout (timeout) is running for all attendance apps. ***Example*** of use: Separate work station for registration of attendance only, used by all employees. Only client-server based solution is affected, not the WEB solution.

3.1.3.11.2 Beas Web Terminal 2.1

In this section of the Configuration settings, you can define Login mask related parameters.

Login Mask

Asynchronous function

© 2026 Boyum IT Solutions A/S

PATH: Administration > System Initialization > Configuration wizard > Terminal and WEB APP.

Parameters

Name	Description
Login Mask	Define all settings for WEB APP Login Mask.
Logout (seconds)	Define the automatic logout from WebApps (in seconds) The WebApps switch automatically to the Login-Mask if the user does not move the mouse or press any key. Default = 1800 seconds (30 Minutes) ***Example:*** The user opens the WebApp "WO Goods Receipt". If they do nothing on the device, the system switches to the Login Mask and the user must log in again. Note for license: The user disconnects from all reserved licenses and they are free for other users.
Default number of items per page	With this global setting, you can define the number of lines to view in WebApps windows.
App Setup	Open Apps administration window for all apps.
Location	Define Location, example for definition of printers. ***See*** Location.

3.1.3.11.2.1 Login Mask

Here you can find Login mask settings for the Beas Web Terminal 2.1.

Note: you must restart the HTML server or HTML Service after changing the settings.

Parameters

Name	Description
Login	Define how to log in to the Web Terminal: **Card number (default)**: Terminal login using card number **Name + Password:** Login with name and password stored in: Personnel administration > Login tab – Name / Password.

© 2026 Boyum IT Solutions A/S

Name	Description
	Title	Define the title displayed on the Login screen.
Work station name	Select how station name is to be entered: **No/manually/selection list.** **Selection**: No new login is possible. Station ID needs to be deposited in Station Setup Wizard. A password is queried.
Location	Select how location is to be entered: **No/mandatory/optional.** Location ID is mandatory For printing control. It can be deposited in station setup wizard or the client selects the location.
Shift	Additional field "Shift" is displayed. This information can be accessed at printing. (<shmtl.shift>)

back to Terminal and WEB APP settings

3.1.3.11.2.2 Asynchronous function

Allow to work in asynchronous mode.
Use this if you work with many clients.

For more information on settings ***see*** Video

Note: Now all settings are saved in this central place.

© 2026 Boyum IT Solutions A/S

The function is working only if Beas Common Service is activated.

Parameters

Name	Meaning
Activate Asynchronous transaction System	Use the asynchronous mode for Print Documents and create Transaction over Beas Common service. If this setting is activated, it is also activated in the Beas Manage Server.
Result Behavior	Define which messages the system should display if the common service cannot return the result in a short time - No display notification - Display All - Display Errors only
Waiting time	Enter the number of seconds that the app should wait until moving forward with the next transaction.

For more information on the Asynchronous function:

back to Apps administration

3.1.3.12 AI - Artificial Intelligence

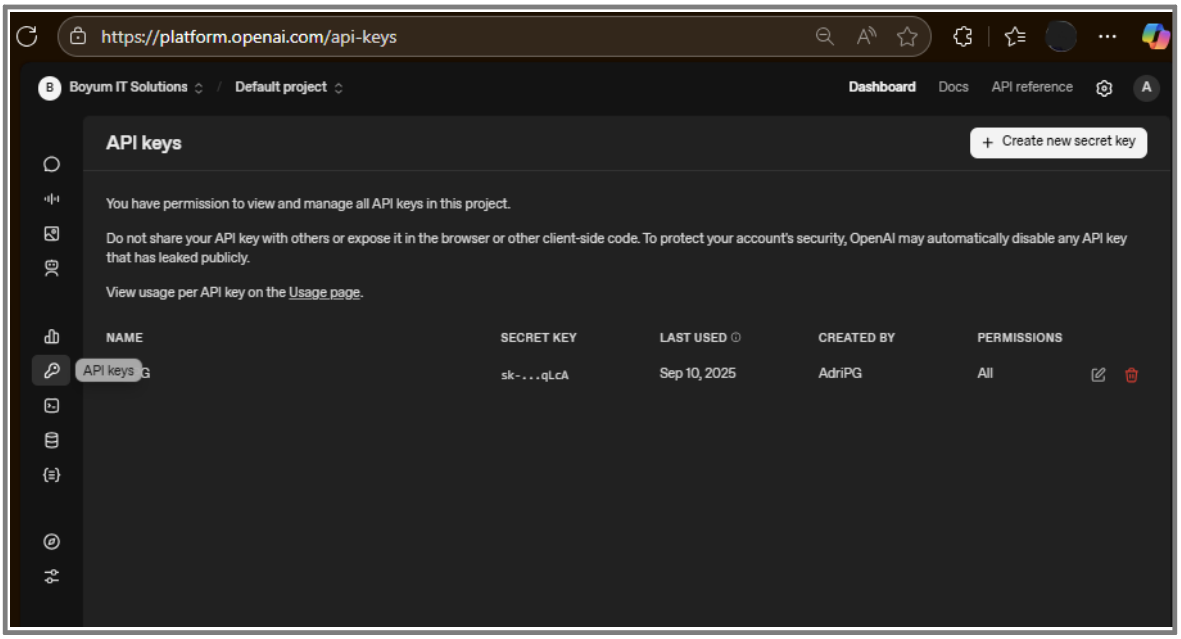
To access the Beas AI Assistant, you must have an Open AI key set defined in this area or in the User configuration:

Model: The Assistant takes ChatGPT 5 as its operating framework by default.

NOTE: Changing the model may return different results, and answers may be less specific or take longer with older models.

Token: Define the token for the user. You should generate your own token in the Open AI platform. ***See*** Open AI platform page.

© 2026 Boyum IT Solutions A/S



.

3.1.3.13 Business performance

PATH: Administration > System Initialization > Configuration wizard > Business Performance

This setting category is only available if the business performance module is activated in **Administration > System Initialization > Configuration wizard > Administration > Modules to activate**.

Parameters

Name	Description
Data basis for effective manufacturing services	**Wage data:** This option uses values manually added to Business Performance as "Wage Data", in the menu Business Performance\Monthly Values\Wage Data. **Work order confirmations:** Using this option, Business Performance automatically retrieves production data from Time Receipts and records them under "Production Activities", no manual data entry is required. The selection of this option is mandatory when using Business Performance for Absorption Costing.
External accounting (respective import program)	Activates the import program for external accounting.

© 2026 Boyum IT Solutions A/S

Absorption costing	Enables absorption costing. ***See*** detailed setup of Absorption costing.

System

The options of the the "System" section in the configuration wizard are described here.

PATH: Administration > System Initialization > Configuration wizard.

Beas check for messages activate: Enable Beas to check for messages.

DI API

If you log in to Beas outside of SAP as a Beas Standalone version user or as a Terminal user, Beas requires an access account to DI API. Special Authorizations are required for this user. Configuration is also possible in Beas logon (without SAP) in the login screen under Options.

Name	Description
DI-API Connection type	Define connection type to the DI-API Only if Beas starts INSIDE SAP Business One **GetDICompany (Shared connection)** (Standard) With this setting Beas and all other AddOns use same instance of DI-API. This reduce the memory requirement **Conext Cookie (Non Shared Connection)**

© 2026 Boyum IT Solutions A/S

	In this variant Beas start a new instance of the DI API. This need more memory. Use this only, if you've follow error message and it's not a problem with 64/32 Bit installation: *Error connecting DI API (singlesignon): (xxx/yyyy)* For more information ***see:*** https://support.boyum-it.com/hc/en-us/articles/360009975673 *beas 9.3 PL 1*
License Server	Insert the conenction to License Server.
B1 API User	Administration User - System user Beas requires administrative access to SAP Business One for database check, and check of transactions which are executed via different interfaces, WEB-server, Beas-server and the terminal. The SBO user entered there, does not require a SAP Business One Professional-User-license. The user requires special authorizations ***See*** required SAP Business One - rights (***See*** Terminal)
SBO API Set Password	Click on the **Set Password** button , to set the password for the API user.
SBO API Test	Test the connection between the entered user and the DI API by clicking on the **Start Test** button.

WEB Services

Name	Description
SAP Service Layer	SAP Service Layer setting group
Active	Select check box to activate SAP Service Layer
Server	Enter server name
Version	Enter server version name
Test Service Layer Connection	Click this button to test Service Layer connection

© 2026 Boyum IT Solutions A/S

Extended error message

Beas can automatically create activities for the current user if certain errors occur. Further measures are described in this activity. If the current user is a terminal or pure Beas user, they will be unable to receive these messages. In this case the recipient is specified here.

Parameters

Name	Description
Extended error messages	Determines if and how the extended error messages should be activated Default = Beas activity. This setting as recommended as this is the only way to have access to the full functionality. **Beas activity**: a Beas activity is generated and displayed in the Beas message window. SAP Business One **activity**: a SAP Business One activity is generated. a business partner must be specified on which this activity is set. If no business partner is stored, a Beas activity is generated automatically. **NO**: no activity is generated.
Recipient of activity	Determines who receives this activity if it is created by a terminal or pure Beas user without a SAP Business One account.
Activity Business partner	Needed if working with SAP Business One activity. For activities, a business partner must be specified. Ideally your own company should be created as a customer and this entered here.

Further parameters

Name	Description
Check Beas messages	Select check box to activate the checking of Beas messages in the system.
Beas News show	Select this check box to display Beas news.
Browse: Max. number of lines (to be displayed)	Maximum number of rows In all lists and selection windows (not analyses, however), only a certain number of lines is shown to facilitate the presentation of

© 2026 Boyum IT Solutions A/S

Name	Description
	the result on the screen. The maximum number of result lines can be set here. The higher the number, the longer the list takes to display, and the higher the load on the network or the server. Default : 200 If a list contains more rows than set up here, on the bottom right corner binoculars are displayed. Clicking on it, all data can be displayed via **Display all**. Note: This is supported by window Templates. Thus the number the rows to be displayed can be defined in the template. The setting in the template has a higher priority here. ***See*** Display - Lists
Participate in the usability improvement program	Check mark: select if applicable. The Usability Improvement Program (UIP) was created to give all Boyum IT customers the ability to contribute to the design and development of the Boyum IT products. Participation in the UIP is voluntary, and the end-results are software improvements to better meet the needs of our customers. **How does UIP work?** When you choose to participate in the UIP, the add-on automatically sends information to Boyum IT about how you are using the product (number of configurations, number of usages etc.). The information then is utilized to improve the features customers use most often. **The UIP does not send any Business Data or confidential information.** All data sent between you and the Boyum IT servers are encrypted.

© 2026 Boyum IT Solutions A/S

Name	Description
	Will I be contacted or receive spam if I participate? No. UIP reports do not contain contact information, such as names, addresses, or phone numbers. This means that you will not be asked to participate in surveys or to read junk e-mail, and you will not be contacted in regards to your participation. **If I choose to participate, can I opt out later?** Yes. You can choose to start or stop participating at any time using the configuration options. **Is the Usability Improvement Program spyware?** No. Spyware can collect information or act on your computer without your full knowledge or consent. UIP does not take actions if you choose to not participate. You can also start or stop participating at any time. **Can I review the information before it is sent to Boyum IT?** Unfortunately the information cannot be reviewed for a couple of reasons: • The Usability Improvement Program is designed to enable all our customers to participate. To be able to handle large number of customers sending data, the collected information is recorded so that the Boyum IT servers can efficiently process all the data. The nature of this processing makes it difficult for most customers so review the information. • The data is sent automatically, without interrupting your work. For these reasons, the Usability Improvement Program is not able to show the information collected.

© 2026 Boyum IT Solutions A/S

Name	Description
	We recognize that some customers might be uncomfortable allowing the information collected by UIP to be sent without having an opportunity to review it fully even though the information does not contain contact information. If you are uncomfortable with sharing this information, please choose not to participate. ***See*** Video B1 Usability Package - Introduction

Customer-specific extensions local	Defines if a customer-specific extension has to be saved locally
	Define where the customer-specific extensions has to be saved
	By default these are saved in following directory
	`\\[server]\b1_shr\beas software\project`
	This can be changed in the option "Directory for customer-specific extensions"
	
	All directories are copied from
	`\\[server]\b1_shr\beas software\project`
	to
	`%programdata%\beas\project`
	and checked and run from there if this function is used.
	
	Note:
	Beas has no access to the local directory if it is launched in service mode. In this case it is necessary that the option is deactivated.
	
	Option deactivated:
	
	Advantage for a central directory:
	Distribution to the clients is not necessary. Thus a deleted file is deleted on all clients and changes will be translated immediately without restart. Server service mode only works if this function is deactivated.
	
	Disadvantage:

© 2026 Boyum IT Solutions A/S

Name	Description
	If the network is already overloaded, this function may worsen the situation. **Option activated** **Advantage:** Changes can be performed and checked, before these are distributed. Program performance is better at heavily loaded networks. **Disadvantage:** Server service has no access to it. A deleted file must be deleted manually on all clients in the directory `%programdata%\beas\project`. An automatic solution is not performed. *beas 9.2 PL: 04*

Server Directory for customer-specific extensions	Project folder - Main folder
	Determines the local directory where customized extensions are stored. If you leave the field empty, the following directory is used:
	
	`\\[server]\b1_shr\beas software\project`
	`\\[server]\b1_shr\beas software\addon`
	
	Below the defined directory the following structure is created:
	
	`[chosen folder]`
	`|_ AddOn`
	`|_ [one folder per AddOn]`
	`|_ project`
	`|_ standard` (default folder for customizing scripts]
	`|_ [customer-name]` (Folder for customer specification)

© 2026 Boyum IT Solutions A/S

Name	Description
	Example: In AddOn-Administration - Customer-Specification - Directory was set up:"`beas`" In Configuration wizard `\\myserver\project\` Customized extensions are saved under: `\\myserver\project\project\beas` **Important:** The directory needs to be accessible by all clients. Should not be changed if possible. ***See*** also: Customizations.

3.1.3.15 WMS

WMS Settings

The following parameters are only available if WMS program is installed on the current computer.

Name	Description
Integrate WMS Reservation System	Check box option to activate integration of WMS Reservation System. By default, this parameter is NOT activated. If active, all reservations created by each system are automatically reflected in the other system. No over-reservation is possible. The systems validate the reservation status before the creation of any SAP documents and both systems ensure that reservation rules are not broken. NOTE: We recommend this setting to be used in activated mode. If you deactivate this parameter, it terminates synchronization between the two systems, and removes all information coming from WMS. ***See*** more information in Beas-WMS integration documentation.

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Name</th><th>Description</th></tr>
<tr><td>Picking Type</td><td>Define how the user can create the picking document.
<table>
<tr><th>Setting</th><th>Description</th></tr>
<tr><td>Pick List Proposal + Picking List (default)</td><td>Create the pick list proposal and automatically create a picking list when stock is available.</td></tr>
<tr><td>Pick List Proposal</td><td>Create the pick list proposal.</td></tr>
<tr><td>Pick List Proposal + Picking List + Status Ready</td><td>Create the pick list proposal and the picking list, and set the picking list to "Ready" status.
Wit this setting, the user can make the pick list automatically "ready" after the pick list has been created.

Attention: Both Beas Manufacturing and PMX WMS must be upgraded to 2024.06 or later for these parameters to work!</td></tr>
</table>
wms_picktype</td></tr>
<tr><td>Enable pick process</td><td>Enable Picking window in work order structure view.

<tr><th>Setting</th><th>Description</th></tr>
<tr><td>New LUID will be generated automatically</td><td>Default setting. If this parameter is set active, the LUID dropdowns only display "new". If you do not make a selection in the LUID dropdown, the system creates a new pallet automatically.</td></tr>
<tr><td>Do Nothing. None Assignment</td><td>With this setting active, the LUID dropdowns display "new" and "no". If you choose "no", the system does not assign the item to a pallet. If you do not define a LUID, the system selects "no" automatically.
If you create receipts with Services or script, the system always uses "no".</td></tr>
</table></td></tr>
</table>

© 2026 Boyum IT Solutions A/S

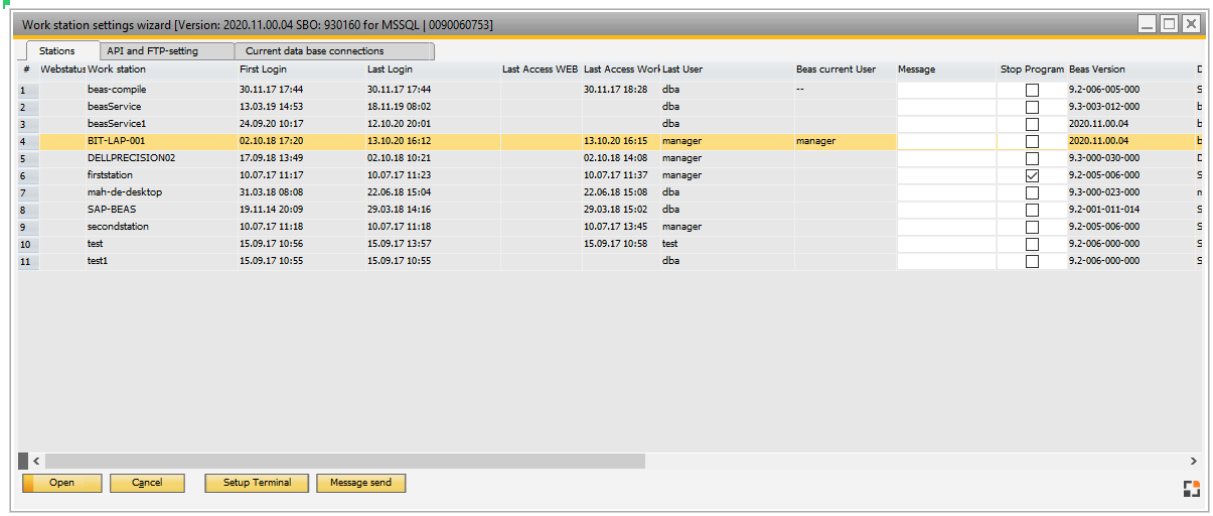
Name	Description
	<table><tr><th>Setting</th><th>Description</th></tr><tr><td></td><td>Note: This option is not compatible with Track location of serial numbers option, because in this case the SSCC is mandatory in WMS.</td></tr></table>
Filter by Zone (WO Issue screen)	Filter stock in the WO Material Issue function according to the WMS Zones defined in this setting.
Filter by Bin (WO Issue screen)	Filter stock in the WO Material Issue functions according to the WMS Bin locations defined in this setting.

See Produmex-Beas integration

See up-to-date BEAS-WMS Integration infopackage

3.1.4 Work station Settings wizard

PATH: Administration > System initialization > Work station settings wizard.



Window system_station_browse.psr

The station settings wizard is the control center setting and monitoring all stations and sessions. This list displays all computers or sessions that are logged on to Beas.

© 2026 Boyum IT Solutions A/S

Furthermore, the following functions are available:

- View and manage stations (name, location, description).
- Manage stations (display total and remaining memory, disk space).
- Terminal: set up which functions are available (right-click menu or button below).

Via this the management and also the support of the existing PC's will be greatly simplified. The station name, location and a description can be adjusted.
Window settings and Templates are supported.
For field descriptions ***see*** Edit work station.

Determination of Station name

All Beas sessions need a unique station name. The BIOS name of the current computer is read out when Beas is installed locally.

The `clientname` environment variable is read and used if it is a terminal server.
The current Windows user (`username` Environment variable) is used as the station name if the `sessionname` environment variable begins with `rdp` or `ica`.

The optimal setup for a remote server is the following:

- The `sessionname` environment variable begins with `rdp` or `ica.`
- The Windows user must be unique and stored in the `username` environment variable.

Excerpt from the Microsoft Documentation

Retrieves the NetBIOS name of the local computer. This name is established at system start-up, when the system reads it from the registry.
GetComputerName retrieves only the NetBIOS name of the local computer (..).
The behavior of this function can be affected if the local computer is a node in a cluster.
For more information, ***see*** ResUtilGetEnvironmentWithNetName and UseNetworkName.

Note: Query of the station namen

Via BeasScript the station name can be queried as follows:

`messagebox=<stationname>` -> the station name, which Beas is using
`messagebox=<global:system_computername>` -> Computer name from GetComputerName()

© 2026 Boyum IT Solutions A/S

Note:
The entry of the own station will be selected automatically at opening of the list.

API and FTP settings

Data connection

Field	Description
License server	Port address of the license server. Must only be specified if there are multiple license servers in the server infrastructure or the license server is not found.
DI-API-SQL-Driver	SQL driver which should be used for connection to the DI API. Only change if the automatic setting does not work. Recommended setting is "Automatic".
B1 API User	Must normally be the SAP manager, as this account is also used to perform administrative functions such as database adaptations.
SBO API Set Password	The password for the DI API user.
SBO API Test	Tests the connection to the DI API. **Important:** If Beas is started within SAP, an SAP-internal connection to the DI API is established. If Beas is started without SAP or a data check is performed BEFORE login, a separate connection is established. This can be tested here.
Program server	Location at which Beas is installed on the server. Normally \\<servername\b1_shr Beas checks whether an upgrade is available in this directory. If you do not want this check to be performed, enter "no".

FTP

The FTP connection is set up in this area. Setting is only necessary if the basic configuration does not work.

Field	Description
Account	Your user name for access to the Beas support server. So far no services have yet been offered. For this reason the field must be empty.
Password	Password for this account.

© 2026 Boyum IT Solutions A/S

FTP address	Address of the FTP server. Leave blank generally so that the default address is used.
Passive mode	Passive mode is used.
Passive use host address	Only visible in passive mode. Please only configure for problems. (Extract from documentation of Chilkat FTP client) This can handle problems that may arise when an FTP server is located behind a NAT router. FTP servers respond to the PASV command by sending the IP address and port where it will be listening for the data connection. If the control connection is SSL encrypted, the NAT router is not able to convert from an internal IP address (typically beginning with 192.168) to an external address. When set to 1, PassiveUseHostAddr property tells the FTP client to discard the IP address part of the PASV response and replace it with the IP address of the already-established control connection. The default value of this property is 0.
Port	If the default port should not be used, the port can be specified here manually.
Proxy mode	Is there a proxy server? If so, the type can be configured here. On activation, all other proxy properties are displayed. The following settings are possible : (Extract from documentation of Chilkat FTP client) ProxyMethod = 1 (SITE site) USER ProxyUsername PASS ProxyPassword SITE Hostname USER Username PASS Password ProxyMethod = 2 (USER user@site) USER Username@Hostname:Port PASS Password ProxyMethod = 3 (USER user@site) USER ProxyUsername PASS ProxyPassword

© 2026 Boyum IT Solutions A/S

	USER Username@Hostname:Port PASS Password ProxyMethod = 4 (USER/PASS/ACCT) USER Username@Hostname:Port ProxyUsername PASS Password ACCT ProxyPassword ProxyMethod = 5 (OPEN site) USER ProxyUsername PASS ProxyPassword OPEN Hostname USER Username PASS Password ProxyMethod = 6 (firewallId@site) USER ProxyUsername@Hostname USER Username PASS Password
Proxy Hostname	Name of proxy server
Proxy Password	Password for proxy server
Proxy Port	Port
Proxy Username	Username
Test connection	Connection is tested. If an error message is returned, a window containing the analysis opens. Use the PAGE key to scroll down.

- Current database connections tab

Info: This tab is only visible in MSSQL Version.

Field	Description
Host name	Host name
Program name	Name of the executed program
Status	current status (runnable, sleeping)
Cmd	Last command

© 2026 Boyum IT Solutions A/S

Last Batch	Last batch run
Login Time	Login Time
SPID:	Process number
Current Command:	SQL-command, which was executed with this process
Blocked from:	If greater than 0, blocked by the given process
Blocked command:	Last command of the blocking process

Functions

Function	Description
Open	Open station entry to edit.
Cancel	Close window without saving changes.
Setup terminal	Opens the window Terminal settings.
Add	Create new work station - the editing window opens.
Remove	Remove selected work station.
Message send	Send message to the client: Type message in a pop-up window.
Delete old entries	⊟ Remove not used station entries Delete all station settings for stations which were not connected in the last 2 months.

back to Station settings wizard

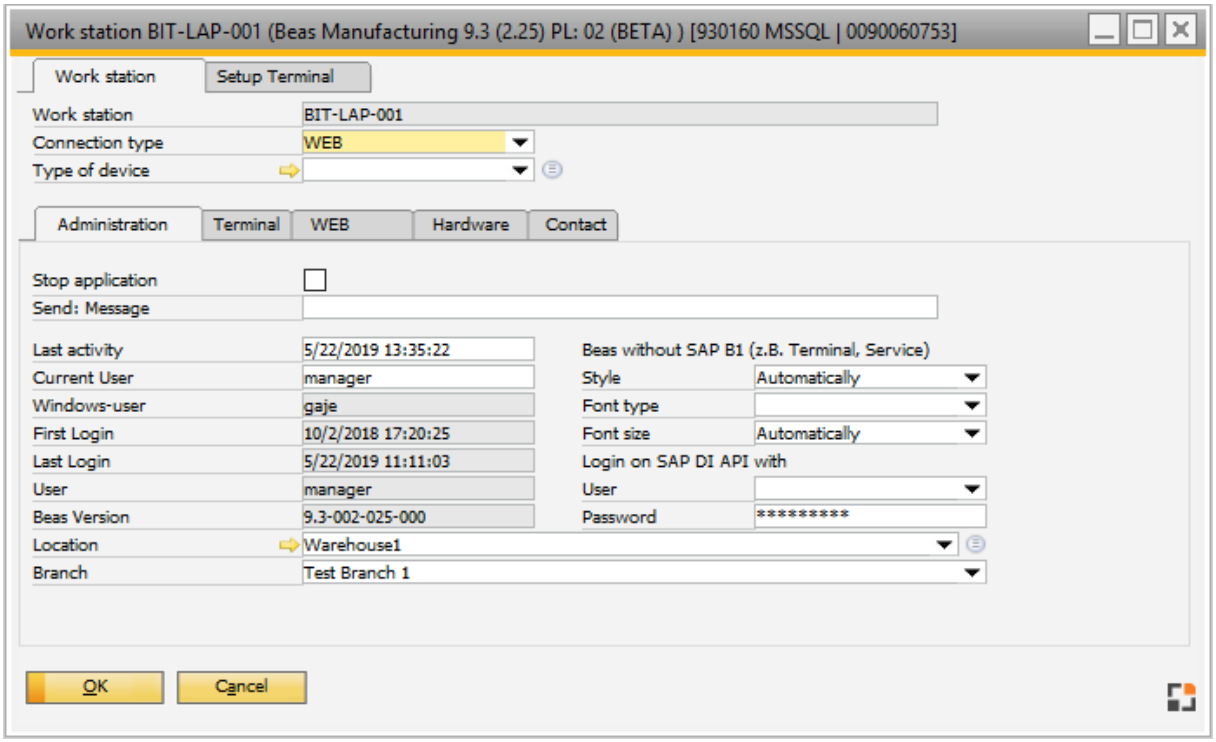
3.1.4.1 Edit work station

Settings for a station, a terminal or a WEB client can be edited or viewed here.

PATH: Administration > System initialization > Work station settings wizard > **Open** selected work station.

Work station tab

© 2026 Boyum IT Solutions A/S



Window system_ station_ edit.psr

Field	Description
Station	Display logged on work station. ***See*** Station Name.
Connection type	Selection: WEB, LAN. Only information, no function.
Type of device	Selection from previously defined device types.

Administration tab

Field	Description
Stop Application	This station stops automatically after max. 2 minutes if activated. This can be used e.g. to update on a terminal server. It does not apply for WEB applications.
Send: Message	A message can be sent to the indicated station here. This may take max. 2 hours. Applies not for WEB applications

Current status

Field	Description
Last activity	Display the last activity on this station. This is updated every 2 minutes.
Windows user	Name of the Microsoft Windows account.

© 2026 Boyum IT Solutions A/S

First logon	Display the first logon in Beas / Beas terminal.
Last logon	Display the last logon in Beas / Beas terminal.
User	Name of the person who has been last logged on on this station.
Beas Version	Beas Version with which the server has been started.

Beas without SAP B1 (eg. Terminal, Service)

The design can be defined here if beas is started without SAP Business One (eg. in terminal mode or as service)

Default setting is "Automatically". The SAP-settings will be read in here, if they exist.

Field	Description
Style	The SAP Business One design.
Font type	Font type. **Important**: The font has to be also installed on the client!
Font size	The font size to be used.

Logon on SAP DI API User / Password	A own SAP DI API license is required for each terminal station. The user can be indicated here with which the terminal station has to be logged on to the SAP DI API. *beas 9.2 PL: 02*
Menu	Standard menu (person independent) assigned o this station If a PC terminal is used, this determines which menu items should be displayed for which authorization group. If the entry is left blank, the setting according to the Personnel setting is used. If a menu is selected, the corresponding entries are displayed depending on the definitions of the workstation. For WEB-Terminal: currently no function.
Location	The location of this Station or WEB Clients. Use this for Printer Definitions. ***See*** Location
Branch	Multi Branch solution: Define the Default Branch for this Station. The System can use this to define Filter (example: only Items for this Branch).

Terminal tab

Following settings for the terminal are in this area

© 2026 Boyum IT Solutions A/S

Field	Description
Operation	Define the type of operation of the device Possible is mouse/touch and keyboard. Affection at type keyboard. PC-Terminal: A quick operation button is displayed at the buttons, so that all of the functions can be used through the keyboard. This can also be set in the **Terminal > right mouse button > "Mode"** ***See*** Terminal *Field OperationMode, beas9.0-000-002-007*
Background Color	Terminal: Define the color of the background
Image	Terminal: An image file can be selected here which is displayed in the terminal in offline mode The image file has to be in a directory on which the Terminal has access. The length and height can be set via comma separation. ***Example:*** \\servername\pictures\logo.jpg,1500,500 *beas9.0-004-047-000*
Preview window	Extended setting for the preview window The behavior of the preview window can be set here. **Synchronous**: Quick display but the program cannot be used during the loading process. **Asynchronous**: slightly delayed display, because the display window is started as a separated program. During the loading process, it is possible to continue working during the loading process. **Manually** (only Terminal): Preview can be opened manually via right mouse-click. **Automatically** (only Terminal): Preview is opened automatically with the start of the terminal. *beas9.0-004-053-000*
Timeout	Client-Server based Terminal: Time for automatic logoff at inactivity. ***See***: Terminal - Client-Server based

WEB tab

Field	Description

© 2026 Boyum IT Solutions A/S

Default application	This option was deleted in Beas 2020.02.00.07
Work Station password	A password has to be defined at WEB-logon with a station specification. This is defined here.

Hardware tab

Description of the station, client or hardware.
Display of information (e.g. hard disk storage, device memory etc.), which can be determined.

- Button Position Correction in %

This defines the original position.
100% = the original position
< 100% = move to top
> 100% = move to bottom
- 1 = automatic determination of the correct position of the buttons.

For this, the system changes the zoom factor of the buttons, which changes the vertical position, as well.

If you change this property, the system changes the buttons in this form directly. You can check if the buttons are in the correct place without clicking on update.
By clicking on update, the new setting is active without restarting the program. Currently opened windows are not affected.

Contact tab

Contact person and location of this station, this client or hardware.

Below: only display

Field	Description
Station	Short description
Station name	Name of the station. In virtual machines or terminal sessions the environmental variable „SESSIONNAME“. If it is „CONSOLE“, then the computer name is used. Session name is usually the name of the user, who logs on to the terminal session.
First logon	First logon to Beas.
Last logon	Last logon to Beas.

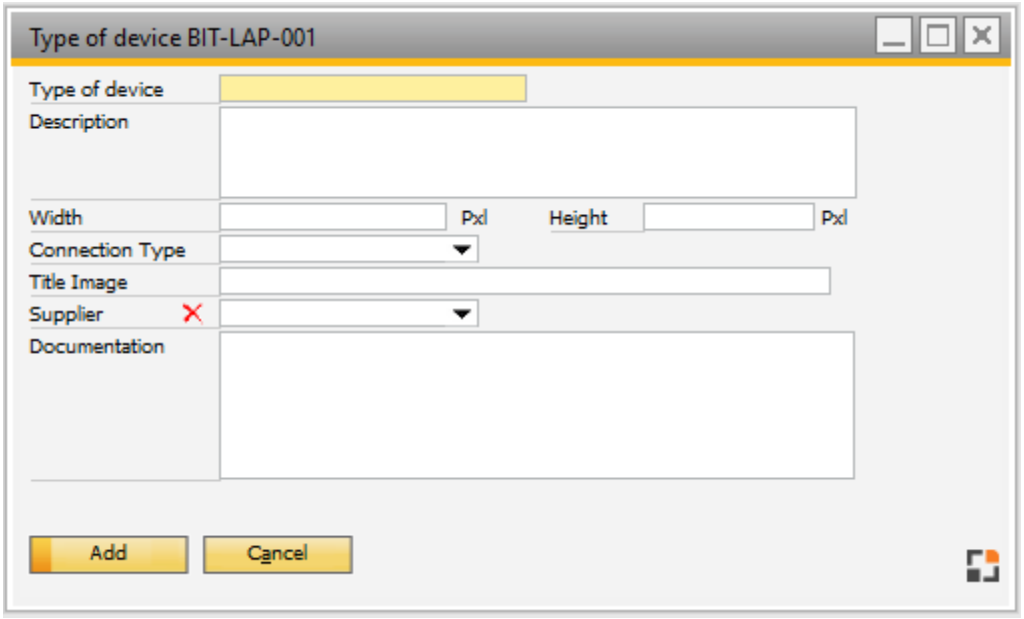
© 2026 Boyum IT Solutions A/S

User	Currently logged on user.
Windows user	User logged on in Windows.
Beas Version	installed Beas version.
DB server	Name of database server.
DB name	Name of the data base logged on.
Memory total	Total physical memory in MB.
Memory free	Available physical memory in MB. If less than 250 MB, secure operation cannot be guaranteed..
Computer name	Name of the computer.
c:\free GB	Free disk space c:\ If less than 5 GB, you should take action.

3.1.4.1.1 Device types

PATH: Administration > System initialization > Work station settings wizard >

1. Edit selected work station.
2. "Type of device field" > filter button.
3. Edit or add New device with buttons.



Window system_device_edit.psr

Field	Description
Device type	Device description.

© 2026 Boyum IT Solutions A/S

Description	Description.
Width	Display width (possible resolution) .
Height	Display height (possible resolution).
Connection type	Allowed connection type for this device (WEB or LAN).
Title Image	Assigned image.
Supplier	Select supplier.
Documentation	Free text for documentation.

3.1.4.1.2 Locations

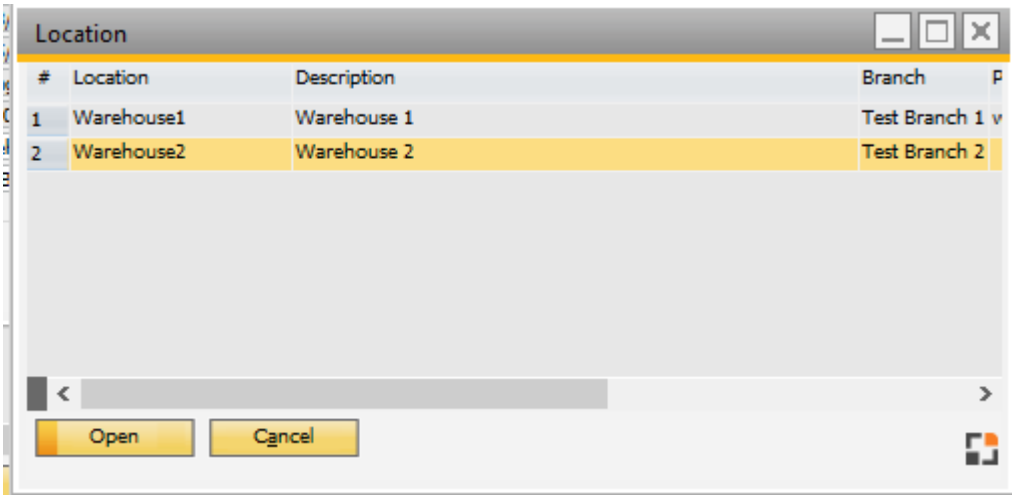
A location is a defined area in a factory.

A location can have own properties (UDF) and a defined printer.

PATH: Administration > System Initialization > Work Station Settings Wizard > "Location" field > open list with selection icon.

If you work with WebApps, you can connect to a location and use the printer defined for this location.

In this window you can manage all locations:



Window system_location_browse.psr

3.1.4.1.2.1 Location

A location is a defined area in a factory

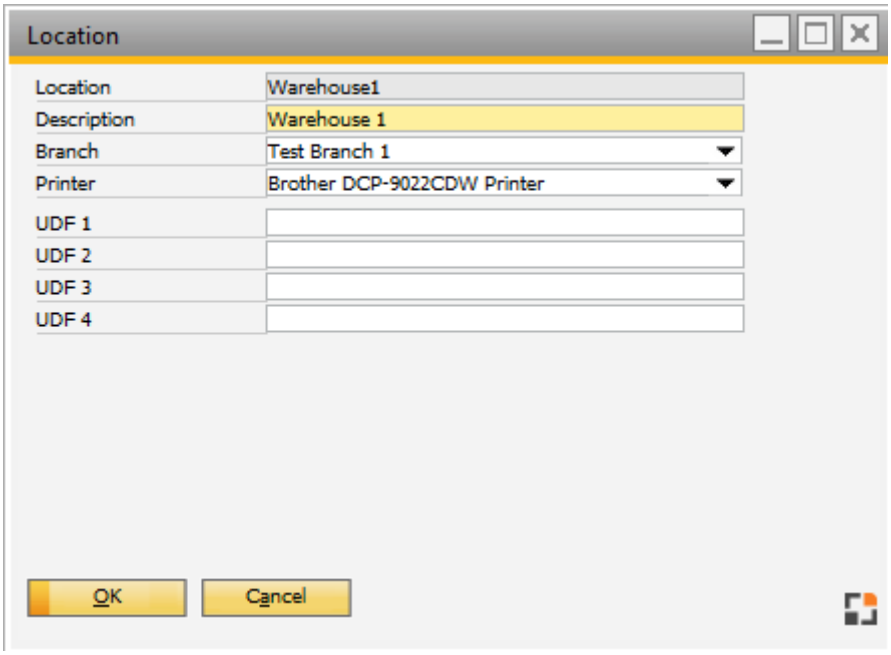
A location can have own properties (UDF) and a defined printer

PATH: Administration > System Initialization > Work Station Settings Wizard > "Location" field > double-click the yellow arrow

© 2026 Boyum IT Solutions A/S

If you work with WebApps, you can connect to a location and can use the printer defined for this location.

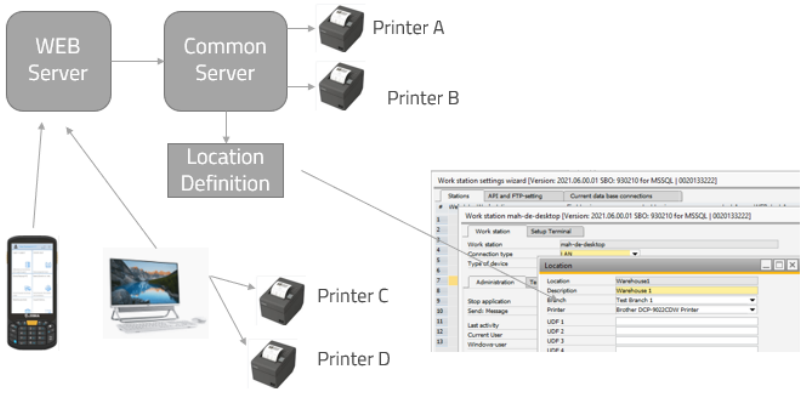
In this window you can manage a location.



Window system_location_edit.psr

Field	Description
Location	Location ID
Description	Description for this location
Branch	Location Branch
Printer	Printer for this location A WebApp sends a print request to the WEB Server and the WEB Server to the Common Server Service. The Web App is registered to a Location, which you can define in in this Station settings. In this field you can define the Printer Driver for the document on this location.

© 2026 Boyum IT Solutions A/S



However, it is not the client that prints the document. The Common Server Service prints the document, and the service can use only printer drivers available on this server in this service session.

If you click on the dropdown icon, Beas asks the Common service, which printers are available and displays all available printers for the service. Not all installed printers are always available in service mode. If a printer is not available, you can try to start the service in a local mode (service setup – use local account).

Note:

In WebApps it is always the Common service to print the document, not the local client.

If the Beas common service is not active, the system returns a warning message and displays local printer drivers.

udf1...udf4	You can define own values for a location. This values is active in the WEB sessions (only for customization).

3.1.4.2 Set up Terminal

The setting for the appearance of the terminal application is entered here (Attendance – Login and Logoff).

PATH: Administration > System initialization > Work station settings wizard > click **Setup Terminal** button.

© 2026 Boyum IT Solutions A/S

See Pool report

back to Station settings wizard

3.1.5 Factory Calendar

PATH: Administration > System initialization > Factory calendar.

In this window you can define the main day planning. You can set:

- holidays

- availability in % for Machine resources and for FDC with graphical visualization

Beas uses this calendar for planning hours of machine resources and human resources

Machine Resources

```
Capacity of resource = hours / day of resource * count of resources * calendar day %
```

Human Resources (FDC)

```
Presence to be = count of hours (shift definition) from current day template *
calendar day %
```

After changing the calendar, the resource planning and human "present to be" time must be recalculated.

This takes place as an automatic process.

© 2026 Boyum IT Solutions A/S

See the following links:

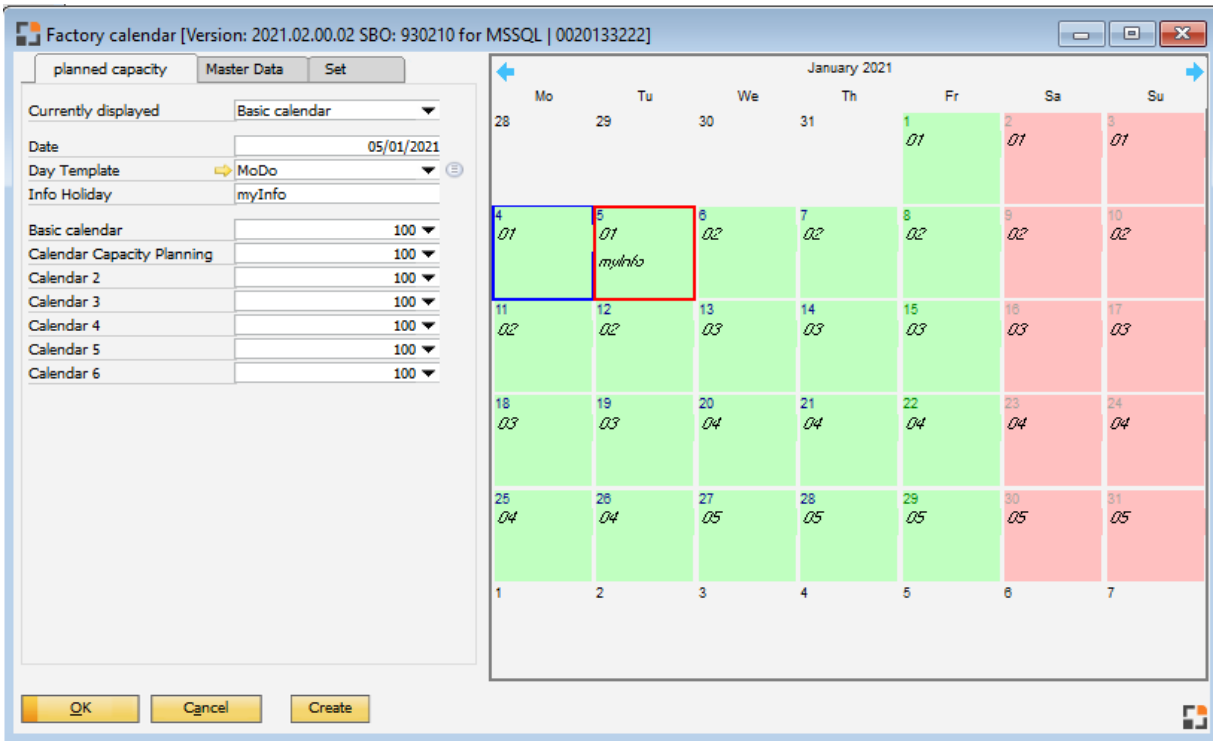
Calendar Creation

Day Template

Shift schedule for Resources

Attendance Recalculation

IMPORTANT: If the B1 UP Usability Package Add-On is installed, but you cannot see Beas Production or Beas Maintenance Calendars, restore calendars as described in B1 UP Usability Package Documentation.



Window bde_kalender_browse.psr

It is possible to define up to 6 calendars + a basic calendar.

Human shift planning uses only the basic calendar.

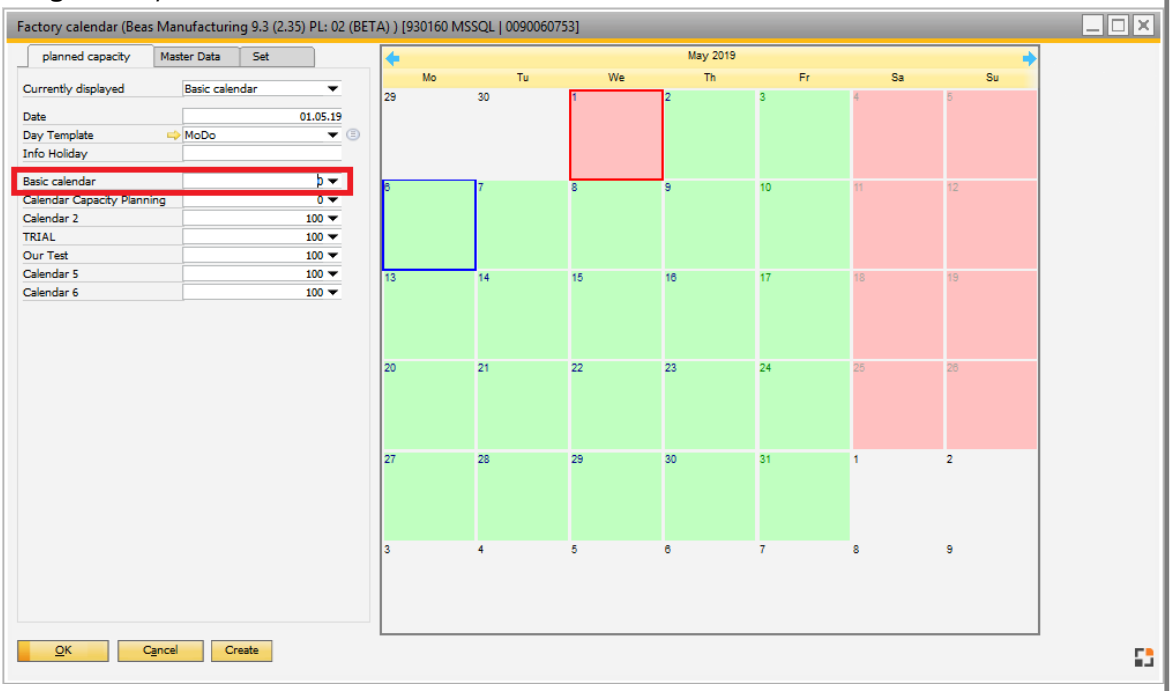
For resource planning it is possible to use the basic calendar or calendars 1–6.

Planned Capacity Tab

In this tab you can define which day template you want to use per calendar and date, whether it is a public holiday, and how much the capacity is on that date. For example, to define the 05.01.2019 as a public holiday in the basic calendar, use the following procedure:

© 2026 Boyum IT Solutions A/S

Select the basic calendar via the drop-down menu named "Currently displayed". If no work occurs on public holidays, select the capacity zero (0) for the basic calendar in the field Basic calendar. When changing the percentage in the capacity drop-down for the actual calendar, the OK button switches to "Update." Click Update and the new capacity will appear in red with 0% on the given day.



Window: bde_kalender_browse

Note:

Do not define a date area > 30 days without capacity. This creates error messages "calendar3" in different areas. ***See*** Message numbers.

Field	Description
Currently displayed	Define which calendar on right side is displayed.
Date	The current date you wish to choose.
Day Template	Define the Day template for this date. This is related to all calendars. ***See*** day template.
Info Holiday	Field used to describe the holiday defined. Related to all calendars. ***Example:*** to define 12.25.2019 and 12.26.2019 as public holidays, use the arrows in the calendar graphical view to select the month December. Click on the day to select the date, select "0%" in all calendars and enter the

© 2026 Boyum IT Solutions A/S

Field	Description
	name of holiday (Christmas day) in the "Info Holiday" field for each day. Click "Update" and the holiday info with capacity will be displayed for the given date.  **Setting half workdays for National holidays:** In certain countries, 24th December and/or 31st December are counted as "half" workdays. For this, set 50% in the Basic calendar which will result in half day. Note: Beas does not display the correct number of workdays/holidays in **Personnel XXX > Absence** as regardless of the percent factor, the half workday is still counted as one workday. To see the correct results broken down to working hours, go to **Personnel XXX > Attendance** and click the "Time Evaluation" button, which displays a report on the number of working hours per day according to the % factor you defined in the Factory calendar.
Basic Calendar	Field used to define the percentage of work to be carried out on this day.
Calendar 1-6	Define percentage of work to be carried out on this day for calendars 1-6. In Tab "Master Data" it is possible to rename the name of calendars 1-6.

© 2026 Boyum IT Solutions A/S

Set Tab

In this tab, Beas allows to edit the capacity defined per day for the calendars for a period of time, except the basic calendar.

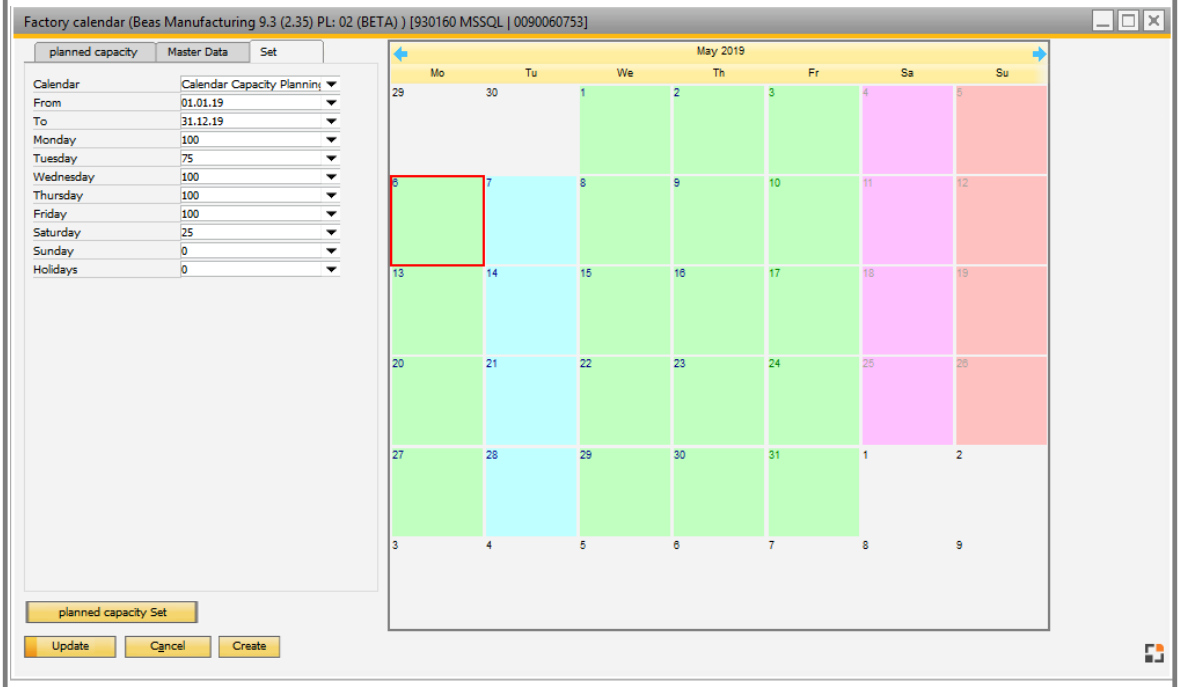
Field	Description
Calendar	Define which calendar on right side is displayed.
From	Field used to define the start date of the new capacity in the selected calendar.
To	Field used to define the end date of the new capacity in the selected calendar.
Monday–Sunday	You can select the capacity of each working day in %.
Holidays	You can select the % capacity of each holiday you have defined.

Example:

From the date 01.01.2019 to date 31.12.2019 in Calendar "Capacity Planning" (that is Calendar 1), a new capacity has been defined. For this period the capacity will be 75% on Tuesdays. As for Saturdays, the percentage will be 25%. On the calendar graphical view, Tuesdays will now change from green to light blue and Sundays from green to purple due to the new capacity.

Planned capacity set: Button used to set the new capacity defined for the period of time. Once clicked, the new capacities are indicated graphically in the calendar with the different colors.

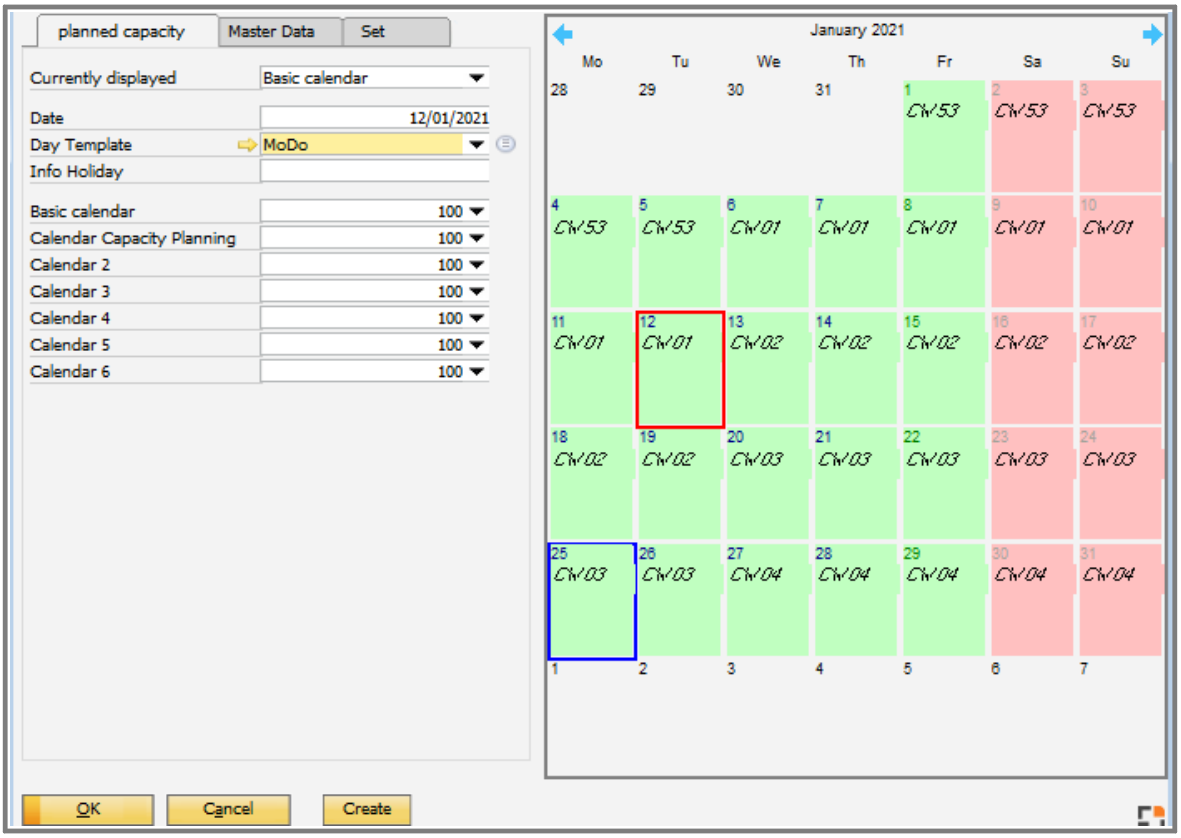
© 2026 Boyum IT Solutions A/S



Window: bde_kalender_browse

To check the calendar week, the factory calendar displays the calendar weeks in the calendar, example "CW 01" for Calendar week 1:

© 2026 Boyum IT Solutions A/S



3.1.5.1 Calendar Creation

In this window it is possible to create a new calendar .

PATH: Administration > System initialization > Factory calendar > "Create".

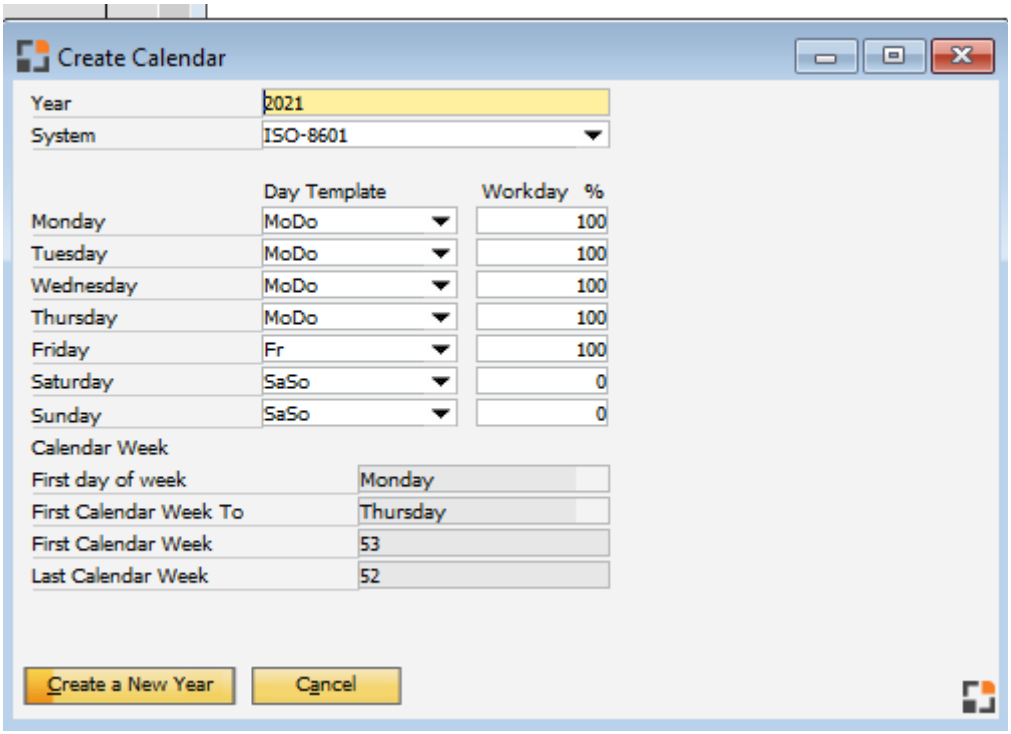
How to create a new calendar for a year:

- if the calendar does not exist, Beas opens this window automatically.
- factory calendar - button "new".

To make certain that calendar weeks are counted correctly, enter the first day of the first calendar week of the year.

The holidays are automatically calculated in German language areas and can be selected or deselected. If the year already exists, and the user tries to create it again, Beas overwrites the existing one. For all other countries you must create the holiday entries manually in factory calendar.

© 2026 Boyum IT Solutions A/S



Window bde_kalender_neu.psr

Field	Description
Year	Create calendar for this year
System	Define the used Calendar system

first day of week	First day to	Used by or in
Monday	Thursday	EU and most other European countries, most of Asia and Oceania. Click for more information.

Field	Description
	<table><tr><th>first day of week</th><th>First day to</th><th>Used by or in</th></tr><tr><td></td><td></td><td></td></tr><tr><td>-</td><td>-</td><td>You can modify all settings.</td></tr></table>
Day Template	Use this day template for this day. ***See*** Daily Schedule
Workday %	Field used to define the percentage of work to be carried out on this day.
First day of week	Define the first day of week related to system setting For ISO-8601 the first day of week is Monday. ***See*** setting "System". If System is defined as Custom, it is possible to choose the first day of the week.
Calendar week to	Define the last weekday which can contain the first week of the year. If later, the week is part of last year (example 53 or 54) The system calculates this automatically related to the defined System (***Example*** ISO-8601 = Thursday). If system is set to "Custom", you can overwrite it.
First Calendar Week	Define the Week Number for 1 January of the year. This is always calculated automatically. If system is set to "Custom", you can overwrite it.
Last Calendar Week	Define the Week Number for last week of the year. This is always calculated automatically .

© 2026 Boyum IT Solutions A/S

Field	Description
	If system is set to "Custom", you can overwrite it.

back to Factory calendar

3.1.6 Report setup

The Beas Report system is highly integrated into SAP Business One. The module offers a wealth of functions which can even be used in each additionally installed add-on. The functions of the Beas Report system are superimposed on the SAP Business One default function. These can also be deactivated window- and even report-specifically if the function is not required. All documents can be printed or sent directly by fax / email.

PATH: Administration > System Initialization > Report Setup.

In "Beas Reports" you can set up standard reports, filters, translations and text components.

Available tabs:

Standard reports

Own Reports

Text components

Translation (Report)

Languages (SAP)

Filter

© 2026 Boyum IT Solutions A/S

Macros

SAP Document Print solution

Crystal

3.1.6.1 Standard reports

PATH: Administration > System Initialization > Report Setup.

Manage standard reports here. System reports and default reports are displayed in a list.

At program update the system reports are updated automatically, but not the default reports.

© 2026 Boyum IT Solutions A/S

Use the **Default load** button to update report settings.

back to Report settings

see SAP Document Print solution

3.1.6.2 Own reports

The list displays all reports which have been stored in the program or in windows. The reports are editable here.

PATH: Administration > System Initialization > Report Setup.

Report settings

SAP Document Print solution

3.1.6.3 Text Modules

You can define text components for reports and e-mails.

PATH: Administration > System Initialization > Report Setup.

Text module	ID for text module
Language	Select language.
Type	Use for which document type (e.g. "Email" for Email).
Subject	Only for Email: subject line Placeholders can be used – ***see*** below. for ***Example***: FAO: <source_header.contactname>.

Functions

New	Create new entry.
Delete	Delete entry.
Edit	Edit email text. An editor opens, where placeholders can be used.

Placeholders

Placeholders can be inserted to texts, e.g. today's date: <today,yyyy/mm/dd>

When working with b1documentgenarte-API additional placeholders are available:

© 2026 Boyum IT Solutions A/S

Available data stores:

source_header	Header of document. All fields, e. g. ORDR for order. Attention: When previewing (as soon as this function is available) not all fields are filled.
source_line	Document-Lines all Fields, example Order all Fields e.c. from rdr1 or inv1
document_header	All fields from beas_document_header
document_line	All fields from beas_document_header
companyinfo	Special fields from oadm (Company): syscurrncy,maincurncy,compnyname,compnyaddr,printheadr,phone1,phone2,fax,e_mail,freezoneno,taxidnum,revoffice,cmpnyaddrf,printhdrf,phone1f,phone2f,faxf,manager,managerf,taxidnum2,taxidnum3
contactadr	All fields from OCPR (contact person)
owneradr	Special fields from Personal (ohem): firstname,middlename,lastname,jobtitle,position,dept,branch,office tel,mobile,pager,fax,email
invoiceadr	invoice address cardcode,cardname,address2,address3,street,block,zipcode,city,state,country,countryname,phone1,fax,email
shipadr	shipping address. All fields from OCRD
payment	all Fields from Payment OCTG
Discount	Discount-Table ocdc: code and tabledesc

***Examples*:**

<source_header.contactname>	Customer contact person
<source_header.cardname>	Name of customer

For an overview of all fields, ***see*** APIs - b1documentgenerate

Beas translation system

3.1.6.6 Filter

PATH: Administration > System Initialization > Report Setup.

The Beas report system is active by default in all windows and overrides the SAP-Standard solution and maybe also other Add-ons.

If the SAP window number (Form ID, e.g. 139 for sales order) is inserted, the Beas – Macro system is turned off completely for this window.

See Macros

back to Report settings

© 2026 Boyum IT Solutions A/S

3.1.6.7 Macros

Beas works with macros. A macro can print, fax, display or edit a report, analysis or marketing document.

A macro can

- Prepare data for a report

- **Use different form systems to prepare the report, e.g.:**
  - Crystal
  - Powerbuilder
  - Infomaker
  - Proprietary generator by SQL query
  - MS Excel, PDF, RTF, WMF, XLS, HTML and other converters
- **Reuse the form in any way, e.g.:**
  - Display
  - Mail
  - Fax
  - Print
  - Export

- Perform batch functions

- Create multiple reports in succession
- Forward a document automatically in another way

- Analyze conditions

- Depending on the station, customer, user, right, call type and much more
- Control the output or call

- Control the printout:

- Tray
- Printer
- Printer driver
- breaking down
- Multiplex
- Paper type
- And much more, depending on the station, customer, user, right, call type, etc.

Any number of macros can be stored in each SAP and Beas window. Each macro is window-specific. If a macro is required in multiple windows, there are two options:

© 2026 Boyum IT Solutions A/S

1. Store the macro separately in each window for the report call.
2. Each program range has a "List" function, e.g. Production list.
All relevant Beas windows in turn have the "List" function, which can be used to call the range list window.
Macros required by multiple windows can now be stored behind these range list windows.

1. Store the macro separately in each window for the report call.
2. Each program range has a "List" function, e.g. Production list.
All relevant Beas windows in turn have the "List" function, which can be used to call the range list window.
Macros required by multiple windows can now be stored with these range list windows.

Macros can be distributed via clipboard using the copy&paste function. ***See*** Data selection copy&paste.

See

Macro definition
Crystal support
Translation
API's
Date and time format

- Supported output formats

Note: An output of Beas windows into PDF format is currently not possible.

Documents, reports, etc. can be output in a variety of formats in Beas. see the following table for more details:

	Beas form	SAP form	Crystal
Acrobat/PDF	It is not yet possible to export to PDF format.	In this case, the SAP standard system is used.	Output in PDF format.
Excel	If a Beas form is exported to MS Excel, the view itself is	Formatting is also performed here.	The Excel default is used.

© 2026 Boyum IT Solutions A/S

	exported formatted to MS Excel, not the data. Only images are not transferred.		
Word	It was not previously possible to export to MS Word format.	In this case, the SAP standard system is used.	The output is exported to RTF format.

- Disable globally

To deactivate the Beas print function generally in the SAP marketing functions:

Administration > System Initialization > Configuration Wizard > Print and report setup > Printing Crystal reports

Simply deselect the tick box "Print B1 documents with Crystal".

Then all printing is performed in all SAP marketing windows using the SAP default or the other installed add-ons.

- Macro – Deactivate directly in an SAP window.

To suppress an element in a specific SAP window:

1. Click on the layout symbol
2. Click the **Deactivate** button

As of now, instead of using the print solution for this window, the default SAP solution or the solution of other add-ons is used.
The deactivated windows are managed under Report settings – Filter

To re-activate the macro for a window, delete the window ID Report settings – Filter.

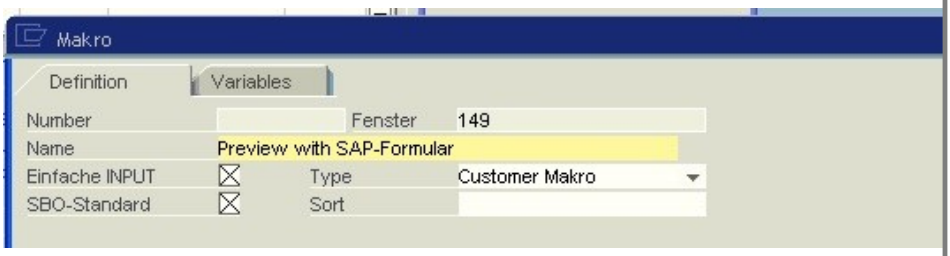
- Macro for SAP Standard

A macro entry can be created for using the SAP default.
If this macro is selected, the default SAP functionality is used.

Example of use:

© 2026 Boyum IT Solutions A/S

Using the Beas report system, it is not (yet) possible to create a preview – unless this is created from a parked document.
To display a preview quickly, you can also use the default SAP form.
To do this, create a new macro and activate SAP Business One Default.



- Assign a macro to several windows

If a macro is needed in more than one window, there are 2 possibilities:

1. Store the macro in every window separately
2. Every program area has a functional list, e.g. work order list. All relevant windows have the function "Lists" to call up the area list window.
   In these windows macros for multiple windows can be stored.

- Start macro automatically (SAP document)

In SAP documents are not printed automatically. If you need this, create a script.

Example for sales order – email via standard report.

```
windowevent update
if <eventtype> = add then
   printobject=makrostart=email==1003
end if
end event
```

3.1.6.7.1 Macro Definition

This chapter describes how to set up a macro. The function is accessible via **right-click >** click the second tab **"printer",** then click the icon **"Layout" .**

In the Report selection window (e.g. Reports – master data): Right-click > Window settings.

In the main window all macros assigned to the current window are displayed. Select one to edit or to create new reports.

see also:
Macro structure
Create Macro

3.1.6.7.1.1 Macro Structure

A macro is structured as follows:

1. Data preparation	Does data have to be prepared, e.g. for sales and purchasing forms or demand lists? Should queries be presented first?
2. Macro Step	Specifications for report creation? With which system (Crystal, Infomaker, current form, SQL query)?
3. Macro Output	How should the report be output? Email, fax, printer, Excel, PDF, etc.
4. Print output	For output by printer: How should the output be executed? Which tray, which printer, which print options?

Any number of sub-entries of the sub-level in question can be added for each level. If an option is not specified, a default setting is used.

Note: If no output form is defined, the output form for starting the macro is used.

Example:
Click on the magnifying glass to use "Preview" as the output form.

© 2026 Boyum IT Solutions A/S

3.1.6.7.1.2 Macro

In this window the Macro is defined. Select one and click Edit.
For further information ***see*** Macro structure.

Field	Description
Number	Number of Macro. When creating a macro, a number can be entered manually. You can define number ranges. Allowed range: 100.000 – 99.999.999 If no number is entered, the next free number is used.
Window	Window title (psr-file) in which the Macro is executed. Filled automatically.
Name	Macro name. A unique name is to be entered (mandatory field). The entered text is not translated into the user's language. Click the script icon displayed left of the entry field to open the script editor. There you can define which report to be used by defining a script. Use the variable "value". ***Example:*** `setvar=value=Report Name from Script` If a script is stored, the icon is displayed in red. The script is executed at call up of a pre-view / print function or via menu entries "Master data report", "Production report".
Simple entry	Disabled: in case of Crystal Reports. This can be selected directly. Enter only variables (***see*** Variables). Enabled: Different types of output can be defined. ***see***: macro structure, Output formats.

© 2026 Boyum IT Solutions A/S

Type	**System macro**: Updated automatically with each Beas update. Please do not change it. **Standard macro**: Standard report which is imported at initial installation or selecting **Report administration - Reset standard**. Changes are allowed. **Customer macro**: Customized macro that can be changed. Default setting.
Sorting	Determines the order of display.
Macro selectable with	Determines, at which action (with which application) the macro may be selected: view, print, Fax, E-mail, PDF, Excel, Word.
Authorization	Select authorization.
Business partner	Select business partner. Report available only if the business partner is active. This works only for SAP Business One sales and purchase documents.
Stations	Select stations where the macro is available.
User	Select authorized users for this macro.

Script	Store a script to control the visibility of the document.
	Ending the script with "return failure" makes the report invisible.
	
	The script is called up in the parent window that is from the window in which the printing is started. If this is done from the menu, the script is called up in the reports list.
	As the script is already edited, you cannot use < and >. Use replacement characters { and }.
	
	Example: Only user "manager" is allowed to print the report
	`if {currentuser} = manager then`
	`  return success`
	`end if`
	`return failure`

Module	Enter the name of a registered module.
Start before extension: API	Functions to be executed in advance: e.g. process data in temporary tables. Which API's are available depend on the actual window. ***See*** API
Set print sign	**Print:** The printing ID is set only for direct printing, not for preview. **Always**: Also, the printing ID is set in work order for preview.

© 2026 Boyum IT Solutions A/S

Print planned order	**No**: Work order of the "planned" type cannot be printed even if marked (default setting). **Yes**: Planned work orders can be printed, as well.

Tabs

Field	Description
Definition	Defines the macro and the pre-generating function (this window).
Variables	Defines variables to be set up or queried in advance.
Macro step	Defines the sequence of a macro.
Scripts	Scripts can be stored which are executed before or after the macro is called. Loop statements are also possible.

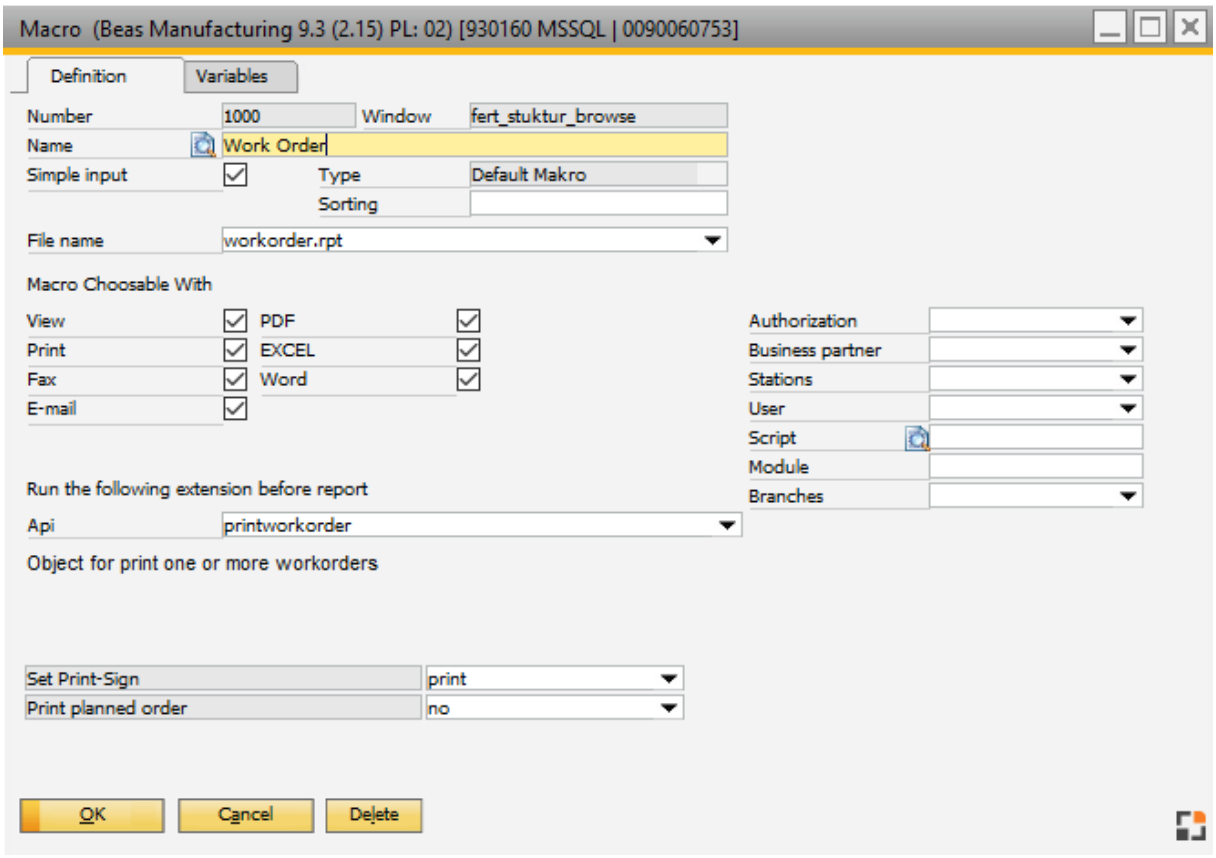
3.1.6.7.1.3 Report Name

A name must be defined for the macro at the start. To do this, the window for which the macro should be stored is opened. Next, you can open the macro editor by using the pencil icon.

see also: "Macro Structure"

Create a new macro by clicking **Add**. The following window opens:

© 2026 Boyum IT Solutions A/S



Window report_makro_edit_page1.psr

Only the following entries are required to define a simple macro:

1. Name
2. File Name
3. API call, if applicable

Field	Description
Number	Number is assigned automatically.
Window	Number or name of the window to which the macro belongs
Name	Name of the macro
Easy input	Simplified input is active if this option is activated. If this is deactivated, the "Process" tab is displayed and "File name" is hidden. The creation of the report is then defined in the "Process" tab.
SBO default	If this option is activated, the default SAP report is called when a macro is selected.

© 2026 Boyum IT Solutions A/S

Sort	Determines the order when selecting the macro.
File Name	Only active for "Simple Input": The Crystal Report to be printed can be selected here. Note: Beas use SAP Crystal Reports. But this Product is not part of Beas.
Macro selection is available for	Activates a filter here that defines the condition under which the macro is available, e.g. only on faxing, only for emails or only for the preview, etc.
Authorization	Configures which Beas right is required to call this report.
Business partners	Configures whether the macro is only available for a specific business partner. Any number of business partners can be selected. Business partner-related forms can be created in this way.
Resource	Configures the PCs on which the macro may be called.
User	Configure the users that may run the macro.
Script	Any Beas script can be stored here. Any filter can be scripted using this.
Module	Configures which Beas module must be activated so that macro can be printed.
API	A data pre-generation function. For example, before printing "B1DocumentGenerate" generates the contents of beas_document_header and beas_document_line which a Crystal form can then access.
Text Components	Here you can save up to 5 text components which are stored for printing marketing documents. Text components can be stored in any number of languages. Beas locates the text components.

Available tabs:

Name	Description
Definition	Defines the macro and the pre-generation function.
Variables	Defines the variables that should be set or queried in advance.
Process	Defines the process of a macro. The macro steps are stored here.
Scripts	Stores scripts that are executed before or after the macro call. A loop instruction can also be stored.

© 2026 Boyum IT Solutions A/S

3.1.6.7.1.4 Macro Step

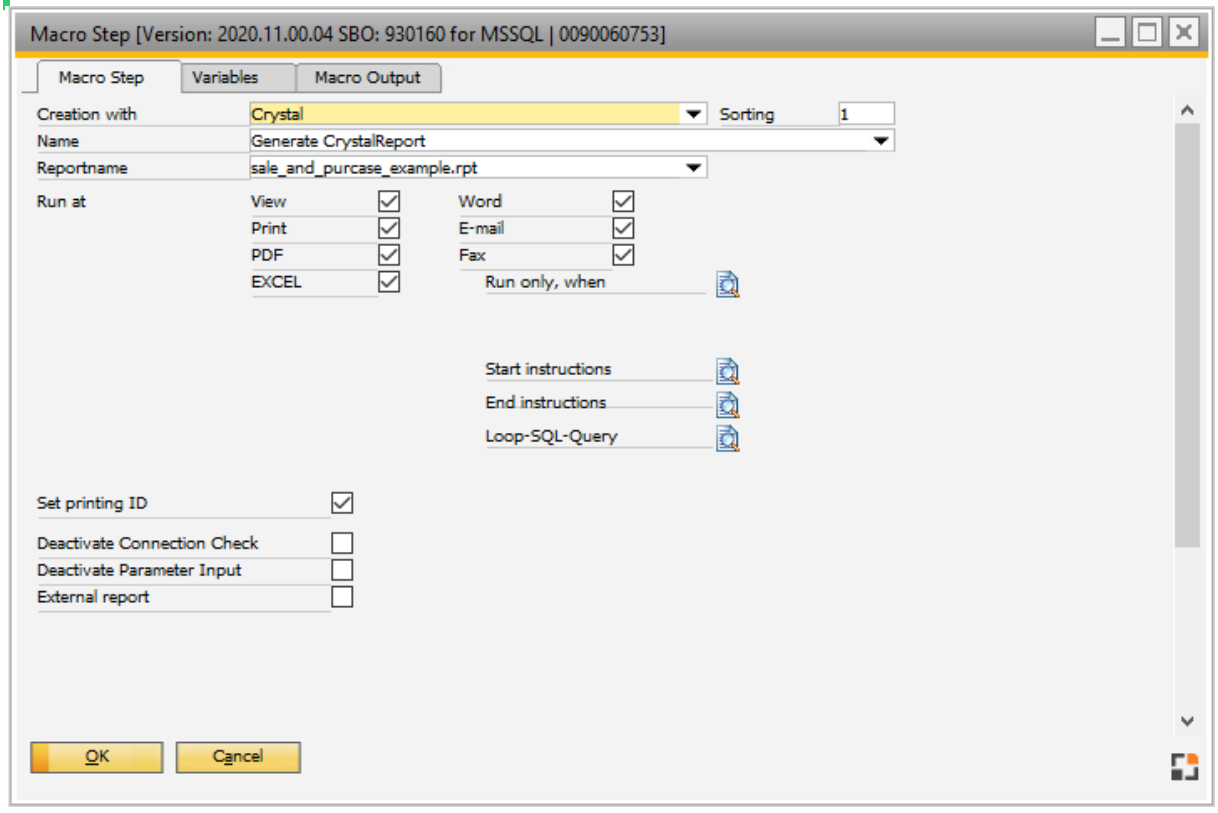
Any number of macro steps can be stored per macro. A macro step determines which system is used to create a form and whether anything should be created at all.

The following is a rough outline of what happens in a macro step:

1. Execute start script
2. Query or define variables
3. Generate form
4. Execute macro output
5. Execute End script

It is also possible to integrate loops. The visible input fields depend on the generation function.

PATH: Administration > System Initialization > Report Setup > **Open** a report > "Macro Step" tab > **Open** a macro step.



Window report_makrostep_edit_page1.psr

General fields:

© 2026 Boyum IT Solutions A/S

Name	Description
Creation with	The system to be used to create the report can be specified here. Beas use the SAP Crystal engine for displaying reports. Note: SAP Crystal report is not a product of Beas.
Name	Name of the macro step
Run at	Here you configure the condition under which the macro step should be run, e.g. only run if it was started via View. A script named "Run only if" can be stored for this purpose. If this script returns "return failure", this step is not executed. The filter function must not be confused with the creation function. This allows you e.g. to print by clicking on “Email”, or create an email on printing. **Limitation of PDF printing:** "Microsoft PDF Printer" is not supported. Install a different PDF printer to use.
Start instructions	Beas script which is executed before the report is created.
End instruction	Beas script which is executed after the report is created.
Loop SQL-Query	Loop function (see example below)
Set print ID	(Marketing window only): Print ID is set.

Creation with

A report can be created in the following ways

Name	Description
Crystal	The report was created with Crystal. The form is available as an RPT file.
Beas form	The report was created with Infomaker or Powerbuilder and saved as a beas form (PSR file). **Important:** If the macro variables should be passed in the call of the base form, they must begin with "var_".
SQL Query	An SQL instruction was stored.
Current window	The current window is used.
No Creation	No form is created – e.g. for re-use of existing files.

Additional inputs for Crystal

© 2026 Boyum IT Solutions A/S

Name	Description
File Name	File name of the form (RPT) File has to be located in one of the following folders: **c:\program files (x86)\beas software\beas\program** **c:\program files (x86)\beas software\beas\program\report** **[project folder]** **[project folder]\report** Alternatively, you can set up the file name in macro step, by setting the variable makro_filename *(beas 9.1 PL: 08)* ***Example:*** `setvar=makro_filename=my_own_report.rpt` **Note:** Beas uses Crystal 11 Viewer. Only object types managed with Crystal 11 viewer can be viewed.
Deactivate Connection Check	A Crystal document is defined for a specific database or connection. Beas breaks the connections stored there and links the form to the current database. If you do not want this (e.g. because a result is expected from a process), you can deactivate this setting here. **Note:** This setting is only available in MSSQL.
Deactivate Parameter Input	Beas retains the Crystal parameter input and provides multilingual, user-friendly parameter input. However, if you want to work with the Crystal parameter input, the Beas function can be deactivated here.
External Report	If this option is activated, all Beas influences are deactivated, e.g. translation, formula breakdown, etc.

Additional inputs for SQL query

Name	Description
SQL Query	SQL instruction from which a report is created.

Tab

© 2026 Boyum IT Solutions A/S

Name	Description
Macro Step	Defines the macro step.
Variables	Defines the variables and parameters.
Macro Output	Defines the output steps.
Scripts	Defines scripts for Macro start, SQL query for Loop and Macro end. Click on the yellow arrow to open the beasgui script editor. **IMPORTANT:** The symbol # can cause errors when placed in the beginning of macro script definitions (e.g. macro start/stop). Users are advised to avoid using this symbol in the beginning of a script. *Window report_makro_edit_scripts.psr*

Example: use loop function in macro step:

If you want to call up a report several times with a macro and change the content of a report variable automatically (e.g. continuous number, work order position etc.) proceed as follows

Store BeasScripts in macro steps "Start statements" and "Loop-SQL-Query" :

Start statement:

```
global function reportscript_step_preinloop
  // set report variable 'pos' with the result of the Loop-SQL Statement
  printobject=setvar=pos=<e_number>
end global
```

Loop-SQL-Query:

```
select column as number from table where .....
```

How it works:
The SQL-statement loads the desired values from the data base and writes them into the variable "Number" (internally extended with "e_"). Then, the value is transferred to the report.

© 2026 Boyum IT Solutions A/S

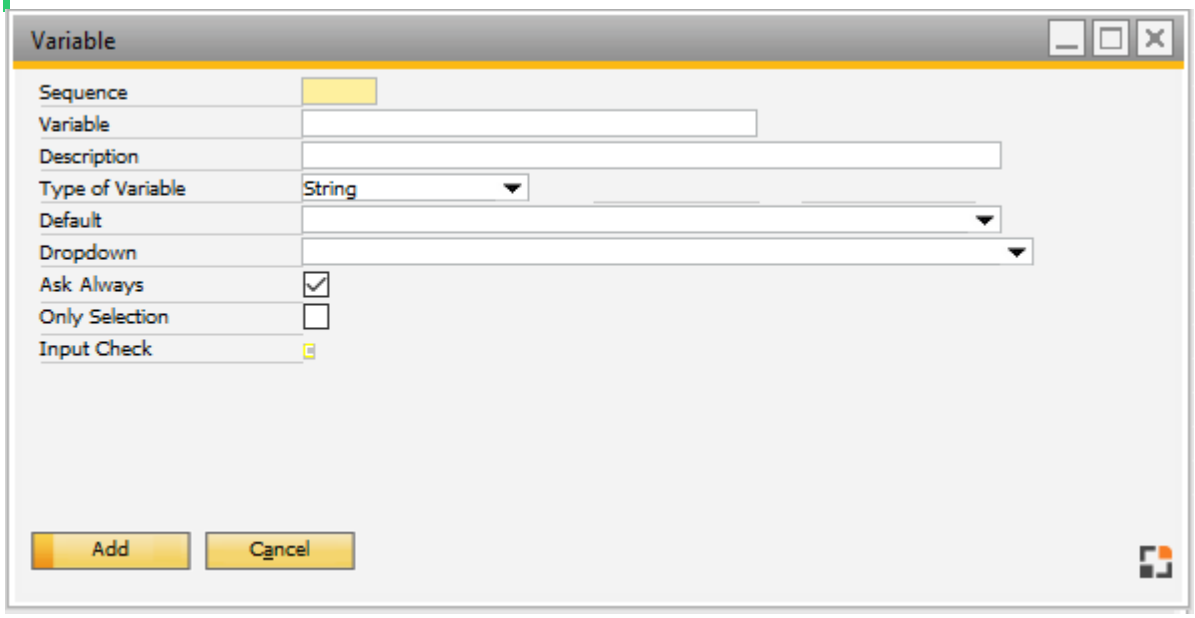
The individual reports, analyzes, and forms have very different parameters. These can be defined on the "Variables" tab.

Button	Meaning
Open	Open the window to edit a selected variable (***see*** below).
New	Create a new variable.
Test	Open query window to check queried variables.
Determine	The necessary parameters are determined automatically for Beas forms and Crystal Reports.

Further definition of variables

PATH: Administration > System Initialization > Report Setup >

1. "**Open**" a report >
2. "Macro Step" tab >
3. "**Open**" a macro step >
4. "Variables" tab >
5. click "**Open"/"Add**".



Window report_makrostep_varialbe_edit.psr

© 2026 Boyum IT Solutions A/S

Field descriptions

Field	Description
Sequence	Specifies the order of the query.
Variable	Name of the variable. In Beas-Forms are only following variables permitted: s_parm1 ... s_parm5, c_parm1... c_parm5, dt_parm1, dt_parm2 In Crystal documents or SQL-Queries, a variable can have any name.
Query	If the parameter is queried during the macro process, the query text can be entered here.
Type of Variable	Type of variable: Date, numeric or string.
Default	Default variable, if this has not been set. You can use Beas placeholders here. Placeholders begin with < and end with >.

Dropdown	Drop-down lists can be stored here, e.g. item selection, business partner selection, etc.
	Use either a Select statement or one of the default lists.
	
	Alternatively, a selection list can be added:
	`value=display:value,display:value`
	Example:
	`value=red:r,blue:b`
	The content (value) is displayed, for selection the name (display) is shown.
	"Value" is translated from German to output language.

Always Ask	If this option is deactivated, the user is only queried if Beas cannot determine the content automatically or there is no content. Special feature: If you want an empty default instead of a query, you must enter "empty" for Default.
Only Selection	If this option is activated, a value can be selected but not input.
Input check	A Beas script that checks the input can be stored here. The check is only performed when all variables have been completed.

Special features

Marketing documents that access beas_document_header and beas_document_line do not require ANY parameters. There is always only one report to be printed in the table beas_document_header or line.

© 2026 Boyum IT Solutions A/S

When printing demand lists using ProdReservationList, the API automatically controls the parameter query. As the output form accesses the previously generated beas_reportauswertung table, only one parameter named "ID" is required. This variable is also set automatically and does not have to be defined.

3.1.6.7.1.5 Macro Output

The macro output defines how the report created is output.

Note:

Normally the macro output does not need to be specified. Beas controls output independently. However, the default behavior is deactivated if a macro output has been defined.

What is the purpose of macro output control?

Example:

The printing of an invoice should run as follows if it was started using "Print":

1. The document is generated via API "B1DocumentGenerate".

2. The document is generated using Crystal Reports. This document accesses the tables created by the API.

3. The first page of the document should be output on printer 1, tray 1.
A variable "Original" is also set.

4. The first page of the document should be output on printer 1, tray 2.

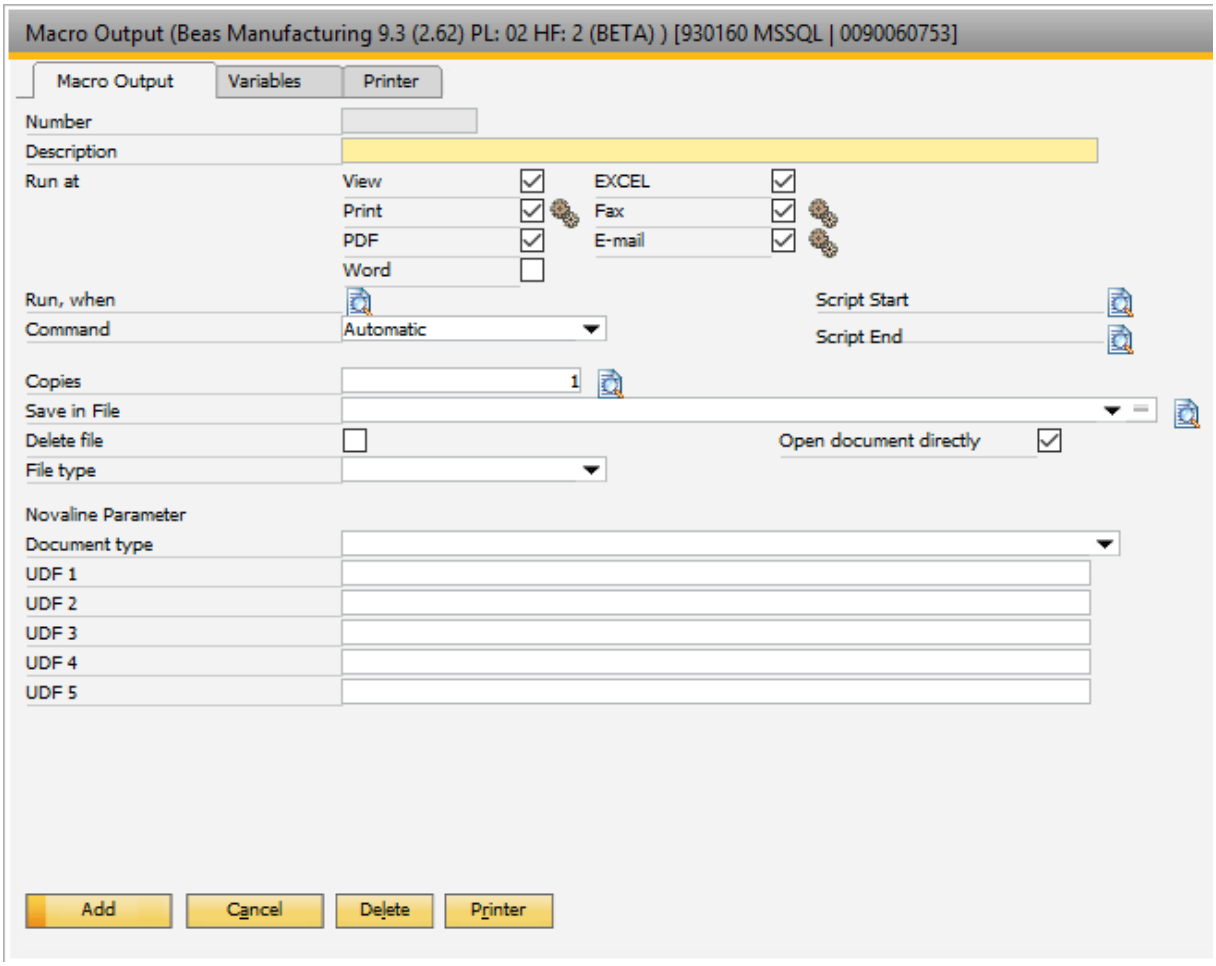
5. The document should also be output again on Printer1, Tray2.
The variable Original is still set to No, as a result of which the word Duplicate is printed on the document.

6. Finally, the document should also be sent by email.

© 2026 Boyum IT Solutions A/S

PATH: Administration > System Initialization > Report Setup >

1. "**Edit**" a report >
2. "Macro Step" tab >
3. "**Edit**" a macro step >
4. "Macro Output" tab >
5. "**Edit"/"New**".



Window report_makrostep_output_edit.psr

Field descriptions

Field	Description
Number	Macro output number (used for sorting – this is run in this order).
Description	For internal use: Description of the macro output step.

© 2026 Boyum IT Solutions A/S

Run at	This output step is only executed if the macro is called using the corresponding icon, e.g. only if "Print" or "Fax" has been selected. Further details for the corresponding process can be stored under Print, Fax and Email using the Settings icon. **Limitation of PDF printing:** "Microsoft PDF Printer" is not supported. Install a different PDF printer to use.
Run if	A Beas script can be stored here. Macro output is only executed if the script returns "True".
Start script	Beas script executed before the macro is output.
End script	Beas script executed after the macro is output.
Command	This is used to define how the output is executed. see next section.
Number of copies	(Only for PRINT type) How often should the document be printed? This setting is forwarded directly to the printer driver. Behind the orange „c“ a script can be deposited. For example, the number of copies can be entered: Use the variable value: e.g. set number of copies to 5: `setvar=value=5`
Save in File	(Not for printing) The file name that should be saved. timestamp -> saves the file in yyyymmffhhmmddfff+counter.filetype in output folder You can use placeholders (beas 9.1 PL: 08), eg. <today,yyyymmdd>_<cardcode> If no folder is indicated, the default output folder is used. The generated report is saved to variable "report_filename".
Delete File Automatically	Files are stored in the attachments directory to prevent too many files from being produced.

Command

The command is used to define how the output is executed.

Output is independent of the call. In this way, you can generate an email on printing.

Name	Description
Automatic	The output depends on the call type. For View – view, for Excel – Excel, for Print – printout, etc.

© 2026 Boyum IT Solutions A/S

	Default setting: Automatic
Display	The report is displayed.
Print	The report is printed.
Save	The report is saved.
Fax	The report is faxed.
Email	The report is emailed.
Only Script	No output. Only start and end script is executed.

The print definition can be stored as a subroutine in the macro output.

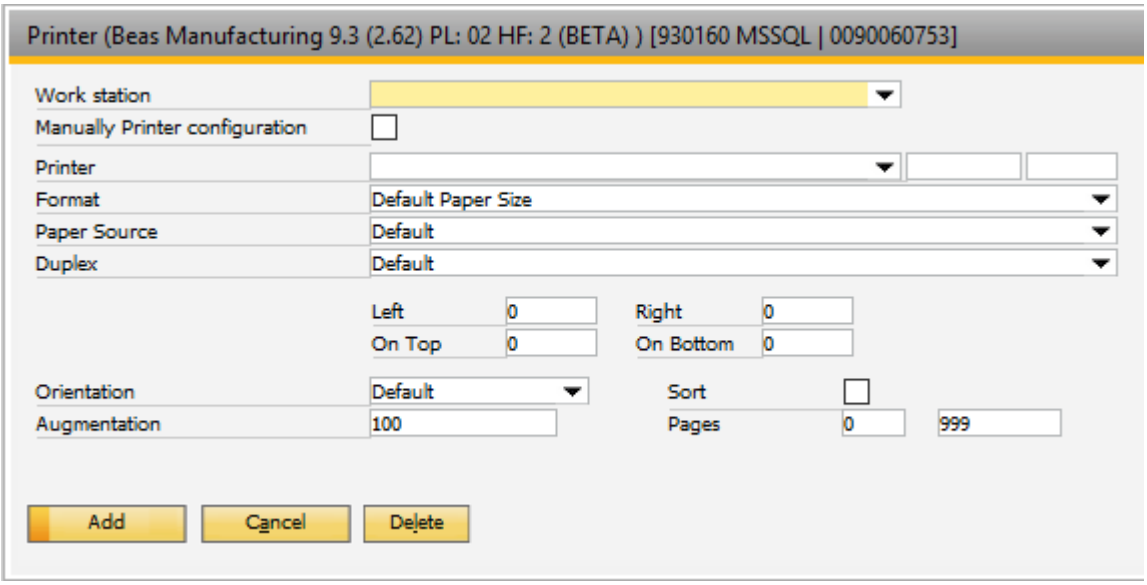
The printer drivers can differ from station to station. Therefore, the setting must be configured directly on the client.

SAP Business One Functions **Administration > User defaults** and **Print preferences** are not supported.

PATH: Administration > System Initialization > Report Setup >

1. **Open** a report >
2. "Macro Step" tab >
3. **Open** a macro step >
4. "Macro Output" tab >
5. **Open/Add**.
6. "Printer" tab >
7. "**Open" / "Add"**.

© 2026 Boyum IT Solutions A/S



Window report_makrostep_output_prt_edit.psr

Name	Description
Resource	Name of the station (client) to which the setting applies.
Manual printer configuration	If activated, the default MS Windows dialog for printer settings opens.
Printer	Name of the printer driver (only using Selection, please)
Format	Only configure if this differs from the default.
Paper Source	Tray...
Duplex print	Print on both sides
Margins	Option for correcting the margin setting
Orientation	Portrait or Landscape - Only configure if this differs from the default.
Sort	If the output should be sorted (only effective if more than one copy is printed).
Pages	Pages to be printed

If it is an SQL query or the current view, additional print options are available:

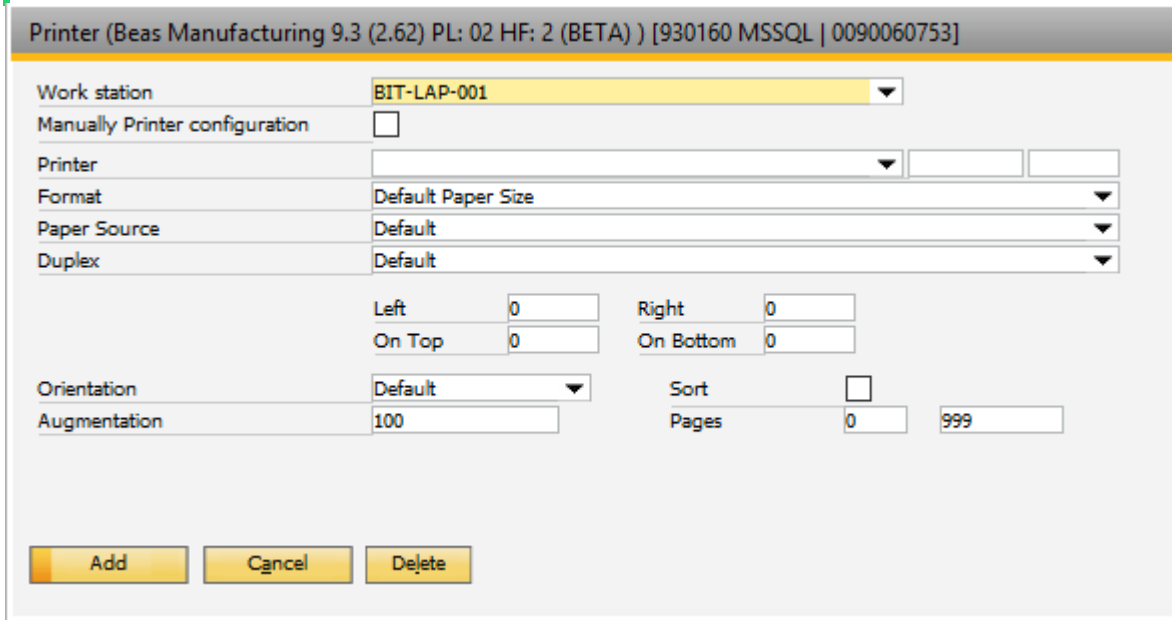
PATH: Administration > System Initialization > Report Setup >

1. "**Edit**" a report >
2. "Macro Step" tab >
3. "**Edit**" a macro step >

© 2026 Boyum IT Solutions A/S

4. "Macro Output" tab >

5. "**Printer**" button.



Window report_makrostep_output_prt_edit.psr

Name	Description
Zoom in	You can zoom in or out on report content.
Color	Print can be switched to black and white.
Quality	Quality of the print – also depends on the connected printer.
Pages	You can also enter page ranges here, such as 1, 2, 4-5, etc.

If the report is emailed, further settings can be configured here.

PATH: Administration > System Initialization > Report Setup >

1. **Open** a report >

2. "Macro Step" tab >

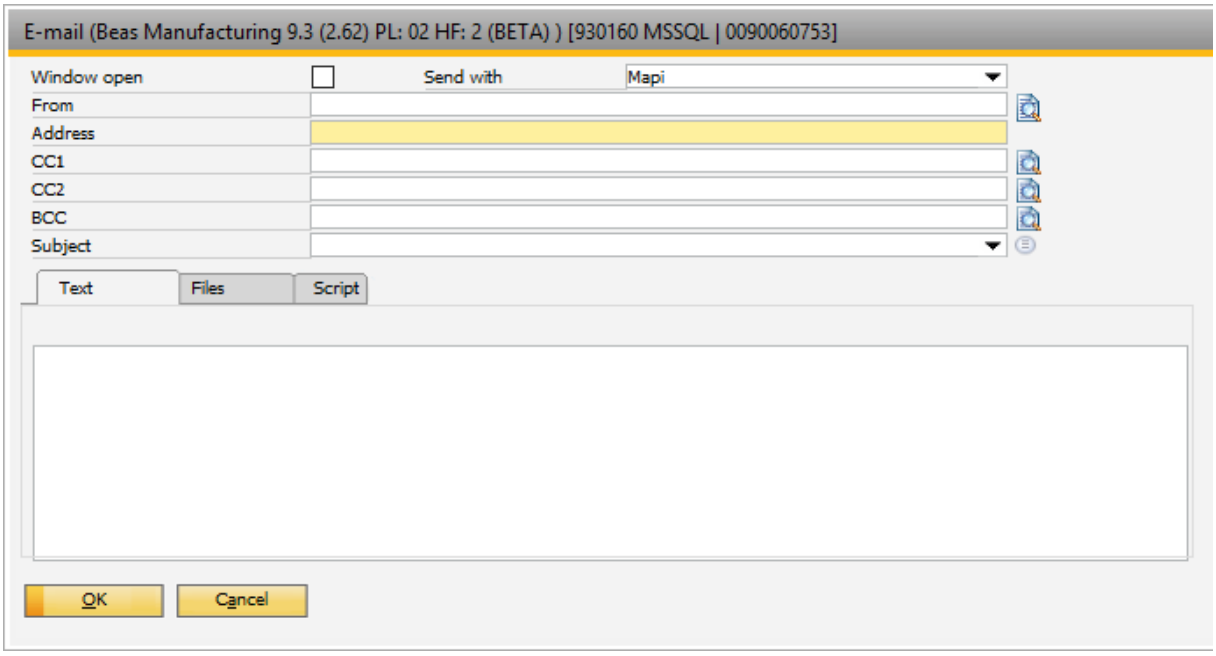
3. **Open** a macro step >

4. "Macro Output" tab >

5. **Open/Add**.

6. Double-click the cogwheel icon right of the "E-mail" check box.

© 2026 Boyum IT Solutions A/S



Window: report_makrostep_output_edit_email.psr

Field Descriptions

Field	Description
Window open	If a document is sent and this option is activated, a window opens in which you can enter the subject line, description, recipient, etc. If a document is sent and Beas does not find all necessary specifications, the email window opens even if the option is deactivated.

From	Enter the sender's Email-address.
	Use the variable "`value`" in the script.
	This works oily with option "send directly"
	This may be necessary, if several users work on one work station but in Windows only one Email-account was set up.
	
	Example:
	On work station "office1" as sender always "`st@mustermann.de`" shall be used.
	`if <station> = office1 then`
	`  setvar=value=st@mustermann.de`
	`end if`

Address	The recipient email address can also be a Beas placeholder.

© 2026 Boyum IT Solutions A/S

	In marketing documents, no instruction has to be entered as the default setting automatically inserts the correct email address.
Email CC1; CC2, E-mail BCC	Secondary recipient. Use direct input or script. **Important:** Script is not executed in the current window, but in the Email-window. To access parameters of the current window, use <parent.> Data is returned in variable "<value>" ***Example***: **// Get Email from Customer-Order UDF U_Email** **select U_Email into value from order where docnum=<parent.item.5.value>** Note: BCC is supported only by Client Type "send directly" and "MS OUTLOOK". For all other variants the recipients are entered as CC - recipient.
Subject	Subject of the email, maximum 50 characters. A Beas placeholder can also be inserted here. Starting the text with a $-character defines the text component for subject and email text. You can also select the component directly. ***See*** Text components
Email text	Text of the email.
File attachment 1...3	Further file attachments. Script is possible. **Important:** Script is not executed in the current window, but in the Email-window. ***See*** above. Script can also be used to define attachments. Format: select format from drop-down: PDF, Excel, WMF, Standard. **Important**: The script is not executed in the current window, but in the email-window. To access parameters of the current window, add <parent.> at the beginning. Return in in variable "<value>"

© 2026 Boyum IT Solutions A/S

	Example: **// Get Attachment 2 from Customer Order, UDF U_Attachment2** **select U_Attachment2 into value from ordr where docnum=<parent.item.5.value>**
Generated File in Format	Field is found in the "Files" tab. Select format to store the generated document. ***see*** Output formats.
Send with	Which client to be used for sending. ***See*** Email-Client-Types User EMail Setup Print and Report settings

Script	Script can be entered to be executed in the E-mail window.
	To access the original window use <parent. ...>.
	
	Script is executed after the E-mail-Client was filled with all properties, but did not start to send.
	Depending on the client type, the following objects are available:
	
	SAP-Message system: not supported
	Send directly: Object "`chilmail=email=...`"
	MAPI or Outlook: "`pmail1234`"
	
	For additional information on parameters and functions of the Client objects please refer to the: BeasScript-Documentation
	
	Example: Enter UDF U_attachment4 as forth attachment via "send directly"
	Note: All information is to be called from the parent-window:
	`// insert attachment4`
	`select U_Attachment4 into :ls_attachment from ordr where docnum=<parent.item.5.value>`
	`if <ls_attachment> <>  then`
	`  chilmail=email=addfile=<ls_attachment>`
	`end if`
	
	for API/Outlook:
	`pmail1234=attachmentfile=<ls_attachment>`

© 2026 Boyum IT Solutions A/S

	to add another CC recipient:
	`chilmail=email=addcc=<ls_mycc>`
	`pmail1234=cc=<ls_mycc>`

The Beas Communications Module offers three sending options:

Windows Mapi	Use Standard-Windows-MAPI. Works with a Lotus Notes-Client, Windows Mail and others. Microsoft Outlook does not work always properly.
Send directly	Beas supplies an own E-mail-Client which is installed automatically. E-Mail accounts are set up with User settings or in Configuration wizard.
MS Outlook	By default a MS-Outlook-32-Bit-API is installed. With the Outlook-Client Emails can be sent. Currently restricted to 32-Bit.
SAP Message system	If the SAP-Email-service is installed, E-mails can be sent. Due to many restrictions, we disadvice to use it.

See

Configuration wizard – Administration – Printing and Report settings

EMail Types

Macro definition – Email

User settings

back to Email

The Beas Report system communicates using the default Windows API. Different email programs behave differently here.

MS Outlook:

A security warning is displayed. This indicates that an external application is attempting to access your data. The "Click Yes" navigates to an auxiliary program which can be downloaded from the Internet provides help (Note: not a Beas program).

Lotus Notes:

The email sending window is always displayed, which, some users may find distracting.

© 2026 Boyum IT Solutions A/S

Activation:

Use of the SAP messaging system is activated as a default setting. However the setting can be set separately for each macro.

Macro Step – Macro Output – Email Settings
Send with local email client

back to Email

Unfortunately the SAP message system is not 100% compatible with the Report system. It is advisable not to use it. In this system, the SAP mailer creates HTML emails.

Shipping address = email address of the user who created the message.

Requirement for using the SAP messaging system:

1. The SAP Business One mailer must be installed, activated and correctly set up in the SAP server tools.
2. A valid email address must be stored for the SAP user.

SBO mailer setup

1. Start SAP Business One mailer service
2. "Auto-Start Service when OS Starts"

© 2026 Boyum IT Solutions A/S

3. Settings

Enter the necessary data here and test them.

4. Connection

Enter connection information on the SQL server.

5. Database

Specify which databases can be used to send messages.

back to Email

Beas is supplied with an SMTP client that can establish a direct link with an email server. The email account can be stored user-specifically (not station-specifically) in SAP for this purpose.

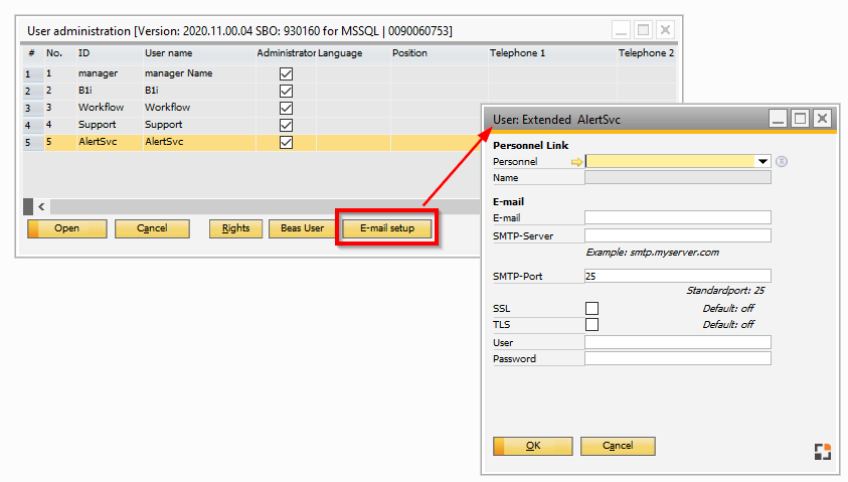
© 2026 Boyum IT Solutions A/S

To set up direct access to the SMTP server, go to:

PATH: Administration > Setup > General > User (Beas)

If the user has already been created, click the **E-mail setup** button to go directly to the settings.

If the user has been created as new, the input must be stored in advance.



Field Descriptions

Input field	Description
Email	Email address of the user
SMTP server	SMTP server of the email address
SMTP port	SMTP port (by default: 25)
SSL	Activates SSL encryption
User	User name of the email mailbox (normally the email address)
Password	Password of the email account

Default email address

If no e-mail address is found in the user profile, a general e-mail address can be stored in the Configuration wizard instead.

© 2026 Boyum IT Solutions A/S

See: **Administration > System initialization > Configuration wizard > Administration > Print and report setup > Email**

Microsoft Exchange

is supported.

POP3	TCP:110
POP3 (SSL)	TCP:995
SMTP	TCP:25

back to Email

3.1.6.7.1.6 Event sequence

This chapter describes the exact event sequence in a macro.
All green entries can be manipulated directly.

Start macro

Saving the environment (variables)
Variable `macroid` with the macro number
Variable `macrostartas` with the macro type (fax, email, preview, print, Word, PDF ..)
Setting the 4 possible parameters as per the window object description (for definition of sales/purchase documents)
Deleting the global header functions
Window definition object: Call window-related script
Macro start script. Cancellation option with return failure.
    Among other things, the global functions can be set here, which are then called.
If API is stored: API script (e.g. creation of entry in beas_document_header/line)

user-definable function
reportscript_report_preinit()
reportscript_report_init()

Loop SQL header query execute - as per macro setting (any SQL instruction).
    This can also have been defined in advance using the variable `report_loopscript`
Variable query as per macro header.

© 2026 Boyum IT Solutions A/S

Variable query as per API

reportscript_post_variable()

LOOP SQL header query

Transfer of all results of the SQL instruction to the variable system, prefix is `e_`,
e.g. the result column "itemcode" is stored in variable `e_itemcode`

reportscript_macro_loop()

Loop macrostep

resetting of global macro step functions

Active script. "`return failure` can be used for canceling

Start Script. "`return failure` can be used for canceling

The global macro step function can also be defined here, for example.

Definition MacrostepSQL query

reportscript_step_prevariable()

Variable query as per macrostep

reportscript_step_postvariable()

If Crystal

setting variables: `parameterrequest`, `externreport`, `connectverify` as per macrostep setting

Open Report

set database connection

If beas form

Setting all variables. Variable `s_parm1`, `s_parm2` ..., `c_parm1`, `c_parm2` .. are transferred to the structure variable

`str_parm.s_parm1`, `s_parm2` ... . Variable beginning with "`var_`" are transferred to the variable system

without "`var_`" to the target window.

Open window. Continue to next macrostep.

END

Loop macrostep SQL query

Transfer of all results of the SQL instruction to the variable system, prefix is `e_`,

© 2026 Boyum IT Solutions A/S

e.g. the result column "itemcode" is stored in variable `e_itemcode`

reportscript_step_preinloop()

If SQL query

Replacement of placeholders in query

Generate report

If current window (only beas form)

as per variable `sys_printdw` cache the corresponding DataWindow in $$tempdwcopy.psr,

reload and remove graphics.

END

Loop macrooutput

Variable query as per macooutput

If Crystal

query missing parameters

Set parameters

Determine Excel path

Determine filename (if fax/email, then "`yyyy/mm/ddhhmmssffff`")

otherwise "preview" or as per specification

Determine output type, if not specified

Determine extension depending on format

Preview? Depending on type and specification

Crystal - disconnect for max. 4 seconds

If printing: set printer driver, print - (the "retrieve" is only performed here)

Otherwise export (the "retrieve" is performed here)

If Current Window, SQL query

find directory, if EXCEL, then the Excel directory,

otherwise the attachment directory.

Determine output type, filename and extension.

If printing: Set printer driver, print

Otherwise export according to data type

END

© 2026 Boyum IT Solutions A/S

If FAX

Determine fax number

If via SAP: generate and send SAP message

If via Windows: send the document to Windows API (only specific data formats are permitted)

If email

If subject starts with $, get text module, replace placeholders

Determine email address

CC1 and CC2 - where applicable also determine using script. Return script must be in variable "`value`".

Determine attachments. Scripts must return attachments in variable "`value`".

Open email window where necessary

Send email depending on type.

If Novaline

novaline_init()

Transfer of Novaline parameters (`novaline_param1,...5`)

Call of Novaline API.

END

reportscript_step_postinloop()

end Loop macrooutput

end Loop macrostep SQL Query

reportscript_step_prinzkz() - but only if "set print ID" has been activated

If Crystal: Disconnect

end Loop macros

end LOOP SQL header query

reportscript_prinzkz() - as header function - but only if "set print ID" has been activated

Reset the variable environment, which has been saved in advance.

© 2026 Boyum IT Solutions A/S

3.1.6.7.1.7 Output Formats

Available output formats:

Format	Crystal	Infomaker / Powerbuilder or own SQL-Statements
Acrobat PDF	yes	currently not possible
XLS	yes	yes
XML	yes	yes
RTF	yes	yes
Word	yes, as RTF	as RTF
HTML	yes	yes
Excel	yes	yes, as data format and as 1:1-view, but not the structure view
WMF	no	yes
CSV	no	yes
Text	no	yes
DBase	yes	yes
Lotus Notes	no	yes

Note: Structure views can only be exported to a limited extent: for example in PDF-Format or WMF-Format. For other, formatting will be lost, in Excel it is not correctly displayed.

Export window content

Each Beas window consist of one or more forms. Always one form can be exported. Example: order recommendation view consist of 3 forms: item list, peggings, additional information (right below)

See

Crystal

3.1.6.7.2 Preview BEAS form

A list of stored macros for the current window is displayed. If it is an SAP Business One window the selection is displayed only in case Beas was not disabled,. ***see*** macros.
If it is a Beas window, the selection "preview" is displayed. If no macro is assigned, the preview of the current window is shown. For more information on Macro Settings refer to Report Settings.

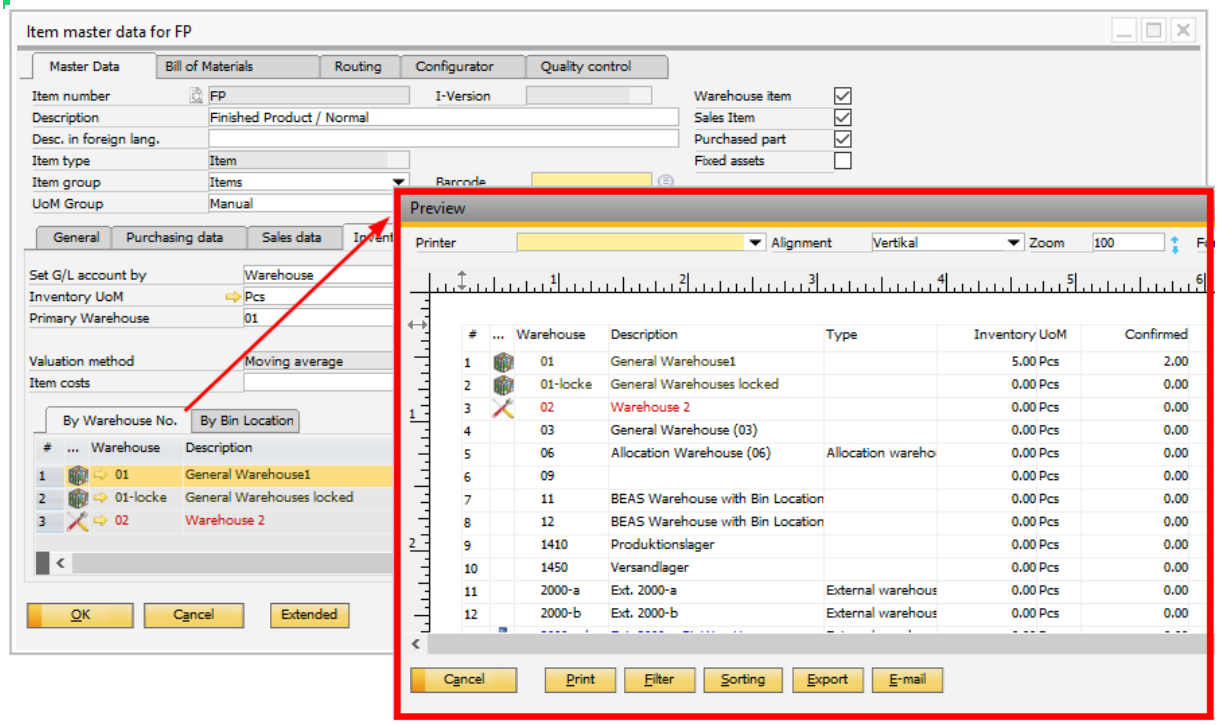
© 2026 Boyum IT Solutions A/S

Preview

The preview is only active in Beas windows. The current window is displayed in a preview function, before printing or exporting adaptations can be made. It can be saved as a file or sent via email. Several data types are supported. ***See*** Output Formats .

Various Beas windows contain multiple forms, partially nested. For example the item master. In the preview only one form is displayed. The form currently in the focus is automatically selected.

PATH: Beas window > right-click menu > second tab > "Preview"



Available options:

Name	Description
Zoom	Content is reduced or enlarged, then printed accordingly.
Alignment	Switch between Vertical (portrait) and Horizontal (landscape.)
Printer	Name of the printer driver to be used for printing.
Print	Print current view as is.
Column width	You can use the mouse to change the column widths for the printout.
Column order	By clicking on the title you can change the order via Drag&Drop.

© 2026 Boyum IT Solutions A/S

Selection field "export"	Export format for buttons Export and Email. ***See*** Output Formats.
Export	Saves the view in the selected format.
Filter	This button opens the "Specify Filter" window where you can select from a range of functions and columns to filter the preview.
Sorting	This button opens the "Specify Sort Columns" window. Here you can drag and drop fields to the sorting editor, and then double-click each field to edit its expression.
E-mail	E-mail the report in a separate window. Edit the recipient, the subject and text of the email. You can add up to 2 CC (carbon copy) and 1 BBC (blind carbon copy) and up to 4 attachments. *Window report_makro_email_response.psr*

Note: To export to PDF, install the Ghostscript driver first.

Download here: http://www.ghostscript.com/download/

3.1.6.8 APIs

In Macros you can select API's is some windows, which simplifies the creation of Crystal-Reports.

Available APIs:

Name	Table	Description
B1DocumentGenerate	beas_document_header and line	Prepares a marketing document and inserts it into these tables.
itemstructure	beas_reportanalysis	Creates the structure for an item, including correct quantity calculation.
ProdReservationList	beas_reportanalysis	Calculates the complete material requirement for work orders.

The APIs can only be called in specific areas. For example, B1DocumentGenerate can only be called in the marketing area, ProdReservationList only in the production area.

© 2026 Boyum IT Solutions A/S

3.1.6.8.1 b1documentgenerate

If this API is active, Beas generates two tables BEFORE printing the documents:

beas_document_header
beas_document_line

These can be easily accessed with Crystal Reports, since the data is calculated, translated and formatted in advance.
Beas also ensures the upward compatibility of the forms, since this structure does not change, however it may be expanded.

After print content of the table is deleted. To keep it, ***see*** Configuration wizard – Print and Report settings

beas_document_header

ID	unique ID
docnum	Document number with prefix and suffix (char)
num_docnum	Document number as number
docentry	Internal document number
docdate	Formatted form date
docduedate	Formatted form date
taxdate	Formatted form date
printdate	Formatted print date (always current date)
cardcode	Customer Number
cardname	Customer Name
cardfname	Foreign language name
lictradnum	UID number of business partner
addid	ID no2 of business partner
vatidincmp	
iban	IBAN of business partner
language	Document language (Beas language type)
languageitem	Item language (Beas language type)

© 2026 Boyum IT Solutions A/S

ID	unique ID
Net	Net total (total of all individual prices before discount), formatted in document currency
discount	Discount, formatted in document currency
discountpercent	Discount percentage, as a number
nettotal	Net total after discount, formatted in document currency
vattot	Tax total formatted in document currency
doctotal	Gross total formatted in document currency
currency	Document currency
num_net	Net total, as number
num_discount	Discount total as a number
num_nettotal	Net total after discount
num_vattot	Tax total as number
num_doctotal	Gross total as number
contactname	Customer contact person
contacttitle	Title
contactposition	Position
contactaddress	Address
contacttel1	Contact telephone number 1
contacttel2	Contact telephone number 2
contactmobile	Contact mobile phone number
contactfax	Contact fax number
contactemail	Contact email address
contactpager	Contact pager
shiptocode	Supplier address name
shipaddress	Formatted address details
shiplictradnum	UID number of delivery address
transportcode	Terms of delivery description
slpcode	Inhouse contact person
ownercode	Document owner (code)
ownerfirstname	Document owner first name

© 2026 Boyum IT Solutions A/S

ID	unique ID
ownermiddlename	Owner middle name
ownerlastname	Owner last name
ownerjobtitle	Owner job title
ownerposition	Owner position
ownerdepartment	Owner department
ownerbran	
ownerofficetel	Owner office telephone number
ownermobile	Owner mobile phone number
ownerpager	Owner pager
ownerfax	Owner fax number
owneremail	Owner email address
paymentconditionname	Payment conditions. If a discount is stored, the name of the discount condition is output
paymentcondition text	Discount information
companyname	Name of own company
companyadress_as_line	Address as single line
companyprintheader	
companyphone1	Company phone number 1
companyphone2	Company phone number 2
companyfax	Company fax number
companyemail	Company email address
companymanager	Managing director
companyrevoffice	
companytaxidnum	Company tax ID number
companyfreezoneno	
report_header	Page header (each page) - can also be RTF-formatted
report_start	First header text
textheader	Document header text
textfooter	Document footer text

© 2026 Boyum IT Solutions A/S

ID	unique ID
document_end	Fixed document end text
report_end	Last fixed footer text
report_footer	Page footer (fixed, each page)

beas_document_line

ID	Fixed ID
line	Continuous serial number. Sorting is performed using this serial number.
linenum	Internal line number of the document
linepos	Visible line number of the document line
linetype	Line type S=Subtotal
baseref	Base document reference
basetype	Base document type
baseline	Base document internal line number
baselinepos	unassigned
basedocnum	unassigned
linestatus	Status of the line. O=Open, C=Close
itemcode	Item Number
catalogno	unassigned
description	Item description. If translation is available, then translated into ITEM DOCUMENT LANGUAGE. If there is no translation in the item document language, the system checks for a document language translation.
Match code	Match code from item master
drawingnumber	Drawing number from item master
longtext	Long description (possibly RTF) If sales document: if item document language = database language, then own long description, otherwise foreign language description. If translation for item document language exists, then its sales description has priority. If purchase document

© 2026 Boyum IT Solutions A/S

ID	Fixed ID
	Long text of order according to item master. If translation for item document language exists, then its order description has priority.
project	
Barcode	"codebars" field from document line
vendornum	From document line
serialnum	From document line
sernumflag	If serial number item, then Y
batchnumflag	If batch number item, then Y
suppcatnum	From item master
quantity	Formatted quantity specification in document quantity unit
openquantity	Open quantity formatted
quantityunit	Document quantity unit Translated according to SAP Business One translation for sale in the item master according to unit of sale. For purchase, according to the unit of purchase.
num_quantity	Quantity as number in document quantity unit
num_openqty	Open quantity as number in document quantity unit
num_in_sale	Conversion factor to unit of store
packunit	unassigned
num_in_pack	unassigned
factor1...4	Packaging factors
num_width	Width
width_unit	Width specification: unit as symbol
num_length	
length_unit	
num_weight	
weight_unit	
num_volume	
volume_unut	
shpdate	Delivery date formatted as a string
price	Individual price in document currency as a string.

© 2026 Boyum IT Solutions A/S

ID	Fixed ID
	Individual price relates to each document quantity unit.
pricetotal	Individual price in document currency as a string. For subtotals, the subtotal price.
discountpercent	Listed here as a number.
discount	As a string
num_price	Price as number in document currency
num_pricetotal	Price as number in document currency
currency	Output currency
whscode	Store Code
vatgroup	Tax group

back to APIs

3.1.6.8.2 itemstructure

This API is only available in "Lists master data" and generates a structure display of the selected item in the "BEAS_REPORTAUSWERTUNG"

It can be called up manually:

```
setstr=art_id=<itemcode>
object=ue_artikelstamm=strukturexport
```

Parameters: no

Default variablen: `str_parm.s_parm1 = Artikelnummer`

Output:

Return

Item structure in table `BEAS_REPORTAUSWERTUNG`

Variable "`id`" referring to `BEAS_REPORTAUSWERTUNG.ID`

Example: Export item structure to Excel

```
setstr=art_id=781-a
object=ue_artikelstamm=strukturexport
declare=lds=ue_datastorevalues
lds=select "BAUGRUPPE"||'' as
assembly,"POS","ItemCode","ItemName","LEVEL","MENGE_VERBRAUCH_SOLL"+0.0000 as
quantity from "BEAS_REPORTAUSWERTUNG" where "ID"=<id> and "ART"=50 order by "NR"
lds=saveas=excel=c:\temp\myresult.xls
destroy=lds
```

© 2026 Boyum IT Solutions A/S

```
sql=delete from "BEAS_REPORTAUSWERTUNG" where "ID"=<id>
```

Result in table BEAS_REPORTAUSWERTUNG

BoM rows

id	unique ID
nr	continuous number
art	row type 50=BOM
level	Structure level
pos	Bill of materials (BoM) position
baugruppe	Item number of assembly
itemcode	Item number of BoM position
itemname	Item description in BoM position
znr	Drawing number in BoM position
menge_verbrauch_soll	Requirement quantity per 1 assembly of the upper level in consumption units, without consideration of scrap
menge_verbrauch_ist	Single quantity in consumption units without consideration of scrap
oberbaugruppe	Item number for first level assembly (also: str_parm.s_parm1)

Routing

id	unique ID
nr	continuous number
art	row type 52=routing
level	Structure level
pos	routing position
baugruppe	Item number of assembly
zeit_tr	Setup time (BEAS_APL.TRAPLATZ)
zeit_te	Mach+Labor Time/unit (main work time from BEAS_APL.TEAPLATZ)
zeit_soll	Total time per 1 assembly of the upper level in consumption units, without consideration of scrap
nutzen	Use factor
anzhal	Number factor

© 2026 Boyum IT Solutions A/S

id	unique ID
ag_id	Catalog number
itemname	Activity (first 100 letters)
aplatz_id	Resource
agtyp	Operation type
oberbaugruppe	Item number assembly first level (str_parm.s_parm1)

back to APIs

3.1.6.8.3 ProdReservationList

This API is only available in production lists and creates an analysis of the material requirement for the selected work orders in the "beas_report analysis" table.

The following variables can be transferred:

cbelnr_id_von	Document from
cbelnr_id_bis	Document to
cbelegnummern	Document numbers separated by commas. Only considered if it is set.
citemcode_von	Item From
citemcode_bis	Item To
cmatchcode	Match Code
clieferdatum	Deliver by ..
ckunde	Customer
cauftrag	Work order ID
cproject	Project code
csachb_id	Employee from
cbsachb_id	Employee to
cverdichtet	Short Y/N

back to APIs

3.1.6.9 Crystal Reports Support

Beas supports Crystal reports documents, but does not use Crystal report functions of SAP Business One. The Crystal-Report-Engine Version XI is used, which is provided together with the server installation.

See Report settings, Macros, Configuration wizard – Reports

Output

Beas puts out the documents as PDF via the installed PDF viewer or a via Beas integrated viewer. This is changeable in the Configuration Wizard.

Connection to the current database

The Beas viewer connects the SQL command which is stored in the document with the current database. All select instructions are be adjusted automatically. If you do not want your commands to be adjusted, execute them as a procedure-object or a SQL-function. This object has to start with the name "command" e.g. "command_mysql". Include in the SQL instruction:

- The name of the server and the database
- Name of procedure or function, or the report in the network environment with the database where it is executed.

Special characters must not be used in a SQL server name. The database must be connected in the Crystal documents via ODBC.

To use reports developed for MS-SQL in the HANA environment, make sure that the correct database connection is used in the report. Also ***see*** Crystal reports errors and solutions.

Translations

Beas translates the report automatically. Text-Object names have to end with "_t", e.g. "itemcode_t".

Notes Crystal functions, which have been added after Crystal version 11, are not supported, e.g. 3D barcodes or QR-Barcodes.

The crystal viewer is a component of the server-installation (only MSSQL) and will be installed only separately.

See

Date and time format

Units of measure (Report)

Formular texts

Item texts

Set up output language manually

3.1.6.9.1 Translation

This chapter details the Beas translation concept.

All reports are generally translated into the currently configured language of the program.

For marketing documents, the language of the business partner or language stored in the document is used.

The Beas report system can translate reports from every language into every language.

There are very different systems involved:

System	Description
Form	All text fields in the form are translated into the language that is transferred to the form system (e.g. customer's language). The translation table for this function can be configured in the settings for every language into every language. To this end, there is: a) A default translation table for sample reports b) A customer-specific translation table c) A report-specific translation table which is stored directly in the report If no translation is found, Beas proceeds as follows: 1. Translation into German 2. Translation from German into target output language
Form contents	Content is translated using the SAP translation system (sales and purchasing documents only). In SAP, a translation can be stored for almost every field. Beas prepares a table in which the report to be printed is supplied fully formatted and translated.
Date formatting	(Sales and purchasing documents only): In a table, the date fields are supplied formatted into the corresponding language BEFORE printing. The report designer does not have to do this.

© 2026 Boyum IT Solutions A/S

	See Date and time format General settings – view
Number formatting	(Sales and purchasing documents only): In a table, the date fields are supplied formatted into the corresponding language BEFORE printing. The report designer does not have to do this. ***See*** Date and time format General settings – view
Units of measure	(Sales and purchasing documents only): In a table, the quantity fields are supplied formatted in the corresponding language BEFORE printing. The system also differentiates between the singular and plural forms. The report designer does not have to do this.

3.1.6.9.1.1 Units of measure

Only applies to marketing documents.

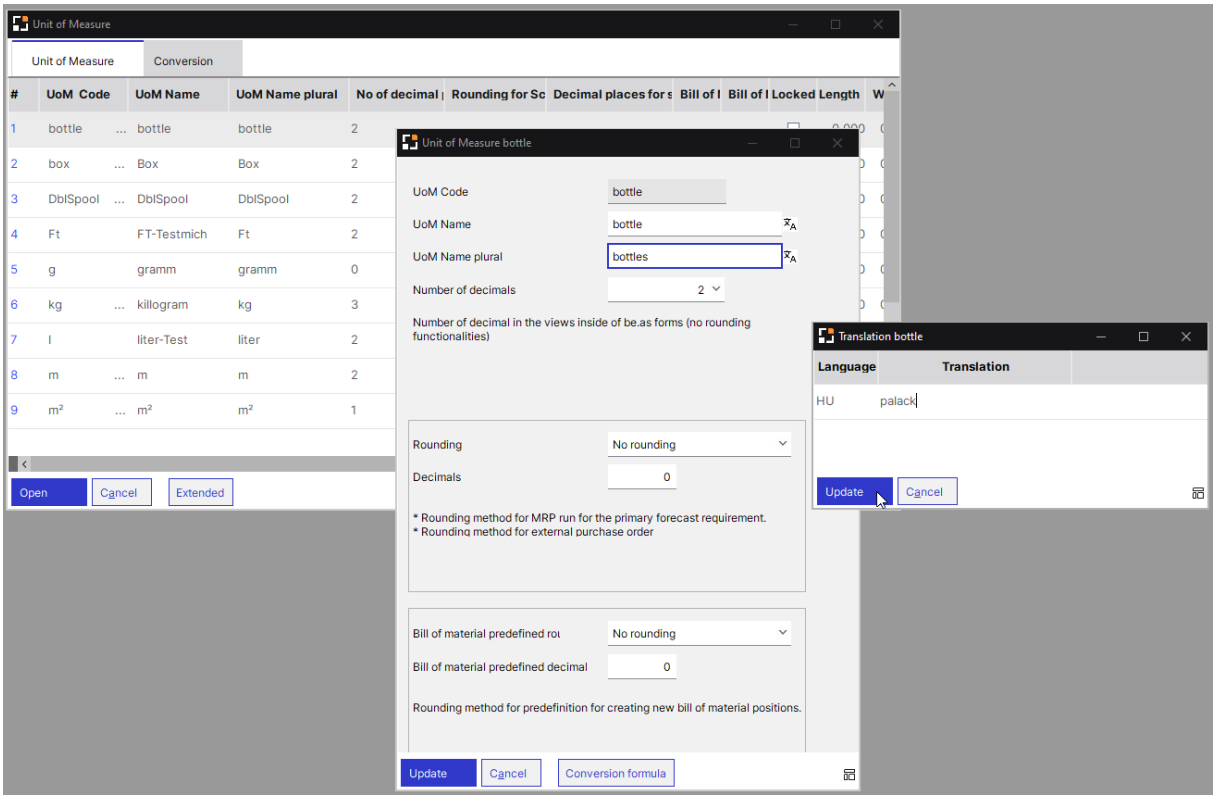
In SAP, quantities can be translated. However, this must be performed separately for each item and language.

This is handled differently in Beas: Beas has a quantities table.
Not only must quantities be translated, the singular and plural forms must also be considered.

Work flow:

1. Double-click a unit of measure in the list,
2. Single-click the "Translation" icon right of the "UoM Name" and "UoM Name plural" fields,
3. Select the Language with a right click,
4. Type the translation in the relevant field.
5. Click **Update**:

© 2026 Boyum IT Solutions A/S



Windows:

Unit of measure - browse: *basis_me_browse.psr*

Unit of measure - edit: *basis_me_edit.psr*

Tranlation: *system_spr_col.psr*

3.1.6.9.1.2 Form Texts

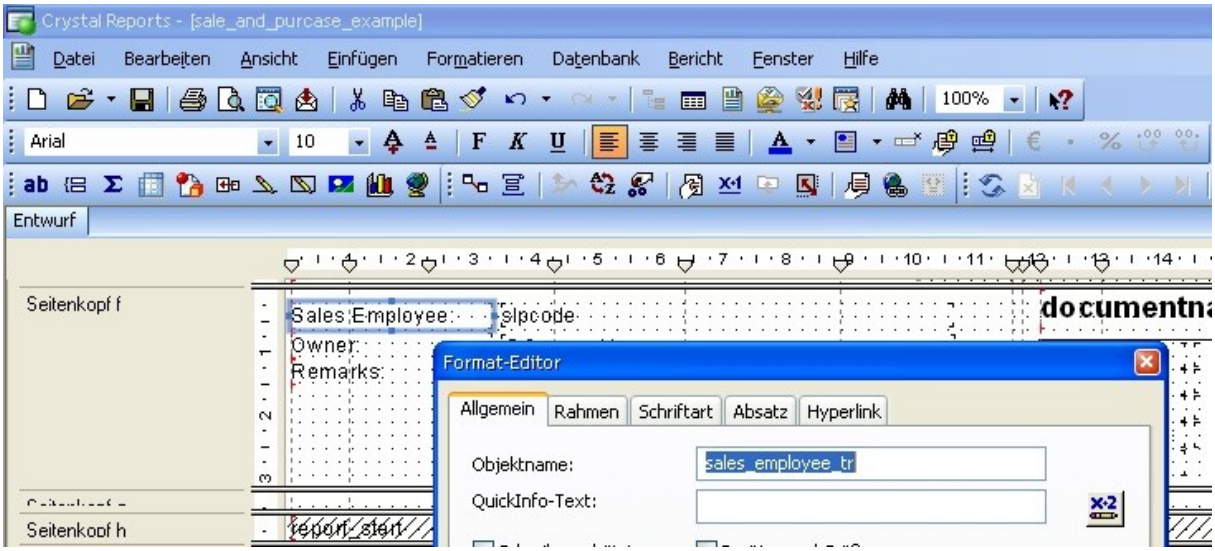
Relates to every type of Crystal document:

Every text that is stored permanently in the form can be translated.

Requirement:

- The object name of a text field in the Crystal document must end with "_tr"

© 2026 Boyum IT Solutions A/S



- OR: This is a formula field that starts with " and ends with ". The content is then translated.

Translation:

Beas uses a multilevel translation system in the following order:

Name	Description

Text field in the Crystal document with the object name "translate"	The translation can be stored directly in this text field:
	`<Original word used in report>=<language>:<Translate>,<language>:<translate>`
	Example:
	`document date=DE:Belegdatum, FR:Date du document`

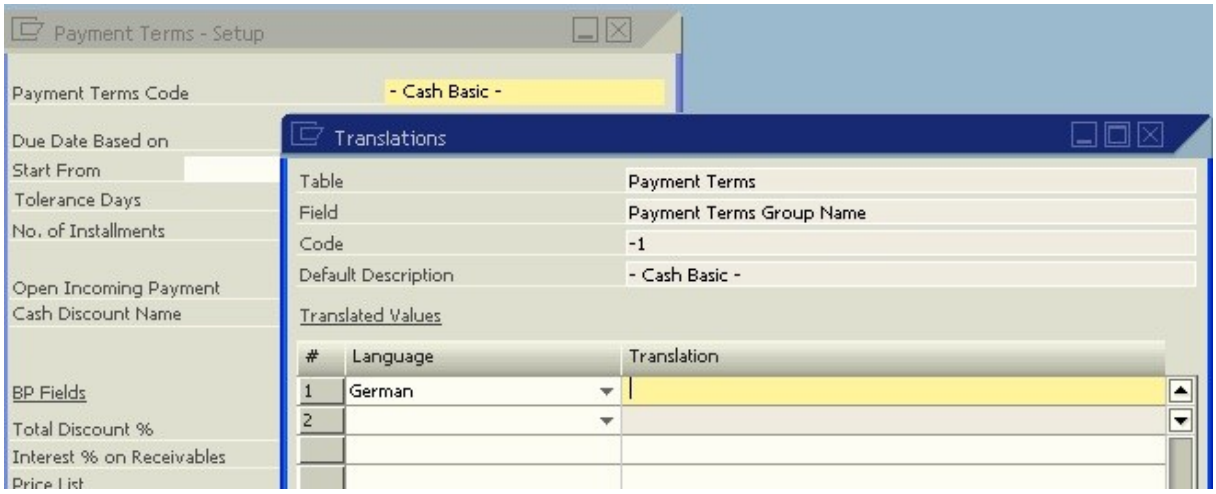
Translation as per Beas/Extra/Report Setup	Each word can also be translated into any language here. See below.
Translation via proprietary Beas translation table	Beas includes multiple translation tables. The base language is German. For this reason, the text is first translated from the form language into German and then into the output language.

3.1.6.9.1.3 Item Text

Marketing documents only:

Item text, delivery type, payment type etc. can be translated directly in SAP:

© 2026 Boyum IT Solutions A/S



When Beas prepares a report, these entries are translated into the corresponding output language.

3.1.6.9.1.4 Set Output Language Manually

If a report is to be printed in another language and it is not a sales or purchase document, a small script can be used to do this:

1. Open layout
2. Open macro step of the report (or add macro step if necessary)
3. Open script on "Start instructions" (on the orange c)
4. Use command "`printobject=setlanguage=x`" to set the required language
   e.g. `printobject=setlanguage=EN` always prints the document in English.

3.1.7 Folio Numbering

Folio Numbering (POI) is not supported in Beas.

3.1.8 Tooltip Preview

SAP Business One – Tooltip Preview function is not supported in Beas.

Note: With the Beas Usability package you can define your own tooltip for every field.

3.2 Setup

The setup section is used for defining settings and defaults for fields that are used throughout Beas

PATH: Administration > Setup.

© 2026 Boyum IT Solutions A/S

General
Financials
Business Partners
Inventory
Precalculation
Production
Project
Complaint

3.2.1 General

PATH: Administration > Setup > General.

The following areas can be set up in the General menu entry:

User administration
Languages
Translation

3.2.1.1 User Administration

User administration

Extended E-Mail Setup , User
Beas user
Rights management

PATH: Administration > Setup > General > User (Beas).

There are different user types:

Overview on user types

Type	Description
SAP Business One - User	Logon to Beas via SAP Business One - user. Every user needs a SAP Business One - license. **IMPORTANT:** Make certain to have the proper rights in the B1 license system to perform your actions. ***Example:*** To create a Goods receiptm, you need a license to perform this in Beas. This user type expands the SAP B1 user to configure additional information for the user. ***See*** Extended User settings

© 2026 Boyum IT Solutions A/S

Beas User	Not compatible with SAP license - user cannot do any action related with SAP. **IMPORTANT:** Due to its limited functionality, use is not recommended.
Personnel	Personnel has access to the Terminal. If the DI-API is required for various functions, the SAP Business One - user according to **Configuration wizard > System** is used (Regard SAP Business One - license rules!) Some functions only work using the Personnel ID, therefore the SAP Business One - user needs to be set up as personnel, too. ***See*** Edit personnel master data.

SAP Business One **– User**

User administration **Administration > Definition > General > Users** shows all SAP Business One-users. If a user is a "Superuser", he also has administrative rights in Beas.
If the user does not need SAP Business One functionality and works only with Beas, he can be created in Beas as Beas user.
He does not need access rights in SAP Business One since all SAP Business One functionalities are then executed under the user stored in **Administration > Definition > General > Users (Beas)**

Functions:

Show disabled messages	If the user selected "do not show anymore" for a warning message, this selection can be reset here ***see*** Warning messages
Rights	Authorization control for Beas. ***see*** Rights management
Beas users	Administrate Beas-users without SAP License.
Extended	General, personnel and cockpit settings, and email - server - port and authentication settings. E-mail-account for this user with link to personnel

Beas – User
There you can store users, who can logon independent from a SAP Business One - license. Use this feature if you work with own program extensions, independent of SAP Business One.
See Beas Users

© 2026 Boyum IT Solutions A/S

3.2.1.1.1 Extended user settings

User administration

Extended: EMail Setup, User

Beas user

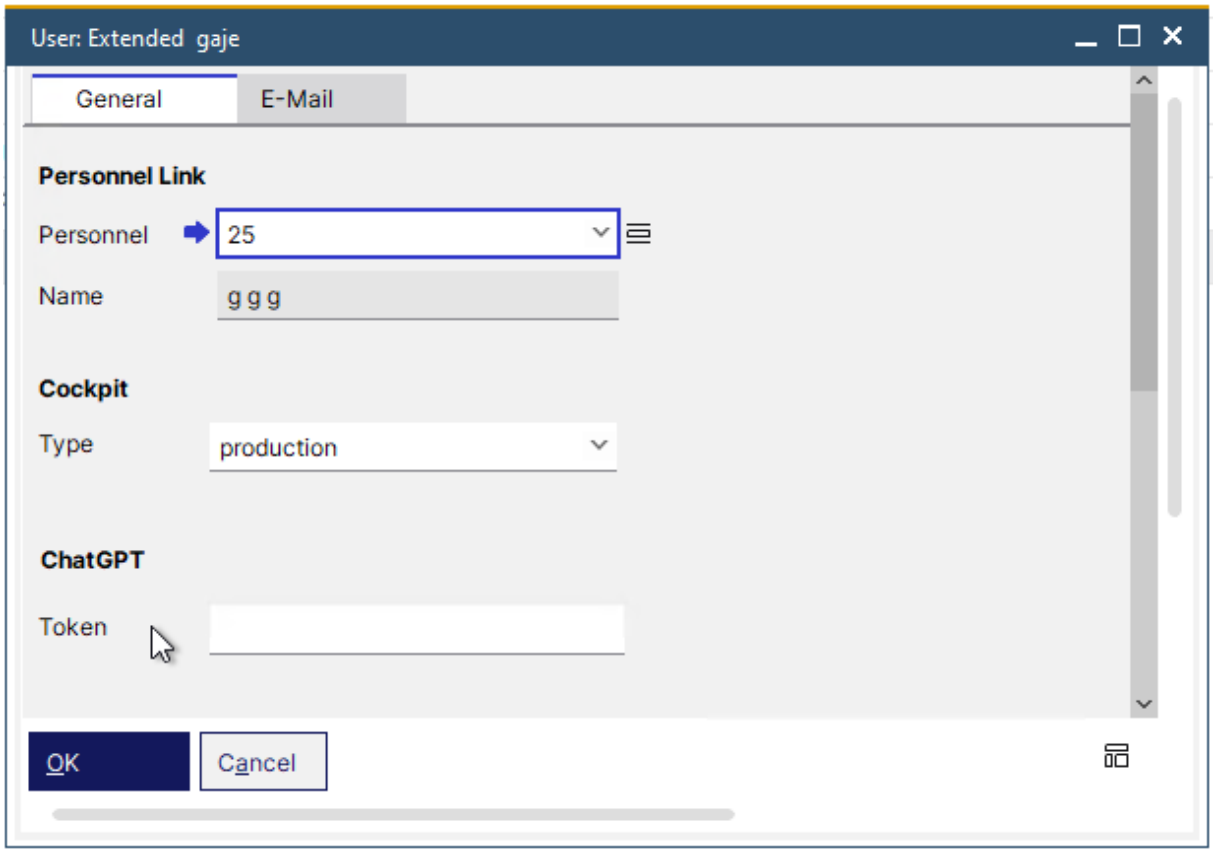
Rights management

PATH: Administration > Setup > General > User (Beas).

1. Select user.
2. Right-click > **Extended**.

General tab

This tab contains personnel link and cockpit settings for the selected user.



Window system_benutzer_ousr_smtp.psr

Field descriptions

Field	Description
Personnel Link	

© 2026 Boyum IT Solutions A/S

Field	Description
Personnel	Personnel user code
Name	Name of personnel
Cockpit	
Type	Set the type of cockpit for the current Beas user. *Type:* • Production *Beas 2025.06* ***See*** Production cockpit window *Beas 2025.06*
ChatGPT	
Token	Set token for the user. Alternatively, you can set it for all users in the Configuration wizard.

E-Mail tab

This tab contains email, server, port and user-password settings for the Beas user.

SMPT-Port	Port number setting for the outgoing server
SSL / TSL	Setting for secure login
User	E-mail user name
Password	E-mail password

back to User administration

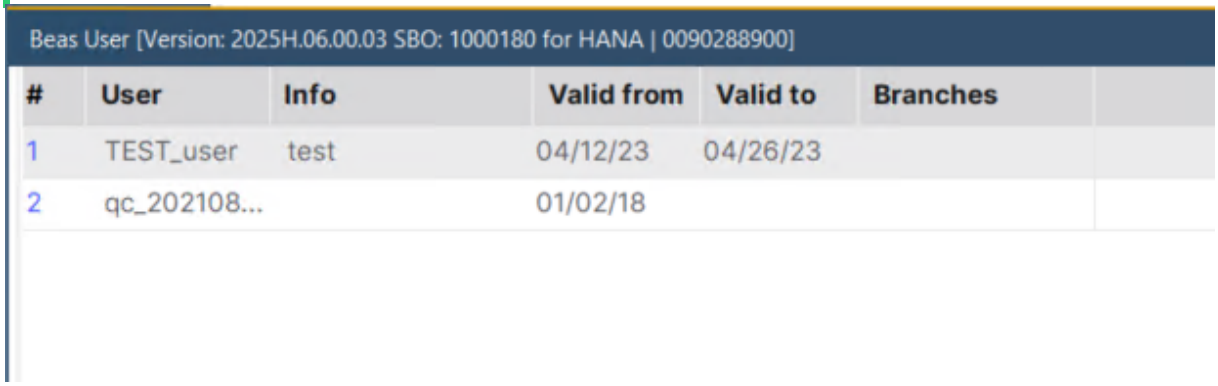
3.2.1.1.2 Beas User

User administration

Beas user

Edit Beas users

PATH: Administration > Setup > General > User (Beas) > **Beas User** button.



Window system_ benutzer_ browse.psr

List of all Beas users.

Here you can store a list of users having the right to log on without a SAP Business One license. Use this feature only if the user works with functions which do not need the SAP Business One – Data-API, like tie recording, calculation, production administration (without item management) or own AddOn-extensions.

© 2026 Boyum IT Solutions A/S

The logon with this user name is possible only if you start Beas directly as standalone, outside the SAP Business One - environment.

Accessing a SAP Business One – function, an automated log-on to DI-API is performed in the background with the user, who was stored in the Configuration wizard.

IMPORTANT:
For using the SAP Business One – DI-API you need one SAP Business One – license per user.

Note:
Accessing basic features of Beas you need a Beas basic license.
When using Terminal functions, you do not need a "Beas user". The logon is managed in Personnel administration.

Field Descriptions

Field	Description
User	User ID.
Info	Free text.
Valid	Period of validity from – to.
Branches	In which branch the user is located.

Functions

Function	Description
Open	Open the Editing window of the selected user.
User rights	Assign Rights to the selected user.
Add	Add new Beas user.
Remove	Delete selected entry.
Duplicate	Duplicate the selected entry. A new query pops up to enter new ID for it.

Window settings are available.

back to User administration

3.2.1.1.2.1 Beas User: Edit

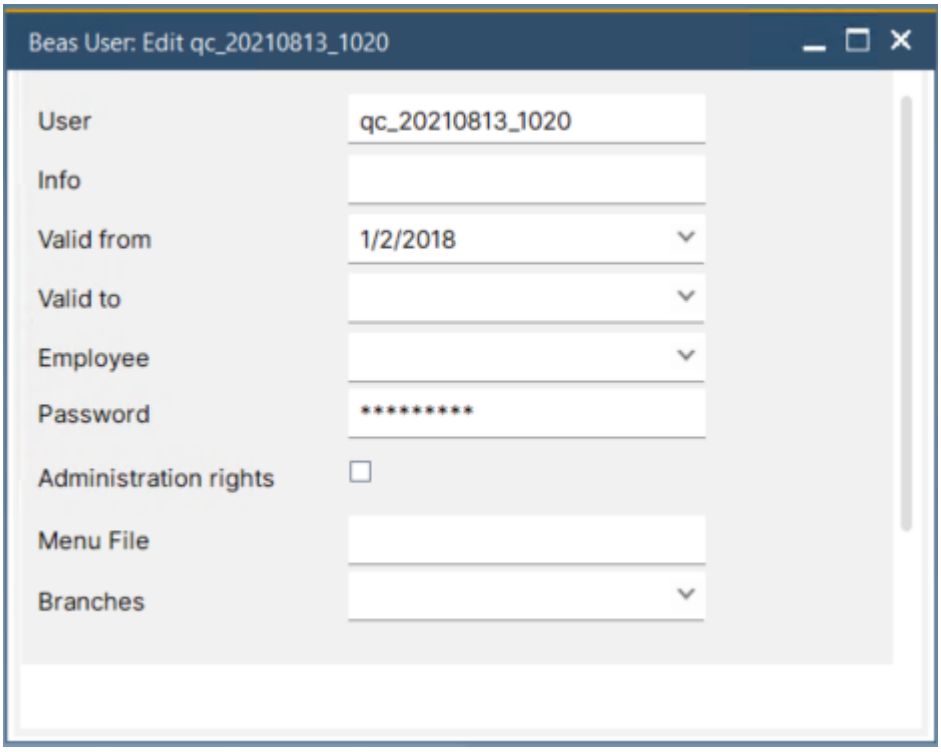
[User administration]

[Beas user]

[Edit beas users]

PATH: Administration > Setup > General > User (Beas).

1. click **Beas User** button.
2. click **Open**.



Window system_ benutzer_ edit.psr

This is an editing window for ONLY-Beas-users, without access to SAP B1.

Field	Meaning
User	User ID. Note: If the same user ID exists in SAP Business One – user administration, the SAP Business One ID has priority.
Info	Free text.
Valid	Period of validity from–to. Outside validity period you cannot logon.

© 2026 Boyum IT Solutions A/S

Field	Meaning
Employee	Assignment to SAP Business One user. The DI-API–log-on uses this user. Note: This function is available for compatibility reasons only. One SAP Business One license per user is necessary when working with SAP Business One – functions.
Password	Password for Beas logon. There are no restrictions or rules.
Administration Rights	Check mark to grant administrative rights in Beas.
Menu File	Menu file for user If the menu type "beas 2009" is used, you can indicate a menu file to be started, allowing a separate menu for each user. **Setup:** 1. Rename and copy the file "menu.ini" to the project folder 2. Edit the copied file 3. File an be entered without indicating the path
Branches	Select the branches in which the user works. This can be used for generating templates and own lists.

Functions

Field	Meaning
Add	Add new user
Duplicate	Duplicate the selected entry. A new query pops up to enter new ID for it.
Remove	Delete selected entry.
Preceding entry	Switch to the previous entry in the list
Next entry	Switch to the next entry in the list
Last messages	Last messages

back to User list

3.2.1.1.3 Rights management

User administration

Extended: EMail Setup, User

© 2026 Boyum IT Solutions A/S

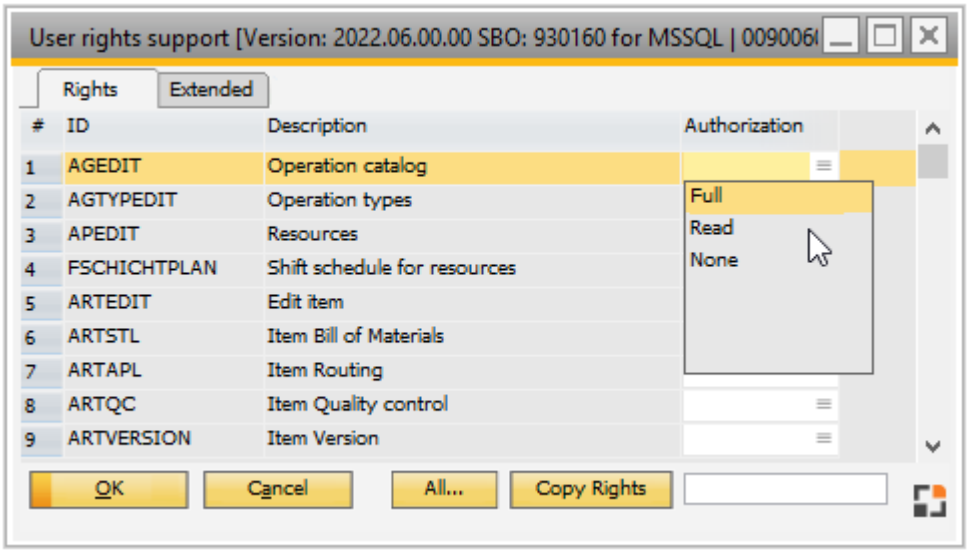
Beas user

Rights management

Beas has its own rights management, which needs to be set up parallel to SAP Business One

PATH: Administration > Setup > General > User (Beas).

1. Select user.
2. Click **Rights**.



Window system_benutzer_rechte.psr

Note: For many functions Beas uses the DI-API of SAP Business One. Therefore, Beas requires various SAP Business One rights.

See Required SAP-Rights.

The following possibilities are available:

None	Function blocked
Read	Reading rights, no changes
Full	Full authorization, change, delete, create new entries

Authorizations

Authorization	ID	Description
Operation catalog	AGEDIT	Authorization for window: Administration - Definition – Production – operation catalog.

© 2026 Boyum IT Solutions A/S

Authorization	ID	Description
Operation types	AGTYPEDIT	Administration – Definition – Production – Operation types. Administrate operation types, assign them to operations.
Resources	AGEDIT	Production – Resources ***See*** Edit resources. Administrate resources, assign them to operations. Administrate resource cost rates ***See*** cost rates.
Resources shift schedule	FSCHICHTPLAN	Administrate shift schedule
Edit items	ARTEDIT	Administrate item master data and warehouse rules (only Beas-item master) Authorization for Edit item master and price lists **Note**: for item view, the Beas authorization "edit items" is enough, To save items, additional SAP Business One authorization is required. Edit warehouse rules. ***See*** Warehouse rules.
BOM	ARTSTL	Administrate BoMs. This setting can be subdivided. Note Setting does not affect Precalculation and own created Crystal reports. Diverse functions are blocked, for example change of item group and material group. But it is still possible to change the group via SAP Business One item window and to get access this way. Accordingly, it is recommended to limit the user's authorization.
Routing	ARTAPL	Manage routings. ***see*** Extended tab and further notes on "Item BoM".
Item quality control	ARTQC	Item: assignment to QC-inspection plan to be used. ***See*** Item master – Quality control.
Customers	GPEDIT	Customer administration (view only, only Beas standalone).
Cost centers	KSTEDIT	Manage cost centers, assign to resources or personnel.

© 2026 Boyum IT Solutions A/S

Authorization	ID	Description
Material group	MAEDIT	Manage material groups, select via item master.
Unit of measurement	MEEDIT	Manage units of measurement, select via item master.
Cut-off	VERSCHN	Manage scrap/cut-off tables, select via item master.
Manufacturer	HEDIT	Manage manufacturers, select via item master.
Tool	WKSEDIT	Manage tools, assign to operations.
Cost types	TIMETYPE	Manage cost types, assign to resources and operations.
Production	FAEDIT	Access on work orders. Full access: User can create, delete, edit work orders e.g. via Work order list, Sales order, Sales order to work order Read access: User can view work orders No access: All access on work orders is locked
Production release	FARELEASE	Allows the release of work order positions With this option the user is allowed to change release options in work order positions: Approved Capacity planning Material planning Login to work order Material posting Allow changes These can still be adjusted directly via the APS list. If the option is disabled, the access changes in the work order position are locked, and in the APS list the respective buttons are hidden.
Production BoM	FASTL	Is the BoM displayed? (window and list)

© 2026 Boyum IT Solutions A/S

Authorization	ID	Description
		Only view is affected. Prints and reports as "Material requirement" are not affected. Extended rights settings are considered. ***See*** Extended tab.
Production routing	FAAPL	Are routings displayed? Only view is affected.Prints and reports as "Material requirement" are not affected. Extended rights settings are considered. ***See*** Extended tab.
Production closed release/post	FAABG	Determines the behavior for closed positions Is the user allowed to re-open a closed position or work order? For BoM positions the switch determines whether or not a posting may be performed via direct input (position number or bar code). Affected: only manual posting (Goods issue, Goods receipt). Possible only if activated in Configuration wizard. ***See*** Manual posting Configuration wizard - Material posting
Production request	MRPWORKORDER	Access on production request created in MRP, from which work orders can be created.
External operation purchase	FRBEST	Create purchases for external operations.
External operation provision	FRBEIST	Transfer provision parts for external operation to the supplier warehouse.
External operation goods receipt	FRWRG	Post in components from external operation.
External operation issue	FRAUSB	issue provision parts from supplier's warehouse.
Project	PRJ	Manage projects.
Project Basis data	PRJBASIS	Set up project basis data (tasks).
Project Template	PRJTEMPLATE	Set up project templates (structures).
Project Catalog	PRJCATALOG	Set up tasks catalog.

© 2026 Boyum IT Solutions A/S

Authorization	ID	Description
Post-calculation	FNAKA	Access on post-calculation for work orders. Affected - post-calculation via menu - work order item – Button post-calculation - post calculation view - production – calculation tab
MRP wizard	FBESTV	Access the MRP wizard Administrated the access to the MRP wizard and the order recommendation list. Read only: - MRP wizard: settings cannot be changed - Order recommendation list: Only view possible Note: In the MRP wizard further authorizations can be set up per scenario.
Create Purchase Order	MRPPURCHASE ORDER	Allow to create Purchase Order from MRP If active, the user can create purchase orders from purchase requests and via order recommendation. Note: The user needs full access to create a purchase request, because the purchase order is always created from a purchase request.
Create Purchase request	MRPPURCHASE	User can create a purchase request manually and change it The user can create or change their own purchase requests. Note: To manage all other purchase requests, the user needs access to "Manage purchase request" For creating purchase orders, the user always needs access to create purchase requests.

© 2026 Boyum IT Solutions A/S

Authorization	ID	Description
Manage purchase requests	MRPPURCHASE2	Access all functions in Purchase requests list Access all entries of all employees. Note: purchase requests and all other planned inflow and outflow are displayed in the order recommendation report. The same applies to the inventory history. This authorization does not affect the view in either function. **Special case: Order recommendation report** No authorization: User sees all order recommendations, but can change or delete only own entries.
Confirm (Time receipt)	FARUECK	Create time receipts to confirm order times.
Administrate time receipts	FAVERWALTEN	Administrate existing time receipts.
Confirm (time receipts) view	FAANSICHT	View existing time receipts.
Priorities	FPRIOR	Set up priorities for production
Calculation types	FCTYP	Capacity planning: set up calculation types in APS.
Interruption reasons	FSTILLSTAND	Administrate interruption reasons, select at time receipt.
Scrap reasons	FAUSSCHUSS	Administrate scrap reasons, select at time receipt.
Mile stones	FMILESTONE	Manage mile stones, select in operations.
Production pool	FPOOL	Access the pool list to distribute operation sequences to production pools.
Production list	FLISTE	Use production lists.
Production server	FSERVER	(only customization).
Internal and external maintenance	MAINTENANCE	Administration Maintenance-Master data maintenance plans.
Maintenance order	MAINTENANCE ORDER	Edit of the maintenance orders
Journal postings	JOURNAL	View journal entries for financial accounting in production (***see*** work order structure – orange barrel.

© 2026 Boyum IT Solutions A/S

Authorization	ID	Description
APS View	APS	View scheduling in APS.
APS scheduling	APSP	Administrate scheduling in APS (rough and detailed planning).
Precalculation	VORKALK	Access the Precalculation.
Calculation objects	KALKOBJ	Manage calculation objects for calculation schemas.
Batch-Precalculation	BATCHKALK	Access the batch-calculation.
Run batch Precalculation	BATCHKALKSTART	Full right required to start a batch calculation. Additionally, at least reading rights are required for the batch calculation itself (option above).
Stock revaluation	PRICEREV	Access in batch-calculation – result – stock revaluation. ***See*** Batch-calculation stock revaluation
Batch post-calculation	BATCHNKALK	Use batch-post-calculation.
QC order	QS-A	Edit QC orders register measurements. In Terminal mode this authorization is activated automatically.
QC orders archive	QS-R	Access closed QC orders.
QC inspection plan	QS-PLAN	Access inspection plans, assign to items or operations.
QC edit defaults	QS-TEXTE	Manage default texts ***See*** QC defaults.
Edit QC order	QS-AE	Change existing QC orders. ***See*** edit measurement position.
MM purchase order post in	MWEINGANG	Post in single purchase items.
MM manual transfer	MWBUCHEN	Post in / issue / transfer as single operation.
MM warehouse management	BINRIGHT	Set up warehouse master data.
MM booking bin locations	BINBOOKING	Access bin location management.
MW Journal	MWJOURNAL	Access stock movements report and posting documents via work order structure. ***See*** work order structure - postings

© 2026 Boyum IT Solutions A/S

Authorization	ID	Description
		warehouse management - inventory history - journal
MM batch reports	MWCHARGE	Access batch reports and Edit batches.
MM batches transfer	MWBTTRANSFER	Transfer item batches to other items.
WO backflushing booking	MWRETROGRAD	Issue material automatically for a work order. ***See*** Backflushing.
MM complaint	RECLAMATION	Access complaints.
MM Inventory	MWINVENTUR	Access inventory function (create and edit stocktaking).
MW Reservation list	MWRESERVATION	Display and manage reserved material.
MM Mobile input	POCKET	Only for old Mobile-System (do not use).
Terminal	TERMINAL	Access Terminal for factory data capture.
Personnel	PEDIT	Access on personnel master data Note: "extended editing rights" are considered only if the user has at least reading rights for the personnel master. Full access on the personnel master has a higher priority than extended editing rights. ***See*** Personnel master data Extended editing rights
Personnel editing rights	PACCESS	Access personnel master data Extended personnel authorization. On user level this defines which program area may be viewed or edited. Note: "extended user rights" are taken into account only, if the user has at least reading rights for personnel master. Full access on personnel master has a higher priority than the extended editing rights. ***See*** Personnel master data Extended editing rights
Currently present	PANW	View list of currently present employees.

© 2026 Boyum IT Solutions A/S

Authorization	ID	Description
Time evaluation	PZAUSW	Create time evaluations ***See*** Time evaluation.
Factory calendar	PKAL	Manage factory calendar, basis for shift schedule and resources.
FDC master data	ANW	Manage shifts, day templates, absence types.
Business performance	BAB	Access Business performance.
Product configurator	CAFT	Access product configurator.
User functions	EFUNK	Old function, visible only for compatibility reasons.
Change company	FAWECHSEL	Access the "change company" function.
Options	SOPTION	Several , for example Configuration wizard.
User administration	BENUTZER	Manage users.
Report settings	REPORTE	Access on report settings.
Reporte administrate	REPORTINSERT	Manage reports.
Language	SPRACHE	Manage languages.
WEB-APPS	WEBAPPS	Manage WEB apps.
WEB Berechtigung	WEB-ACCESS	Manage WEB app authorizations.
Import	IMPORT	Manage Import Definitions.
SQL-instructions	SQL	Execute SQL-statements directly.
Template, window settings	TEMPLATE	Template-administration, Window settings and Edit objects (Ctrl+Double click).
Database test	DBTEST	Run database test.
System	SYSTEM	Diverse system functions.
Debug	SYSDEBUG	Debug-window. Note: Beas-script is available. Everything can be executed.
Generate Item	SYSARTGEN	Access the function item generation.
Customized extensions	CUSTFEDIT	Manage customer specific extensions.
System programming	SYSFEDIT	Manage system specific extensions.
Cockpit - Production	CKPTPROD	Manage the Beas Production Cockpit.

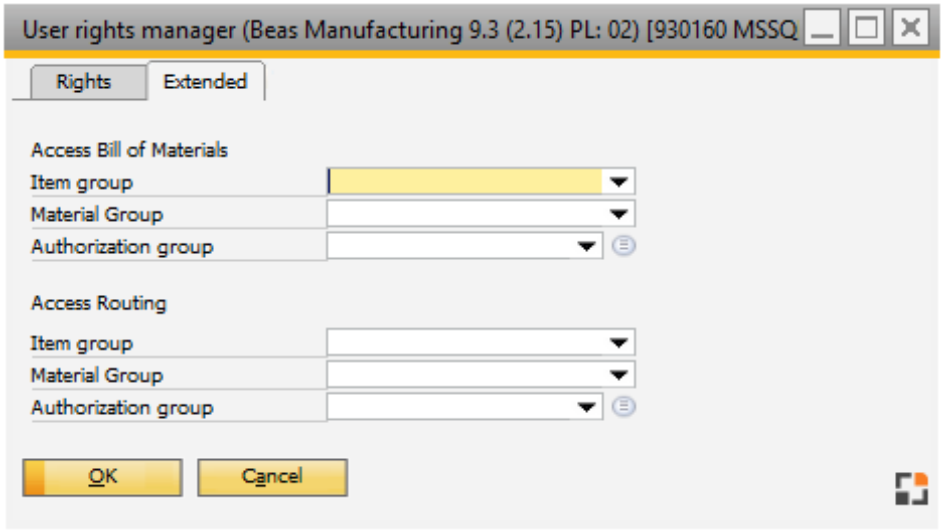
Extended tab

© 2026 Boyum IT Solutions A/S

Use this to determine whether the user has permission to view or edit BoMs and routings. Furthermore, you can set up, for which groups of items or material the users has a right to edit BoMs and routings. Currently, this setting applies only to the item master and not on work orders.

PATH: Administration > Setup > General > User (Beas).

1. Select user.
2. Click "Rights".
3. Select "Extended" tab in the opening "User rights manager" window.



system_benutzer_accessextented

You can select material groups and item groups which the employee can access. If nothing is selected, all entries can be accessed.

If a user has no right to access the routing or BoM, he may also not edit the item group and material group of the item (applies only in Beas item window)
In the Item Master, the BoM / routing tabs are hidden depending on the authorization. In the item structure view or in the structure report (Crystal document) only BoMs and routings are displayed, for which the user has authorizations.

The standard report “BoM single level” is generally blocked if the user does not have access to all items. Note: This limitation applies only if the standard report will be read in new (restore default). Own reports are not affected.

© 2026 Boyum IT Solutions A/S

There are other points in the program, where the BoM is recognizable as in the Order Recommendation Report, Precalculation and various other functions. For this reason it is very important to restrict the access to the necessary functions, in case the user shall not see this information.

Attention

A 100% secure protection cannot be guaranteed.

The following fields are available per BoM and routing:

Field	Description
Item group	Select item group.
Material group	Select material group.
Authorization group	Select authorization group. Note: Selection not yet supported.

- Known issues in authorization control

Beas requires special user rights to work properly with the functions of SAP Business One. ***See*** Required SAP Business One Rights

Terminal application

In the Terminal application, Beas logs on in the background using a central DI-API user, which is set up in **Configuration Wizard > System > DI API**. This user needs special rights. ***See*** Required SAP Business One Rights

The user who logs on to the terminal, does not notice the information. He only has a personal set of functions available. In case documents are generated, the personnel number is entered in [document-line table] `u_beas_pers_id`. Logging is based on which user created the document.

WEBAPPs

The WEBAPPs work the same way as the Desktop terminal.

Start **Beas without SAP Business One**

Beas can be started without SAP Business One. Then only selected functions are available in Beas. Use this if the user does not need SAP Business One functions.

see also

© 2026 Boyum IT Solutions A/S

User administration

3.2.1.1.3.1 Required SAP B1 rights

For many functions Beas uses the DI-API of SAP Business One. Various authorizations are required to run DI-API-objects. After a time receipt a journal entry is created. Accordingly, the user needs the authorization "create journal entries"

To make sure, that the user can execute all Beas functions, there are the following possibilities:

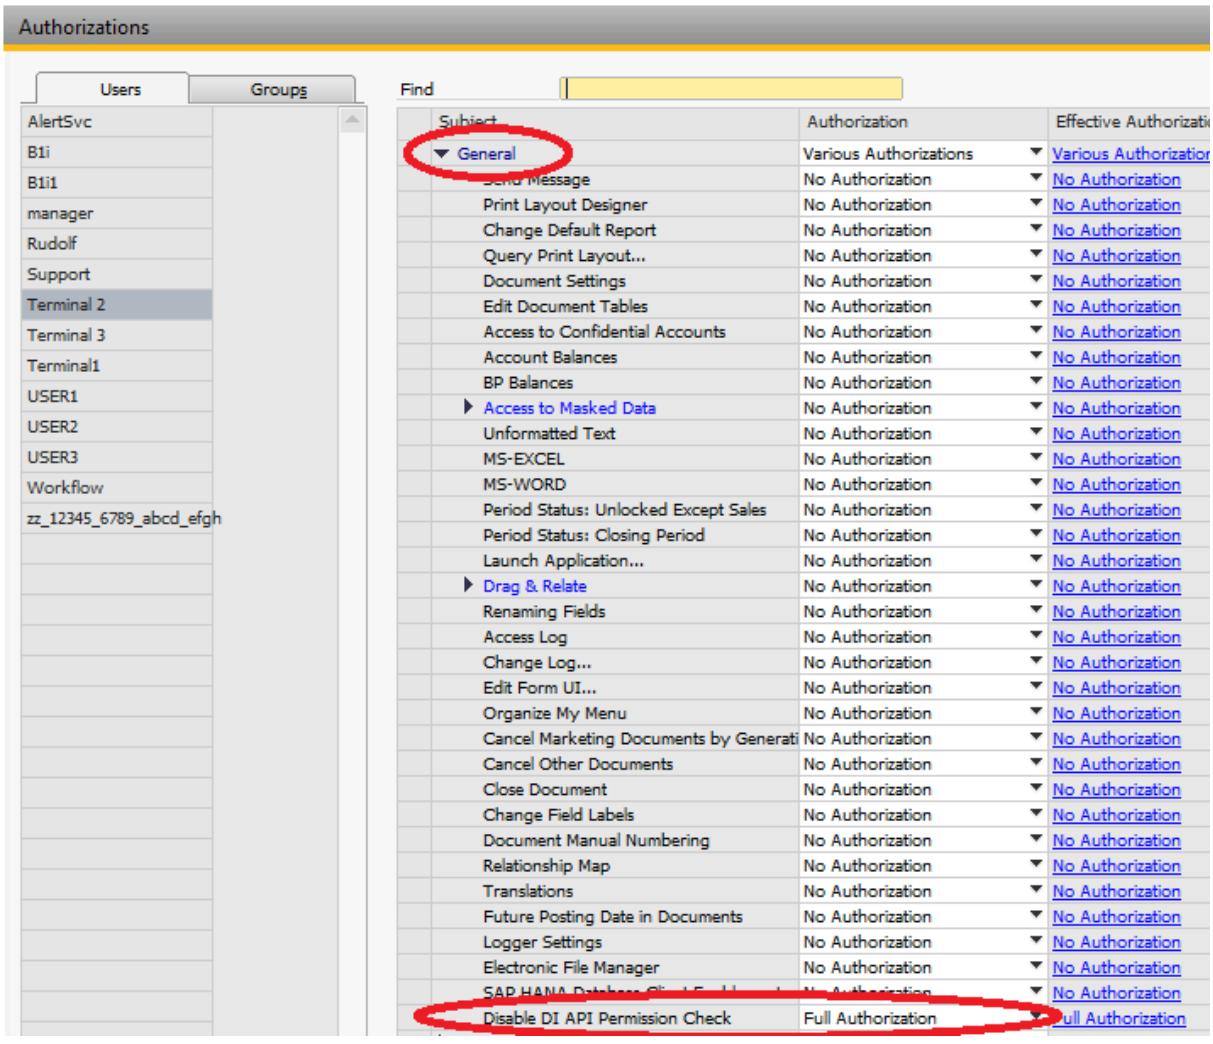
From SAP B1 Version 9.1

The user requires the following authorization:

Administration > System initialization > Authorization > General Authorizations

Select employee or authorizations group.

General Authorizations – last entry "**Disable DI-API-Authorization**" set to "full".



© 2026 Boyum IT Solutions A/S

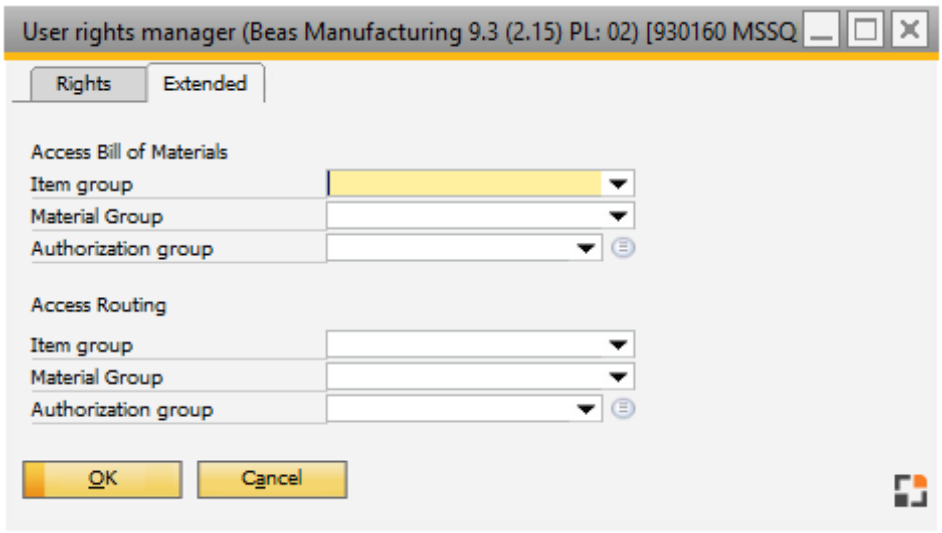
See Terminal

3.2.1.1.3.2 Rights extended

Use this to determine whether the user has permission to view or edit BOMs and routings. Furthermore, you can set up, for which groups of items or material the users has a right to edit BOMs and routings. Currently, this setting applies only to the item master and not on work orders.

PATH: Administration > Setup > General > User (beas).

1. Select user.
2. Click **Rights**.
3. Select "Extended" tab in the opening "User rights manager" window.



system_benutzer_accessextented

You can select material groups and item groups which the employee can access. If nothing is selected, all entries can be accessed.

If a user has no right to access the routing or BoM, he may also not edit the item group and material group of the item (applies only in Beas item window)
In the Item Master, the BoM / routing tabs are hidden depending on the authorization. In the item structure view or in the structure report (Crystal document) only BoMs and routings are displayed, for which the user has authorizations.

The standard report “BoM single level” is generally blocked if the user does not have access to all items.

© 2026 Boyum IT Solutions A/S

Note: This limitation applies only if the standard report is read as new (restore default). Own reports are not affected.

There are other points in the program, where the BoM is recognizable as in the Order Recommendation Report, Precalculation and various other functions. For this reason it is very important to restrict the access to the necessary functions, in case the user shall not see this information.

Attention:

A 100% secure protection cannot be guaranteed.

The following fields are available per BOM and routing:

Field	Description
Item group	Select item group.
Material group	Select material group.
Authorization group	Select authorization group. Note: Selection not yet supported.

3.2.1.2 Languages

Languages – Definition of SAP Business One is extended by the Beas button "**Extended**".

This is to define the format of numbers and dates to be issued on documents.

See Languages – Extended.

Officially supported languages:

German
English
French
Italian
Simplified Chinese (P.R. China)
Spanish (Spain)
Portuguese (Brazil)

A number of other languages are available and supported by Partners.

In case there is a problem with a language or you need a new language, please inform our support.

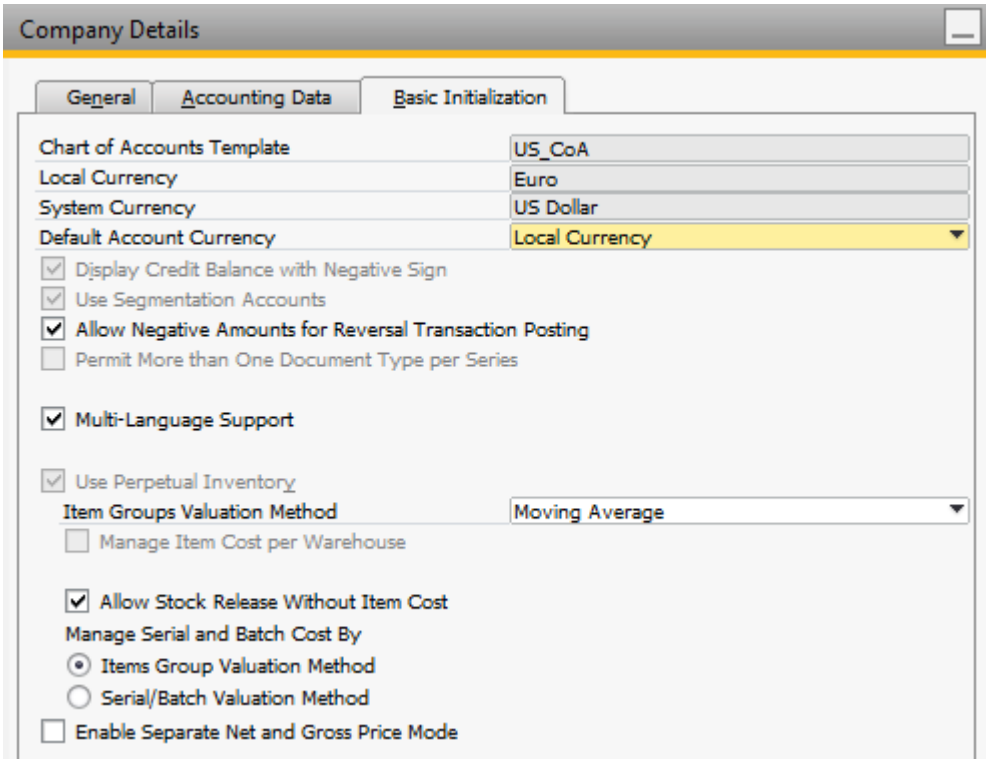
© 2026 Boyum IT Solutions A/S

3.2.1.2.1 Date and Number Format

Date and number format control only works in marketing documents.

The settings are stored under **Administration > System Initialization > Company Details > Basic Initialization**.

For more information ***see*** SAP Document Print solution.



Window beasgui_sbo.psr

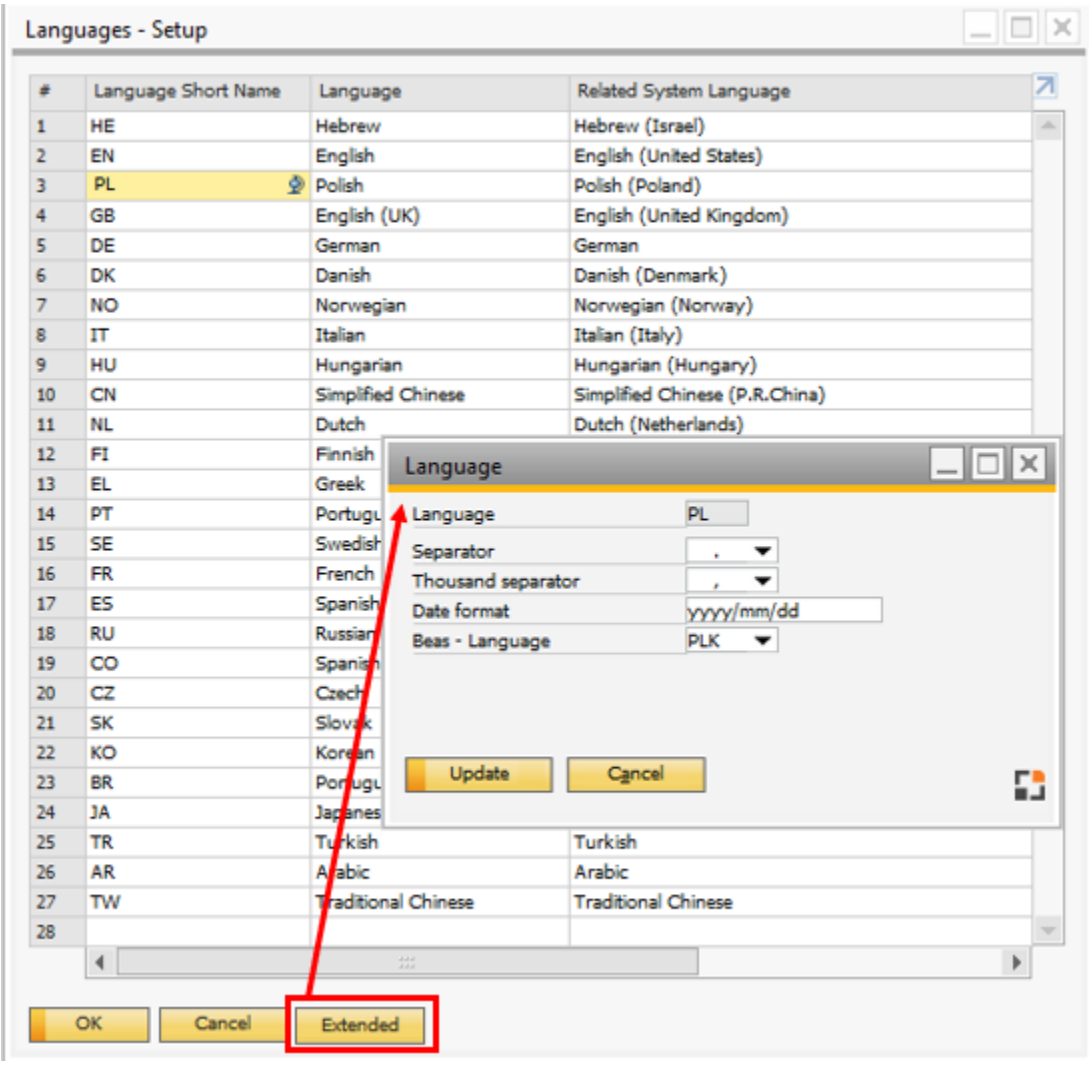
Attention: Activate the multilingual feature here. Then restart SAP. Important: Restart – do not change company!

The "**Extended**" button is now available for the languages.

The extended settings can now be configured.

PATH: Administration > Setup > General > Languages > click **Extended**.

© 2026 Boyum IT Solutions A/S



Window_system_sprachen_erweiterung.psr

Field descriptions

Name	Description
Separator	Separator for decimal places
Thousand separator	Thousand separator
Date format	Format for date output d = day, one-digit dd = day, two-digit dddd = day, written – system language only m = month, one-digit mm = month

© 2026 Boyum IT Solutions A/S

Name	Description
	mmmm = month, written – system language only yy = year, two-digit yyyy = year, four-digit e.g. yyyy/mm/dd = English format dd.mm.yyyy = German format
Beas language assignment	Beas has dynamic translation tables. Their identification differs party from the language identification in SAP. You can set the assignment here.

3.2.1.3 Translation (Beas)

Beas is equipped with a translation module.

PATH: Administration > Setup > General > Translation (Beas).

The Beas interface is delivered in German and English. The English translation list is imported automatically.
Additional languages can be imported manually. These will be updated automatically.

If you start Beas inside SAP Business One, Beas use same language as used in SAP Business One
If you start Beas without SAP Business One, Beas use the current windows regional settings
if you start Beas in terminal mode, Beas use the language defined in human definition

if you edit a number, date or time field, Beas always uses the Windows Regional Settings.

- More information

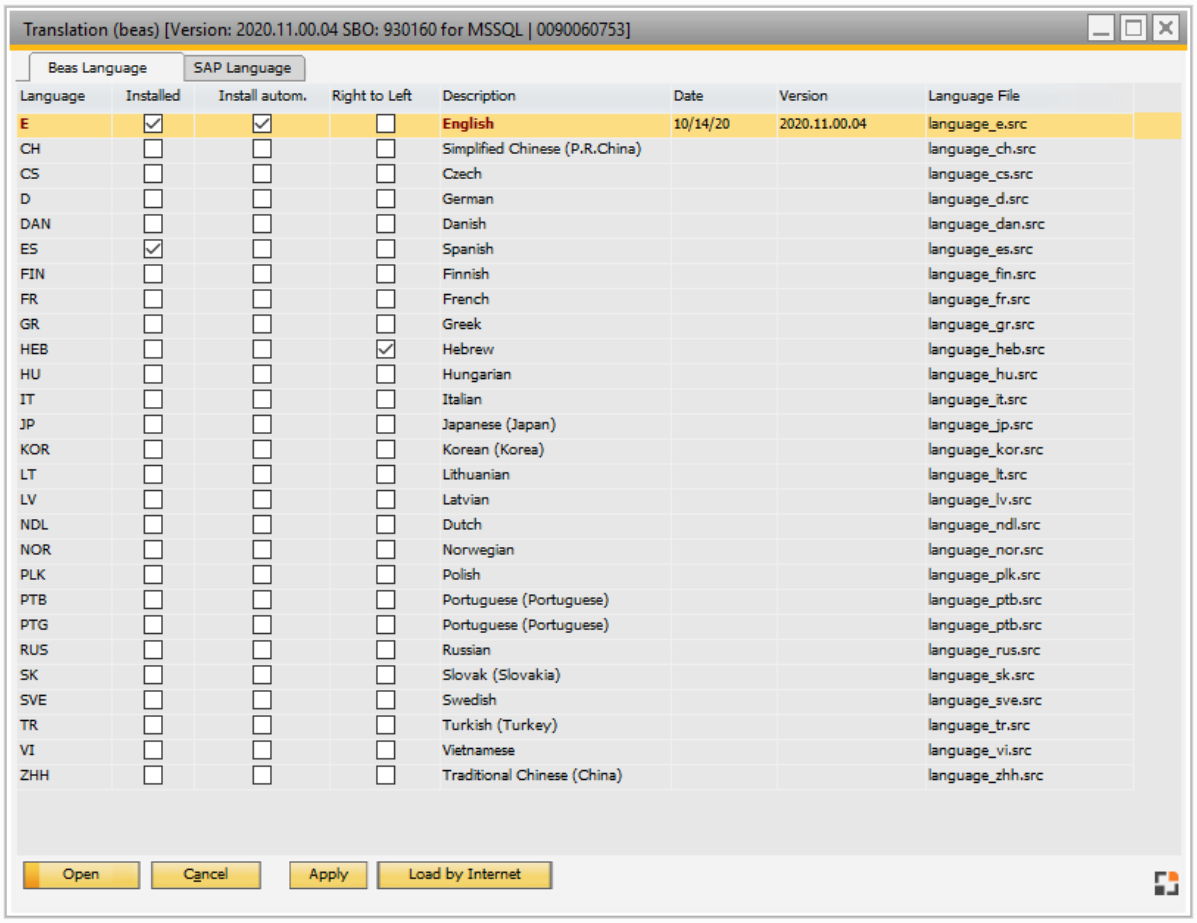
In Windows regional settings you can define the time and date formats.
Beas uses these for input fields and view if you start Beas outside SAP Business one or the time format is not defined in the translation table.

Differences
Beas does not accept ' or "
in Beas 9.3 PL 0 or older an error message is displayed if you use the ' sign.

© 2026 Boyum IT Solutions A/S

In Beas we have the following definition:
h, hh = hour
m, mm = Minute
s, ss = seconds
AM/PM or tt: Display AM or PM
If you use other AM/PM symbols: Beas ignores this.

You can overwrite the standard translation (Edit Translation > Translation)
or you can define own translation or message (Beas AddOn administration)



Window system_spr_browse.psr

Beas languages tab

Field	Description
Open	Edit selected language.
Cancel	Close window without saving changes.

© 2026 Boyum IT Solutions A/S

Field	Description
Apply	Set up the selected language for testing purpose. Note: printing documents or evaluations, the language is reset to Window-settings.
Download from Internet	The current version of the selected language is downloaded from the Beas internet portal. You need this if new language definition is available, for example: if you help to work on the translation. NOTE: In every Beas Version the last translation file is inside. Normally, there is no need for this function. The program needs access to http:\\www.beascloud.com. If this is not working, check your firewall setting. NOTE: THIS IS AN HTTP CALL. For this action Beas installs a new .src file in the C:\program filex (x86)\beas software\beas\program folder. For this Beas needs administration rights. --- You must **START BEAS IN ADMINISTRATION MODE.**
Reset	Reload all language settings and translation table. Use this if Beas delivers a new language and it is not displayed in your list.

SAP Language tab

Field	Meaning
Description	Language name
Windows	Language ID in Windows
Beas language	Language ID in Beas
B1 Number	Language number in SAP Business One
B1 enum	Linkage SAP Business One-language to Beas-language

Because SAP Business One supports more languages than Beas, a 1:1-linkage is not possible. For this reason in a translations table the links between SAP Business One and Windows language settings and Beas language settings are defined.

© 2026 Boyum IT Solutions A/S

This table is defined in the file system_language.ini which is read in at new installation and upgrade. It is available under Language / SAP Business One language.

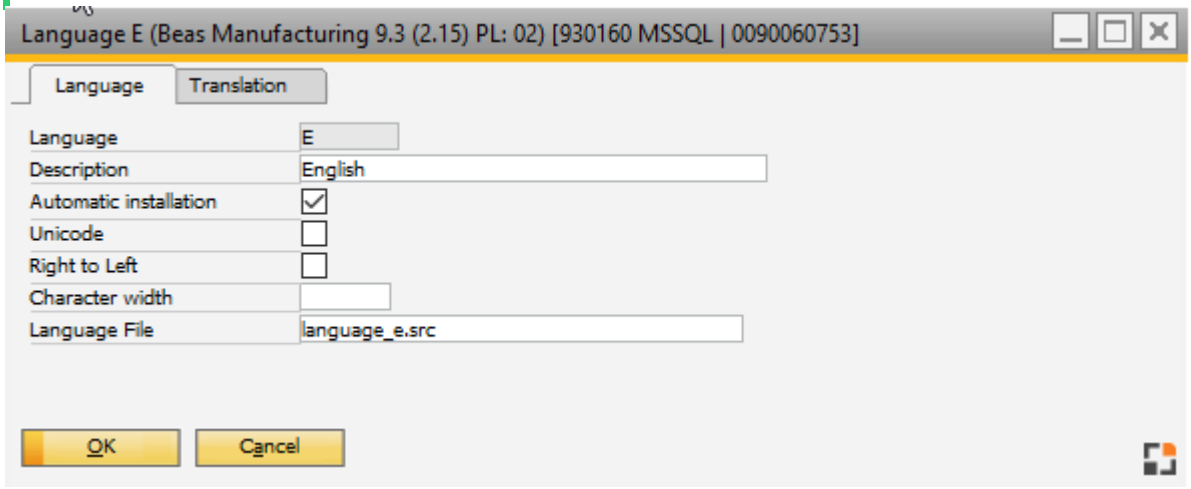
Default: Button is used to reset to default settings.

Beas translation system

3.2.1.3.1 Language/translation edit

In this window you can edit/change a translation.

PATH: Administration > Setup > General > Translation (Beas) > **Open** an entry.



Window system_spr_edit.psr

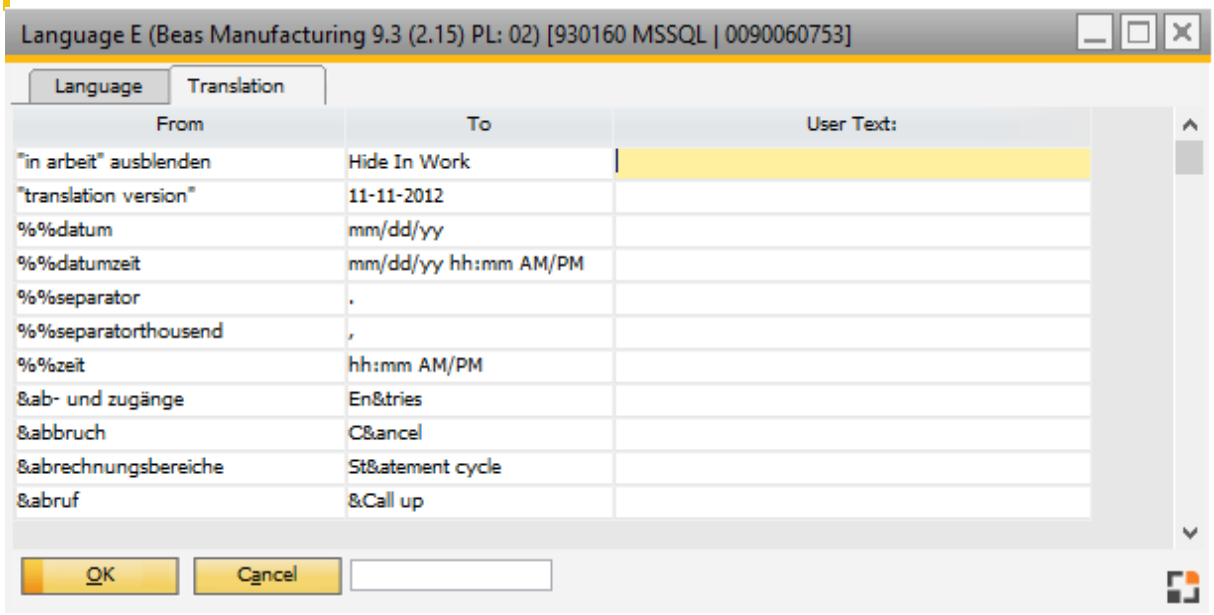
Field	Meaning
Language	Info is used in this language.
Description	Name of the language.
Automatic installation	Beas imports the language after the automatic update. You can activate/disable this function.
Unicode	Info: language needs unicode font.
Right to left	Info: right to left language?
Character width	You can define a fix width for every letter (***example*** for Chinese font).

Translation Tab

© 2026 Boyum IT Solutions A/S

In the "Translation" Tab you can overwrite the standard translation. Your own translation is saved in the current database.

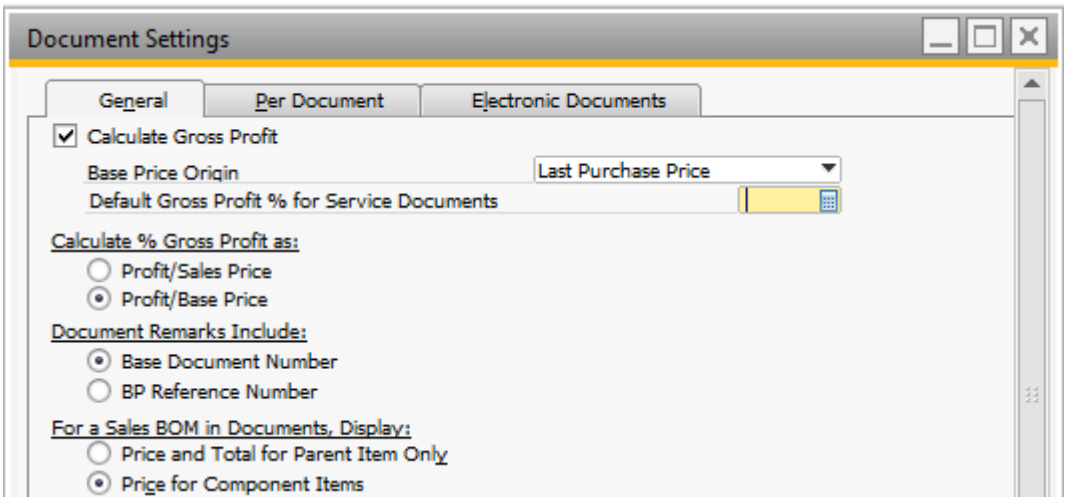
Note: Words starting with %% are not changeable.



Window system_sprachen_browse.psr

3.2.1.4 Document settings

For details on this window: ***See*** SAP Business One documentation.



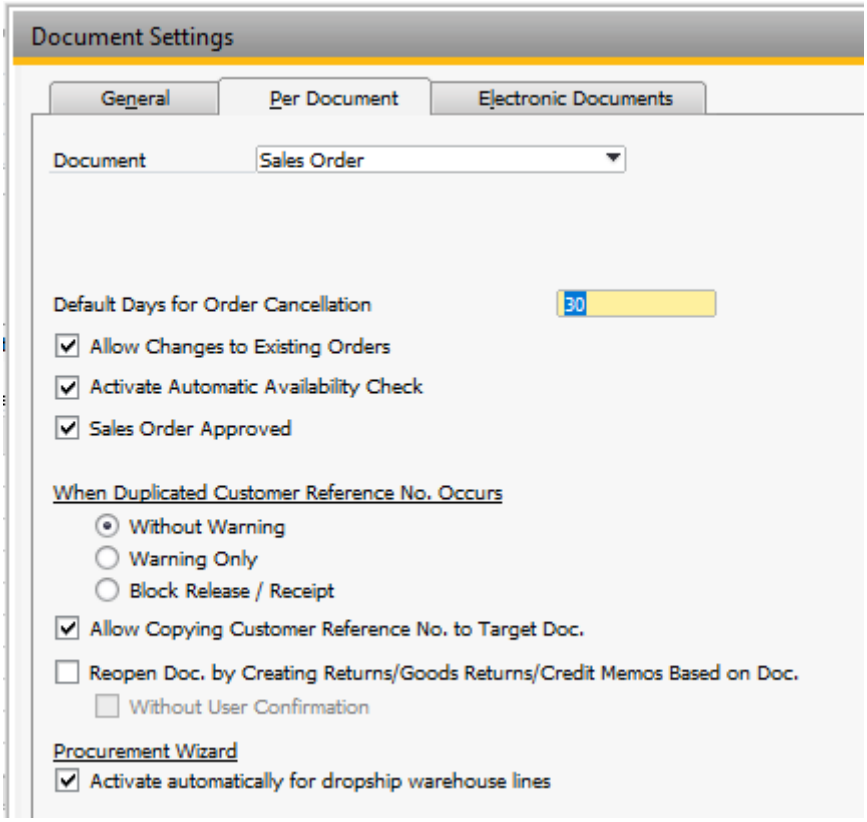
For additional information to these settings ***see***

Per Document

© 2026 Boyum IT Solutions A/S

3.2.1.4.1 Per Document

Additional information to Document Settings - Per Document.



Setting	Description
Activate Automatic Availability Check	This function opens an Availability Check. But this ignores Reservation and Work orders - it is not recommended to be used. Alternative information is - Item History: Check all Stock- and Reservation informations a) Real time b) With more information related to last MRP run - CTP / ATP: calculate Availability and Delivery time based on Resource planning and Material availability Note: If you activate this setting, the Product configurator can't change the description in the sales order.

© 2026 Boyum IT Solutions A/S

3.2.2 Financials

PATH: Administration > Setup > Financials.

GL Account Determination

3.2.2.1 GL Account Determination

GL Account Determination is supported by Beas

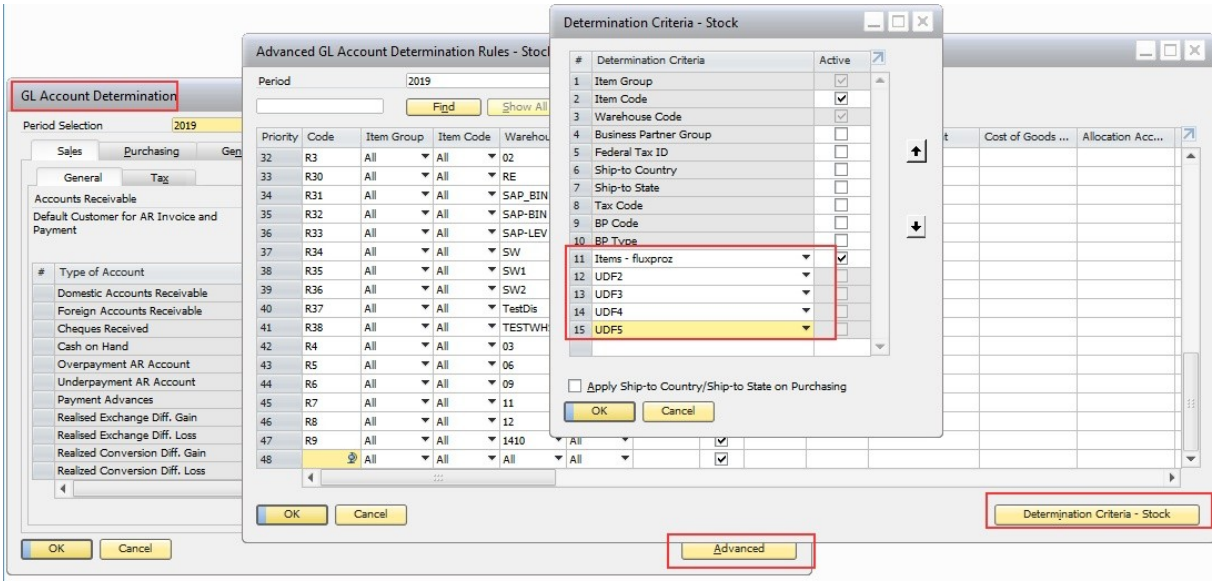
PATH: Administration > Setup > Financials > G/L Account Determination.

Advanced GL Account Determination Rules:

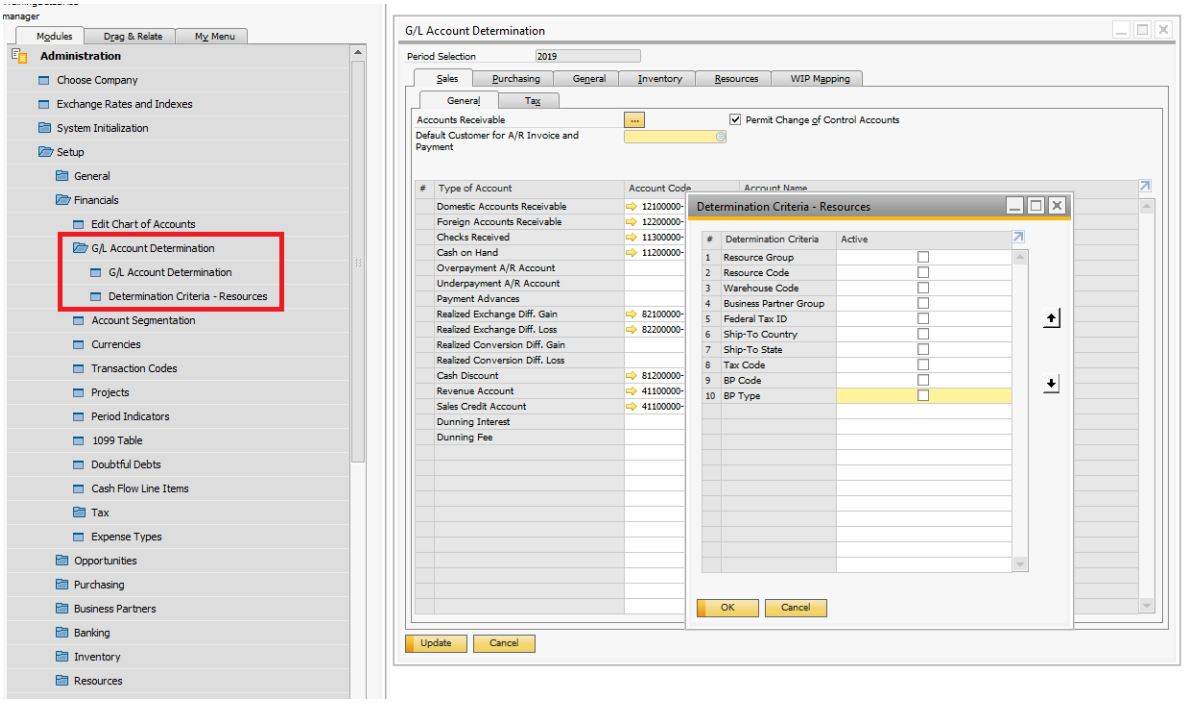
Default settings: Code, Item Group, ItemCode and Warehouse are supported.

Note: Determination Criteria – Additional fieds e.g. UDF 1–5 are not supported. In an attempt to use them, the following error message appears in Production transactions:

Error: (-10) 234109545 - Enter valid code [JDT1.ContraAct][line: 4] , SYS_xxxx



© 2026 Boyum IT Solutions A/S



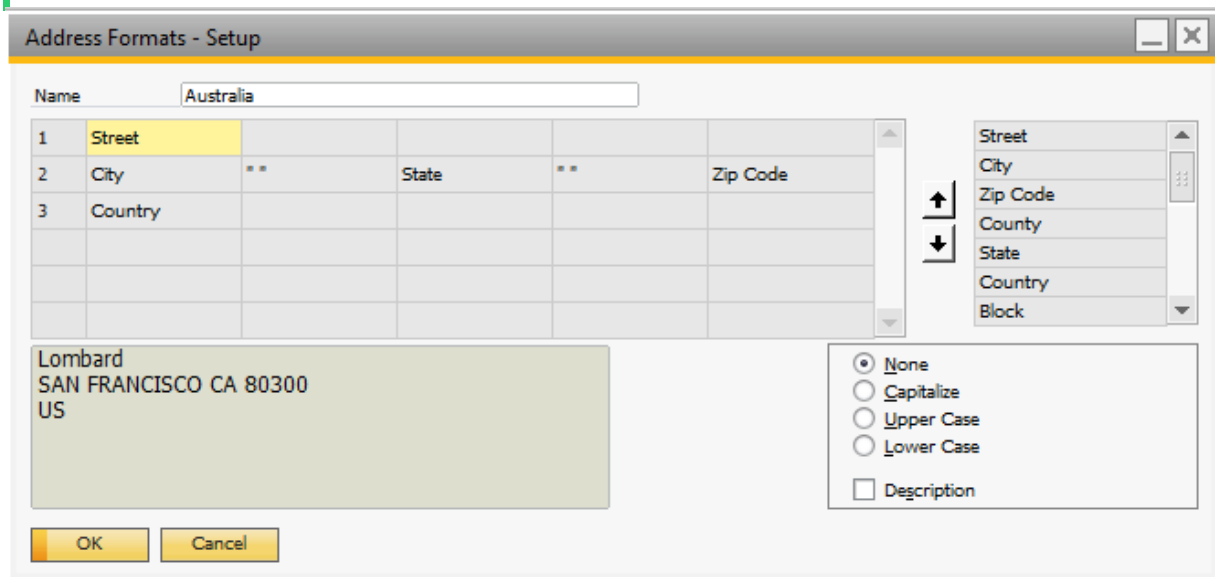
3.2.3 Business Partners

3.2.3.1 Address Formats - Setup

In SAP Business One you can define the Address format:

In some areas in Beas must create the Address text itself and support most definitions from

PATH: Administration > Setup > Business partners > Address format



Window beasgui_sbo.psr

Supported fields:

© 2026 Boyum IT Solutions A/S

- Street
- Address 2
- Address 3
- City
- Post Code
- County
- State
- Country
- Block

Supported functions:

- Display Description for Country Name
- Capitalize only first letter
- Upper case
- Lower case

Note: All other additional functions and fields are not supported.

3.2.4 Inventory

PATH: Administration > Setup > Inventory.

Generate Item Overview
Material Group
Units of Measure

3.2.4.1 Generate Item Overview

When creating a new item, Beas can generate the item number automatically, use any item as a template and also predefine the description as well as any additional fields. Item generation becomes active during new item creation and copying of items.

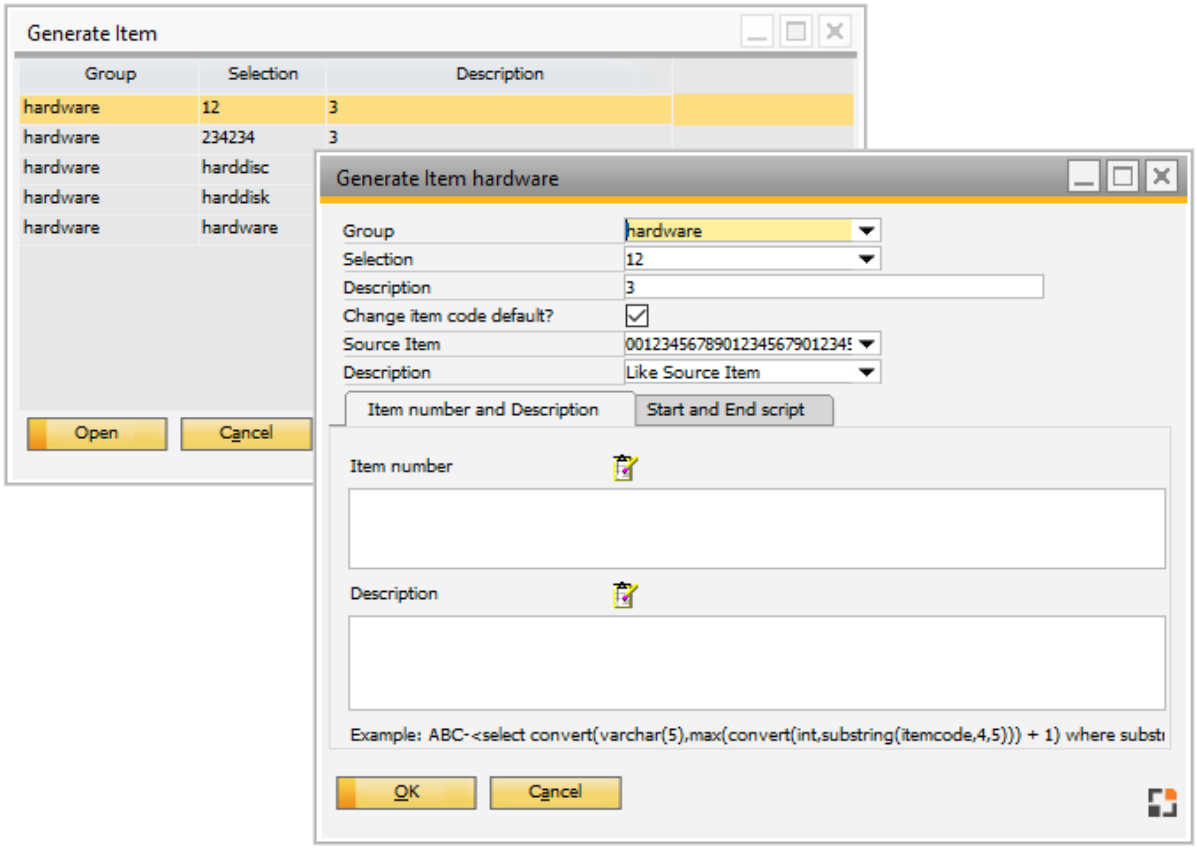
PATH: Administration > Setup > Inventory > Generate item.

You can use it for:

- Definition of Templates
- Item Number generation

Needed Access: Generate Item *(SYSARTGEN)*

© 2026 Boyum IT Solutions A/S



Window artikel_artgen_edit.psr

Activate Item generator

Define the generation of items to activate this function. Then, creating new items or copying additional fields are available (only if this is done in Beas) To set up, knowledge of BeasScript is required.

Item generation works on 2 levels: "group" and "selection". For group selection, more than one group need to be defined. Before and after items are created, scripts can be executed.

Example

```
Hardware -> Computer
Hardware -> Printer
Software -> Office
Software -> Games
(...)
```

Example: Use algorithm with rules to generate items

© 2026 Boyum IT Solutions A/S

Important: direct access to all fields. For SAP Business One fields the content is not checked. Entering an illegal value, can result in the item not to be useable.

In the list all set up item generation methods are displayed. Entries can be edited, copied and deleted.

Button	Meaning
Open	Edit the entry, Editing window opens.
Add	Create a new generation method – Editing window opens.
Remove	Delete an entry.
Duplicate	Duplicate an entry.

Window to create new items (also manually)

3.2.4.1.1 Generate item

When creating a new item, Beas can generate the item number automatically, use any item as template and also predefine the description as well as any additional fields. Item generation becomes active during new item creation and copying of items. In this window it is possible to define all rules.

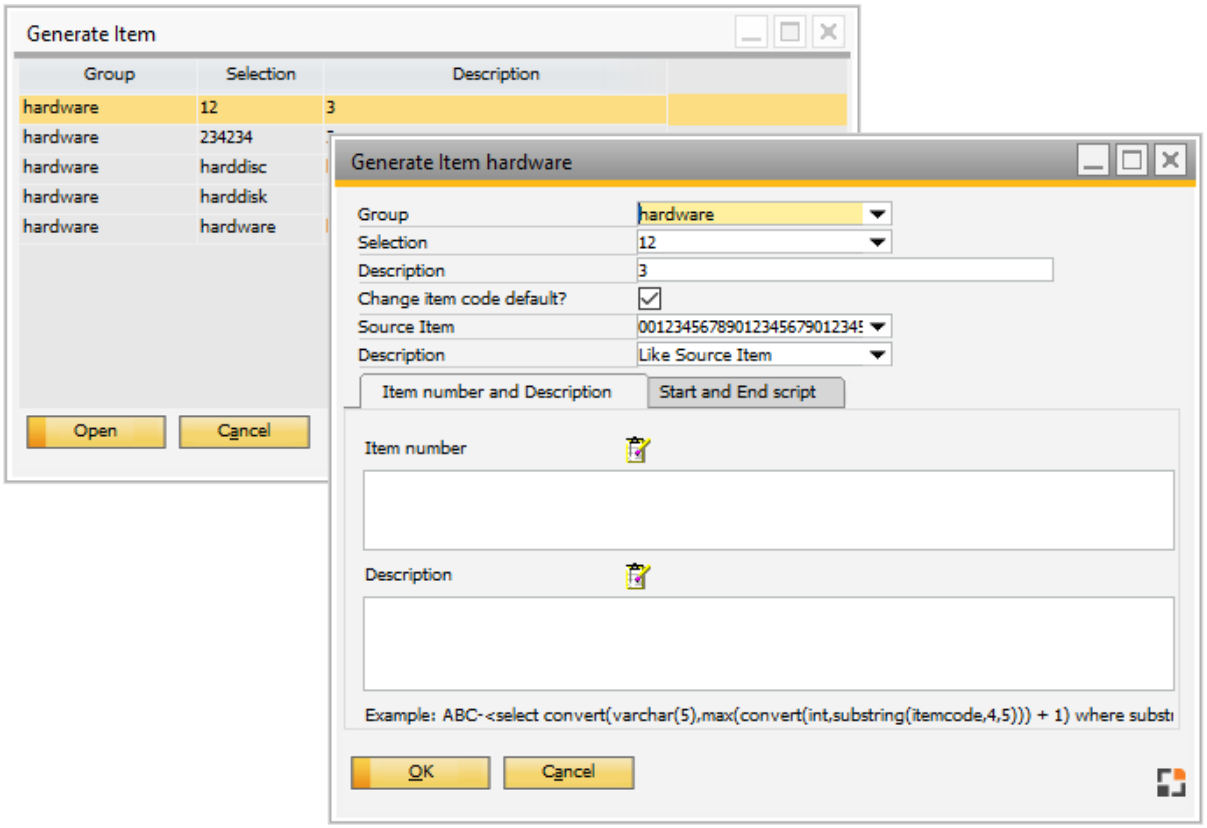
PATH: Administration > Setup > Inventory > Generate item >"**Add**" function.

You can use it for:
- Definition of Templates
- Item Number generation

Needed Access: Generate Item *(SYSARTGEN)*

See Create new items

© 2026 Boyum IT Solutions A/S



Window artikel_artgen_edit

Header

Field	Meaning
Group	Define a group to select from (optional) If a group is defined, Beas will display the field "Group" in item creation window  *Window artikel_new.psr*

© 2026 Boyum IT Solutions A/S

Field	Meaning
	You can use this generate an item. Together with "Selection" it is possible to perform a 2 level item generation. You can select an existing group or you can insert a new group directly.

Selection	Definition of group selection. Input mandatory. Select from groups.
	Define the second level of item generation.
	It is automatically activated if a group has more than one selection. In this case, it is possible to make a selection for the chosen Group.
	Example
	`Hardware -> Computer`
	`Hardware -> Printer`
	`Software -> Office`
	`Software -> Games`
	`(...)`

Description	A further description of the selection can be entered. Upon creating a new item, the selection is displayed in brackets, followed by the designation.
Item no. changeable?	Check box defines if it is allowed to change the item code. Activate to make item code changeable.
Source item	You can select a source item to use as default (as template).
Description	Types of description: - like source item - manual input at new creation - automatic generation

Tabs

Tab	Meaning
Item number and description	Determines structure of item number and description.
Start and End script	You can deposit a script which will be executed at selection, start and end of item creation. You can use it to predefine the description or item number (temporarily saved in a variable).

© 2026 Boyum IT Solutions A/S

Item number and description tab

Field	Description

Item Number	Text and placeholder describing the structure of the item number
	
	Example:
	`ABC-<time,hhmmss>`
	Creates an item number with ABC-[time], ABC-100520
	or
	`AA0<select CAST(Coalesce(max(CAST(substring("ItemCode",4,8) AS decimal(10,0))),0)+1 AS varchar(8)) from "OITM" where substring("ItemCode",1,3)='AA0' and Length("ItemCode") =8%,padr 0=5>`
	creates item number AA000001, AA000002, ...
	
	Also possible: in tab `Start and end script` in field "script at selection"
	build up the item number in advance with BeasScript `select CAST(Coalesce(max(CAST(substring("ItemCode",4,8) AS decimal(10,0))),0)+1 AS varchar(8)) from "OITM" where substring("ItemCode",1,3)='AA0'`
	
	`setvar=ls_itemcode=AA0<wert1>`
	
	enter variable in field item number
	`<ls_itemcode>`
	
	Example
	for item generation:
	Item number "A00" + an 8-digit consecutive number should be generated:
	
	`AA0<select CAST(Coalesce(max(CAST(substring("ItemCode",4,8) AS decimal(10,0))),0)+1 AS varchar(8)) from "OITM" where substring("ItemCode",1,3)='AA0' and Length("ItemCode") =8%,padr 0=5>`

Description	If the description is to be generated, define with placeholders: `hello world` → In description field this text would be entered.

Start and End script tab

© 2026 Boyum IT Solutions A/S

Field	Description
Script at selection	You can enter a BeasScript to be executed at selection of new item creation. In this way, item number or description can be generated in advance. To cancel the process: return false.
Start-Script	This script is called after clicking the New / Copy button, but before the item is copied. Reading and writing access on the variables: `itemcode_from` from which the item is copied `itemcode_to` target item number ***Example***: `setvar=itemcode_to=11134` The item number is changed. Jump back by `return false` to cancel the process.
End-Script	This script is called after copying. Subsequently BoM or routing positions can be matched. The created item is in variable `itemcode_to` After copying has finished, it jumps back with `return false` having no effect.

back to Generate item overview

3.2.4.2 Warehouse rules

This window lists all the rules you can define to which warehouse, bin code or / and production line the system must use for:

- Quality Control - Transfer process
- Work order

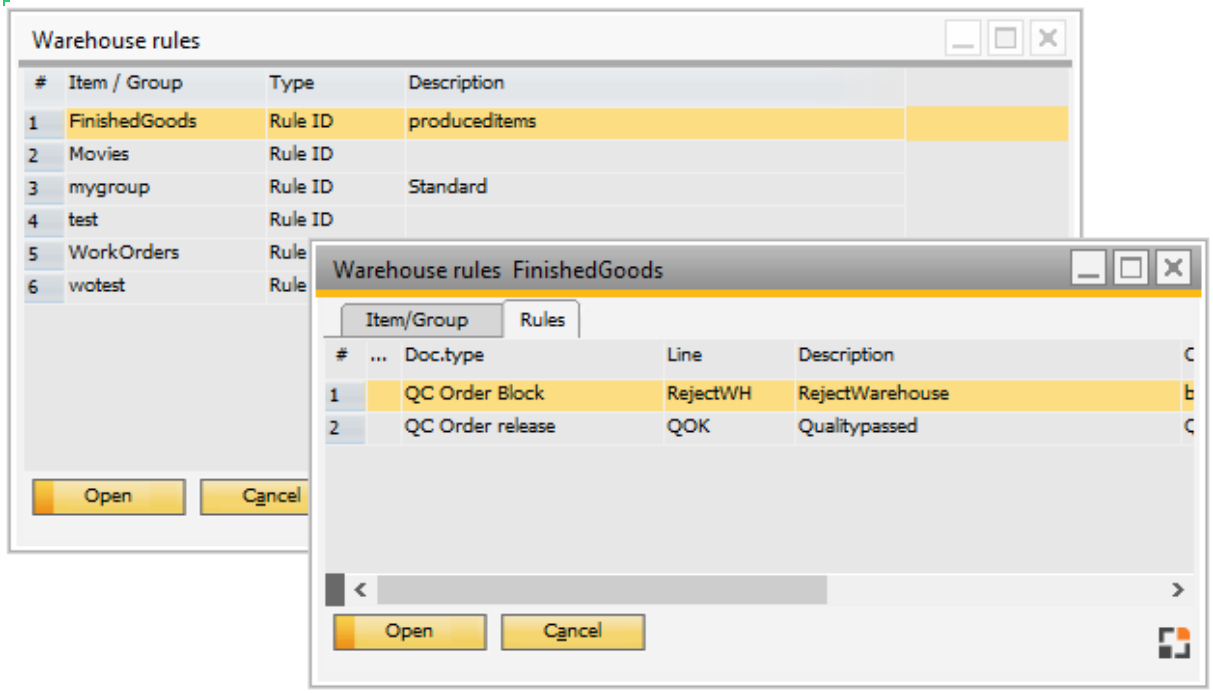
A rule can be defined for

- for one item (if rule only valid for this item)
- as "Rule - ID", if valid for different items. In this case you can define the Rule-ID inside the item master data

VIDEO: Using Warehouse rules in Work orders:

© 2026 Boyum IT Solutions A/S

PATH: Administration > Setup > Inventory > Warehouse rules



Window bin_owhs_bindefine_browse.psr, bin_owhs_bindefine_edit.psr

Item/Group tab

Field	Descripton
Type	Select type: Item number or Rule ID
Rule ID/Item Number	- **Rule ID**: You can create a rule group for an item, referring only to this item. Or, define a group rule and store in the item. ***See*** Edit item – Inventory data. - **Item Number**: With this selection, the rule is linked to the specified item code. The item rule has a higher priority. For editing, you need the authorization to edit items. ***See*** Authorizations.
Description	Free text.

Rules tab

In this Tab you can see all defined rules.

A rule has 3 Areas:

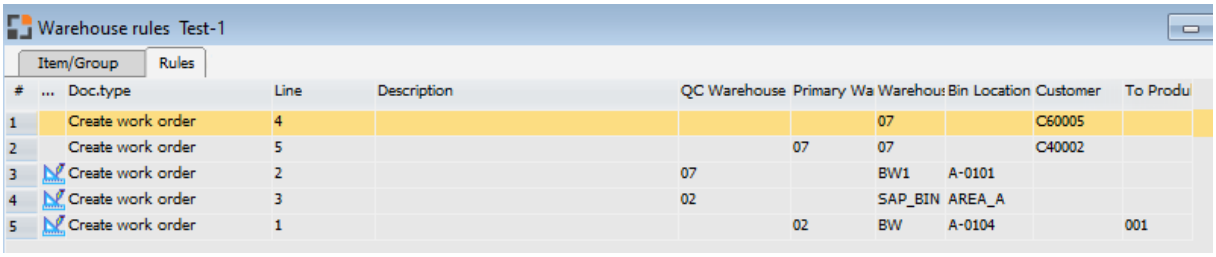
- The Description (Line, Description, Image, Color)

- The Definition when the system has to use it (for Doc.Type, QC/Sales order Warehouse, Primary Warehouse)

© 2026 Boyum IT Solutions A/S

- The Warehouse/Bin code which the system has to use if the Rule is valid.

It is possible to define more than one Rule inside one Warehouse rule.
The system checks the rule line by line from top to bottom, and uses the first valid rule.
You can change the order of rules with Drag and Drop.



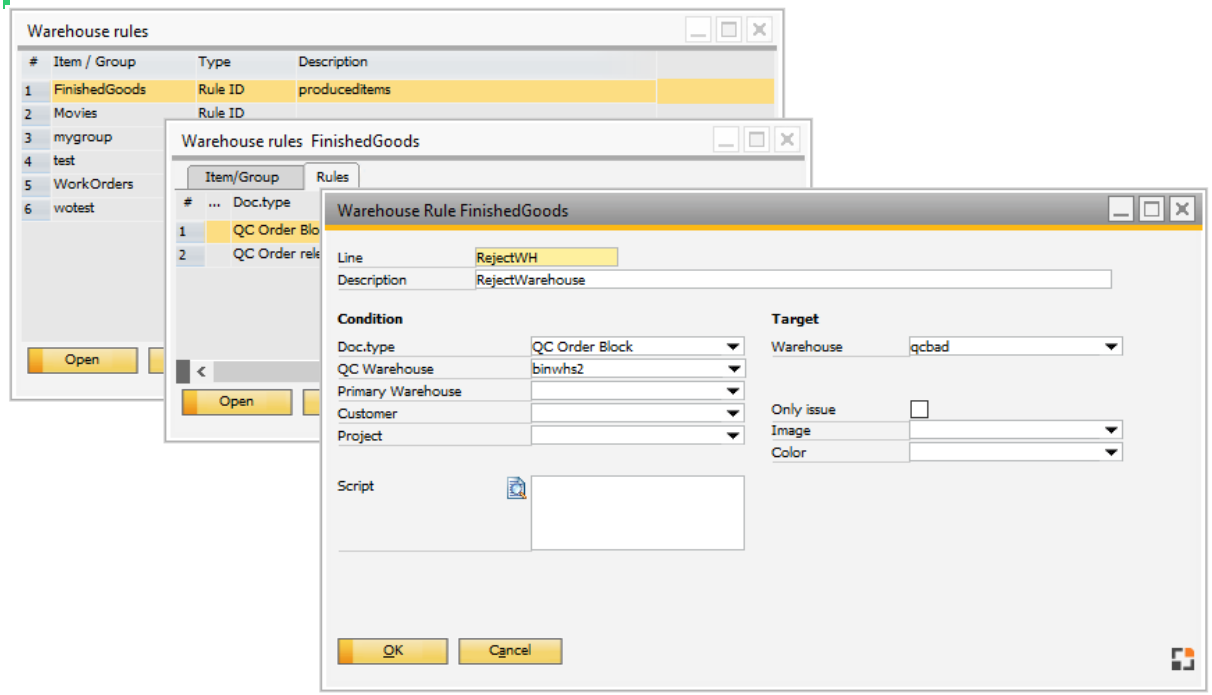
bin_owhs_bindefline_browse

For more information ***see*** Field Descriptions.

3.2.4.2.1 Warehouse rules - Edit

In this window you can edit warehouse rules.

PATH: Administration > Setup > Inventory > Warehouse rules > Rules tab > **Open/Add** an entry > Rules tab.



Window bin_owhs_bindefine_edit.psr

© 2026 Boyum IT Solutions A/S

VIDEO: Using Warehouse rules in Work orders:

Rule description – Condition

Field	Meaning
Line	Line Number (or identity for this line)
Description	Description of rule group. Displayed in various windows.
Doc. type	Rule applies for the displayed document type. Document types **QC-order Release**: QC-Order – Release goods via transfer. ***See*** QC-transfer. **QC-order Block**: QC-Order – Block goods via transfer / issue. **Create work order:** The field "Origin Warehouse" is displayed. (***see*** below)

Origin Warehouse	Define source warehouse
	From Sales order and Pre Invoices
	Empty: Ignore the warehouse from sales order.
	Defined: Use this rule only if the same warehouse is defined as in the used sales order.
	
	For sub assemblies:
	Empty: Ignore
	Defined: Use this rule only if the same warehouse is defined as in Bill of Materials.
	
	Example
	`Assembly A`
	`  Bill of Materials B (order related Assembly) on Warehouse 07`
	
	The system must create a work order position for order-related sub-assembly "B" and checks all warehouse rules, on which this field is empty or "07".

© 2026 Boyum IT Solutions A/S

Primary warehouse	Default warehouse for the item. Rule applies only if the warehouse defined here matches the standard item warehouse. ***See*** Item master – Inventory data.
Customer	Rule applies only for given customer.
Project	Rule applies only for given project.
Only with QC	If active, the rule applies only if a QC-order was stored. Affects only document type "production create new". If enabled, the rule applies only if in work order position a QC order was stored.
Image / Color	Icon and color for this entry.

Rule execution – Target

Field	Meaning
Warehouse	Which warehouse to use.
Bin location	Which bin location to use. Beas/SAP/WMS Bin managed warehouses supported.
Production Line	Define WMS production line that can be linked to work orders. Field is only visible when Document type is **Create work order**. **Automatic assignation:** The WO position is updated automatically if this linked field is changed. ***See*** also Warehouse Master, Resource Master.
Script	Use script for a more precise definition. ***See*** Script.

Script

Available variables

Variable	Meaning
`e_itemcode`	Item number
`e_cardcode`	Business partner
`e_fromwhscode`	Source warehouse, e.g.

© 2026 Boyum IT Solutions A/S

	- QC warehouse at transfer - Warehouse from Sales order - Warehouse from related Bill of Material position, if order related assembly
e_doctype	The document type: WONEW -> Work order Main assembly WOSUB -> Work order Sub assembly

You can define the following variables:

Variable	Changeable	Meaning
rule.whscode	x	Target warehouse
rule.bincode	x	Bin location
rule.description		Description
rule.onlypostout	x	For QC-transfer:1 = only issue, 0 = transfer (eg. at QC order - transfer)
rule.wms_prodline	x	Production line (only if WMS is installed)

Example:

Use always same warehouse as target warehouse

```
// in rule.whscode the current warehouse is saved. Overwrite self, then the
system take it.
setvar=rule.whscode=<e_fromwhscode>
```

For sub-assembly always use the warehouse defined in Bill of Materials

```
if <e_doctype> = WOSUB then
  setvar=rule.whscode=<e_fromwhscode>
end if
```

As warehouse, always use the origin warehouse of the main assembly

```
if <e_doctype> = WONEW then
  setvar=rule.whscode=<e_fromwhscode>
end if
```

Transfer always to warehouse 02-005, if linked to business partner C001

```
if <e_cardcode> = C001 then
  setvar=rule.whscode=02-005
end if
```

If a work order is created from a sales order, use the warehouse stored at the moment

© 2026 Boyum IT Solutions A/S

```
// 139 = customer order
// item 38 = the grid, col 24 = warehouse field
if  <sys_formtypeex> = 139 and <itemuid> = 38 then
  setvar=rule.whscode=<item.38.col.24>
end if
```

If a work order is created from a sales order to production order screen, use the warehouse stored at the moment

```
if  <form.name> = fert_kdauftrag_zu_fertauftrag then
 setvar=rule.whscode=<e_fromwhscode>
end if
```

Remove: Right-click function to delete the current warehouse rule.

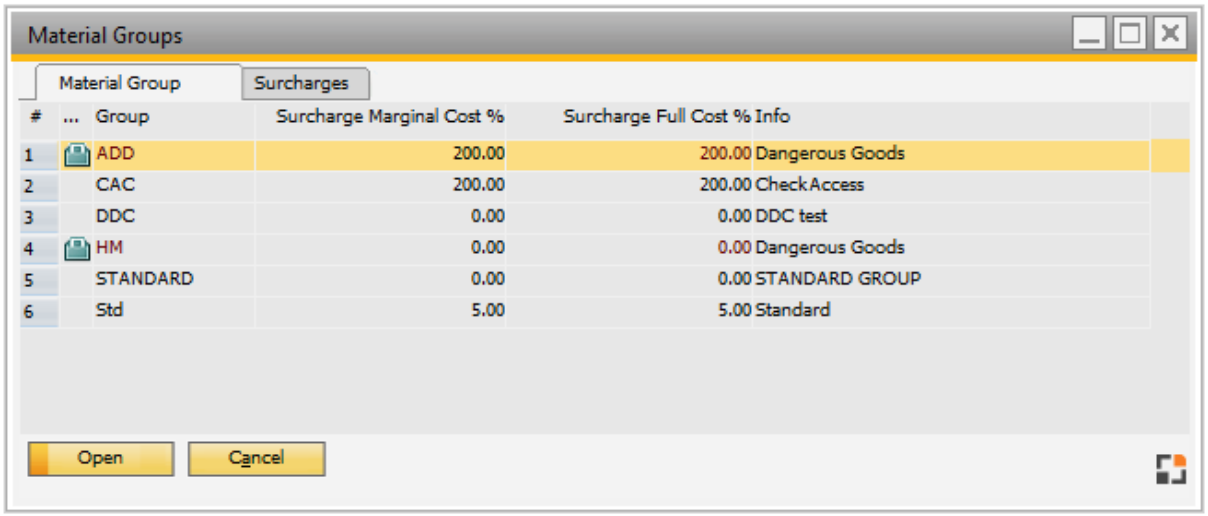
3.2.4.3 Material Group

Items can be arranged through material groups. In the material groups, the material surcharges and group specific surcharges can be stored for the calculation.

MASTER DATA SETUP: Material Groups must be created before they are assigned to items.

PATH: Administration > Setup > Inventory > Material Group

ALTERNATIVE PATH: Item master data extended screen > Click on the list button right next to Material Group field



Window basis_materialgruppe_browse.psr

Description of tab

Tab	Description
Material Group	List of all defined material groups. For field descriptions ***See*** Edit material group.
Surcharges	Calculation schema-dependent surcharge management .

© 2026 Boyum IT Solutions A/S

Material Group tab
Surcharges tab
Data record selection

3.2.4.3.1 Material Group tab

In this window properties of the material group are displayed. It is a dynamical window, and UDFs are supported.

PATH: Administration > Setup > Inventory > Material Group.

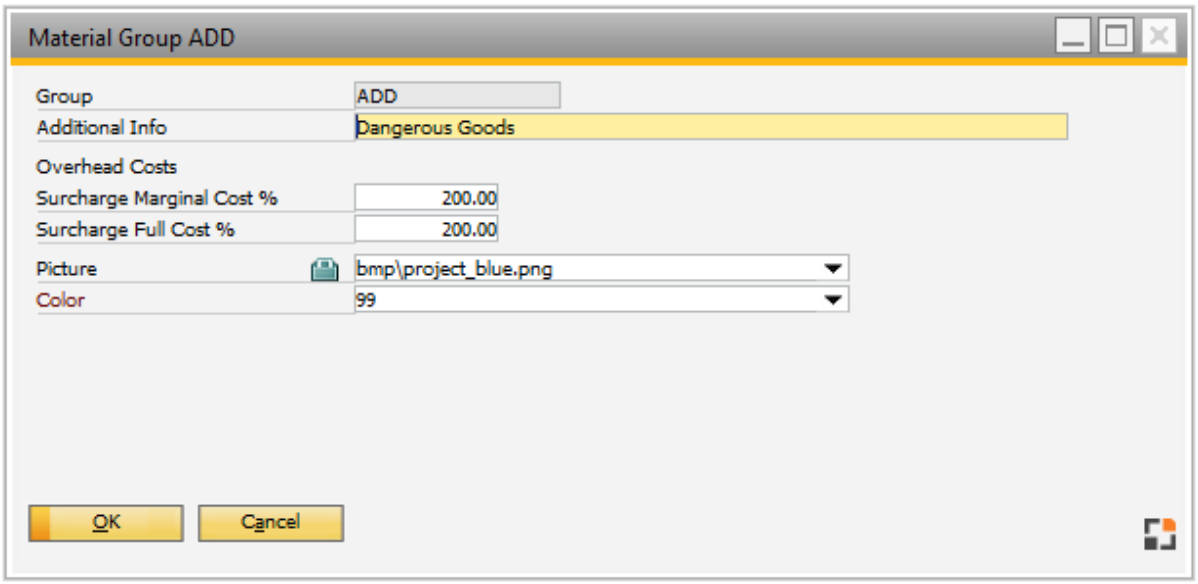
Surcharges

3.2.4.3.1.1 Edit material group

Material groups are edited here. For further information ***see*** Material group

PATH: Administration > Setup > Inventory > Material Group > **Open** an entry.



Window basis_materialgruppe_edit.psr

Field	Description
Group	Unique ID of the material group.
Additional Info	Any additional information or description of the group.
Surcharge Marginal Cost %	Surcharge on the material marginal cost rate – can be identified separately e.g. in calculation.
Surcharge Full Cost %	Surcharge on the material full cost rate – can be identified separately e.g. in calculation.
Image	Icon (displayed in selection windows).
Color	In the selected color the material group will be displayed in lists.
UDF1...UDF4	Up to 4 additional entry fields are available. For setup ***See*** Configuration wizard – Master data – Material group.

© 2026 Boyum IT Solutions A/S

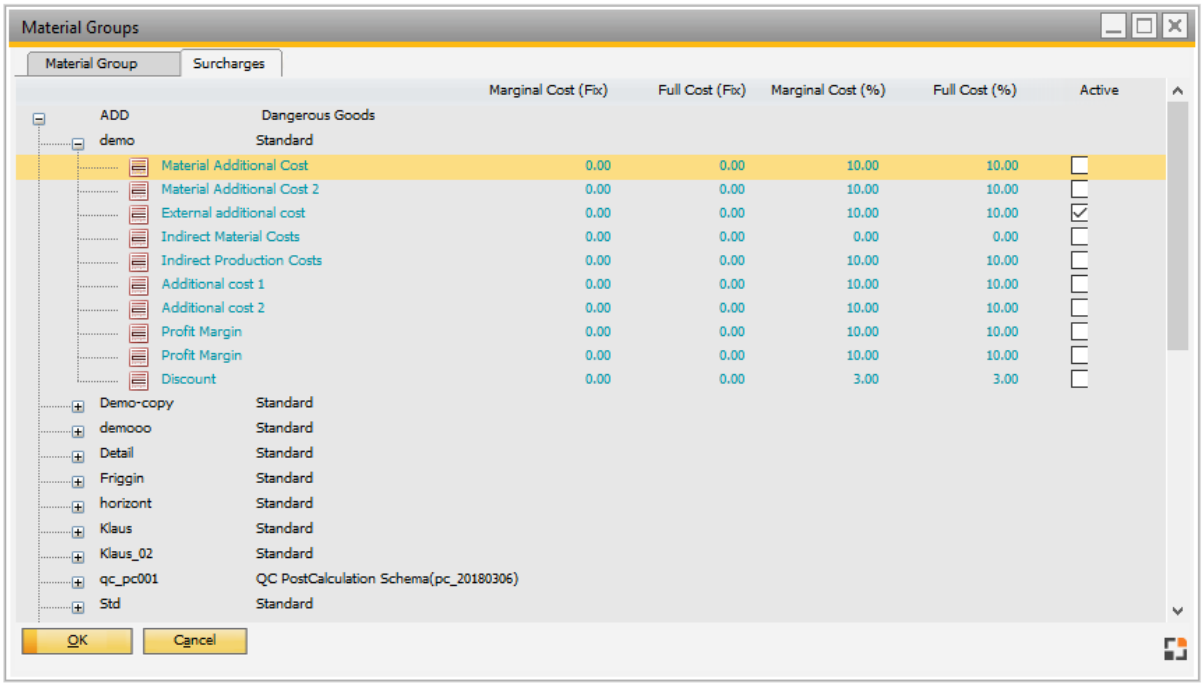
3.2.4.3.2 Surcharges tab

For every calculation schema different material group-dependent surcharges can be defined for each surcharge object.

Once the "Active" check mark has been set for an entry, the values stored there are used, otherwise the values as per the calculation schema are considered.

Under "Detail" you can store accounts, depending on the material group.

PATH: Administration > Setup > Inventory > Material Group > Surcharges tab.



Window basis_materialgruppe_zuschlag.psr

Field Description

Field	Description
Marginal costs (fixed)	Fixed surcharge at marginal costs.
Full costs (fixed)	Fixed surcharge at full costs.
Marginal costs (%)	Surcharge on the marginal cost rate.
Full costs (%)	Surcharge on the full cost rate.
Active	If active, the surcharge defined for this material group is used.

3.2.4.4 Units of measure

The SAP Business One window called "units of measure" is opened.

Here you can define all UoM Codes. For more information see SAP documentation.

NOTE: UoM Code and UoM Name must always be identical.

Consequently, it is only possible to modify an existing UoM by deleting it first, and creating a new Code and Name!

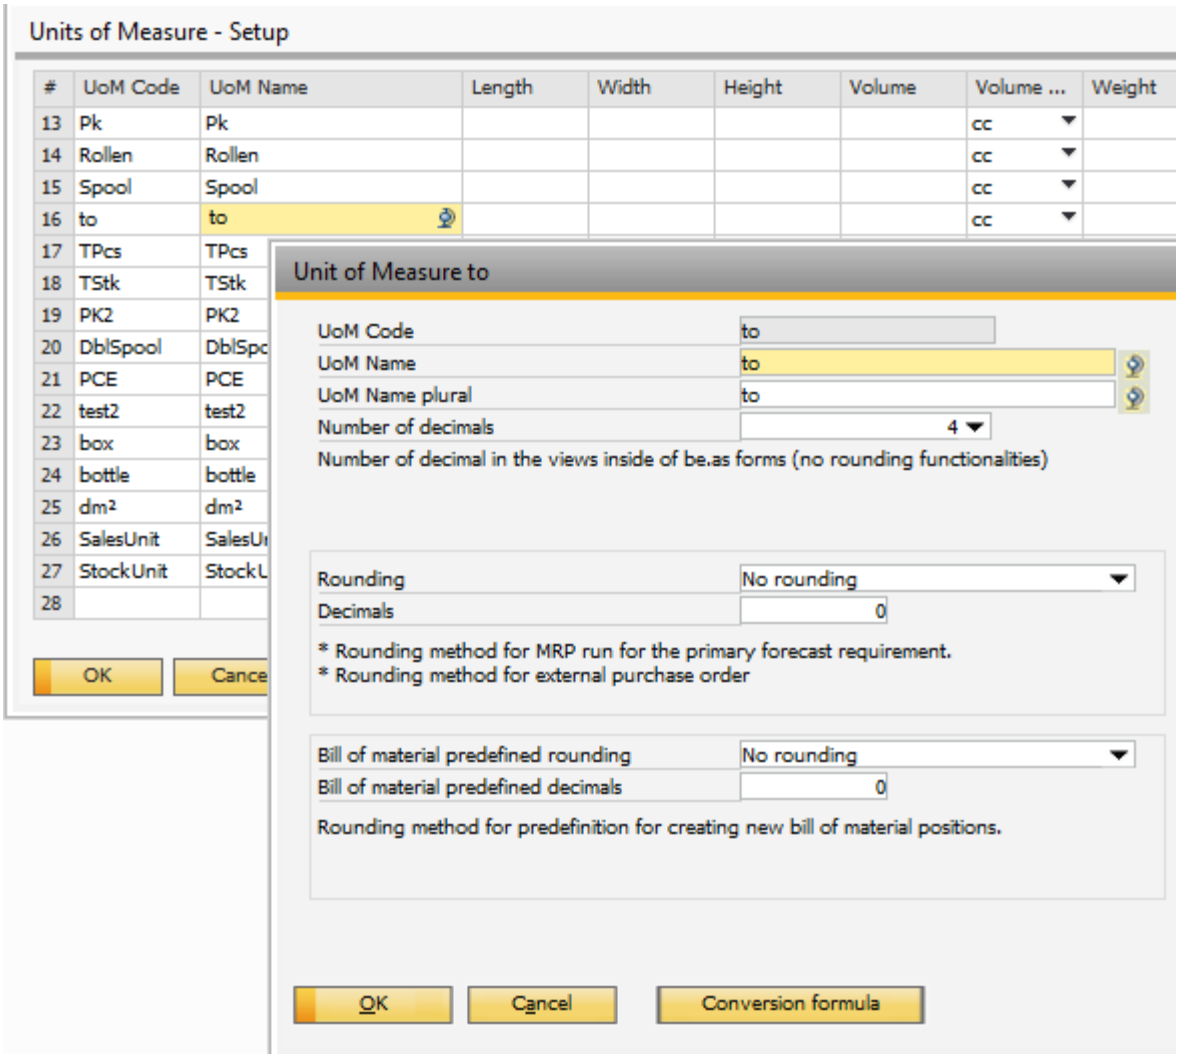
See Concept of UoM

If Beas is started without SAP Business One, the Beas – window units of measure opens.

Administration of units of measure in Beas and SAP Business One uses the same data; it is always synchronized.

In the Beas – screen additional information can be stored. Accessible: in SAP Business One – window use **right-click > extended.**

© 2026 Boyum IT Solutions A/S



PATH: Administration > Setup > Inventory > Units of Measure.

See

[General settings – View – Decimal places]

[Edit units of measure]

[Precalculation pricing]

- The following units of measure are available in Beas:

Type	Description
Inventory UoM	For storing goods and counting at inventory and display in [inventory history] *(Field OITM.InvNtryUom)*
Production UoM	This is the production Unit.

© 2026 Boyum IT Solutions A/S

Type	Description
	Every quantity in Bill of materials and work order position is stored in production unit. Conversion between production unit and inventory unit is defined in the Conversion. Note: In BoM you can define a separate Input Unit. In this case the system calculates the production unit from input unit and the inventory unit from production unit *(Field OITM.U_me_verbr)*
Sales UoM	Used for offers, customer orders, delivery note, invoice and all other documents in area Sales. *(Field OITM.SalUnitMsr)*
Purchasing UoM	Used for purchases, delivery, purchase invoices. *(Field OITM.BuyUnitMsr)*
Inventory Counting UoM	Unit for stock counting. Currently not supported by Beas. *(Field OITM.CntUnitMsr)*
Input UoM	In the Bill of materials window you can define an own UoM. From this Unit the system calculates the production UoM and from this the inventory UoM.

The warehouse unit is always used for postings. If a posting is done through Beas, you have the option to enter the quantity in consumption units or in warehouse units.

- Extended functions in SAP Business One environment.

Restrictions:
SAP Business One allows a subsequent change of the unit ID and description. In the item the description is saved, not the ID. Because Beas connects the ID with additional information, for example with rounding function, the ID and description need to match in SAP Business One.
In SAP Business One it is also possible to change existing unit ID. For example, "kg" can be changed to "ton". All existing items originally stored in "kg" are then stored in "tons". Inventory would change from 10 kg to 10 tons.

This is why there are restrictions in Beas:

© 2026 Boyum IT Solutions A/S

Description and ID of the unit must be the same. IDs may not be changed subsequently.

Available extended functions

Extended: calls the extended features of Beas. ***See*** Edit units of measure.
Conversion: conversion formulas between warehouse unit and consumption unit. ***See*** conversion.

- View Beas without SAP Business One.

A dynamically adjustable list opens. ***See*** window settings.
All stored units of measure are displayed.

Edit: open extended settings, defined in Beas ***See*** Edit units of measure.
Extended: opens the SAP Business One - window for units of measure.

(window basis_me_browse)

3.2.4.4.1 Edit units of measure

PATH: Administration > Setup > Inventory > Units of Measure.

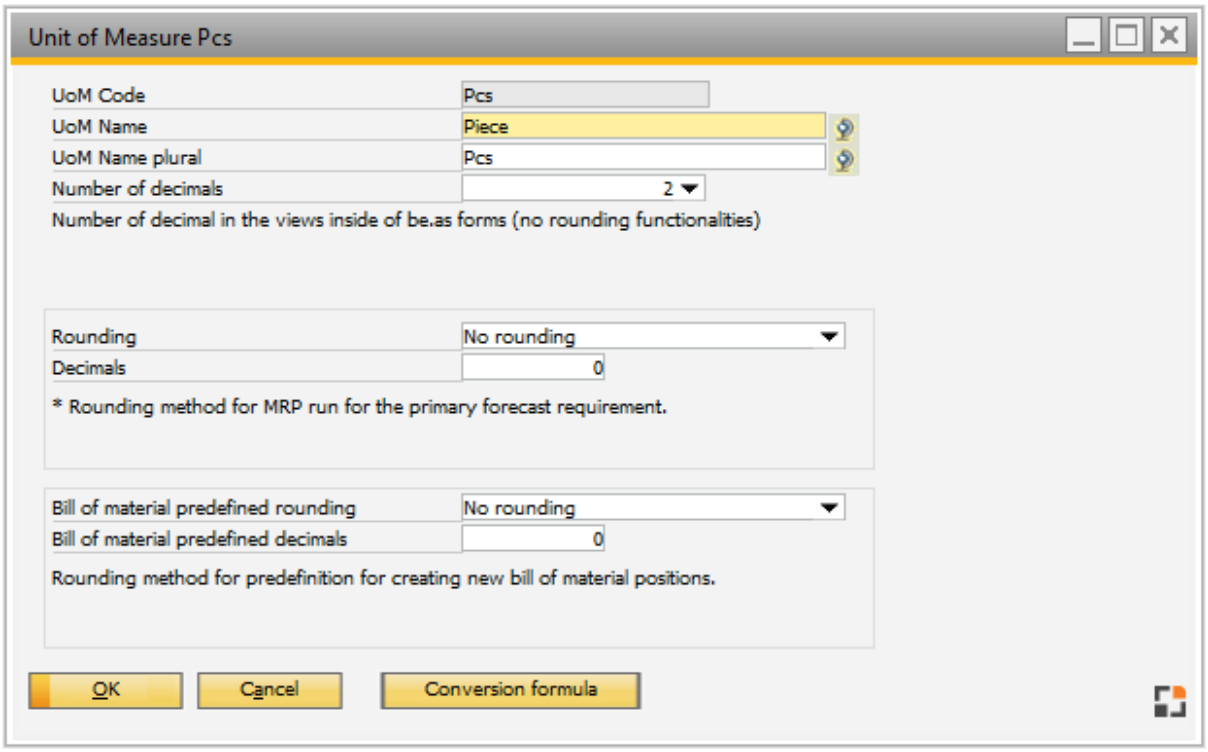
Additional details for units of measure can be defined here. The window can be called up from **SAP B1 unit of measure > right-click > Extended** or via beas **units of measure list > extended.**
This is an extension of SAP B1; no deletion is possible. To delete, use SAP Business One – units of measure.

For more notes on units of measure ***See*** Units of measure.

Function	Description
Extended	Call up window SAP Business One – Units of measure.

PATH: Administration > Setup > Inventory > Units of Measure > right-click an entry > **Extended** .

© 2026 Boyum IT Solutions A/S



Window: basis_me_edit

Field definition

Field	Description
UoM Code	Name code of the unit of measure. This field supports Unicode characters.
UoM Name	Name of the unit in singular form(can be used for report printouts)
UoM Name plural	Name of the unit in plural form (can be used for report printouts)
Number of decimals	Defines the number of decimals displayed for the UoM. In Beas, numbers are always formatted according to the Windows settings (**Control Panel > Regional Settings**), since all beas fields are input fields conforming to Windows. **Important:** This is not a rounding for calculation. These settings are used for display purposes only. Therefore, if the number of decimal

© 2026 Boyum IT Solutions A/S

	places has been set to 4 digits in Beas, but it has been set to 2 digits in SAP Business One, then 4 digits are displayed on the screen, but the transaction is posted using only 2 digits. **Example:** kg = 2 decimal places Inventory = 1.523 kg, in Beas area an inventory of 1.52 kg is displayed Inventory = 1.553 kg, in Beas area an inventory of 1.56 kg is displayed **It is a pure display setting in Beas forms**. Beas essentially works with 6 decimal places and posts with the number of decimal places configured in **SAP > Administration > System > General Settings > Display** under Decimal Places.
Rounding	Define Rounding for special Areas This defines the Rounding Method for • MRP run for the primary forecast requirement • external purchase order (field quantity), *(beas 9.3 PL 1)*
Planning decimal places	Determines rounding for forecast in MRP Note: The available rounding types are: • Rounding at .5 • Round up: always round up • Round off: always round down • No rounding ***Forecast Scheduling Example***: Scheduling: 50 pieces are scheduled for the current month and today is the 20th day of the month. Results in a requirement of 50 : 30 days/month * 20 = 33.3333 When planning decimal places, the number of decimal places is specified and the type of rounding is specified during rounding.

© 2026 Boyum IT Solutions A/S

	Rounding Examples: Requirement 33.33 with 1 decimal place Commercial: 33,3 round up: 33,4 round down: 33,3 Requirement 33.45 with 0 decimal places Commercial 34.0 Round up 34.0 Round down 33.0
BoM default rounding	Determines the rounding default to be used for this UoM when creating a new Bill of material position. BoM items can be stored in any unit of measure. A rounding definition can be stored in BoMs. Here you can specify the rounding default to be used for this unit of quantity when creating a new BoM position. Rounding affects the total result – computed per warehouse unit, not per piece or consumption unit. ***Example*** Requirement 0,03 per piece Rounding: multiple = 1 Production: 30 pieces = 0,03 = 30 = 0,9 Requirement = multiple of 1 = 1 Pcs Available rounding methods: commercial round up round down multiple of no rounding Requirement 33.33 1 decimal

© 2026 Boyum IT Solutions A/S

	commercial : 33.3 round up: 33.4 round down: 33.3 Requirement 33.45 0 decimal commercial 34.0 round up 34.0 round down 33.0 Compute multiples Multiple = 1 0.5 = 1 0.7 = 1 1.1 = 2 Multiple = 2 0.5 = 2 0.7 = 2 1.1 = 2 2.0 = 2 2.1 = 4
BoM default decimal places / multiple of	Defines the decimal place to be set per inventory unit, not per piece or consumption unit. If "multiple of" is selected, the factor is specified here.

3.2.4.4.2 Conversion

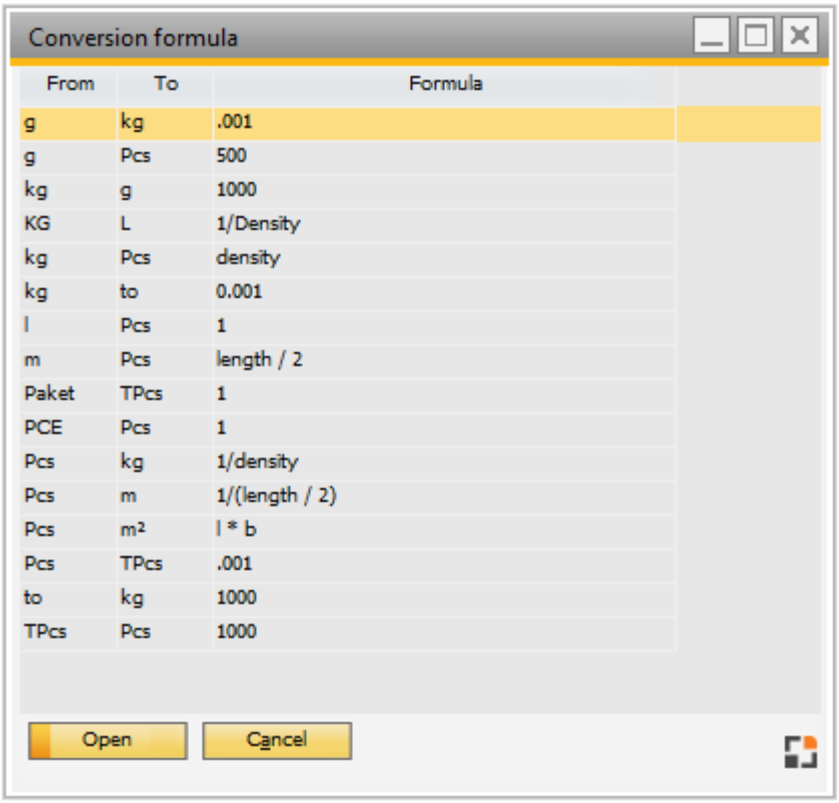
In the Conversion form you can define the formula for conversion between Production UoM and Inventory UoM.

In different places the system checks the conversion formulas to calculate the factor between 2 units.
Not supported: Sales UoM, Purchase UoM, Inventory counting UoM

Please define all formulas in both access, for example kg > Pcs and Pcs > kg.

© 2026 Boyum IT Solutions A/S

PATH: Administration > Setup > Inventory > Units of Measure > right-click an entry > **Conversion** /

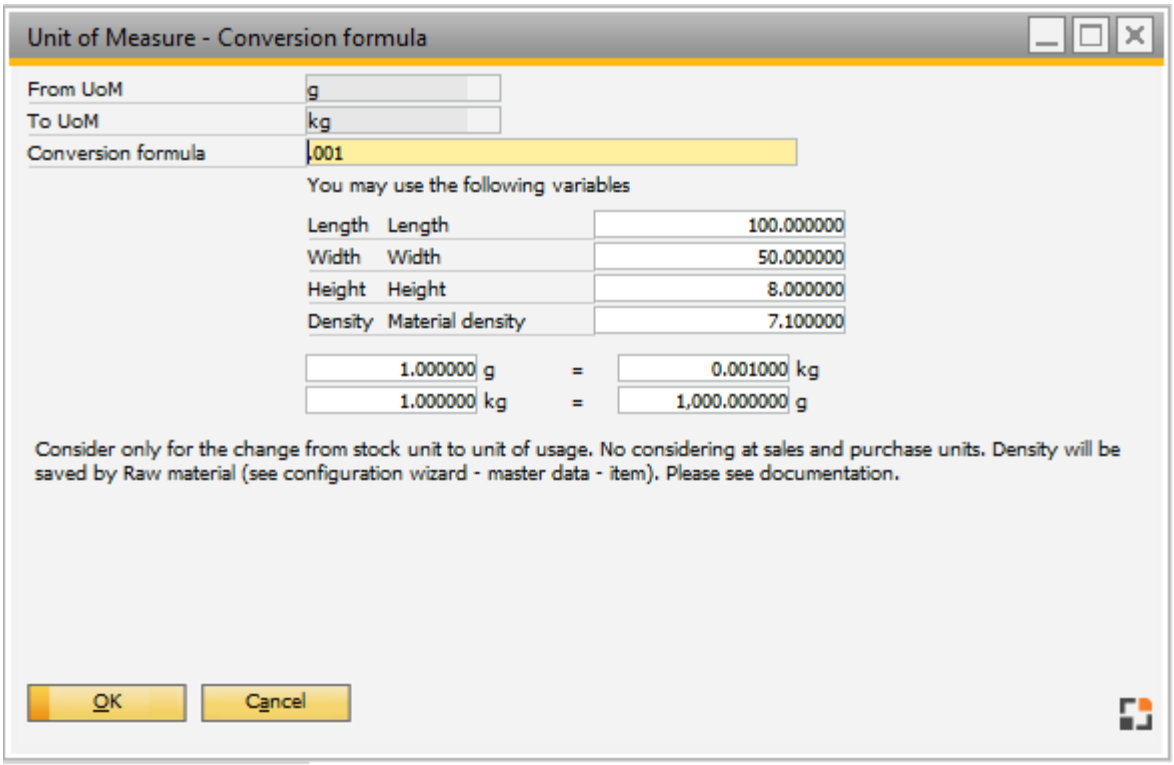


Window basis_meumr_browse.psr

Click **Open** to access the Conversion formula Editing window.

PATH: Administration > Setup > Inventory > Units of Measure > right-click an entry > **Conversion** / > **"Open"**.

© 2026 Boyum IT Solutions A/S



Window: basis_meumr_edit

When using extended conversion formulas:

Conversion takes place in the so-called data window syntax.

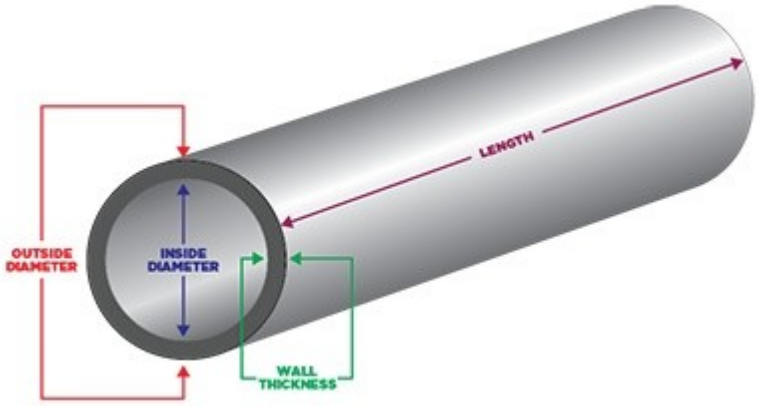
IMPORTANT: When an UoM Group is defined for an item, the UoM Conversion is applied based on SAP definitions and NOT the conversions defined in Beas.

- Example: Pipe in a Bill of Materials Position

  Inventory UoM is kg

  Consumption is Pcs with length, height and width.

© 2026 Boyum IT Solutions A/S



Formula:

```
((length *  od * pi()^2)  - (length * id * pi()^2) ) * density
```

For more information ***see*** Unit of Measures.

- Available variables

You can use properties for calculation of the factor between both units. The following properties are available:

length width, od height, id	Length, Width, Height in Bill of material: Use information from this position in Item master data: Use information from purchase area Note: The system ignore the UoM from length/widt/weight You must use always same UoM, example mm
density	Density according to the raw material. If set in the options: The item master determines density and hence the density used is in accordance with the item master data. ***See*** Item master – specific weight Configuration Wizard – Master data – Item – specific weight Raw Material

In Variant generator, unit of measurement calculation and in other areas for formulas DataWindow-Syntax is used. This is to give a short overview of available functions. Further

© 2026 Boyum IT Solutions A/S

details ***see*** online Powerbuilder-descriptions.

Mathematical symbols (operators)

Mathematical symbols (operators)	
+	Addition (numbers) or consolidation (characters)
-	Subtraction
*	Multiplication
/	Division
^	Power

Auxiliary symbols

(	Left parenthesis
)	Right parenthesis
.	Decimal separators **(all nationalities !!!)**

- The formula must be logical, '('must be followed by')' etc.
- Any level of nesting is permitted.

Numeric functions

abs	Absolute – removes the sign	abs(-3) = 3 abs(3) = 3
ceiling	Return of the next higher integer	ceiling(-4.2) = 4 ceiling(-4.8) = 4
cos	The angle (in rad) for which the cosine should be calculated	cos(0) = 1 cos(1) = 0.540302
exp	The power for the exponential e (2.71828)	Exp(2) = 7.3890560989
fact	Value for the faculty	fact(4) = 24 fact(0) = 1
int	Rounds down to the next integer	int (3.8) = 3 int (-3.2) = 4
log	Calculates the natural logarithm of a number	log(10) = 2.302585092
logten	Calculates the logarithm to base 10	logten(10) = 1
mod	Calculates the remainder of a division	mod(20, 6) = 2 mod(25, 4.5) = 2.5
pi	Multiplies Pi by the specified number	Pi (1) = 3.14159265

© 2026 Boyum IT Solutions A/S

Border	Random number between 1 and specified number	rand(20) = 1 ... 20
round	Rounds the number from the specified position	round(3.333,2) = 3.33 round(3.335,2) = 3.34 round(324,-2) = 300
sign	Calculates whether the number is negative, zero or positive. (by checking the sign)	sign(5) = 1
sin	Calculates the sine of an angle	sin(1)=0.84147098
sqrt	Calculates the square root of a number	sqrt(2) = 1.414213562
tan	Calculates the tangent of an angle	tan(1) = 1.55741
truncate	Reduces a number to the specified places	truncate(9.22, 1) = 9.2 truncate(9.28, 1) = 9.2

Logical formulas

Beas also permits the use of logical formulas with the following structure:

```
if ( logic , value by true , value by false)
```

e.g.

```
if ( red = blue , 3.34 * x , 0 ) + (x * 2)
```

Logical characters and functions

=	Both values are identical	Price = 100
>	Left value greater than right value	Price > 100
<	Left value smaller than right value	Price **<** 100
<>	Left value is not right value	Price <> 100
>=	Left value greater than or equal to right value	Price >= 100
<=	Left value smaller than or equal to right value	price <= 100
NOT=	Left value is not right value	Price **not =** 100
LIKE	Left value is part of right value	Name **like** 'C%'
IN	Left value contained in right list	Price **in** (100,200,300)
BETWEEN	Left value is in the range of	Price **between** 1000 and 2000

© 2026 Boyum IT Solutions A/S

NOT LIKE	Left value is not in right value	Price **not like** 'C%'
NOT IN	Left value is not in right list	Price **not in** (100,200,300)
NOT BETWEEN	Left value is not in range	Price **not between** 1000 **and** 2000

LIKE works with placeholders:

% Any number of characters

_ Any single character

Example:

'c%' corresponds to any string beginning with c

'c_' corresponds to any string beginning with c and containing one additional arbitrary character

Logical links with "if"

Conditions can be linked with AND and OR as well as with NOT AND/OR:

```
if ( x = y and x = z ,1,0)
if ( x = y or x = z,1,0)
if ( x = y and not x = z,1,0)
```

Logical formulas with "case"

With **case** different results can be returned depending on a condition.

```
case ( column when value1 then result1 { when value2 then result2
   { ... } } { else resultelse } )

case (marriage_status when 'S' then 'Single' when 'M' then 'Married' else 'Unknown')
```

Working with characters (strings)

Characters can be processed.

Characters are combined through +

```
a = "Adam"
b = "Eve"
a + " " + b = "Adam Eve"
```

The beginning and end of a string must be identified.

The following identifier fields are permitte:

" "Hello World"
' 'Hello World'
[.] [Hello World]

© 2026 Boyum IT Solutions A/S

The use of identifier fields in string fields is permitted if the string begins with a different identifier field:

"[Hello] 'World'" Result: **[Hello] 'World'**

There are many character editing functions:

fill	Returns a filled string	fill("*"),3) = "***" fill("-+"),5) = "-+-+-"
left	String that is truncated at the right	left("hello world,6)="hello "
lefttrim	String that is truncated at the right and has blank spaces removed	leftright("hello world,6)="hello"
len	Return of number of characters in a string	len("hello") = 5
lower	Swaps uppercase letters in a string for lowercase letters	lower("Hello") = hello
match	Checks characters used (for more information, see Sybase Infomaker)	match("A","^[A-Z]) = true
mid	Returns the specified part of a string	mid("Hello",2,2)= "al"
Pos	Returns the position of a given string in the first string	pos("Hello","l") = 3
replace	Replaces a string in another string	replace("David", 4, 2, "e") = "Dave"
right	String which is truncated at the left	right("hello world",5)=" world"
righttrim	String which is truncated at the left and has blank spaces removed	righttrim("hello world",5)="world"
space	Returns specified number of spaces	space(5)=" "
string	Converts a number, date, character into a formatted string. Observes international settings in doing so.	string(5.2344,"#,#0.00") Germany: "5,23" USA: 5.23
trim	Removes the spaces left and right	trim(" hello ") = "hello"
upper	Swaps lowercase letters in a string for uppercase letters	upper("Hello ") = "HELLO"
wordcap	Converts first letter into a capital letter and the remainder into lowercase letters.	wordcap("boston, MASSACHUSETTS") = "Boston, Massachusetts"

Used for ***example*** in

Variant generator - Formulas
Work order structur view - Adaptation

To provide a better overview, sample values are listed for the available placeholders incl. conversion between the two units in both directions.

Field definition

From UoM	Conversion of UoM (unit of store)
To UoM	Conversion to UoM (consumption unit)
Conversion Formula	Conversion formula between both units. Add mathematical operators or functions. ***See*** Properties and Syntax
In the lower part of the screen you can see a two-way conversion calculation based on the conversion formula.	
length, width, height, od, id,	Dimension defined by the item. The value is retrieved from the item master data in SAP. The value shown on the screen is only an example to allow testing.
Density	Dimension defined by the item to be used as a conversion factor. This option is used when the conversion is not fixed as, for example, kilogram to gram. In this case, we use variables. As Purchase and Sales units have a conversion factor in SAP, in Beas we can use the density variable to define a factor to convert from inventory unit to the bill of material unit. Density can be defined using the raw material field or the specific weight field from the item master data. Only one option is available and it depends on a parameter from the Configuration wizard > Item > Spec. Weight by Item.
Number unit 1	Conversion from unit 1 to unit 2
Number unit 2	Conversion from unit 1 to unit 2

See

3.2.4.4.3 UoMNames

Type	Description
Inventory UoM	For storing goods and counting at inventory and display in inventory history *(Field OITM.InvNtryUom)*
Production UoM	This is the production Unit. Every quantity in Bill of materials and work order position is stored in production unit. Conversion between production unit and inventory unit is defined in the Conversion. Note: In BoM you can define a separate Input Unit. In this case the system calculates the production unit from input unit and the inventory unit from production unit *(Field OITM.U_me_verbr)*
Sales UoM	Used for offers, customer orders, delivery note, invoice and all other documents in area Sales. *(Field OITM.SalUnitMsr)*
Purchasing UoM	Used for purchases, delivery, purchase invoices. *(Field OITM.BuyUnitMsr)*
Inventory Counting UoM	Unit for stock counting. Currently not supported by Beas. *(Field OITM.CntUnitMsr)*
Input UoM	In the Bill of materials window you can define an own UoM. From this Unit the system calculates the production UoM and from this the inventory UoM.

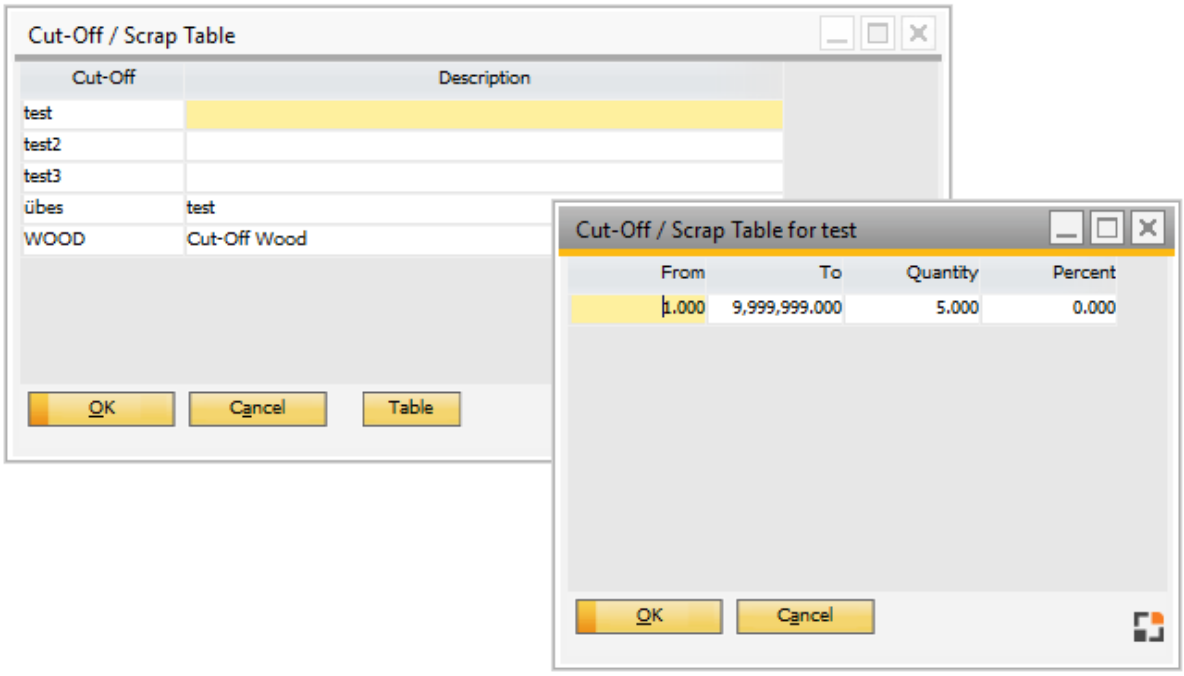
3.2.4.4.4 Cut-off

Scrap can be used to define the material loss in production.

Calculation of material loss can be set up in Configuration wizard – scrap quantity.

PATH: Administration > Setup > Inventory > Cut-Off > **Table**.

© 2026 Boyum IT Solutions A/S



stamm_verschnitt_browse, stamm_verschnitt_werte_browse

see concept: Cut off / Scrap.

Any number of scrap tables can be defined and allocated to the individual assemblies.
he scrap information depends on the quantities and can cause a percentage or quantity value.

Note:
Cut-Off is only considered in the production and material requirements calculation or MRP run, but not in the precalculation.

Field Description

Field	Description
Cut-Off	Unique ID.
Description	Long Description.

Field description of the scrap position

Field	Description
From	From quantity in production unit
To	To quantity in production unit

© 2026 Boyum IT Solutions A/S

Quantity	Surcharge quantity as value in production unit
Percent	Surcharge quantity in percent .

Functions

Function	Description
Add	Add new line to the Cut-off/Scrap table.
Remove	Remove selected line from the table.
Refresh window	Refresh window after changes.
Duplicate	Duplicate entry.
Table	Opens the scrap position table (***see*** image and field descriptions above).
Copy	Copy text.
Insert	Insert text from clipboard.

see

Option consider scrap

Video: Scrap on Item Level

3.2.4.5 Raw Material

The raw materials of an Item can be stored here. Raw materials serve as information. If different units of quantity are used, the density information can also be read from the raw material.

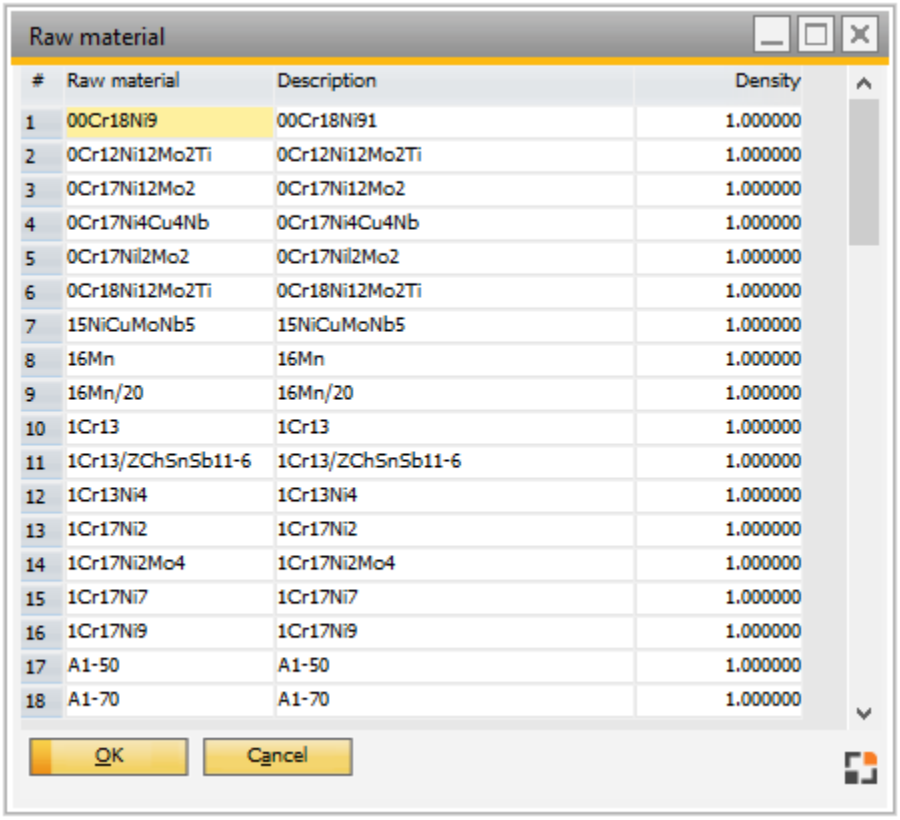
PATH: Administration > Setup > Inventory > Raw material.

Raw Material info defines the raw materials of an item.

In the Raw Material definition you can define the Raw Material Id, the Description, Density, up to 4 Properties and a price.
Access: Edit Raw Material, License: Basic License, Windows setting are supported.

You can define the raw material in the item master data and Bill of materials position.

© 2026 Boyum IT Solutions A/S



Window basis_ wst_ browse.psr

Example for Raw Material:

A sheet of metal is made of aluminum or iron.

A pipe is made of plastic or stainless steel.

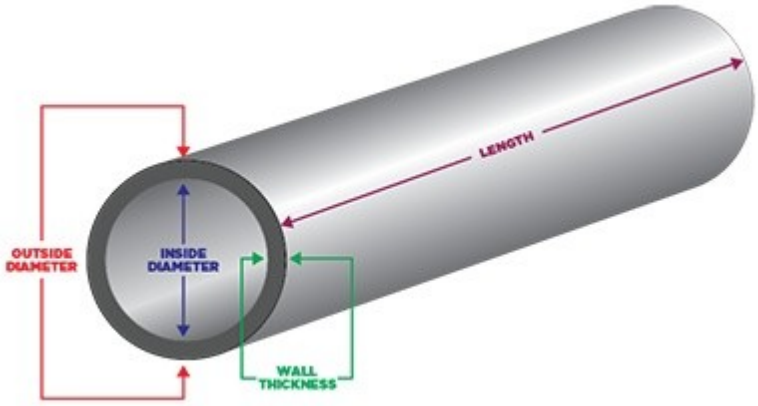
Used for

- Work order Variant system: Define Raw Material by formula.
- Work order Variant system: Define Machine: permitted number of rpm .
- Calculation: Calculate price by Raw Material (own formula system).
- Work order report: Report additional properties for example Melting temperature.
- Conversion between the units of quantity if the density stored in the raw material is required for this. ***See*** Unit of Measurement – Conversion.

Example: Pipe in a Bill of Materials Position

Inventory UoM is kg Consumption is Pcs with length, height and width.

© 2026 Boyum IT Solutions A/S



Formula:

```
((length *  od * pi()^2)  - (length * id * pi()^2) ) * density
```

For more information ***see*** Unit of Measures.

Field Description

Field	Meaning
Raw Material	Raw material – ID.
Description	Description of the material.
Density	Specific density. It can be used e.g. to convert from warehouse unit to consumption unit (weight where applicable). If density is defined in item master, the field is hidden in raw material administration. This is set up in Configuration wizard.
Group	Define Group definition (without additional functionality).
UDF1-4	Define up to 4 UDF's.
Propertie1-4	Define up to 4 Properties.
Price	Define a price.

Several additional fields as UDF, properties, price etc. can be set up via window settings.

see

Data record selection

© 2026 Boyum IT Solutions A/S

3.2.4.6 Manufacturer

PATH: Administration > Setup > Inventory > Manufacturers.

Manufacturers is for information purposes; this field can also be used for searching or sorting. Manufacturers can be defined in this table. This input is identical to the input in SAP Business One.

see

Data record selection

3.2.4.7 Warehouses

The setup function of SAP Business One is called. Thus the field description is the same. Additional functions are accessible through **right-click.**

PATH: Administration > Setup > Inventory > Warehouses.

In this window, define all the general information regarding the warehouses used by your company.

Field	Description
Drop Ship	Attention: This SAP parameter is not supported in Beas Manufacturing.
Nettable	Select this check box if you want the warehouse to be involved in the MRP process.
Address Fields	Enter the address of the warehouse.
Federal Tax ID	Enter the relevant tax ID for this ship-to address. This number is saved in the documents and will be used for calculating the EU Sales Report.
Tax Code	Specify the default tax code for purchasing documents created for items related to this warehouse.
Allow Use Tax	Select this check box to determine whether the shipping address of the warehouse may apply use tax.

Right-click to open the Beas menu:

Menu item	Description
Inventory list : (Warehouse)	Show the stock level of the selected warehouse.
Open documents	Show all documents still open.

© 2026 Boyum IT Solutions A/S

Bin location management Overview	Overview all warehouses.
Extended	Open extended settings.
Delete	Delete entry .
Duplicate	Duplicate entry.

3.2.4.8 Tool Administration

The tools necessary for the production are managed here.

PATH: Administration > Setup > Inventory > Tool Administration.

Tools can be assigned to resources or maintenance sequences, they have an effect on capacity planning.
Tools have a number and a planned capacity, the planned capacity is fixed at 24 hours/day.
A tool can be assigned to a work sequence only as a parallel resource, it also has its own planning calendar and resource utilization information.

For tools, the capacity limit is not considered.
For detailed tab/field descriptions ***see*** Tool Administration.

Training unit 07 Tools

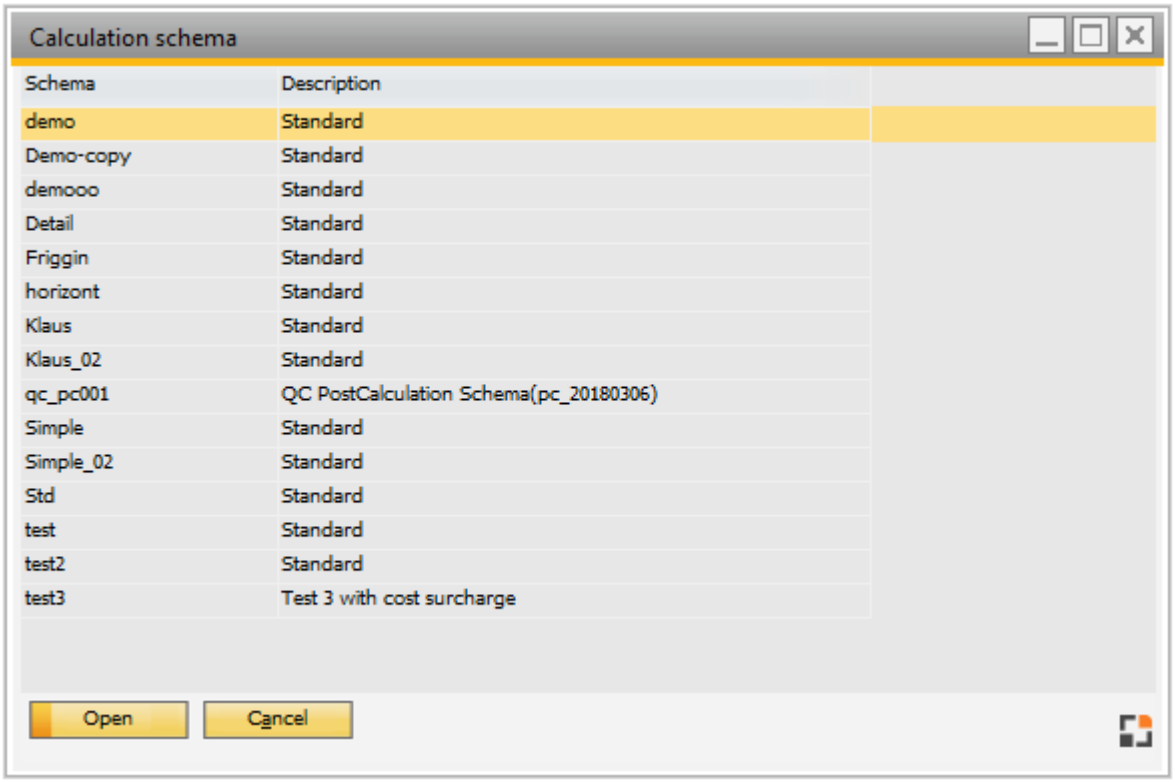
© 2026 Boyum IT Solutions A/S

3.2.5.1 Calculation schema

In a calculation schema surcharges are determined for Precalculation and for post-calculation. The accounts for WIP-bookings can be defined here.

PATH: Administration > Setup > Precalculation > Calculation Schema



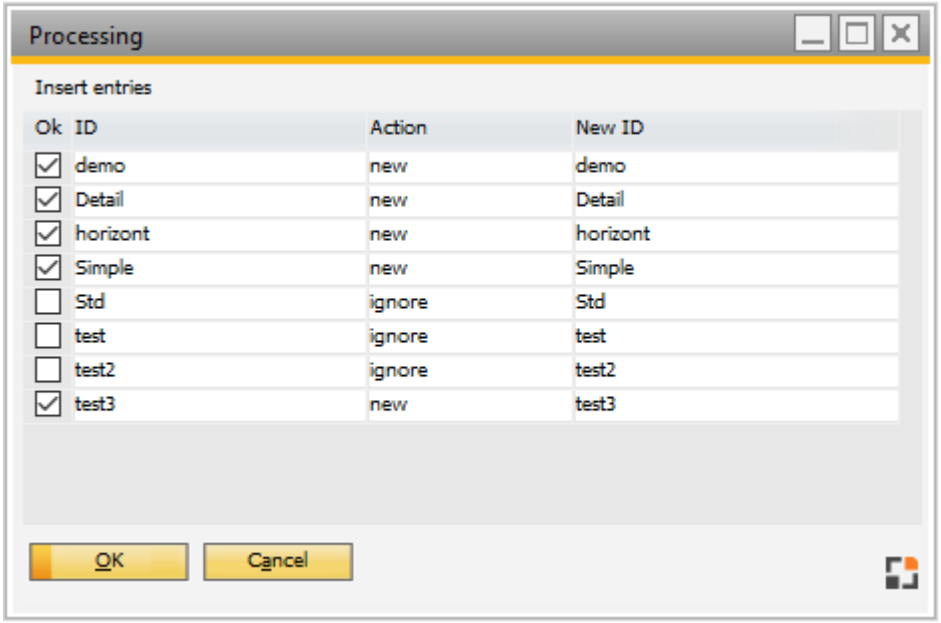
Window pk_schema_browse.psr

Field / (contextual menu) function descriptions

Field/Function	Description
Schema	Calculation Schema ID
Description	Description for the schema
Remove	Delete selected schema(s).
Duplicate	The function generates a duplicated entry of the currently selected schema by copying data to the clipboard and automatically pasting the information in the newly created entry.
Copy to clipboard	Use this function for transferring calculation schemas to other databases. Multi-selection is possible. ***See*** Data record selection copy&paste function.

© 2026 Boyum IT Solutions A/S

Field/Function	Description
Open	Open the Schema edit window.
Insert from clipboard	After pressing the Copy button you can rename and Insert a new schema in the list.



Window system_copy_edit.psr

Field descriptions

Field	Descriptions
Insert entries	The list shows the Calculation schemas that were copied.
OK	Use the radio box to select which calculation schemas should be created or ignored by the insert.
ID	Existing calculation schema ID.
Action	If OK is selected, the action is "new" and you can insert a renamed version of the selected calculation schema. If OK is unselected, the action is "ignored", and this entry will not be inserted from the list.
New ID	Create a new ID for the copied calculation schema before it is

© 2026 Boyum IT Solutions A/S

Field/Function	Description
	<table><tr><th>Field</th><th>Descriptions</th></tr><tr><td></td><td>inserted.</td></tr></table>
Import/Export setup	Create a .psr file to export/import the definition.
Reload default	Reload calculation schema "Std" (Standard definition).

- Reference

A calculation template defines the following:

Field	Meaning
Preliminary costing	Display and valuation of surcharges, sums, and overheads
Final costing	Display and valuation of surcharges, sums, and overheads
WIP posting	Storage of which accounts should be debited with which values ***See*** Configuration wizard - account determination.

- Default calculation schema

A default calculation schema is supplied with Beas. This cannot be changed as it is updated automatically in every update. It is used as a basic template for all other calculation schemas. This schema is created in the language which was set up in Configuration wizard – Administation – Language. Via right-click "reset default" the calculation schema can be read new new in the system language.

- Determination of calculation schema to be used

In Precalculation

according to following priority:

a) as stored in **Administration > Configuration wizard > Calculation > Calculation schema**

b) as stored in **Item master > Calculation Template**

c) if nothing like this exists, the "Std" template is used, which is always installed automatically

WIP and post-calculation

The schema is determined according to the following priority

a) as per **Administration - Configuration wizard > Production > Valuation and posting > Valuation > Calculation schema**

b) as per **Item master > Calculation schema**

b) as stored in **Configuration wizard > Calculation > Calculation schema > Default schema**

© 2026 Boyum IT Solutions A/S

d) if nothing like this exists, the "Std" template is used, which is always installed automatically

Special case Standard costs method:
The calculation schema of last valuation is used.

Areas

A calculation template consists of the following areas

Field	Description
Template	The calculation template ID.
Overheads	All surcharge and sum values. Changeable value.
Default	Default objects. Only its designation and color can be changed.
Final costing	Objects for costing analysis. Only its designation can be changed.

A name and description can be stored. If the Option "Calculation surcharges for sub positions" has been activated, the tab " Display" appears.

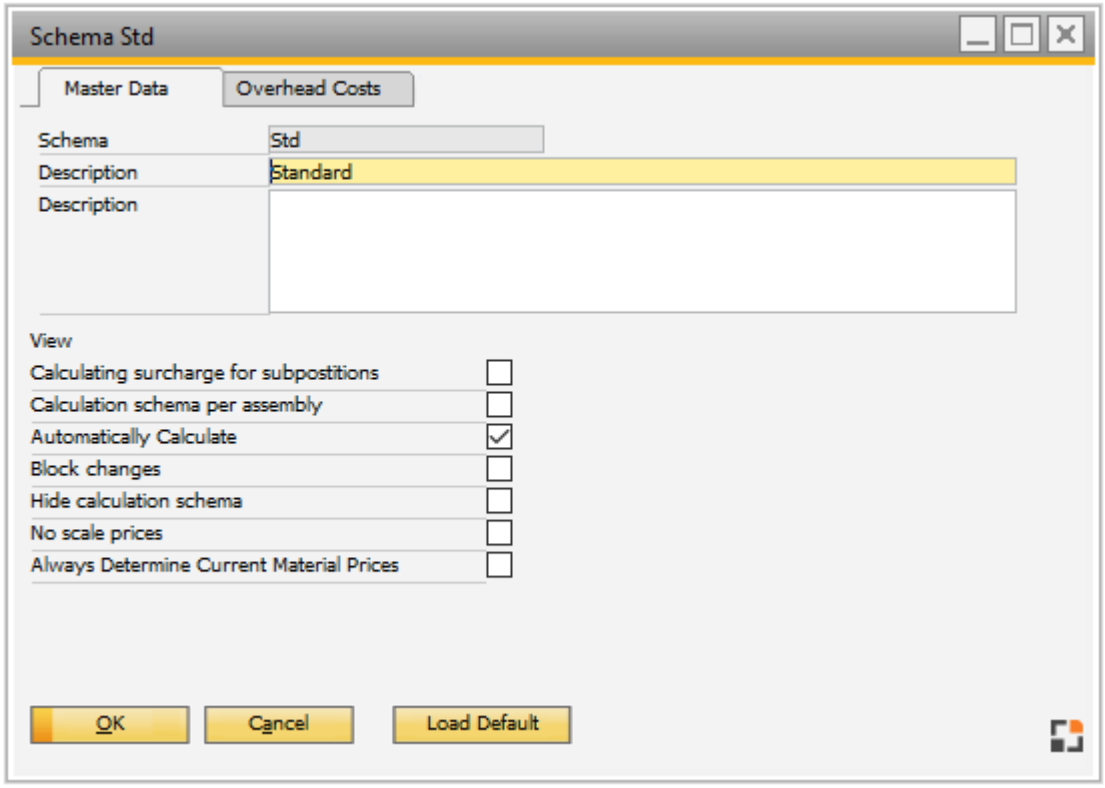
Webinar: Financial accounting in Beas Manufacturing

3.2.5.1.1 Master Data tab

In this tab you can set your options for the calculation view.

PATH: Administration > Setup > Precalculation > Calculation Schema > **Open** schema

© 2026 Boyum IT Solutions A/S



Window pk_schema_edit.psr

Schema: Calculation schema ID

Description: Add short description of the schema

Description: Add long description of the schema

Calculation view settings (lower window section)

Field	Description
Calculation surcharges for sub positions	If this option is activated, the Display tab appears, and surcharges are calculated not only in the main assembly, but also for all sub-assemblies. Results of the sub-assembly. The results of the sub-assembly can be seen: 1. By double-clicking on the sub-assembly, tab scale price or tab result 2. By defining the enlarged view in tab "Display" in the calculation template, and changing the view in the calculation via tab "View" - button "Extended view" For large calculations the computation takes much longer. If no calculation is required per sub-assembly, this option should be disabled. ***See***

© 2026 Boyum IT Solutions A/S

	Extended view Precalculation – Concept of extended view
Calculation schema per assembly	This option is only active if "Calculation surcharges for sub positions" was enabled. If this option is enabled, then the surcharges can be edited separately for each sub-assembly. This is done by double-clicking on the assembly, tab "Schema". This tab is only visible when the option described here has been activated and this scheme has been included in the calculation. Calculation per assembly webinar
Automatically calculate	If enabled, results of the calculation are recalculated automatically if any change takes place. If the processing is slowed too much, the option can be disabled. In this case, the calculation must be rerun by manually clicking on "Edit - Calculate". The automatic calculation can be switched on and off in the calculation under "Functions" - calculate automatically" The option defined there, serves as a template, if the calculation is re-opened and the schema updated.
Block changes	If enabled, to the calculation in the calculation schema no new object can be included and an existing one cannot be deleted. This is important when working with the extended display.
Hide calculation schema	Hides calculation schema in the calculation
No scale prices	If enabled, only a sales prices can be entered, which applies for all lot sizes. In this case, all other sales price fields are locked. If the sales price is changed for scale 1, this applies for all other scales.
Always determine current material prices	If active, material prices are determined anew at the moment of calculation. If active, the material price can not be changed in Precalculation, as it is always determined automatically. This is very computationally intensive. That why it is disabled by default. If disabled, the price entered in material position is used. The price is determined at the moment of the calculation.

© 2026 Boyum IT Solutions A/S

	This option is considered also for pricing of external operations. *(beas9.0-004-053)* Note: this option is not taken into account at batch-Precalculation. *beas9.0-000-003-010*

Delete: With this button you can delete the calculation schema.

go back to Calculation Schema

Calculation objects - Overhead costs tab

3.2.5.1.2 Calculation objects

The Overhead Costs tab lists all the calculation objects of the actual Calculation schema.

Calculation objects can be edited in the following areas:

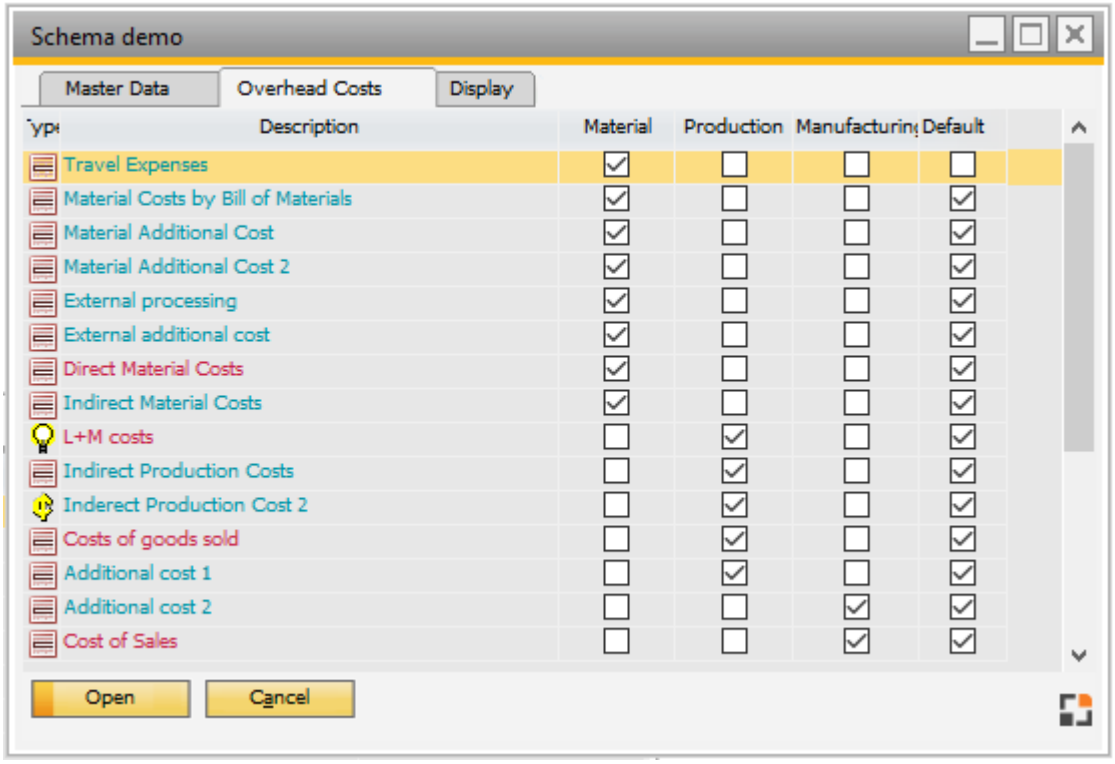
Administration > Setup > Precalculation

Edit of a calculation > Double-click a calculation object

All calculation objects will be displayed in the sequence to be considered via **Administration > Setup > Precalculation > Calculation schema > Overhead costs**.

The sequence can be changed using Drag&Drop.

© 2026 Boyum IT Solutions A/S



Window pk_typen_object_zuschlag_browse

Edit: Press this button (or double-click an object in the list) to edit a Calculation object.

See

cost elements, tool costs

go back to Calculation Schema

Master Data tab

Product cost determination

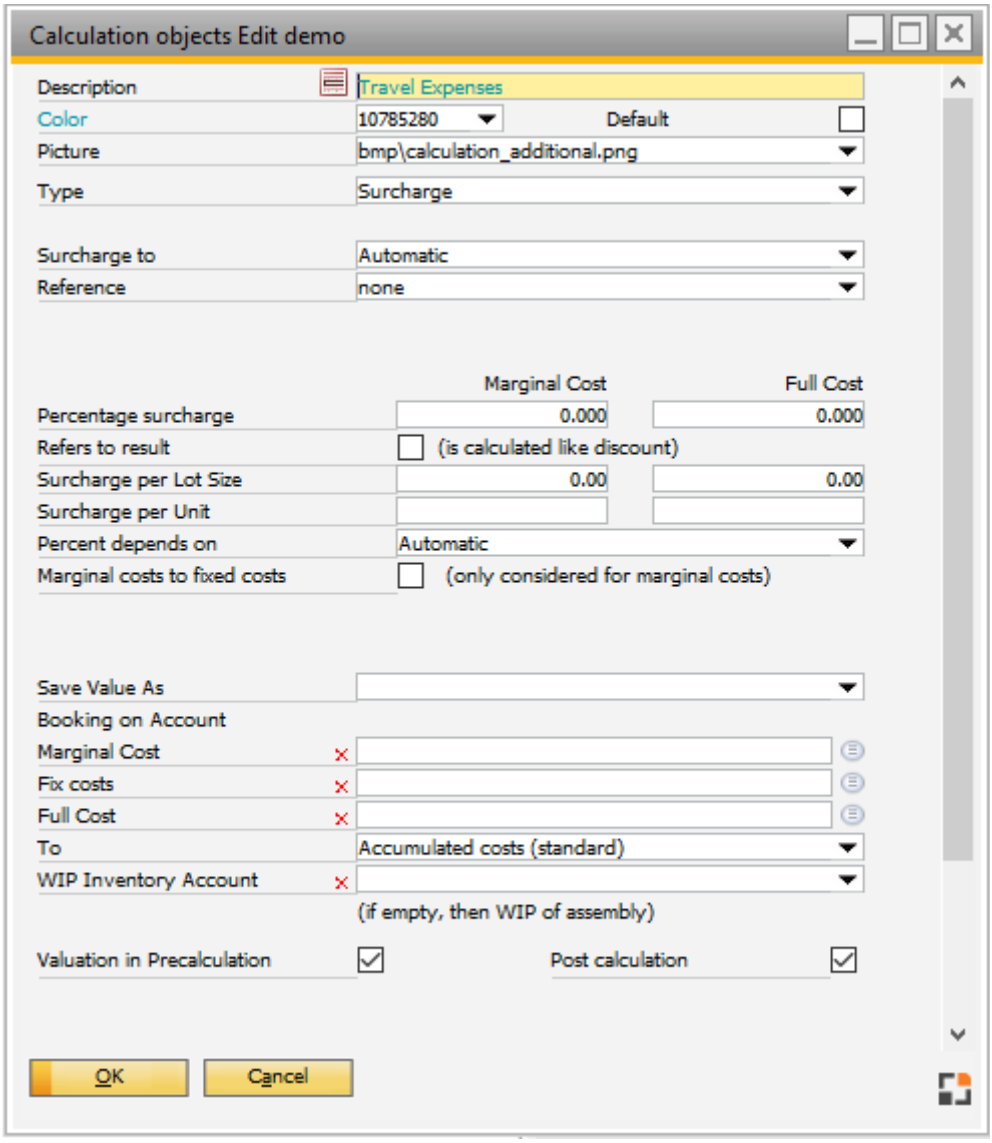
3.2.5.1.2.1 Calculation Objects Edit

This chapter is set to describe the different calculation objects in Beas.

In this window you can edit a calculation object of a calculation schema.
Only the fields available for this will be displayed depending on diverse settings if a calculation object is edited.

PATH: Administration > Setup > Precalculation > Calculation Schema > Edit schema > "Overhead Costs" tab > **Open** an entry.

© 2026 Boyum IT Solutions A/S



Window pk_typen_edit

Note: The calculation schema will always be copied from **Administration > Setup at a post-calculation**. Changes made in the Precalculation will not be considered in the post-calculation.

Type	Description
Description	Description
Color	Objects of different areas have the following colors Light blue: defined calculation objects (RGB 10785280) Red: Subtotal of the above objects (RGB 4793544) Blue: Sales price and revenue (RGB 11941650)

© 2026 Boyum IT Solutions A/S

	Colors can be adapted individually.
Image	This image is used to represent the object in all lists
Type	Determine the object type

Type	Description
Surcharge	Surcharge object: arbitrary surcharge as value or per cent or cost type ***see*** cost element
Material sum	Pure sum field: represents the material costs including outsourced operation costs.
Production sum	Pure sum field: Represents the sum of manufacturing costs
L + M costs	Pure sum field: sum of all material, production and surcharge costs calculated up to this position
Sales price acc. to entry	Represents the sales price. Option "Sales price according to default": if you don´t enter a sales price, the calculated gross full costs or gross marginal costs are used.
Margin amount	Represents the margin
Margin %	Represents the margin in %
Margin (hr)	Represents the margin per hour
Material costs without outsourced operation	Pure sum field: represents the material costs without outsourced operation costs.
Cost of External Operation	Pure sum field: represents the external operation costs

Surcharge to	Charge to which area?

Charge to" can only be configured in the "Total Cost Field" object type

Type	Description

© 2026 Boyum IT Solutions A/S

	Material Costs: Charge to material costs Non Material Mfg Cost: Charge to manufacturing costs Production Cost: Charge to production costs Cost of Sales: Charge to cost of sales Net Sales Price: Charge to net sales price Gross Sales Price: Charge to gross sales price Price from Offer: Charge to price from offer Basic Material Costs: Charge to source material costs Automatic: Automatic calculation (preferred setting)
Reference	What is the object referring to ? "Reference" can only be configured in the "Total Cost Field" object type

Type	Description
Loading for material	Material surcharge costs (surcharges are defined in the material group of the material).
Cost of tools	Tool costs (currently can only be determined via cost element) – ***see*** Tool.
No	Manual input of surcharges as amount and / or percent at marginal and full costs.
Material price as per BOM	Material costs without external operation costs.
Non Material Mfg Cost for WO Stat.	Non Material Manufacturing Cost.
cost of External Operation	Cost of External Operation.
Net weight	Weight surcharge calculation at net weight (does not currently work).
Gross weight	Weight surcharge calculation at gross weight (does not currently work).

© 2026 Boyum IT Solutions A/S

	<table><tr><td>Calculated Shipping Costs</td><td>Shipping cost calculation (does not currently work)</td></tr><tr><td>Cost element</td><td>Sum of the cost element to be defined here. This can be used to perform an analysis for setup, processing, tool costs, wage costs, etc.) ***see*** cost elements, tool costs.</td></tr><tr><td>Cost element surcharge</td><td>Surcharge sum of the cost element to be defined here. The surcharges are defined in **Master data > Cost element .**</td></tr><tr><td>Cost element group</td><td>Sum of cost element group (sum of all cost elements in this group).</td></tr><tr><td>Cost group surcharge</td><td>Sum of cost element group (sum of all cost elements in this group).</td></tr><tr><td>Script</td><td>surcharge is calculated with a script. A script management is available, which can be called up via selection feature in this field ***See*** Scripting.</td></tr></table>
Cost element	For reference "Cost element" and "Cost element surcharge" only - Determines which cost element sum should be considered.
Time requirement display	For reference "Cost element" only - should the time requirement planned for this cost element be displayed in the calculation (visually only)
Cost element group	For reference "Cost element group" and "Cost element group surcharge" only – determines which cost element group sum should be considered.
Script	For reference "Script" – Determines, which script to use for surcharge calculation. ***See*** Scripting, Scripting Precalculation, Scripting Post-calculation
% Surcharge	Only visible for reference "None": determines the percentage value of the surcharge at marginal and full costs
Surcharge per lot size	Determines fixed value of surcharge added per lot size at marginal and fixed costs **Precalculation**

© 2026 Boyum IT Solutions A/S

Value refers to lot size of the item to be calculated. If the item has no lot size, the calculation lot size applies.

Example:
Lot size: 10
Surcharge per: 5€ (in this case per 10)
View per: 100
Displayed: 50€ for 100

Production Price calculation
Lot size depends on valuation method
Example: Price per Lot size = 100€, Work order: 10 Pcs
Calculation for plan costs: Projection is always on

Example: Receipt same quantity as planned

Receipt Qty	Close	Projection off	Sum (*1)	Projection On (*2)	Sum *1)
2		100€	100 €	Lot size price 100€ / 10 Total Qty * 2 Receipt Qty) = **20€**	20€
3		0	100 €	**30€**	50€
5	x	0	100 €	100€ - previous total (50 €) = **50€**	100 €

(*1) Valuation type Post calculation: The system calculate always the complete sum (Accumulated) and divide at end all previous costs
(*2) Valuation type Plan calculation: Always use "Projection on". Always calculate per receipt quantity.

Example: Receipt less than planned

Receipt Qty	Close	Projection off	Sum (*1)	Projection On (*2)	Sum *1)
2		100€	100 €	Lot size price 100€ / 10 Total Qty * 2 Receipt Qty) = **20€**	20€

© 2026 Boyum IT Solutions A/S

Receipt Qty	Close	Projection off	Sum (*1)	Projection On (*2)	Sum *1)
3		0	100 €	**30€**	50€
1	x	0	100 €	100€ - previous total (50 €) = **50€**	100 €

Example: Receipt more than planned

Receipt Qty	Close	Projection off	Sum (*1)	Projection On (*2)	Sum *1)
2		100€	100 €	Lot size price 100€ / 10 Total Qty * 2 Receipt Qty) = **20€**	20€
3		0	100 €	**30€**	50€
10	x	0	100 €	100€ - previous total (50 €) = **50€**	100 €

Surcharge per unit

- Refers to "surcharge per" per unit to be calculated

This is to define surcharge per unit.

- Unit definition (pieces/quantity)

Precalculation
Lot size given in Precalculation

Production post-calculation
Planned value: quantity as per manufacturing position quantity in warehouse units
Actual value: total posted quantity

Assembly valuation
Partial posting / Calculation object: quantity to be posted in

© 2026 Boyum IT Solutions A/S

	Partial posting / Summation: already posted + quantity to be posted in Final posting / Calculation object: quantity to be posted in Final posting / Summation: already posted + quantity to be posted in Note on valuation at planned costs: Only the posted quantity is valued, not the planned quantity. At final valuation (upon closing the work order) the total planned quantity is taken as reference. ***Example 1:*** Surcharge per unit: 5 € 1. Partial posting 2 pieces: 10€ on object, 10€ in sum 2. Partial posting 2 pieces: 10€ on object, 20€ in sum Because an account can be stored in calculation object, it is mandatory to calculate costs for posting. ***Example 2***: Calculation at post-calculation price Referring to example 1 costs are booked to the the given account 1. partial posting 2 pcs = 2*5 = 10€ 2. partial posting 2 pcs = 2*5 = 10€ Calculation of L+M costs: 1. partial posting 2 pcs = 2*5 = 10€ 2. partial posting 2 pcs = 4*5 = 20€ Less the already posted 10€ = 10€ Even if the calculation type is different, the result is the same.
Percentage value relates to	Only visible for reference "None". Defines the sum to which the percentage value refers

© 2026 Boyum IT Solutions A/S

	Automatic	Refers to the last sum. If no intermediate sum is there, the first entry, which returns a value serves as reference.
	Price of material by Bill of Mat.	Refers to the material sum
	L + M costs (work sequence)	Refers to the manufacturing costs
	Cost of External Operation	Refers to the external operation costs
	Material- + Cost of external operation	Refers to the sum of the material costs and external operation costs
Save value as	Allow to save the result of this object separately in batch calculation result table	
Booking on account (marginal costs, fixed costs, full costs)	If an account is stored here and in the **Configuration wizard > Production > Valuation Assembly > Valuation > Post overheads for partial delivery** is NOT set to "No posting" and continual inventory maintenance is activated, the accounts specified here are credited and the WIP account debited at the time indicated there. The cost rate at marginal costs, fixed costs (= full costs - marginal costs) or full costs can be used.	
To ...	To accumulated or planned costs Refers to the account to be debited: Defines the amount to be posted:	
	Accumulated costs	The actually accumulated costs are posted (actual value)
	planned costs	The planned costs as per precalculation are posted
	planned for partial delivery, other accumulated	Can only be used if posting of overheads to "For assembly receipt" is activated.

© 2026 Boyum IT Solutions A/S

	<table><tr><td>Accumulated costs</td><td>The actually accumulated costs are posted (actual value)</td></tr><tr><td></td><td>For partial delivery, the planned value (target value) is posted, otherwise the accumulated costs (actual value).</td></tr></table>
WIP inventory account	If the amount is not posted to the WIP inventory account of the assembly to be produced, the WIP account to which postings are made can be defined here. Option is only visible if in **SAP > Administration > System Initialization > Document Setting > Per Document > "Production Order" "Component WIP Accounts** ' is activated.
Valuation in precalculation	If deactivated, the object is displayed in the precalculation but not valued.
Valuation in costing analysis	If deactivated, the object is NOT displayed in the precalculation and also not valued.
Refers to result	Determines whether the % value relates to the previous sum or to the reference sum (A) or to the reference sum + addition to be calculated. (B) (similar to calculation of discount or revenue) ***Example***: Switch deactivated, reference is A(100€) first sum 100 €+10% of A(10€) = 110 ***Example***: Switch activated, reference is B(110€) second sum 99€+10% of B(€ 11) € 110 = 110
marginal costs to fixed costs	⊟ The fixed cost surcharge determined in calculation of marginal costs is added to marginal costs. ***Example***: The fixed cost share of the labor costs shall be added at marginal costs calculation. Reference = manually Surcharge per cent = 100% for marginal and full costs Per cent refers to production costs according to the working sequence At marginal costs to fixed costs: activate

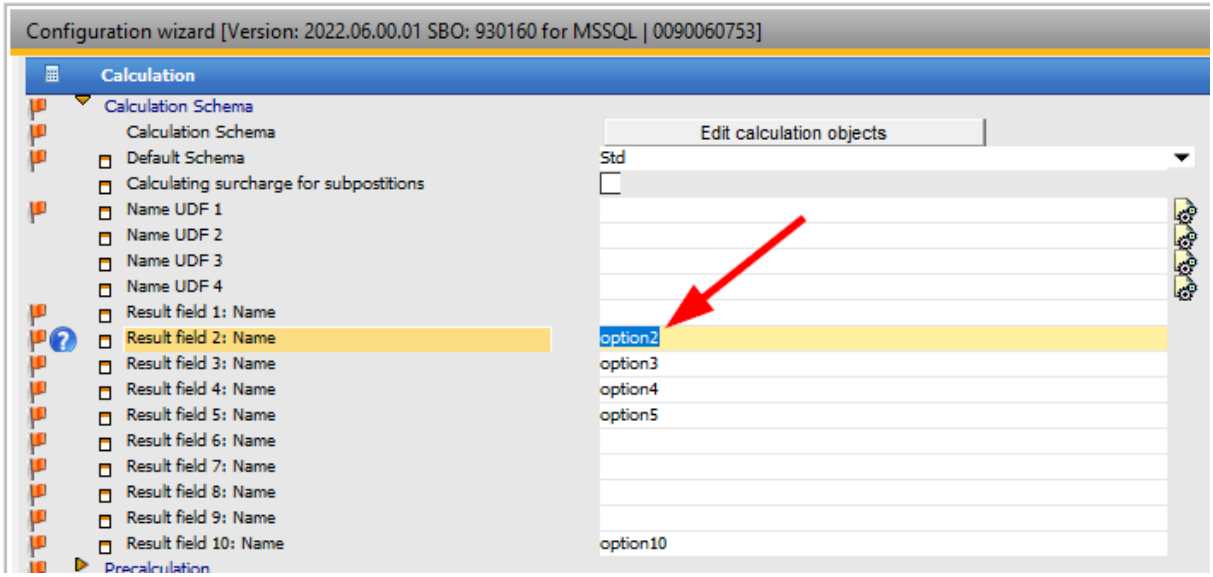
© 2026 Boyum IT Solutions A/S

	Production costs would be 60 (marginal costs) or 80 (full costs) At marginal costs calculation the 20 (100% full costs -100% marginal costs = the full fixed costs) are added up.
Post calculation	If this check box is selected, this calculation object is considered in Post calculation.

go back to Calculation Objects
Calculation Schema
Master Data tab

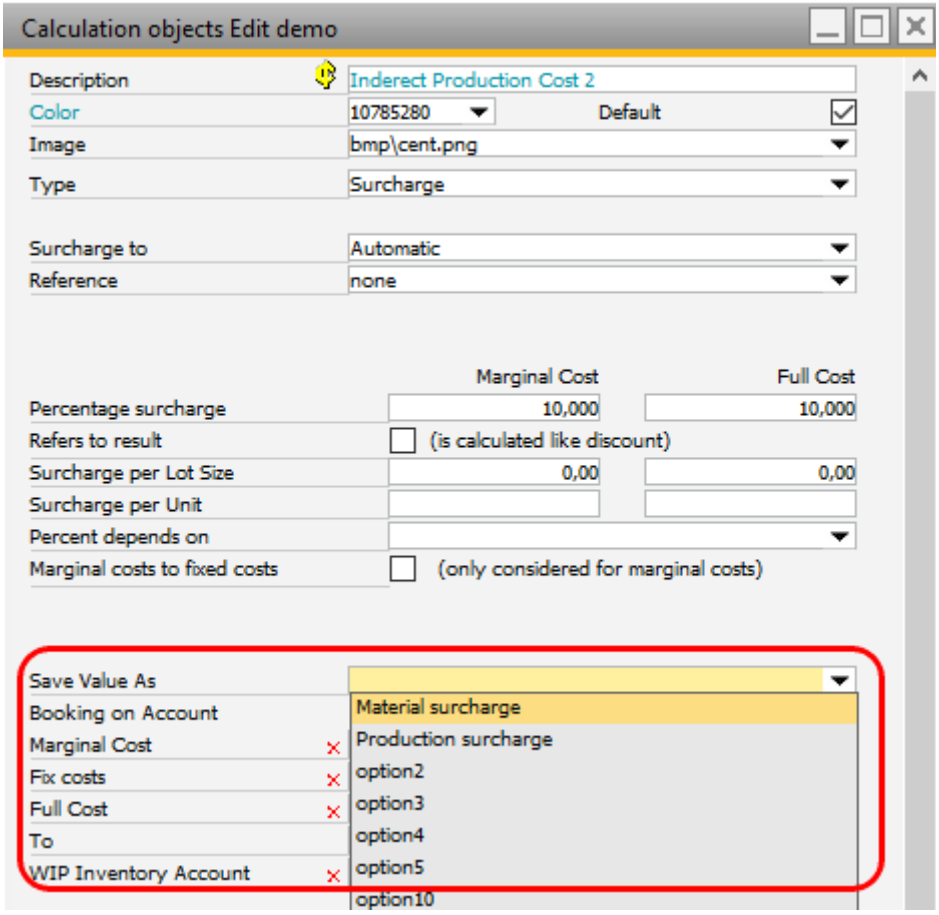
In Batch calculation and Precalculation - Extended view you have the possibility to save up to 10 values in the result table.

In the Configuration wizard you can define the Names:



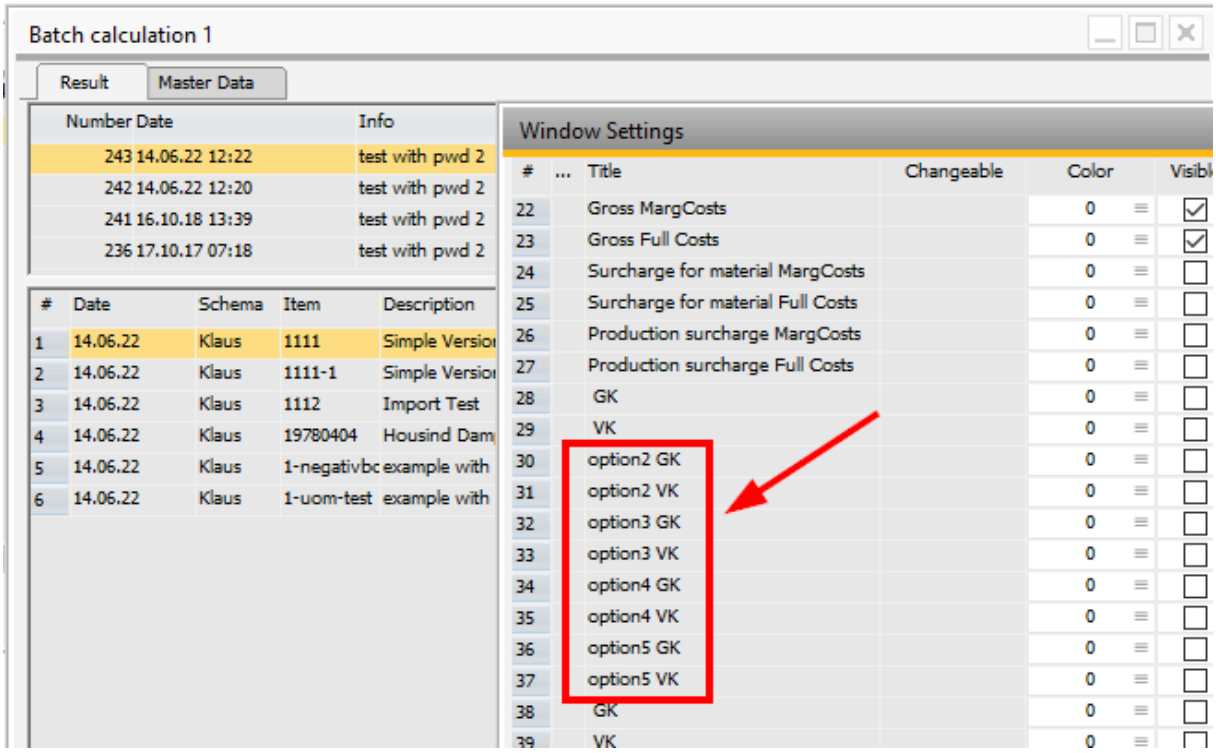
In the calculation schema object you can link this to a result field:

© 2026 Boyum IT Solutions A/S

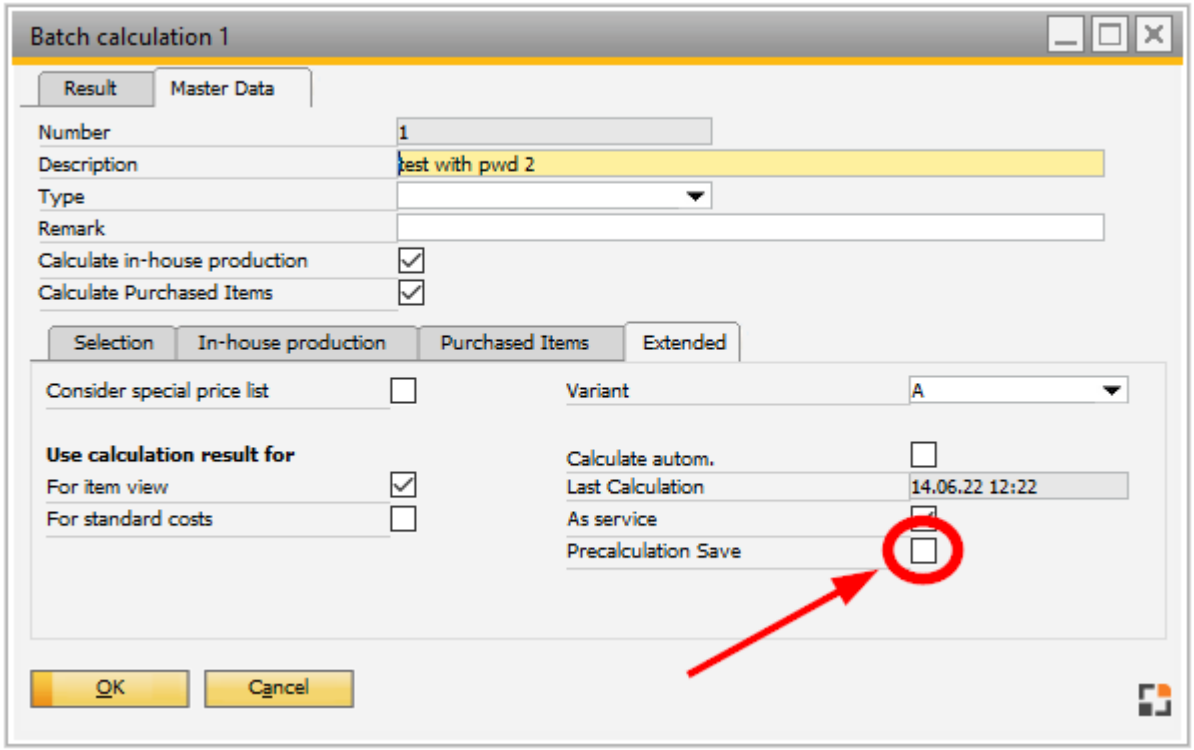


In the Result list of Batch calculation you can activate the result fields in window settings:

© 2026 Boyum IT Solutions A/S



Note: This is only working in batch calculation if "Precalculation Save" is disabled.



- Example: save Tool Cost in separate field

© 2026 Boyum IT Solutions A/S

The tool costs are to be separately accounted for in the results list of the batch Precalculation / batch costs analysis.
1. Entry in results field 1: "Cost of tools".
2. Creation of cost element tool.
3. Assignment of the tool costs in this cost element (tool management).
4. Calculation Template: New overall cost object type “cost element”, select cost element “tool”, save under "Cost of tools".
All tool costs are now shown in the “Cost of tools” column.

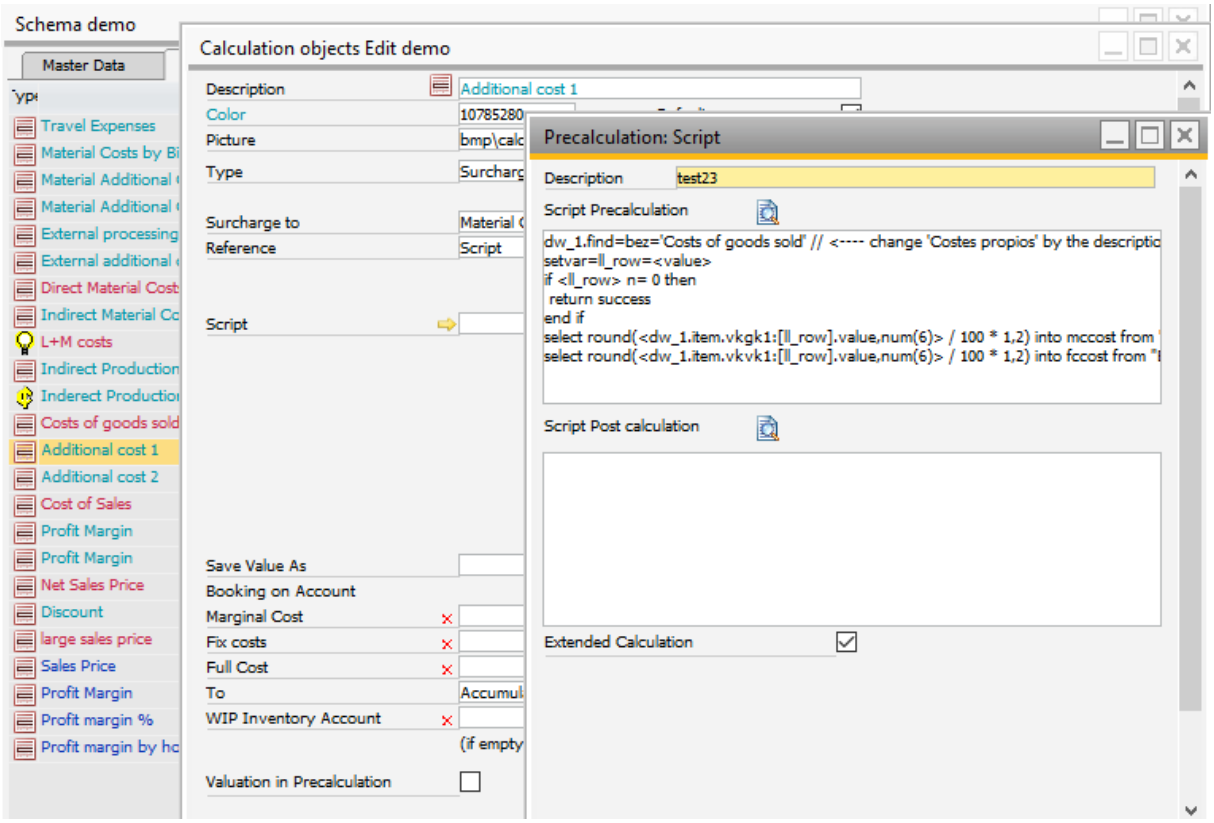
see Precalculation - Concept extended view
Calculation per assembly webinar

With scripts you can change various Calculation objects, or make them programmable. In these you can determine the surcharges or designation using MSSQL, VB, Java or Beas-Script or all of them.

PATH: Administration > Setup > Precalculation > Calculation schema > Overhead costs

1. **Open** an entry.
2. Select "Script" in the Reference field.
3. Select script from drop-down.
4. Double-click the yellow arrow.

© 2026 Boyum IT Solutions A/S



Window pk_scripting_edit.psr

Therefore, set up the following in Calculation object

Type = Surcharge

Reference = Script

Script = script to be executed. Click the selection icon to open a list of available scripts. You can view, edit and add scripts here.

> Note: Because Precalculation and Post-calculation are very different from each other, no script can be used for both of them. You need to define separate scripts.

Script window

Field	Description
Script Precalculation	Script to be executed at a Precalculation. ***See*** Scripting Precalculation.
Script Postcalculation	Script to be executed at a post-calculation. ***See*** Scripting Post-calculation.

© 2026 Boyum IT Solutions A/S

Extended calculation	Define whether the calculation should save all values in the background. **General button** (not script related) If a Precalculation or post-calculation is executed (eg. pricing at posting-in assembly) in the background, not all information is saved and thus there is no access to various information via script. **Active**: Precalculation or post-calculation saves also all information if started in the background. Thus the stored script can also access BoM information and routing information. The option should only be activated if you really need to access BoM information and routing information, as it can slow down the computation and needs more memory.

See

Scripting Precalculation

Scripting Post-calculation

Please consider for batch-calculations, that only fields relevant for calculation are filled: that means drawing number, designation additional identifier and other fields are not filled.

Scripting for calculation of surcharges in Precalculation. Entered in Script administration > **Edit > upper window**

For Pre- and for Post-calculation the scripts need to be created separately.

See

Calculation objects – Scripting

Scripting

Scripting post-calculation

Create script

Three writable variables are available for marginal costs, full costs and description. Special variables are available for accessing calculation results.

Writeable variables:

Variable	Descriptions
`fccost`	Set full costs for the current object.

© 2026 Boyum IT Solutions A/S

Variable	Descriptions
	Example: `setvar=fccost=<sum.fc.labor>`
`mccost`	Set marginal costs
`description`	Set description If values are added to the description, they will be entered regardless of the view lot size, for example: current lot size = 2, view per 10: the price for 2 pieces is entered, the remainder calculated for 10 pieces. By using <calc.lotsize> you can always scale down to 1 piece. However, the view lot size can not be considered. Furthermore, the description for marginal and full cost view is the same. In the example above, full costs are always independent of the current view.
`e_Row`	For which row in dw_1 the calculation is current running Normally e_Row is always 1. But if you activate "Calculation schema per Assembly", the system starts the calculation for every assembly. In this case you must check in your script if this is for the complete calculation (e_Row=1) or for a sub-assembly (e_Row>1) ***Example***: Read current ItemCode `setvar=my_ItemCode=<dw_1.item.st_itemcode:[e_Row].value>` *Beas 2020.03*

Example: Material cost + 5€

Example: set L+M costs

```
[vbs]
function ppercent (s)
ppercent=<sum.material,num(6)>/100*s
end function

[/vbs]
setvar=fccost=<vbs.ppercent(5)>
```

© 2026 Boyum IT Solutions A/S

```
setvar=mccost=<fccost>
setvar=description=Material Overhead 5% from <sum.material,#0.00> = <fccost,#0.00>
```

Variables: you can access the following special variables

`<sum.material>`	Material costs without costs for external operation
`<sum.manufacturing>`	External operation costs
`<sum.materialoverheads>`	Material surcharge
`<sum.mc.labor>`	L+M costs at marginal costs
`<sum.fc.labor>`	L+M costs at full costs
`<sum.mc.production>`	Material + External operation + L+M cost at marginal costs
`<sum.fc.production>`	Material + External operation + L+M cost at marginal costs
`<timetype.fc/mc/fx.[timetype]>`	Costs of a time type at full costs (fc), marginal costs (mc) or fixed costs (fx)

Example: marginal costs for time type „machine“
`<timetype.mc.machine>`

Configuration: <timetype.[typ].[timetype-id]>

Available tpes [typ]

`fc`	Total full costs incl. external operation
`mc`	Total marginal costs incl. external operation
`fx`	Total fixed costs (Full costs – marginal costs)
`time`	Total time
`mcsurcharge`	Total - surcharge marginal costs
`fcsurcharge`	Total - surcharge full costs
`mcexternal`	External operation at marginal costs
`fcexternal`	External operation at full costs. This can also be prices from external operations or tool costs

These costs can be split up even further into setup time, processing time etc.

© 2026 Boyum IT Solutions A/S

<table>
<tr><td><sum.material></td><td>Material costs without costs for external operation</td></tr>
<tr><td></td><td>
<table>
<tr><th>Setup time</th><th>Time/unit 1</th><th>Time/unit 2</th><th>Time/unit 3</th><th></th></tr>
<tr><td>fctr</td><td>fcte</td><td>fctn</td><td>fcth</td><td>Full costs without external operation</td></tr>
<tr><td>mctr</td><td>mcte</td><td>mctn</td><td>mcth</td><td>Marginal costs without external operation</td></tr>
<tr><td>timetr</td><td>timete</td><td>timetn</td><td>timeth</td><td>Time in minutes</td></tr>
<tr><td>mcsurchargetr</td><td>mcsurchargete</td><td>mcsurchargetn</td><td>mcsurchargeth</td><td>Surcharge setup costs at full costs</td></tr>
<tr><td>fcsurchargetr</td><td>fcsurchargete</td><td>fcsurchargetn</td><td>fcsurchargeth</td><td>Surcharge setup costs at marginal costs</td></tr>
</table>
</td></tr>
<tr><td><calc.lotsize></td><td>Currently calculated lot size</td></tr>
<tr><td><calc.line></td><td>Current assembly to be calculated (usually 1)</td></tr>
<tr><td><calc.docentry></td><td>Calculation number. If <= 0, temporary calculation</td></tr>
<tr><td><calc.precalcnr></td><td>Calculation number, linked to an offer, sales order or advance invoice via field „u_beas_precalcnr
There is no 1:1-linkage to a customer order. A calculation can be stored in several documents.</td></tr>
<tr><td><calc.cardcode></td><td>Client number, stored in calculation</td></tr>
<tr><td><dw_1.item.[fieldname].value></td><td>Access to fields from current calculation
with <dw_1.xxx> you have access to all fields.

Scan all fields:
for ll_loop = 1 to <dw_1.rowcount>
ls_test=<dw_1.item.pos_text:[ll_loop].value>
next</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

<sum.material>	Material costs without costs for external operation

	Note:
	for - next - loop is slow. It is better to work with the "find" command.
	`dw_1.find=pos_text='xxx'`
	`setvar=ll_row=<value>`
	`ls_text=dw_1.item.info:[ll_row].value`
	
	Available fields:
	Open the Precalculation and check the field names with the debug window.
	
	Batch Calculation:
	The system only fills fields that are needed for calculation.
	Example:
	The following fields are not filled: `UDF1-15, st_info, info, znr (Drawing Number), info, bez (Item Name), color, bitmap`
	If you need access to this field, you must activate **Batch Calculation -> Extented -> Precalculation Save.**

Place holders return values in Windows regional format with 6 digits.

- ***Example***

© 2026 Boyum IT Solutions A/S

Setup time time type „Machine“ at full costs	setvar=fccost=<timetype.fctr.machine>
Processing costs time type “Personnel” + “Labor” at marginal costs	setvar=mccost=% numadd(<timetype.mcte.labor>,<timetype.mcte.personell>)

Example with declared variables	// If no variable is declared with „dec“ or „decimal“,
	// you can continue to calculate with these in „datawindow-Syntax“
	// but a conversion into international format is necessary
	
	dec fcsum
	fcsum=<timetype.fc.machine,num(6)>
	fcsum=<fcsum,num(6)> + (<fcsum,num(6)> / 100 * 5)
	setvar=fccost=<fcsum,#0.000000>

Example with VB Script	// Working with beas-Script-Formula system, SQL-Script,
	// VB-Script or JavaScript, variables nmeed to be converted by num(x)
	
	[vbs]
	function ppercent (s)
	ppercent=<sum.material,num(6)>/100*s
	end function
	[/vbs]
	
	setvar=fccost=<vbs.ppercent(5)>
	setvar=mccost=<fccost>
	setvar=description=Material Overhead 5% from <sum.material,#0.00> = <fccost,#0.00>

Complex example:
"Item amount in sales units"
* value from item value "SWW"
* Cost rate from first operation
* current lot size
	// Amount in sales units of the item to be produced
	// (First row of DW_1)
	select "NumInSale" into :ll_numinsale from "OITM" where "ItemCode" = <dw_1.item.st_itemcode:1.value,dbstring>
	// Position first operation
	// (row type)
	// "find" is easier than for - next
	dw_1.find=art=52
	setvar=ll_row=<value>
	if <ll_row> n= 0 then
	  return success
	end if
	// Use SQL statement to compute the value, write with "into" directly to
	// the correct variable
	// from BEAS_DUMMY is important, as without "from" "into" does not work
	// Marginal/Full costs are taken from the operation

- Complete example of use

The calculation puts out the setup time of a machine + setup time of employee and processing time of machine + processing time of employee separately.
In this example 3 cost types have been registered. Also one cost type would be sufficient. Cost elements have been extended to 2, and personnel costs are valued separately. Cost types are assigned and cost centers have been stored. 2 formulas have been entered.

Setup:

// setup-time from machine and personnel
setvar=fccost=%numadd(<timetype.fctr.machine>,<timetype.fctr.personell>)
setvar=mccost=%numadd(<timetype.mctr.machine>,<timetype.mctr.personell>)
setvar=description=Total setup Time <timetype.trtime.machine,#0> Min

Processing:

// Edit-Time from labor and personnel
setvar=fccost=%numadd(<timetype.fcte.labor>,<timetype.fcte.personell>)
setvar=mccost=%numadd(<timetype.mcte.labor>,<timetype.mcte.personell>)
setvar=description=Total Processing Time <timetype.tetime.labor,#0> Min

Afterwards, surcharge objects need to be defined, in which these formulas are stored. Then, the requested result is put out correctly.

Additional information are available in the post-calculation. The calculation is executed differently as in the Precalculation. That is why the script must be created separately for the post-calculation.

Note:
No all variables are available in DataWindow dw_1 if the calculation results in the background (eg. at a posting-in assembly)

- Available variables:

© 2026 Boyum IT Solutions A/S

Only a limited amount of fields is available if the calculation is executed in the background (Batch-post-calculation or assembly valuation) .

beas 9.2 PL: 01 and older
No information is saved.

beas 9.2 PL: 02
Bill of materials art (50) s_level, belnr_id, belpos_id, pos_id, itemcode, art, ke (=prcmntmtd) and all result values
routing: art (52),aplatz_id, s_level, belnr_id, belpos_id, pos_id and all result fields

If you activate the option "**extended calculation**" all fields are available, the calculation may take some more time.

Note: If you need to access material or routing positions via script, **extended calculation** is required.

Per calculation object the script is executed four times. In variable <sum.typ> is is stored, which value is calculated currently:

`mc.plan`	Planned costs at marginal costs
`mc.actual`	Current costs at marginal costs
`fc.plan`	Planned costs at full costs
`fc.actual`	Current costs at full costs

The following variables are available:

`sum.typ`	What is calculated (*see* above)
`sum.material`	Material costs without surcharges, without external operations
`sum.labor`	L+M costs
`sum.manufacturing`	Cost of external operation
`sum.production`	Production costs - including all surcharges until this calculation object
`sum.quantity`	At `mc.typ` = `mc.plan` or `fc.plan` the planned quantity, otherwise the current quantity At projections always the projection quantity

© 2026 Boyum IT Solutions A/S

You can set the following values:

`cost`	Surcharge costs - separately for the currently calculated value (see sum.typ).
`description`	Description - transferred from the latest set value.

Available basic variables

Note: It is not mandatory to set these variables. If empty, default values are used.

`e_von`	Valuation considered from date
`e_bis`	Valuation considered to date
`e_batch`	J = Batch-calculation - no output on screen
`e_schema_id`	Default - Calculation schema, if empty, automatic determination
`e_postcalcquantity`	set only in case of single step calculation: Conversion to the defined quantity independent from planned or reported quantity
`e_receiptquantity`	Is set, if the calculation is called up at posting in goods. The quantity to post in is entered
`e_postcalcorder`	Determines, whether purchase orders for external operations are to be considered. True or J = consider, false or N = not to consider
`e_costrate`	Alternative resource cost rates
`e_onelevel`	Determines the extended pricing of storage related sub-assemblies in post-calculations (setup: onelevelcalc) S=Standard, V=determine prices from last Precalculation
`str_parm.belnr_id`	Document number (BEAS_FTHAUPT.BELNR_ID)
`str_parm.belpos_id`	Document position (BEAS_FTPOS.BELPOS_ID) If 0, all document positions

Furthermore, you can access all values of dw_1.

Note: Not all fields are filled for calculations running in the background (for example, when posting in an assembly).

Example

© 2026 Boyum IT Solutions A/S

```
// Get Information from Item Master data and calculate this with udf1 from first
resource
//
// Get information from item
select "NumInSale","SWW" into :ll_numinsale,:ls_meterprobox from "OITM" where
"ItemCode" = <dw_1.item.itemcode:1.value,dbstring>

// search for first labor position
dw_1.find=art=52
setvar=ll_row=<value>
if <ll_row> n= 0 then
 return success
end if
// get udf1 from resource
select UDF1 into :ls_meterpreis from BEAS_APLATZ where
APLATZ_ID=<item.aplatz_id:[ll_row].value,dbstring>
if <ls_meterpreis,#0.000000> n= 0 then
 setvar=ls_meterpreis=1
end if
// udf1 is a text field. Replace comma with dot
tools=globalreplace=ls_meterprobox=,=.
// current calc quantity
lc_qty=<sum.quantity,#0.000000>
// check null
if <lc_qty> n= 0 then
  setvar=lc_qty=0
end if
// calculate and write back to variable cost (see "into cost"
select <ls_meterprobox,num(6)> * <ll_numinsale,num(6)> * <ls_meterpreis,num(6)>
* <lc_qty,num(6)> into cost from BEAS_DUMMY
```

Example: L+M Cost always to Planned costs

```
if <sum.typ> = mc.plan or <sum.typ> = mc.actual then
  setvar=cost=<dw_1.item.soll_fkgk:1.value>
  return success
end if
setvar=cost=<dw_1.item.soll_fkvk:1.value>
```

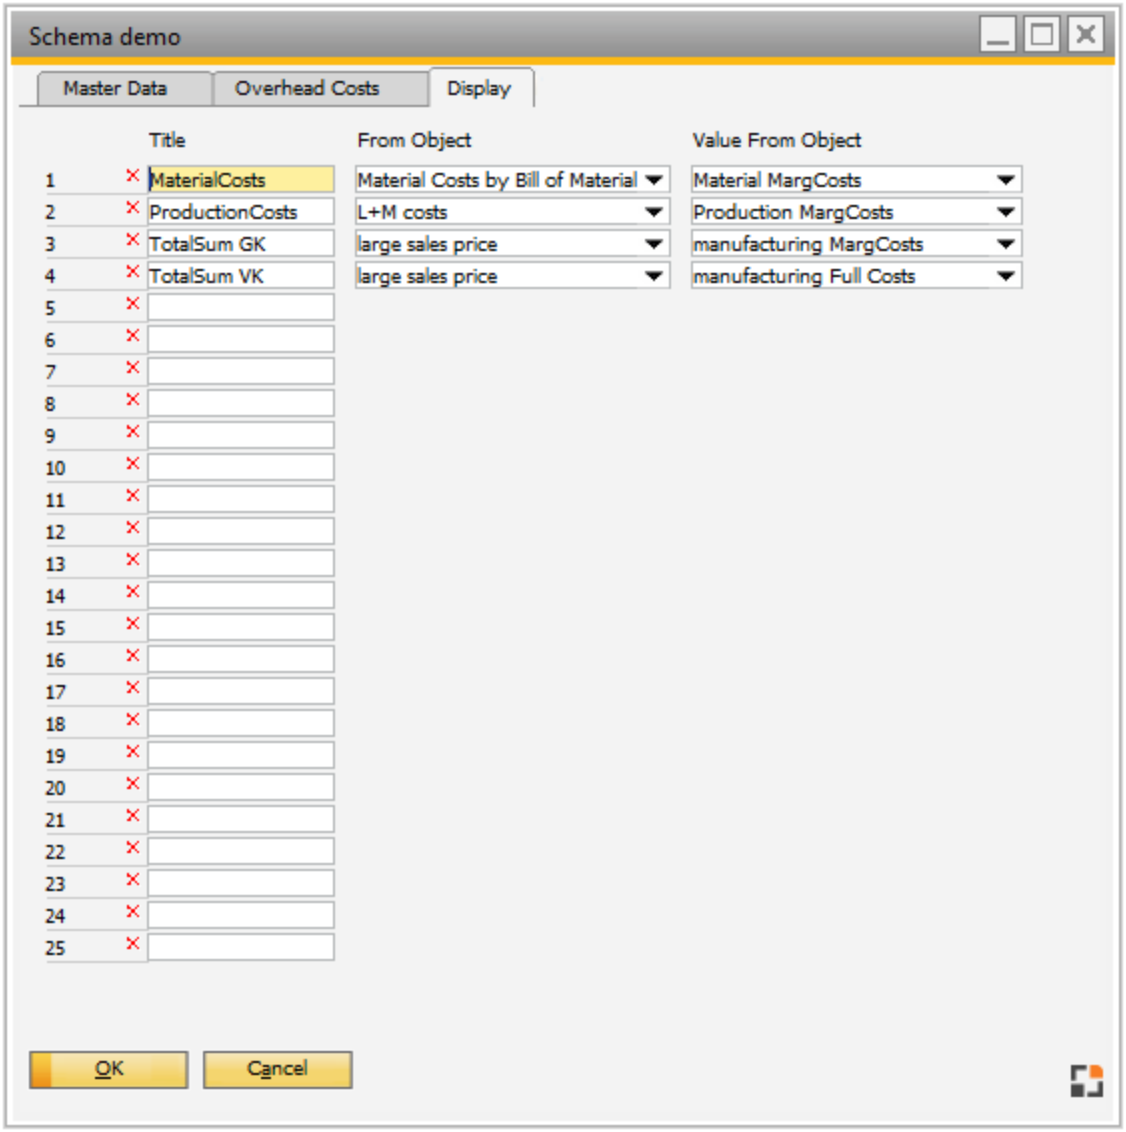
(beas9.1-004-064-000)

3.2.5.1.3 Display

In this tab you can define how the Calculation should be displayed.

PATH: Administration > Setup > Precalculation > Calculation Schema > **Open** schema > "Display" tab

© 2026 Boyum IT Solutions A/S



Window pk_schema_userformel.psr

The view is defined in the calculation schema in tab "Display". Up to 20 result fields are available. These results are always referring to the calculation schema.

Use this to have for example separate calculations per assembly.

See

Calculation schema – surcharge per item

Precalculation – Concept of extended view

Define the following:

Field	Description

© 2026 Boyum IT Solutions A/S

Header/Title	Header to be displayed
From Object	To show result from which calculation object OR from which variable: In the calculation object there is the column "save as" : there you can select "Material overhead costs", "manufacturing overhead costs" or up to 4 freely definable fields. If for more than one calculation object this variable is selected, the value is summed up. This way, sums or values can be displayed which are not incorporated in the result. Subtract from column 1: In first column for example sales price, in columns right to it the price less various selectable costs. That way any intermediate result can be displayed. Sum up: from the first column on everything is added. Using this object, from left to right the accumulated intermediate sum can be displayed.
Value from object	Only visible, if for "from object" a calculation row was selected. Here you can select, which value to be displayed from the selected row. Available: • total surcharge of the row at marginal fixed or full costs • percentage of row surcharge at marginal fixed or full costs, as surcharge value or standard value material costs at at marginal fixed or full costs • L+M costs at marginal fixed or full costs • costs of goods sold at marginal fixed or full costs (for object "sales price" this is the stored sales price or the calculated sales price at full costs. At "contribution margin" the calculated value

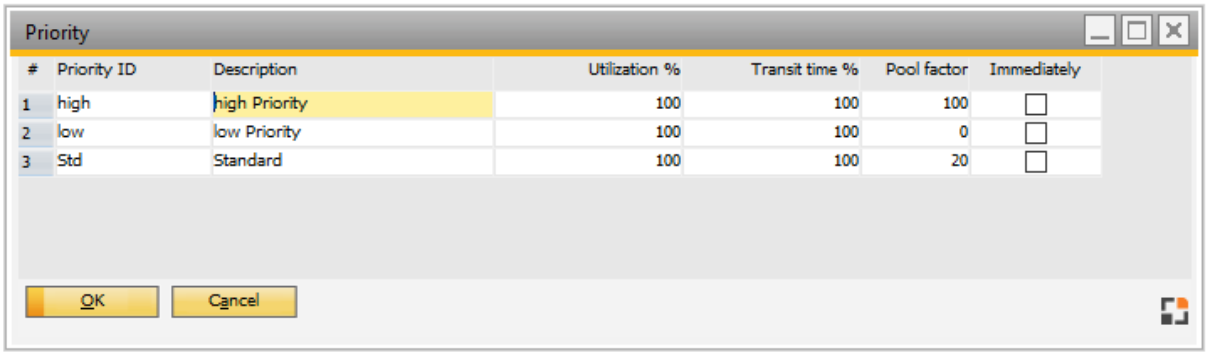
Scrap reasons
Interruption reasons
Cost elements
Shift schedule for resources
Production types
Operation types
Operation catalog

3.2.6.1 Priority

The sequence of processing as well as the throughput time of the work orders is controlled via priorities.

PATH: Administration > Setup > Production > Priority.

Priorities affect capacity planning including throughput time calculation, as well as pool control.



Window basis_prioritaeten_browse.psr

You can use Window settings and Templates for the configuration.

In Item and in Work Order a priority can be stored. The higher the number, the higher the priority is.
If a priority is stored in the order, it has precedence.
In case of multilevel calculation, the priority is passed on to the demand items.

Field Description

Field	Description
Priority	Unique identification of the material group.

© 2026 Boyum IT Solutions A/S

Information	Arbitrary text describing the priority.
Utilization %	Percentage to which a resource may be utilized on a work day. The greater the value the greater the throughput time is. ***Example:*** If the resource has 8 hours for 1 machine, a utilization of 120% means that the machine can be scheduled for max. 9.6 hours for this order per day. ***See*** Expand and compress. Note: If this is not 100%, the system uses calculation method Exploit full capacity.
Transit time %	Transit time between resources. The corresponding default is used if set to 100%. The transit time can be reduced by minimizing the % amount and it can be maximized respectively. The following applies: The smaller the percentage value is, the faster the throughput will be. ***Example:*** At a defined transit time of 6 hours and 50% transit time, a time of 3 hours is calculated. ***see*** Transit time
Pool Factor	In priority definition in pool control, the orders are aged by this factor. Basic rule: The higher the pool factor is defined, the higher the priority is. The sort order can be controlled using the pool factor. Simply enter a very high number here for instant orders. ***See***

© 2026 Boyum IT Solutions A/S

	Introduction Pooling Function Pooling, Scheduling
Immediately	If this option has been activated, the order always has first priority, regardless of whether it can be produced.

Functions

Functions

Function	Description
Add	Add a priority line to edit.
Remove	Remove selected priority from the list.
Evaluation	Open Reports This report is an analysis on the scrap reason.  *Window fert_report_parameter.psr*

Field description

© 2026 Boyum IT Solutions A/S

Field	Description
ID	ID of the scrap reason.
Description	Description of the reason.
Active	Entry is only selectable if it is activated.
Description changeable	The description will be used for the time receipt. The user can change the description if this option is enabled.
Check quantity	If active (by default) the indicated quantity will be added to the total scrap quantity. If not active: the indicated quantity will be ignored. If no scrap reasons are registered with this enabled option, the quantity of the order time receipt will not be changed.
Filter Production Type	Only selectable for selected production types. If nothing was selected, scrap reason is independent from the production type.
Filter Resource	Only selectable for selected resources. If nothing was selected, scrap reason is independent from the resource.
Filter Personnel	Only selectable for selected personnel numbers. If nothing was selected, scrap reason is independent from personnel numbers.
Image	You can store an Icon here to be shown at the pick list.
Color	The font color can be defined here.
UDF 1...4	Free available fields which can be defined in **Configuration wizard > Production > Master data >** Scrap reasons.

3.2.6.4 Interruption Reasons

PATH: Administration > Setup > Production > Interruption Reasons.

Interruption times can be reported at the terminal. Interruption times are resource-related (machine) and are documented there as well.

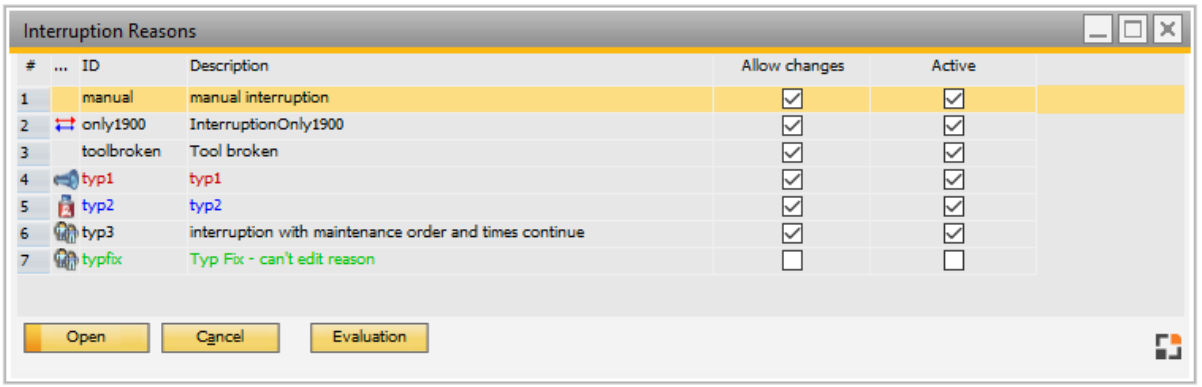
If an order is reported and an interruption then occurs, then the time for the active order will stop running until there is no longer any interruption.

If an interruption is reported, then an entry is made immediately in resource / Interruption with due date of 1.1.2050. This date indicates that the message has not yet been reported. The correct date will be entered at the end of the interruption.

© 2026 Boyum IT Solutions A/S

Note: As long an interruption is registered on a resource, there is no order logon possible for this resource.

Evaluation: Various evaluations can be created using the button "Evaluation" or "production reports". ***See*** report below.



Window basis_stillstandsgruende_browse.psr

Functions

Function	Description
Open	Open the selected entry for editing.
Add	Add an interruption reason to edit.
Remove	Remove selected priority from the list.
Evaluation	Open Reports This report is an analysis on the scrap reason.  *Window fert_report_parameter.psr* .

Window settings are available.

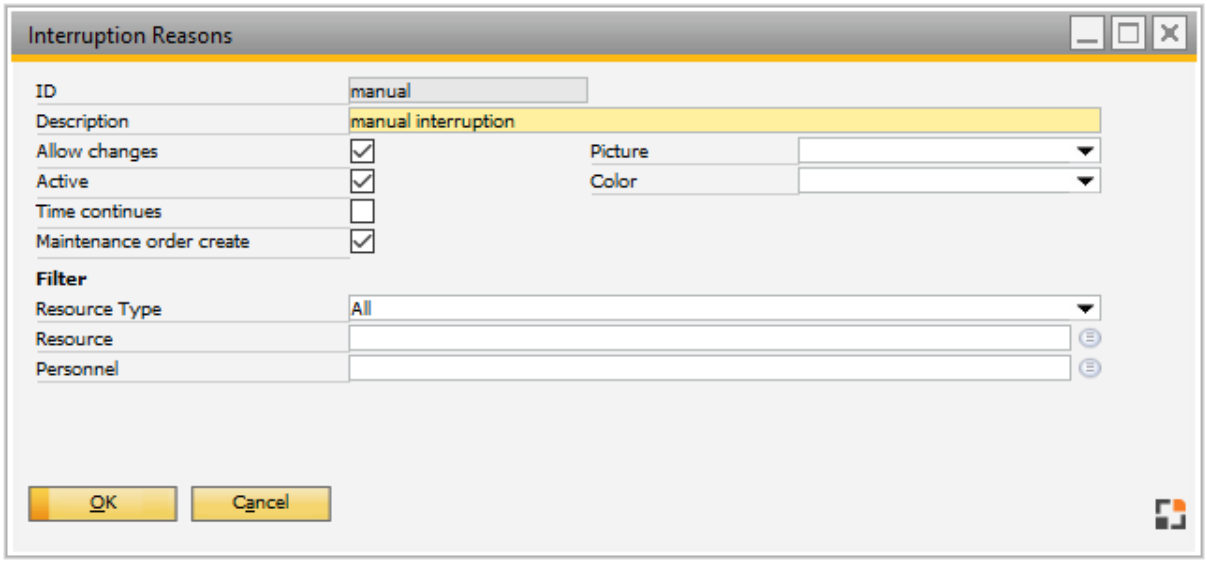
3.2.6.4.1 Edit Interruption

PATH: Administration > Setup > Production > Interruption Reasons > **Open** button.

In this window you can:

- Create a new interruption manually
- Stop running interruptions
- Plan interruptions
- Delete an interruption

Access: To administrate this window, you need access to Resources.



Window basis_stillstandgruende_edit.psr

Field	Description
ID	The ID of the interruption.
Description	Description for the interruption reason.
Allow changes	If active, the contents of the description can be changed by activating the interruption at the terminal.
Active	If deactivated, the entry cannot be selected at the terminal.
Time continues	Determines if the production time continues, as long as interruption is active. This can be activated e.g. if also costs of the interruption times should run on the current running work order. Interruption time continue *(beas 9.2 PL:00)*

© 2026 Boyum IT Solutions A/S

Maintenance order create	Defines if a maintenance order should be created when an interruption is created. This is used specifically when the interruption is linked with a planned maintenance. NOTE: WebApp Start Interruption does not support this parameter.
Image	Stored image for this interruption reason.
Color	Stored color for this interruption reason in the work order structure view. Independent from color setting of operation type.
Filter	Assign filters to the specific interruption reason. These can be: by resource type, resource, and personnel.
Resource Type	Select resource type from the drop-down menu: Resource, Tool or All.
Resource	Select resource(s) – multiple selection is available (***see*** image above).
Personnel	Select Personnel – multiple selection is available (***see*** image above).

This list is dynamically adjustable, and templates are supported.

See

Personnel – resources

Resources – interruptions

3.2.6.5 Cost elements

PATH: Administration > Setup > Production > Cost Elements.

Cost elements can subdivide and categorize all the incurred costs. The costs can be grouped into machinery costs, personnel costs, setup costs, external processing costs etc.
Cost elements are stored in resources, work sequences, tools, and so on. The usage of the calculation is defined in the calculation schema.
This grouping is then displayed in the pre-calculation and costing analysis.

Accounts can also be stored in cost elements. If an order report (FDC) is made, the accounts stored here are debited directly. Alternatively, the accounts can be stored in the calculation schema. In case

© 2026 Boyum IT Solutions A/S

the accounts are in the calculation schema, the accounts are debited on receipt of the finished part or closure of the work order.

Cost elements are grouped into cost element groups, allowing a summary per cost element group. Surcharges can also be defined in cost elements. These can be considered in the pre-calculation, cost analysis and posted separately.

Webinar: Financial accounting in Beas Manufacturing

3.2.6.5.1 Types of costs

The following basic costs can arise:

- Material costs
- Cost of external operation
- Non-material manufacturing cost
- Cost of tools
- And the definition of any surcharges

Extended costs evaluation makes it possible to split all costs except material costs. As an example we can split the cost in the following elements:

- Cost of Setup
- Labor Cost
- Machinery costs
- Quality control costs
- Tool procurement costs
- Tool maintenance costs

This is controlled via **Administration > Setup > Production > Cost Elements > Edit Group button**.

© 2026 Boyum IT Solutions A/S

Window settings and Templates are supported in this window.

Example: Tool

The procurement costs and maintenance costs go to different accounts and therefore must be considered separately with different cost elements. However, in the pre-calculation only the sum of the tool costs should be displayed.

A cost element groups can be set up to handle this requirement. The cost element group collects the cost elements that are defined in it. In our example the maintenance and procurement costs are summarized as tool costs in the group.

External operation

For external operation the costs can be posted to the WIP account at goods receipt.

see External operation - operation, Routing - External operation

3.2.6.5.1.1 Display of cost elements

Cost elements are analyzed in the pre-calculation and cost analysis, in surcharges, for example under the BoMs and work sequences.

This area is the calculation template, which is defined in **Setup > Calculation schema**.

The default calculation schema called *Dft* is supplied with the Beas installation.

© 2026 Boyum IT Solutions A/S

This template includes the material costs, external production costs, and production costs including surcharges. A division into cost elements is not considered here as these must be created separately.

To perform an analysis by cost elements, proceed as follows:

1. Create the cost element groups and cost elements.
2. Store the cost elements in resources.
3. Store the cost elements in the operation catalog or routings (these are transferred automatically when new resource entries are created).
4. Copy and edit the *DFT* calculation schema.
5. Remove the production costs object.
6. Insert the new object with the *Surcharge* type, surcharge on *Manufacturing costs.* Select *Cost element* in the reference field. Select the required cost element in the Cost element field.
7. Repeat this for all cost elements to be displayed. Alternatively this is also possible or even advisable with cost element groups.

Important: The *Manufacturing costs* object must be removed first, otherwise the costs is duplicated in the calculation.

see

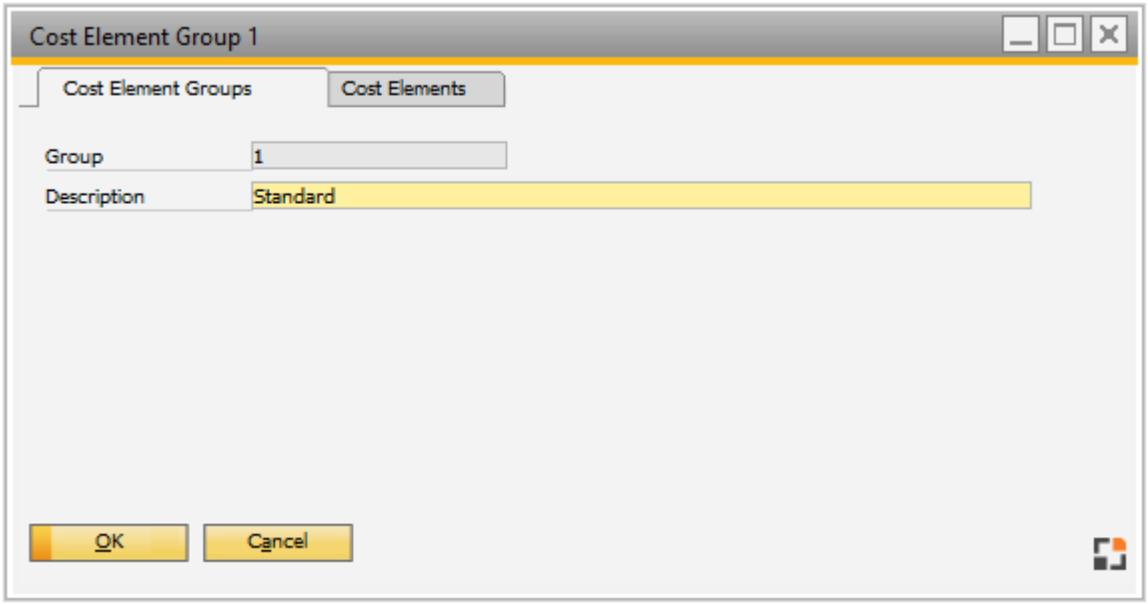
Calculation schema

Calculation objects

3.2.6.5.2 Cost Element Group

PATH: Administration > Setup > Production > Cost Elements.

© 2026 Boyum IT Solutions A/S



Window basis_ timetypegroup_ browse.psr

Field Description

Fields are available in the group list and in edit mode of the group details.

Field	Description
Group	Name of the group.
Description	Short description of the group.

Functions

Function	Description
Edit group	Edit group definition and elements.
Delete group	The entire group is deleted including all stored cost elements.
New group	Create a new group.
Cost Element Edit	All cost elements of the currently selected group are displayed.

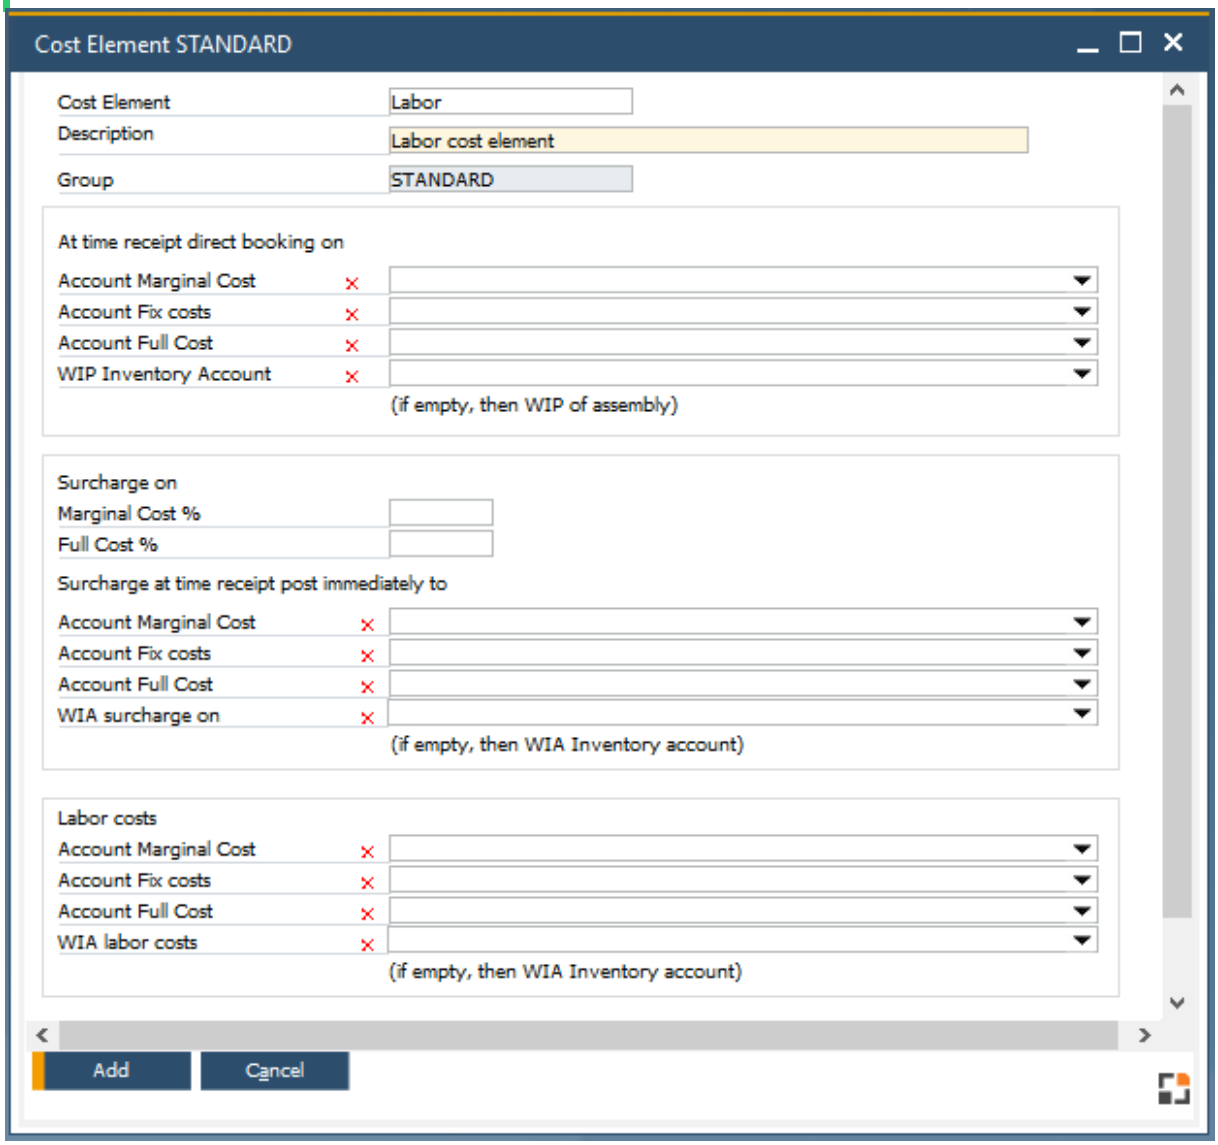
Tabs in edit mode

Tab	Description
Cost Element Group tab	Description of the group.
Cost elements	List of all cost elements that belong to the group.

© 2026 Boyum IT Solutions A/S

3.2.6.5.3 Cost element

PATH: Administration > Setup > Production > Cost Elements > "**Cost Element Edit**" button > **Open**.



Window basis_timetype_edit.psr.

Field Description

Field	Description
Cost element	Unique ID of the cost element. The ID must be unique across all groups.
Description	Description of the cost element.
Group	The cost group that the cost element belongs to.

© 2026 Boyum IT Solutions A/S

Note: Only fill the account values if the accounts should be credited during the time receipt process. This requires careful consideration. To avoid errors, it is recommended to post when receiving assemblies or closing the work order.

You can specify either overheads and fixed costs or full costs, but not all three values since that would result in duplicate posting.

At time receipt direct booking on

Field	Meaning
Account Marginal Cost	Account to be credited with marginal costs .
Fixed Costs account	Account to be credited with fixed costs (fixed costs = full costs - overheads) .
Full Costs account	Account to be credited with full costs.
WIP Inventory account	If the amount is not posted to the WIP inventory account of the assembly, another account can be used. Note: This option can only be used if it is configured in the Configuration Wizard as **Production > Valuation and Posting of Assembly > Use for component transactions > "Components WIP Account"**. **Set WIP accounts for Labor and Surcharge costs:**

Surcharges can be identified separately in the precalculation and costing analysis. Define the rate for surcharge in these fields.

Surcharge on

Tab	Meaning
Marginal costs %	Surcharge on the marginal cost rate
Full costs %	Surcharge on the full cost rate

Note: The surcharges can be posted directly, like normal costs, during the time receipt process.

This requires careful consideration. To avoid errors, it is recommended to post when receiving assemblies or closing the work order.

© 2026 Boyum IT Solutions A/S

Surcharge at time receipt post immediately to

Field	Meaning
Account Marginal Cost	Account to be credited with marginal cost.
Fixed Costs account	Account to be credited with fixed costs (fixed costs = full costs - overheads) .
Full Costs account	Account to be credited with full costs.
WIP Account	Define WIP Account Important: for older Beas installations where WIP Account is not defined, the system reads the "WIP Inventory Account" field. When you create time receipts with costs, the system generates WIP information in separate accounts (If defined):  Note: This option can only be used if it is configured in the Configuration Wizard as **Production > Valuation and Posting of Assembly > Use for component transactions > "Components WIP Account"**.

Labor costs

Field	Meaning
Account Marginal Cost	Account to be credited with marginal cost.
Fixed Costs account	Account to be credited with fixed costs (fixed costs = full costs - overheads) .
Full Costs account	Account to be credited with full costs.

© 2026 Boyum IT Solutions A/S

WIP Account	Define WIP Account Important: for older Beas installations where WIP Account is not defined, the system reads the "WIP Inventory Account" field. When you create time receipts with costs, the system generates WIP information in separate accounts (If defined):  Note: This option can only be used if it is configured in the Configuration Wizard as **Production > Valuation and Posting of Assembly > Use for component transactions > "Components WIP Account"**.

To delete an account entry, click on the ✕ symbol.

Webinar: Financial accounting in Beas Manufacturing

3.2.6.6 Shift schedule for resources

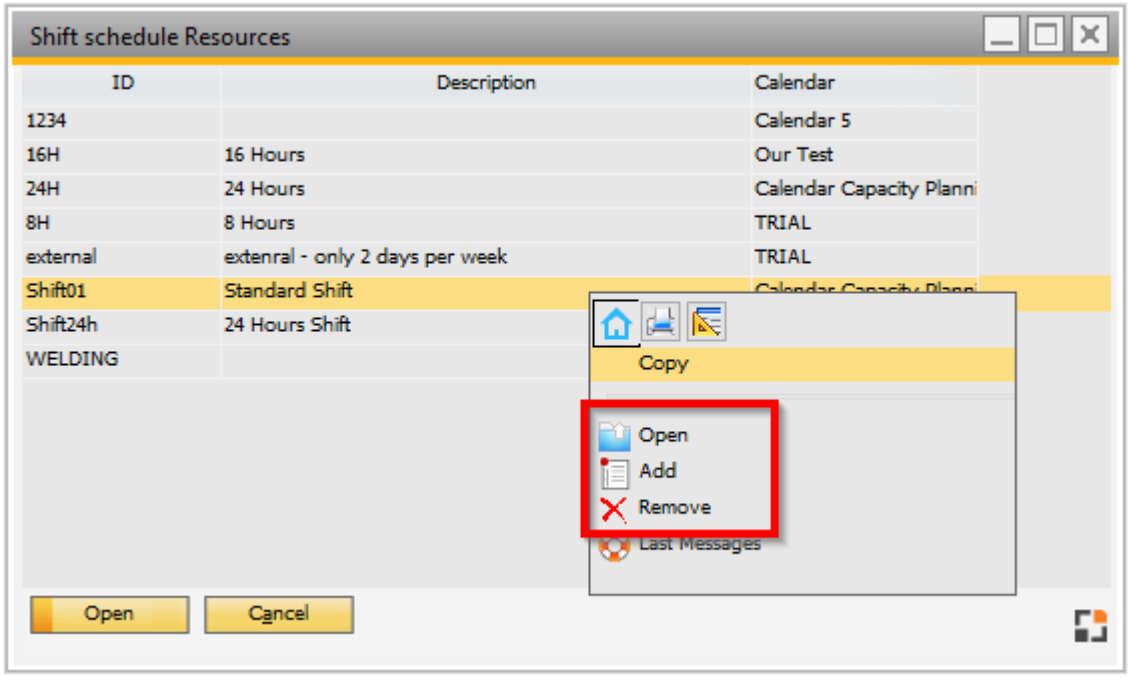
In shift schedule for resources you can enter the planned start and end time for the resource, and determine the available capacity.

The shift can be stored in a resource under the Scheduling tab.

PATH: Administration > Setup > Production > Shift schedule for Resources.

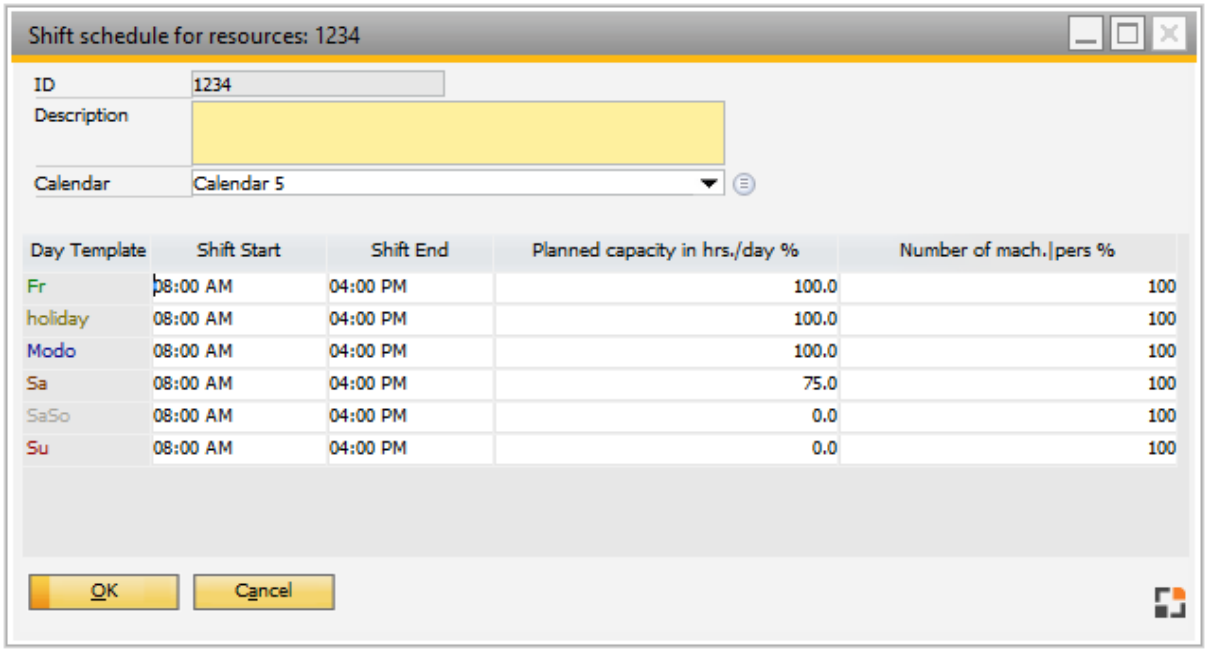
You can edit an existing shift, or add a new one with the help of the right-click menu or the controls below:

© 2026 Boyum IT Solutions A/S



Window basis_resource_layerplan_browse.psr

Click **Open** to add/modify information in the Shift editing window:



Window basis_resource_layerplan_edit.psr

Field	Description
ID	Shift ID.

© 2026 Boyum IT Solutions A/S

Description	Description of the shift.
Calendar	Selected factory calendar to be used as reference. The button opens the factory calendar.
Day template	You can deposite a day template with separate capacities per each line.
Shift Start/End	Start and End of shift Planned capacity is calculated as follows Planned capacity as set in resource * %-value as per shift calendar * number of persons per resource * %-value as per shift calendar * %-value as per factory calendar If the calculated planned capacity is bigger than the time between shift start and shift end, it is reduced to this value. ***Example:*** Shift from 10 to 16 Calculated capacity = 8 hours Calculated capacity will be reduced to 6 hours in this case. Additional dependencies: - Resource calendar - APS – calculation settings Note: The planned capacity is adjusted accordingly to the maximum available time if the time period between shift start and shift end is not longer than the planned capacity in hrs/day. If the time period is longer, it has no effect on the planned capacity, because breaks are considered to be included. **Note: Working over midnight** It is not possible to define a shift over midnight.
Planned capacity hrs./day %	With this value the planned capacity is multiplied. See above: Shift start/end

© 2026 Boyum IT Solutions A/S

	If capacity not 100%, beas ignores Shift Start / Shift End, because the calculation method is changed to Planned Capacity /hour : 100 * Planned capacity hrs/day% The calculated Start is at 12 o'clock - (planned capacity in hours : 2) The calculated End is 12 o'clock + (planned capacity in hours : 2)  Backward scheduling considers only the end date Forward scheduling considers only the start date ***Example***: If you define a shift from 8:00 AM – 4:00 PM you have a capacity of 8 hr. If you reduce the capacity to 75% your effective time is 6 hrs. beas overwrites Start/End with 12 AM +/ (6 : 2) hour calculated start time = 9 AM calculated end time = 3 PM
Number of mach. / pers %	With this value the number of machines / employees is multiplied.

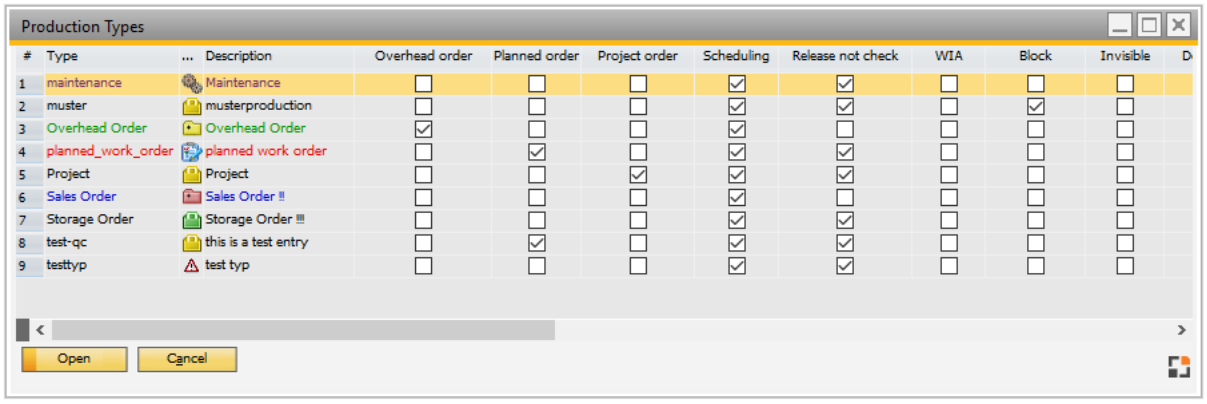
3.2.6.7 Production Types

There are different types of work orders. Here it is possible to define production types and their behavior.

PATH: Administration > Setup > Production > Production types

Window settings and Templates are supported in this window. UDFs can be set up in the Configuration wizard.



Window basis_fttyp_browse.psr

Besides the three types supported by SAP Business One

Standard – Based on the Bill of materials and used to produce a regular production item.

Special – Used to perform activities that are not necessarily Bill of materials items, e.g. repair orders.

Dis-assembly – Used to dismantle a parent item of the regular product into its child items.

in Beas the following types of work orders are available:

Field	Description

© 2026 Boyum IT Solutions A/S

Overhead cost order	Internal order for monitoring overhead costs. Overhead cost orders cannot be scheduled in Capacity planning.
Planned order	Only for planning purposes: requirement is considered in MRP and APS. No login or time receipts are possible. The switch can be set in **Configuration Wizard > Production > Master data > Work order types.** At new creation of this type, mark the columns "planned order" and "blocked".
Storage order	Production to increase stock without a current sales order.
Customer order	Production due to a customer order. This work order is connected to the purchase order.

This table provides an overview of all existing production types.The behavior of each production type can be adjusted individually. (Edit button)
The check marks in the table show the current behavior. (Box checked =enabled)

- Default settings

At new creation of a database the most important work order types are created automatically:

Type	Description
Sales Order	Work orders, firmly connected to a sales order
Storage Order	Work orders, not connected to a sales order. For make to stock.
Overhead Order	Overhead costs work orders

Note: This is only text, no user interface. That is why the entries are not translated. Entries are inserted using the language which was set up at the moment of installation.

Training database

Type	Description
Overhead Order	Overhead costs order: Scheduling, overhead costs, WIP, customer order enabled
Sales Order	Simple sales order: only scheduling enabled
Storage Order	Storage order: scheduling enabled

© 2026 Boyum IT Solutions A/S

If the table has been cleared manually or you are updating Beasfrom an old version, which did not contain production types, existing work orders are analyzed and the needed production types are created automatically.

For further information on production types ***see*** Basic Production Types

Store production types: Configuration wizard > Production > Create new > Production type for storage orders / sales orders
Work order document > Type

Right-click menu:

Name	Description
Open	Opens the selected production type.
New	Adds a new production type.
Delete	Deletes the selected production type.
Change log	Change log is displayed.
Support	Opens last error messages.

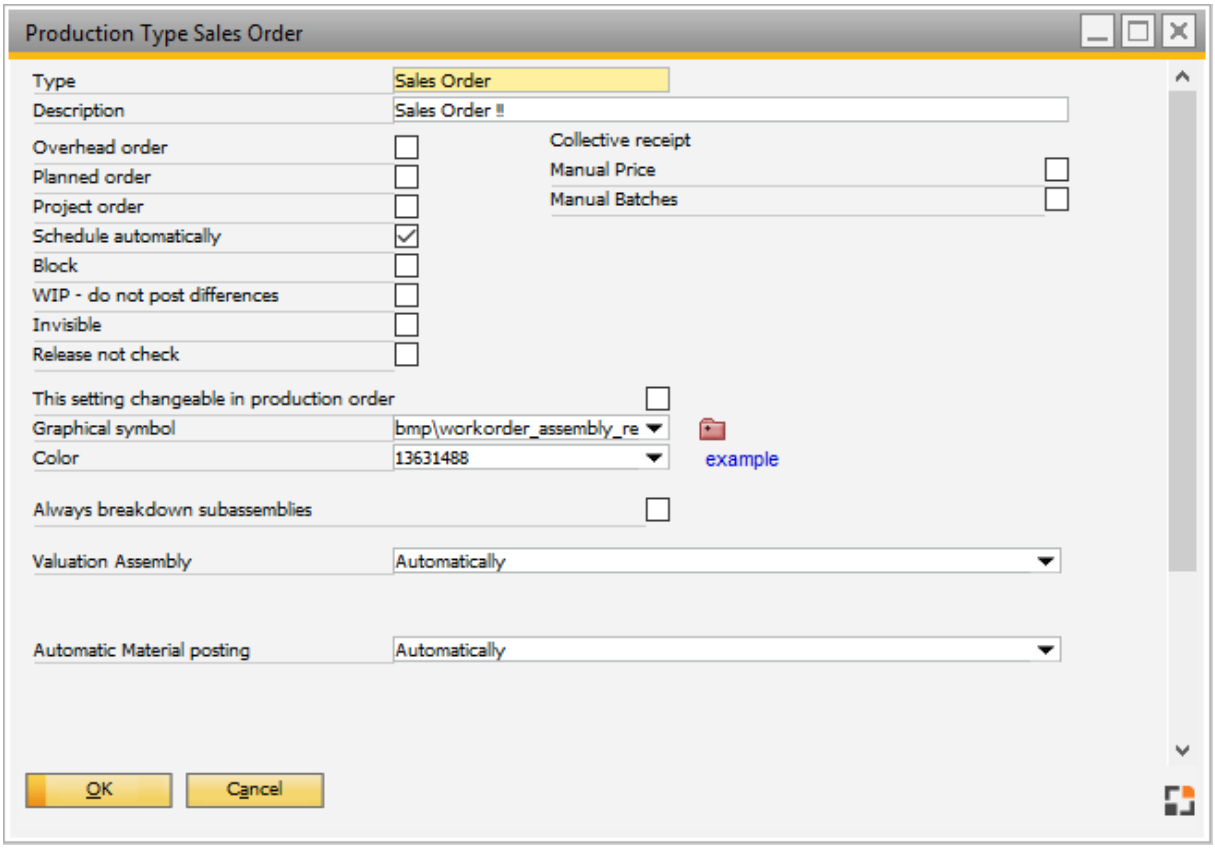
Edit/Add new production type

3.2.6.7.1 Production type - edit

In this window you can edit an existing / add new production type.

PATH: Administration > Setup > Production > Production types > "**Open/Add**" button or right-click menu.

© 2026 Boyum IT Solutions A/S



Window basis_fttyp_edit.psr

The Change log is available from the right-click menu.

- Field descriptions

Field	Description
Type	Short name of the production type. It can be changed and this chnage takes effect in all work orders.
Description	Long description.
Overhead order	- Work order as overhead order If active, this relates to an overheads order. This flag is transferred to work order. ***See*** Overheads. This can be used to register costs of non-productive work, like machine cleaning, training, etc. As an assembly, use it to insert a non-storage related item so it is not closed automatically and is independent of all other settings.

© 2026 Boyum IT Solutions A/S

Field	Description
	See Close work order automatically
Planned order	Work order is a planned order Planned work orders can not be started, and no material can be posted. They are created for planning purposes only. However, the work order can be scheduled for material and resource capacity planning. MRP2 (Material requirement planning – Resource requirement): If the work order has a sales order reference, it is displayed in *MRP2* as a sales order. If not, it is displayed as a forecast. The requirement of the order is taken into account in MRP and APS, login and completion confirmation is blocked. Therefore, both the planned order and blocked switches must be activated! The Consider planned orders switch in the MRP Wizard also affects the behavior of planned orders. *(BEAS_FTTYP.PLANNINGORDER=1)*
Project order	Project order The project order can be defined as one work order or one including several work orders. The work order defining the project is displayed as Project order (displayed green in the WO structure). As an assembly, a non-storage related item should be added. In this case the assembly is never closed automatically, regardless of the settings. ***See*** Close WO items automatically
Schedule automatically	If active (default), the work order is scheduled automatically backwards after it is created without consideration of the capacity (calculates with unlimited resources). Use APS, for capacity planning. If changes happen in an existing work order (dates, times, quantities, items or sub-structure) the whole work order is rescheduled. We recommend disabling this option for overhead orders and project orders.
Block	Work order is blocked after it is created, but can be released. This is the default type for the block flag. If activated is ignored by both APS and the purchase order list.

© 2026 Boyum IT Solutions A/S

Field	Description
WIP – do not post differences	If enabled, accumulated costs on the WIP account are not automatically booked to the difference account. This setting is useful for example for overhead orders. If continuous inventory maintenance is activated and the option to empty the WIP account is activated in the Setup Wizard, no postings are performed for work orders with this type from the WIP account to the WIP difference account. ***For example*** in overhead work orders transfer of the WIP amount is not desirable, since no assemblies are posted. Note: For customer-specific adaptation, a command which can be used to transfer the amount independently of this switch. You can use this e.g. to generate a monthly posting.
Invisible	Work order is treated like a closed work order, but it is active. Only times can be booked on this type of work order.
Release not check	Enables the production of blocked item versions. If you work with item versions, the production of an item version can be blocked in item version – status. Activate this switch to override the block in item version – status for this production type. When active, it is always possible to create a WO position for an I-Version. When disabled, it is allowed to create a Work order position only if Release I-Version and Create WO parameters are enabled. ***Example*** of use: A yet unreleased item version is to be created (Production blocked). You want to produce a sample, however. For this, a Sample order work order type is be created, in which this flag is activated. As a result, it is possible to create a work order for a blocked item version.
This setting is changeable in production order	Refers to both the graphical symbol and color switches. If enabled, the graphical symbol and color can be changed in the work order.

© 2026 Boyum IT Solutions A/S

Field	Description
Graphical symbol	This order is displayed in the tree view with the chosen image.
Color	The order is displayed in the chosen color in Work order list. Note: the selected color is not displayed in the Work order structure!
Always breakdown subassemblies	If enabled, the system breaks down all sub-assemblies, whether they are stock- or order-related. This affects only newly created work orders. ***See*** work order item > always breakdown assemblies
Valuation of assembly	A separate valuation method can be set for a production type. For example, a repetition part can be valued at standard costs, a repair order at post calculation price etc. It can be set to automatic in **Configuration wizard > Production > Valuation and booking of assembly > Valuation**. This option affects assembly posting only. The following selections are available: *Window basis_fttyp_edit.psr* Note: When working with the Merge function, a production type with the "like manual posting" valuation method needs to be created.
Pricing at valuation	Determines which calculation value from the calculation schema is used for valuation. The option is only visible if *Post calculation* or *Production planned costs* was selected from the Valuation Assembly drop-down list.
In house production pricing booking	Determines which price list is to be used for valuation. Only visible if *As Stock Transfer* was selected from the Valuation of assembly drop-down list.
Automatic material posting	Determines how to execute the issue of materials for the production type: • at first operation • at last operation • no automatic

© 2026 Boyum IT Solutions A/S

Field	Description
	• automatically By default this is set to automatically. In this case settings in the Configuration Wizard apply. All other options override the settings in the Configuration Wizard. This option is only available if "work order backflushing" was not selected in the Configuration Wizard. ***See*** Configuration wizard – material posting.
Collective receipt – Manual Price	If enabled, the price can be entered manually in Production > collective receipt.
Collective post in – Manual Batches	If enabled, in the batch numbers can be manually entered in Production > collective receipt (for example for disassembly processes).

3.2.6.8 Operation types

PATH: Administration > Setup > Production > Operation types.

This table provides an overview of all existing operation types. The behavior of each operation type can be adjusted individually. (Edit) The check marks in the table show the current behavior. (Box checked = enabled)

Field	Description
Setup time	Setup time for Pre- and post-calculation The setup time in hours or minutes is taken into account in production and costing analysis as well as in Precalculation. Note: Designation can be changed in Configuration wizard – Resource – Definition Time types. **Precalculation and Lot size** Setup time is calculated per calculation lot size. ***Example:*** Lot size 10, setup time=5 minutes, calculated: 19 pieces Result: total setup time 10 minutes or 0,52 per piece If a sub-assembly has its own calculation lot size, it will be taken into account. ***See*** Precalculation – View and lot size. **Production and lot size** If a work order is created automatically (e.g. via order recommendation report or sales order to work order, a separate work order position per

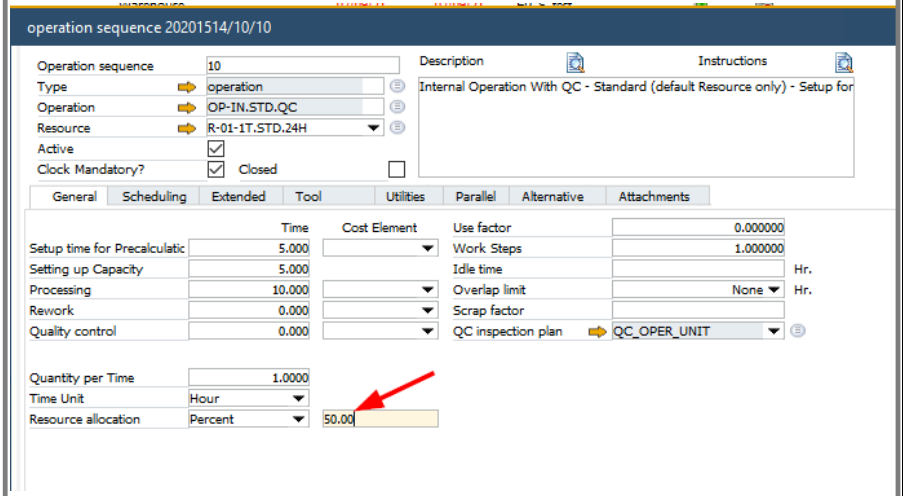
© 2026 Boyum IT Solutions A/S

	item-lot size is created. The setup time indicated here refers to the lot size in item master. **Separate reporting of setup times** If "Extend to cost elements" was set to 2 or more in the Resource, the setup time can be reported separately via FDC and evaluated separately in calculation. Enter the cost element to which the accrued costs are posted.
Setup time Capacity	The set-up for scheduled capacity in hours or minutes is considered in capacity planning and throughput time calculation. This setting has an effect on calculation of target time.
Mach+Labor Time/unit	The actual processing time per work step. The field designation can be changed in **Configuration wizard > Master Data > Resources > Time types** or via Ctrl+ double-click in the text field. Times are specified in units "Times in ..." (hour/minute) and refer to "Times per .. " finished parts taking account of the utility and work steps in units of usage of the assembly. The Cost Element field specifies the cost element for which the planned or accumulated costs should be totaled, facilitating detailed analysis. Tools that determine the throughput time and also alternative operations can only influence the job time (processing time). ***See*** Calculation of planned time.
Secondary, main time	Secondary time and main time. In addition to the job time, two other secondary processing times can be specified if "Extend to cost element" is set to 3 or 4 in the resource. The secondary processing times are designated in Configuration Wizard or via Ctrl+Double click in the text field. ***See*** Concept Time types.
Quantity per Time	Determines the assembly quantity the time refers to. Enter to which assembly quantity (Production UoM) the time refers to. Thus you can indicate even short lead times correctly.

© 2026 Boyum IT Solutions A/S

	Example: Lead time 0,0001 minutes per piece To make it more readable, you can enter 1 minute per 10000 pieces If it is a fixed time, enter 0 at "quantity per", that means this time is needed only once per lot size. Same effect as for setup time. ***Example:*** Lot size 10 Production 50 pieces Time = 2 Minutes per 0 Total time: 5 lot sizes a` 2 minutes = 10 minutes **Fix Quantity: Quantity per Time = 0** This means you need the time per lotsize ***Example***: 3 Minute per 0, you produce 100 Pcs. The System calculates 3 Minutes for all 100 Pcs. For additional information on lot sizes ***see*** Precalculation – Display and lot sizes.
Time Unit	Unit of time in which times are stored – hours or minutes. The default can be stored in the options.
Resource Allocation	The extent of utilization of a resource. Determines the utilization of the available resource capacity.  ***See*** Default Calculation type: Reallocate forward.

© 2026 Boyum IT Solutions A/S



Type	Description
Number	Number of resources used (subject to the prerequisite that the resource exists more than once, e.g. if the resource is a group of persons. Where 2 is input for 5 persons, the resource of 2 persons is scheduled at most. Note: If this is not 1, the system uses the calculation method Exploit Full capacity for this routing position.
Percent	Percentage utilization of the resource. ***Example 1***: Group of 6 persons. At a utilization of 50% the resource of 3 persons is used at most. ***Example 2***: Machine which is only partly utilized. To extend the throughput time, a lower utilization can be specified here. If 20% is specified, throughput time is quadrupled while costs remain the same. Note: If this is not 100%, the system uses the calculation method Exploit Full capacity for this routing position.
Simple	Default setting: For "Simple", only one resource is 100% utilized.

Note:

© 2026 Boyum IT Solutions A/S

	For Detailed planning (i.e. a resource should be planned to the minute) the option must be set to "Simple".
Operation active	Determines whether the operation is active and can be used You can set here whether the operation should be included. Apart from Yes/No, a condition is also possible, such as production quantity greater, in between or smaller than a specification defined here. ***Example***: The operation in which a small machine has been defined should only be used when the production quantity is smaller than 30. If it is greater, an operation should be used in which a large machine with a respectively higher set-up time but smaller mach+labor time is stored. Quantities refer to "per units of usage" of assembly. Note: This switch is only visible if in the Configuration wizard – Routing – Operation field show is activated. Operation catalog: In operation catalog this field is not available. Routing: In routing it can be set up depending on the quantity: **Yes**: Always active. **No**: Not active. Quantity bigger: Only active if quantity exceeds the given value. Quantity smaller: Only active quantity falls below the given value. Quantity between: Only active if the quantity is between two given values. Thus you can activate a routing depending on the quantity. ***Example:*** Depending on the quantity, a certain resource is to be used. until 10 kg (active quantity < 10 kg): Resource "small bowl", planned duration: 10 minutes from 10 kg (active quantity > 10 kg): Resource "big bowl", planned

© 2026 Boyum IT Solutions A/S

duration: 20 minutes

Field description

The value is saved in `aktivformel` with the following configuration `Id=Value1=Value2`

G = "Quantity bigger"

K = "Quantity smaller"

Z = "Quantity between"

N = "Not active"

J = "Active" (Default)

If the field is empty, the entry is treated as active.

Example: Only active for quantity between 10 and 20 "`Z=10=20`"

Note regarding variants / formulas

Only the following values may be returned here if a formula has been stored via the – icon: Y for "Active" or N "Not active". "bigger", "smaller" or "between" are not allowed via the formula system.

Generate Work order

By defining value "N" in the formula, the system does not insert the routing position in the Work order. This is to be activated in **Configuration wizard > Production > Create >** Apply inactive work order sequence.

Generate Precalculation

In Precalculation the system always transfers inactive routing positions. *(beas 9.3 PL 2)*

Generate new Item (Product Configurator)

By defining the value "N" in the formula, the system does not insert the routing position in the Work order. This is to be

© 2026 Boyum IT Solutions A/S

	activated in **Configuration wizard > Production > Product Configurator >** Apply inactive work order sequence *(beas 9.3 PL 2)* **Active field as Script** If you click in field Pos on – icon, you can define all fields with `setvar=e_[fieldname]=value` If you want to disable a routing position, use the following script: `setvar=e_aktiv=N` With *beas 2020.02* the Variable "`e_aktivformel`" is not supported. Pre-calculation In Precalculation there is an active-field and an "only if quantity" .... The second field has the same meaning as in routing. The operation is only active if the condition is met. Work order Only active routing positions are transferred to the work order. If you make a selection in the Configuration wizard to accept inactive routing positions as well, these will be transferred to the work order, and deactivated. You cannot log on to these operations and they do not cause time demand. This switch can be disabled manually.
Valid Period	In Precalculation Operation: Select the From - To dates of a validity period.
Use factor	Determines the use factor of the operation If several parts are produced with only one work step, the use factor is higher than 1. ***Example*** Cut a plate with a saw Duration: 1 minute Result: 2 plates, per 1 plate, only 30 seconds are required. Use factor in this case:2

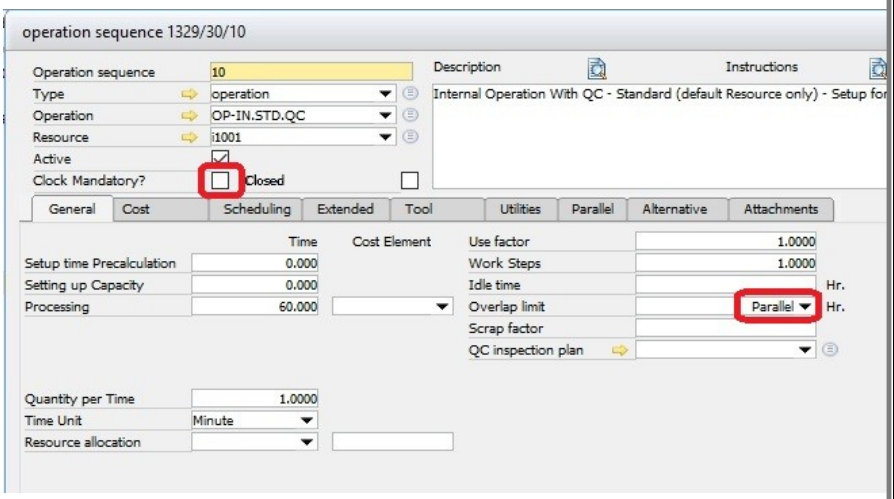
© 2026 Boyum IT Solutions A/S

	Example 2: Injection molding with 12 nozzles. One process creates 12 parts, the use factor is 12 in this case. ***See*** Calculation of planned time.
Work steps	Works opposite to the use factor. Define how many work steps are needed for one part If several steps are needed to finish one part you can enter the number here ***Example:*** Tighten 10 screws. Per screw, 15 seconds are needed. Piece time is `15 seconds` Work steps `10` Total time `15 * 10 seconds = 150 seconds` ***See*** Calculation of planned time
Idle Time	Idle time in hours in which the semi-finished part must not be further processed, e.g. drying time, cooling etc. `|--- Transfer time --| |-- Planned time --| |--- Idle time---|` The resource is available at this time for other orders. There are no arising costs . Forward Scheduling: The next sequence of operations can begin only after the idle period. The idle time should not be used for the extension of lead times. It is recommended to use transit time (***see*** resources). By default, factory calendar and resource calendar are not considered. These can be taken into consideration by changing the settings in the Configuration wizard.
Overlap Limit	The overlap time to the next operation is stored in hours. By using overlap settings, you can define the delay for the subsequent

© 2026 Boyum IT Solutions A/S

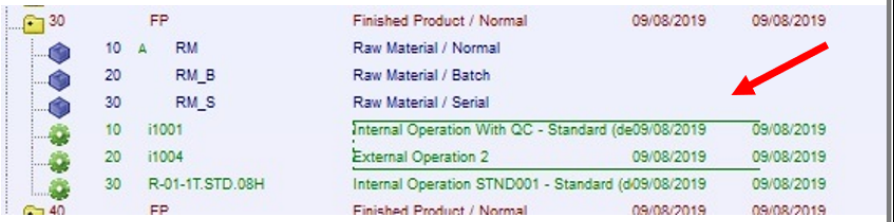
work sequence or define to start it in parallel.
Unlike parallel resources, the subsequent work sequence can be moved freely.

You can define the overlap limit in **Routing position > Overlap limit**.
Choose "Parallel", "No" or insert the number of hours/minutes manually.
If this is defined in Position 10, the next position will be parallel.
This means: "Clocking mandatory" must be disabled, because you can start with Position 20 before closing Position 10.



Window fert_arbplanos_edit.psr

In Item Structure view you can see parallel / overlap limit information in this way:
In this example in Position 10 the "Overlap limit" is defined:



Note:

Overlap calculation runs correctly only with forward calculation.

© 2026 Boyum IT Solutions A/S

Value	Meaning
0	No overlap.
Parallel	⊟ Next Routing position will have same or next possible start date ⊟ Forward calculation The earliest start date of the following operation can be the same as the first one or the next possible start. The next possible start may also be earlier than the one of the previous operation. ***Example 1 :*** Pos 1 is defined as parallel, so Pos 2 can start parallel to Pos 1  View in Beas  Start of 3. routing position is after the end of the

© 2026 Boyum IT Solutions A/S

Value	Meaning
	latest parallel routing position. ***Example 2***: Pos 2 needs less time than Pos 1.  View in Beas  Start of next routing position is always after the end of the latest parallel routing position. ***Example 3:*** *Scenario:* Position 3 is parallel to Position 2, but after Position1 finishes, resource for Pos 2 is not available. For example Resource is reserved by another work order. If the resource is not available immediately, the routing position starts at the next available time. In this example, the position 3 can start **BEFORE** the first position:

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 ***Example 4:*** Scenario: 2 work order positions. Both WOs have defined the 2. operation as parallel. Start date is same. First operation has different resource, but the second parallel operation has same resource for both WOs. Explanation: The parallel resource uses the start date, on which the resource is free. For the first WO this is the time when operation 1 starts. In the second work order position you see that the start date of second operation does not start together with the first operation. The reason is that WO 1 already occupies the resource. So the second operation of WO can only start after the operation 2 of WO 1 stopped. In that case the the second operation does not start parallel but delayed:

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 You can set parallel-defined operations to always run in parallel in the Configuration wizard. Result with setting "Overlap limit = fix" Start date of Pos 40 on Resource i1001-1 start later, because the next resource i1004 is not available before. 
© 2026 Boyum IT Solutions A/S

Value	Meaning
	See APS fix parallel routing positions Backward Calculation The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration. Parallel resource: The system calculates the following:  If duration of Pos 2 is less than that of Pos 3, then Pos 1 ends with the start of Pos 2.  In this case, the system is working different from forward calculation. If you work with backward calculation, the first parallel position must have the longest duration. Differences between parallel resource and parallel operation Parallel resource: - is always parallel - 100 % - Parallel resource have always same start / end

© 2026 Boyum IT Solutions A/S

Value	Meaning
	time - Use Parallel resource, if you don't need this resource 100% (Example: A worker is the "parallel resource", but is working on 4 machines in parallel. In this case he must invest only 25% for his time for this operation) Parallel Operation: - is not always parallel. Only if the resource of parallel operation is available - can have different work time - can work with resource optimization - can have own parallel resource, tools and so on
> 0 Overlapping	Overlap of the following routing position or assembly if it is the last routing position. Forward Calculation The Overlap time define, when the next operation can be started. The time, which you define, is the delay in hours/minutes, until the next operation starts. The defined time is the earliest time. **Example:** 2 hours means, the next operation can start - 2 hours after start current operation or after end of this current operation (if the current operation is less than 2 hours) - if resource of next operation is not available after 2 hours, then at the time, when the resource is available. **Example:** In this scenario the start date of the third routing position is the real start date of the second routing

© 2026 Boyum IT Solutions A/S

Value	Meaning
	position + defined overlapping time in hours, here 1 hour.  An overlap is specified in hours – based on a 24-hour day. The specified overlap always applies to the following routing position. The overlap time is not bound to a resource calendar. This is purely hour-based time excluding time reservations or other factors. The overlap time begins AFTER the transit time. The next routing position cannot possess a transfer time, otherwise it will be appended to the transfer time. ***Example:*** Scenario: 2 Work orders, same routing plan. In first operation different resources. Overlap limit = 0.5 hours First work order: Position 20 start 0.5 hours after

© 2026 Boyum IT Solutions A/S

Value	Meaning
	start of position 10 Second work order: Position 20 start later, because the time is reserved from first work order  If you want, that the overlap have always exact the same overlap time, a setting is available. ***See*** Configuration wizard ***Example:*** Scenario: Work time of second work order position is less than the work time of the first operation. In the first operation, overlap time is defined:  In this case you're ready with second routing position before you're ready with first routing position. But you can start with third routing position only, if all parallel / overlapped routing

© 2026 Boyum IT Solutions A/S

Value	Meaning
	positions are done. In this case after end of Routing position 10.
	Backward calculation
	In a simple example the result of backward calculation is same as forward calculation Example: Work time 1 hour, overlap 0.5 hour in first operation  But is the duration of second operation is not same as first operation, then the result is different to forward calculation: The system calculate backward: First 30, then 20 - from 20 the overlap is calculated (Start time from Operation 20 + Overlap time from Operation 10 = End time from Operation 10.  Alternative for backward calculation is "forward late as possible" Note: The backward calculation cannot calculate the

© 2026 Boyum IT Solutions A/S

	<table><tr><th>Value</th><th>Meaning</th></tr><tr><td></td><td>correct start date. It is only capable of calculating the duration.</td></tr></table>
	Note:
	The last operation corresponds to the last "reportable operation".
	If an overlap is also configured in the last operation, Beas does not recognize this as the last operation.
	However, the automatic assembly receipt or adjustment of the backflushed material depends on this.
	
	Overlapping using assemblies
	Assemblies can also overlap in an order-related structure.
	Example:
	`|- Main assembly -|`
	`|--- Subassembly -|`
	
	Start date of the main group is normally the end date of the last routing position of the subassembly. If this last routing position has an overlap, this is also considered.
	Important: If an overlap is entered in the last routing position, it is no longer recognized as the "last routing position" in the backflushed posting transactions.

Scrap Factor	Scrap factor related to this routing position in % In this field an additional Scrap factor on routing position level can be defined. This is calculated as (Mach+Labor) / 100 * Scap Factor Example: Production 8 Pcs Setup Time = 60 Minute Labor Time = 10 Minute

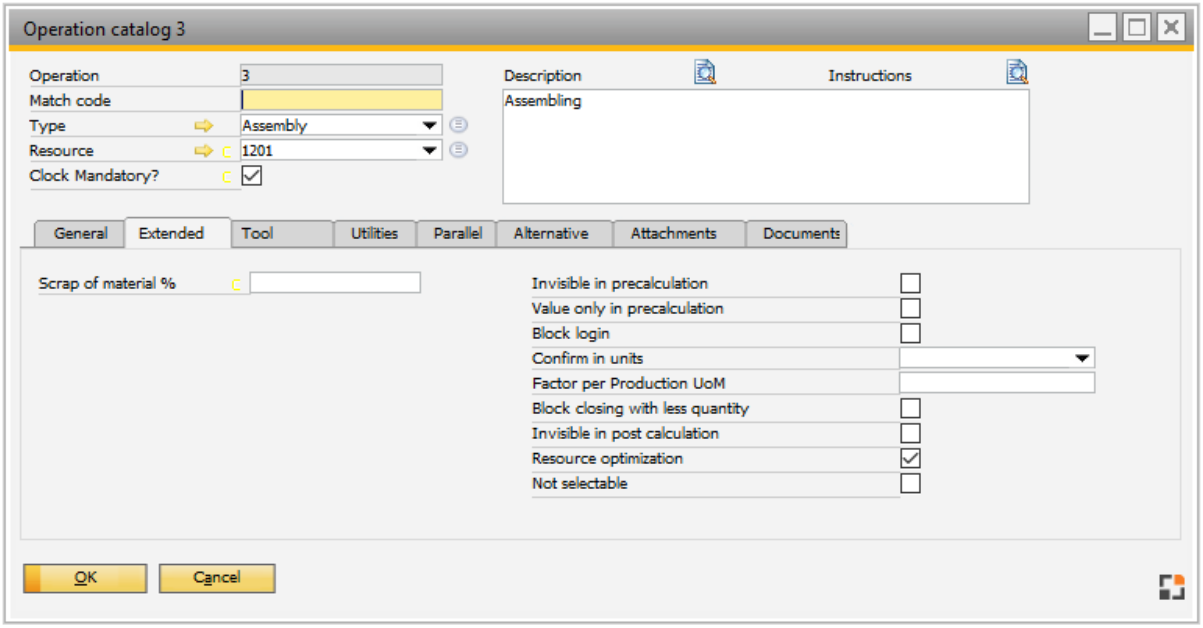
© 2026 Boyum IT Solutions A/S

	Scrap Factor = 5 % Total Time = 60 + (8 * 10) + (8 * 10 : 100 * 5) = 144 Min.
QC Inspection Plan	Store a QC-inspection plan in operation If a QC-inspection plan is stored, – depending on the settings – a QC order will be created. ***See*** Configuration wizard Measured values can be registered via QC-order, Terminal or WEB-Apps. If respective rules are defined, the release of the next operation may depend on that. ***See*** Configuration wizard – FDC – login rules ***See*** QC-inspection plan Quality control order
Number of payslips	Information field – if applicable, for information on number or pay slip printouts.
Expand to Cost Elements	In Precalculation Operation: Select the number of cost rates. The default is one cost element (processing time), which can represent a mixed calculation of machinery and personnel costs. Select the number of cost elements you are to use in Precalculation, update the window, and the selected cost elements appear in the Costs tab. ***See*** more details in Costs.
Value Labor costs separately	In Precalculation Operation: If this option is activated, a separate cost rate can be stored for personnel costs and the "Labor cost rate" field appears in the Cost tab. ***See*** also Costs.

3.2.6.9.2.2 Extended

Administration > Setup > Production > Operation Catalog > Open an operation to edit > **Extended** tab

© 2026 Boyum IT Solutions A/S



Field	Description
Valid from / to	Define the Valid Date Area. If no date was entered, it is valid always, otherwise only in the specified period. **Precalculation:** Precalculation date serves as reference. In Precalculation, all BoM positions are displayed but only the valid ones are valued. **Production** Depending on **Configuration wizard > Production > Capacity planning > Default calculation method** Calculation backwards: Delivery date serves as reference. It is checked only at work order creation. If the delivery date is changed subsequently, there is no second check as long as the work order is not updated. Item-Processing time: The Delivery date of the respective assembly serves as reference. The item-processing time of the respective assembly will always be used for the calculation of the completion date of a sub-assembly *(beas 9.1 PL: 08)*.

© 2026 Boyum IT Solutions A/S

Field	Description

	Creation via ue_api_wo
	The parameter "validdate" can be defined additionally, if the work order will be created via the API. *(beas 9.1 PL: 08)*
	`declare=wo=ue_api_wo`
	`wo=set=validate=<mydate>`
	`// .. normal script to create or refresh a work order`
	
	Sales order in Order recommendation
	At breakdown of the assemblies the delivery date of the sales order is used, minus the average delivery time, stored in the Configuration wizard.
	
	Special case: **Configuration wizard > Production > Capacity planning > Default calculation method = Default calculation method**
	The calculated date of requirement of the respective sub-assemblies is used as reference date for sub-assemblies.
	
	Example 1
	A supplier changes the item number from a given date
	Pos 10: previous item number until date x
	Pos 20: new item number from date x+1
	
	Example 2
	At date x additional material is required.
	If larger changes are needed, we recommend to use item version control.

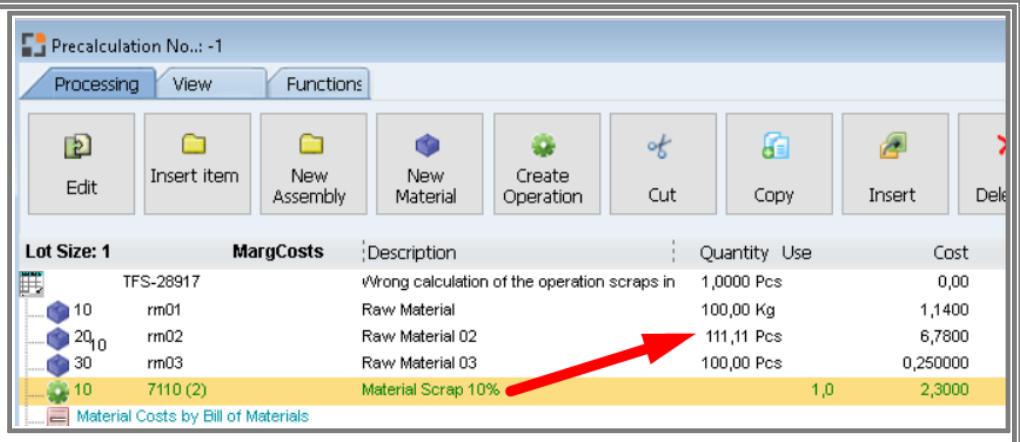
I-Version From	Field used to select the first I-Version to be taken into account in a range.
I-Version To	Field used to select the last I-Versions to be taken into account in a range.
I-Version Range	Field used to select the specific I-Versions to be taken into account. Clicking on the will open the Multiple selection window to choose several versions.
Scrap of Material	Material scrap %

© 2026 Boyum IT Solutions A/S

Field	Description
%	In **Routing position > Extended** you can define the Scrap of Material related to a routing position. ***Example:*** You must produce and fill 6 kg of paste. 15% is lost during filling. Now you must calculate how many liters of paste are needed. **Calculation** Correct formula is: Quantity: (100 – Scrap %) * 100 If you need 6 kg of finished product, you need 6 kg : (100 - (0.15) * 100 = 7.059 kg paste If you see the opposite: I fill 7.059 kg paste and lose 15% = 7.059 - (7.059 / 100 * 15) = **6 kg** In the **Configuration wizard >** "Behavior for Routing Scrap of Material % affects" you can define how the program should work. The "Exceeding planned quantity allowed" affects BoM position - material scrap: The Minimum/Maximum percentage is calculated based on total quantity. ***see*** Configuration setting. The following settings are available: Only the linked material is affected by the Scrap % setting Result see this example:

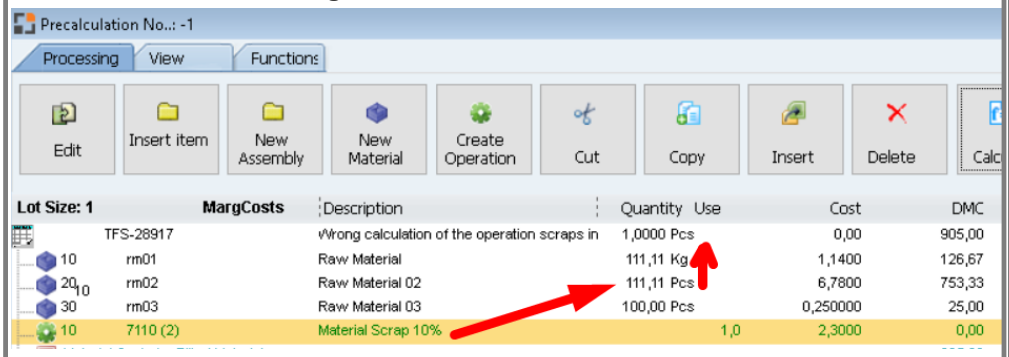
© 2026 Boyum IT Solutions A/S

Field	Description

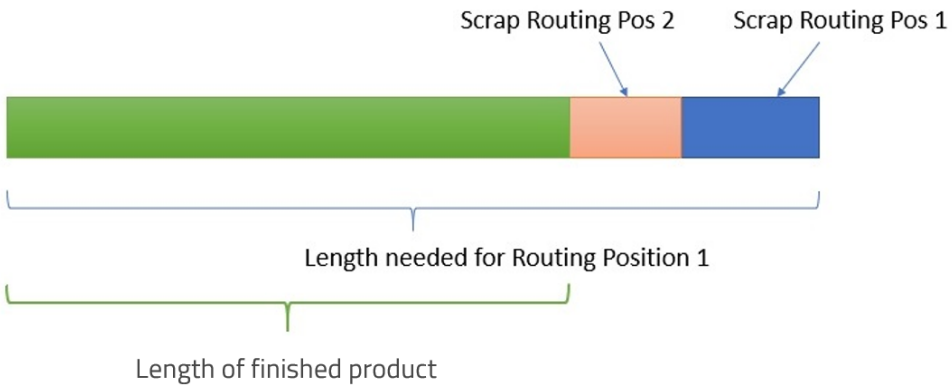


All materials under the last linked materials are affected

This is the Standard setting



Example: When a bar is sawed, a scrap rate of 10% may incur. If the material is ground, the bar becomes even shorter, that is a longer length must be cut beforehand,



Example:

© 2026 Boyum IT Solutions A/S

Field	Description

We need a finished product with a length of 250 mm.

We start with 308.65 mm - sawn : scrap 10% = 277.78.
Continue with 277.78 mm - ground : scrap 10% = 250 mm.

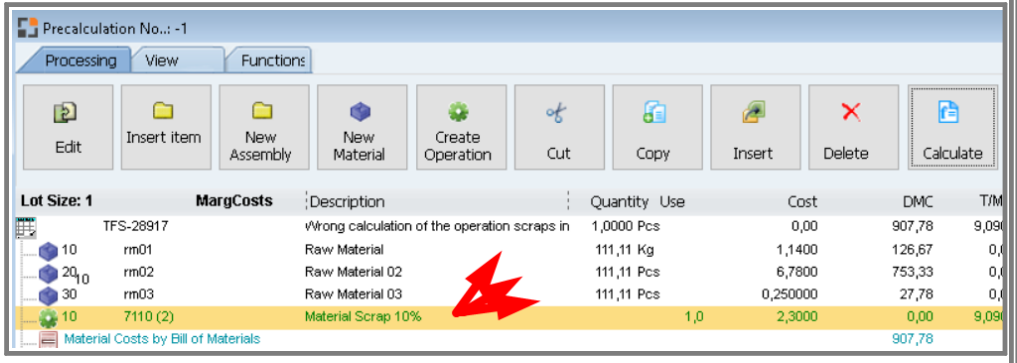
Routing Position	Material	Quantity	Scrap %
10 sawed	bar	308.65 mm	10
20 ground		277.78	10
30 QC		250 mm	

Calculation

Correct formula is: Quantity : (100 – scrap%) * 100

Position 20 we need 250 : (100 – 10) * 100 = 277.78
The value is entered into the production BOM item, column "calculated scrap" as fix value.

All materials are affected by the Scrap % setting



Notes:

- This field is only visible when the parameter in **Configuration wizard > Master data > routing > "operation related material scrap**" is enabled.
- The Item Report – Item Structure report does not support Material Scrap factor on Routing Level.

© 2026 Boyum IT Solutions A/S

Field	Description
	• Enable this option only if absolutely necessary; the computation will take considerably longer. • In Work orders this field is blocked, because scrap of material is determined only at the moment of creating the work order. • When checking which routing positions are considered, the following criteria apply: - Validity date - Active (no formula, no quantity check) - Variants (A–Z) Not checked: - Variants formulas, Product configurations
Personal allowance %	Define the rate of personal allowance. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Recovery time %	Define the rate of recovery time. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Efficiency Rate %	Define the rate of Efficiency rate. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Invisible in Precalculation	Control the visibility The position is inserted in the calculation but not valued and also not displayed, i.e. these are available here but completely invisible. Creating a work order from calculation, this operation will be inserted. Different behavior applies to "blocked operations". These are not included into the work order. *Field in Document: precalc_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 2* *Example:* *0*00000 = Pos 1 = 0 = Off *1*00000 = Pos 1 = 1 = On
Value only in	Control the Visibility "only in pre-calculation" If this option is active, the position is only valued in the Precalculation, but is not

© 2026 Boyum IT Solutions A/S

Field	Description
Precalculation	transferred to the work order and is also ignored in the scheduling function in the material requirements list. *Field in Document: workorder_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 2* *Example:* *00**0**000 = Pos 2 = 0 = Off* *01**1**0000 = Pos 2 = 1 = On*
Block Login	Block the login or receipt of order times If active, the affected resource is not reserved and a logon/logoff or time-related message of any type is blocked (the "Clocking mandatory" option must be deactivated). *Field in Document: workorder_lock* *Field in Database: BEAS_FTAPL.FLAGS, Pos 3* *Example:* *000**0**00 = Pos 3 = 0 = Off* *001**1**000 = Pos 3 = 1 = On*
Confirm in units	Confirm in Units Determines in which UoM quantities will be reported for this operation sequence via the terminal. ***Example***: Production Unit = kg Confirm unit = Liter, Factor = 1.2 If you create a time receipt with 1 Liter, you confirm 1,2 kg in production unit This is considered in Production Time Receipt External production - Collective Purchase Order.
Factor per Production UoM	Unit conversion factor Determines the conversion factor between time receipt unit and the production unit of the Assembly ***Example:*** Example: Production Unit = kg Confirm unit = Liter, Factor = 1.2

© 2026 Boyum IT Solutions A/S

Field	Description
	If you create a time receipt with 1 Liter, you confirm 1,2 kg in production unit
Block closing with less quantity	If active, the planned quantity needs to be posted If this option is enabled, the operation can only be completed with a time receipt if: - the full planned quantity was reached - the reported quantity of the previous operation (mandatory to report) was reached, the quantity is larger than 0 and the previous operation is closed. Note: The operation can be closed at any time. *Field in Document: workorder_minqtylock* *Field in Database: BEAS_FTAPL.FLAGS, Pos 4* *Example:* *000**0**00 = Pos 4 = 0 = Off* *000**1**00 = Pos 4 = 1 = On*
Invisible in post-calculation	Define the visibility on post-calculation. If active, the position is hidden in the post-calculation – for planned and actual cost calculation. *Field in Document: postcalc_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 5* *Example:* *00000 = Pos 5 = 0 =*
Resource optimization	Activate resource optimization. If enabled: If the stored resource is part of a resource group, at scheduling, the resource is automatically selected from the group with the shorted lead time. Note: Option can only be changed if the APS has been licensed. ***See*** Resource group Alternative Resources *Field in Document: resourcenoptimization*

© 2026 Boyum IT Solutions A/S

Field	Description
	Field in Database: BEAS_FTAPL.FLAGS, Pos 6 *Example:* *000000 = Pos 6 = 0 = Optimization is on* *000001 = Pos 6 = 1 = Optimization is off*
Slave op. sequ. belongs to Master	Define which operation is the master-operation for this operation It is possible to define a master operation. An order time receipt is done automatically on all operations if a quantity or time has been receipted via the master operation. Thus a receipt can be done for multiple operations at once. ***Example:*** Master-operation 10 Slave-operation 20 Slave-operation 30 If an order time receipt is done on master-operation 10, so is an receipt done on position 20 and 30, as well. Important: A concatenation of multiple operations is not possible, which means that a master-operation cannot be a slave-operation at the same time. **Notes:** Master-Slave operations are not connected to or affect parallel resources or parallel working. Not supported in WebApps and by the "Open QC Order after transaction" setting. **Master-Slave operations - time receipt creation** **IMPORTANT NOTE:** When the user defines Master-Slave operations when creating a Time receipt for a "master" operation, Beas first generates all Time receipts for the slave operations, and *then* the time receipt for the master operation. Due to this sequence, if something fails during the time receipt process of the master operation, the previous Time receipts are **not** rolled back.

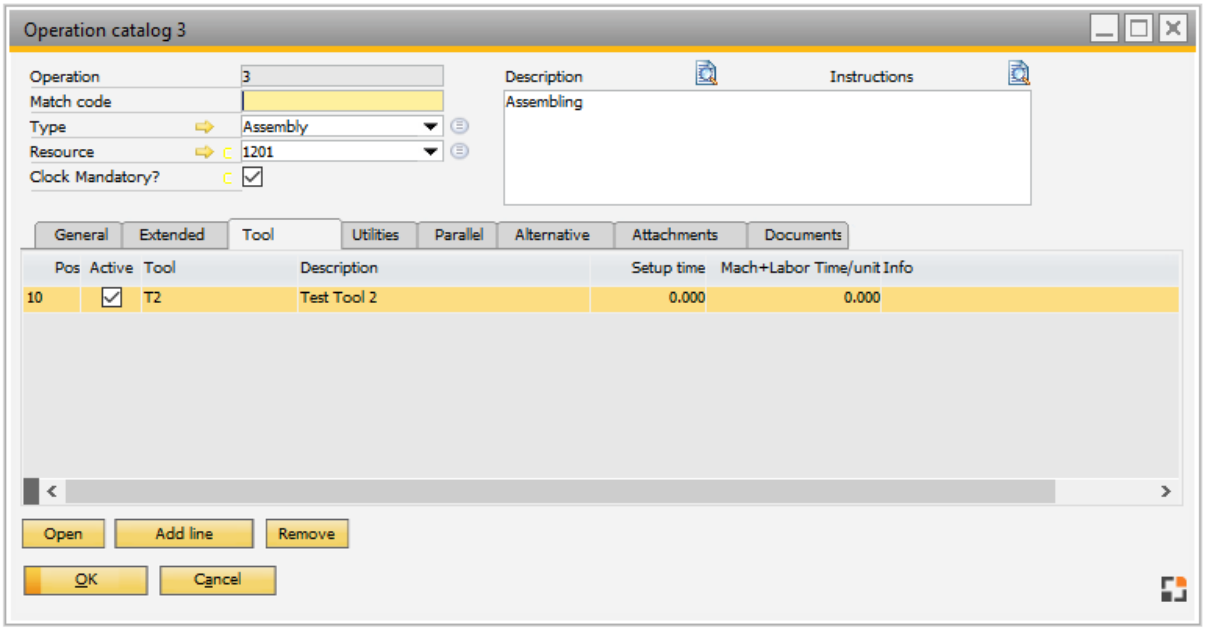
© 2026 Boyum IT Solutions A/S

Field	Description
	Working with master slave ***See***: Configuration wizard - Master-Slave
Not selectable	Only operation catalog: If active, the entry is hidden and can no more be selected.
Image	Image for this operation, for better recognizability ***See*** Image selection.
Color	With this color the operation is displayed in all screens. ***See*** Color selection.
Synchronization	Determine the behavior at import At import or inserting a routing position, the routing is always deleted completely and re-imported. Use the settings to manipulate the behavior on routing position level. **yes:** Position will be deleted before the import **do not delete:** Position will not be deleted, but can be overwritten **no:** Position will not be deleted and cannot be changed.

3.2.6.9.2.3 Tool

Administration > Setup > Production > Operation Catalog > Open an operation to edit > **Tool** tab

© 2026 Boyum IT Solutions A/S



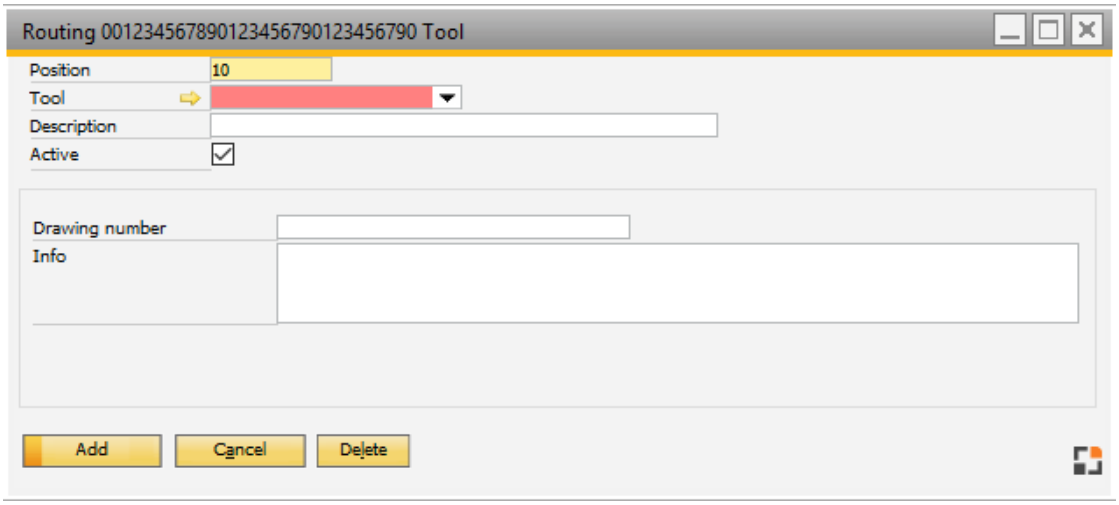
Field description of the Tool tab

Field	Description
Position	Consecutive number, but not a primary key. The list output is sorted by this number.
Tool	Tool key (selection from master data / tools).
Active	Checked if entry is active.
Description	Designation of the tool (cannot be changed).
Defines lead time	⊟ Does the tool determine the lead time? If enabled, the default times of the tool are transferred to the operation. In this case, the tool influences lead time. Only values are used, which had been entered in "planning". Empty fields are ignored. If more than one tool was stored in an operation and for both "determine lead time" was enabled, only one tool can be activated. Activating or exchanging the tool is possible in Work order structure or in APS – graphic view.
Setup time	Setup time.
Mach + Labor Time/unit	Job time. Machine + operation time per unit

© 2026 Boyum IT Solutions A/S

Adding a new tool

To assign a new tool to the selected operation sequence, click on "**Add line**" under **Routing > Tool tab** and the following window opens:



Window artikel_arbplanpos_Edit_werkzeug_edit.psr

Field	Description
Position	Field used to sort the tool lists from the routing. It is a consecutive number but not a primary key.
Tool	Field used to assign the tool to perform this operation. This field is mandatory.
Description	Field used to display the tool description. This field cannot be changed because it automatically comes from the chosen tool.
Active	Check box field used to set the tool as active in the routing.

Important: Tools that define lead time cannot be simultaneously active for the routing position. Only one of them can be active at the same time, but the active tool can be switched directly in work orders. The time information is copied to the operation. Therefore, the user must check one tool as “Active”; all other tools that define lead time are deactivated automatically.

(Previously Resources tab, in which tools, alternative work sequences, and parallel work sequences were listed in a table)
A second row of buttons has been inserted here now. The top row of buttons relates to the tool list. Care should be taken here during processing.

© 2026 Boyum IT Solutions A/S

General tab

Field	Description
Drawing Number	The technical drawing number. This field cannot be changed because it is read from the chosen tool.
Info	Additional free text information on the tool entry.

Planning tab

This tab is only active if you have selected a tool with capacity planning.

Field	Description
Idle Time	Defines the time in hours after which the tool can no longer be used for other work orders (e.g. cooling, quality control, maintenance, etc.).
Next work sequence begins after idle time	If activated, the next work sequence can only be started after the idle time. Example: If the tool is a bin and this must be cooled before the finished product can be removed from the bin, the next work sequence can only be started after cooling. However, if the idle time is for quality control of a tool, you can begin with the next work sequence immediately (i.e. switch deactivated).

Default Time tab

This tab is only active if the tool defines the throughput time.

If this tool is activated (only one tool can ever be activated which defines the throughput time), its throughput time information is copied to the operation.

Note:

Only fields are considered where entries have been stored in the tool. Consequently, you can remove all entries. Work step and use factor are only used if > 0.

Example:

Setup time of tool = nothing entered

Processing time in tool = 5 mins

Setup time is not changed in operation, thus it comes from tool.

Please make sure that you work the same way for all tools.

© 2026 Boyum IT Solutions A/S

If a tool which determined the time is activated, it is transferred automatically to the operation at saving.

Field	Description
Setup time	Enter the setup time to start using the tool. Time specified per "Time per". **Important**: This replaces the operation setup time when this tool is used.
Processing time	Set the time the tool takes to produce the items. This is the actual processing time per unit produced in the routing position. The processing time for a unit of quantity per "Time per" in consumption unit per "Quantity per" finished parts. **Note**: Secondary processing times cannot be specified here.
Quantity per ..	Defines the number of finished parts in consumption units during the processing time refers to, e.g. 10 minutes per 1000 kg.
Time per	Specify whether the time unit for the setup and production processes is hours or minutes.
Use Factor	Split the production time amongst more finished goods.
Number	Number of required work steps e.g. 10 work steps in "processing time".
Utility	Utility factor, e.g. 10 units are produced at once per step or hub and per processing time.
Cost Element	Set the account in which the standard costs from the usage of this tool is booked. Accumulated costs are written to this cost element.

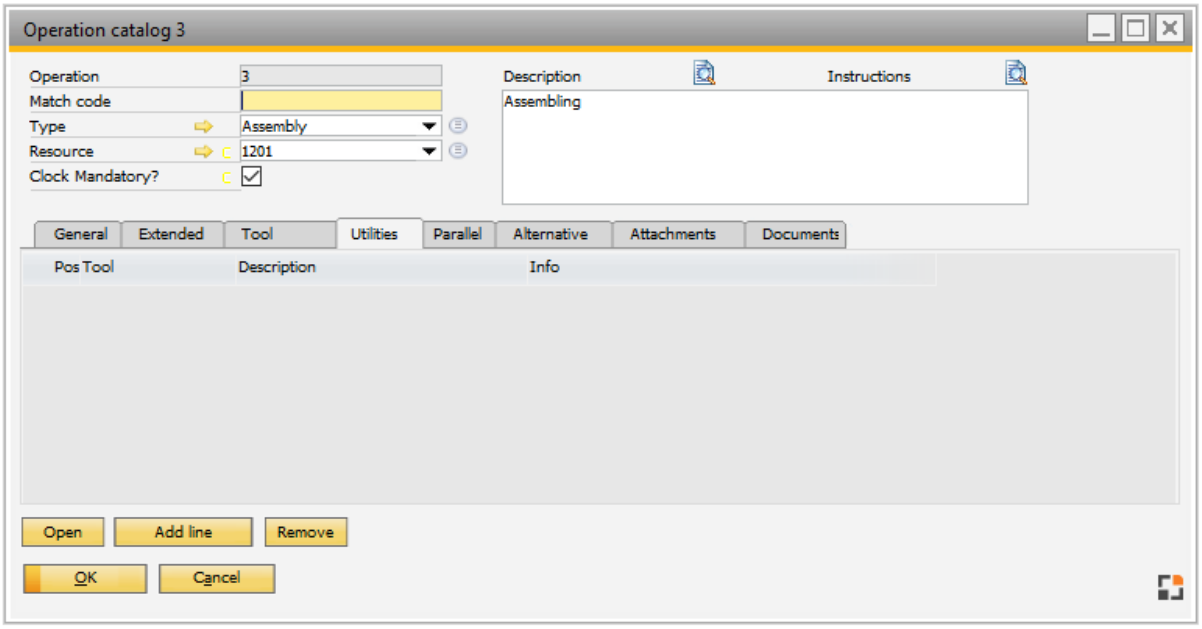
General settings on tools:

See: Tool administration.

3.2.6.9.2.4 Utilities

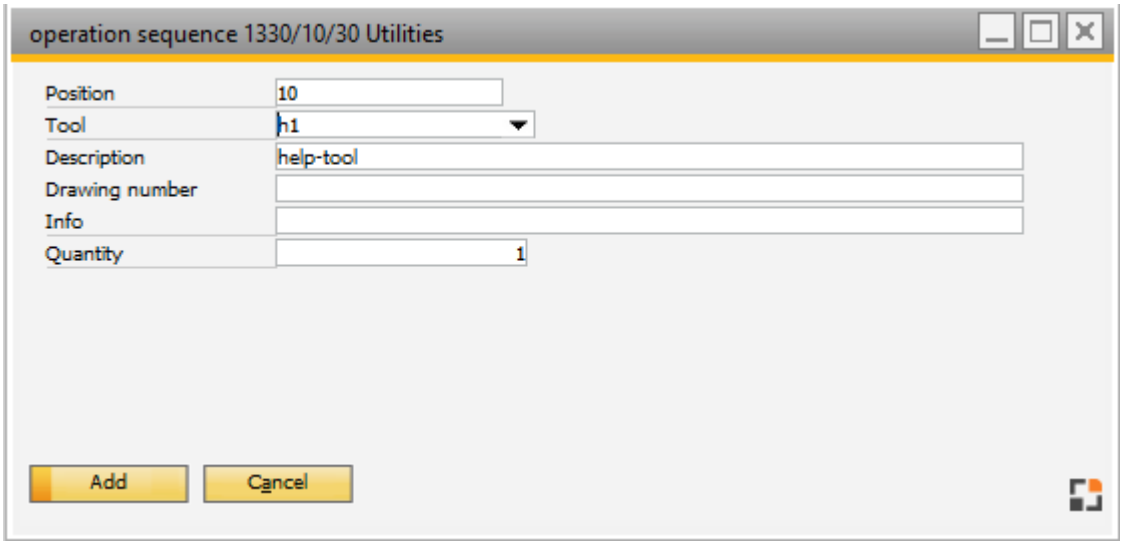
Administration > Setup > Production > Operation Catalog > Open an operation to edit > **Utilities** tab

© 2026 Boyum IT Solutions A/S



Add a new Utility

To assign a utility, click on "**Add line**" under **Routing > Utility tab** and the following window opens:



Window artikel_arbplanpos_edit_hilfswerkzeug_edit.psr

Field descriptions

Field	Description
Position	Sort the utilities list from the routing. It is a consecutive number, but not a primary key.
Utilities	Utility key (selection from Master Data / Tools / utilities). Assign the utilities to perform this operation. This field is mandatory.
Description	Displaya the utilities description. This field cannot be changed

© 2026 Boyum IT Solutions A/S

	because it is read from the chosen utilities.
Drawing Number	The technical drawing number. This field cannot be changed because it is read from the chosen utilities.
Info	Additional free text information.
Quantity	Specify the number of utilities needed to perform the operation. This field is for information only and has no influence on the routing position.

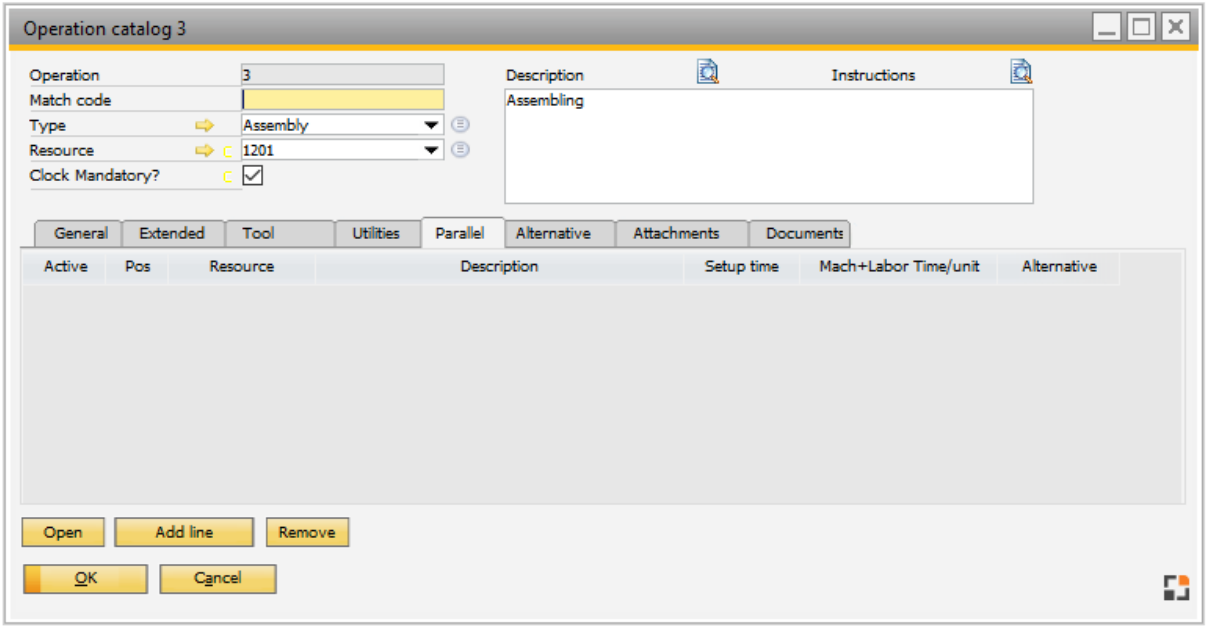
Buttons:

Open: Click button to open the editing window of the selected utility (***see*** image above "Add a new Utility")

Remove: Delete utility for this routing position.

3.2.6.9.2.5 Parallel

Administration > Setup > Production > Operation Catalog > Open an operation to edit > **Parallel** tab



In the Parallel tab, Beas displays a list of all resources that will be used in parallel with the main resource assigned in the Header. The user can insert, edit and delete resources.

Important: Only use parallel resources if a separate time planning is required for parallel resources.

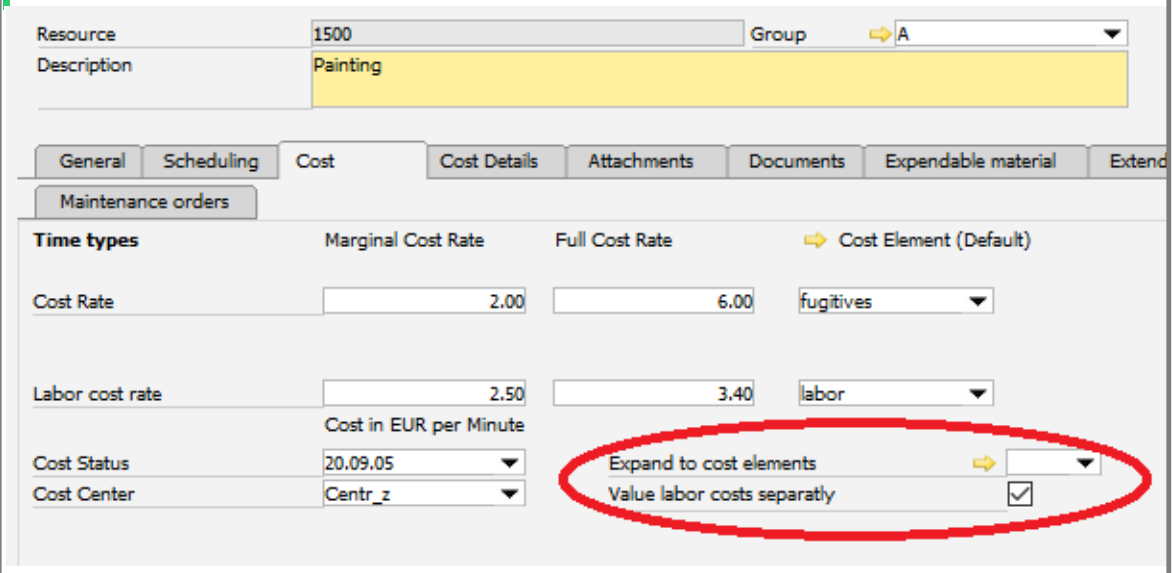
NOTE: Parallel operations do not consider quantities and do not manage Open/Close status!

- Alternative possibilities:

© 2026 Boyum IT Solutions A/S

a) Define personnel costs separately. Thus these costs will be calculated separately.
b) Up to 4 separate cost elements can be defined, which can also be receipted separately.

PATH: Resources > Resource Master Data XXX > Cost tab.



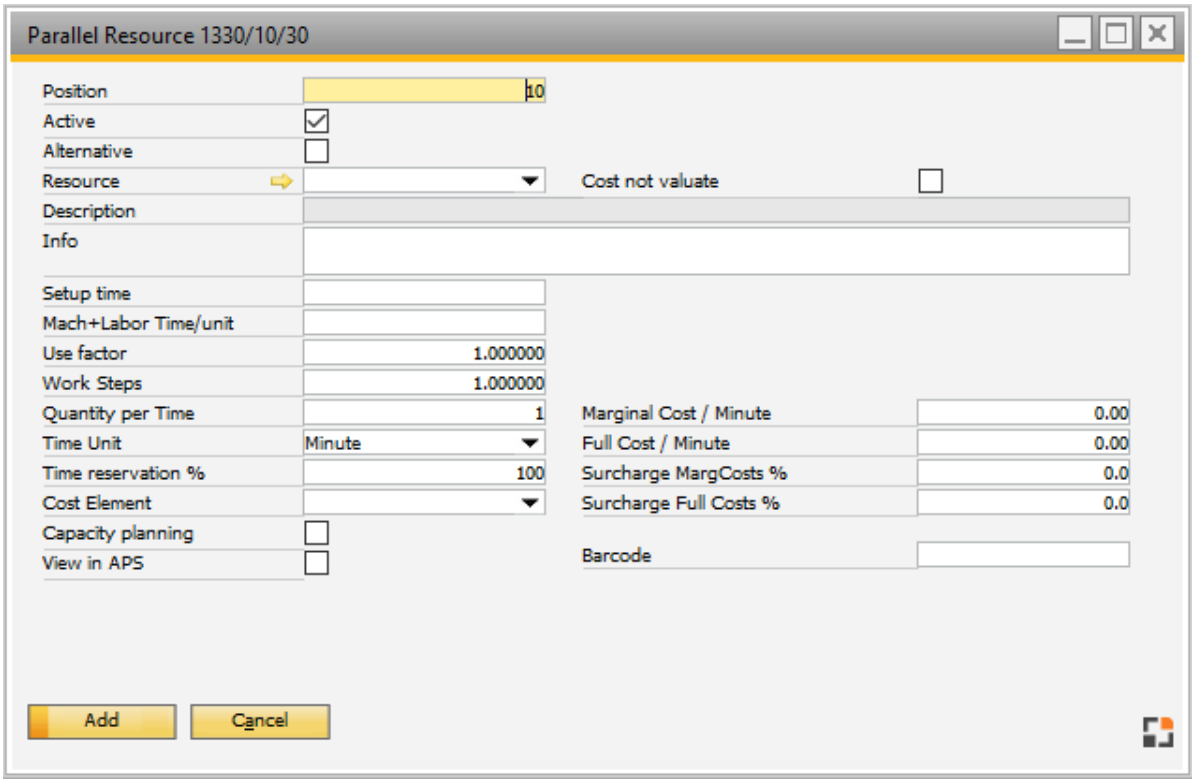
Window stamm_arbplatz_edit.psr

To assign a parallel resource, click on New and a new window opens:

PATH: Inventory > Item report >

1. "Open" an entry >
2. Routing tab >
3. "Open" routing position >
4. "Parallel" tab >
5. "**Open**" / "**Add line**".

© 2026 Boyum IT Solutions A/S



Window artikel_arbplanpos_edit_parallel_edit.psr

Field	Description
Position	Used for sorting the parallel resource list from the routing. It is a consecutive number, but not a primary key.
Active	Set parallel resource active. If enabled, only one position can be active. **Important**: Only one parallel resource can be activated which defines the throughput time per routing. This information is copied to the operation, therefore, the user must check one parallel resource as "Active", and all other resources should have "Active" unchecked.
Alternative	Set if this parallel resource can also be alternative to other parallel resources for the same operation.
Resource	Resource ID of the parallel resource **Note**: No external resources or resources with extended cost rates , for example personnel costs, are allowed.

© 2026 Boyum IT Solutions A/S

Cost not valuate	Determine whether to consider resource costs in calculation If enabled, the resource costs of this parallel resource are ignored. Precalculation and post-calculation are affected. Costs created with time receipts are not taken into account. Use this option if the cost is included with the main resource. Disabled by default. *beas 9.1 PL: 08*
Description	Description of the resource that comes from the resource master data and cannot be changed.
Info	Additional free text information.

Throughput Time area

This information relates only to Business performance, not to the throughput time of the work sequence itself, as this is ALWAYS parallel to the main work sequence and always has the same start and end time.

Field descriptions

Field	Description
Setup time	Setup time of the parallel resource process.
Mach+Labor Time/unit	The Mach+Labor time for a unit of quantity using the *Time unit* in consumption units *Quantity per time* finished parts. **Note**: Secondary mach+labor times cannot be specified here.
Use factor	Split the production time amongst more finished goods ***See*** Calculation of target time.
Work steps	Used as a multiplication factor for the production times ***See*** Calculation of target time.
Quantity per Time	Used as a multiplication factor for the production times
Time Unit	Defines times in hours or minutes. To register a processing time independent from the quantity you can enter 0. ***See*** Calculation of plan time.
Time reservation (%)	If no setup and edit time was entered, the time of the main operation * time reservation is used as reference.

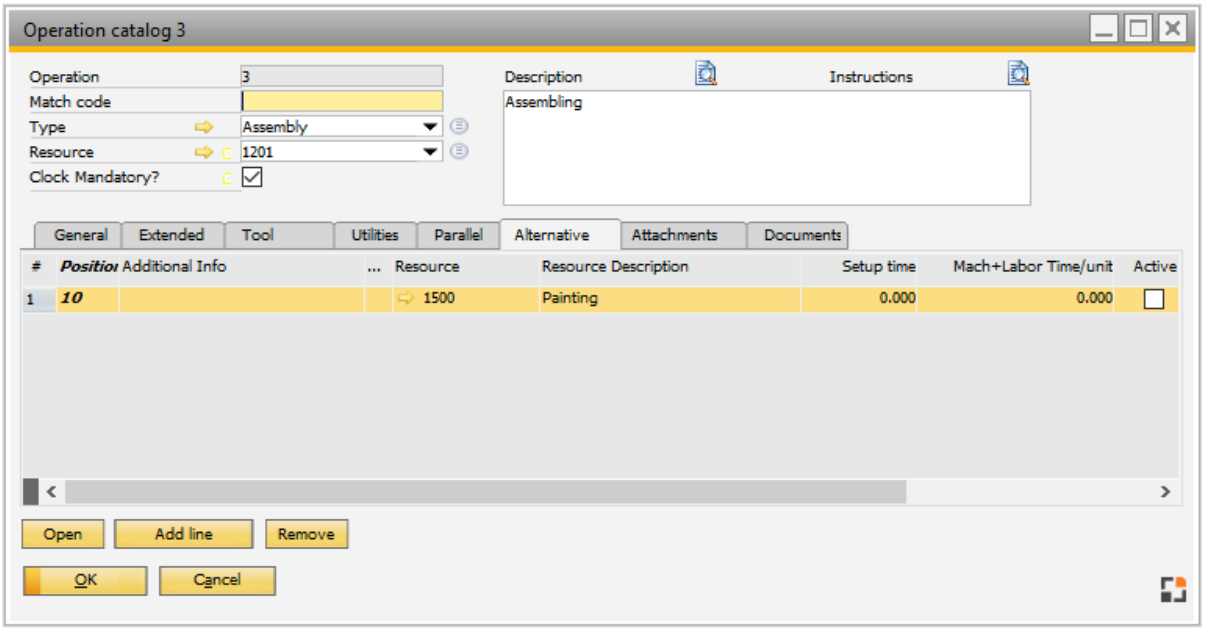
© 2026 Boyum IT Solutions A/S

	At which % should the resource be scheduled? ***Example***: The parallel resource is an employee operating four machines at once. He needs to be available for the machine at the whole time but only at 25%. ***Example***: The parallel resource should work during 30% of the main resource time, the user can enter the value "30" in the Time Reservation field, and Beas calculates the times for the parallel resource automatically. If the setup time or processing time is entered, in Precalculation this value is ignored. ***See*** Calculation of plan time.
Cost element	Accumulated costs are written to this cost element.

Technical information:
Parallel resources share a database table with tools, utilities, and alternative operations.
Structure of bar code on routing card: 6-digit beas_ftapl.number + 3-digit beas_ftapl_wkz.pos_id

3.2.6.9.2.6 Alternative

Administration > Setup > Production > Operation Catalog > Open an operation to edit > **Alternative** tab

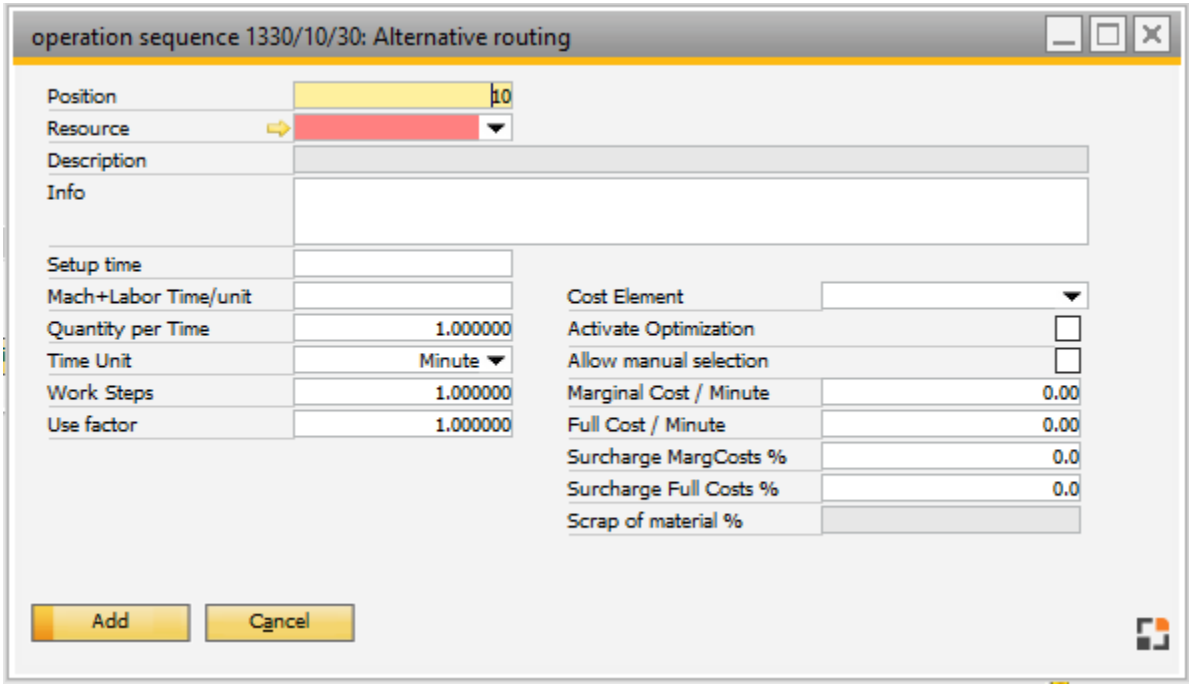


© 2026 Boyum IT Solutions A/S

In this tab you can define alternative resources related to a routing position.
In APS and Work order you can change the alternative resource with one mouse-click.
The alternative resource can have its own parameters as setup time, processing time etc.

The option "Optimization"checks whether a faster production would be possible using this alternative resource.

The user can insert, edit and delete resources. To assign an Alternative resource, click on **Add,** and a new window opens:

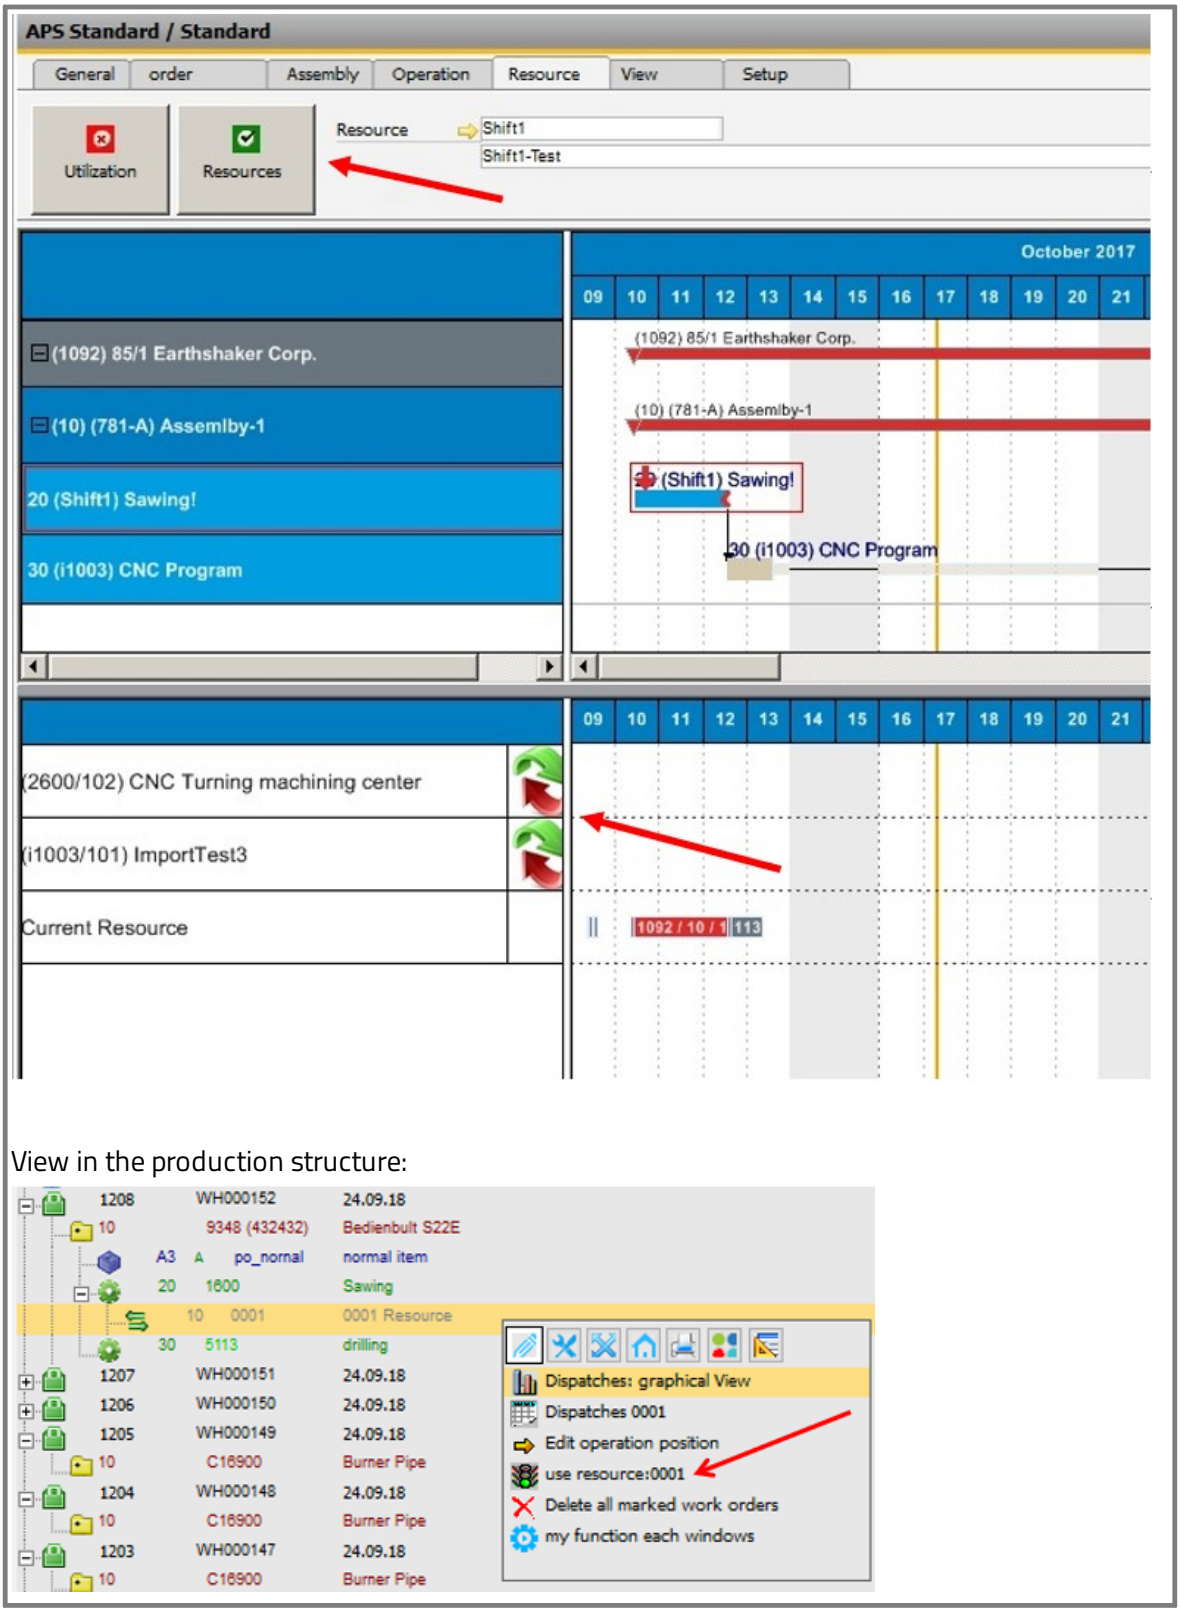


fert_arbplanpos_edit_alternativ_edit, artikel_arbplanpos_edit_alternativ_edit, stamm_ag_alternativ_parallel_edit

- The alternative resource can be selected manually in APS – graphical view and in production structure view.

  Selection in the APS view:

© 2026 Boyum IT Solutions A/S

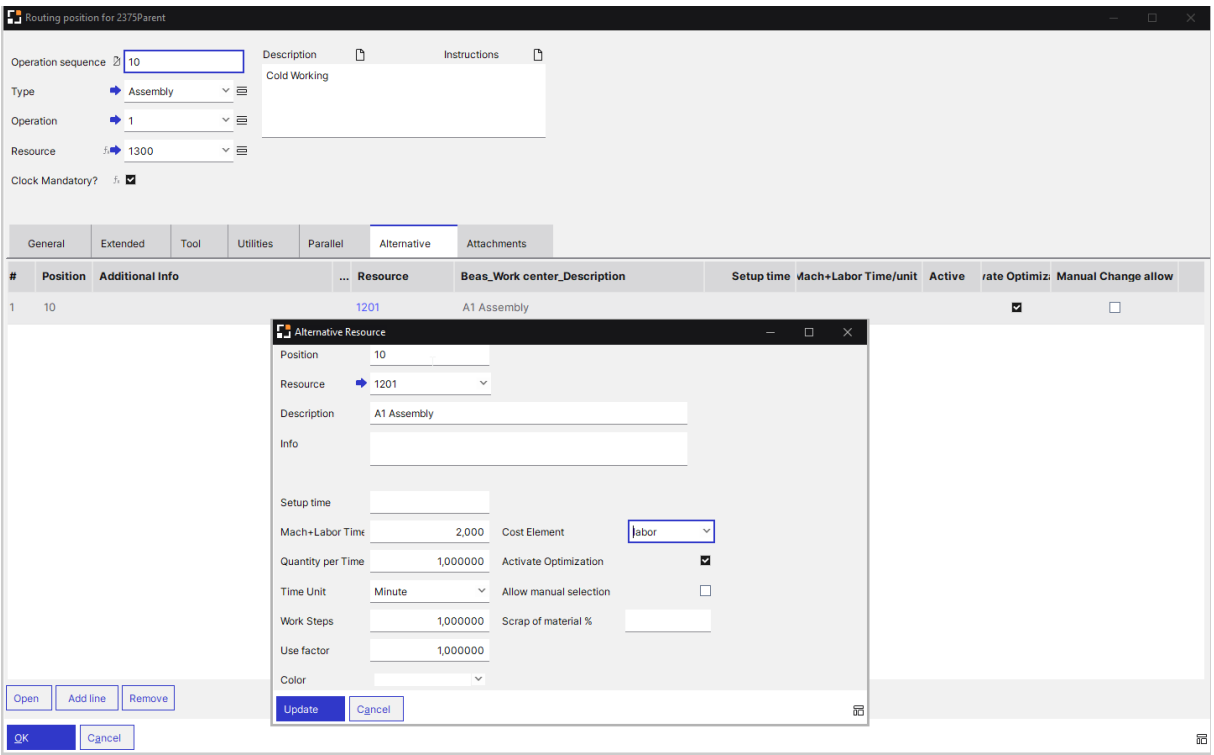


See Overview alternative resources

© 2026 Boyum IT Solutions A/S

The alternative resource can be selected manually in the APS – graphic view and Production structure display.

Note: Alternative resources are not supported in the Precalculation.



Field	Description
Position	Used for sorting the parallel resource list from the routing. It is a consecutive number, but not a primary key.
Resource	Select the resource ID of the parallel resource from the existing resources. The alternative resource can be selected manually in the APS - graphic view and production structure display.
Description	Description of the resource that comes from the resource master data and cannot be changed.
Info	Additional free text information.

Throughput Time area

Field	Description
Setup time	Setup time of the alternative resource process. Default time can

© 2026 Boyum IT Solutions A/S

	be specified in the *Quantity per time* parameter.
Mach+Labor Time/unit	The Mach+Labor time for a unit of quantity using the Time unit in Production UoM Quantity per time finished parts. **Note**: Alternative resources do not manage Secondary+Labor times. Therefore, if a main resource manages secondary times when switching to an alternative resource, the information of the secondary values in the operation will be lost, especially if you want to return to the main resource again. In this case you will have to add those data manually or refresh the order if applicable.
Quantity per Time	Defines the number of finished parts in Production UoM to which the processing time refers, e.g. 10 minutes per 1000 kg. ***See*** Routing position.
Time Unit	Defines whether times are specified in hours or minutes. ***See*** Routing position.
Work Steps	Number of required work steps used as a multiplication factor for the production times e.g. 10 work steps in "processing time" are required .
Use factor	Use factor to split the production time amongst more finished goods, e.g. 10 units are produced at once per step or hub and per processing time.
Cost element	Accumulated costs are written to this cost element.
Activate Optimization	If active, define whether Beas should automatically select the most adequate resource, amongst the main and alternative resources in the APS calculation. The resource is replaced automatically.
Allow manual selection	⊟ Allow the manual selection of this alternative resource. This alternative resource can only be selected manually if this option is enabled. The event is canceled and receipted with the error message *'(aktivaplatz440)Resource cannot be selected when flag 'allow manual change' is off'* if this option has been disabled and an attempt has been made to select the resource. **Note**: A change is only possible if change has been allowed according to the production position (**Production position**

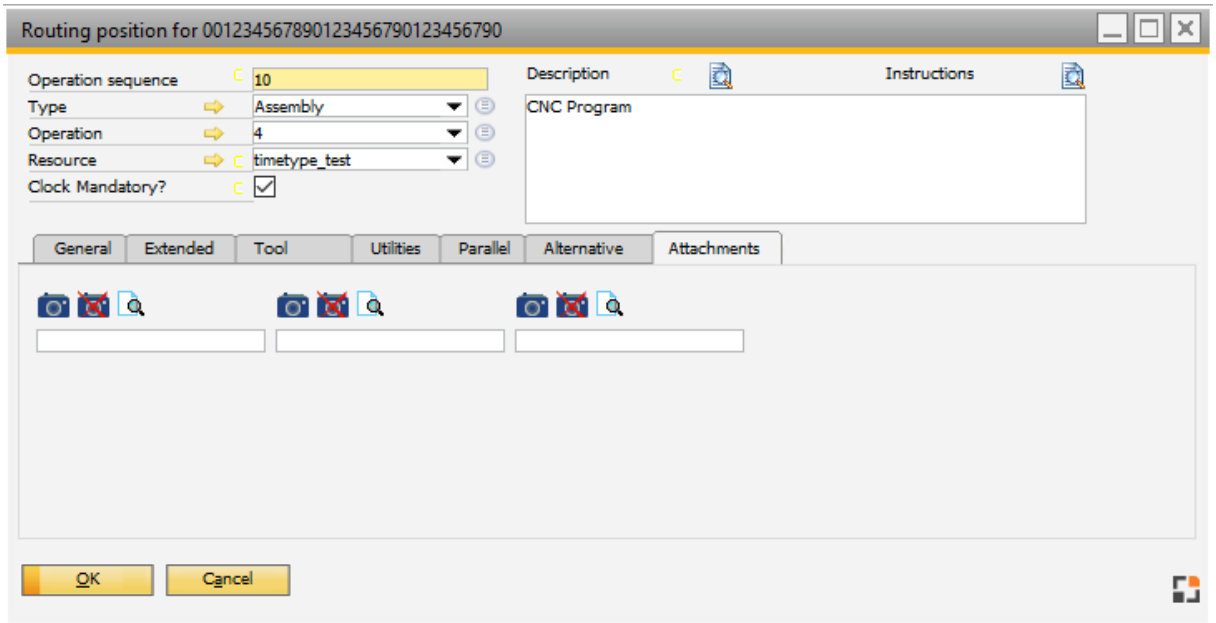
© 2026 Boyum IT Solutions A/S

	> **Allow change** has to be activated).
Scrap of material %	Define Scrap of Material. If the user uses this alternative resource, the system replaces the Scrap material % too and recalculates the scraps per Material for all routing positions. ***See*** Concept Scrap of Material Note: If you switch the resource with another Scrap of Material entry in the work order, the system calculates the new quantity of the related BoM Position, but not the quantity of order related sub assemblies. ***See*** this video: *Beas 9.3 PL 1*

3.2.6.9.2.7 Attachments

Administration > Setup > Production > Operation Catalog > Open an operation to edit > **Attachments** tab

There are three buttons for each field:



Window artikel_arbplanpos_edit.psr

© 2026 Boyum IT Solutions A/S

Icons

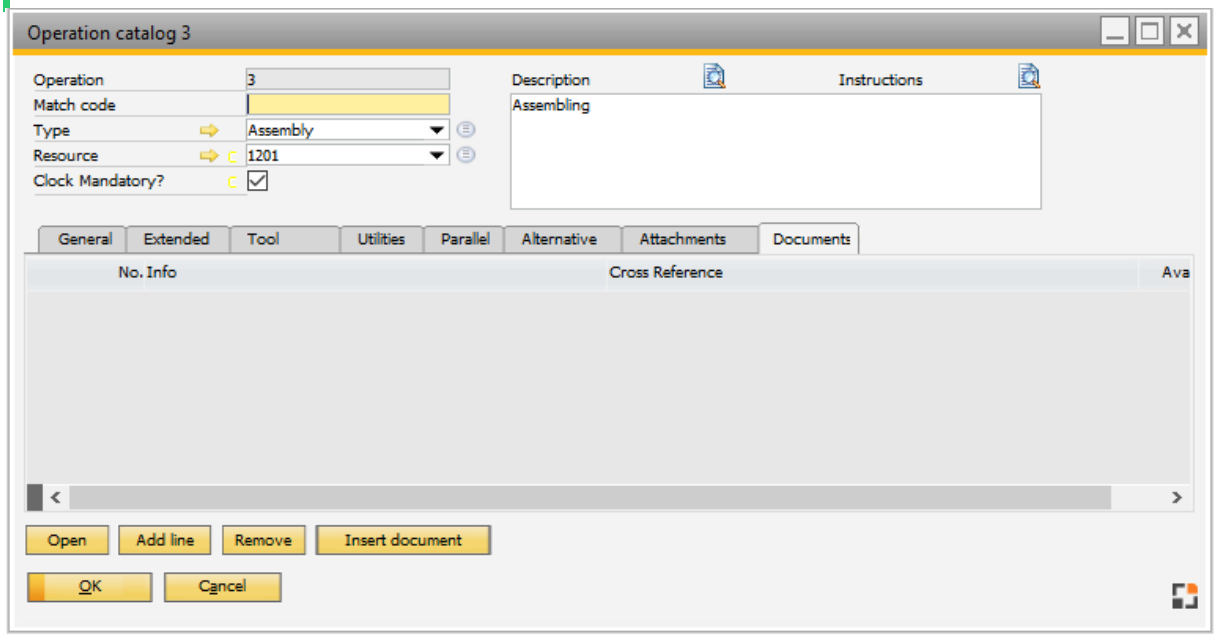
Traditional style	Boyum Style	Description
		The camera button enables the user to select an image or document to attach.
		The camera button marked with an "X" removes the attachment.
		The document with a magnifying glass opens the attachment.

All attachments included in this tab are available in the FDC Terminal.

For more information on storing images ***see*** Window.

3.2.6.9.2.8 Documents

Administration > Setup > Production > Operation Catalog > Open an operation to edit > **Documents** tab



Field Description

Type	Description
Info	Input of text information.
Version	Document version number.
Cross Reference	Directory and file name of the document.
Available	If active, the document exists; if deactivated, the reference is incorrect or

© 2026 Boyum IT Solutions A/S

	the user does not have access to the specified directory.
Entry From	Document was stored by...
Entry on	Document was stored / modified on ...

3.2.7 Project

PATH: Administration > Setup > Project.

For a project a project template is required.
In the task catalog you can define the tasks.
In Project cost types you define cost types to register project costs.

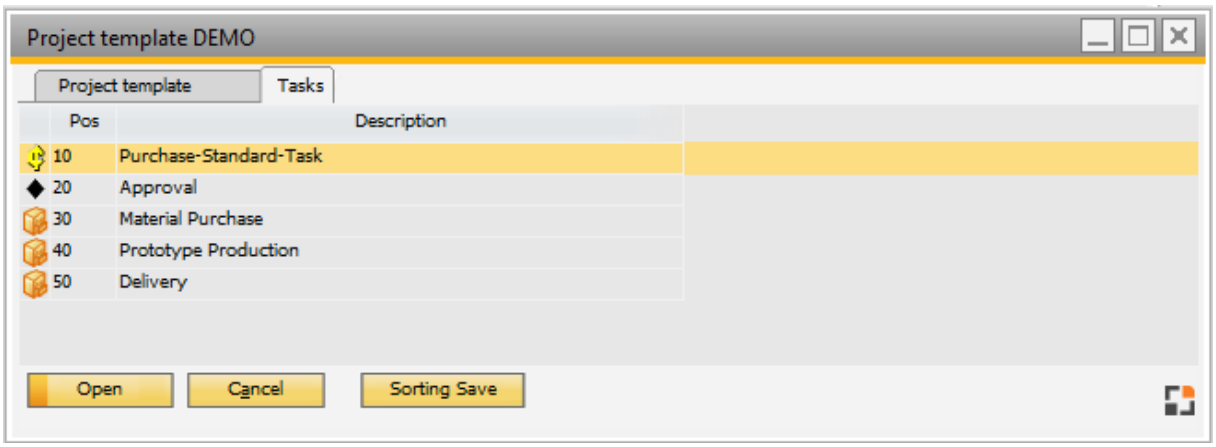
3.2.7.1 Project template

PATH: Administration > Setup > Project > Project template.
List of all project templates.

ID and description is displayed. Use "**Open**" or double-click to open the Editing window.
You can add a new template with the "**New**" button, or selecting it from the right-click menu.

3.2.7.1.1 Edit project template

PATH: Administration > Setup > Project > Project template > **Open** / **Add**.



© 2026 Boyum IT Solutions A/S

Window prjtemplate_edit.psr

Project template tab

Field	Meaning
ID	Creating a project template an ID needs to be assigned which cannot be changed subsequently.
Description	Enter a description for this template.
Work order	Creating a project in the background a work order is created which will be used for booking project related times.
Work order item	The header item of the work order, it may not be a storage related item.
Work order type	A production type needs to be defined and assigned to the work order. In this Production type it ins mandatory to activate the switch Project order. It is recommended, to create a separate work order type for this purpose. This makes easier to differentiate this order from other normal work orders such as storage related or sales order related work orders.
Attachments folder	Project related documents can be stored in this folder.
View Zoom	Zoom factor in %.

Tasks tab

Various tasks are assigned here to the project template. It is recommended, to define the tasks before in the task catalog.

Function	Meaning
Open	Open the marked task for editing.
Cancel	Close the current window without saving changes.
Add	Create a new task.
Remove	Delete the selected task from the template list.

back to Project templates

3.2.7.2 Task catalog

PATH: Administration > Setup > Project > Task catalog.

This window provides a list of all project tasks.

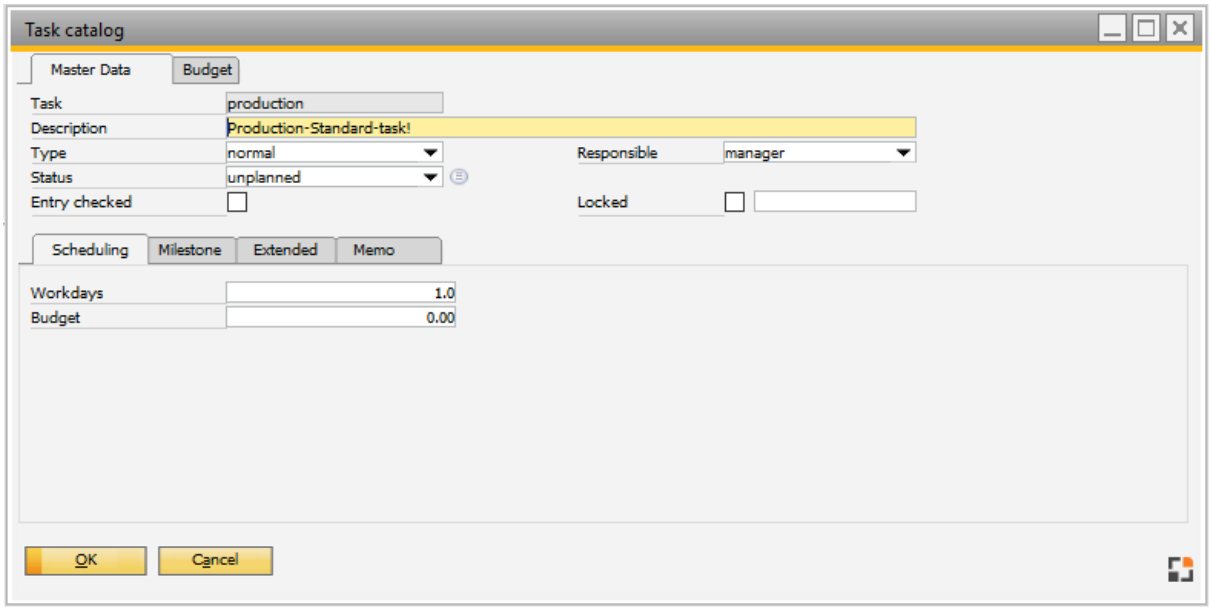
ID and description is displayed. Clicking the Open button over a task line or double-clicking a task opens the Editing window.

© 2026 Boyum IT Solutions A/S

3.2.7.2.1 Edit task catalog

PATH: Administration > Setup > Project > Task catalog > **Open** / **Add** button.

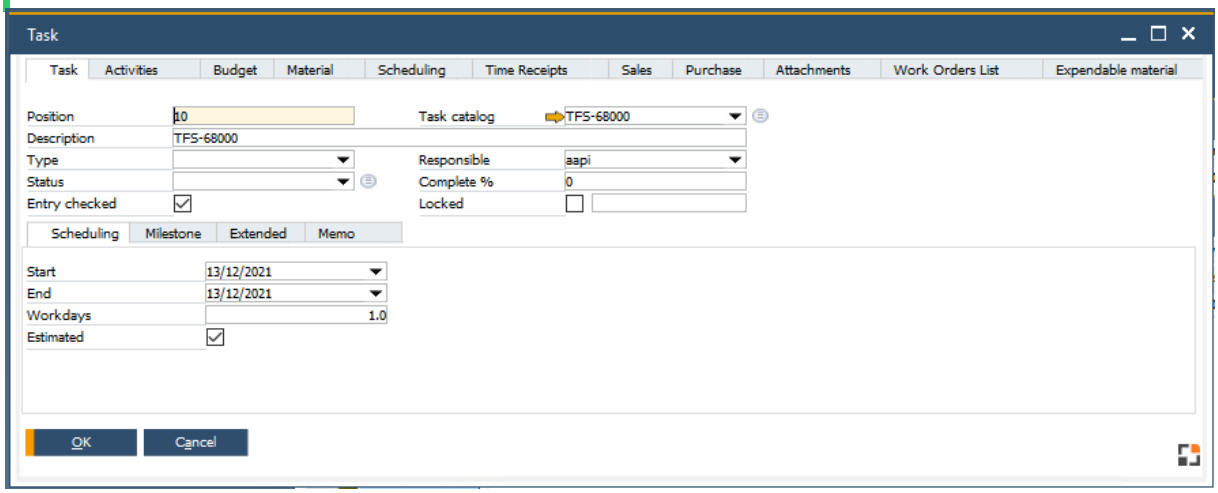
You can select a predefined Task catalog to create project templates or projects.



Window prj_linetyp_edit.psr

In this window you can edit a Project task / Project Template / Task Catalog.

PATH: Production > Project > **Open** a project >"Tasks" tab > **Open** a task from the list.



Window prj_line_edit.psr

Task tab / Master Data

Field	Description

© 2026 Boyum IT Solutions A/S

Position	Position of the task. Can be alphanumeric, the number does not determine the order of processing. Order is set up by sorting with drag&drop in the list. Notes on data structure: `beas_prj_line.prjcode` = Project number `beas_prj_line.lineid` = Task ID (same number as in template) `beas_prj_line.pos_id` = Visible position number `beas_prj_line.sortid` = Sorting `beas_prj_line.prjuid` = Unique ID of the task over all projects. Used for linking to other documents.
Description	Task description.
Type	Type of task: Milestone or Standard.
Status	Status of the task. Select a status. Only information, no function here. You can edit the statuses by pressing the selection icon. Values "complete%" and "blocked" are accepted after selection, but can still be changed afterwards. For more information, ***see*** Status
Entry checked	Determines whether an entry is marked as "checked". Unconfirmed tasks are marked with a warning, with icon .
Task catalog	Select a predefined task from task catalog. Visible when opened from Project Task and Project Template.
Responsible	Person in charge for this task.
Complete%	Determines the rate of completion for this task. In percent If in "Planning" tab - "Production % Processing" was not set to "manual", this field is blocked.
Blocked	Use this to block the task. When no more activities are possible, the task is marked with a Stop-Icon. Additionally, you can enter a blockage reason.

Tab: Task - Activities

Manage all activities assigned to a task. Create new and edit existing ones.

© 2026 Boyum IT Solutions A/S

Tab: Task - Budget
All assigned budgets are displayed with planned and actual values (times and money). Use the "**Calculate**" button to display all related budgets.

Tab: Task - Material

Tab: Task - Purchase
This tab within a Project task is visible only if the option "Purchase" was selected under **Task > Extended**. All assigned purchase documents are displayed. Use "**Open**" button to open the purchase documents.

Tab: Task - Sales
This tab within a Project task is visible only if the option "Sales" was selected under **Task > Extended**. All assigned sales documents are displayed. Use the "**Open**" button to open the sales documents.

Tab: Task - Scheduling
This tab within a Project task is visible only if the option "Scheduling" was selected under **Task > Extended**.

Tab: Task - Time receipt
This tab within a Project task is visible only if the option "Order times" was selected under **Task > Extended**. The resource selected for order time receipts is displayed. All reported order times are displayed. Use "**add**" to create new order related project times.

Tab: Task - Attachments
Manage attachments assigned to the task. Edit attachments and create new ones of type file or text.

Tab: Task - Work orders list
Work orders associated with the Task are listed in this tab. You can edit the WO document from here and create post-calculation for it as well.
This Project task tab is visible only if the option "Production" was selected under **Task > Extended**.

Tab: Task - Expendable material

Lower tabs

© 2026 Boyum IT Solutions A/S

Scheduling tab:

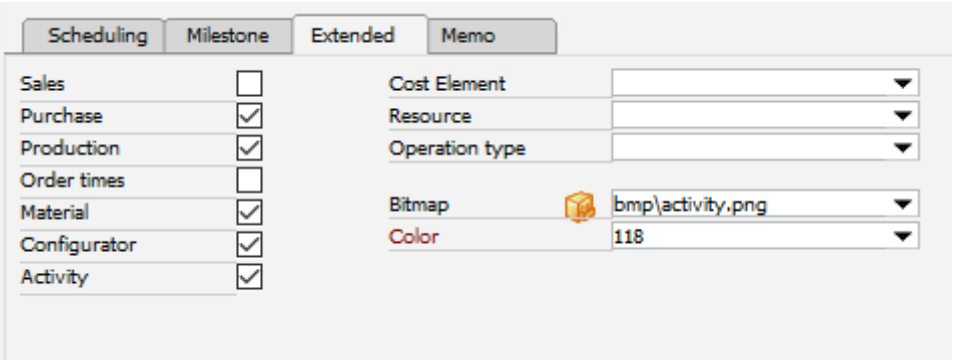
Field	Description
Work days	Work days planned for the respective task.
Budget	Define a budget available for the task.

Milestone tab:

Field	Description
Milestone	Assign a mile stone to the task or define a new one using the selection icon next to the drop down field.
Acceptor 1,2	Acceptor 1 of the event defined in the milestone.
Text	Text, displayed to Acceptor.

Extended tab:

In this tab you define, which documents can be created for which business objects.



Field	Meaning
Sales	When active, the following documents can be created from the task: Quotation, Sales order, Delivery, A/R down payment invoice, invoice, A/R credit memo.
Purchase	When active, the following documents can be created from the task: Purchase order, Goods receipt, A/P invoice.
Work order	When active, the following documents can be created from the task: work order.
Order times	When active, you can register or edit order times from the task. **Note:** Order times are meant to be project times not linked to a normal

© 2026 Boyum IT Solutions A/S

	work order. This could be installation time, meetings or project administration. If the flag order times has been activated, the fields cost element, resource and operation type are important to be filled, because the order times are booked using the project work order.
Material	Without function.
Configurator	Activating this flag allows the creation of a configuration from the task (only if the product configurator is used).
Activity	Activating this flag allows the creation of an activity.
Cost element	Cost element assigned for this task.
Resource	Assigned resource for this task.
Operation type	Assigned operation type for this task.
Image	Select an image for the task to be displayed in lists.
Color	Select a color for the task to be displayed in lists.

Memo tab:
In the editor window you can edit and store task-specific texts.

back to operation catalog

3.2.7.3 Project cost types

PATH: Administration > Setup > Project > Project cost types.

Project cost elements are required when working with budgets. Use project cost types to control which documents or project times are booked to the stored budgets.

Window prjcosttype_browse.psr

List of all created project cost elements:

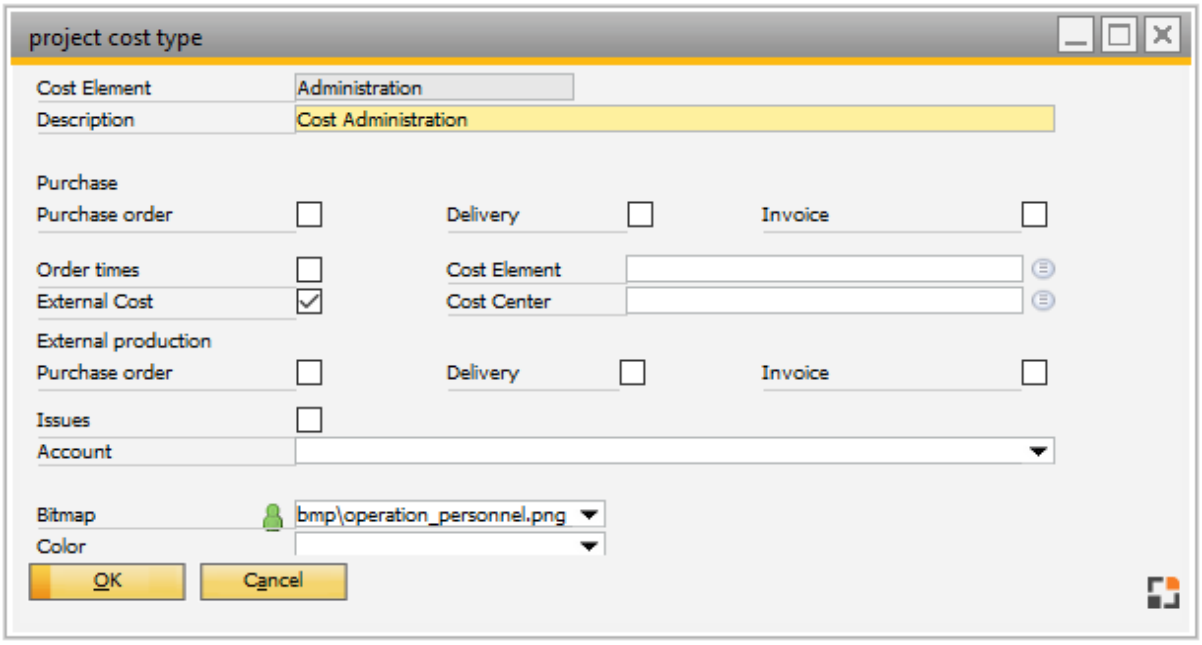
Function	Meaning
Open	Edit an existing Project cost element.
Cancel	Close window without saving changes.
Add	Create a new project cost element.
Remove	Delete the selected project cost element.

Edit Project cost elements

3.2.7.3.1 Edit project cost types

PATH: Administration > Setup > Project > Project cost types > **Open** / **Add** button.

In this window you can edit cost types for a project.



Window prj_costtype_edit.psr

Field descriptions

Field	Meaning
Cost element	ID or short description of project cost element.
Description	Detailed description of cost element .

© 2026 Boyum IT Solutions A/S

Purchase flags: Purchase order / Delivery / Invoice	Flags below define which documents will charge the budget. If more than one document is selected, the documents will be balanced against each other. ***Example***: Flags are set for purchase and for invoice. A purchase order of 1000 EUR is created from a task, 1000 EUR are charged to the budget. After receiving the payment, the invoice is booked. The invoice amount is not 1000 EUR but 1100 EUR. Then, the budget will be charged another 100 EUR – in sum 1100 EUR.
Order times	If active, order times related to project tasks are charged to the budget. By selecting a cost element right to this field the reported order times can be linked to the selected Cost element.
External costs	Use this flag to define a project cost element for charging external costs (e.g. accommodation). Therefore, in the task (***See*** task catalog) the operation type "costs" needs to be selected. Then, the Project order is set up accordingly. A cost center can be entered right to it to book the costs there.
External operation flags: Purchase order / Delivery / Invoice	The flags below (purchase, delivery, invoice) determine, which documents are charged to the budget. If more than one document is selected, the documents will be balanced against each other ***Example***: for purchase and for invoice flags are set. From a work order assigned to a project, an external operation is created with a purchase of external service about 1000 EUR. As result, 1000 EUR are charged to the budget. After receiving the payment, the invoice is booked. The invoice amount is not 1000 EUR but 1100 EUR. Then, the budget is charged with another 100 EUR - in sum 1100 EUR.
Issues	If active, a project cost type can be created in which issued material (via work orders) is charged to the budget. If necessary, an account can be defined (next row).
Account	Account for issues of the cost element "issues".
Bitmap	Select a bitmap for the project cost element to be displayed in lists.
Color	Select a color for the project cost element to be displayed in lists.

3.2.8 Complaint

Beas Manufacturing has its own complaint management feature.

Overview of functions:

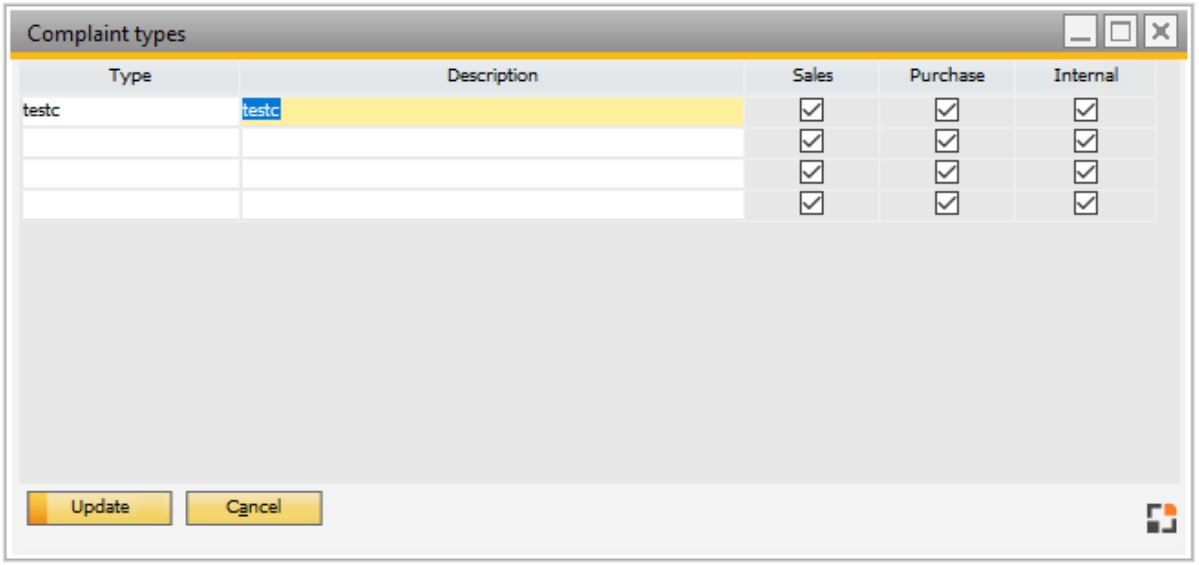
" Recording complaints
" Managing complaints
" Performing an arbitrary evaluation on the basis of recorded data
" Creating arbitrary indicators on the basis of the data
" Suppliers, People and Supplier valuations

General
Financials
Business Partners
Inventory
Precalculation
Production
Project

3.2.8.1 Complaint types

PATH: Administration > Setup > Complaint > Complaint types.

Beas distinguishes between the following types of complaints:



Window reclamation_md_typ.psr

© 2026 Boyum IT Solutions A/S

Field descriptions

Item	Description
Internal complaint	An internal complaint refers to a work order, e.g. for semi-finished goods. This can be generated directly from the work order and is also managed via the work order. **Production > internal Complaint**
Customer complaint	Customer complaints relate to delivery notes. That why the delivery note always has to be indicated. **Sales > Customer complaints**
Supplier complaints	Supplier complaints relate to goods receipt. These are generated from the Beas menu. **Purchase > supplier complaints**

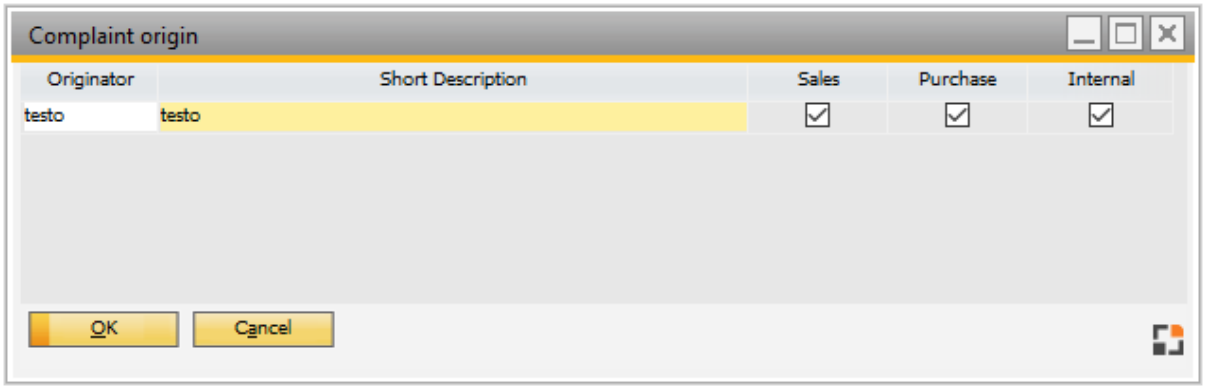
Use the check boxes (Sales/Purchase/Internal), to define the possible assignment.

Add or **Remove** a complaint type from the right-click menu.

3.2.8.2 Complaint origin

You can define the different Originator of complaints. Use the check boxes (Sales / Purchasing / Internal) to classify the complaints.

PATH: Administration > Setup > Complaint > Complaint origin.



Window reclamation_md_causer.psr

Sales → Customer Complaint,

Purchase → Supplier complaint,

Internal → Internal Complaint.

© 2026 Boyum IT Solutions A/S

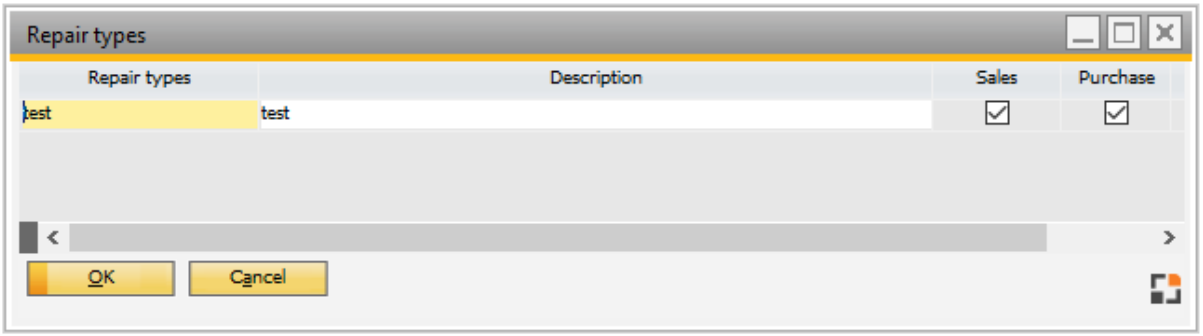
Add or **Remove** a complaint origin with the right-click menu functions.

See also Complaint types

3.2.8.3 Repair types

You can define the different types of repair in Repair Types. Use the check boxes (Sales / Purchasing / Internal) to classify the complaints.

PATH: Administration > Setup > Complaint > Repair types.



Window reclamation_repair_browse.psr

Sales → Customer Complaint,
Purchase → Supplier complaint,
Internal → Internal Complaint.

Add or **Remove** a repair type with the right-click menu functions.

See also Complaint types

3.3 Data Integration Hub

Beas provides an easy-to-use import function for the company data.

PATH: Administration > Data Import/Export > Data Integration Hub.

This function is useful in the following scenarios:

- Importing master data at the setup
- CAD – Integration (e.g. importing BoM directly from the BoM administration).

© 2026 Boyum IT Solutions A/S

- Automatic synchronization with third-party applications using Beas – Service (e.g. PDM).

The following import formats are supported:

- XML.
- Excel (Excel must be installed).
- Text files, CSV in different formats.
- Access to all ODBC-capable files and databases.

The following information can be imported:

- Item, BoM, routing
- Various master data
- Transaction data, like working hours, attendance
- Transactions like receipts, issues

The main flow of the import process is as follows:

1. Determine what to import (e.g. Item master)
2. The import file is selected and analyzed by Beas
3. Fields of the import file are reviewed and can be renamed or hidden
   XML-files: unnecessary XML-structure areas can be hidden
4. Fields of the target and source need to be linked, using the functionality of the Data Integration Hub
5. Preview the result of the mapping
6. Start the import manually or schedule a regular event

An import file can contain multiple sets of information, e.g. item information, BoM and routing. Only one area can be imported with one import definition. In this case, the same file is used for multiple definitions, for example the following items can be defined in the same import file, which is then used for each area:

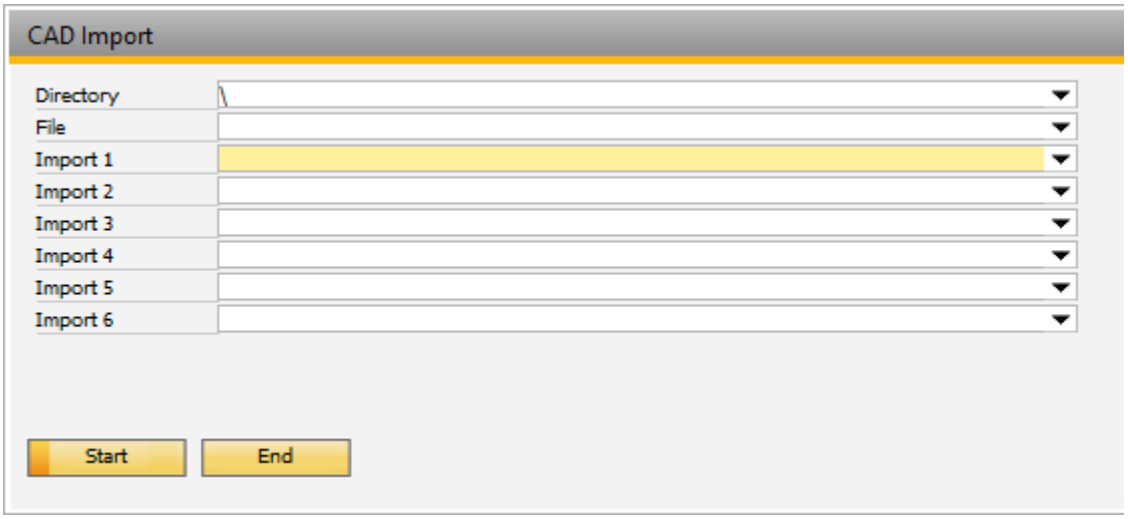
- Item
- Versions
- Files
- BoM
- Routings

For automatic synchronization an import task can be stored in a Beas service. In this case, the specified directory is regularly checked and up to 6 import definitions can be set in this task. The

© 2026 Boyum IT Solutions A/S

definitions are started, reading the file and then moving it to another directory, depending on the settings.

For CAD Integration in the BoM administration a file and up to 6 import-definitions can be selected to import this CAD file:



Window import_ local_ definition.psr

See

YouTube Webinar Concept and using Integration hub 2016/12.

YouTube Webinar Beas Industries 4.0 Data Integration Hub from 2016/4.

Example for Import: Item, BoM, Times. These can be imported directly.

Window importkopf_browse.psr

Column description

Field	Description
... (image)	The icon defined for the definition.
Type	Type of the definition: import, PDM, CAD etc.
Table structure	Target table of the import .
ID	Unique ID for the import definition.
Description	Description of the import definition.
Status	Processing status of the definition.
Status description	Description of the status.
Status %	Completion in % .
Last run	The date of the last import.
Executions	The number of times the import has been executed.
Error	Number of detected errors.

© 2026 Boyum IT Solutions A/S

Further columns to be displayed can be added in window settings.

Functions

Name	Description
Open	Opens the selected entry for editing.
Start Import	Starts the import of the selected row.
Open Hub Templates	Opens the explorer window where DIH Excel templates are stored. By clicking on this button, you can access the folder with Excel templates for each table definition in Beas. For each table you can generate an excel file with all columns marked as Import =yes. The information, then, can be saved in Excel template (.xlts) format in the Beas folder **program\DIH_templates**. **Match the field information stored in the Excel table** The first line in the Excel sheet stores the exact field ID. The second line in the Excel sheet stores the necessary information related to a field - the exact field ID, description, data type and possible values. (***see*** image below) **Orange** fields are mandatory. **Blue** fields are optional. To match the information from the Excel sheet, the system uses the first line containing each field ID. The below image demonstrates how the information from the Excel table matches the target fields of the Beas window. **Note**: Remember to delete the second row of the excel when you prepare the file for import! ***See*** Automatch ***Example:*** Mandatory fields with "Mandatory: YES" in orange: PERS_ID (Employee number)

© 2026 Boyum IT Solutions A/S

	NAME 1 (First name) NAME 2 (Last name) KSTST_ID (Cost center) Search field	Add information to filter the Import definition list

Right-click menu options – further functions

Name	Description
Protocol	Opens the error protocol for the current entry. Note: At each renewed import, the protocol is deleted first.
Add	Create a new definition.
Duplicate	Duplicates the current entry.
Remove	Deletes the selected entries. Multi-select is supported.
Planned activities	Opens the Planned activities window, where import operations can be scheduled and automated.
Counter: Reset	Resets the error error counter for the selected entry.
Column definition new load	Reloads the column definition (database description) in the current database. This occurs usually at each program update.
Export Definition	Definition of the selected rows are exported to a file. Multi-select is supported.
Import Definition	Imports definitions that have been exported can be imported. If an ID already exists, it is renamed automatically.

3.3.1.1 Import Definition

PATH: Administration > Data Import/Export > Data Integration Hub > right-click > **Open** or **Add** new Import definition.

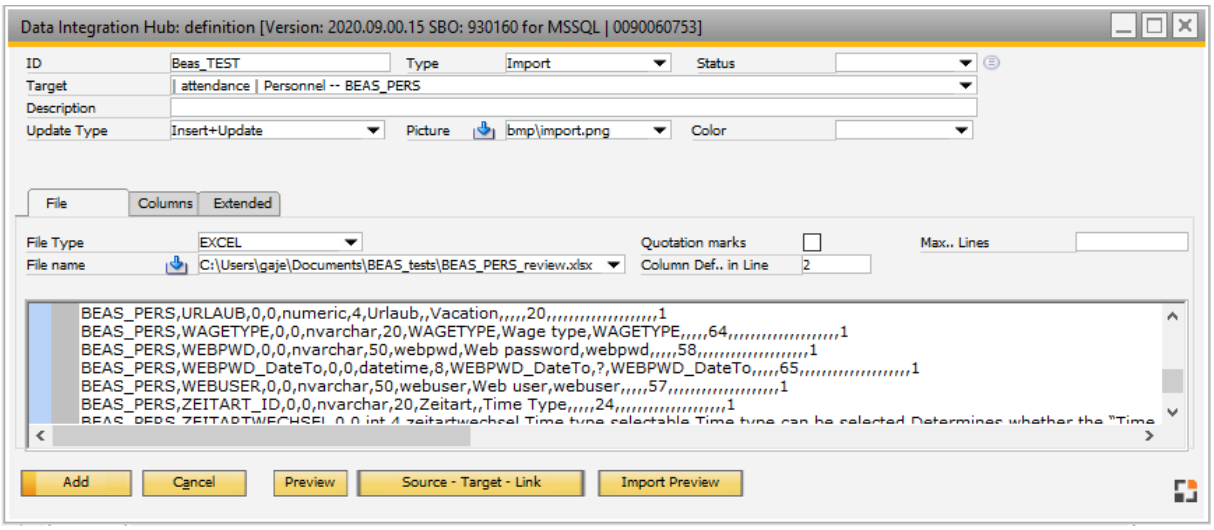
Extended

Definition Data Target

Preview

Source -Target - Link

The details of the import are defined in this window.



Window importkopf_edit.psr

Field	Description
ID	Unique ID of the scenario.
Target	The area or table where the data should be imported. ***See*** Definition Data Target for details.
Description	Short description of the import scenario.
Update type	⊟ Defines update type: import, update, both - Only Insert: Imports the data if the target is not yet available. - Only Update: Imports only if the target is already available. Therefore, ONLY existing data are replaced or updated with the new information, depending on the import area. Non-existent entries are ignored. Insert + Update: Imports new data rows and matches existing data rows. Note:

© 2026 Boyum IT Solutions A/S

	When importing BoM and routing, they are matched as a whole, therefore, single BoM positions cannot be changed. It is possible to delete positions subsequently. The matching is defined in the BoM position or in the routing position. ***See*** BoM position – Synchronize.
Image / Color	The icon and color for the import schema.
Type	Import type This field serves only as information. • Import • PDM Synchronization • CAD Import This field can also accept any text. The entered text affects the sorting in the import list, because it is sorted by type.
Status	Status of the import Import definition Using the icon next to the status field a number of statuses can be defined to describe the status of an import, for example: • Example • Creating • Testing • Released This is for information purposes only. ***See*** Status.

Buttons:

Add: Create the import definition.

Cancel: close this editing window without saving.

Preview

Import Preview

Source - Target - Link

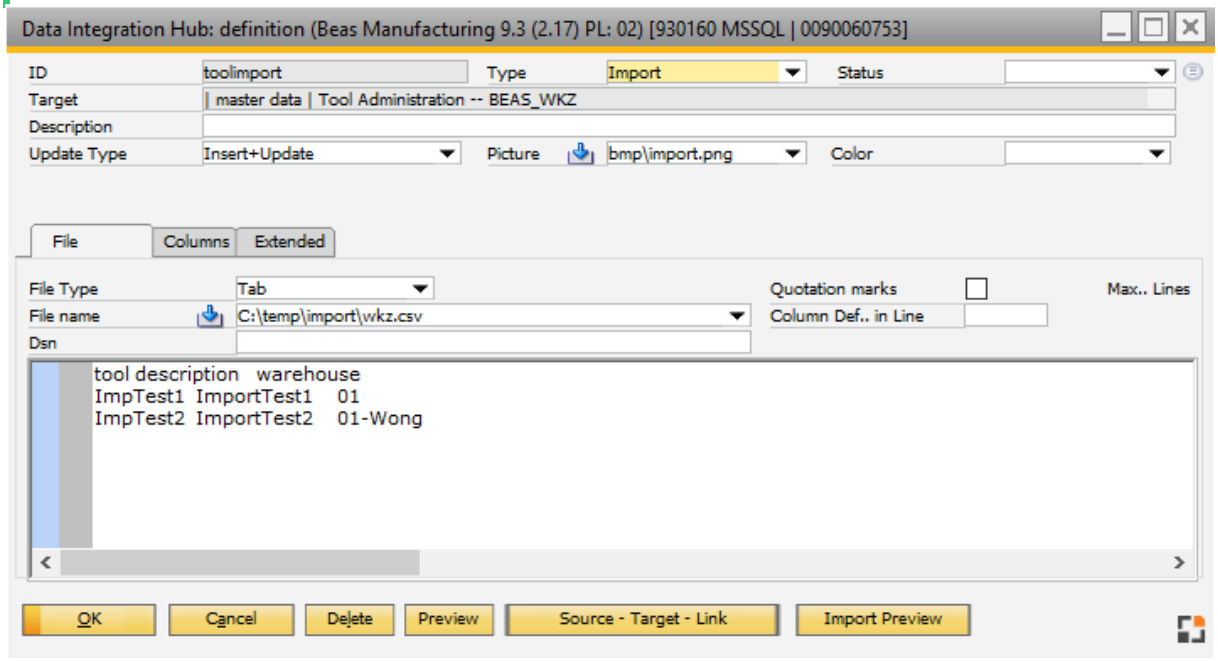
3.3.1.1.1 File

In the File tab you can define a file or source to be imported.

PATH: Administration > Data Import/Export > Data Integration Hub > **Open** Import definition.



Window importkopf_edit.psr

Field	Description
File type	Determines the data type or the separator in a CSV file • Excel: Imports an excel file. **Note for Excel import:** Microsoft Excel must be installed. **Important Notes for import in service mode:** Importing from Excel in service mode requires a number of correct settings in the windows system. 1. Microsoft Excel must be installed on the computer; it performs the import. 2. The following folders must exist as they are crucial for the operation of Excel when it is to be executed in unattended mode. C:\Windows\System32\config\systemprofile\Desktop C:\Windows\SysWOW64\config\systemprofile\Desktop

© 2026 Boyum IT Solutions A/S

	3. Beas converts the xls? files to CSV internally. Beas needs files with a ";" as separator. The separator for lists can be set in the regional settings of the computer. • ODBC: Imports an OBDC file. An SQL-statement - and optionally - a DSN connection string needs to be provided. • Tab, semicolon, comma: Determines the separator in a CSV file. • Any other separator can also be entered manually. Note: Only Encoding ANSI (Windows-1252) and UTF-8 are supported. ***See*** Description in the File name.
File name	Select the file to be imported Note: To define the import schema, the file must be available and contain all fields. The file name may not begin with "select" or "exec" because this would be interpreted as an SQL statement. In this case the file will automatically be entered as an ODBC type. After selecting the file name, click on the import symbol left of the field to update the file information. **CSV/Excel:** The setup of the file must be identical for all subsequent imports. The name and order may not change. To import excel-files, Microsoft Excel must be installed. **XML:** Configuration is ignored but the following rules apply for import definitions: • All fields that are to be imported must be included. • All fields must be filled with the max. length, because this is used as default for the max. length. In the field definition, the length indication can be changed. • Function attributes can be changed. ***See*** Extended.

© 2026 Boyum IT Solutions A/S

Special characters in format `&#...;` e.g. `Ä` -> Ã are allowed. Special characters in format `&...;` e.g. `€` are not fully supported.

File size:

It is recommended to keep the file as small as possible, because it is always fully read.

It is not possible to import large files > 1 MByte or > 10 000 Lines. It is allowed by the program, but the procedure may take considerable amount of time. In this case it is recommended to split the files in smaller parts.

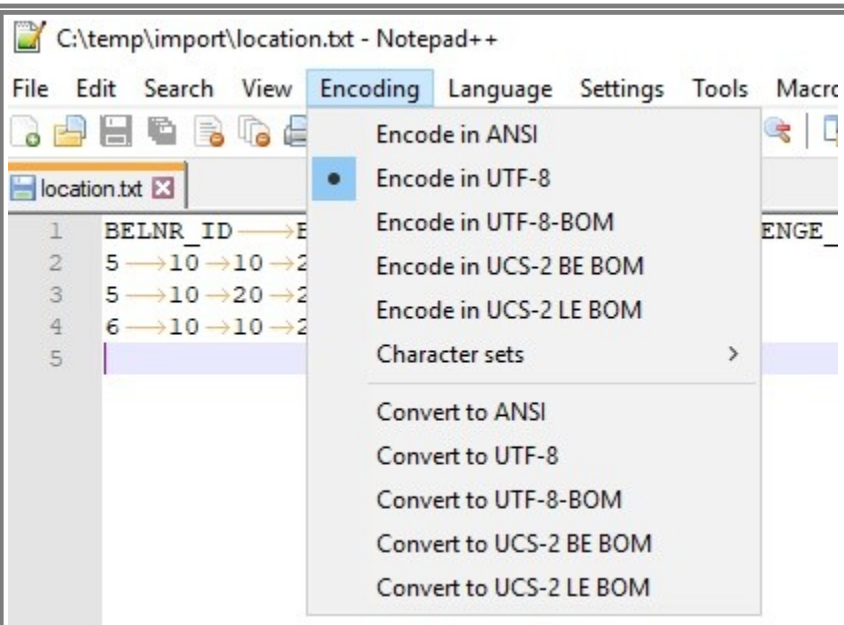
File Encoding:

The System tries to read every File encoding. But only UTF-8 encoding is working completely without problems with all windows regional settings. If you use a different Encoding, converting may not work properly.

How to check the file format:

1. Open the import file with Notepad ++ and click on "Encoding".
2. Check if the point on "Encode in UTF-8". If not, change the export program: File format = UTF-8

© 2026 Boyum IT Solutions A/S



Note: Only Encoding ANSI (Windows-1252) and UTF-8 are supported.

SQL statement	For ODBC: enter SQL-statement Only visible for the ODBC type. For the ODBC file type a SQL-statement can be entered, which is used to filter the imprt. The result of this SQL-statement can be imported. After defining the SQL-statement and the DSN string, click on the import symbol left of the field to update the file information. For further information, ***see*** DSN below. ***Example***: `select top 100 "ItemCode","ItemName" from "OITM" where "ItemName"<>''`
DSN	At ODBC: ODBC-connection string Only visible for the ODBC type. Nothing is required if the SQL-statement occurs on the current, registered database.

© 2026 Boyum IT Solutions A/S

	If an ODBC connection string is entered, a connection is established to the ODBC driver, using the given parameter, and the statement is executed there.
	If it is an MSSQL server, the ODBC driver `beas_sap` can be used.
	
	***Example*:**
	Connection to an MSSQL-database:
	`DSN=beas_sap;server=MyServr;database=MyDataBase;uid=sa;pwd=****`
	
	Connection to a HANA-database:
	`DSN=BEAS_HANA;server=vhana;database=MyDataBase;uid=SYSTEM;pwd=****`

Quotation marks	If active, all elements are displayed in quotation marks
	This option is hidden when XML-files are selected.
	If the elements are in quotes, multi-line text inputs are also possible.
	
	Example:
	`Itemcode;Description`
	`"A001","My Description"`
	`"A002","First Line`
	`Second Line"`
	`"A003","Third Item"`

XML without structure	Option for import of XML-file without structure
	Usually a file is built as follows:
	`<item>`
	`  <itemcode>abc</itemcode>`
	`  <bom>`
	`  <position>10</position>`
	`  <material>def</material>`
	`  </bom>`
	`</item>`
	
	There are also programs where the values are in consecutive order instead of a structure.
	
	`<item>abc</item>`
	`<material><def>/material>`
	`<bom><position>10</position></bom>`

© 2026 Boyum IT Solutions A/S

<table>
<tr><td></td><td>
To import these structureless values, mark the XML without structure checkbox . All imported values of the preceding line are copied to the next line.

Result of the lower table with "as structure":

<table>
<tr><th>item</th><th>material</th><th>position</th></tr>
<tr><td>abc</td><td></td><td></td></tr>
<tr><td></td><td>def</td><td></td></tr>
<tr><td></td><td></td><td>10</td></tr>
</table>

Result of the lower table with "as structure":

<table>
<tr><th>item</th><th>material</th><th>position</th></tr>
<tr><td>abc</td><td></td><td></td></tr>
<tr><td>abc</td><td>def</td><td></td></tr>
<tr><td>abc</td><td>def</td><td>10</td></tr>
</table>

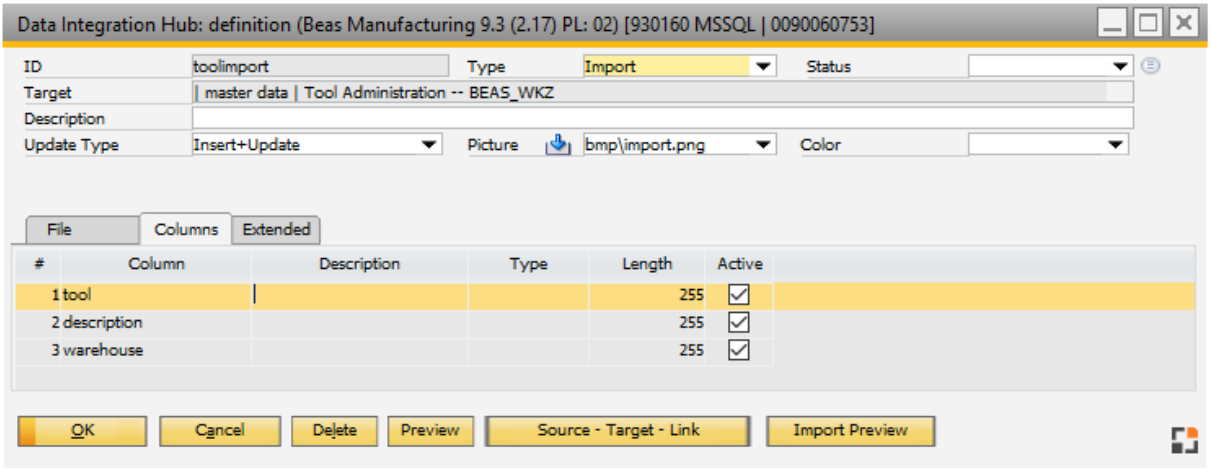
In this manner, you have all relevant information in the third line.
</td></tr>
<tr><td>Column Def.. in line</td><td>Defines the line in which the column definitions are stored in the CSV file.</td></tr>
<tr><td>Max.. lines</td><td>The number of lines to be imported.
Note: The Preview function ignores this setting.</td></tr>
<tr><td>Source</td><td>A part of the selected import file is displayed here. This is only a preview. Changes are ignored.
If you start a preview or import, the system always loads the data from the original file.
An Excel file is displayed in CSV-format.</td></tr>
</table>

3.3.1.1.2 Columns

In this tab the columns found in file to be imported are displayed.

PATH: Administration > Data Import/Export > Data Integration Hub > "**Open**" Import definition.

© 2026 Boyum IT Solutions A/S



Window importkopf_browse.psr

You can change the Names, insert description, Type and Length.
The system overwrites this if you change the File type or File name.

For XML Files you can define these additional attributes in the Extented Tab.

Field descriptions

Field	Description

Column	Name of the column
	For XML-files the XML-structure is stored in the column name, separated with "#".
	Example:
	`<xml>`
	`  <items>`
	`  <itemcode>A001</itemcode>`
	`  </items>`
	`</xml>`
	In this case the column "Itemcode" has the following definition:
	Column: `xml#items#itemcode`
	Length: `4`
	Description: `itemcode`

Description	Editable description of the column.

© 2026 Boyum IT Solutions A/S

	If an exact name is defined, the assignment between the target and source field is easier. This can also be changed in the Preview. The description can be stored in the XML file. ***See*** Extended > XML Attribute-Definition ***Example***: Title=FIELDNAME <itemname FIELDNAME="Description from item">
Type	Column type For XML-files define using the "TYP" attribute (you can define the Name of the attribute in the **Extented tab > Xml Attribute definition** e.g. <itemcode TYP="varchar"> ***See*** Extended > XML Attribute-Definition
Length	Maximum field length. This may be increased, if the determined length is incorrect. For XML-files defined using the "LEN" attribute. e.g. <itemcode LEN="20"> ***See*** Extended > XML Attribute-Definition
Active	Determines if the column should be provided or hidden at target-source linking.

Right-click function:

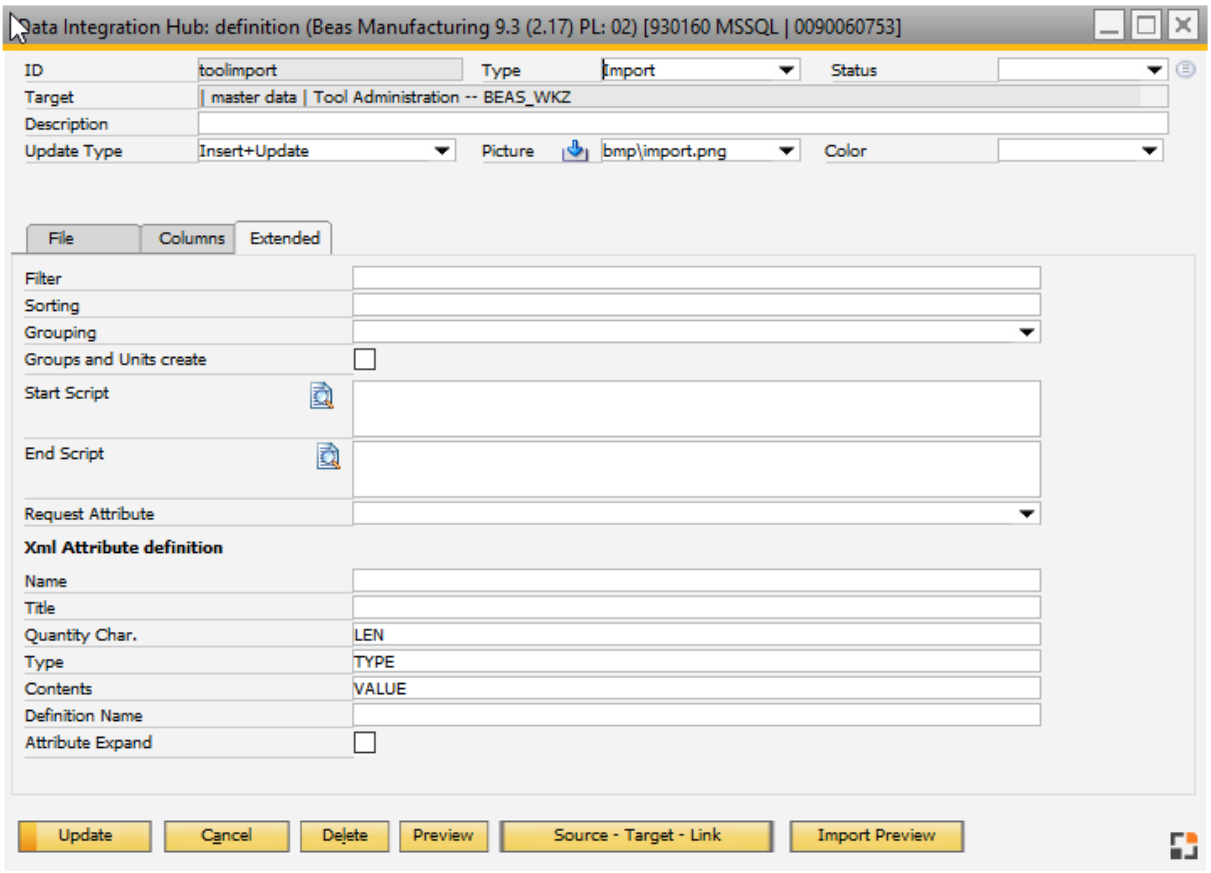
"Set Column description": Select this function for Beas to set a column description automatically with the name of the column.

3.3.1.1.3 Extended

More conditions, sorting and conversions can be defined under the extended information.

PATH: Administration > Data Import/Export > Data Integration Hub > **Open** Import definition.

© 2026 Boyum IT Solutions A/S



Window importkopf_edit.psr

Field descriptions

Field	Description
Filter	The source table can be filtered here, that is, the entries to be imported can be limited this way. In XML-structures, you can define which area of the stored structure is to be imported. ***Example:*** Import only if the item number does not begin with 1 and is not empty. `left(item,1)<>"1" and item<>""` The easiest way to define the filter is using the Preview.
Sorting	The transfer sequence can be defined here. ***Example***: Sorting according to source field "item" ascending: `"item"` ***Example***: Sorting according to source field "item" descending and "nr" ascending: `"item desc, nr asc"` The easiest way to define the sorting is using the Preview.

© 2026 Boyum IT Solutions A/S

Field	Description
Grouping	Select the field by which the rows are grouped All the following rows are hidden that have the same value in this field. Note: This only works if you sort by this field. **Example:** Row;Item 1;A001 2;A001 3;A002 Sorted and grouped by item results: Row;Item 1;A001 3;A002
Groups and Units create	If active, missing entries are created automatically in master data This includes among others: • Item – Item group • Item – Unit of measure • Item – Material group
Start Script	BeasScript is executed before the import Note: The import process does not allow message boxes, prompts or other modal forms, which can block the import process.
End Script	BeasScript is executed after the import
Request Attribute	Definition of a request id A column can be defined, the value of which is stored in the variable `<importrequestid>`. This can be used to create a response file which is returned to a PDM-software. From the import file the first row is determined, in which this column is present. Filters and other restrictions are not considered. Thus, the Request ID can also be located outside the import structure. ***Example:***

© 2026 Boyum IT Solutions A/S

Field	Description
	<request><requestid>1000044422</requestid></request> <item> <itemcode>A001</itemcode> <description name="Assembly 001"/> <bom> <material>C001</material><quantity>5</quantity> </bom> <bom> <material height="5" lengh="10">C002</material><quantity>5</quantity> </bom> </item> In this case the Request Id would be = 1000044422 It can be further processed with <importrequestid>.

XML Attribute definition

In a TAG-field attributes can be defined.
Which meaning divers tags have or in which kind these needs to be considered can be determined here.
A tag has following structure:

```
<tag attribut1="wert" attribut2="wert" />
<tag attribut1='wert' attribut2='wert' />
```

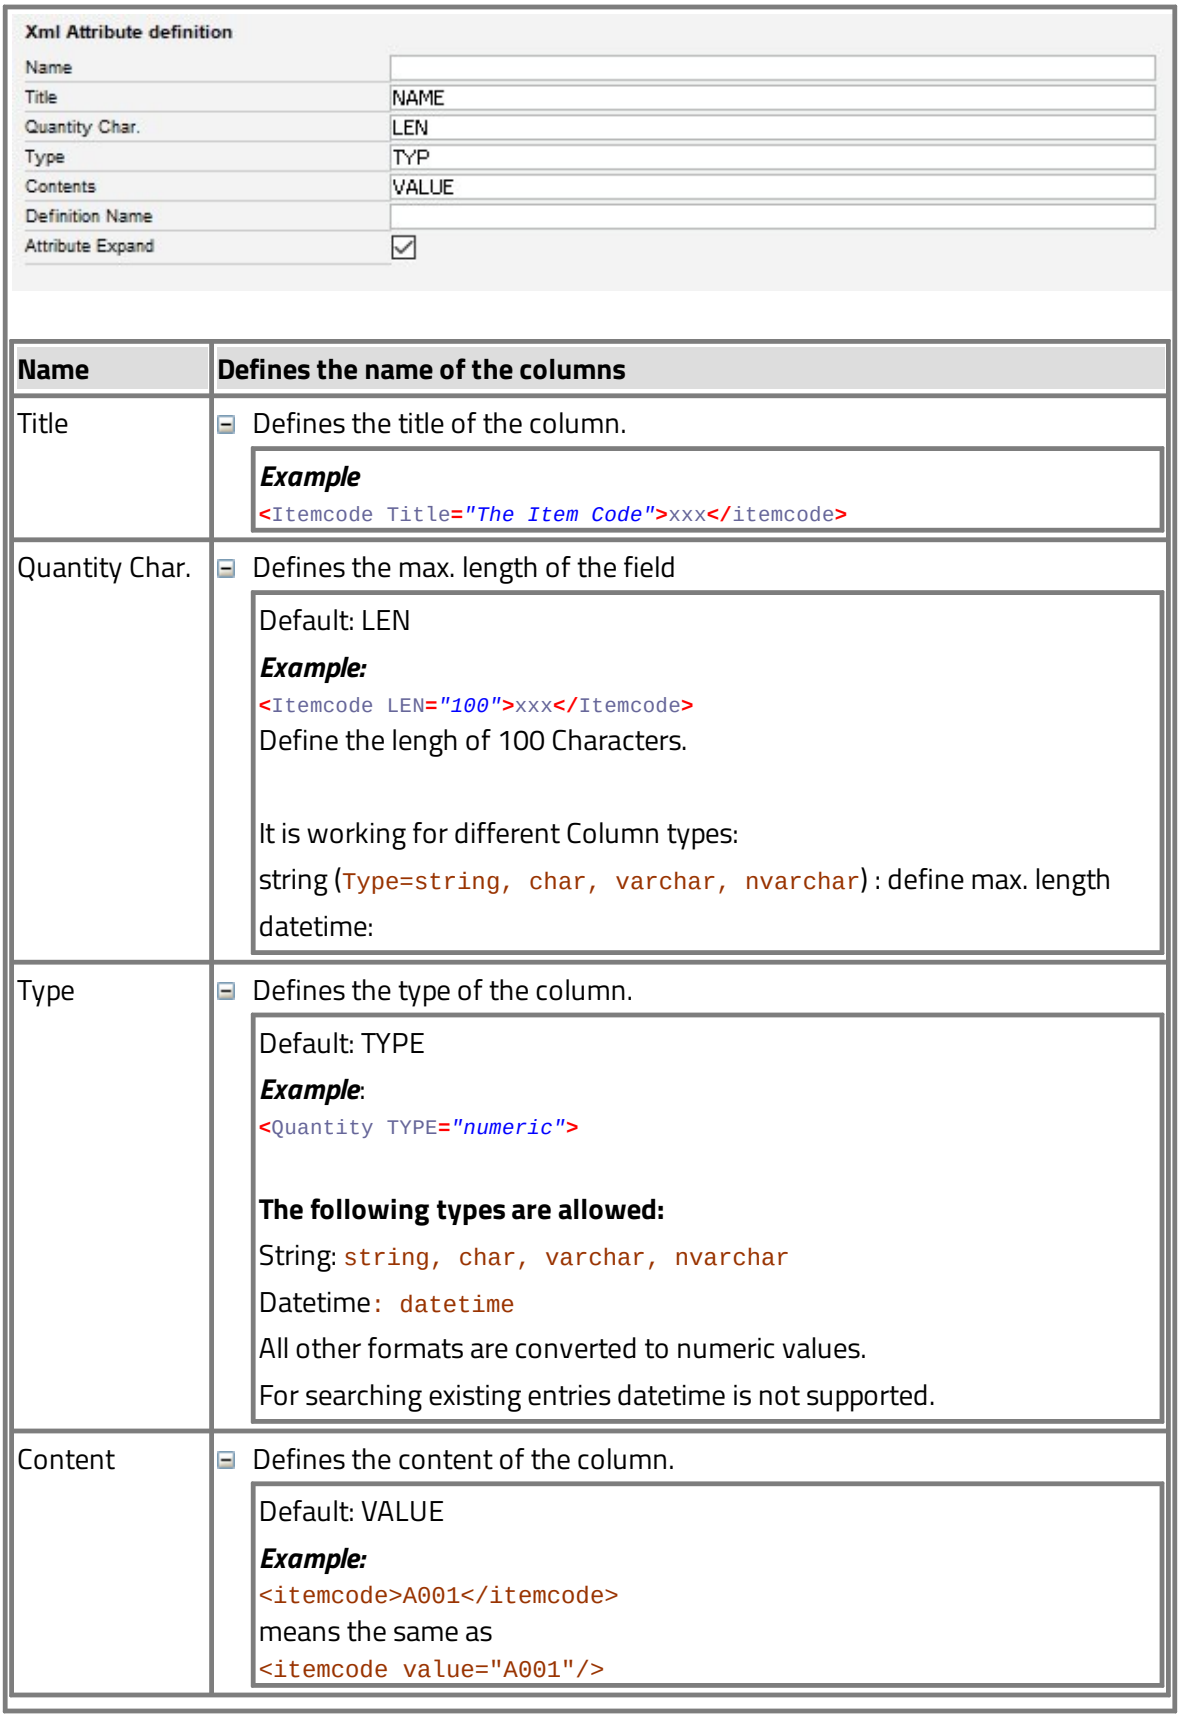
It is important to do blanks and to set quotation marks. There should be no blanks between an attribute and the "=" character.
Quotation marks " or ' are allowed.

A mix of attributes and substructures is allowed.
<item value="A001"><itemname>My Item</itemname></item>

A mix out of substructures and content is not allowed:
Wrong: <item>A001<itemName>MyItem</itemname></item>
Correct: <item value="A001"><itemname>MyItem</itemname></item>
Correct: <item>A001</item><itemname>MyItem</itemname></item>

Functions attribute

© 2026 Boyum IT Solutions A/S



Name	Defines the name of the columns
Title	Defines the title of the column. ***Example*** `<Itemcode Title="The Item Code">xxx</itemcode>`
Quantity Char.	Defines the max. length of the field Default: LEN ***Example:*** `<Itemcode LEN="100">xxx</Itemcode>` Define the lengh of 100 Characters. It is working for different Column types: string (`Type=string, char, varchar, nvarchar`) : define max. length datetime:
Type	Defines the type of the column. Default: TYPE ***Example***: `<Quantity TYPE="numeric">` **The following types are allowed:** String: `string, char, varchar, nvarchar` Datetime`: datetime` All other formats are converted to numeric values. For searching existing entries datetime is not supported.

Content	Defines the content of the column.
	Default: VALUE
	Example:
	`<itemcode>A001</itemcode>`
	means the same as
	`<itemcode value="A001"/>`

© 2026 Boyum IT Solutions A/S

Definition Name	Defines the name of a column. This attribute will be found, and its tag and sub- structure will no longer be noted.
	Some XML files have a special construct.
	
	Part 1: Define Field Name Index, example 0 = Itemcode, 1=Itemname
	Part 2: Define The values, example: 0="A001", 1="The ItemNmae"
	
	Example:
	Name = COL_ID
	Definition Name = NAME
	`<attrib COL_ID="0" NAME="ItemCode"/>`
	`<attrib COL_ID="0">A001</attrib>`
	
	The field "0" gets the name "ItemCode" with the number "A001"

Expand attributes	If active, a database field for the import is created for each attribute. ***Example:*** `<item len=30 value="A001" drawing="Z1" revision="5"/>` **The following structure is created:** item | drawing | revision A001 | Z1 | 5

3.3.1.1.4 Definition Data Target

This chapter comprises of the various areas of import of Definition Data Target.

DIH Attendance
DIH Attendance - Absence
DIH Attendance - Personnel
DIH Factory Data Capture
DIH Item
- DIH Item - BoM Positions
- DIH Item - BoM Header
- DIH Item - BoM Alternative items
- DIH Routing Header

© 2026 Boyum IT Solutions A/S

- DIH Routing positions
- DIH Routing Tool - alternative-parallel resource
- DIH Documents - Item OP catalog
- DIH Item parameter
- DIH Documents Item Version
- DIH Item version Status

DIH Master Data

- DIH Resources
- DIH Operation templates resources
- DIH Operation templates
- DIH Warehouse Bin Location, warehouse area
- DIH Warehouse Bin Location - bin definition
- DIH Business partners
- DIH Tool Administration
- DIH Tool - Bill of Materials
- DIH Raw material

DIH Production

- DIH Work Order
- DIH Production Time Receipt

DIH Quality Control

- DIH QC Inspection plan Header
- DIH QC Inspection plan measurement position
- DIH QC Order results
- DIH Item QC Cross reference

DIH Transactions (Production, Bookings, Manual Posting etc.)

- DIH Material management - transaction plan lines

3.3.1.1.4.1 DIH Attendance

Description	See	Table
Attendance data	Enter attendance time	BEAS_ANWZEIT

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

Imports attendance data.

The following details are required:

- Personnel number

© 2026 Boyum IT Solutions A/S

- Start date
- End date

Personnel numbers and start dates are matched during the update.

Attention: It is not possible to link order times with attendance times if the attendance data is imported, because the order times are calculated at the time of the order time receipt and the attendance report is usually not imported at that point.

Field	Name	M	Type	Description
PERS_ID	Employee Number	X	char(0)	
VONDAT	From Date	X	datetime(8)	best date format: yyyy/mm/dd hh:mm in 24 hour format Time format with am/pm not working.
BISDAT	To Date	X	datetime(8)	best date format: yyyy/mm/dd hh:mm in 24 hour format Time format with am/pm not working.
DAUER	Duration		datetime(8)	best date format: yyyy/mm/dd hh:mm in 24 hour format Time format with am/pm not working.
BEWERTUNGDAT	Valuation date		datetime(8)	best date format: yyyy/mm/dd hh:mm in 24 hour format Time format with am/pm not

ORGINALZEIT	Original Time Info		char(0)	if you change the original time, copy this in this field

3.3.1.1.4.2 DIH Attendance - Absence

Description	See	Table
Absence areas	Edit absence	BEAS_ABWZEIT

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

Imports absence areas, like holiday, sick leave, etc.
The primary keys are "Personnel ID" and "from date". It is also possible to update this data.

© 2026 Boyum IT Solutions A/S

The following details are required:

- Personnel ID
- From Date
- To Date
- Absence ID

Field	Name	M	Type	Description
PERS_ID	Personnel Id	X	nchar(20)	
ABWGRND_ID	Reason Id	X	nchar(20)	
VON	From Date	X	datetime(8)	best date format: yyyy/mm/dd hh:mm in 24 hour format Time format with am/pm not working.
BIS	To Date	X	datetime(8)	best date format: yyyy/mm/dd hh:mm in 24 hour format Time format with am/pm not working.

ZEITART_ID	Time Type		nvarchar(20)	

3.3.1.1.4.4 DIH Factory Data Capture

Imports work order times.

This data can only be imported and it is not possible to change existing order time receipts.

The following details are required:

- Work order document number
- Work order position
- Routing number
- Employee
- Start/End
- Time (in minutes)

© 2026 Boyum IT Solutions A/S

Dates have to be indicated in `yyyy/mm/dd` format and time in `hh:mm` format. Example: `2016/05/17 09:00`

Backflushing

The *Disable backflushing* filed is enabled by default. The backflushing process can be deactivated here. To activate, set the filed to *Y*.

Only material and assemblies can be posted, if the data could be identified automatically.

> **Important:**
>
> The time is not set, it must be indicated. All rules stored in the Configuration Wizard are applied.

3.3.1.1.4.5 DIH Item

Description	See	Table
Item	Edit Item master data	OITM

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

DIH Item - BoM Positions
DIH Item - BoM Header
DIH Item - BoM Alternative items
DIH Routing Header
DIH Routing positions
DIH Routing Tool - alternative-parallel resource
DIH Documents - Item OP catalog
DIH Item parameter
DIH Documents Item Version
DIH Item version Status

Import and match items.

When a new item is imported, the "default item" from the Configuration Wizard is used as a reference. As an alternative, it can be set in the "e_sourceitem" variable (to define in conversion script from field "Itemcode") and an alternative default item can be used.

item import procedure:

© 2026 Boyum IT Solutions A/S

1. Define the default item. Fill all fields (unit of measure, planning method, procurement method etc.).
2. Set the default item in the Configuration Wizard.
3. Define and perform import

Note:

Material group, unit of measure and item group can be created automatically, if Extended / Create groups and units was enabled in the import . If the data is incomplete, the data set is not created.

The following fields have extended settings:

All unit of measure fields	In case a unit of measure that does not yet exist in the UoM table, is imported, it is automatically created.
Material group (u_BEAS_GRUPPE)	Material group is automatically created, if it does not exist.
Item group	When, instead of the item group ID, the item group description is indicated, the internal item group ID is determined and used automatically in the description. When the item group is not found, it is automatically created.
Procurement method	If enabled, the scheduling ID is set to *storage-related assembly*, otherwise to it is set to *Purchase item*.
I-Version	If a version number is entered, an item version is created immediately. This is done independent of the Create groups and units settings.
Series	Only for item generation: Define series defined in SAP Document Numbering - Setup. You must define the internal Id (NNM1.Series) If you have only the SersiesName in the import file, you can convert it with follow syntax in source-target defintion: `// search for series name and return the series number`

© 2026 Boyum IT Solutions A/S

	`select "Series" into value from "NNM1" where "SeriesName"='<import.series>' and "ObjectCode"=4`

Import table

Field	Name	M	Type	Description
ItemCode	Itemcode	X	nvarchar(50)	
ItemName	Description		nvarchar(100)	
Series	Serie		int(4)	For number generation you can define the series in system init - Document Numbering - Object "Items" DIH: here you can define the name of series (NNM1.Seriess) as Number If you'Ve only series name, you can use follow script : select "Series" into value from "NNM1" where "SeriesName"='' and "ObjectCode"=4
U_beas_ver	Item Version		nvarchar(20)	Version number of the item editable. If it's defined in Item Version Control, it's not editable and the system is working with Item

U_batchroh	Batch determination		char(1)	Define automatic batch number / serial number generation can generate the batch automatically for a receipt transaction. Here you can set up whether the batch is entered manually or generated automatically when posing in material. Batch according to material ========== ========== If an assembly is

© 2026 Boyum IT Solutions A/S

				posted in, as batch number is determined that one of the first material in the BOM of the assembly which was last posted in. Example: Assembly: "Paste y in container x" |- Bill of Materials: Paste y |---|- 1. issue batch aaa |---|- 2. issue batch bbb If "Paste y in container x" is now produced and posted in, the batch number of "Paste y" of the last posting, i.e. batch "bbb" is assigned. Automatic batch determination ========== ========== = Batches are generated automatically, at stock correction the next number

© 2026 Boyum IT Solutions A/S

				can be requested. see Batch generation Special case at SAP-posting processes: If the entry field for quantity is left with Ctrl-Tab, the batch assignment screen opens. There is a button "next batch" Clicking there, the next batch number according to SAP - batch determination program is determined and entered to the current field. Batches are always determined automatically. Manual batch input ========== If activated, manual batch input is always performed for this item.

Description	See	Table
Bill of Materials positions	Edit Bill of materials	BEAS_STL

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

A Bill of materials is always regarded as a whole and can only be imported completely. In case of an update, the BoM is deleted first and re-inserted. It is not possible to update single positions, but synchronization can be done on position level.

An item needs to be defined which is used if the imported position has no valid item number. This is done in the Configuration Wizard.

The correct order for an import is:

- Item
- Routings
- Bill of materials head data
- Bill of materials

A Bill of materials can also be imported directly. Positions numbers are assigned automatically if they are not set manually.

If the material number is not defined, the default item is inserted, and the bill of materials is set to *manually*.
If the stored material number is unknown, the default item is inserted, Bill of materials position is set to manually, and the transferred item number is inserted into the information field.

NOTE: It is not possible to import Input Unit and Input factor for a BoM position.

Field	Name	M	Type	Description
ItemCode		X	nvarchar(50)	Id of bill of material Linked to header of bom (BEAS_STL_HEADER)
POS_ID		X	int(4)	internal position number id (not

© 2026 Boyum IT Solutions A/S

				visible)
ART1_ID			nvarchar(50)	Material number of item linked to OITM.ItemCode Import: If you insert a unknown itemcode, beas move this imtecode in field "userfield" and insert the "unknown itemcode" which you can set in the configuration wizzard
POS_TEXT			nvarchar(20)	
INPUT_QTY		X	numeric(4)	Determines the requirement in entry units per assembly in Input UoM. Usually, the entry unit is the consumption unit of the selected item,
nonSynch			int(4)	Define the synchronisation option Valid values: synchronisation on (import: delete and import new)=0 synchronisation on, but don t

© 2026 Boyum IT Solutions A/S

				delete this line=1 don t synchronisate this position=2
MENGE_JE			decimal(9)	
SortId			int(4)	Define the sorting in the bom list self
Version			nvarchar(20)	
UseOwnDescription			int(4)	if activ, beas use description and drawing number from this position (Field DESCRIPTION and ZNR) if not activ, beas use the description and drawing number from the item or choosed Version number Valid values: yes=1 no=0
DESCRIPTION			nvarchar(255)	Item description about the bom position beas ignore this, if "UseOwnDescription" not 1
AKTIV			nchar(1)	 Valid values: activ=J not activ=N
ZNR			nvarchar(50)	Item drawing number about the bom position beas ignore this, if

© 2026 Boyum IT Solutions A/S

				"UseOwnDescription" not 1
AUSSCHUSS			numeric(4)	Scrap for bom
ROUND_TYPE			int(4)	type of rounding Valid values: no rounding=-1 commercial=0 round up=1 round down=2 multiple of=3
ROUND_DEC			int(4)	
APLANPOS_ID			int(4)	Bom linked to this operation Operation is linked with item without separat bom: same id as the bom item with separat bom: id of routing is in BEAS_STL_HEADER.ROUTINGID Attention: Import don't check the link information.
ABM1			numeric(4)	
ABM2			numeric(4)	
ABM3			numeric(4)	
INFO			nvarchar(50)	
UserText			nvarchar(255)	
GUELTIG_BIS			datetime(8)	best date format: yyyy/mm/dd hh:mm in 24 hour format

Description	See	Table
Routing position	Edit Routing position	BEAS_APL

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

The standard operation type needs to be defined. Resources must be created. You can work with operation sequence catalog numbers. In this case, all default values are accepted.
Resource allocation type import is supported. *Beas 2021.11*
A routing can only be imported or replaced completely. Single routing positions cannot be replaced.

Important:

When working with parallel resources, the input of the internal position number is necessary for linking.

Attached documents from item version	Item master Data - Item Version - Documents	BEAS_DOCUMENTS

NOTE:

In this table documents for different sources are saved.
For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

Settings for import Item Version documents:

Column	Type	Link
Link Type	Default	itemversion
Reference 1	From table	item code
Reference 2	From table	item version

© 2026 Boyum IT Solutions A/S

Column	Type	Link
Reference 3	No	
LineId	No / FromTable	Line Number. Defined only if you want to update a line. If 0, the system creates a new line. Note: If the user deletes a document in the program, the system does not delete the entry, but marks it as invisible. If you update the line, you must disable the invisible flag (invisible=0)

Note:
You must save the link of the original file name.
The file must be in a shared folder.

The system does not create a copy of the file if you import the data - it only provides a link to the file.

For more information ***see*** Detailed documentation.

Field	Name	M	Type	Description
TYP	Link Type	X	nvarchar(20)	define the linked object Valid values: link to item Version=itemversion

Item version administration status	Edit Item version status	ITEM_VERSION_STATUS

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

Field	Name	M	Type	Description
Status	Status Id	X	nvarchar(20)	
DESCRIPTION	Description		nvarchar(255)	
Deleted	Entry deleted / blocked		int(4)	
Release	Release		int(4)	Valid values: yes=1 No=0 do not change=2
Block	Locked		int(4)	Valid values: Yes=1 No=0 do not change=2
BITMAPNAME	Picture		nvarchar(50)	
COLORID	Color		int(4)	
CanSaleOrder	Sales order		int(4)	Valid values: Yes=1 No=0
CanDeliver	Delivery note		int(4)	Valid values: Yes=1 No=0
CanSaleInvoice	Sales Invoice		int(4)	Valid values: Yes=1 No=0
CanPurchaseOrder	PO Order can be created		int(4)	Valid values: Yes=1 No=0

© 2026 Boyum IT Solutions A/S

CanGRPO	Purchase delivery note		int(4)	Define, if a Goods Receipt PO can be created Valid values: Yes=1 No=0
CanPurchaseInvoice	Purchase Invoice		int(4)	Describe, if a PO Invoice can be created Valid values: Yes=1 No=0
CanModify	Change allow		int(4)	If this option is deactivated, the stored routing cannot be changed. But the fields in the item version are still changeable. Valid values: Yes=1 No=0
CanCreateWo	Work order can be created		int(4)	A work order can only be created for this item version if this option is active. Note: If the status is blocked the work order is created but blocked if it is a sub-item. The work order is also be blocked if it is created in an automatic process (via integration hub).

© 2026 Boyum IT Solutions A/S

				The blocking can be avoided by using Production types eg. for a sample production. Valid values: Yes=1 No=0
CanReservationWo	Reservation for Wo		int(4)	Valid values: Yes=1 No=0
CanIssueWo	Issue for wo can be created		int(4)	Defines whether the item version is to be considered in material planning. If a work order has already been created, this option affects the same option in the work order position. See Update Status. Yes / No / None change are selectable. Valid values: Yes=1 No=0 None Chagen=2
STARTDISPOSITION	Material planning		int(4)	Related to work order setting "Disposition" Defines whether the item version is to be considered in material planning. If a work order has already been created, this option affects the same

3.3.1.1.4.7 DIH Production

Import Production related definitions.

DIH Work Order

DIH Production - WO Header

DIH Production - WO Position

© 2026 Boyum IT Solutions A/S

DIH Work Order BoM

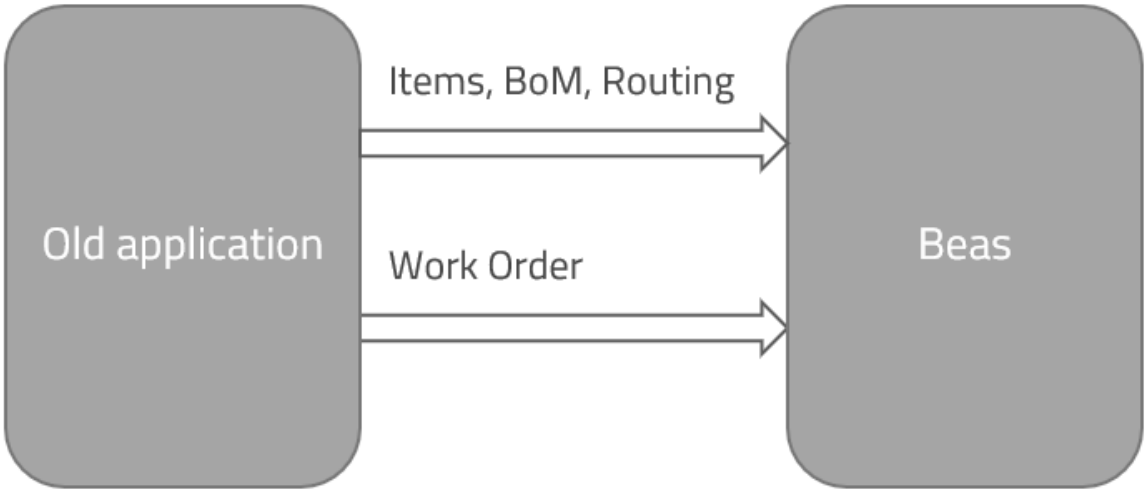
DIH Production Time Receipt

Imports Work order definitions.
A work order has the following objects:

- Migration from old or third-party application

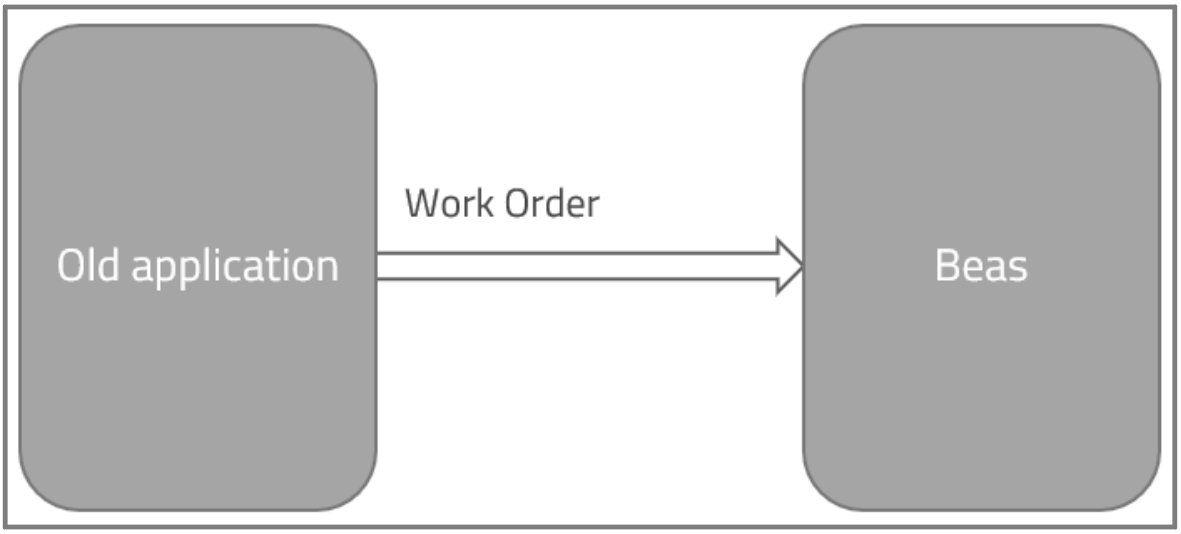
Example:
The old system contains all items, Bill of materials and routing information. These data can be imported with the Integration hub. After this is complete, work orders can be imported.
Only the top level assembly can be defined. Beas reads Bill of materials and routing information from imported master data.

It is not possible to import routing or bill of materials for every work order separately.

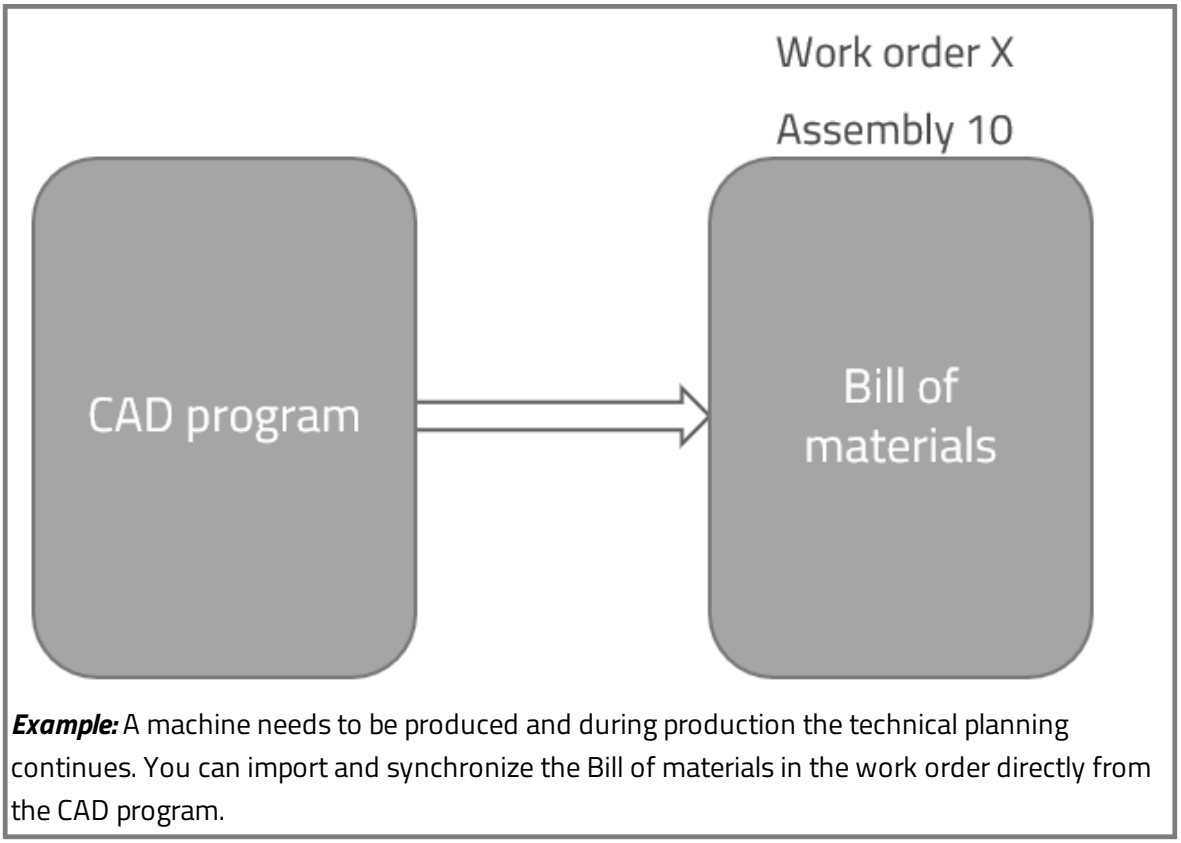


A third-party application can define the work orders in Beas. You can use this option if you have an external planning tool for production in stock.

© 2026 Boyum IT Solutions A/S



- Creating Bill of materials synchronization between a third-party application and Beas



Example: A machine needs to be produced and during production the technical planning continues. You can import and synchronize the Bill of materials in the work order directly from the CAD program.

Description	See	Table
Work order Header	Edit work order header	BEAS_FTHAUPT

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

© 2026 Boyum IT Solutions A/S

Use this if you want to update the header information or if you want to create new work orders and you need only the item code and quantity for the work order position.
Inserts first work order position with item code and quantity.
Beas explodes the Bill of materials, routing position and all order-related sub-assemblies.

Note: Creating reference to other documents or changing any properties in the work order line is not possible.
You can change the work order type, but it is not possible to change the work order type related flags; Beas ignores these changes.

You cannot define the document number (BEAS_FTHAUPT.BELNR_ID), only the order number (BEAS_FTHAUPT.AUFTRAG).
Most properties are changeable, but you cannot change the created work order positions.
Beas ignores the item code and quantity property.

Field	Name	M	Type	Description

Enter topic text here.

Description	See	Table
Work order position	Edit Work order position master data	BEAS_FTPOS

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

Use this to import work order positions with extended position information.
The assembly can be defined, but Beas always uses the BoM and routing information from item master data.

© 2026 Boyum IT Solutions A/S

Add position to existing work orders.
Beas explodes the Bill of materials, routing position and all order-related sub-assemblies.
If you do not define a work order number, Beas creates a new work order (BELNR_ID=0).
It is not possible to define additional information for work order header if the system creates a new work order.
It is not possible to update existing positions.

The work order document number, work order position and bill of materials position are mandatory.
When trying to insert an exiting BoM position, Beas updates the position.
Beas does not explode order related assemblies. Multilevel work orders cannot be created.

Defines linked information.

Field	Name	M	Type	Description

Description	See	Table
Work order Bill of materials	Edit Work order BoM - General	BEAS_FTSTL

For detailed information on how to import ***see*** Data Integration Hub and Source-Target-Link.

Use this to synchronize the BoM with external programs.
You can add and change Bill of materials positions of existing work order positions.
All properties of an existing Bill of materials position can be updated.
Beas does not change existing sub-position.
You can delete a BoM if you set the quantity to 0, but only if no related transaction or reservation exists.

Imports Work Order Bill of Materials definitions.
The following fields are mandatory:

- Document number, work order position number, bill of materials position number
- Quantity

Entries can only be changed if changes are allowed and the work order position is not closed.

Position numbers:

© 2026 Boyum IT Solutions A/S

- The internal position number. If this is a new number or if it is 0, Beas creates a new position.
- If you do not set the position text, Beas sets the position number in position text.
- The internal position number does not define the sorting. You must define this separately. ***See*** Sorting rules.

Position text:

- If this is not set manually, Beas inserts the defined or generated internal position ID.
- It can be defined and changed every time.

ItemCode:

Item code is mandatory and the item must exist.

The integration hub does not check additional rules.

If you change the item and the related position, reservation or transactions exist, Beas does not change anything.

Note: If you insert an order-related item, Beas does not create an order-related sub-position.

ItemVersion:

The system checks if the Item Version exists and not locked.

But it is allowed to use it, if not released.

Quantity:

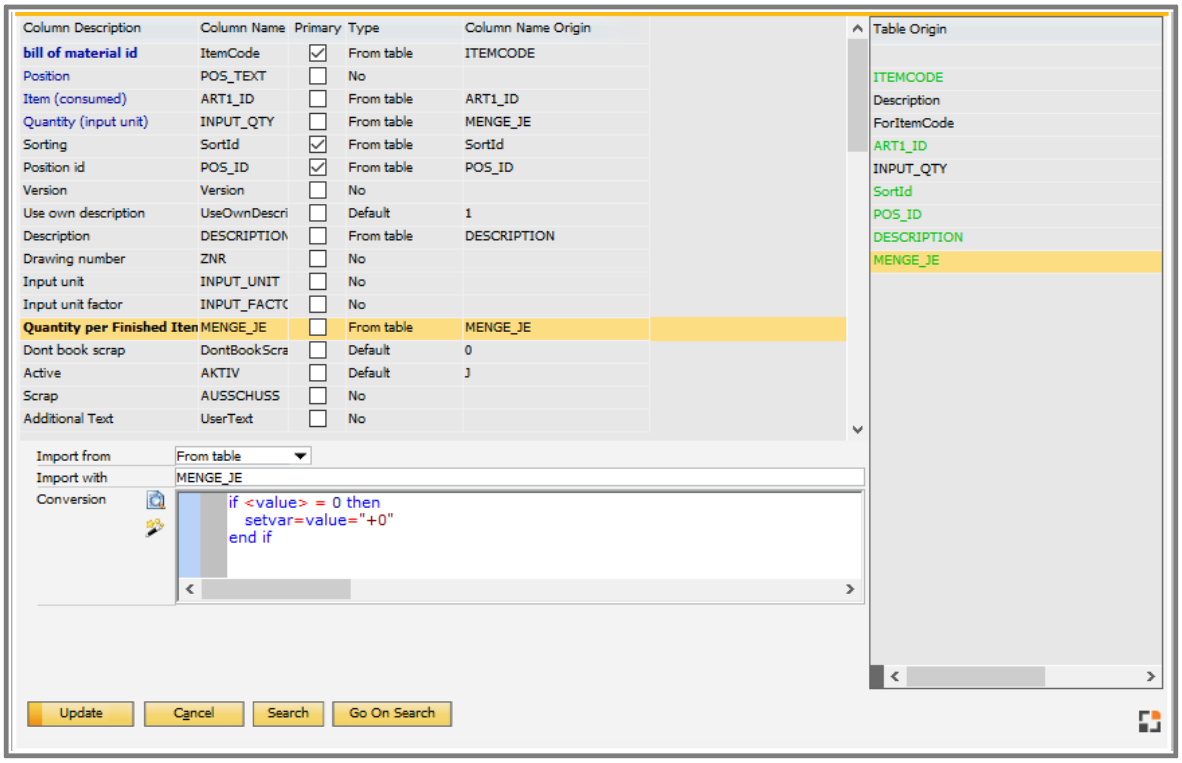
Rules for quantity in the BoM import:

- A value > 0 inserts a positive amount.
- A value < 0 inserts a negative amount.
- A value of 0 deletes an existing position. ***See*** Delete a bill of materials position.
- A value of +0 adds a position with 0 amount.

Example of importing a +0 value

If you only have 0 quantity in the importfile, you can convert the value

© 2026 Boyum IT Solutions A/S



Delete a Bill of materials position:

It is possible to delete an existing Bill of materials position. Beas requires the following fields: BELNR_ID,BELPOS_ID and POS_ID and Quantity=0.

- If any transaction exists on this position, the position cannot be deleted.
- If a reservation exists, Beas deletes the reservation.
- If the position is an order-related assembly, Beas deletes all related sub-positions.
- If a deletion of a sub-position is not possible, Beas closes all related sub-positions.

Sorting (SortId):

Defines the sorting for the Bill of materials positions. You can define a positive number or special sorting rules.

Special sorting rules

Sort Id	Description
-1	Order by internal position number. The system searches by position, and chooses a number that is lower than the current position and higher than the lowest existing position. It receives this sortid, increments it with 1 and defines it as a sortid from the current position. ***Example:***

© 2026 Boyum IT Solutions A/S

Sort Id	Description
	Pos 10 – Sort 10 Pos 20 – Sort 20 You insert Pos 15 Pos 10 – Sort 10 Pos 15 – Sort 11 Pos 20 – Sort 20 This is a fast variant, because Beas must only insert Pos 15, but in other situations this can generate a problem. ***Example:*** Pos 10 – Sort 1 Pos 20 – Sort 2 You insert Pos 15 Result in MSSQL: Pos 10 – Sort 1 Pos 15 – Sort 2 Pos 20 – Sort 2 Result in HANA: Pos 10 – Sort 1 Pos 20 – Sort 2 Pos 15 – Sort 2 In this case Pos 20 and Pos 15 have the same Sort id and it is not clear which position is the first position.
-2	Order by internal position number. In this case Beas sorts the complete bill of materials position by internal position number

© 2026 Boyum IT Solutions A/S

Sort Id	Description
	Beas must save every change from every bill of materials position. In case a large number of positions must be inserted, this concept produces a lot of change requests. Do not use this for mass import. ***Example:*** Pos 10 - Sort 10 Pos 20 - Sort 20 Pos 30 - Sort 30 You insert Pos 15 Pos 10 – Sort 10 Pos 15 – Sort 20 <- insert Pos 20 – Sort 30 <- update Pos 30 – Sort 40 <- update
-3	Order by position text (alphanumeric). ***Example*** Pos Text A10 Sort 10 Pos Text A20 Sort 20 Pos Text A50 Sort 30 You insert position with Pos Text = A30 Pos Text A10 Sort 10 Pos Text A20 Sort 20 Pos Text A30 Sort 20 <- insert Pos Text A50 Sort 30 <- update Attention: You can encounter the following issue when working with numbers: ***Example*** Pos Text 10 Sort 10 Pos Text 20 Sort 20

© 2026 Boyum IT Solutions A/S

Sort Id	Description
	Pos Text 100 Sort 30 Insert Position Pos Text = 50, and the result (alphanumeric sorting) is the following: Pos Text 10 Sort 10 Pos Text 100 Sort 20 <- update Pos Text 20 Sort 30 <- update Pos Text 50 Sort 40 <- insert
-4	Order by position text (converted to number) ***Example*** Pos Text 10 Sort 10 Pos Text 20 Sort 20 Pos Text 100 Sort 30 You insert position with Pos Text = 50 Pos Text 10 Sort 10 Pos Text 20 Sort 20 Pos Text 50 Sort 30 <- insert Pos Text 100 Sort 40 <- update If you insert a position with alphanumeric position text, Beas sets this to first position. ***Example***: insert position with text A001 Pos Text A001 Sort 10 <- insert Pos Text 10 Sort 20 <- update Pos Text 20 Sort 30 <- update Pos Text 100 Sort 40 <- update

WO BoM

Field	Name	M	Type	Description

© 2026 Boyum IT Solutions A/S

SortId	Sort		int(4)	Internal sort id. beas sort the bom list by this number Integration hub -1 = sort by POS_ID, fast solution -2 = sort by POS_ID, beas sort the complete bill of material list -3 = sort by Position Text - alphanumeric -4 = sort by Position Text - Numeric More information see documentation object ue_api_wobom - beas check the sortid and all special rules too, if you save this with wobom.save
BELNR_ID	Work order Number	X	int(4)	
BELPOS_ID	Work order Position	X	int(4)	
POS_ID	internal bom position		int(4)	Internal Position number. You can't change it. This is not the sort number. Sorting is defined by SortId

© 2026 Boyum IT Solutions A/S

				Integration hub - use POS_ID=0 - beas create the next number - if you define a POS_ID, beas update the existing position number or create a new line, if not existing ue_api_wobom - the object don't check, if the pos-id is existing. if you insert a existing pos_id a second time, you create a primary key error.
POS_TEXT	Bill of Material Position		nvarchar(20)

COLORID	Color		int(4)	

3.3.1.1.4.9 DIH Transactions (Production, Bookings, Manual Posting etc.)

Material transactions are defined in a definition file: "Transaction plan lines".
Different transaction types like receipt and issue, goods receipt etc. can be executed here.
The transaction type is indicated in the "Transaction Type" field.

The following transaction are supported:

- Work order Receipt / Issue
- Manual Receipt / Issue

Note: The system creates one document PER import line.
This means: If you import 200 lines, the system will create 200 documents.

© 2026 Boyum IT Solutions A/S

See also DIH Material management transaction plan lines.

All the fields in this table are mandatory related to document type and item management method.

Field	Value
Transaction Type	Define the type of transaction type **Transaction Typ** / **Description** WOISSUE – Production – Material issue (or "WOIM") WORECEIPT – Production – Material / Assembly receipt ISSUE – manual Issue RECEIPT – manual receipt
Link Document Type	"WO"
Link Document	Work order Number (BEAS_FTHAUPT.BELNR_ID)
Link Line 1	Work order Position (BEAS_FTPOS.BELPOS_ID)
Link Line 2	Only for Bill of Material: Internal Bill of Material Position (BEAS_FTSTL.POS_ID) For assemlby: Don't define it or 0
ItemCode	The Item Number (Assembly: BEAS_FTPOS.ItemCode, Bill of Material: BEAS_FTSTL.ART1_ID)
Quantity	the Issue Quantity in Inventory UoM
WareHouse	The Warehouse from the Item OWHS.WhsCode
Bincode	Bincode if warehouse is a bin-managed warehouse Supported: SAP, WMS and Beas bin-management If this is a WMS or Beas bin-managed warehouse, the bin code is mandatory.
RFID / LUID	The RFID (beas) or LUID (WMS) Number for current Bin code
DistNumber	The visible Serial/Batch Number Normal Item: Empty Batch Administration: OBTN.DistNumber Serial Administration: OSRN.DistNumber

© 2026 Boyum IT Solutions A/S

Field	Value
	If this is a work order receipt or purchase receipt and batch number generation is activated, it is not mandatory to fill it.
SysNumber	Only for Issue documents Alternative to DistNumber (visible Batch/Serial Number) you can use the internal System Number. (OBTN.SysNumber, OSRN.SysNumber) Don't define both. Don't use it for receipt documents.
Batch Number	**Not supported anymore**. Please use DistNumber or SysNumber
Price	⊟ Price per Unit Only for RECEIPT If a price is defined in the first import line, the system activates the Price Import function automatically. If the first entry is 0, the system uses the standard valuation for all lines and ignores any price definition in the subsequent lines. ***Example:*** RM1 has average price 3 USD RM2 has average price 4 USD Import defintion RM1: 0.0 USD RM2: 4.5 USD System import RM1: 3 USD (Average price) RM2: 4 USD (Average price) Import definition RM1: 1.0 USD RM2: 4.5 USD System import RM1: 1 USD (Price from Import) RM2: 4.5 USD (Price from Import)

© 2026 Boyum IT Solutions A/S

Field	Value
	Price per Batch / Serial number: Normally, the system imports all batches for one item in one line If the batches have different prices, the system will create a receipt line per Batch. The system can define the different batches only in this way. ***Example 1:*** Item RM_B Batch A: 3 USD Batch B: 3 USD The system creates a receipt document in the following way: Item RM_B Price 3 USD |_ Batch A, Batch B Item RM_B Batch A: 3 USD Batch B: 4 USD The system creates a receipt document in the following way: Item RM_B Batch A Price 3 USD Item RM_B Batch B Price 4 USD

Important:

The data must be checked for correctness before the import. There is no further check in the import process.

The values must be checked in the Import Preview function or all necessary checks must be defined in the Source – Target – Link.

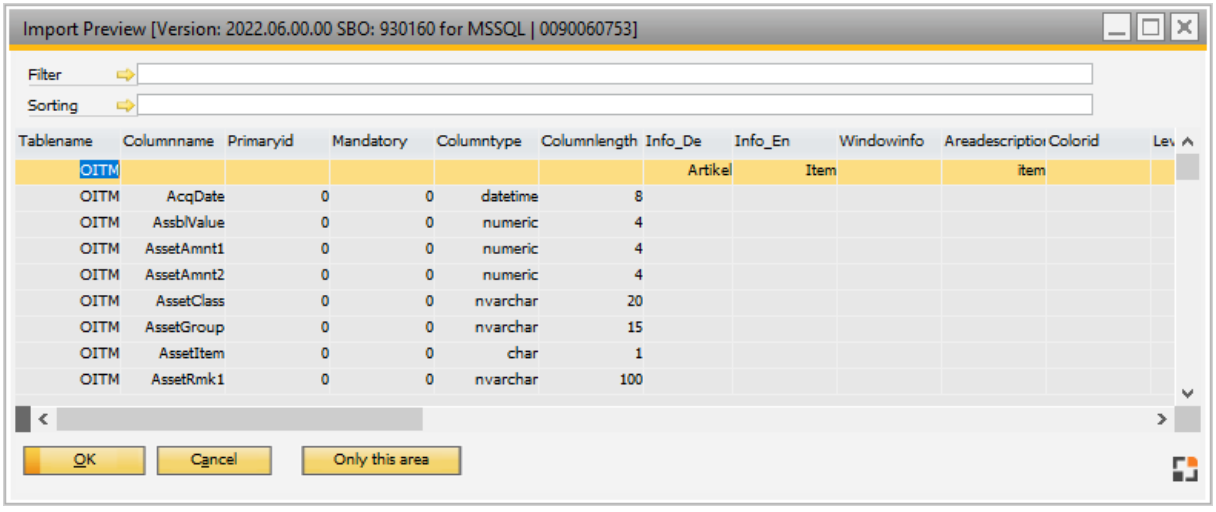
3.3.1.1.5 Preview

PATH: Administration > Data Import/Export > Data Integration Hub > **Open** Import definition > **Preview** button.

In the Preview, the file to be imported is displayed as a list.



Window import_ defpreview.psr

- XML-files are also shown as a list

  Each tag in the XML-file has a separate column. Accordingly a double-designation is possible.
  If the cursor is on the title, the structure name is shown.

© 2026 Boyum IT Solutions A/S

Example: `<item><itemcode>A001</itemcode><item>`
Column name = `itemcode`
Structure column name = `item#itemcode`
Area = `item`
Content = `A001`

Options in the right-click menu:

Option	Description
Filter	The filter can be defined by right-clicking on the header row. For XML-files proceed as follows to define the structure area to be imported: 1. Select the rows to be imported. 2. Click the **Only this area** button. All other rows are hidden outside this area. Use the reference arrow to define a filter manually.
Sorting	Defines the sorting of the table to import right-clicking. Use the reference arrow to define sorting by Drag&Drop.
Table	In the table all fields are displayed that are defined in the import file. Double-click on any title to change the text. Right-click and delete all empty columns: all columns are deleted, which have no entry in the currently selected row.

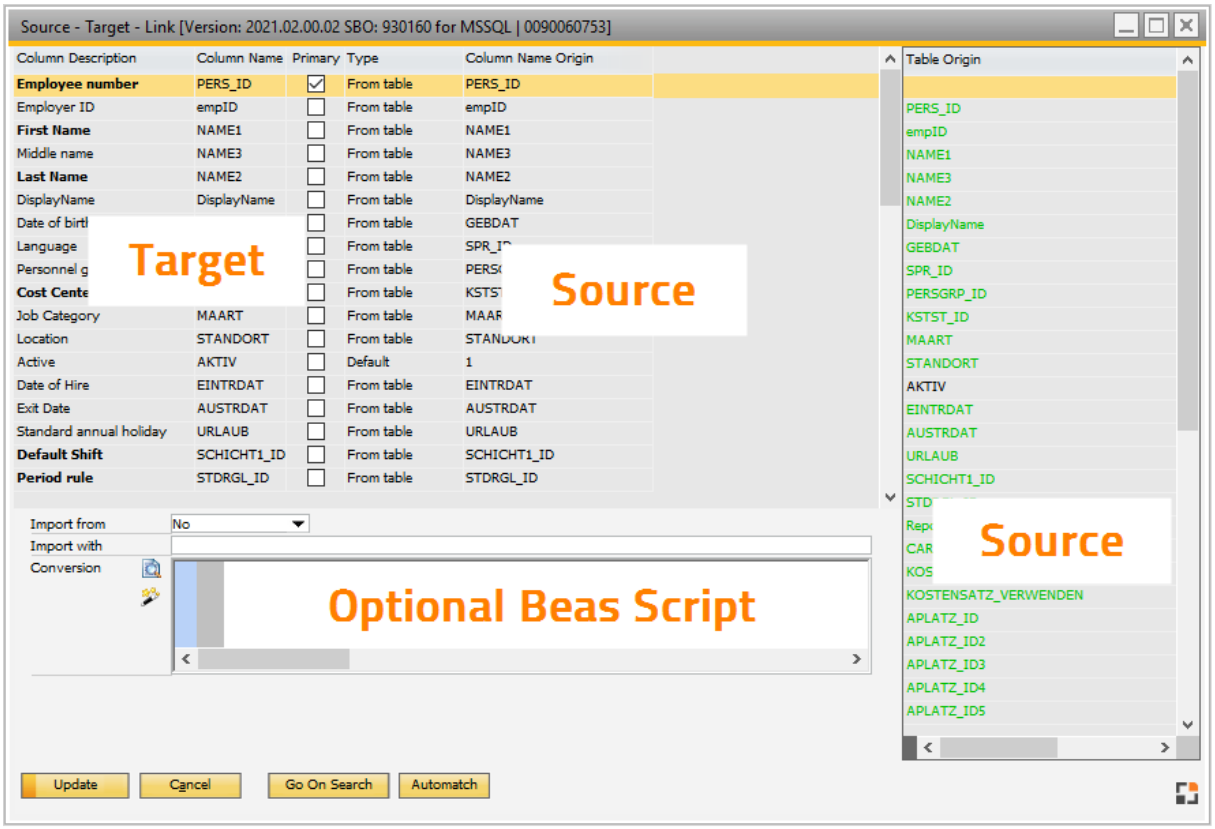
3.3.1.1.6 Source -Target - Link

PATH: Administration > Data Import/Export > Data Integration Hub > **Open** Import definition > **Source - Target - Link** button.

Target field and source field can be linked in this window.

Important: The target fields are on the left side and the source fields are on the right side.

© 2026 Boyum IT Solutions A/S



Window import_fields_browse.psr

All available target fields and their details are displayed. A source field can be assigned to a selected target field from the right-side list. The assignments are displayed in the last column.
A value from the source table, a default value or a calculated value must be transferred to the target field.

The **Import preview** window shows the result.

Field	Database column of the target field
Column description	⊟ Description of the target field Displays the target field name. Mandatory columns are displayed in **bold**. When you hover over the description, Beas displays more information about the field.
Primary	If check mark is active, the field is a key field in the database. Only for information.
Column name	Database field name
Type	⊟ The type of assignment

© 2026 Boyum IT Solutions A/S

	From table: Directly apply type from the source "Import column". **SQL instruction**: Execution of the SQL-instruction, which was defined in the "Import column" **Default**: The default value was applied directly. **No**: No transfer

Column Name Origin	Indicate what to import
	Type table: Field name from the source table or field name in placeholder "<" and ">", for example <description1> <description2>. All default Beas placeholders as well as formatting information are available.
	
	From the right-click menu a source field can be selected directly.
	Type SQL: Select-instruction. The field name of the source table may be inserted as a placeholder.
	Type default: The text entered here is inserted directly as a number.
	
	Note on data types:
	Numbers
	In script, all values are used with the Windows regional settings.
	Germany: 300,25
	USA: 300.25
	It is important to ensure that these values match the Windows regional settings.
	
	Date
	Date should be in the following format:
	`yyyy/mm/dd`
	or
	`yyyy/mm/dd hh:mm`
	otherwise the import can be incorrect.
	
	Date
	`yyyy` = Year, four digits
	`mm` = Month, two digits
	`dd` = Day, two digits
	
	Time

© 2026 Boyum IT Solutions A/S

	`hh` = Hours two digits, 24h format `mm` = Minutes two digits If date or number are not available in the correct format, you can use the conversion field to convert the value.
Max. length	Max. length of a character string The max. length of a character string can be indicated. Value 0 indicates that there is no maximum value. Setting the maximum length is usually not necessary, because Beas controls these automatically: **Automatic control:** If the target field is a mandatory field, the maximum length is exceeded, the data row is not applied and an error is reported. For all other fields the exceeding length is cut off.
Conversion	The value can be converted, changed or checked using a script BeasScript can be included, which can change or check the source. The transfer value is in the value variable and can also be changed. `setvar=value=<today,yyyy/mm/dd>` Returns the date. If the field is selected and you double-click on an item in "table origin", Beas inserts the field in the conversion field. The assistant and extended editor helps to define the script. All existing variables or window information (of the window from which the import is accessed) can be used. **Special variables:** `<importfile>` — File name, if a file is imported. For example, the item number can be encrypted. `<importrequestid>` — The RequestId, which is stored in the Import-Settings - Extended. *(beas 9.2 PL: 01)*

© 2026 Boyum IT Solutions A/S

<import.[columnname]>	On a column of the source file directly, if a value has to be filled that is dependent on another column.
	`if <import.ite#bom#quantity> n> 5 th`
	`  setvar=value=A`
	`end if`

Note: The import process does not allow message boxes, prompts or other modal forms, which can block the import process.

Example: Convert a value

Converts the source to "M", when this is "Y", otherwise this is not changed.

```
if <value> = Y then
  setvar=value=M
end if
```

The return value true/false can determine, whether the data row should be applied.

Example: Replace dot with comma

Regional settings: comma is the separator:

```
tools=globalreplace=value=.=,
```

10.5 is converted to 10,5

Regional setting: dot is the separator, but at import a comma should be used:

```
tools=globalreplace=value=,=.
```

Example: Cancel in case of a certain value

Stops the import, if the value begins with 1:

```
if <value,left 1> = 1 then
  return failure
end if
```

All source fields can be accessed. For this, the "<import.[feldname]>" placeholder is used.

Example: Determine item group

The "itemgroup" source field is available.

Material group should be "100", if "item group" is 50, otherwise material group 200 should be used.

To achieve this enter the following in "Material group" field at the test script:

© 2026 Boyum IT Solutions A/S

```
if <import.itemgroup> = 50 then
  setvar=value=100
else
  setvar=value=200
end if
```

Note:

For primary fields (example: item number for item master data) the system read the value 2 times. Means: The script behind this is executed 2 times.

Buttons

Button	Description
OK/Update	After modifying any field, you can update the changes and close this window.
Cancel	Close window without any changes.
Search	Search
Go on search	Continue searching
Automatch	With this button you can create an automatic match between fields defined in the import file with fields defined in the import. ***See*** Automatch function.

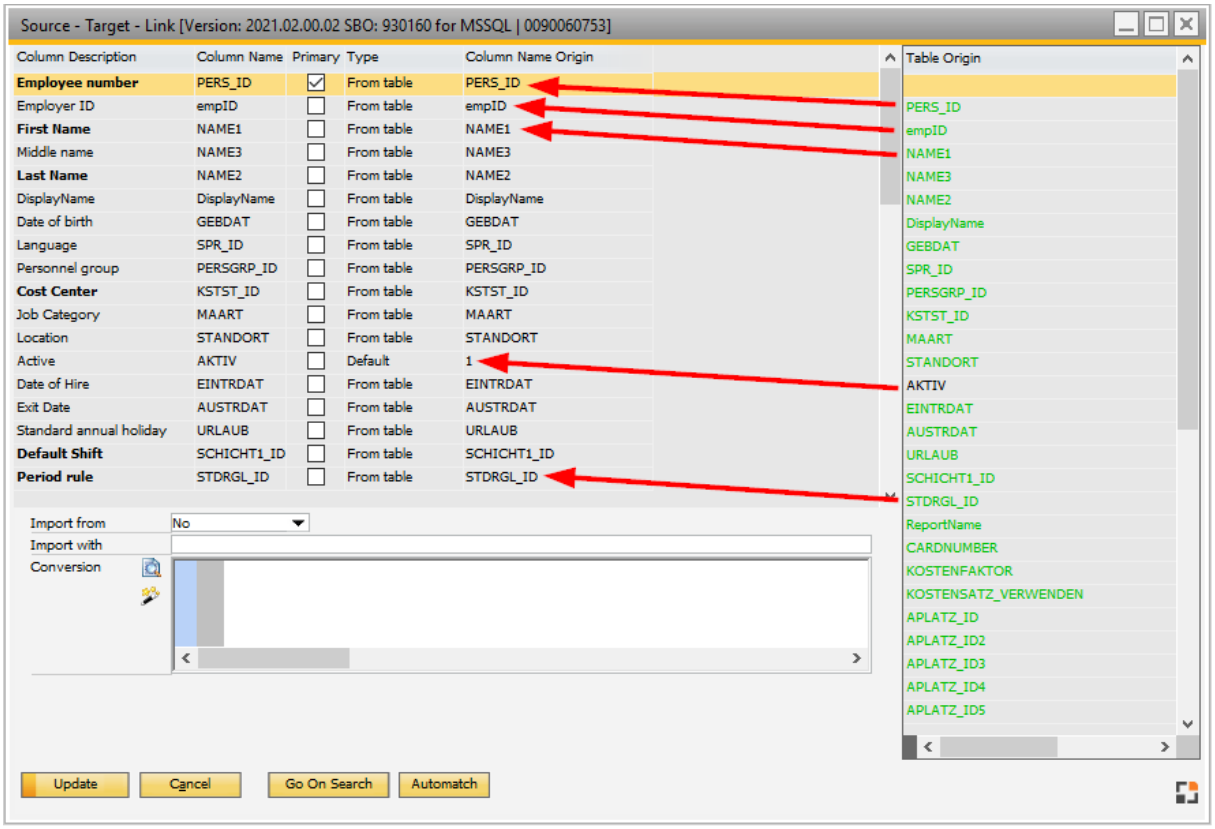
3.3.1.1.6.1 Automatch

After pressing the **Automatch** button in the Source-Link-Target window, the system attempts to link the source table to the target table automatically.
Therefore, the system checks if the field name (or the description) matches the field in the target table.

- If an entry is found, the field is automatically linked.
- Fields that are already linked, will not be changed or deleted.
- Fields that are linked, will be displayed in **green**.
- Fields that are not linked, will stay in **black** color.
- Fields that are assigned more than once, will be shown in **red**.
- Fields with a "_" in the name can also be matched.

© 2026 Boyum IT Solutions A/S

NOTE: Some fields in Source-Target-Link are pre-defined as "Default" and with a fix value. If the user wants to import the value of these fields from the table, the fixed value needs to be deleted before starting the Automatch.



Window import_fields_browse.psr

3.4 Utility programs

Database test

Beas Server Management

Program Group Administration

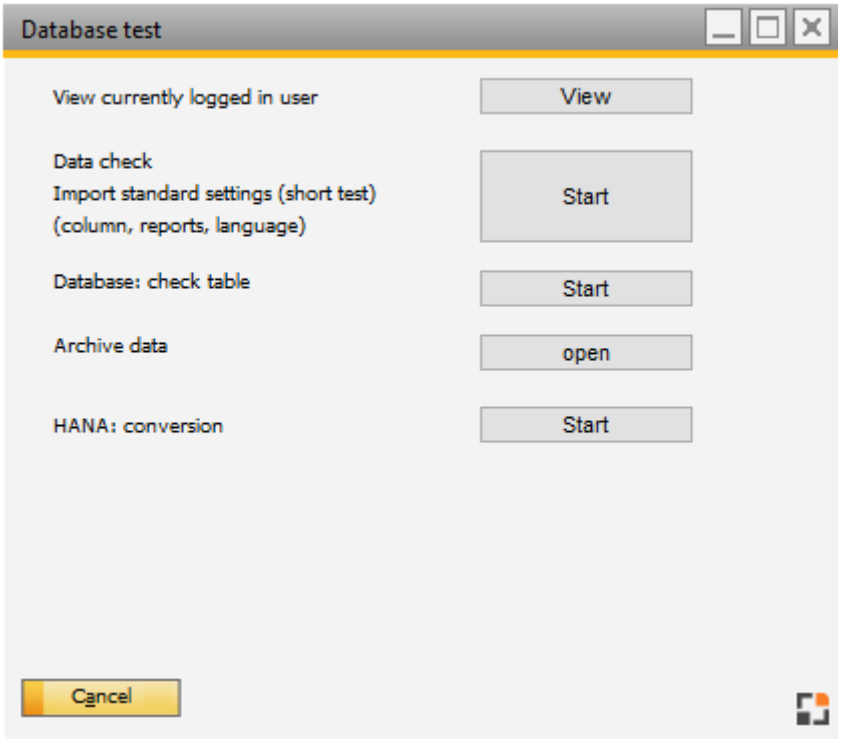
Data Protection Tools

3.4.1 Database Test

PATH: Administration > Utilities > Database test.

With this function, you can perform a database test.

© 2026 Boyum IT Solutions A/S



Window system_ dbtest.psr

ATTENTION: Manual Database modification is **not** allowed! If the user modifies the database manually, it can generate problems in the database test functionality.

The following functions are available under database test:

Function	Description
View currently logged in users	Displays which users are currently logged on to the SQL database server. Note: It is not available in HANA version.
Data check, Import standard settings (short test) (column, reports, language)	The content of the tables is checked to determine whether the relevant settings or contents are correct. This test is performed automatically during an upgrade and can also be started via **Administration Utility programs > Data Check**. For more information, ***see*** Data Check. Furthermore, defaults as column settings, standard reports, current Terminal WEB-version are imported. User-specific settings are not affected by this.
Database: check table	Database: check table Another component of the upgrade or setup process. The system checks whether the tables and UDFs used by Beas are present. Missing tables or UDFs are automatically created.

© 2026 Boyum IT Solutions A/S

	Beas does not work with UDTs (SAP Business One User Defined Tables), but instead creates all tables directly with the prefix "beas_" an. If Beas tables have been extended manually, the extension is NOT removed. The structure of all tables is defined in the db.ini file. If you have created a customer-specific db.ini of your own and stored this in the project directory, this is also executed during the database test. ***see*** Customer-specific adaptations After a SAP Business One database test (upgrade) or a change to the data structure (creation of further UDFs in SAP), the Beas database test must be performed so that the Beas tables can be adapted. **"Delete unused columns" option** Some table columns are not longer needed as they have been replaced by new columns and are no longer supported by Beas . If the option is set, all table columns previously supported by Beas and now no longer needed are removed. Configuration of db.ini ***see*** Structure of the db.ini For database documentation ***see*** Documentation
Archive data	Call up Data archive
HANA: conversion	Preparation for MSSQL – HANA – Conversion (Only in MSSQL Version) Make DB convertible using HANA Migration tool: Convert all Table and Column Names to the correct HANA-compatible variant. If you want to convert your MSSQL – Database to HANA, preparations are necessary. Please start this function before migration. This function deletes some indexes and constrains.

© 2026 Boyum IT Solutions A/S

	Necessary steps: 1. Start this function. 2. Read SAP documentation on migration and start migration. 3. Check if all tables are on HANA side. 4. Download latest Beas version and install it. 5. Start Beas and start the "Database Test" and "Check table" functions. 6. Check if everything is working as intended. **Note:** We cannot guarantee that the conversion will work correctly. Perform a deep test before you start with the life system. Check configuration, accounting and related areas. Check the complete work flow and all customizations. **Customizations, Reports, Templates** These are not always HANA-compatible. Convert all SQL statements in customizations in the HANA Version and test every customization. Custom Crystal reports for MSSQL are not compatible with HANA. a) Define correct connection to the HANA Server. b) Check the SQL statements. All statements should be HANA-conform. c) Templates are not compatible after migration, user must create query to HANA or recreate them.

3.4.1.1 Data check

Beas includes a data check function which checks all relevant data for consistency.

As Beas can only function correctly if data is consistent, all errors that occur during the data check must be processed and rectified in advance.

The data check is started for example
- if a program update is performed
- via **Administration > Utility programs > Data Check**

© 2026 Boyum IT Solutions A/S

The data check is performed immediately. The Beas data check always creates messages using the Beas message system. As well as displaying the error, the message window offers help or appropriate interactive analyses. Messages from data check cannot be created as SAP activity. The message window is opened automatically if messages are output, and it can be opened afterwards via **Administration > Utility programs > Data Check**.

If there are data errors that could affect the MRP run or APS material check, a warning is displayed when starting the MRP run, although it will still start in most cases.

The following tests are carried out:
- Data content check
- Check and extension of Procedure SBO_SP_TransactionNotification
- Plan times of all resources and resource groups are calculated
- Standard calculation schema is checked and corrected if necessary
- Manufacturing Position: The switch "Disposition", "Order reporting", "Material posting" and "Consideration of scheduling" are checked and corrected if necessary
- Operation types are checked and adjusted, installed, or corrected
- Quality control orders: cross-references are checked and corrected
- Print documents: The table beas_document_header / beas_document_line are rebuilt. If necessary, re-defined UDF's are added.
- WEBAPP: standard Web applications are imported
- Several default values are set

Via "news" at any time the result of the test can be viewed. After a new check, previous results are deleted from the message list and new ones are inserted. ***See*** news
At the end of a message the message number is displayed. A blue question mark indicates that additional information is available on that topic. Click the icon.
Use the button "**Close activity**" to hide selected messages. Multi-selection is supported.

In the following list all possible messages are summarized:

Message	Meaning
tnsfnfg04442	Beas adds various extensions to the procedure on SBO_SP_TransactionNotification. Details These values are pasted starting from the text '- ADD YOUR CODE HERE' . If this text is not found, Beas cannot enter its extensions. This can be the case if the procedure has been manipulated.

© 2026 Boyum IT Solutions A/S

	In this case please restore the original or insert the placeholder at a suitable point. Precise structure: [TAB]ADD[TAB]YOUR[TAB]CODE[TAB]HERE There may be no spaces, only TAB characters. Re-run data check. Omitting the data check can lead to the following problems: - No control in warehouse management at bookings into negative stock - No control of reservations; the reservation function may work incorrectly
tnsfnfg04443	Beas adds various extensions to the procedure one SBO_SP_TransactionNotification. In this case, an SQL error has occurred. More information in the messages when you click "View".
tnsfnfg04444	Beas adds various extensions to the procedure one SBO_SP_TransactionNotification. This process has not been carried out - or the procedure does not exist.
checkdb05l044	Extended error notification system enabled: **Configuration Wizard > System > Extended Error Messages: SAP activity** In this case, a business partner needs to be defined - switch below, "activity business partners" because the SAP Business One activity-system requires the disclosure of a business partner. If nothing is done, no activities are generated.
checkdb05lacc44	In a perpetual inventory system, the WIP accounts must be set up. Affected is the WIP stock account and the WIP inventory variance account. After creating accounts, set up in **Configuration wizard > Production > Valuation and booking of assembly > Account Determination > Define**

© 2026 Boyum IT Solutions A/S

	WIP accounts > "START" button, or press the button directly in the message. Account determination is done automatically and must be checked afterwards. If these are not specified, no postings are possible in the production area.
checkdbwialacc44	In **Configuration wizard > Production > Valuation and booking of assembly > Account Determination > Define WIP accounts > "START"** button, the WIP accounts are defined. Faulty or nonexistent accounts had been deposited and must be corrected. If no correction is made, no postings are possible in production.
blockzeroq1dbc	"Block negative stock" has been disabled. When working with negative values, no MRP is possible. All planning functions in Beas are blocked as a result. Action: re-activate this switch! Features not working correctly when negative stock is enabled: - Correct stocktaking - Warehouse management - Reservation Function - Batch Management - Serial Number Management - Material Requirements Planning We strongly advise not to work with negative stocks! Setup: **Administration > System initialization > Document settings > Block negative inventory by**: enter "Company"
ass55manageonhnd	Negative stocks are present in the system. as a result, planning functions will put out incorrect values. To keep data approximately correct, Beas does not consider negative values in the planning functions. Action: correct existing negative stocks and bock the negative posting facility completely. Setup: **Administration > System initialization > Document settings > Block negative inventory by**: enter "Company"

© 2026 Boyum IT Solutions A/S

ass55itemdfltwh	For several items the default storage is not defined. This is required for several standard functions. Action: Edit item and set the standard warehouse. This is done in the **Item master > inventory data tab > default warehouse** If the default warehouse is not defined, this will result in the following problems: - Incorrect results in order recommendation report - WIP account determination is not possible - Manufacturing: backflushing not possible
ass55wbz93	For several items no lead time is stored. If there is a scheduling ID, a lead time is also required. Otherwise there will a wrong requirement date in the order recommendation report For assemblies, this can be done automatically if routings are stored. Enable: **Item structure > right mouse button > third tab in right-click menu > compute resources > calculate lead time.**
ass55w5z93	For several items a faulty material group is stored. If no material group is stored, this can lead to erroneous results in the calculation. Material groups are defined under **Administration > Setup . Inventory > Material group** and deposited in the **Item master > Material Group.**
ass55w5del	Incorrect item number. There are item numbers with illegal characters. Under no circumstances may be used: spaces (Asc 32) and apostrophe (Asc 39). This could lead to severe program errors in any area.
ass55wbz9d	For several items of type PURCHASE PART a faulty or no scheduling ID is stored. Please check scheduling in the item master, see "breakdown". Without correction, the order recommendation report works incorrectly.

© 2026 Boyum IT Solutions A/S

ass5dsbz9d	Several items are defined as manufacturing parts, without having the scheduling ID. Please set the switch "break down" for the affected items. Without correction, the order recommendation report works incorrectly.
ass55item1unitstl	For several BoM items a value is missing for quantity factor. Without correction, this can lead incorrect calculations, for example in - Precalculation - Manufacturing - Order recommendation report Please correct corresponding BOM items. **Edit BOM > Quantity field "per"** Affected in the bill processing is the "ever" (the amount field, after the word "each")
ass55itemunitvb	For several items warehouse unit or consumption unit is missing. Without correction, this can lead to incorrect calculations in - Precalculation - Manufacturing - Order recommendation report Please make sure to deposit the correct units. **Item master data > Tab "General." > orange arrow for "Production UoM"** - Input Unit.
ass55itemunitbom	In several item part lists quantity units are stored, which are not stored in the data base. Without correction, this can lead to incorrect calculations, etc. in - Precalculation - Manufacturing - Order recommendation report Action: there are two possibilities:

© 2026 Boyum IT Solutions A/S

	a) Enter missing units under **Administration > Setup > Inventory management > Units of measurement** b) Edit BoM - behind the quantity" field there is the field for the unit c) Edit **item master > "General" tab > orange arrow after "Production UoM"**
ass55item1unitvb	In several BoMs unknown item numbers are stored, or item numbers are missing. These entries can lead to additional errors: - No consideration in order recommendation report - No postings possible Beas offers an automatic correction.
ass55itemunitvbm	In item entries Inventory / Production UoMs are defined, which have no conversion formula. Result: - Incorrect calculation in order recommendation report. For this reason, the calculation is disabled. - Erroneous postings Two possibilities to solve this problem: a) enter conversion formula under **Administration > Setup > Inventory management > units of measurement** b) Correct units o.M. in **Item master > "General" tab > orange arrow after "consumption unit"**
assv1w5del	Item Version Items that have item version(s) and are neither batch- nor serial-managed are not supported. For MRP to run correctly, remove the item version from these items or convert them to batch-managed items. (assv1w5del) Details Beas does not support Item Version control for non-batch/serial managed items. The button "**Edit**" displays all non-batch/serial managed items with item version number.

© 2026 Boyum IT Solutions A/S

	Delete the item Version information or convert this item to a batch managed item. ***See*** how to fix the problem
assv2w5del	Item Version **IMPORTANT:** Items that have item version(s), are neither batch- nor serial-managed, and have separate bill of materials are not supported. For MRP to run correctly, remove the item version from these item or convert item to batch-managed items. Note: You must fix this before using MRP. Details Beas does not support Item Version control for non-batch/serial managed items. You have some items with separate Bill of Material settings. MRP does not support this for this type of items and ignores the defined Bill of Materials definition, which results in wrong calculation. The Button "**Edit**" displays all non batch/serial managed items with the setting "separate BoM" Note: It is mandatory to fix this. **How to fix the problem:** - delete item version information and change setting "Administration" to "Default" - convert item to a batch managed item **How to convert a normal item to batch managed item:** 1. Clean the inventory (it must be 0). 2. Delete all reservations and transfer requests. 3. Change the item to batch-managed item. 4. Insert old inventory over receipt function with a standard batch number or use version Number as Batch Number. Positive effect: You can see the inventory per item version.
calccheck303245	With Beas 2008-0-11-22 the connection between Offer/Customer order and the Precalculation has been changed. With this repair program the connection can be reestablished for existing documents. The repair should always be performed.

© 2026 Boyum IT Solutions A/S

repcheck03245	The communication module has been installed. There are standard reports are available, which need to be imported once and which can be changed or adapted. It is recommended to import these reports.
qscheck13245	Quality control order - quantity units: For a correct display of the measurement positions a unit needs to be deposited. Otherwise, no decimal places are displayed. Beas has issued a correction program to fill default values. 1. Click on edit to open the editing window. 2. Enter a valid unit of measure 3. This will be entered to all measurement positions, which do not have stored a unit of measure.
fagcheck03245	External operations: The data structure has changed. Costs of external operations are now stored in a different field. Existing entries have to be adjusted. Beas can perform the correction automatically. If no correction is made, pre- and post-calculation cannot calculate correctly, valuation methods lead to erroneous results and to erroneous account postings.
amgmet0435	In item master (OITM) there are entries in which "mngmethod " is not filled. It may be that these items cannot be edited or posted. Click on "Edit" to perform an automatic correction.
ass75itemunitvbm	Order related items in storage orders. There are make to stock work orders, in which order-related items are stored. For a correct calculation in order recommendation report, these work orders need a reference to customer orders. Click EDIT to open the list of all affected positions.
ass55waoapl00	Work order - work sequence 0. There are work orders with a work sequence containing a position 0. This position will not be processed correctly and should therefore be deleted. Click EDIT to open the list of all affected positions.
ass55woabgkzft	Several production items are not completed. There are unfinished work item in closed work orders. This condition can lead to problems. Click EDIT to display production list with all affected work orders. These need to be re-opened. **Open work order > right-click > select "Open"**. Then it can be closed again. The

© 2026 Boyum IT Solutions A/S

	associated components are also closed and the necessary closing entries (WIP Account crediting) are performed.
amgmet1pers32	Links to Human resource master. The Beas and SBO HR master are now linked. There are some entries in which the connection is not correct. The link here may be performed automatically.
ass35afolink	Wrong BoM links. BoMs are linked to non-existent operation sequences. Click EDIT to display all affected assemblies. If no correction is made: The affected BoM items are not posted during backflushing.
ass35resok	Resources without capacity. There are several resources without free capacity. In order recommendation this leads to infinite lead times! Affected column: planning/planned capacity or number Machines|Employees
ass35priceok	Resources without costs. There are several resources at no cost. This leads to wrong results in calculation. Affected: Fields COSTS/ cost ratio to marginal costs and total costs.
ass35grpok	Resources with wrong group assignment. There are several resources without or with incorrect resource groups. Click EDIT, the resource list opens where the resources can be corrected.
agcheck001	In several entries faulty operation types are registered. Effect: various functions are not shown because these have been deposited in operation. Measure: a) correct manually: If you click on the message "EDIT", all document types are displayed, in which a faulty operation type is stored. b) create the missing operation types c) carry out the correction using SQL ***Example***: Add operation-type 'std' if link is corrupted 1. Creating an operation type "std" 2. Execute the following SQL statements `update "BEAS_AG" set "AGTYP"='std' where "AGTYP" not in (select "AGTYP" from "BEAS_AGTYP")`

© 2026 Boyum IT Solutions A/S

	`update "BEAS_APL" set "AGTYP"='std' where "AGTYP" not in (select "AGTYP" from "BEAS_AGTYP")` `update "BEAS_FTAPL" set "AGTYP"='std' where "AGTYP" not in (select "AGTYP" from "BEAS_AGTYP")`
srivv040	Serial numbers need to be unique. Otherwise Beas will not work correctly. In **Administration - System initialization - General settings - Stock - Unique serial numbers by** set to "serial numbers" Using other settings, serial number related items cannot be posted in Beas, because serial numbers are always displayed for selection. With another setting, at postings the following error could occur: *10001172 - Leere Strings sind in Zeile 1 (eindeutiges Feld) nicht zulässig [OSRN.SysNumber][line: 0]* Measurements: Use settings as described above. If a change of settings is impossible due to existing data entries, serial numbers need to be entered subsequently.

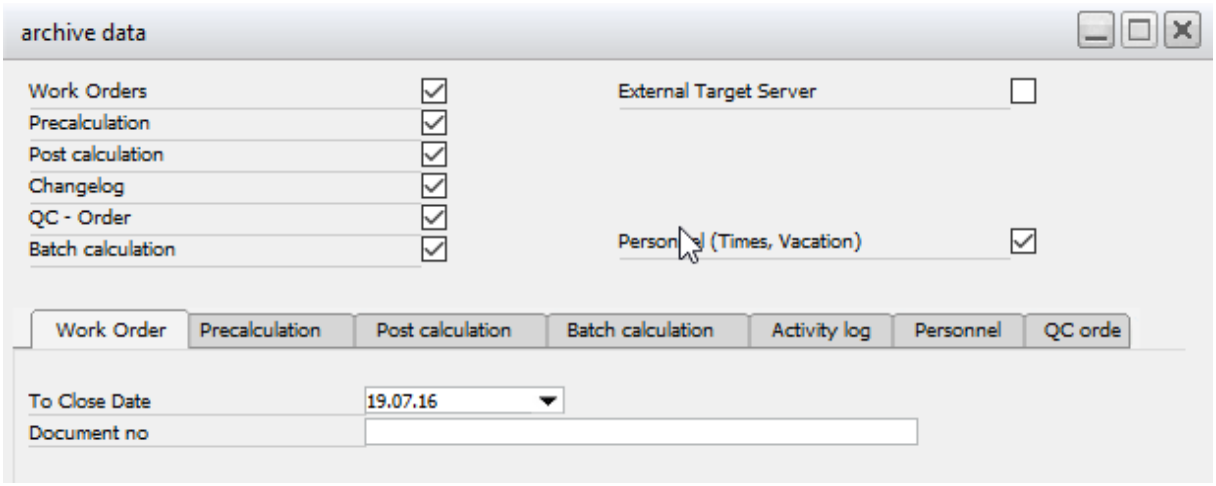
3.4.1.2 Archive data

PATH: Administration > Utilities > Database test > Archive data **Open** button.

Use the data archive function to move data from productive system into archive tables or to an archive data base or archive server.



Window system_backup.psr

Thus, the continuous growth of recently used tables can be prevented. The authorization "System" is required.

IMPORTANT:

The process cannot be undone.

Create a backup before archiving data.

There is no access on archive data within beas.

Recommendation: regular annual backup to keep an access on old data.

© 2026 Boyum IT Solutions A/S

Process:

1. Data base is backed up
2. Select the area to be archived
3. Select a target server or target db
4. Select a period to be included in archive
5. Start archiving

Archiving process:

1. On target data base table structure is created or updated. A 1:1-image of the source table is created.
   Name: `BEAS_BACKUP_[Origin Table name]`, eg: from `"BEAS_FTHAUPT"` the table `"BEAS_BACKUP_FTHAUPT"` is created.
2. All data are moved.
3. Data in source tables are deleted.

Depending on the selected area tabs are displayed, to enter more data.

Field	Meaning
Work order	If active, work orders are archived. Select by completion date (displayed in work order position). Additionally, a document number can be entered. The following tables are affected: `BEAS_FTHAUPT, BEAS_FTPOS, BEAS_FTSTL, BEAS_FTAPL, BEAS_FTAPLCHARE, BEAS_FTCAFT_VARENRTY, BEAS_FTPOS_PROFITCENTER, BEAS_FTPOS_RESERVIERUNG, BEAS_FTPOS_SCHEMA, BEAS_FTPOS_SCHEMA_HEADER, BEAS_FTPOS_SCHEMA_JOURNAL, BEAS_FTZUORDNUNG, BEAS_JOURNAL, BEAS_ARBZEIT` Affected data areas: - Work order - Order times - Batch / Serial number tracing - Batch-calculation / Batch-post-calculation
Precalculation	This is to archive results of Batch-Calculation. Select by creation date.

© 2026 Boyum IT Solutions A/S

	Following tables are affected:
	`BEAS_OITM_CALCPRICE,`
	`BEAS_OITM_CALCPRICE_SCHEMA`
	
	Affected data areas:
	Item master: Price history
	Batch-calculation history

Change log	Archives the change log. Select by creation date. Following tables are affected: `BEAS_AENDERUNG` Affected data areas: All windows, in which **right-click - Change log** is available. Not in item master, because there, the change log of SAP Business One - is used. ***See*** Change log
QC Order	If active, QC order are archived. The indicated "to date" considers all QC orders, which had been created until this date. Affected tables: `BEAS_QSFTHAUPT,BEAS_QSFTMESSUNG,BEAS_QSFTPOS,BEAS_QSFTATTACHMENT,BEAS_QSFTATTACHMENT_CONFIRM`
External target server	A server or a data base can be indicated to which data shall be moved. Required information: server, data base, user, pass word and trusted connection. Any change is saved immediately and is available at next call up. In MSSQL-environment a MSSQL-Server is needed, in HANA-environment a HANA-Server is needed.

© 2026 Boyum IT Solutions A/S

Personnel (Times, vacation)	Data from vacation planning, recorded attendance times, shift planning and monthly values of persons can be deleted. You can only delete dates that are at least 500 calendar days older. Note: Archiving is not possible, only deletion. The following tables are affected: *beas 9.3-001-000*

3.4.2 beas Server management

PATH: Administration > Utilities > Beas Manage Server.

Tomcat and Xampp Service
Planned activities tab
E-Mail tab
Extended tab
Development
Internal HTTP server
beas common service

What is a Beas service?

A Beas service can be a web server, a service which executes planned activities or an asynchronous common server which executes transactions.
The web service can be activated more then once. Load balancing is supported.

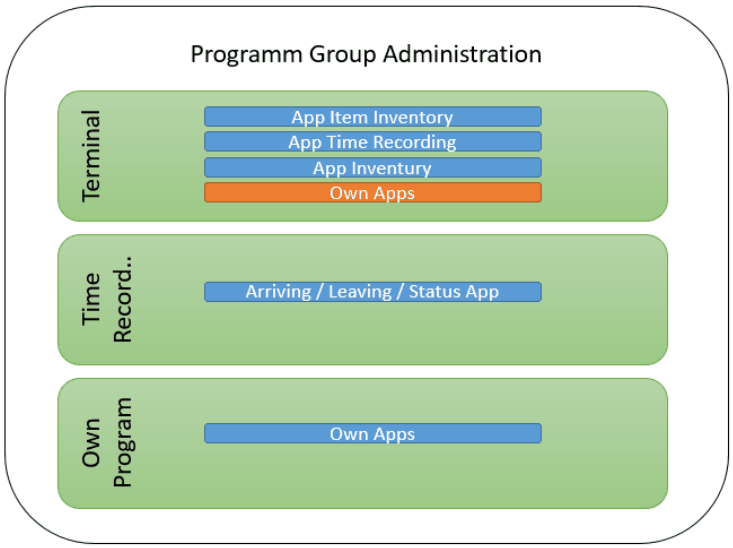
A Beas service is the Beas application which is started as "service".
It is possible to simulate it
- for WEB Server: Tools > Web Server
- for all Services: Beas Manage Server - "Start Local Server" button.

WEB Application Server

© 2026 Boyum IT Solutions A/S

A Web-Application which edits WEB queries (WEB sites, service queries etc.). Required to operate the Terminal App via browser.
See Beas WEB Server presentation.

This service offers all programs set up and enabled in Program groups administration.
Only the program group Terminal is installed and updated by default.



A program group can be e.g. a WEB application as well as a WEB service. All the usual methods will be provided here by the Beas Framework-like WEB-Application with finished Login-screen (employees, customer etc.), as well as, services like SOAP, REST with XML or JSON-format support.

Example: Program group "Terminal": Our mobile solution

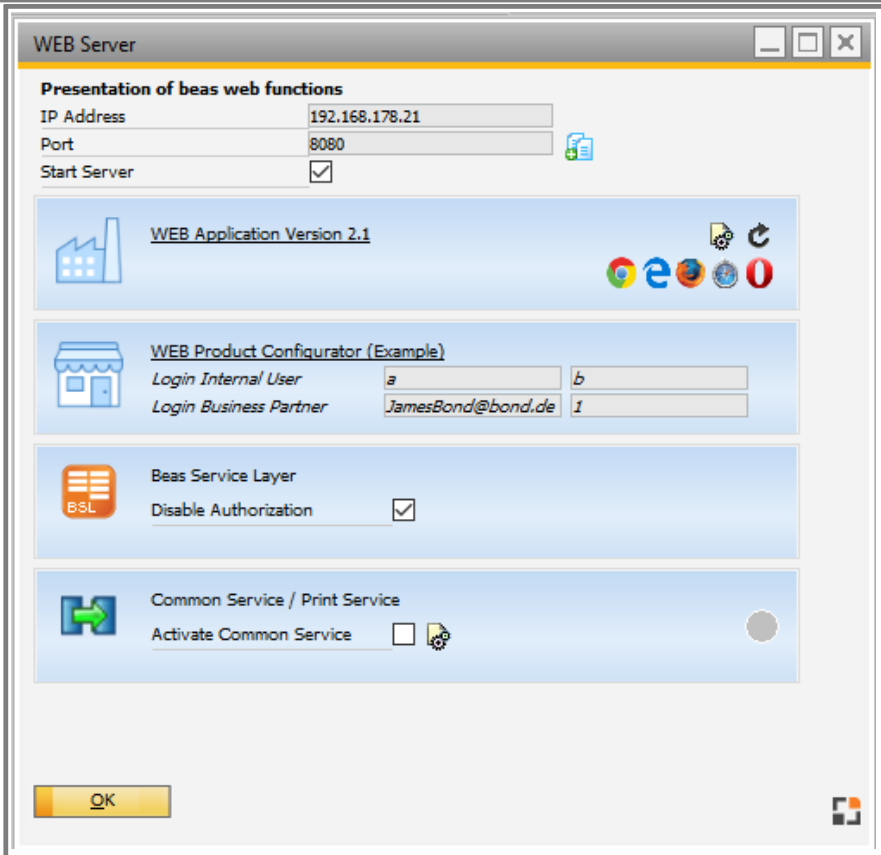
© 2026 Boyum IT Solutions A/S

- This requires an Interface to the HTTP Protocol

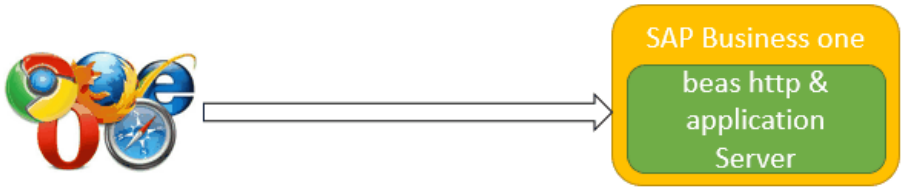
Internal HTTP is used by default. This is a fully integrated WEB Service in Beas. There is no need for an additional Web Server.

You can test all functions with **Tools > WEB Server**.

© 2026 Boyum IT Solutions A/S



Every modern browser can connect directly to the build in HTTP Server.



Compatibility mode

It is possible to use other HTTP Servers e.g. Apache, Tomcat, IIS. Beas provides relevant interfaces for this.

See

Internal HTTP Server

Beas: Install Web Services

Beas KEEP ALIVE System

© 2026 Boyum IT Solutions A/S

The Beas Web Service includes a "Keep Alive system" to avoid any technical problems with access to the current web solution.

When the Web Service is started, a process is started in parallel to ensure the integrity and availability of the web page.

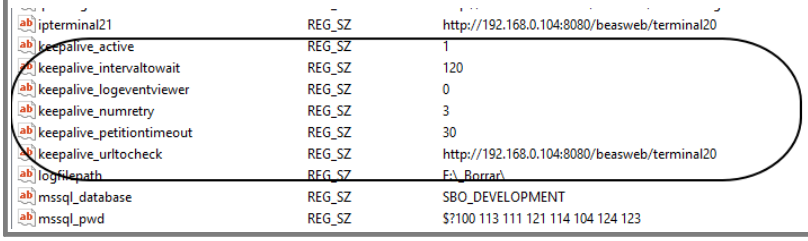
When the system detects that the Web solution is down for any reason, it restarts the web solution to ensure that the web page is always available.

- Parameters

The Keep Alive system manages the following parameters:

Parameter	Description
KeepAlive_Active	You can decide if the system should be active for the current service. The default value is "Yes".
KeepAlive URL to check	This field contains the URL that the system will validate to check if the system is active. if no value is defined, the system goes on to check the URL: http://127.0.0.1:8080/beasweb/index.php
KeepAlive Num Retry	Define the number of attempts by the system to execute before initiating the restarting process.
KeepAlive Petition TimeOut	The number of seconds that system will wait for a valid connection to the URL to check before generating an error in the connection.
Keep Alive Interval to Wait	The number of seconds that the system will wait before the next validation to check if the Web is active.
KeepAlive Log Event Viewer	Define if the Keep Alive System should generate Log information in the Event viewer system. Default value is 0. We recommend to activate this parameter for testing and verify that everything works properly.

The Parameters in the Event viewer:
(HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Services\beasServiceXXXX):

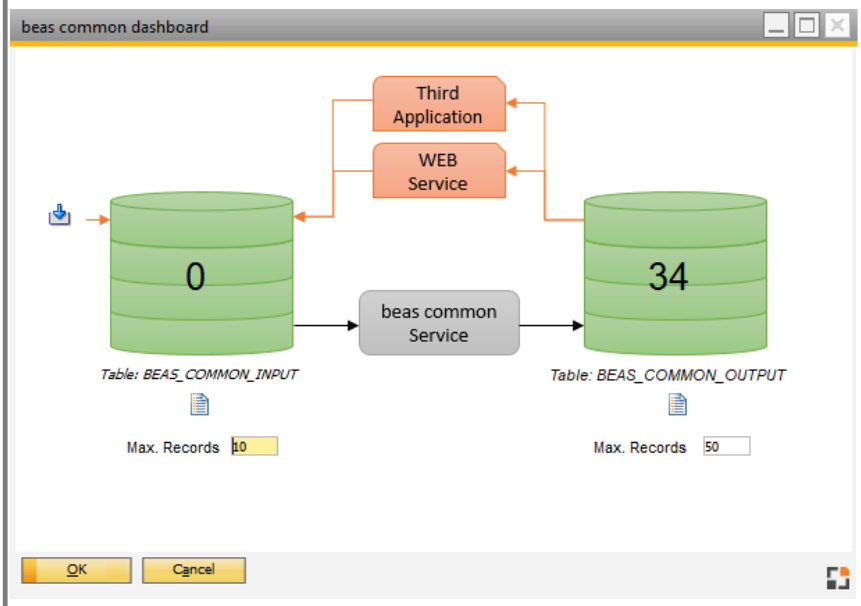


© 2026 Boyum IT Solutions A/S

The WEB Applications are always administrated via Program group administration.
The Program Group Terminal is installed by default. ***See*** Terminal Apps.

- Common Interface

With a common interface, activate asynchronous process working.



Window syste_common_dashboard.psr

Area of use:

- The WEB-Server service sends all Crystal Report
- SAP transactions to this service, via which this asynchronous can be worked off. This relieves the WEB server and reduces load peaks
- External services and third programs can be linked here e.g. to execute transactions

There are finished functions available.
A complete BeasScript can be sent, as well. Then, the script is executed by this service.

See: Common_service

- Planned activities

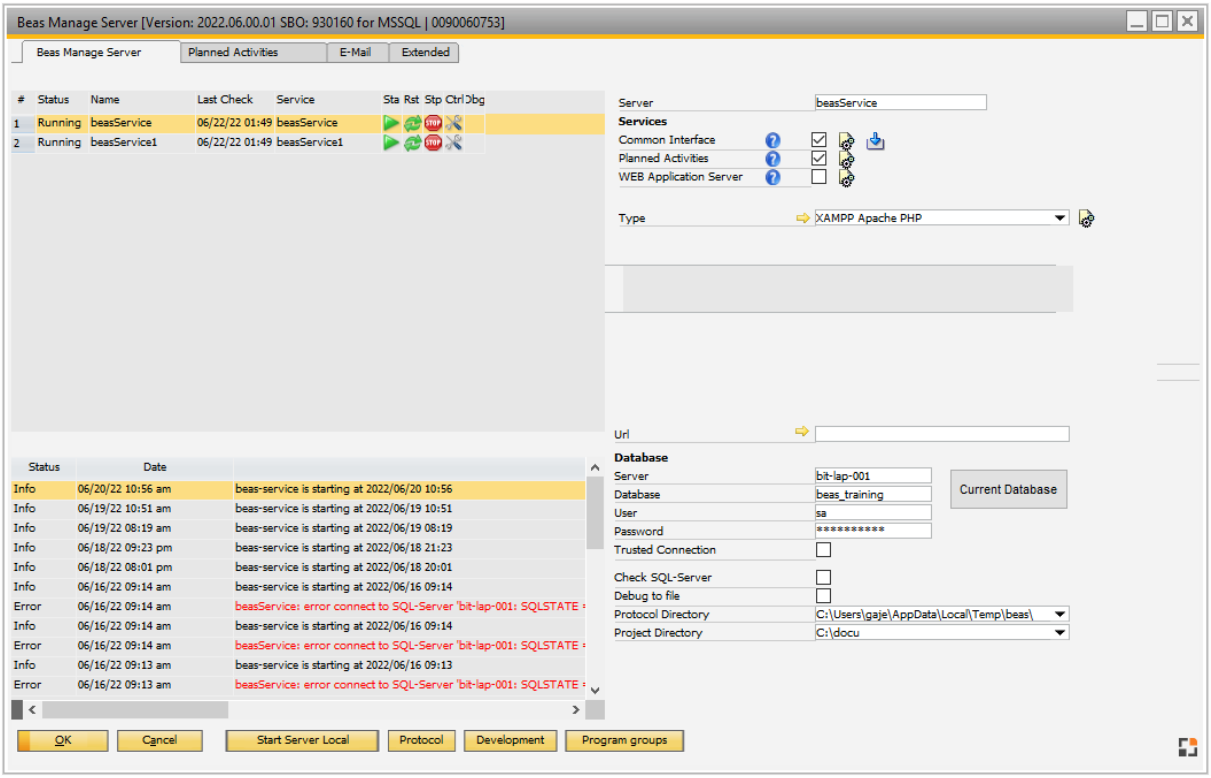
Time controlled activities can be executed here.

- Integration Hub: scan directories and read in files e.g. for machine connection, PDM connection etc.

© 2026 Boyum IT Solutions A/S

- Perform calculation regularly
- Create statistics and send per mail

See: Server-Examples , planned activities



system_server_admin

- List of servers (left side)

All installed services on the current server / PC are in this list.

Field	Description
Status	Status of service (started, stopped, etc.)
Name	Displayed name of service
Type	Type of service (IIS, Tomcat, Apache)
Last Check	Time of last check
Start, Stop,	Buttons to control the service, call up configuration of Tomcat or XAMPP. - Notes on service

© 2026 Boyum IT Solutions A/S

Field	Description
Restart and Control-Center	Service settings are saved on the setup work station or server. These are usual Windows-Services. The service logs on to the stored database; it does not necessarily have to be the current database. If the service is not starting, proceed as follows: 1. Try to re-start 2. Uninstall service 3. **Re-start Server / PC** (mandatory) 4. Re-install service For additional information ***See*** Troubleshooting on services.

- Configurations area (right)

Change settings of the selected service from the list.

Field	Description
Server	Displayed name of server
Services	
Common Interface	- Start common interface Use this to connect external systems. Beas processes can be asynchronized, as well. When activating this service, the following features are automatically moved to this service: WEB APP printing WEB APP all SAP transactions (asynchronous working) Batch-calculation Price lists - Entries Additionally, it can be used for communication between Beas and a third program.

© 2026 Boyum IT Solutions A/S

	Overload and deadlocks can be avoided by using asynchronous processing. Clicking the icon opens the following window to set Max. Records:  *Window syste_common_dashboard.psr* Clicking the icon below opens the "Beas common service test" window for script editing:  : **Attention:** Start this service only once!
Planned activities	Execution of planned activities. The next field indicates the interval of query. Clicking the icon opens the Planned activities window.
WEB Application Server	Activate the Web Application service - For WebApp Terminal 1.0, 2.1 and WEB Product Configurator - Activate all Rest Services and ODATA

© 2026 Boyum IT Solutions A/S

	Note: This is an HTTP Server that does not support HTTPS Protocol. If you need HTTPS, you must use a "Router" between Client and Server, which translates the HTTPS to HTTP protocol. If the user connects to the WEB Application, the current WEB Session has full access to the Beas Service Layer. The user has the possibility to manipulate the session and then receive full access to all Beas Service layer functions. **Attention:** Do not use this for access from outside. This is ONLY an Intranet solution. For higher security, you must use a middle layer, in which you can define the access rules.
Type	Determines the type of HTML Server **The following types are available:** Internal HTTP Service Beas has an integrated WEB Server. This web server does not need any additional tools or interfaces. It is entirely integrated and fast. **Limitations:** It works only with HTTP and not with HTTPS. If HTTPS is necessary, an Apache server can be used as a Proxi Server. Certain services run ONLY with the internal HTTP Server, for example the WEB Product configurator or REST Services. ***See*** internal HTTP Server Alternative ***see*** Other HTTP Services (compatibility mode)

© 2026 Boyum IT Solutions A/S

WEB Application V2.1 Configurator BSL Service	Display the complete IP Address for the related Application Icons: - Question Mark: More information - Arrow: Open this Application in default browser - Clipboard: Copy IP Address in Clipboard
Web Server Port	Every HTTP Service needs an own port. Standard is 80 or 8080. Define the Server Port for this HTTP Server Service It is important to use a HTTP Port, which is not used by other services, otherwise the HTTP Service cannot be started. In many cases Port 80 and 8080 are used from other HTTP services. Use **Tools > WEB Server** to check which port is free. If you need more then one WEB Service then you need for every service an another Port Number.
BSL Password	For using BSL Service (ODATA Service) outside the Terminal WEB Application, you need a password. You can define additional Login Rule in Tab "Extended".
Database	All settings for login to SQL database.
Database	the database in use
Server User Password Trusted connection	Connection information to the SQL Server. Click on Button "Current Database" to connect to current connection information It is possible to create service for another SQL Server. In this case, insert all connection information from the SQL Server.
Check SQL-Server	☐ Check if SQL Server is running on the same machine before connecting to the server Note: This checks the running services on the current machine. Only working if the services and the SQL Server are running on the same machine and only one SQL server instance is activated. Only compatible with MSSQL.
Debug to file	☐ Activate debug log to file

© 2026 Boyum IT Solutions A/S

	It is possible to activate the debug to file for every service. In the Protocol directory you can define the path for the log. Notes: - If you activate this for more than one Service, use a different folder for each service. - The log can grow to be a large file in a short time. Activate the debug log only if it is necessary and always remember to disable it. - Web service is slow if the Debug log is active. For more information ***see*** System Information. Available from *2020.05.*
Protocol directory	This is the folder where the protocol is stored and the log file is saved. Select a directory to which both the service and the application have access. It is best to choose a directory which was not created by Windows. You can also select the directory in System information > Settings tab.
Project directory	Directory for customizations. Normally, the project directory is located at %allusers%. In service mode, this directory is located under Windows\ with resulting access issues. For this reason, the directory must be specified here. Beas generally adds the files to the correct directory. The Service User need access to this project folder.

Functions

Function	Description
Current data base	Name and patch of current database are read out and entered.
Development	This opens WEB Apps development window for Import/Export and Editing the Apps.
New	Right-click menu entry to creates a new server entry.
Delete	Right-click menu entry to delete the selected server entry. **IMPORTANT:** After deletion the server needs to be restarted before a new service can be set up.

© 2026 Boyum IT Solutions A/S

Start Server Local	Starts the selected server in local mode. This mode is used for debugging and development.
Protocol	This opens the protocol.
Program groups	This opens the "Program groups: Administration" window.

Protocol area: shows status of started services

Protocol contains the following information:

- Start / Logon information from Services
- Error messages
- IP-address of current server
- For Apache: monitored ports
- For Apache: error log of Apache Servers

While starting process the service records all log information in the "Protocol Directory" folder. This window reads the information from this file and inserts this in the Beas Protocol and displays the information in this area.

Note:

If the service does not have an active SQL connection, it uses the "Protocol Directory".

This only works if the Service has access to this folder.
It is important for every user to have access to this folder, especially the service user.

Installation notes, Service configuration

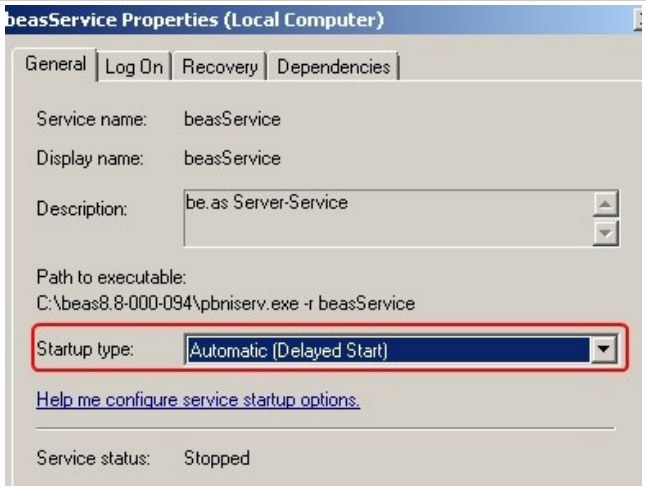
Note on licensing:

SAP B1: Per server one SAP Indirect license is required.

Beas: Depending on the used app the respective license needs to be purchased per parallel connection.

After the service was installed, in Windows–Service the settings need to be adapted:
- Windows - Service
- Set Startup-Type to "automatic (delayed)

© 2026 Boyum IT Solutions A/S



If problems occur with the server connection or contacting the local printer, set to "logon" with account and name / password of the user who runs the services.

IMPORTANT: set up a separate user, start Beas once with this user to set up the environment variables. If the password of this user is changed, the password needs to be changed here, as well.

- Self help in error case

If the service does not start:

- Restart PC/Server
- Check login: Windows Service / Logon - if "this account" was selected: is the password correct?
- After an update: uninstall the service - restart PC - install service and check the entry
- View Server administration - Protocol
- In case of SQL-errors: Windows-Service: switch logon to "this account" – ***see*** Installation.

© 2026 Boyum IT Solutions A/S

Webinar Beas sever tools (8/2017)

3.4.2.1 Tomcat and Xampp Service

The following types are available:

- XAMPP Apache PHP
- B1 Server Tomcat JSP
- Internet Information Service (ISS)

The new WEB APPS are not compatible to other solutions.

For all three post-selections you need to indicate the accessible local HTML folder. A network folder is accepted. Files required for beas are automatically copied.

Information on different services

Type	Description
Internal HTTP Server	Beas has an integrated WEB Server. This web server does not need any additional tools or interfaces. It is fully integrated and fast. Limitations: It works only with HTTP and not with HTTPS. If HTTPS is necessary, an Appache server can be used as a Proxi Server. Some services run ONLY with the internal HTTP Server, for example the WEB Product configurator or REST Services. ***See*** internal HTTP Server
XAMPP Apache	XAMPP Apache needs to be installed in advance. Download and install Download from: https://www.apachefriends.org Install to C:\XAMPP . The service needs to be installed as well and started.

© 2026 Boyum IT Solutions A/S

Type	Description
	Note: Not compatible to WEB APP Version 2 and WEB Configurator
B1 Server Tomcat JSP	Installed automatically by SAP B1 if *Integration Solution Components* have been installed. The correct folder is proposed automatically. Changing / Modification of the folder is not allowed. Note: Beas required administration rights on the Tomcat folder. Beas might be launched with administrator rights. Note: Not compatible with WEB APPs 2.0 and WEB Configurator
Internet Information Service (ISS)	The PHP version is used. Not compatible to WEB APPs Version 2.0 and WEB Configurator.
external Server PHP	uses a selected external PHP Server Note: Not compatible to WEB APPs Version 2.0 and WEB Configurator.

If the HTML server is not located in the local network "external server PHP" can be selected. ***See*** also the separate manual: WEB Apps installation and troubleshooting

For Tomcat and XAMPP the following functions are available:
opens the control center
cogwheel: opens the configuration file

The following, additional fields are available:

Internal Connector	Using an internal connector, Beas works based on the files. Only the folder to be monitored is to be specified here.

© 2026 Boyum IT Solutions A/S

Directory connector	This is the directory where the connector is stored. The connector consists of a bundle of files, as index.php, or *.jsp and some sub-directories for bitmaps. If XAMPP is used, the path is c:\xampp\ htdocs\
Directory communication	Beas communicates via files with the connector. The directory is allocated automatically and should not be changed. Generally, it is the folder \beasweb\ within the connector folder.
External Connector	☐ Activate external connector An external connector is used when the web server is located outside the local network, e.g. in a data center. This communication does not take place by means of files, but by the WEB protocol. Beas queries every second if there is a request on the web server. For this purpose, the content of **%program files%\beas software\beas\program\beasweb\beasweb.zip** needs to be installed on the web server. The following files are not required: .htaccess, index.jsp The connector requires a sub-directory "beasweb" with rights to read and write. Beas communicates with connectorread.php and connectorwrite.php and requires global variables (must be enabled in PHP if necessary)
URL Connector	URL of Connectors
Connector Password	Password. Set up on opposite party in common.php
Performance Monitoring	☐ Activate monitoring of performance of the HTML-Server If enabled, every activity usable for performance monitoring is logged. **IMPORTANT:** Activate this option only for analysis, then deactivate it again. Use the arrow left to the field to call up. The average processing time is displayed in ms.

© 2026 Boyum IT Solutions A/S

Service Pool	Various services can be managed in one "pool" by assignment to a service pool. If one service has to process more sessions than another at the moment of first access, the task is re-routed to another service of the pool. **Note**: For the re-routing to be working correctly, the field URL must always be up-to-date. (***See*** also Distributed Server landscape*)*

3.4.2.1.1 Distributed Landscape

PATH: Administration > Utilities > Beas Manage Server.

Configuration of Server management

By using different types of servers and the possibility to run services simultaneously, it is possible to configure complex, distributed server landscapes. This chapter is explains several configuration scenarios.

Attention:

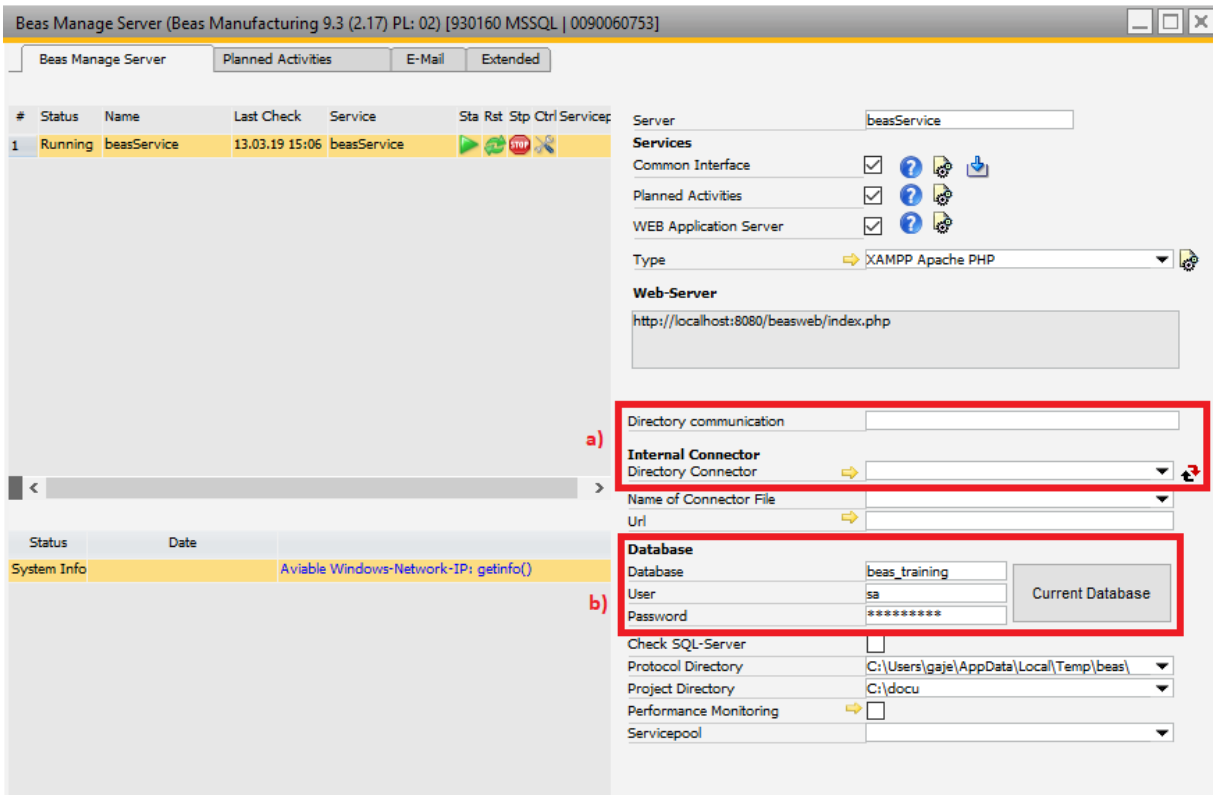
This documentation is only for XAMPP/Tomcat Connector
New WEB Application support - only internal server. No settings are necessary for this internal server.

Scenario 1: Demo area of Beas Mobile

This scenario is to configure a dedicated demo area besides the productive environment for Beas Mobile. This demo area is based on a separate database.

1. Setup of *BeasService #Prod*

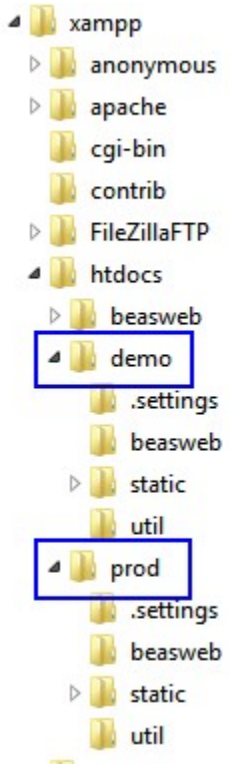
© 2026 Boyum IT Solutions A/S



Window system_ server_ admin.psr

First step is to setup a productive environment to provide apps. For this, create a new service in the Beas Manage Server and activate Common Interface and HTML-Server. After changing this, select a type for the service (for example XAMPP). The important part is to select the correct directory for the connector and for the communication directory. It is recommended to use the following structure:

© 2026 Boyum IT Solutions A/S



Tip 1:
Make certain that the selected directory already exists. The necessary files can be installed to the connector directory by clicking the icon next to the related field. In case there is a problem with installing the files, you can unzip them manually from the installed archive (common: *C:\Program Files (x86)\beas software\beas\program\beasweb\beasweb.zip*) to copy them to the target directory.

Tip 2:
The directory for the connector should contain a folder *beasweb*. In the Beas Manage Server window this directory should be displayed in the Directory communication field.

Tip 3:
When using Tomcat, the communication directory must be the same as the one for the *index.jsp* of the connector.

2. Setup of BeasService #Demo
Follow the steps to create the productive services and modify the settings for the directories of communication and for the connector. ***See*** (a) in the screenshot above.
Note: The connection to the database must be switched to the demo system (b).

© 2026 Boyum IT Solutions A/S

3. DI-API configuration

You can modify the settings for the DI API in the *Common*Tab. This setting is saved to the current database. If you want to modify this for the specific instance of the service, use the Beas client to connect to the related database.

4. Test your systems

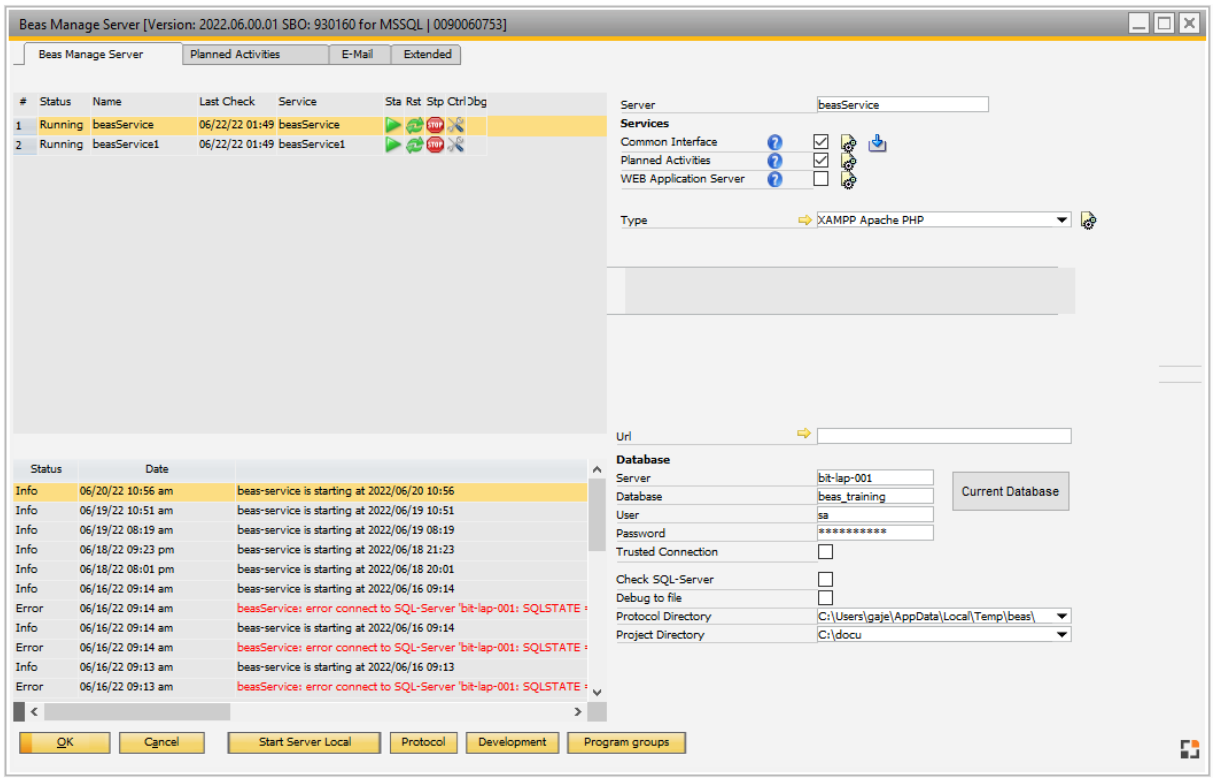
Make certain that your Apache or Tomcat is running. The system should be accessible with URL http://myserver/prod and http://myserver/demo.

Scenario 2: Load Balancing for BEAS Mobile

Current server systems are using multicore architectures and high reserves of memory (RAM). To allow Beas-Services to use these resources optimally, it is recommended to install multiple services for load balancing. Especially if it is needed to provide applications to a high amount of mobile devices, the installation of a multi-service architecture should be considered. It is possible to split the load for HTML-Services, to render the application interface in multiple instances, and give them separated URL endpoints to access.

1. Setup the Common Interface Service

First the so called Common Interface Service is necessary to process the business logic asynchronously. It is necessary to set the Asynchronous Processing on the Extended Tab.



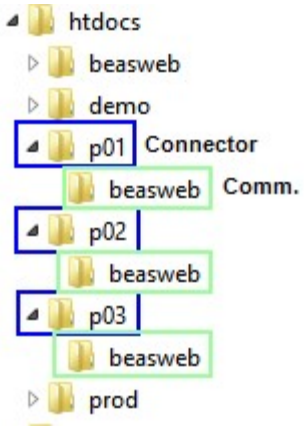
© 2026 Boyum IT Solutions A/S

Window system_ server_ admin.psr

2. Adding HTML-Services

Now, the preferred number of service instances could be added.

Note: All services must use their own folder for the Connector and for communication.



In this case the instances are accessible by the URLs http://myserver/p01, http://myserver/p02, ...

3. System test

Before testing make sure that any services to test are running. Additional check the status of the Apache or the Tomcat service.

Call the Websites:

http://myserver/p01

http://myserver/p02

http://myserver/p03

For all URLs BEAS should be accessible.

3.4.2.2 Planned activities tab

Beas Manage Server

Planned activities tab

E-Mail tab

Extended tab

© 2026 Boyum IT Solutions A/S

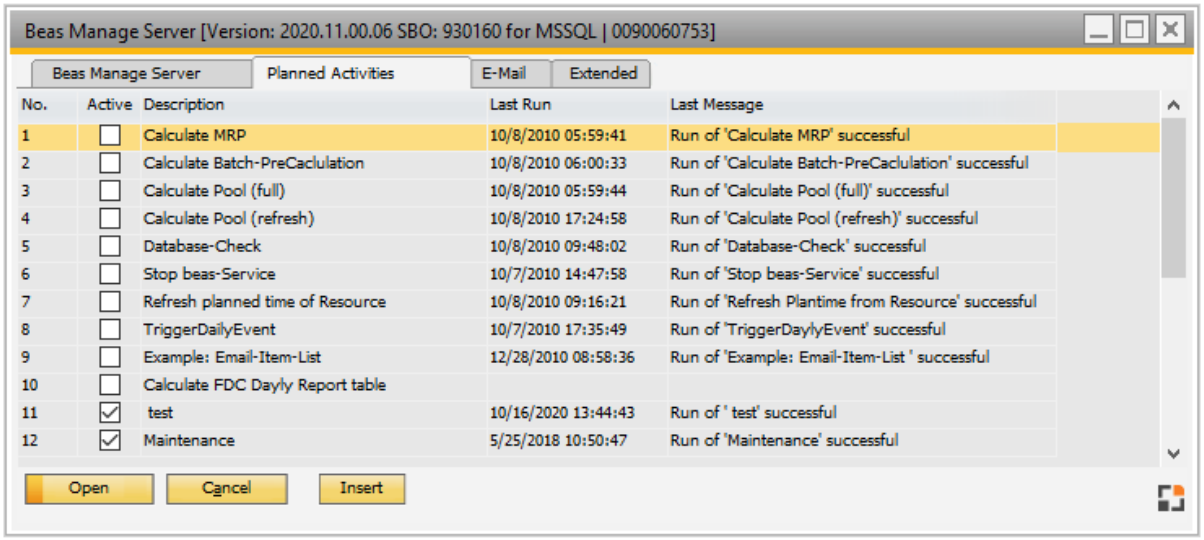
Planned activities are small scripts, which are executed regularly.
These can be called:

- From Beas-Server service (***see*** Server administration configuration)
- From the Windows task planner (***see*** Concept Tasks, Beas-call-up parameters)

For general information ***see*** Tasks.
If a task is called from the Windows task planner, (call-up parameter task=..") settings "active", "from time" and "iteration" are not considered, as this can be set up in more detail in the Windows task planner.

In this tab you can manage planned activities. Activities are listed with the date of the last execution and last message. For details, ***see*** Examples of activities. All stored tasks are displayed. Multiple selection and copy and paste of the selected functions is also possible.

PATH: Administration > Utilities > Beas Manage Server > "Planned Activities" tab.



Window system_server_browse.psr

Field descriptions

Field	Description
No.	Number of the activity. If Beas.exe is called up using the parameter "task", you can indicate the stored number. ***See***: Tasks.
Active	Enabled activity

© 2026 Boyum IT Solutions A/S

Description	Description of the task.

Functions

Function	Description
Open	Edit the selected task.
Add	Create a new task.
Remove	Delete currently selected task. A copy is stored in the clipboard.
Duplicate	All marked entries are copied to the clipboard.
Insert	All entries from the clipboard are inserted.

Back to Server administration

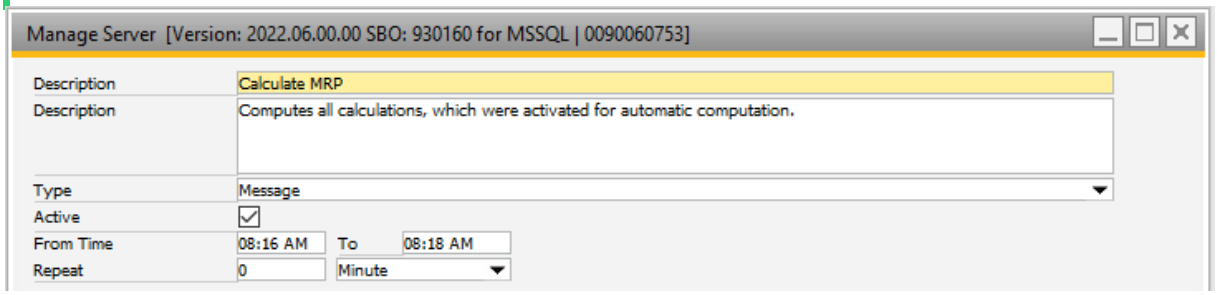
See Server examples

3.4.2.2.1 Manage Server - editing a task

In this window you can edit a task opened from the planned activities tab of the Beas Manage Server.

Execution
Condition
Message
Button
Statistics
Import tab

PATH: Administration > Utilities > Beas Manage Server > "Planned Activities" tab > **Open** an activity.



Window system_server_edit.psr

© 2026 Boyum IT Solutions A/S

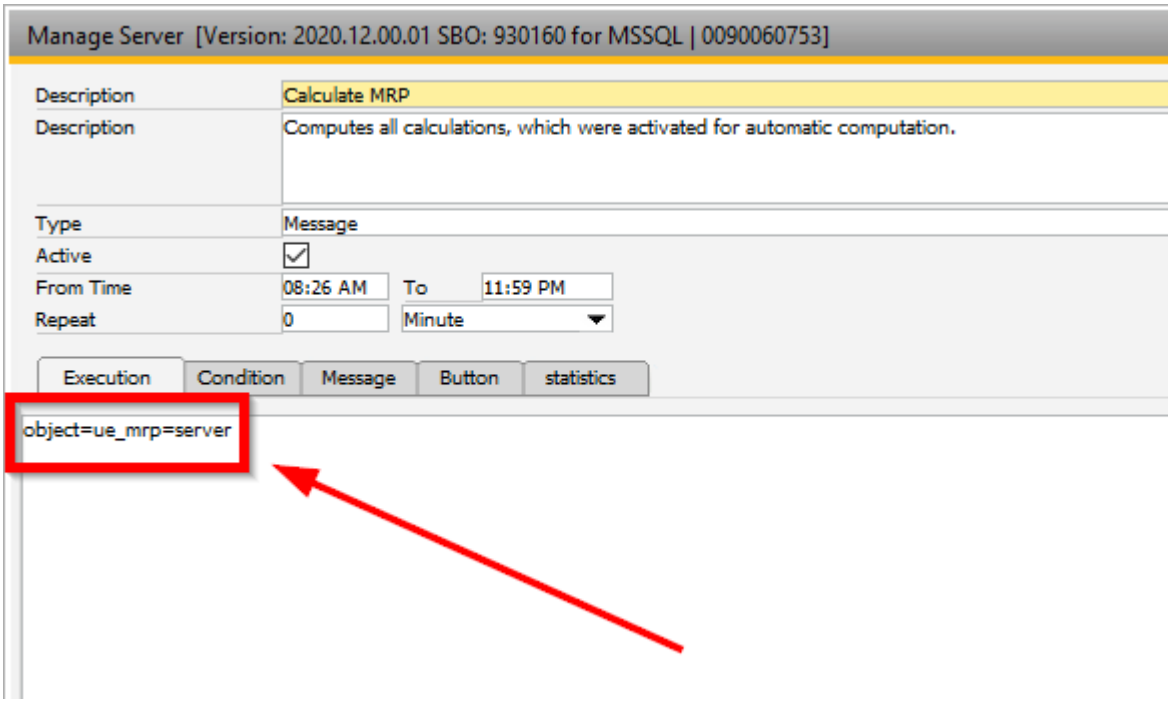
Editing a task

Field/Function	Description
Description	Specifies the name of the task.
From time xx:xx to xx:xx	The time period is defined here, during which the task is carried out.
Repeat	A regularity with which the task in the given time period is carried out. Enter 0 to execute the script only once in the given period. ***Example***: Period 8:00 hrs to 18:00 hrs Loop 10 Minutes Every Monday, Wednesday and Friday This means that the task starts on Monday, Wednesday and Friday every 10 minutes between 8:00 and 18:00 hrs.
Run	The action to be taken is defined here with the help of BeasScript. ***See*** Server examples.
Last Run	The date and time that the task was last started.
Last Message	Using the message, see whether the task was successful or faulty in the last run.
Reset	Right-click function to remove last run and last message.
Test	Execute the script directly.

3.4.2.2.1.1 Execution

In this tab you can add a script that will execute the activity in the times and repetition defined in the header.
Default scripts can help you schedule an activity. For each activity it is possible to set the default scenario for calculation in the related settings of the Configuration wizard.
See how to define additional execution conditions.

© 2026 Boyum IT Solutions A/S



Window system_server_edit.psr

See Example of activities

back to Planned Activities tab

3.4.2.2.1.2 Condition

In this tab you can define further execution conditions:

Condition	Description
Monday – Sunday	Activate radio box for the day(s) when the execution should be performed.

Execution only (return failure = Cancel)	You can insert a script which defines if the system has to execute this task
	if script returns failure (-1) , the system does not execute this task.
	
	Example:
	`#jbs`
	`if (file.fileExists("c:\\import\\importFile.xml") == false) return -1`

© 2026 Boyum IT Solutions A/S

Execution tab

back to Planned Activities tab

3.4.2.2.1.3 Message

In this tab you can save a message, a title and an image for the performed activity.

Field	Description
Save as	Define how to save the message **Beas activity with decision:** Create a Beas Message with Buttons for additional activities **SAP activity with decision:** Create a SAP Activity with Buttons for additional activities **Message without decision** Create a Beas Message without additional functionality
Image	Save an image for the message (only beas messages)
Title	Save a title for the message
Message	Add a message
Recipient 1	The recipient of this message - only when logged in. If acceptor is not logged in, the system sends the message to optional users. If no optional user is logged in, the system sends this to acceptor 1.
Optional 1	The recipient of this message, if Recipient 1 is not logged in.
Optional 2	The Recipient 2 of this message, if Recipient 1 and Optional 1 not logged in.

back to Planned Activities tab

3.4.2.2.1.4 Button

Field	Description
Button 1 – 3	Name of Button 1-3

© 2026 Boyum IT Solutions A/S

Field	Description
Activity close	Closes the actual message.
Script	Executes the saved script.
Reference Type	Type of linked document (Work order, Sales order)
Reference 1 – 3	Linked document number

back to Planned Activities tab

3.4.2.2.1.5 Statistics

This tab provides statistics for the execution of the planned activity.

Field	Description
Last Run	
Start	The starting time of the last execution. ***Example:*** 11/24/2020 08:27:16
End	The ending time of the last execution. ***Example:*** 11/24/2020 12:27:16
Duration	Duration of the last execution defined in minutes.
Total	
Execution	Number of all performed executions.
Time	This is the total value of all durations that is the sum of every execution.

back to Planned Activities tab

3.4.2.2.1.6 Import tab

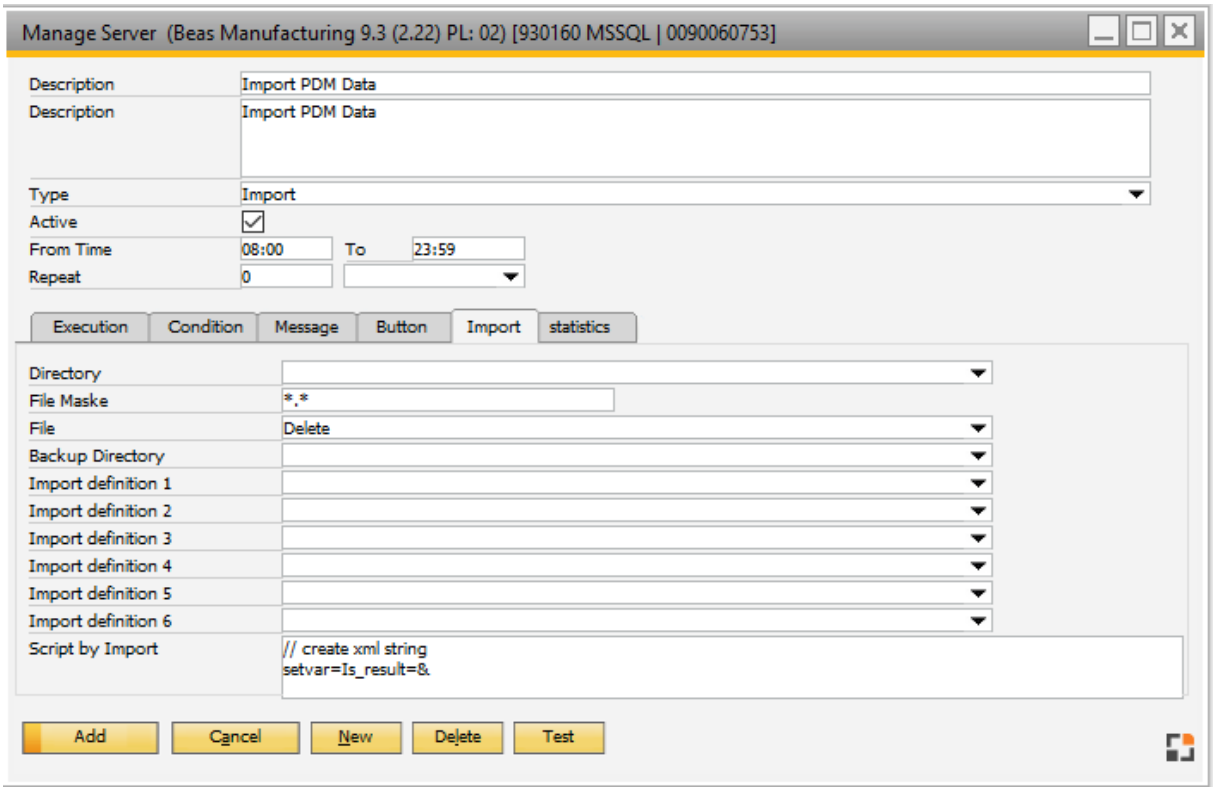
PATH: Administration > Utilities > Beas Manage Server > "Planned Activities" tab > **Open / Add** button.

In the Import tab you can define which files are imported automatically. A directory is defined for this which is checked for new files.

For each import up to 6 import definitions can be defined, which are read in order.

Example: A file contains information on items and bill of materials. First, the items are read, followed by the bill of materials.

© 2026 Boyum IT Solutions A/S



Window system_server_edit.psr

Then the inserted file is deleted or moved depending on the settings.

In case of an error, the import stops immediately. The `importlog` variable saves the error log.

In the *Script after import* field a script can be stored, which is called after the import. This can be used to display a message (for example, in a response file), to enable two-way communication.

Report of import errors

If a message must be issued with the Beas message window (Default), select *beas activity with decision* in the Message tab and a report has to be stored for the respective message. A default value is inserted automatically. Only the recipient has to be entered. The message is generated only in case of error. The same variables are available, which are described in "Script after import".

Field	Description
Directory	The directory to be checked for new files.
File mask	The files to be read. Wildcards are allowed (*, ?), e.g. *.xml.
File	Determine the action to be taken on the file after the import. • No action. • Delete.

© 2026 Boyum IT Solutions A/S

	• Move to the backup folder. • Move with time stamp. The date and time is added to teh file name.
Backup folder	The backup where file is moved to after the import is complete.
Import Definition 1-6	Max. 6 import definitions can be added that run in order. The process is canceled in case of error. Previously executed actions are not taken back. You can define additional behavior in case of errors in the "Script after import".
Script after Import	Script to be executed after the import. The script is executed only once. The following variables are available:

Variable	Description
importfile	Imported file name
importok	1 = all ok, -1=error
importtyp / importreihe	Definition name, link to BEAS_IMPORT_KOPF.TYP / REIHE
importlog	Error log, text format with cr_lf per error
importrequestid	The request ID, which is stored in the Import-Setting – Extended *(beas 9.2 PL: 01*
importfilenewname	The variable contains the new name of the backup file generated by the system. If the definition is to "delete file", this variable is empty.

Example create an answer file

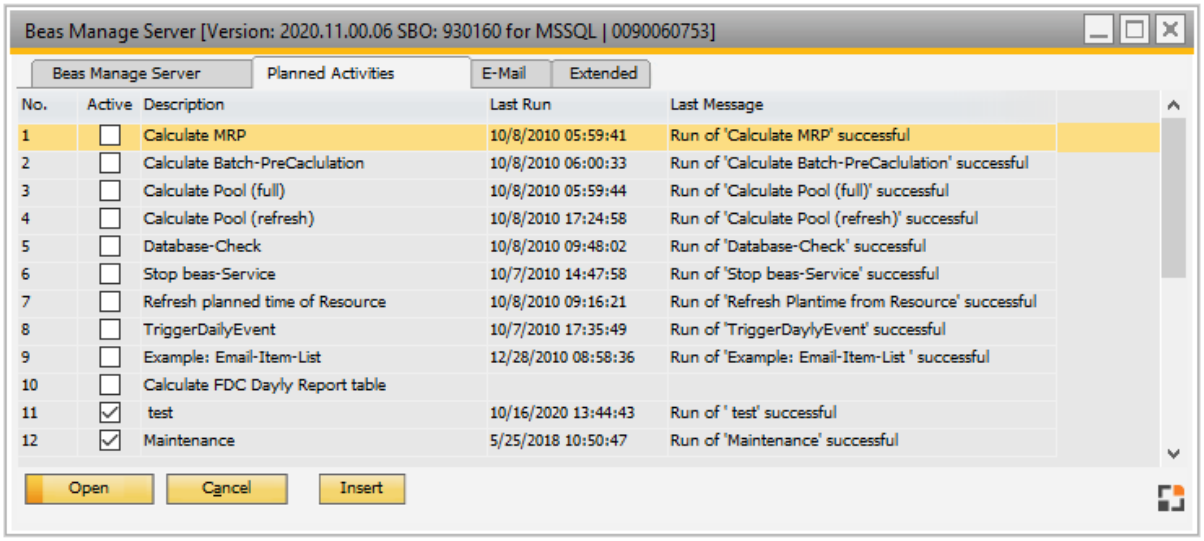
```
// create xml string
setvar=ls_result=&
   <request>&
   <requestid><importrequestid></requestid>&
   <importstatus><importok></importstatus>&
   </request>
// save as file
tools=filesave=c:
\import\requestfiles\<importrequest>.xml=<ls_result>
```

Note: if you create an answer file

© 2026 Boyum IT Solutions A/S

3.4.2.2.2 Examples of activities

PATH: Administration > Utilities > Beas Manage Server > "Planned Activities" tab.



Window system_server_browse.psr

In server management, the following tasks are available by default:

Task	Description
Calculate MRP	Executes all calculations that are activated for automatic computation.
Calculate Batch-PreCalculation	Executes all batch pre-calculations which are enabled for automatic computation. ***See*** Batch-calculation.
Calculate Pool (full)	Computes the resource pool including the active pool (once daily).
Calculate Pool (refresh)	Computes the resource pool, leaving pool 1 unchanged.
Database-Check	Performs a data check and records the existing data integrity problems. This is the same check as performed after a program update.
Stop Beas service	⊟ End the service At least once a day the server service should be restarted to clear the memory. Proceed as follows: Task manager – Restore 1. First error – Restart service 2. Second error – Restart service

© 2026 Boyum IT Solutions A/S

	3. Third error – Restart service The service is restarted automatically if it is stopped with this task.
Refresh planned time of resource	Calculates the time available for the resources and resource groups. This is normally done, but it should be recalculated from time to time.
TriggerDailyEvent	(Event System: Event dailyevent "and Milestone-Check) In events daily messages can be created based on this event .
Calculate FDC Daily Report table	Update the Daily attendace report This report creates tables which are necessary for various reports and views in attendance. This can also be calculated manually. For further information see Recalculation. It is recommended to start recalculation once per week.
Calculate Material requirements for Cockpit	Calculates material requirements of work orders for the Beas Production Cockpit on a regular basis.

Script examples

Example	Script
Calculate MRP	Calculate all recommendation reports marked for automatic calculation `object=ue_mrp=server`
Precalculation	Batch pre-calculation with the given number is executed `tools=runbeas=batchcalc=1`
APS	Calculate a APS scneario In Capacity planning it is possible to define different scenarios: 
© 2026 Boyum IT Solutions A/S

	Add the following script in the Execution tab of the APS Planned activity to calculate an APS scenario automatically in a task:
	`object=ue_aps_browse=calculate=<ScenarioId>`
	
	Example
	`object=ue_aps_browse=calculate=olgo`
	
	Note: If you wish to execute the default APS scenario, leave the scenario ID part of the script empty.

Calculation of lead time and material requirement	Computes material and resource requirement and the lead time per production lot size (oitm.leadtime)
	Information is saved in beas_oitm_material and beas_oitm_resourcen tables. It can be used as base for MRP rough planning.
	
	The function can be called manually from the item structure list.
	`setvar=is_itemcode_from=`
	`setvar=is_itemcode_to=zz`
	`setvar=is_itempropertie=`
	`setvar=is_save_leadtime=true`
	`setvar=is_save_material=true`
	`setvar=is_save_resource=true`
	`object=ue_mrp=resourcenplanung`

Beas starting parameter "`task=`"
With this parameter a stored activity is executed directly and Beas is closed afterwards.
See access parameters

3.4.2.3 E-Mail tab

PATH: Administration > Utilities > Beas Manage Server > "E-Mail" tab.

Beas Manage Server
- Planned activities tab
- **E-Mail tab**
- Extended tab

© 2026 Boyum IT Solutions A/S

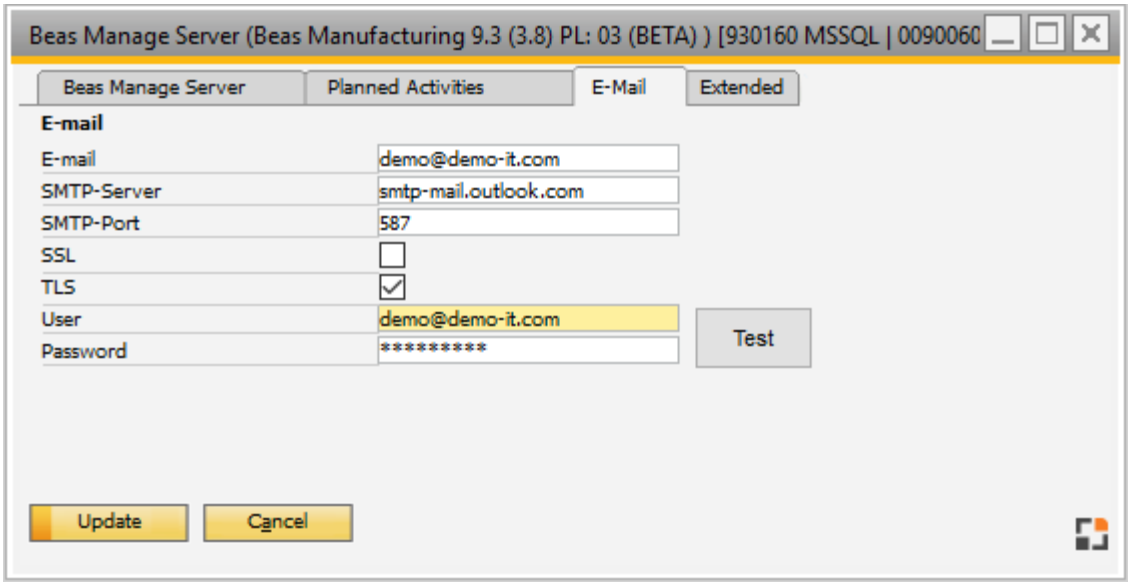
E-mail tab:

In this tab it is possible to enter E-mail account data for the service.

The following settings are available: SMTP Server, SMTP-Port, SSL, TLS, User+Password, Encryption.

You can also perform these settings in **Administration > System initialization > Configuration wizard > Administration > Print and report setup > Email**

Example: Outlook setup with TLS port



Window system_server_email.psr

For Field descriptions of this window click here.

For details of SMTP server settings for outlook ***see*** documentation of used email provider.

For SMTP settings of MS Outlook visit this page.

Buttons

Button	Description
Test	Create a email for the defined email address For this the system ask for your email address. It will send a test email to you.

3.4.2.4 Extended tab

PATH: Administration > Utilities > Beas Manage Server > "Extended" tab.

© 2026 Boyum IT Solutions A/S

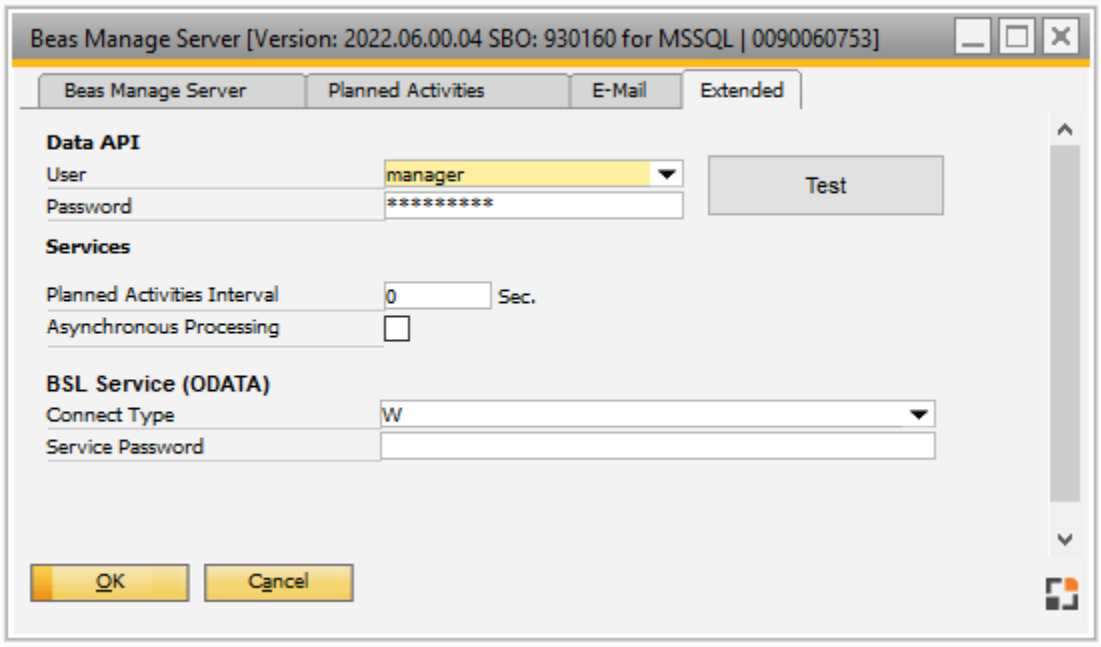
Planned activities tab
E-Mail tab
Extended tab

Extended tab:



Window system_server_common.psr

Field/Function	Description
Data API	*Settings for data API*
User	Select user from the drop-down list.
Password	Enter user password.
Test button	Test settings for data API.
Services	*Settings for Beas services*
Planned activities Interval	Define interval of planned activities execution in seconds.
Asynchronous Processing	☐ Activate asynchronous processing Related to most of WEB APP's Version 1.

© 2026 Boyum IT Solutions A/S

<table>
<tr><td></td><td>If this option is enabled, the transactions will be redirected to the Beas Common service. Transactions are no longer carried out on the WEB service, but on the Beas Common Service that can be started in parallel. The processing on the Beas Common Service is running serial (batch processing). The WEB service is not blocked and the client can continue working. When the transaction is complete, a message is sent to the web client.
See also Configuration wizard setting.</td></tr>
<tr><td>BSL Service (ODATA)</td><td></td></tr>
<tr><td>Default Connection Type</td><td>Types of Connection<table><tr><th>Setting</th><th>Description</th></tr><tr><td>Employee + Password</td><td>Provide employee name + password</td></tr><tr><td>Employee + Password + Service Password</td><td>Provide employee name, password and special, service password</td></tr><tr><td>Service Password</td><td>Provide service password only.</td></tr></table>Test BSL: The button tries to connect to the server, reads the service password, and verifies if the connection was successful.</td></tr>
<tr><td>Service Password</td><td>Set a password for the BSL Service</td></tr>
<tr><td>Beas WEB URL (https://Server:port)</td><td>The port to communicate with the SAP Server. SAP web can access Beas web through this port.
NOTE: SAP only works with secure connections.</td></tr>
<tr><td>SAPWebExtensions path</td><td>The folder where SAP Web Extensions are saved in Beas.
Click on the drop-down to select the folder. Note: The system may take time to load the "Browse for folder" window.</td></tr>
<tr><td>Update .mtar files</td><td>After testing the BSL with the corresponding button above, updating the .mtar files in the B1_SHR folder is necessary to have correct customer information in
the system to work with Beas integrated in the SAP Web solution.
Clicking this button will create a copy of the two .mtar files that are installed by default:
BeasManufacturingWebClient.mtar: Contains special functions for the SO and Inventory history screens of SAP.</td></tr>
</table>

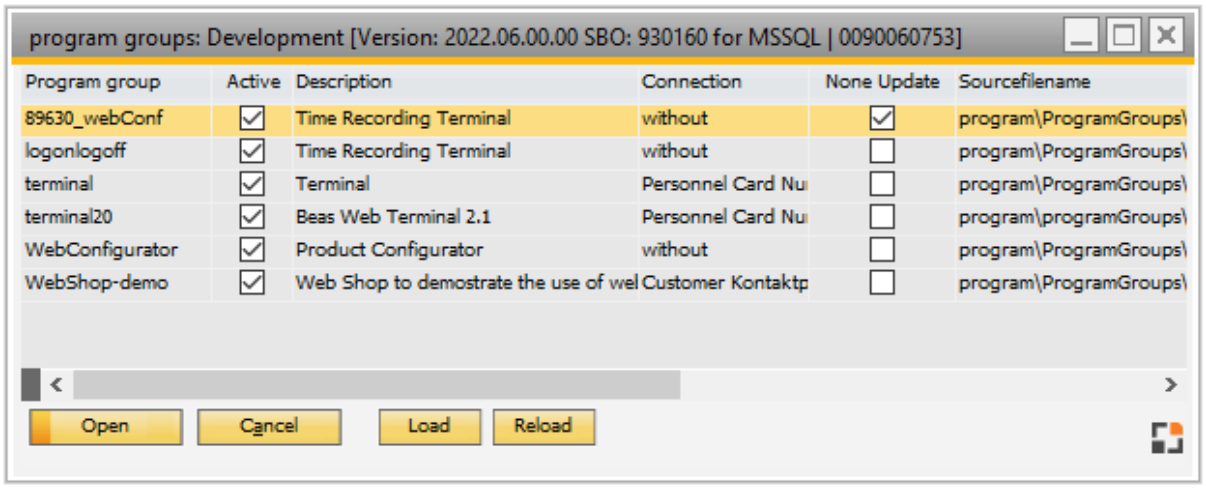
© 2026 Boyum IT Solutions A/S

	BeasManufacturingWebClientTiles.mtar: Contains two tiles to add in the SAP Web Solution. The new (copied) file names will be: **BeasManufacturingWebClient_Install.mtar** and **BeasManufacturingWebClientTiles_Install.mtar**. Use these two files to import in the SAP Business One Extension manager.

3.4.2.5 Development

PATH: Administration > Utilities > Beas Manage Server > Development

Here you can see all installed Program groups



webprogram_browse.psr

Standard Program groups

Program Group	Description
logonlogoff	Simple time registration app
terminal	Terminal Desktop definition (and WebApps Version 1 - not supported)
terminal20	WebApps 2.0
WebConfigurator	Web Product Configurator

Function

© 2026 Boyum IT Solutions A/S

Function	Description
Open	Open the development window for a program group
Load	Load additional program groups
Reload	Reload a program group. **Note:** This deletes all customized entries!

Right-click menu – further functions

Function	Description
Add	Add program group
Remove	Remove selected program group
Development	Open program groups: Development window
Export to ZIP file	Create ZIP file to export definition
Import from ZIP file	Create ZIP file to import definition
Copy in Clipboard	Copy information on clipboard
Insert from Clipboard	Insert copied information from clipboard
Copy in Clipboard (alt)	
Insert from Clipboard (alt)	
Program group load	Load program group

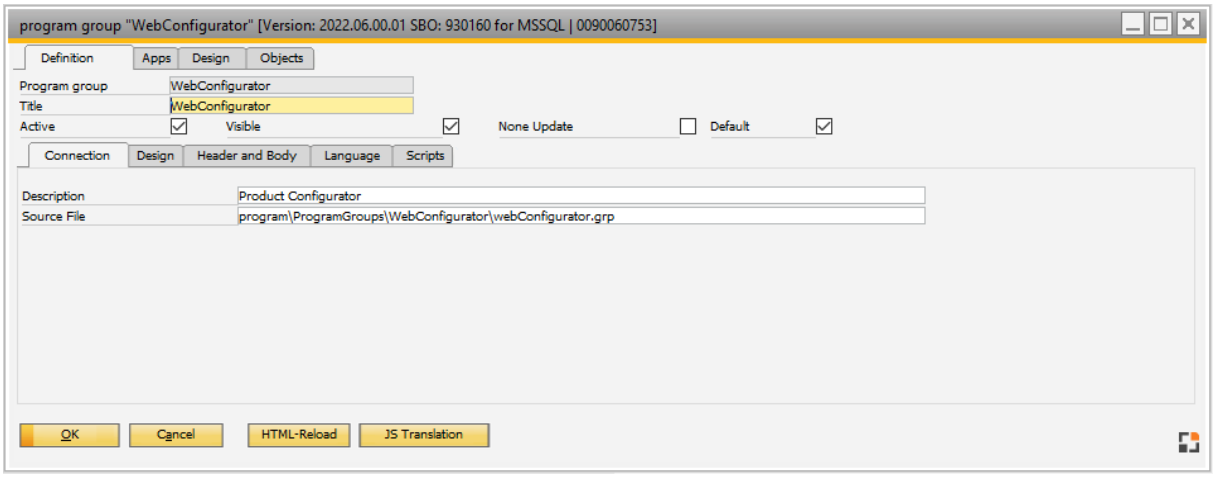
3.4.2.5.1 Program Group Development

PATH: Administration > Utilities > Beas Manage Server > Development > **Open**

A program group is a box containing single apps. An application may be for example the Terminal program which makes various functions available.
NOTE: Do not change the definition of Standard Groups!

© 2026 Boyum IT Solutions A/S

Here it is possible to manage and adjust the selected Program Group:



Window webprogram_edit.psr

Upper tabs

Tab	Description
Definition	First tab with basic settings, displayed below.
Apps	Display and edit functions (Apps).
Design	Open tab to edit design. Only for Terminal1 - Not supported anymore
Objects	Open tab to edit App-Objects - Not supported anymore

Field	Description
Program group	Name of the app.
Title	Displayed title.
Active	Check mark if active.
Visible	Check mark if visible.
None update	Check if no automatic update is requested.

Lower tabs

Field	Description
Connection	First tab with basic settings.
Design	Enter icon and CSS-file .
Header and Body	Definition of Header, Body and Footer (script).

© 2026 Boyum IT Solutions A/S

Language	Language for development and translation table.
Scripts	Additional possibility to enter scripts.

Field	Description
Description	Description of the application.
Source File	Define a Source file for the connection.

Buttons below

HTML-Reload: Reload HTML code.

JS Translation: JavaScript translation for all apps.

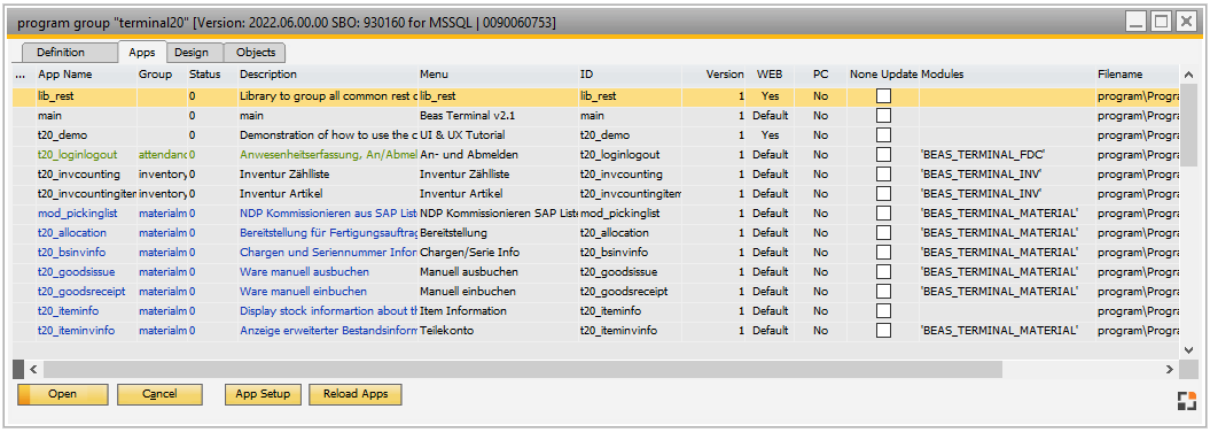
back to Program group Administration

3.4.2.5.1.1 Apps List

PATH: Administration > Utilities > Beas Manage Server > Development > **Open**

Present the list of all apps from a program group.

Here are, as an example, all apps of the program group WebApps terminal 2.0.



webwindow_browse.psr

In this window you can add your own APPS.

IMPORTANT: Do not delete or modify standard apps. The system overwrites all changes in the next update!

The following documentation is only for Program Group Terminal 2.0:

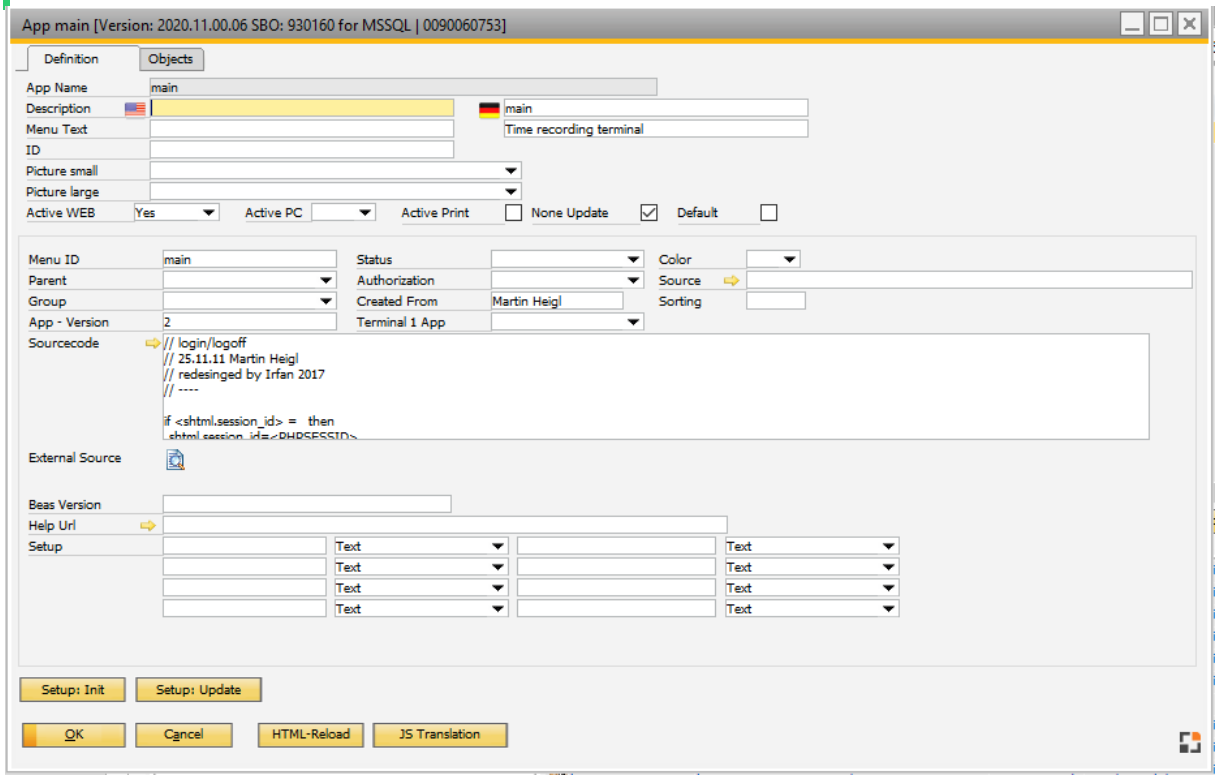
© 2026 Boyum IT Solutions A/S

Function	Description
Open	Open the Development window for an App
App Setup	Open Standard setup window for an App
Add	Create a new App in project folder
Duplicate	Duplicate the current app to project folder
Reload apps	Reload all apps in the terminal program group.

All sub-functions of the selected apps can be edited here.

Note: The "Objects" tab is not supported anymore.

PATH: Administration > Utilities > Beas Manage Server > Development > **Open** > **Open** an app in the list



Column	Description
App Name	Name of the app.
Description	Description.
Menu text	Assigned menu.

© 2026 Boyum IT Solutions A/S

Group	Functional group of apps (Inventory/Production/Attendance).
ID	Apps ID. This must be the same as the App Name.
Image small / large	Image appearing in the WebApps Main Menu. Note: WebApps Version 2 supports only one variant. The files are located in `program files(x86)\beas software\beas\program\httpserver\beasweb\static\gfx`
WEB	Check mark if app is available for WEB.
PC	Check mark if app is available for the Desktop Terminal. Note: Only for program group "Terminal".
Active Print	Activate to make the Print solution available for this app.
None Update	Don't update as copy in a separate file (save only in database). Disable it for custom apps.
Default	Define as default app if no menu is defined.
DETAIL AREA	
Menu ID	ID for Menu. This must be the same as App Name.
Parent	Not supported.
Group	Define the group (material management, FDC and so on). Useful for overview.
App - Version	Define App Version. Only for information.
Status	Define development status. Only for information.
Authorization	Not supported.
Created from	As information.
Terminal 1 App	Link to Terminal 1 App (for customization it is not supported).
Color	Define color in list.
Source	Provide path and file name for copy of all definitions.
Sorting	Define sorting in the app list.
Source Code	The source code for WebApps.
External source	open the external source, which is used for the WEB APP
Beas Version	Not supported.
Help Url	Not supported.

© 2026 Boyum IT Solutions A/S

Setup	Define up to 10 settings which you can save in the app settings. This definitions are saved in the local database.

Buttons

Field	Description
Open	Open authorization group to assign available apps.
Remove	Delete the selected authorization group.
Copy	Copy an app to clipboard as compressed string. Then it can be transferred to a customer via remote access or email.
Insert	Insert an app from clipboard. Accessible via **Program group Administration > Program groups development > App > Button "Insert"** You can copy received by email the app to the clipboard, insert and confirm the name. It can be also inserted with another name. Note: If this app already exists, you must delete it first.
Description	Open online help to get a description of the app.
Apps Setup	Open extended settings of a single app.

Right-click menu

same functions as buttons below, additionally:

Field	Description
Level left	Display in Terminal: button is aligned on the left.
Level right	Display in Terminal: button is aligned on the left.

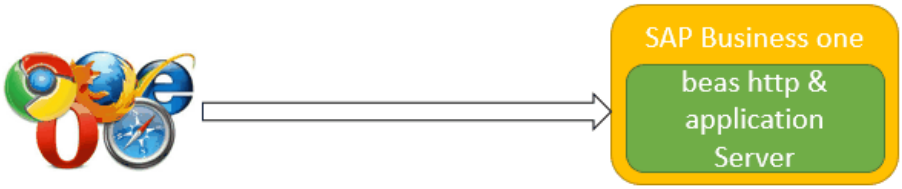
Right-click on App Name: color settings

back to App development

3.4.2.6 Internal HTTP server

Beas has an integrated, complete HTTP Server

© 2026 Boyum IT Solutions A/S



This allows a simple installation and usage of WEB applications
Terminal 2.1, WebConfigurator and all internal services are compatible only to internal HTTP Server

For an example of use ***see*** WEB Server

Advantages:
- Fast, because no additional interfaces are required
- Simple to use
- Fully integrated

Without the use of a Proxy server the limitations are:
- Only HTTP, no HTTPS
- Can only transmit the images one after another instead of parallel

In general, the use of the internal WEB server is recommended.
Without additional services this is completely sufficient services at internal use or for presentation.

But a Proxy-server is required if a public access is required or larger image file is transmitted. The setup for this is very simple.

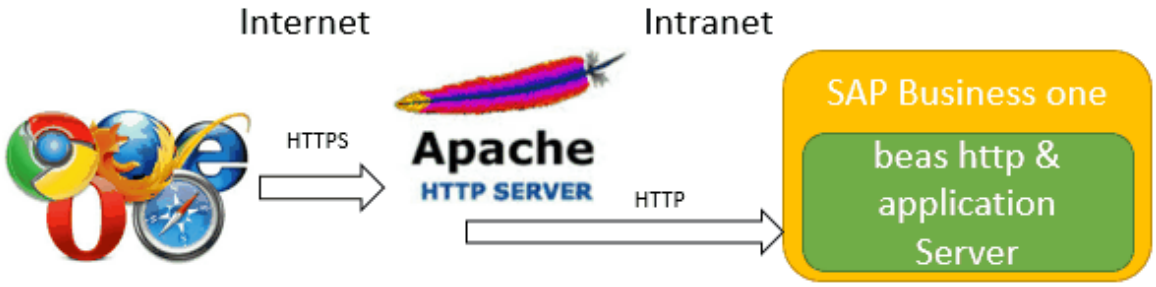
Display of different possibilities

Only internal Beas WEB Server
The client communicates directly with Beas AddOn, because this provides the HTTP Server at the same time.
Because the interface can be renounced, the following changes:
a) Setup and support of Apache HTTP Server are not required
b) Faster processing of Inquiries
But no HTTPS is available
Good for intranet solution or presentation

© 2026 Boyum IT Solutions A/S

Apache as Proxy Server

The HTTPS protocol has to be used if an internet access is required. The apache HTTP server should be used. This routes the HTTPS inquiries to Beas http and application server using HTTP



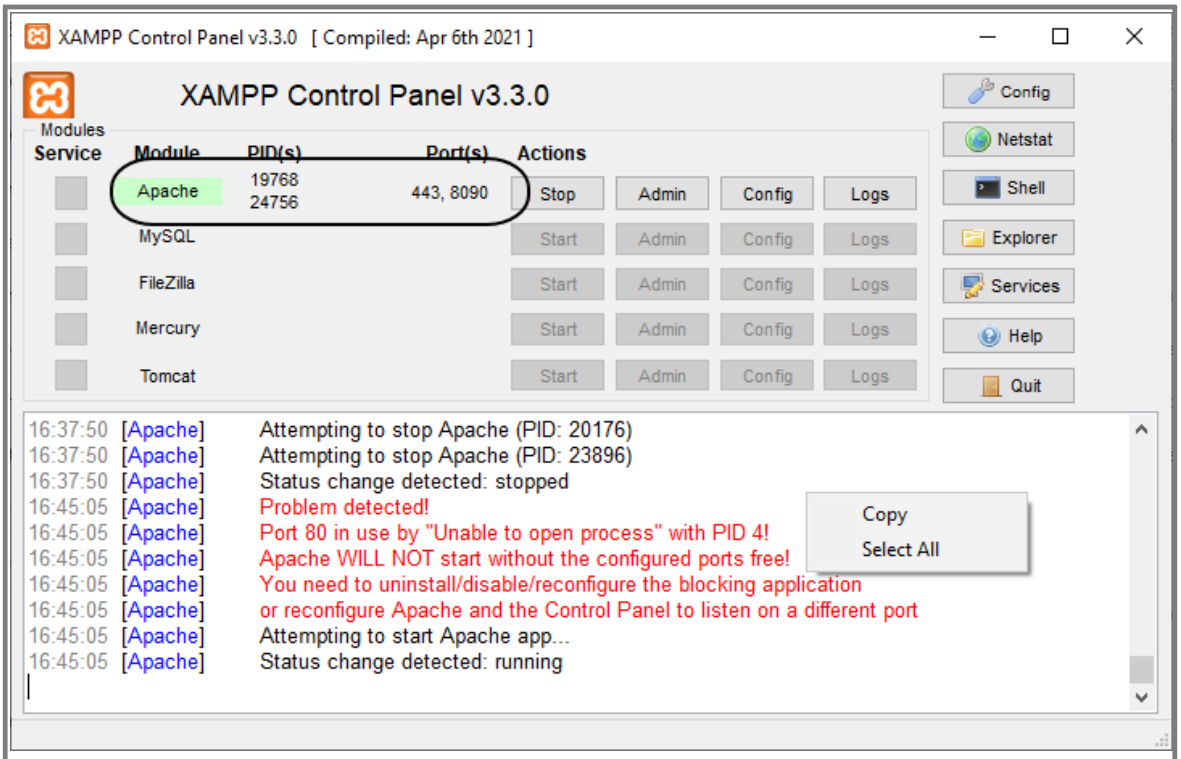
- HTTPS configuration steps for Beas with XAMPP

Internal Beas Web server only works with HTTP protocol and by default it does not support HTTPS connections. To solve this limitation, you can add a simple configuration by using XAMPP software as a proxy.

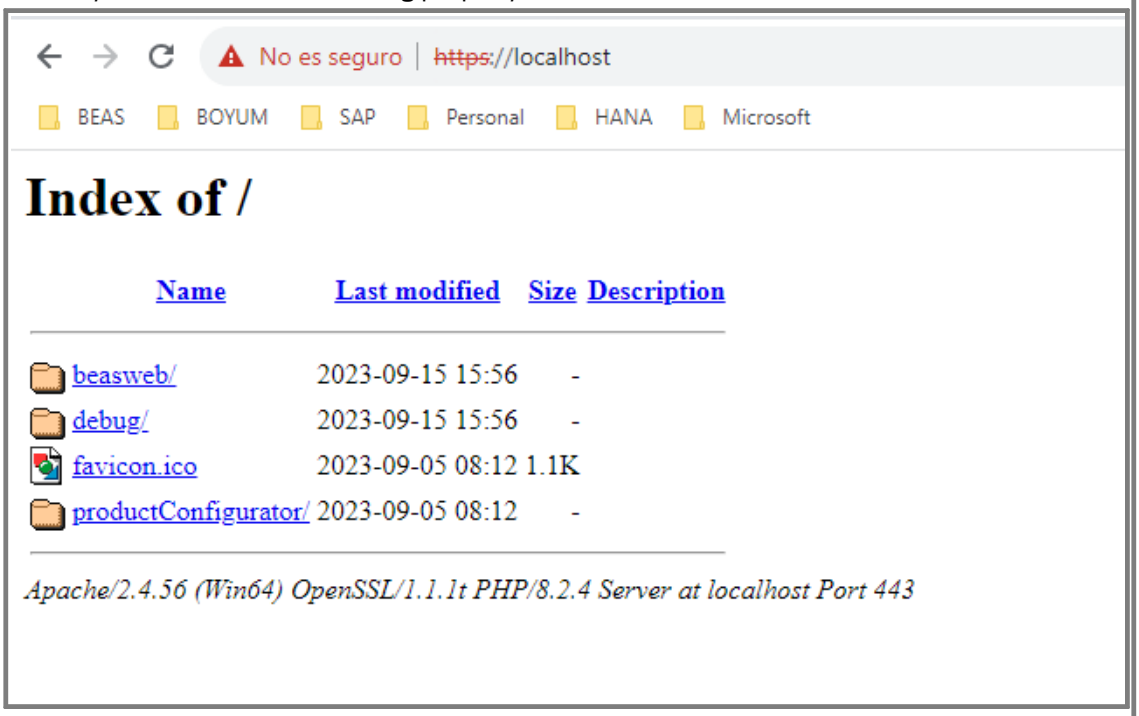
Follow the steps below:

1. Install XAMPP (the latest version)
2. After installation, the first step is to validate that the server is up and running without any problems:

© 2026 Boyum IT Solutions A/S



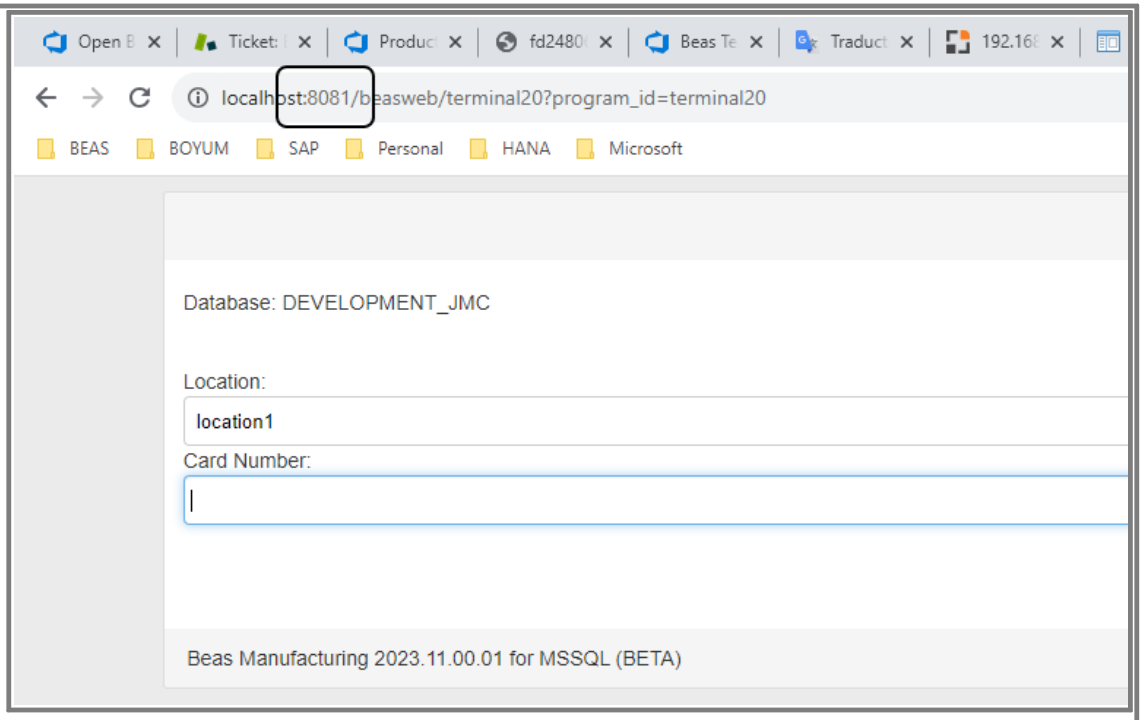
3. Verify that local host is working properly:



4. After validating that XAMPP is installed and running, start the Beas Web Server and check the port if Beas is working.

In this example below it is configured as port 8081:

© 2026 Boyum IT Solutions A/S



5. Start the configuration of XAMPP to redirect requests to Beas Web.

6. Modify httpd.conf to uncomment the following text: ule proxy_http_m

```
#LoadModule proxy_html_module modules/mod_proxy_html.so
LoadModule proxy_http_module modules/mod_proxy_http.so
#LoadModule proxy_http2_module modules/mod_proxy_http2.so
```

7. Start/Stop XAMPP to reload configuration.

8. Modify httpd-ssl.conf to add the rule in the system to redirect incoming requests from XAMPP to BeasWeb.

9. Add the following lines before the end of the file (port should be the port where Beas is running):

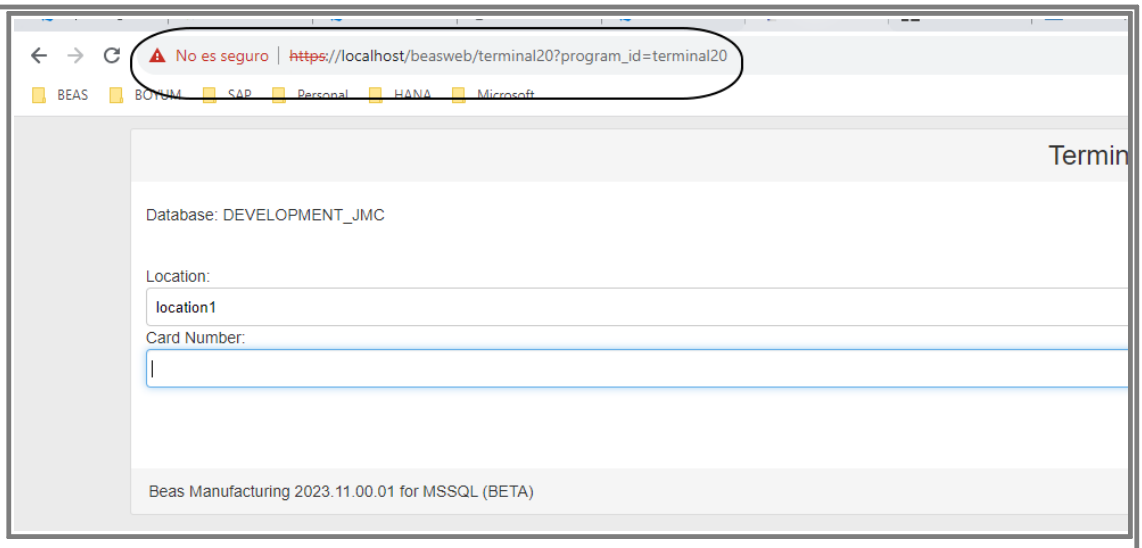
```
ProxyPass / http://localhost:8081/
ProxyPassReverse / http://localhost:8081/

</VirtualHost>
```

10. Start/Stop XAMPP to reload the modified configuration.

11. Load Beas via HTTPS, and everything should be operating properly:

© 2026 Boyum IT Solutions A/S



Continue configuration by generating certificates to make http secure.

OPTIONAL:

You we can also get the advantages of XAMPP to load some static information like icons from Beas in parallel mode.
To configure this you have to:

1. Modify variable "DocumentRoot" defined in file "httpd-ssl.conf" to determine the path where the system is going to load static resources. The Web server should have access to the defined folder.

```
DocumentRoot "c:/program files/beas software/beas/httpserver"
```

2. Add the ProxyPass lines to redirect the requests to the correct places:

```
ProxyPass "/beasweb/assets21" !
ProxyPassReverse "/beasweb/assets21" !
ProxyPass "/beasweb/static" !
ProxyPassReverse "/beasweb/static" !
```

3. Stop/Start XAMPP to reload the modified configuration.
4. Reload the Beas web page through HTTPS.

© 2026 Boyum IT Solutions A/S

- Start Beas with HTTP Server

Beas can be started directly as HTTP Server
For this in the directory c:/program files(x86)/beas software/beas
start Beas with the parameter /httpserver=[port]

Example:

beas.exe /httpserer=8080 user=manager pwd=manager database=training

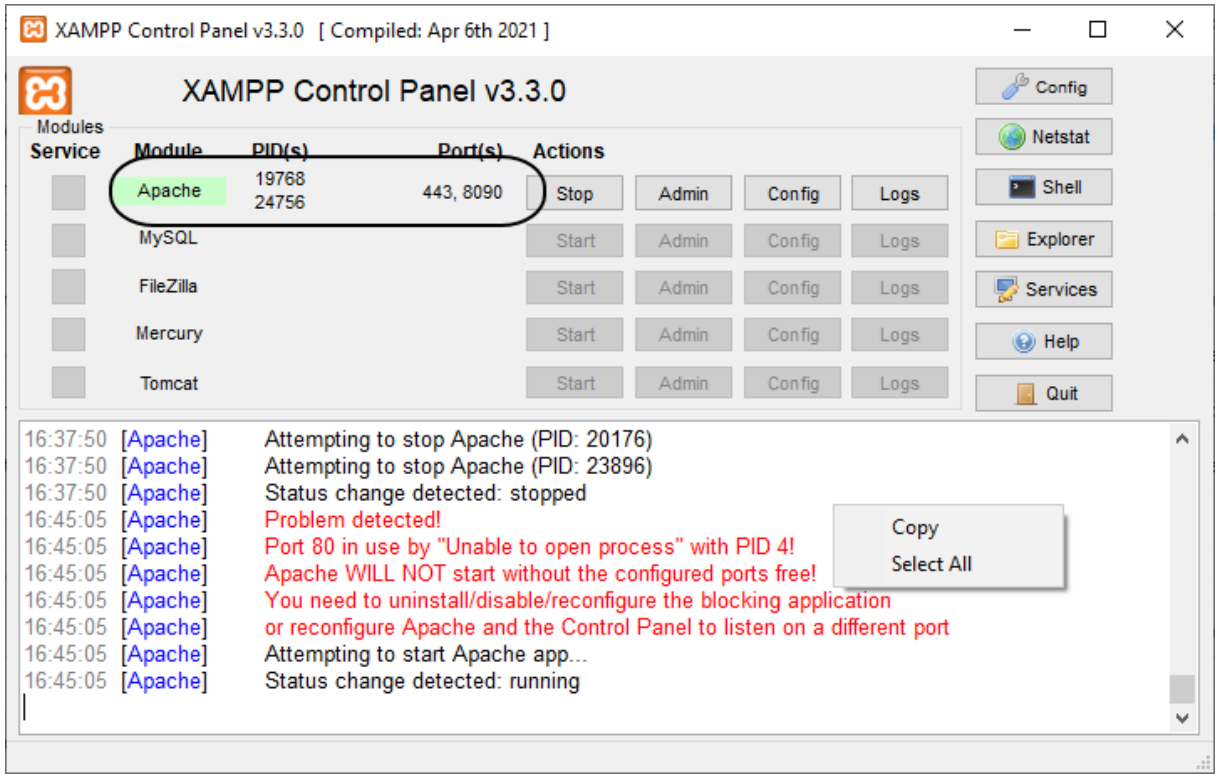
Beas can now be used normally. But the HTTP server runs in the background and Beas can be addressed directly.

3.4.2.6.1 HTTPS configuration for Beas

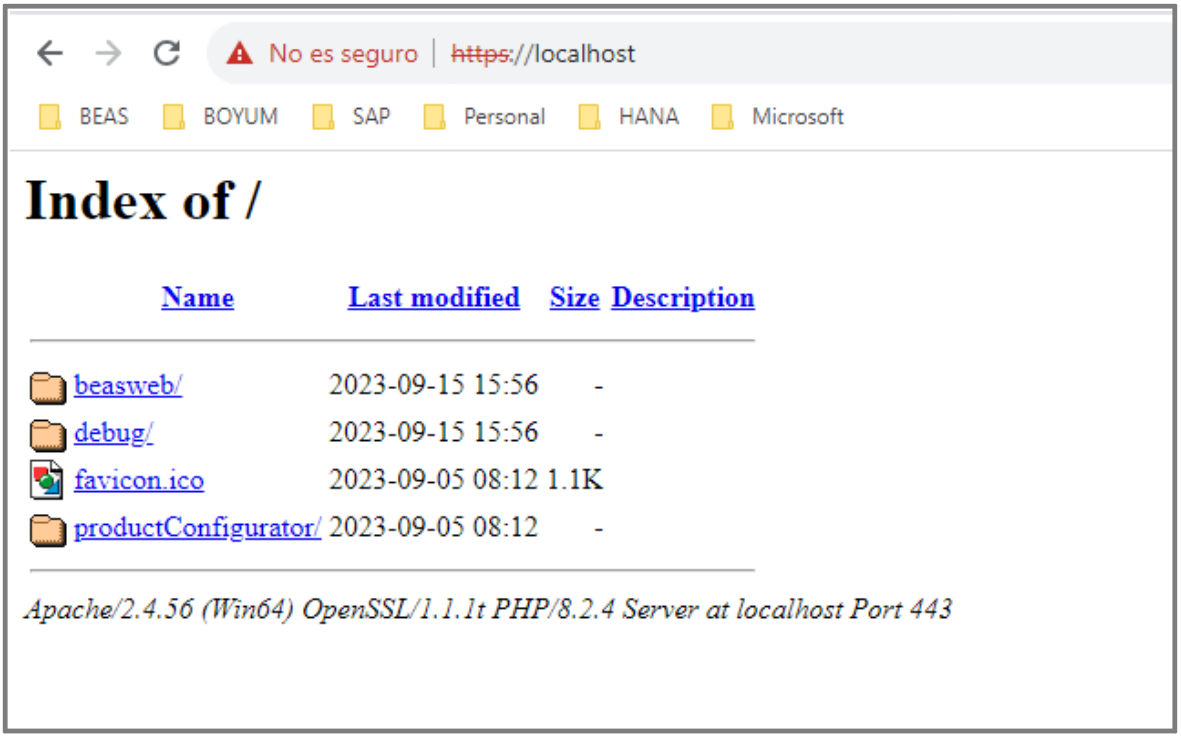
Internal Beas Web server only works with HTTP protocol and by default it does not support HTTPS connections. To solve this limitation, you can add a simple configuration by using XAMPP software as a proxy.
Follow the steps below:

1. Install XAMPP (the latest version)
2. After installation, the first step is to validate that the server is up and running without any problems:

© 2026 Boyum IT Solutions A/S



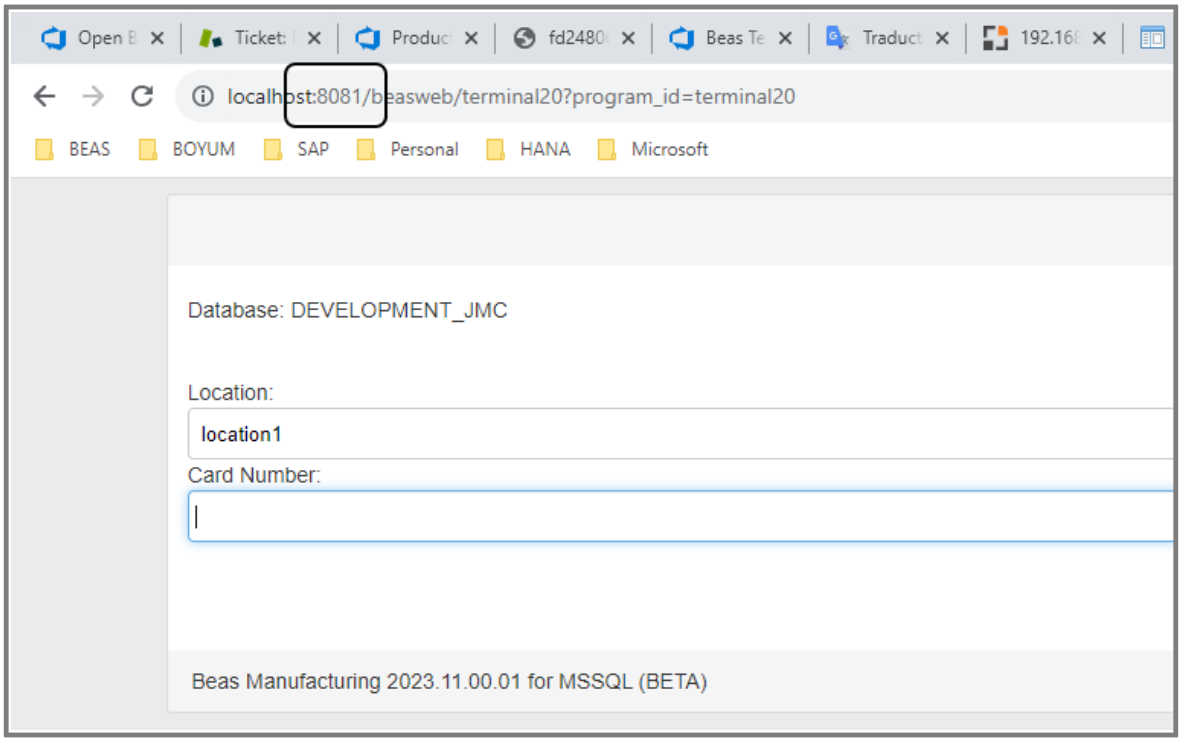
3. Verify that local host is working properly:



4. After validating that XAMPP is installed and running, start the Beas Web Server and check the port if Beas is working.

In this example below it is configured as port 8081:

© 2026 Boyum IT Solutions A/S



5. Start the configuration of XAMPP to redirect requests to Beas Web.
6. Modify httpd.conf to uncomment the following text: ule proxy_http_m

```
#LoadModule proxy_html_module modules/mod_proxy_html.so
LoadModule proxy_http_module modules/mod_proxy_http.so
#LoadModule proxy_http2_module modules/mod_proxy_http2.so
```

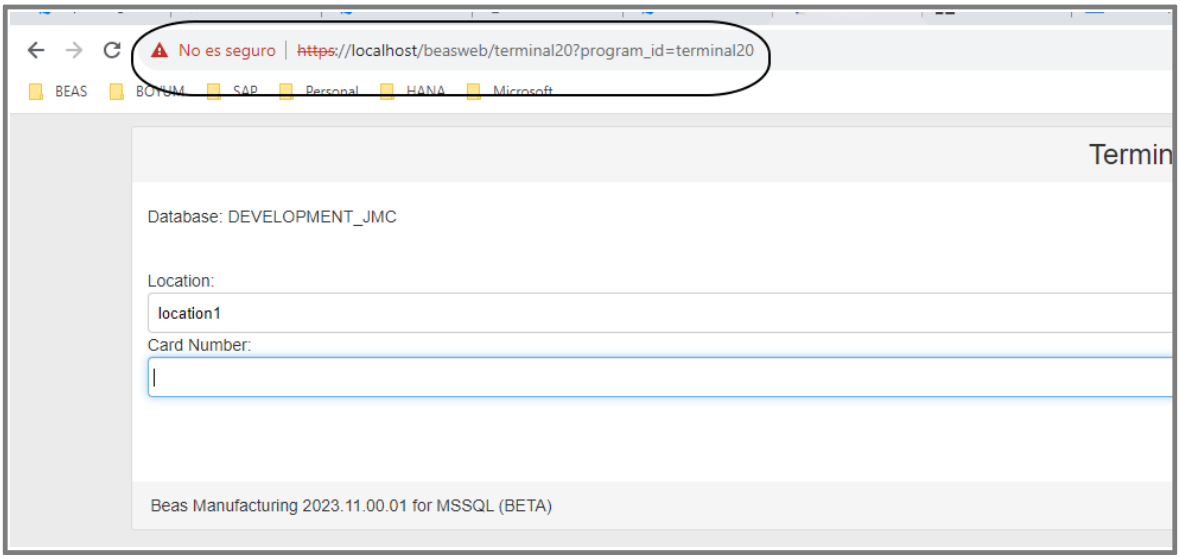
7. Start/Stop XAMPP to reload configuration.
8. Modify httpd-ssl.conf to add the rule in the system to redirect incoming requests from XAMPP to BeasWeb.
9. Add the following lines before the end of the file (port should be the port where Beas is running):

```
ProxyPass / http://localhost:8081/
ProxyPassReverse / http://localhost:8081/

</VirtualHost>
```

10. Start/Stop XAMPP to reload the modified configuration.
11. Load Beas via HTTPS, and everything should be operating properly:

© 2026 Boyum IT Solutions A/S



Continue configuration by generating certificates to make http secure.

OPTIONAL:

You we can also get the advantages of XAMPP to load some static information like icons from Beas in parallel mode.
To configure this you have to:

1. Modify variable "DocumentRoot" defined in file "httpd-ssl.conf" to determine the path where the system is going to load static resources. The Web server should have access to the defined folder.

```
DocumentRoot "c:/program files/beas software/beas/httpserver"
```

2. Add the ProxyPass lines to redirect the requests to the correct places:

```
ProxyPass "/beasweb/assets21" !
ProxyPassReverse "/beasweb/assets21" !
ProxyPass "/beasweb/static" !
ProxyPassReverse "/beasweb/static" !
```

3. Stop/Start XAMPP to reload the modified configuration.
4. Reload the Beas web page through HTTPS.

© 2026 Boyum IT Solutions A/S

3.4.2.6.2 Certificate generation for secure http

With the generation of certificates, you can make your http connection secure. Follow the steps below:

1. Install a program to generate certificates. You can use software from the github page: https://github.com/FiloSottile/mkcert/releases

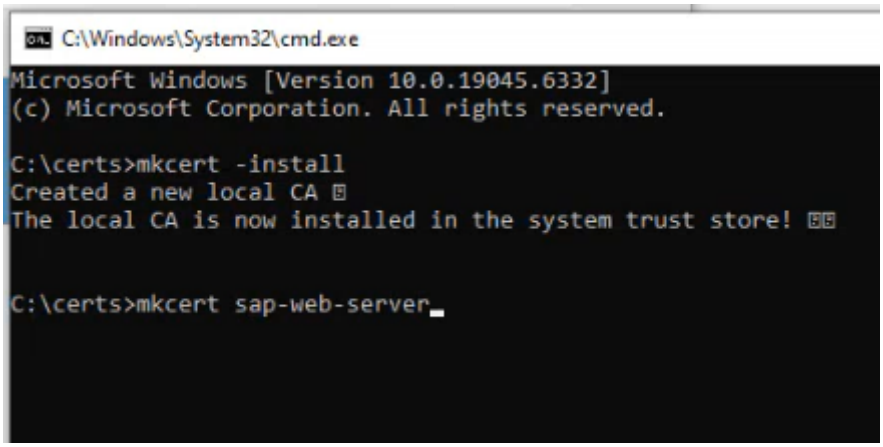
2. To execute certificates, create a folder in your computer named "certs" or similar.

3. Download the certificate file and rename it.

4. Execute the file in the Command prompt:

Insert "`mkcert - install`" command to generate the certs.

The system returns a message: "`Created new local CA`":

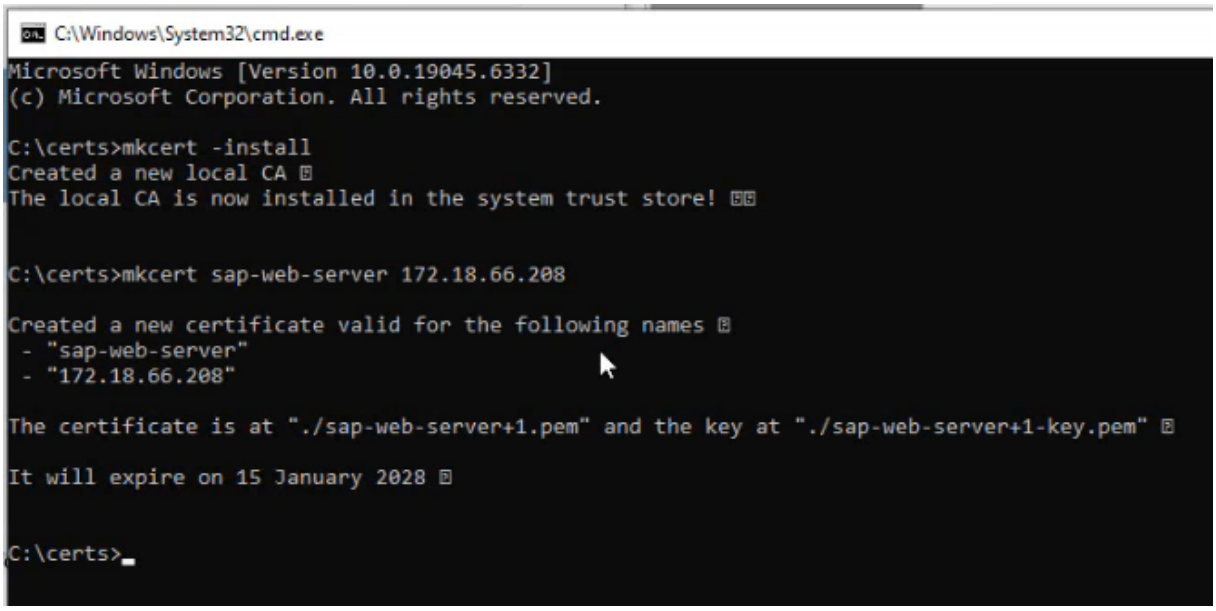


5. Copy the link or IP address and add it in the command prompt (***see*** image above).

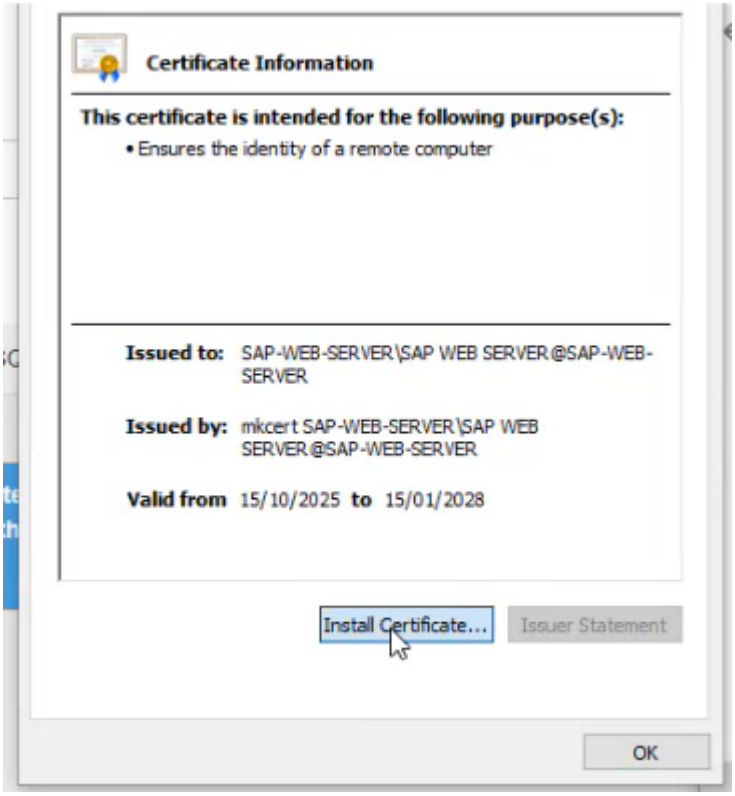
You can also generate more than one certificate by typing the links/IP addresses after each other.

The system then returns the message: "`Created a new certificate valid for the following names: XXX`" (***see*** image below):

© 2026 Boyum IT Solutions A/S



6. To install the certificates, change the extension of the file in the cert folder from ".pem" to ".crt", double-click the file, and click the "**Install Certificate...**" button in the opening Certificate window. The system displays the related certificate information. Then click "**Install Certificate...**" again:



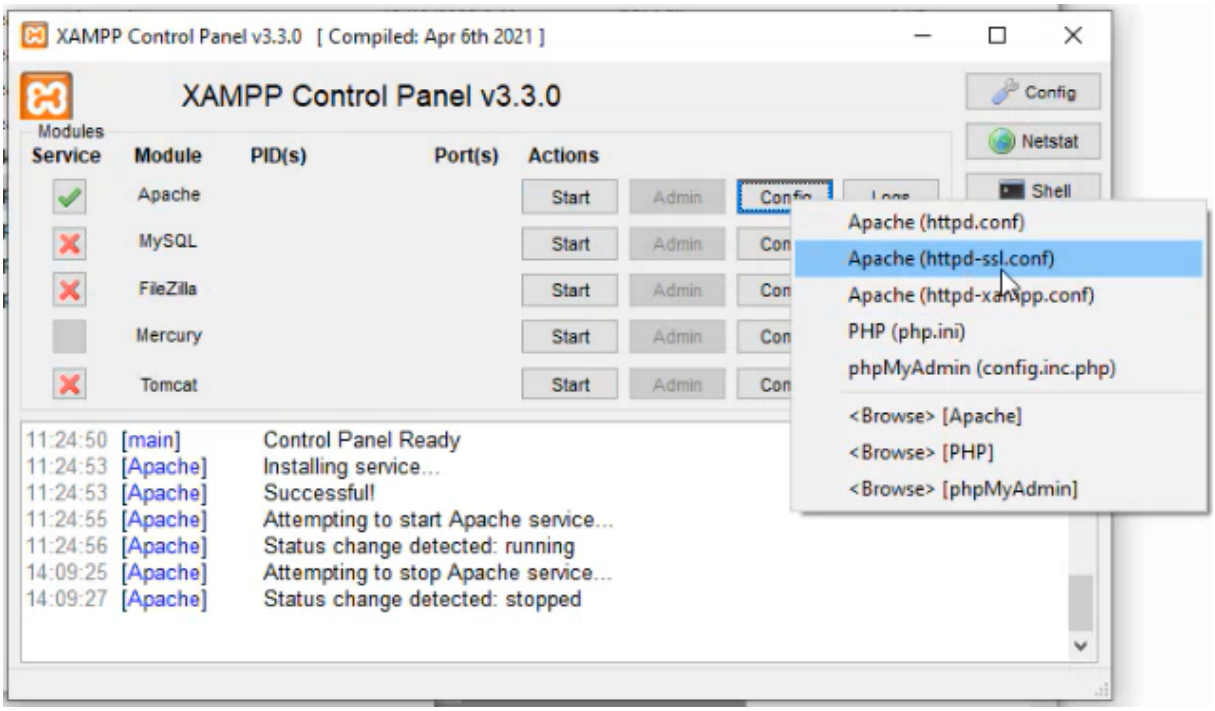
7. Select User, click **Next** and add the location to store the certificate: the "Trusted Root Certification Authorities" folder. This finishes installation.

© 2026 Boyum IT Solutions A/S

You can check if installation was successful in the "Manage user certificates" Windows Control panel option. Go to the "Trusted Root Certification Authorities" folder, and check it for certificates starting with "mkcert".

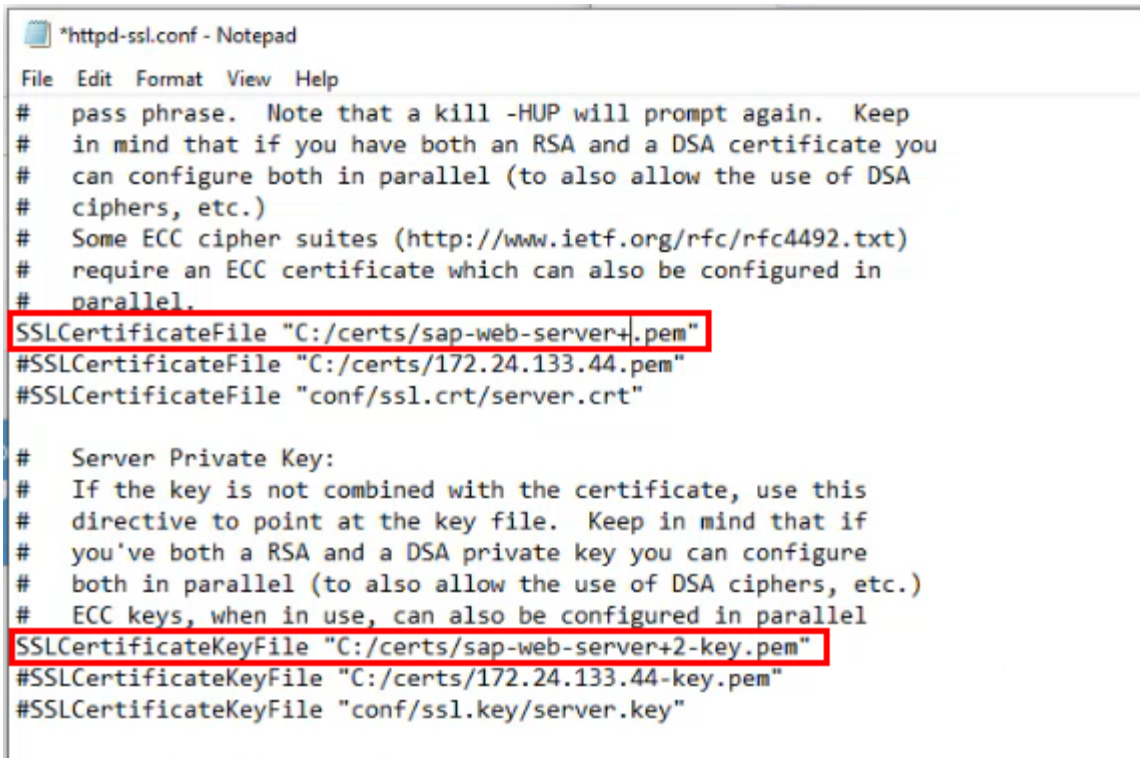
8. Rename the certificate file to the original ".pem" extension.

9. Go back to Apache configuration of http, and open the configured Virtual host:



10. Find the SSL certificate file and SSL Certificate keyfile, and place a **#** before the default ones there, and delete the **#** from before the ones you just generated:

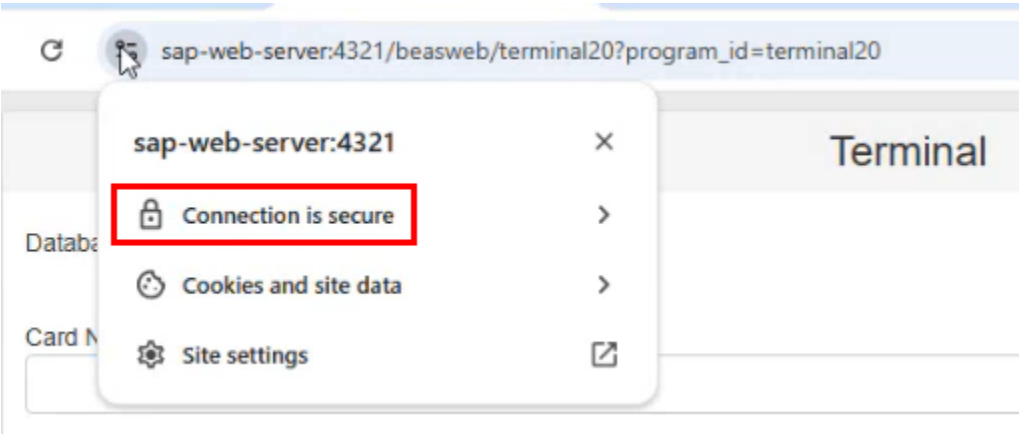
© 2026 Boyum IT Solutions A/S



11. Save the configuration.

12. Click **Start** in the XAMPP Control Panel, and open the web server with the current port number.

The result should be:



IMPORTANT: If Chrome was open during configuration, close and reopen it.

Note: When updating the .mtar files, provide the https link in the "Beas Web Url ..." field.

See

Internal HTTP server

HTTPS configuration for Beas

© 2026 Boyum IT Solutions A/S

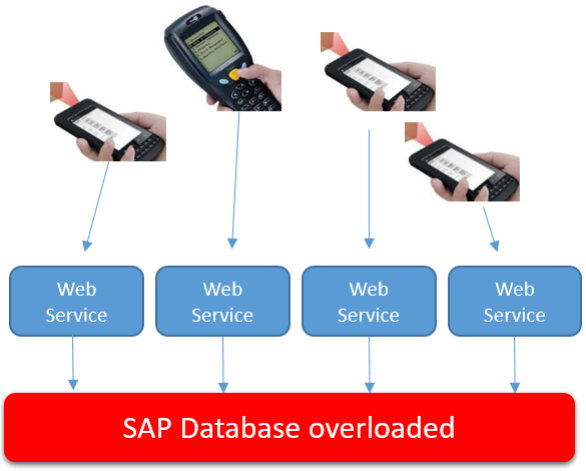
3.4.2.7 beas common service

The functionality of Beas Common Service

- print asynchronously (Example WEB Application)
- create all SAP transactions asynchronously (Example WEB Application)
- simple interface to third applications.

The concept of asynchronous operation

If lots of clients are working in **parallel** with the SAP Transaction on one SAP Table, it does not work because SAP must lock the database for every transaction.
This working tends to get unstable causing long waiting time for clients.

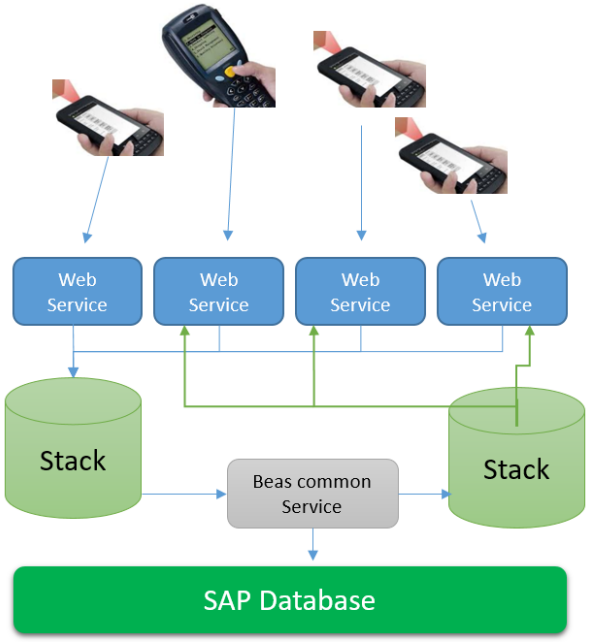


In the Beas common service work is carried out with a stack. Every service sends the transaction command in this stack.
The Beas common service executes this in SERIAL and not PARALLEL.

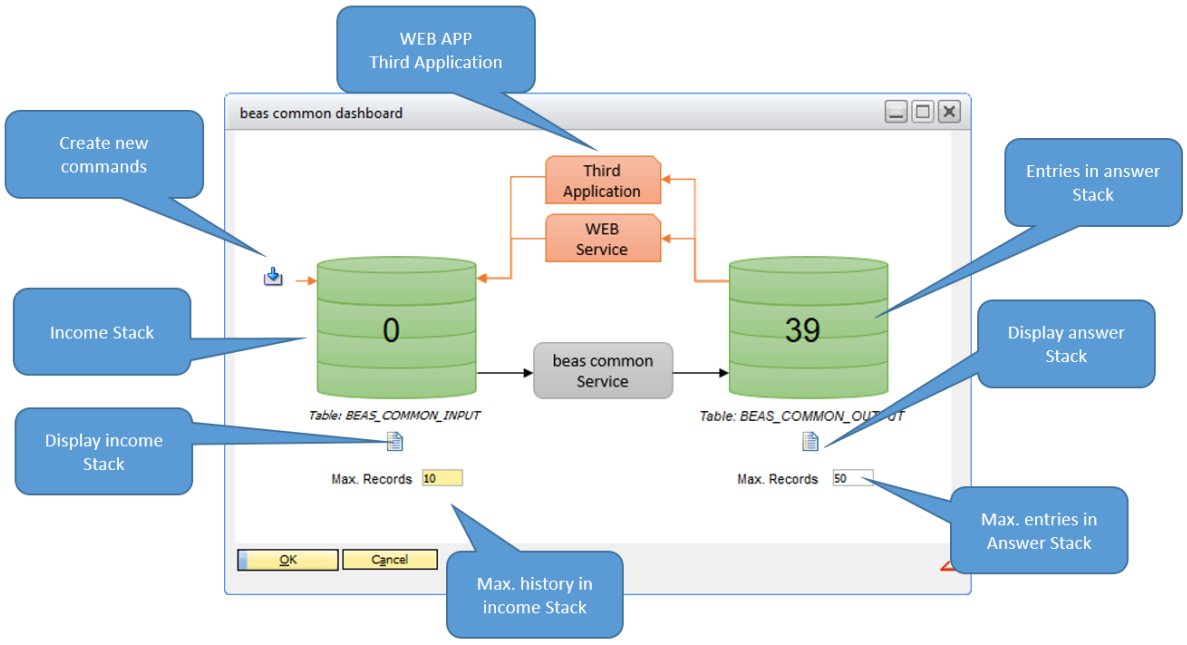
This does not create deadlocks or an overload of the database and results in stable execution.
The worker does not need to wait for a response and can continue since the web service does not execute the transaction itself.

The Beas common service sends the answer (good, docentry number, error message etc.) in an answer stack.
The client can check if an answer is available at any moment, and can display it in the window (= synchronous working).

© 2026 Boyum IT Solutions A/S

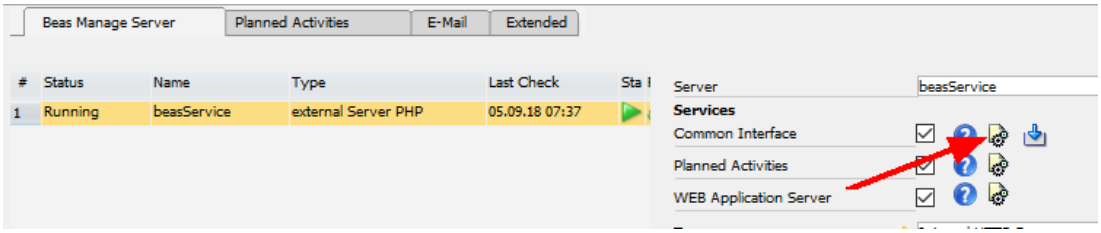


In Beas you can see the current stack in the Beas common dashboard.



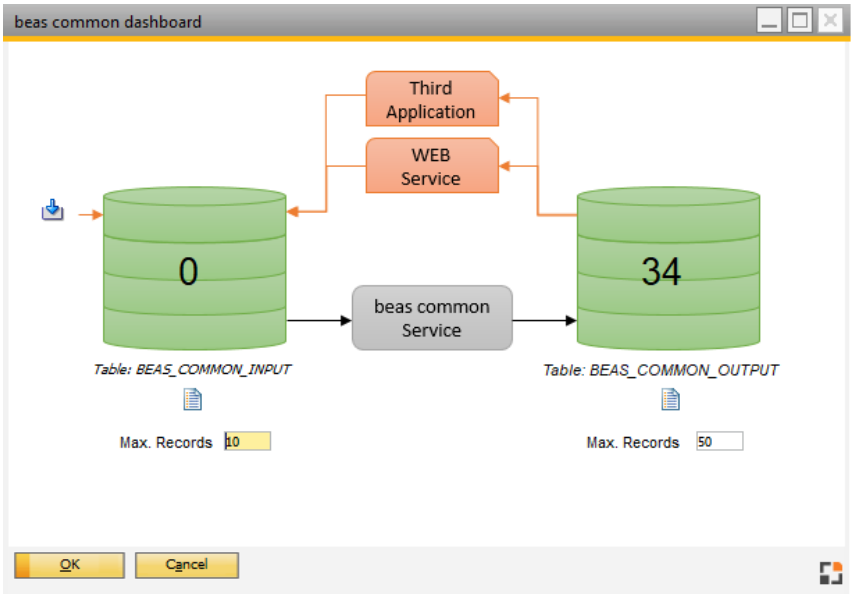
To open the Beas common dashboard from Beas manage server, click on the configuration Icon ***see*** image below.

© 2026 Boyum IT Solutions A/S



3.4.2.7.1 beas common interface

With the Beas common interface every third application with every language can connect to Beas. The interface itself is the current database and 2 tables.



Window syste_common_dashboard.psr

Table BEAS_COMMON_INPUT

In this table you can write your command to execute

If you define a request id, beas will write an answer in BEAS_COMMON_OUTPUT

Priority: Time critical functions may be granted higher priority. The beas common service always executes stack records with high priority first.

Details

Structure of the table

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>COUNTID</td><td>Serial number – automatically generated (Type int identity) and it is not to be added

*In HANA version this field is NOT identity and therefore this field has to be filled, as well.
This query can be executed to return next CountID value:

<code>select coalesce(max("COUNTID"),0) + 1 from "BEAS_COMMON_INPUT"</code></td></tr>
<tr><td>COMMONTYP</td><td>Define command for
<table>
<tr><th>Command</th><th>Description</th></tr>
<tr><td>script</td><td>Execute BeasScript</td></tr>
<tr><td>json</td><td>Post BSL command "Parameter1" with Body "TEXT PARAMETER"
See Beas service layer with Beas common service</td></tr>
<tr><td>print</td><td>Print document</td></tr>
</table></td></tr>
<tr><td>PARAMETER1</td><td>post command, if COMMONTYP = json
example Issue, Receipt, Transfer ...</td></tr>
<tr><td>LOCALCOMMAND</td><td>0 = command to Server, 1 = command to the client "stationid". This parameter is optional. Normally it is not necessary</td></tr>
<tr><td>PARAMETER2 ...9</td><td>related to commontyp</td></tr>
<tr><td>TEXTPARAMETER</td><td>beas script or json string

if you work with json, insert only the json string, example</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description

	{
	"DocumentLines": [
	{"ItemCode": "po_baetman",
	"WhsCode":"01",
	"BatchNumbers":[
	{"DistNumber":"BT-014","Quantity":2 },
	{"DistNumber":"BT-015","Quantity":5}
	]
	}
	]
	}
	More see beas service layer documentation

DATEPARM1..2, DECIMALPARM1..2 DocNum, LINENUMBER, LINENUMBER2	Not supported
STATIONID	Station ID on which the script must be executed.
REQUESTID	A unique request ID. If available, Beas creates an answer in BEAS_COMMON_OUTPUT with the same requestid
CLOSED	Status of this record 0 = new command, 1 = the command was executed Attention After some minutes beas will delete the line, if this is a closed line
UDF1...UDF4	Not supported in the future.
PERS_ID	Executed by Personnel Entry ...
PRIOR	Priority 0=normal, 2=high
PROGRAM_ID	WEB APP Program ID
WINDOWNAME	WEB APP App ID
SESSION_ID	WEB APP Session
LOCATION_ID	WEB APP Location ID
TimeLife	Time Life of this record.

© 2026 Boyum IT Solutions A/S

Field	Description
STATIONNAME	Name of station, which sent this command.

Bidirectional working: Table BEAS_COMMON_OUTPUT

In this table you can read the answer from beas common service

If you defined a request id, you can read the answer which is marked with same Request id

Details

Strucuture of the table BEAS_COMMON_OUTPUT

Field	Description
COUNTID	Serial number – automatically generated (Type int identity) and it is not to be added *In HANA version this field is NOT identity and therefore this field has to be filled, as well. This query can be executed to return next CountID value: `select coalesce(max("COUNDID"),0) + 1 from "BEAS_COMMON_INPUT"`
COMMONTYP	Command type – depending on the executed command
ANSWERTYP (int)	Answer as number
ANSWERTEXT	Answer as text
PARAMETER1	Additional Return Value, for example docentry number
STATIONID	Response comes from Station "XY"
REQUERSTID	If the REQUESTID defined in BEAS_COMMON_INPUT the system generate an entry after executing in BEAS_COMMON_OUTPUT with same REQEUSTID Use this for bidirectional communication In BeasScript you can read the RequestId in field is_requestid
CLOSED	0 = unreaded, 1 = answered

© 2026 Boyum IT Solutions A/S

Field	Description
	Attention: If the application reads the answer it must set the flag to 1 or must delete the entry

Execute own Scripts

It is possible to execute every BeasScript. Functions not possible are
"open window"
"questions"
"messageboxes"
and any other functions related to user interface as it is a service

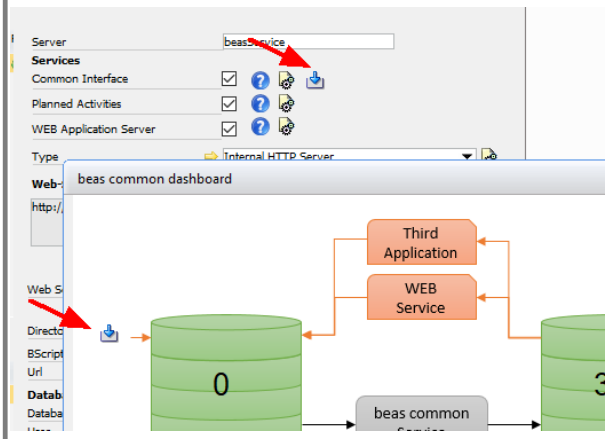
Only the following line can be inserted in the program:

```
insert into BEAS_COMMON_INPUT (commontyp,textparameter) values ('script','[[the beas script]]')
```

To receive an answer, the answers must be defined in the script. ***See*** Beas common reference – Script
The field BEAS_COMMON_INPUT.REQUESTID must also be filled with an unique value (for example time stamp with milliseconds)

For testing and creating C# Core it is possible to use the Beas common service test window.

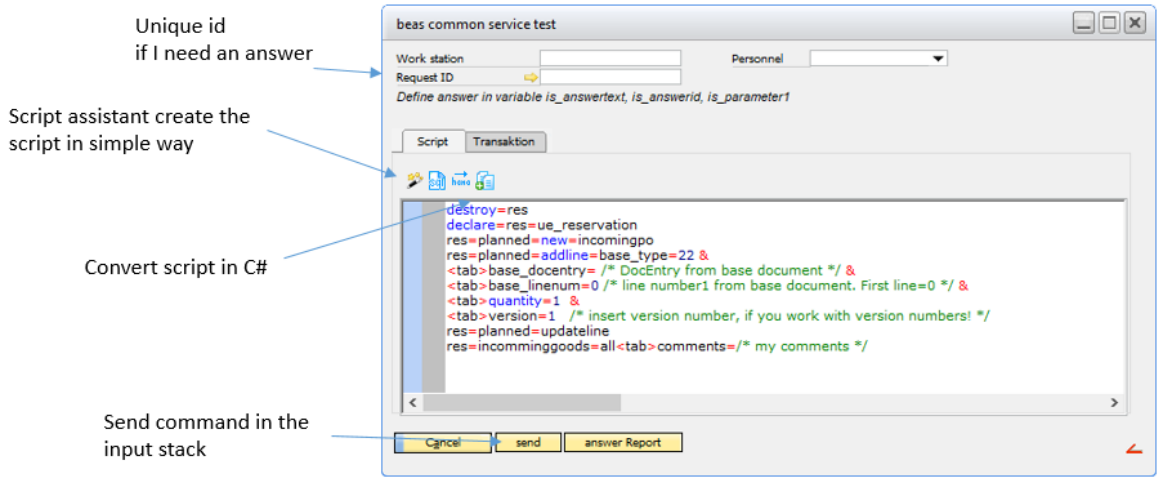
You can test this function with the Beas common test window.
you can open this in Beas manage server – click on marked icon or
Beas common dashboard – marked icon



© 2026 Boyum IT Solutions A/S

This icon opens the Beas common service test.

With the script assistant it is possible to create lot of different scripts, e.g. create work order, create time receipt.



With "Convert script in C#" it is possible to create the SQL Statement for a C# application or other.

Insert this script in the application and replace the place holder:

```
String sql = "insert into \"BEAS_COMMON_INPUT\"";
  sql += "(\"COMMONTYP\", \"PARAMETER1\", \"TEXTPARAMETER\") values('script', '',\r\n";
  sql +="destroy=res\r\n";
  sql += "declare=res=ue_reservation\r\n";
  sql += "res=planned=new=incomingpo\r\n";
  sql += "res=planned=addline=base_type=22 &\r\n";
  sql += "<tab>base_docentry= /* DocEntry from base document */ &\r\n";
  sql += "<tab>base_linenum=0 /* line number1 from base document. First line=0 */ &\r\n";
  sql += "<tab>quantity=1  &\r\n";
  sql += "<tab>version=1   /* insert version number, if you work with version numbers! */\r\n";
  sql += "res=planned=updateline\r\n";
  sql += "res=incomminggoods=all<tab>comments=/* my comments */\r\n";
  sql += " )";

SqlCommand command = new SqlCommand (sql,connection);
command.ExecuteNonQuery();
```

- Print Service

© 2026 Boyum IT Solutions A/S

Special web app use the common service for printing documents.

Field	ODATA Name	Description
COUNTID	PrintRequest	Serial number – automatically generated (Type int identity) and it is not to be added *In HANA version this field is NOT identity and therefore this field has to be filled, as well. This query can be executed to return next CountID value: `select coalesce(max("COUNTID"),0) + 1 from "BEAS_COMMON_INPUT"`
COMMONTYP		Print
PARAMETER1	ReportName	Crystal: Report Name
PARAMETER2	Title	Title of this Job
PARAMETER3	PrintType	Print Type `Crystal,RTF,Script`
PARAMETER4	NumberOfCopies	Number of copies as Number. Empty=1. Only Crystal Print
PARAMETER8	Parameter	Print Variables in json format `{"Variable":"value",...}` max. 1024 chars or Crystal Report Definitions with "`crreport=x=y`" or `"NumberOfCopies"=x`
PARAMETER9	Text	RTF Text
TEXTPARAMETER	PreScript	beas script, which executing before printing starting
LOCATION_ID	LocationId	Define this, if you want to use Driver / Printer from this location

© 2026 Boyum IT Solutions A/S

Field	ODATA Name	Description
PROGRAM_ID	ProgramId	Define Program_id and windowname, if you want use default settings from this app
WINDOWNAME	AppId	

3.4.2.7.1.1 beas common reference

List of available commands (commontyp)

Depending on the commontyp other parameters must be set.
For example: in commontyp "script" the executed script is deposited in the parameter `textparameter`. Other fields are not required.

commontyp	Description

script	Execute BeasScript
	Any script is executable with this command.
	
	Example MSSQL:
	`insert into BEAS_COMMON_INPUT (commontyp,textparameter) values ('script','script line 1'+CHAR(13)+CHAR(10)+'script line 2')`
	
	Example HANA:
	select coalesce(max("COUNTID"),0) +1 into :ll_countid from "BEAS_COMMON_INPUT"
	`insert into "BEAS_COMMON_INPUT" ("COUNTID","COMMONTYP","TEXTPARAMETER") values (<ll_countid>,'script','script line 1'||CHAR(13)|| CHAR(10)||'script line 2')`
	
	The following values must be added in beas_common_input:

Field	Description
commontyp	"script"
textparameter	Executed script Note: commands messagebox and question are not executed in server mode!

© 2026 Boyum IT Solutions A/S

The following variables can be added:

Variable	Description
is_requestid	Reply to this ID (is preallocated) - Only readable variable You set this with the insert command `insert into "BEAS_COMMON_INPUT" ("COUNTID","REQUESTID","COMMONTYP","TEXTPARAMETER") values (<nextNumber>,<requestId>,'script','script line 1'||CHAR(13)||CHAR(10)||'script line 2')` In this way you become an answer in BEAS_COMMON_OUTPIT with the requestid defined in `<requestId>` and variable **is_requestid** is defined with this value
is_stationid	Reply to this station-ID, which is defined in BEAS_COMMON_INPUT.StationId
is_answerid	Answer ID (only numbers) If empty, no answer to beas_common_output
is_answertext	Answer text will only be added if is_answerid was set
is_commontyp	The commontyp to be added to the beas_common_output
is_parameter1	The parameter1 to be added to the beas_common_output

Example:

```
insert into BEAS_COMMON_INPUT (COMMONTYP,REQUESTID,TEXTPARAMETER)
values ('script',1234,

-- Clear errortext variable
'setglobal=errortext='+char(13)+char(10)+

-- Execute custom script
'protocol=error<tab>area=BCI<tab>info=<today,yyyymmdd>_<now,hhmmss
>'+char(13)+char(10)+

-- Define default values for answerid and answertext
```

© 2026 Boyum IT Solutions A/S

```
'setvar=is_answerid=0'+char(13)+char(10)+
'setvar=is_answertext=Script successfully executed '+char(13)
+char(10)+

-- Write errormessage to field answertext in case of error
'if <global:errortext> <>  then'+char(13)+char(10)+
' setvar=is_answerid=1'+char(13)+char(10)+
' setvar=is_answertext=<global:errortext>'+char(13)+char(10)+
'end if
```

post

Send a JSON Post Command

Current possible:

```
Receipt
Issue
Transfer
PurchaseDelivery
```

See Beas service layer with beas common service

Example

Type: Receipt

```
{
"DocumentLines": [
  {"ItemCode": "RM_B",
   "WhsCode":"01",
   "BatchNumbers":[
       {"DistNumber":"BT-014","Quantity":2 },
       {"DistNumber":"BT-015","Quantity":5}
           ]
   }
   ]
}
```

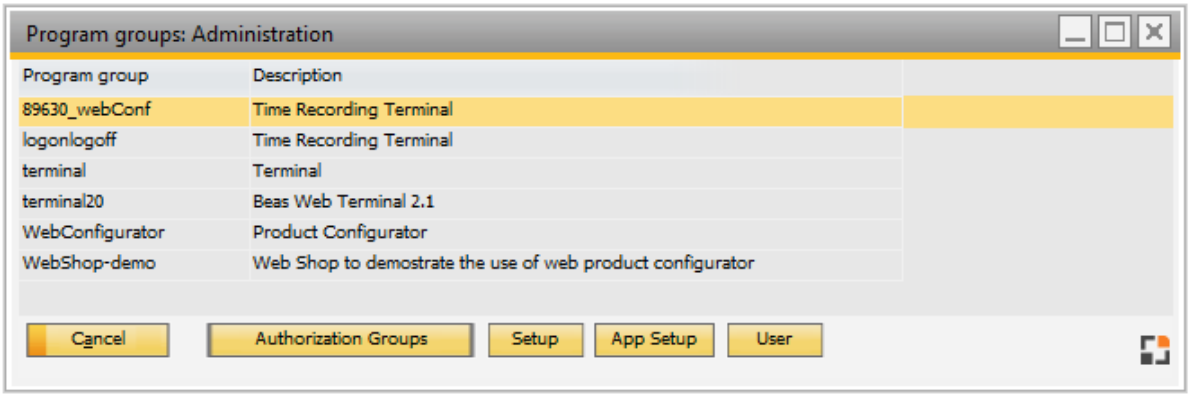
3.4.3 Program group Administration

PATH: Administration > Utilities > Program groups Administration.

List of all installed WEB Services.

An account needs to be set up, for each user as an employee only sees the features that had been released and set up for them in their language.

© 2026 Boyum IT Solutions A/S



Window webprogram_user_browse.psr

The following program groups are delivered by default:

Program group	Meaning
Terminal	All Standard App functions for WEB APP and Desktop solutions for Attendance recording, factory data capture, Material management, Quality control etc. This program group will be installed and updated automatically at a program update. Call: IP-address:port/terminal10 ***Example***: http://192.168.178.64:8080/beasweb/terminal10 ***See*** Terminal Apps Catalog
Terminal20	New web terminal. This group is to replace the "old" Terminal in the future and is only compatible with internal HTTP Service.

© 2026 Boyum IT Solutions A/S

	 Call: IP-address:port/terminal20 ***Example***: http://192.168.178.64:8080/beasweb/terminal20
Web Product Configurator	Opens a WEB shop Example together with the Product Configurator Call: IP-address:port/terminal10 ***Example***: http://192.168.178.64:8080/beasweb/WebConfigurator

© 2026 Boyum IT Solutions A/S

Here all program groups (Terminal, WEB, Client) are managed. These can contain several applications.

Column	Meaning
Program group	ID of the program group. It can contain different apps.
Description	Description.
Visible	Functional group of apps (warehouse / production / attendance.
Connection	Currently installed version.
None Update	Check mark to block automatic update.

Functions descriptions

Functions	Meaning
Authorization Groups	Opens the Authorization Groups window.
Setup	Opens the Configuration wizard settings for selected entry: Desktop/Web terminals or the Web Product Configurator.
App Setup	Opens the Apps Administration window.
Development	Opens Apps development.
Import	Import Apps via file explorer.

See

Utility programs

Terminal Apps catalog

Personnel – Master data – Terminal Functions

back to utility programs

3.4.3.1 Authorizations groups

PATH: Administration > Utilities > Program groups Administration > select "terminal" > click "Authorization Groups" button.

Window is also available from the right-click menu.

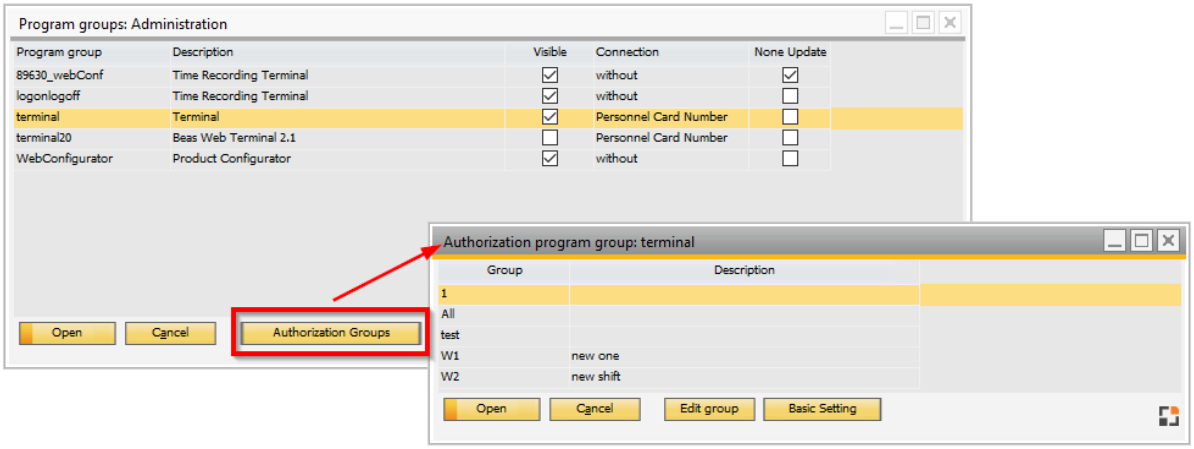
In Authorization groups you can define which menu items (apps) are available.

Authorization groups can be defined separately for every Program group.

Attention: Define all settings for "Terminal20" inside "Terminal".

© 2026 Boyum IT Solutions A/S

If an authorization group was defined for the program group "Terminal", you need to store it in Personnel master.



Window menu_group_browse.psr

Functions

Field	Meaning
Open	Open authorization group to assign available apps.
Cancel	Close the window.
Add	Create a new authorization group.
Remove	Delete selected authorization group.
Authorization Groups	Open an administration window to change authorization.

See

Program group

Personnel master

Terminal

Program group Terminal

back to Program group Administration

3.4.3.1.1 Authorization groups: assign apps

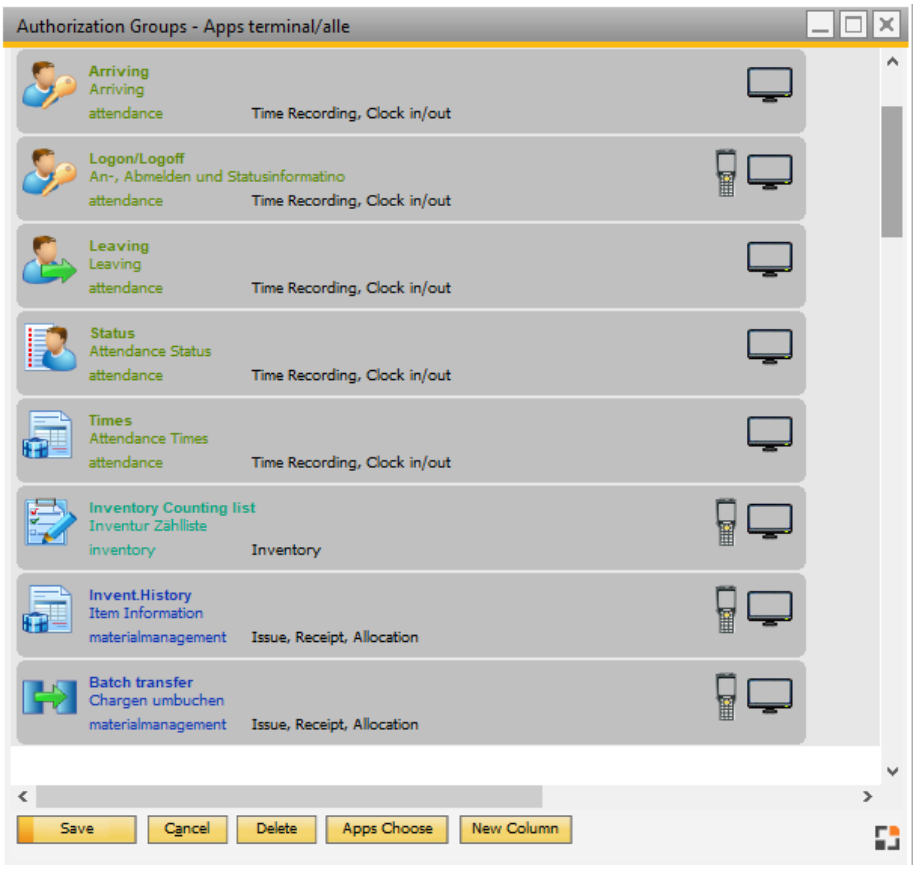
PATH: Administration > Utilities > Program groups Administration >

1. Right-click on "terminal" >
2. Select "Authorization Groups" >
3. **Open** selected group.

© 2026 Boyum IT Solutions A/S

Window is also available from the right-click menu.

In this window, the currently assigned apps are displayed for the selected authorization group. Each app has a description, a color and a symbol, indicating its use.



Window menu_ entry_ to.psr

Field	Example
Designation – related area	Logon / Logoff – relates to attendance
Color	Green: Apps for attendance Red: Apps for manufacturing Blue: Apps for inventory management
Symbol left	Symbol of the App (character with key)
Symbol right	Indicator, whether the app is available for terminal (monitor) or for WEB (mobile)

Buttons below

© 2026 Boyum IT Solutions A/S

Name	Example
Save	The selection of apps is saved for this authorizations group.
Cancel	Screen is closed without saving.
Delete	App is deleted from group.
Apps Choose	Window is opened with all available apps. Select, (multiple selection with CTRL possible, then click on "apply") .
New Column	On the cursor's position an empty field is entered. From there, apps in terminal are displayed in a new column. With drag&drop, the order of display can also be changed.

back to Authorizations groups

3.4.3.1.2 Apps basic settings

There are basic settings for certain applications, for example the terminal.

PATH: Human Resources > Master data > Terminal Functions > select an entry > "**Basic Setting**" button.

The button opens the Terminal and WEB APP section of the Configuration wizard:
In this section you can configure settings for the Desktop Terminal and WebApps 2.1.

PATH: Administration > System Initialization > Configuration wizard.

Authorization Groups: The **Details** button opens the Administration terminal window.

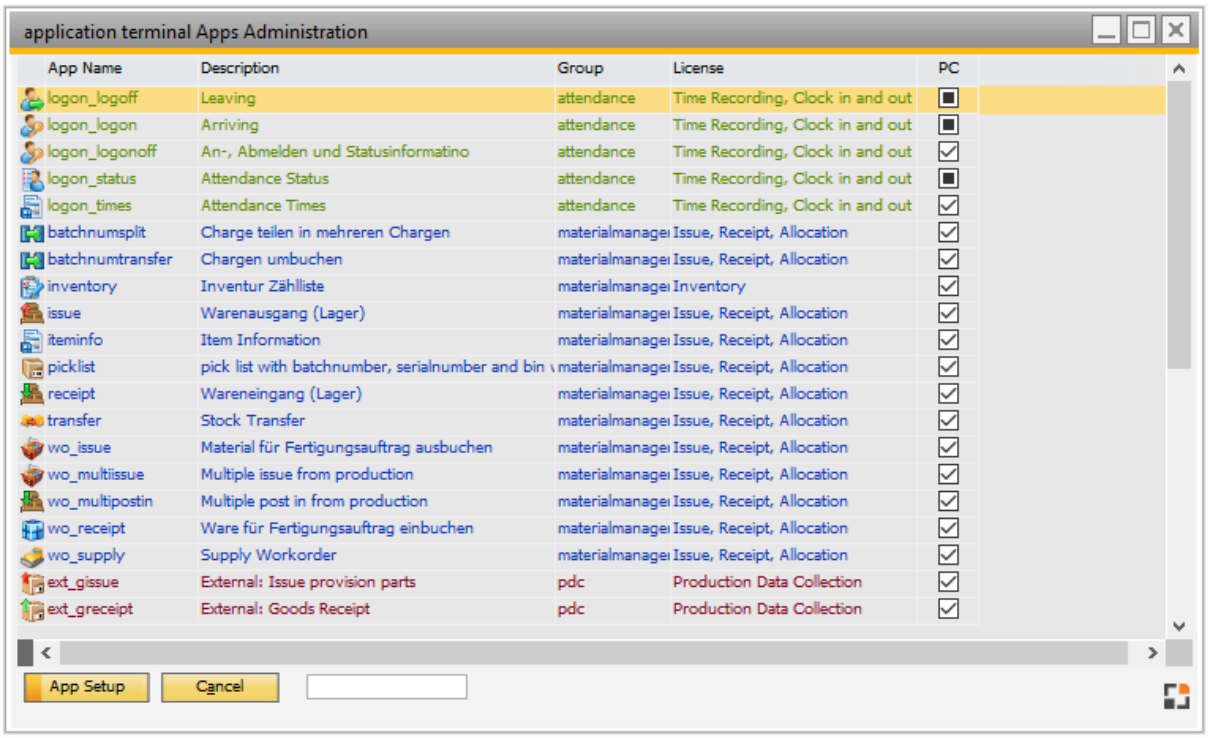
3.4.3.2 Apps administration

PATH: Administration > Utilities > Program groups Administration > select "terminal" > click **Setup** button.

Window is also available from the right-click menu.

This window provides an overview on all available apps:

© 2026 Boyum IT Solutions A/S



Window webwindow_user_browse.psr

Column	Meaning
App Name	ID of the app.
Description	Description.
Group	Functional group of the apps (Inventory/Production/Attendance).
App version	Currently installed version .
Available	Available Version.
WEB	check mark, if app available for WEB.
PC	check mark if app available for Terminal.
License	Displays the relevant License for the app in the line. E.g. "logon_status" app has a "Time Recording, Clock in and out" License.
None update	Select if no automatic update is desired.

Functions

Function	Description
Cancel	Close window.

© 2026 Boyum IT Solutions A/S

Function	Description
App Setup	Opens the extended App settings window
Reload Apps	Reload all apps in the list.
Import Cloud	Import file from the Cloud. The button opens a dialog box to provide the file name.
Copy	Copy text to clipboard.

Select App and double-click – the same function as button "App Setup".

back to Program group Administration

3.4.3.2.1 App Setup - extended

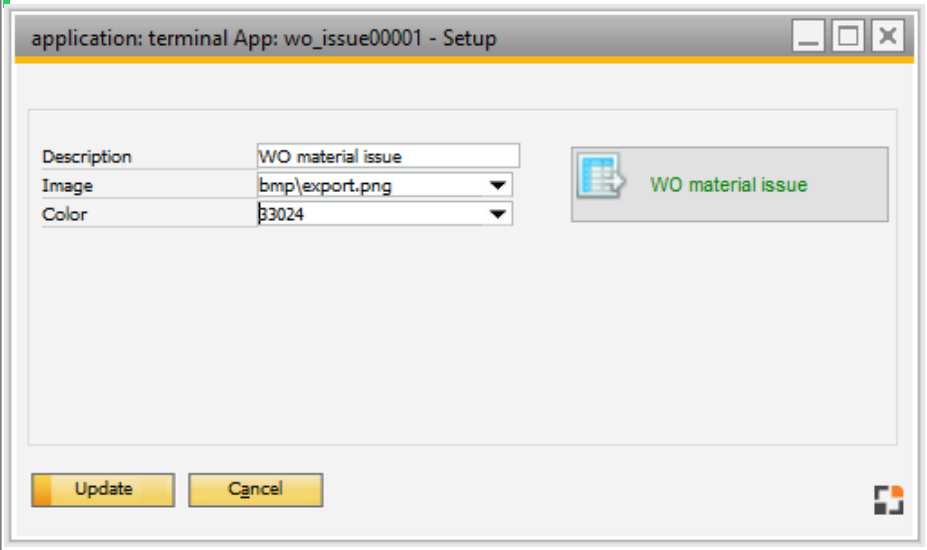
In this window you can perform additional settings for the individual apps of a program group.

PATH: Administration > Utilities > Program groups Administration > select a program group > click **App Setup** button.

Desktop Terminal apps setup

Set the following parameters for how the apps should be displayed in the list:

PATH: Administration > Utilities > Program groups Administration > select "terminal" > click Setup button.



Window webwindow_user_setup.psr

Description: Enter a description to appear in the list for this app.
Image: Select an icon to appear in the list for this app.

© 2026 Boyum IT Solutions A/S

Color: Configure a color that displays the text for this app in the list.
When the definition is empty, the preview on the right reads "none".

- Web Terminal 2.1 apps setup

PATH: Administration > Utilities > Program groups Administration > select "terminal20" > click **Setup** button.

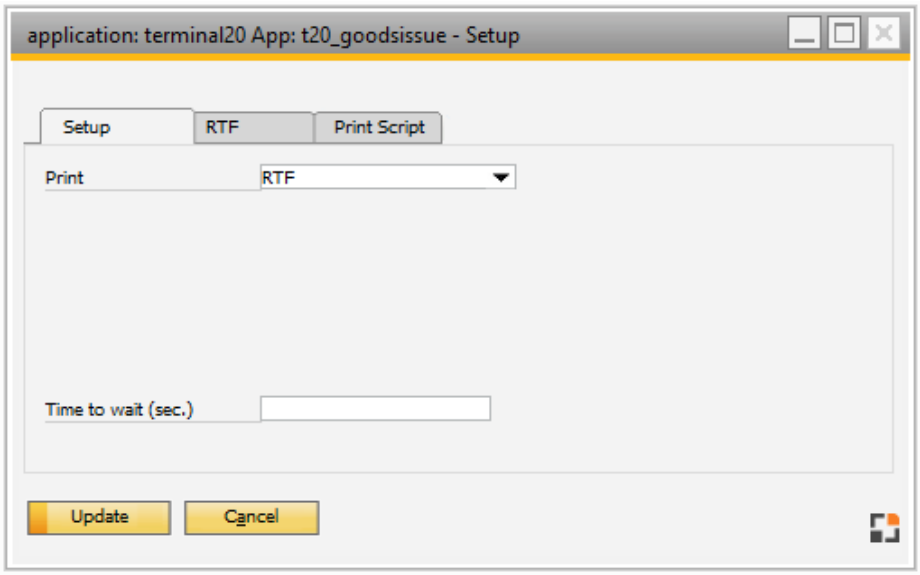
- In certain WebApps setup, you can select from more printing formats:

Print extended settings

PATH: Administration > System Initialization > Configuration wizard > Terminal and WEB APP > Beas Web Terminal 2.1 > "App Setup".

-Crystal reports: Uses Beas Crystal reports
-RTF: Prints in RTF-Format
-Automatic: Uses the Beas printing format

If you select Crystal / RTF, more tabs appear:



Window webwindow_user_setup.psr

RTF: Enter formatted text

Print Script: A script scan be stored, which is called before printing. Set parameters:
`shtml=print=set=[variable name]=[variable value]`

See detailed description of these options and other setting in the WebApps 2.1 help chapter Print Solution.

© 2026 Boyum IT Solutions A/S

For additional settings available in this window for each WebApp, ***see*** individual WebApp 2.1 app descriptions.

- Web Product Configurator apps - print settings:

PATH: Administration > Utilities > Program groups Administration > select "WebConfigurator" > click **Setup** button.

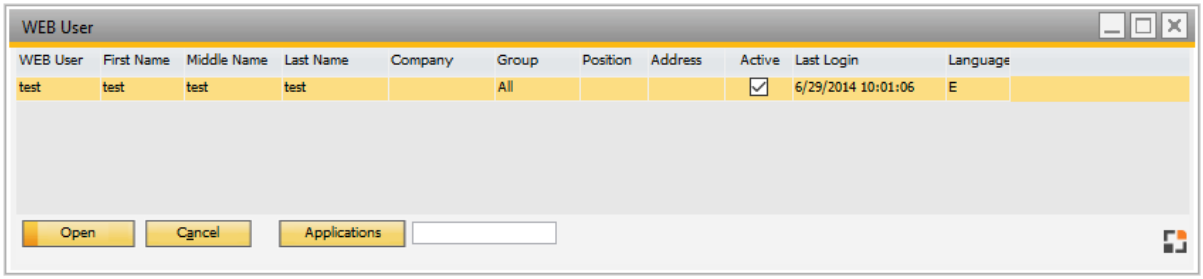
Select print settings for the Web Product Configurator.

back to Apps administration

3.4.3.3 WEB User

This window contains a list of all registered WEB users.

PATH: Administration > Utilities > Program groups Administration > Click **User** button



Window webuser_browse.psr

Columns

Field	Meaning
WEB User	User ID
First name	First name
Second first name	Second first name
Last Name	Last Name
Company	Define the name of the WEB user's company
Group	Assign user to a group (All) for the WEB User
Position	Position of the WEB User at the company
Address	Define address of the WEB User
Active	Check mark if user is active
Last login	Date of last login
Language	Language in which APP-menu is displayed for this employee

© 2026 Boyum IT Solutions A/S

Functions

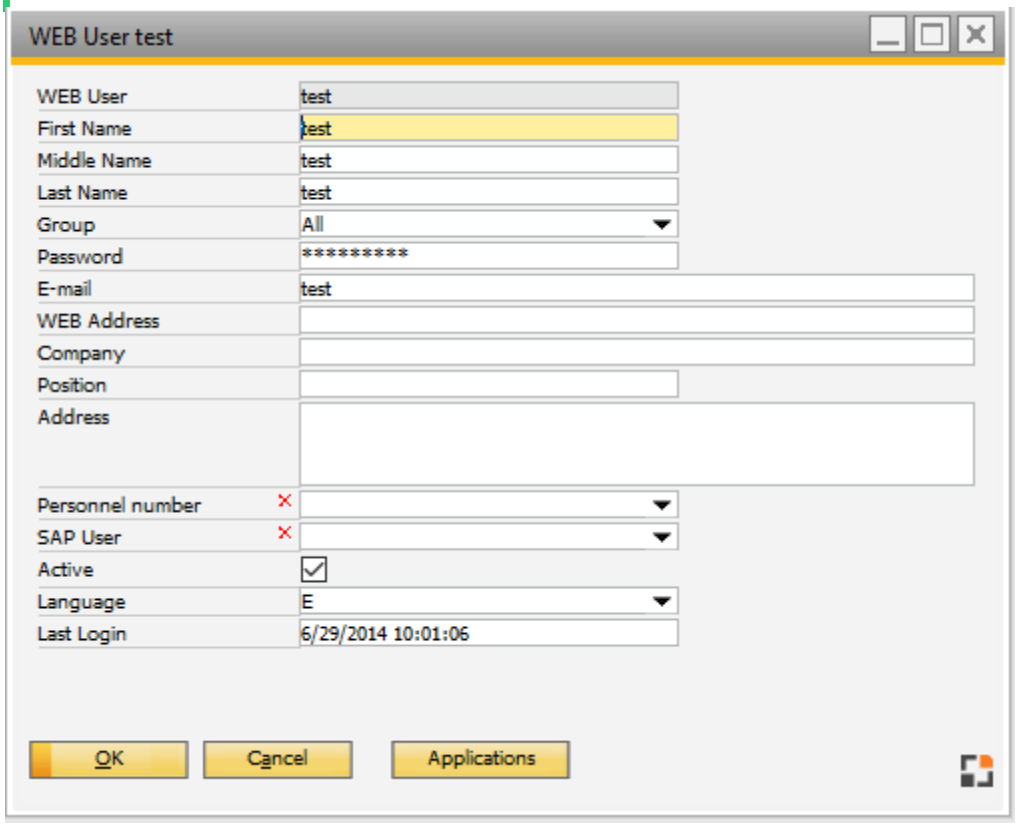
Function	Meaning
Open	Edit settings for selected Web user.
Add	Create new user.
Remove	Delete user.
Applications	Open list of assigned apps.

back to Program group Administration

3.4.3.3.1 Edit Web users

Editing screen for selected WEB users. Fields with red background are mandatory.

PATH: Administration > Utilities > Program groups Administration > Click **User** button > Click **Open/Add**



Window webuser_edit.psr

Field	Meaning

© 2026 Boyum IT Solutions A/S

Password	Password of WEB-user.
E-mail	Define the E-mail address of the WEB user.
WEB Address	Define the WEB address of the WEB user.
Personnel number	Select employee number from the drop-down menu.
SAP User	Select SAP Business One-user from drop-down menu.

For other field descriptions ***see*** WEB users

back to WEB users

3.4.4 Data Protection Tools

Personal Data Management (Beas)

3.4.4.1 Personal Data Management (beas)

In Beas personal data is stored which cannot be output via SAP Business One. For this reason, the SAP Business One - data must be synchronized with Beas and an additional report is available.

In this window you can

Synchronize personal data protection with SAP Business One
Output reports for personal data stored in Beas
See GDPR Notes

Requirements:
Required authorization: System rights
Employee entries in SAP Business One must be synchronized with employee entries in Beas. If necessary, check the database and whether synchronization has taken place.

Synchronization
In SAP Business One business partners and employees can be defined as "natural persons".
This is done under **Data Protection Tools > Personal Data Management > Assistant**

These entries are marked as "natural person" in the master data (personnel, business partner).

Natural persons can be "cleaned up" in the same assistant.

© 2026 Boyum IT Solutions A/S

The master data entry is marked with the status "deleted" and the personal data (name, address, etc.) is replaced with an asterisk "*".

Also, in all other tables, all personal data for the selected natural person are replaced with an asterisk.
This is done in all tables and fields defined under "Management of personal data".

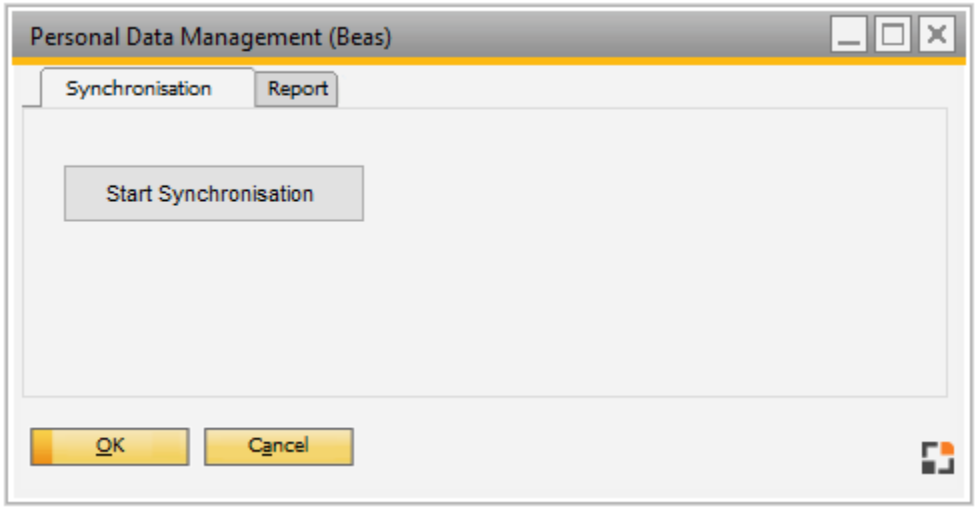
However, no Beas - tables and table columns can be selected here.

Therefore, synchronization is provided for this purpose. This replaces all personal data (name, address) with an asterisk of all personnel and business partners who have the status "deleted".

Process:

1. Cleanup of personal data using SAP Business One assistant
2. Beas – Management of personal data - "**Start Synchronization**" button.

PATH: Administration > Utilities > Personal Data Management (Beas)



Window personal_data_management.psr

Report

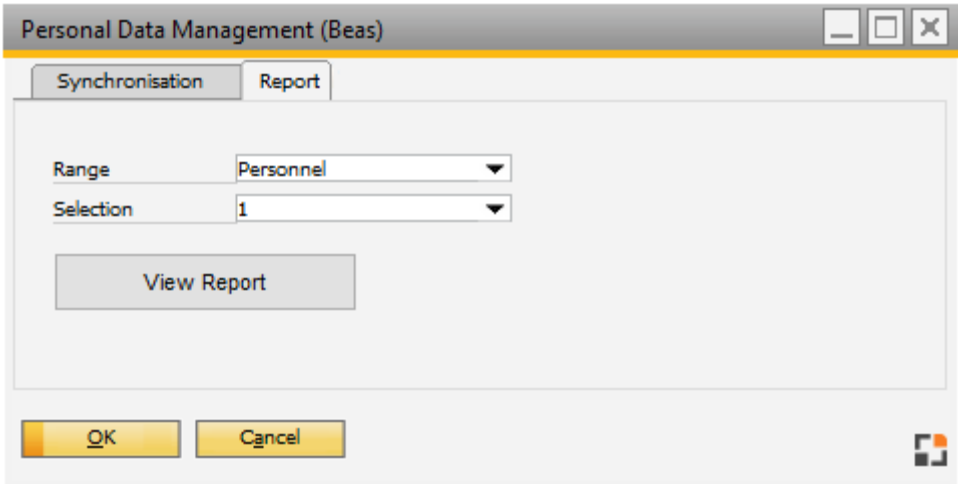
Beas can generate a report about the stored personal data.
This is an additional report for the report that can be created in SAP Business One

Proceed as follows:

Create and print personal report in SAP Business One
in Beas print the personal report

© 2026 Boyum IT Solutions A/S

In Beas, the name is only stored in a few areas and the address is also stored in the production order. All addresses and names stored in different ways are output.

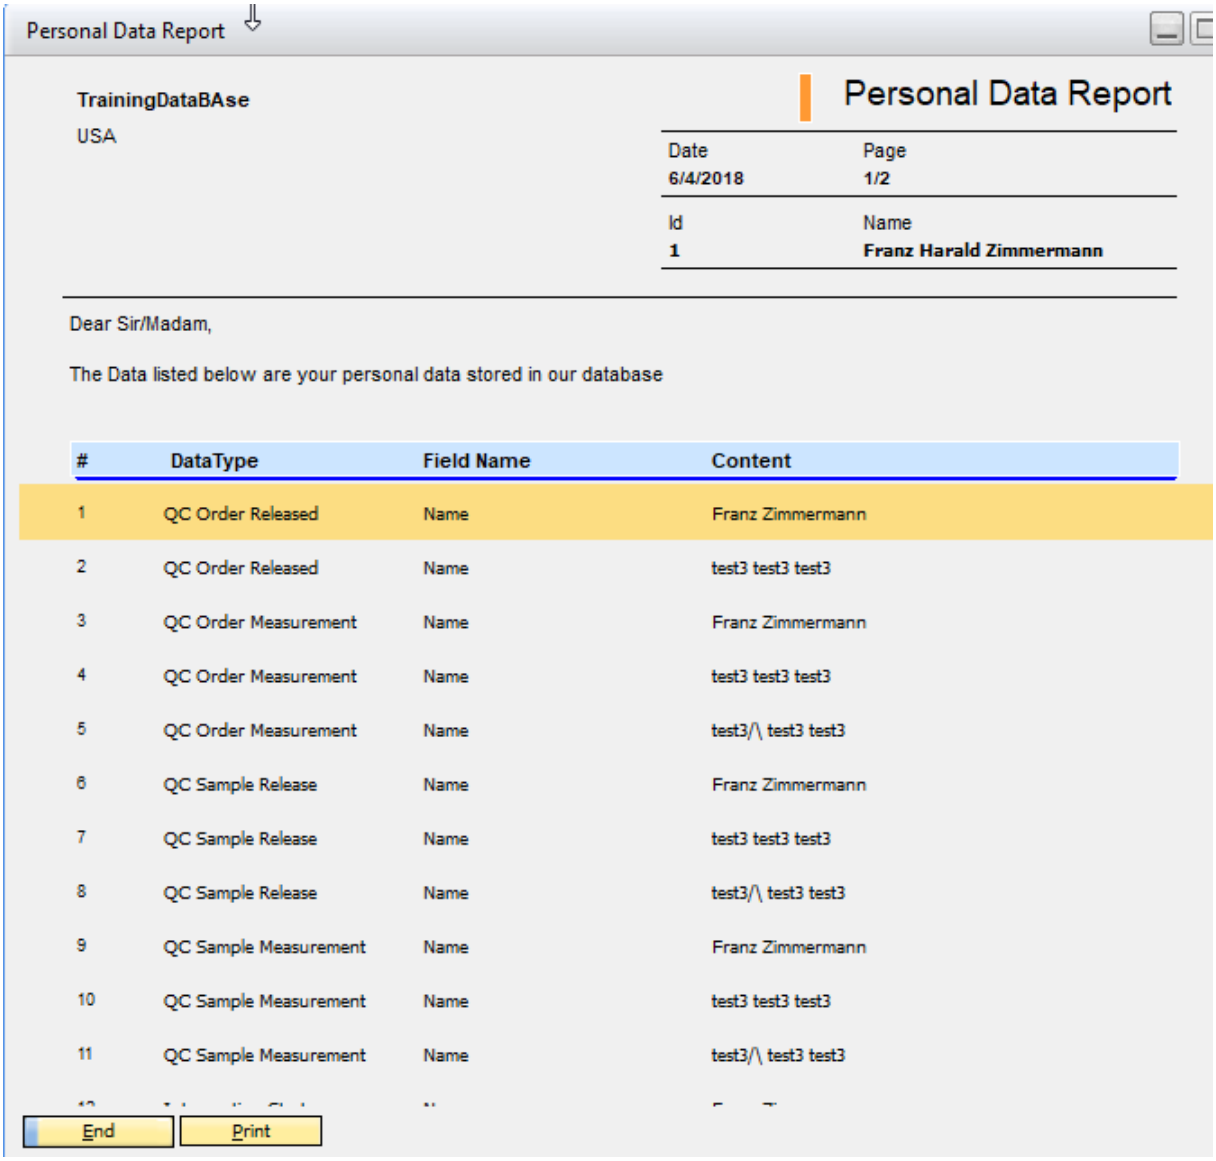


Window personal_data_management.psr

Function	Description
Area	For which area is the report to be created: Personnel or business partners.
Selection	A personnel entry or business partner can be selected for the above area.

Via the "**View report**" button, the report can be displayed and printed out directly.
Via right-click > "Printer" tab > "Preview" the report can be exported in the preview and another printer can be selected or sent directly by email.

© 2026 Boyum IT Solutions A/S



Window personal_data_management_report.psr

3.5 License

To use a Boyum product, you need a license.
All licenses are managed in the Boyum portal.

Partner Portal

In the Beas License Administration window you can manage the license inside Beas.

See:

© 2026 Boyum IT Solutions A/S

License Types
License Installation
License Administration Beas
License administration questions and answers.

How the license is working:

Online-Check
The license is checked daily. Open the firewall for boyum-it.com to allow this check. The license is extended automatically if the fee has been paid at http://portal.boyum-it.com. No further steps are necessary.
If Beas cannot establish the connection to the license server, the license has to be updated at least once per month using "License activation without internet access". ***See*** offline License

License management per database
Licenses are managed per database and per SAP Business installation number. The configuration per database has to be set up separately. The simultaneous use of a license is limited to a specific number of databases.

Basic License: Simultaneous use, specific User
The basic license is assigned to one user. A user can start Beas on a client (Windows System) several times at once in parallel, but not on different stations.

Support User
The SAP support user has full access but this is only possible if Beas is started within the SAP surface as an Add-On.

Terminal License concept
Terminal License is used by Beas Desktop Terminal and WEB APPS.
A terminal license is by concurrence of users. For more information ***see*** Terminal Licence concept.

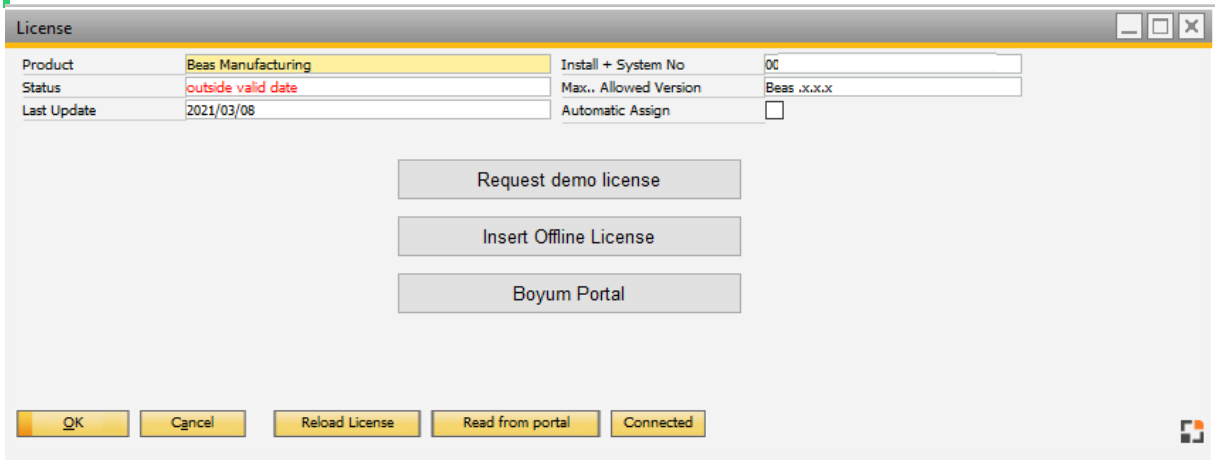
Beas Services
(BSL, Common Service, Background calculations):
If Beas started as service, the system does not need any license.

© 2026 Boyum IT Solutions A/S

3.5.1 License Installation

To register Beas license, the system needs an SAP Installation Number + System Number.
You can see this in:

PATH: Administration > License > License Administration



Now you can request a
Demo license or
Runtime license
Information for updating from old Beas Versions (9.2 and older)
If you do not know, which license you need: ***See*** License types.

Functions:

Function	Description
Request demo license	Open Boyum portal – Demo license page.
Insert Offline License	Use this function, if no internet connection is available. ***See*** Offline license.
Boyum Portal	Open the Boyum Portal. Here You can register a new license request. ***See*** Runtime License.
Read from Portal	You can click this button if license is available.

3.5.2 Demo License

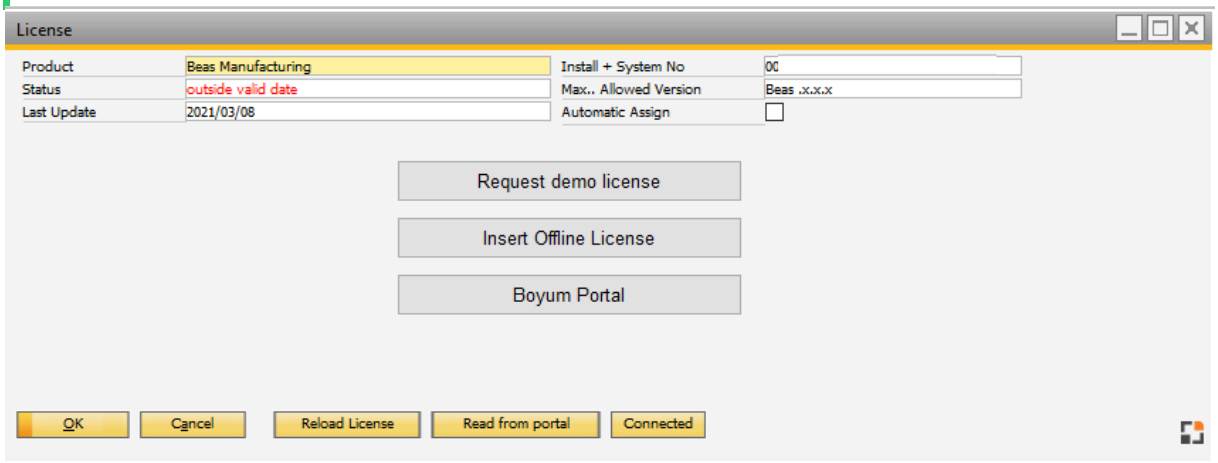
With the DEMO License all functions are available immediately.

Note: The internal Beas Usability License is activated, as well.

© 2026 Boyum IT Solutions A/S

To register a Demo license, open the license window.

PATH: Administration > License > License Administration



visit our Portal Try Beas Basic.
After registration, click on "Read from portal"

Demo License

If no internet connection is available,

Portal: https://portal.boyum-it.com/TryBeas/TryCustomer
Insert license: ***See*** Offline License.

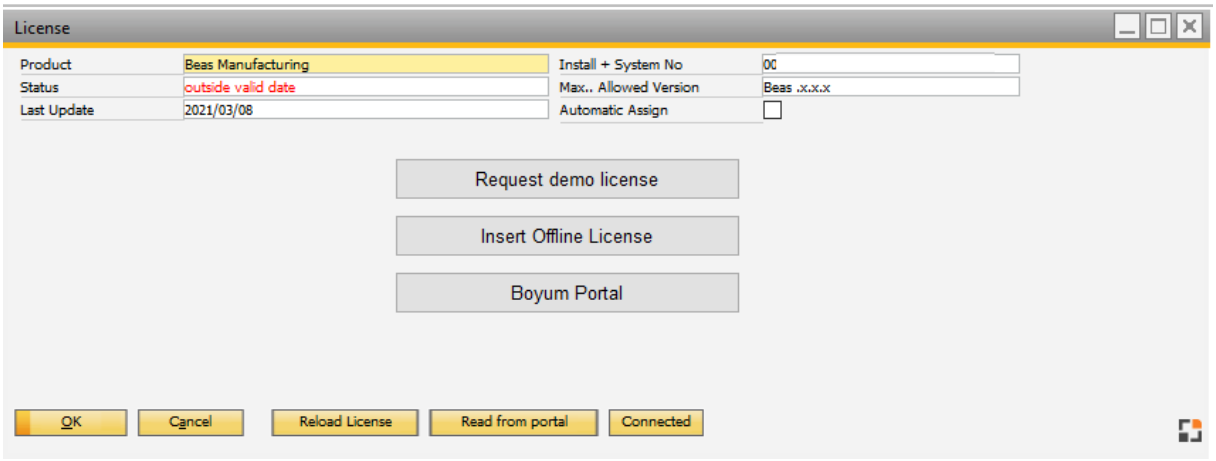
The demo license is valid for 2 weeks. For longer demo use, please contact sales@boyum-it.com.

3.5.3 Runtime License

To register a Runtime license, open the license window.

PATH: Administration > License > License Administration

© 2026 Boyum IT Solutions A/S



For more information on Beas license types ***see*** License types.
Click on "Boyum Portal" and register your license. ***See*** Partner Portal.
Install + System No. see in this window field "Install + System No"
After registration, click on "Read from portal". Note: Beas needs internet access to boyum-it.com websites. If it is not working, check your firewall settings.
If no internet connection is available, you can use the Offline License.

After activation you must assign the license or you can use auto-assignment (only Beas Basic license).
For more information ***see*** License Administration (Beas).

3.5.4 Offline License

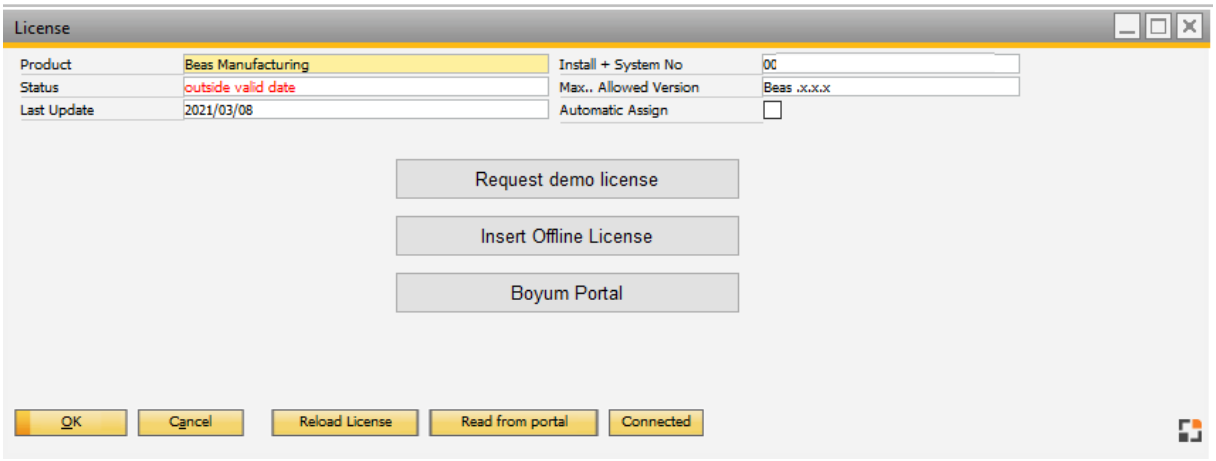
If Beas does not have internet connection, you can insert the license key by copy and paste.

Indicate installation number and select "Beas basic" at https://portal.boyum-it.com/LicenseKey.
An offline-license will be created. Copy to clipboard.

To register an offline license: open the license window.

PATH: Administration > License > License Administration

© 2026 Boyum IT Solutions A/S



Click on "Insert Offline License" and insert the clipboard with Ctrl + V.

3.5.5 Update from old Beas Versions

The correct installation number has to be entered in the portal if the customer has an older version than Beas 9.2 PL: 02.
See the following video:

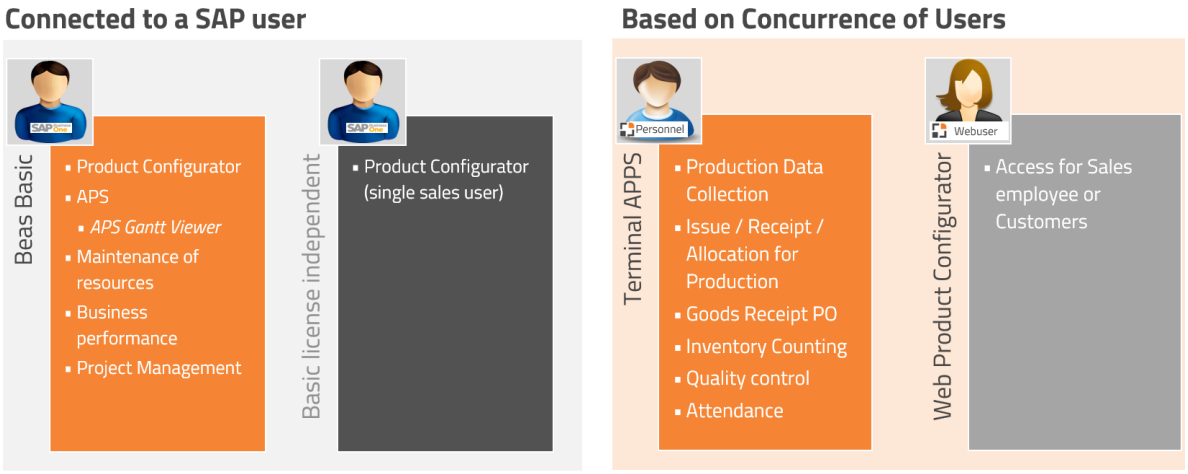
Partner to modify installation number

3.5.6 License Types

The following license types are available:

© 2026 Boyum IT Solutions A/S

Type of License



PRODUCT	ID	DESCRIPTION
Beas Basic	BEAS_BASIC	Beas Manufacturing core product. Each user that should have access to the Beas Manufacturing functions from inside SAP Business One or as a stand-alone application (except Terminals) require a Beas Basic license.
Beas Product Configurator	BEAS_PCONFIG	Incorporates a Configuring-to-Order process to Beas, with administrative features for defining Product Configurator parameters and rules, dynamic pricing calculation, linking parameters to BoM and Routing, using Product Configurator on SAP Sales Quotations and Sales Orders, and applying configured rules to Work Orders.
Beas Product Configurator (single sales user)	BEAS_BCONFIGSALES	License designed specifically for sales users to use Product Configurator interface on SAP Sales Quotations and Sales Orders, without the need for a “Beas Basic” license. Users that already have “Beas Basic” license do not need “Beas Product Configurator (single sales user)” license.
Beas Product Configurator (web interface)	BEAS_BCONFIGWEB	Incorporates a web portal for Product Configurator, enabling sales representatives and customers to

© 2026 Boyum IT Solutions A/S

PRODUCT	ID	DESCRIPTION
		configure their own products and generate SAP Sales Orders instantly.
Beas APS (Advanced Planning and Scheduling)	BEAS_APS	Enhances the Beas Basic capacity planning by incorporating features for finite capacity planning, with powerful functions for forward and backwards production scheduling, linking production scheduling to materials availability, sorting production by priorities and grouping by common characteristics, custom prioritizing according to freely definable rules, and optimizing of resources' usage (automatically selecting resources with free capacity when working with alternatives or groups of resources).
Beas APS Gantt Viewer	BEAS_NETRONIC	Graphical visualization of the APS scheduling on a Gantt chart, with features for displaying schedule per work orders or per re- sources, viewing of resources' workload, and for manually adjusting the work orders' scheduling on a timeline.
Beas Maintenance of Resources (Machines, Tools) and shipped Components / Equipment	BEAS_MTC	Fully integrated maintenance solution that includes features for internal and external maintenance scenarios, maintenance plans for preventive (calendar based) and predictive (productivity based) maintenance, corrective maintenance, maintenance for produced and sold items with serial numbers, registration of maintenance transactions from terminal application, calculation of maintenance costs based on maintenance orders, maintenance material planning integrated to MRP, and automatic creation of interruptions for maintenance, enabling APS to consider maintenance when scheduling production.
Beas Cost Accounting extended / Business Performance	BEAS_BAB	Advanced cost accounting integrated to production data, allowing the creation of dynamic distribution rules according to production activity, different rules for processing and analyzing financial transactions from SAP Business One, budgeting, profits and

PRODUCT	ID	DESCRIPTION
		losses statement, and specific reports for analyzing transactions related to cost centers and cost elements. This module also in- corporates an Absorption Costing function, which enables the distribution of the actual accounted cost to the produced items, recalculating their costs according to real transactions instead of using fixed cost rates on resources and personnel.
Beas Project Management	BEAS_PROJECT	Powerful module for project-based manufacturing, including the creation of multilevel projects with time tracking possibility, definition of expenses budgets for projects, creation of activities, sales and purchase transactions directly from the project, triggering work orders and Product Configurator from the project, defining milestones, and calculating actual projects' costs
Beas App: Issue / Receipt / Allocation for Production, Pick and Pack, Labels, Stock Information	BEAS_TERMINAL_MATERIAL	Terminal license for stock related transactions. This license includes the following applications: stock transfer, stock transfer request, goods receipt, goods issue, receipt from production, issue for production, reservation and allocation for production, collective issue for production, collective receipt for production, pick and pack and label printing.
Beas App: Goods Receipt for Purchase Orders, Labels, Stock Information	BEAS_TERMINAL_PO	Terminal license for purchase related transactions. This license includes the following applications: goods receipt (single and collective), label printing, inventory history, and reservations.
Beas App: Inventory	BEAS_TERMINAL_INV	Terminal license for inventory stocktaking. This license includes the following applications: inventory.
Beas App: Quality Control	BEAS_TERMINAL_QC	Terminal license for quality control related transactions. This license includes the following applications: QC by samples, QC by test and QC transfer and QC Orders.
Beas App: Time Recording, Clock in,	BEAS_TERMINAL_FDC	Terminal license for attendance related transactions. This license includes the following applications:

© 2026 Boyum IT Solutions A/S

PRODUCT	ID	DESCRIPTION
Clock out, Absences (Terminal)		arriving, leaving, login/logoff, status, and times.
Beas App: Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap	BEAS_TERMINAL_PDC	Terminal license for production related transactions. This license includes the following applications: login work order, logoff work order, quick input, production time receipt, external production, order status, pool report, activity, display documents, login interruption, logoff interruption, and maintenance orders. Note: automatic production good receipts and good issues could be performed. For manual material transactions in production, it is needed to consider the Beas App: Issue / Receipt / Allocation for Production, Pick and Pack, Labels, Stock Information.

3.5.6.1 Basic

Description

Beas Manufacturing core product. Each user that should have access to the Beas Manufacturing functions from inside SAP Business One or as a stand-alone application (except Terminals) require a Beas Basic license.

Requirement

SAP Business One Professional or Limited license for using Beas inside SAP Business One; SAP Business One Indirect Access license for using Beas as a standalone application.

ID

BEAS_BASIC

Rules

License per SAP User

Can connect only on one Station per time

Can start with same user more then one time on same station

© 2026 Boyum IT Solutions A/S

3.5.6.2 Product Configurator

Description

Incorporates a Configuring-to-Order process to Beas, with administrative features for defining Product Configurator parameters and rules, dynamic pricing calculation, linking parameters to BoM and Routing, using Product Configurator on SAP Sales Quotations and Sales Orders, and applying configured rules to Work Orders.

Requirement

"Beas Basic" license.

ID

BEAS_PCONFIG

License Rules

Same quantity as "Beas Basic" quantity.

3.5.6.3 Product Configurator (Web Access or SAP Client)

Description

This license is designed for sales users to use the Product Configurator interface for SAP Sales Quotations and Sales Orders, without the need for a "Beas Basic" license or to access to the Web Configurator.
In case of users that access the Web Configurator through SAP sales quotation or order: if a user has a "Beas Basic" license they do not need this license because they already have access to this function.

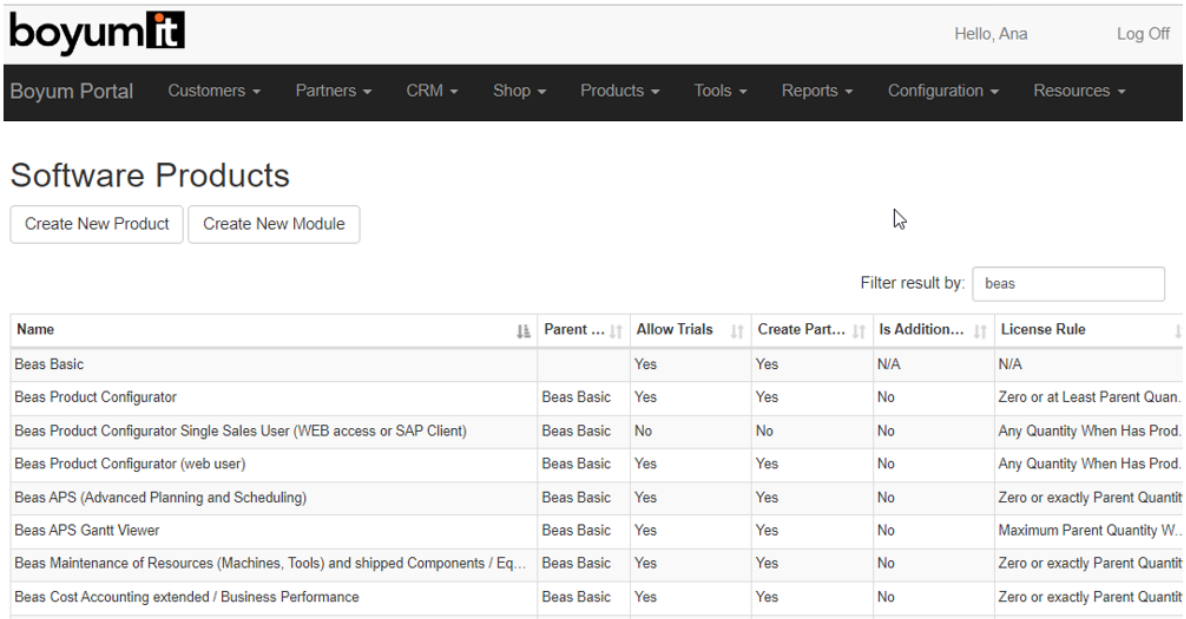
Requirement

"Beas Product Configurator" license.

ID

BEAS_BCONFIGSALES

© 2026 Boyum IT Solutions A/S



Name	Parent ...	Allow Trials	Create Part...	Is Addition...	License Rule
Beas Basic		Yes	Yes	N/A	N/A

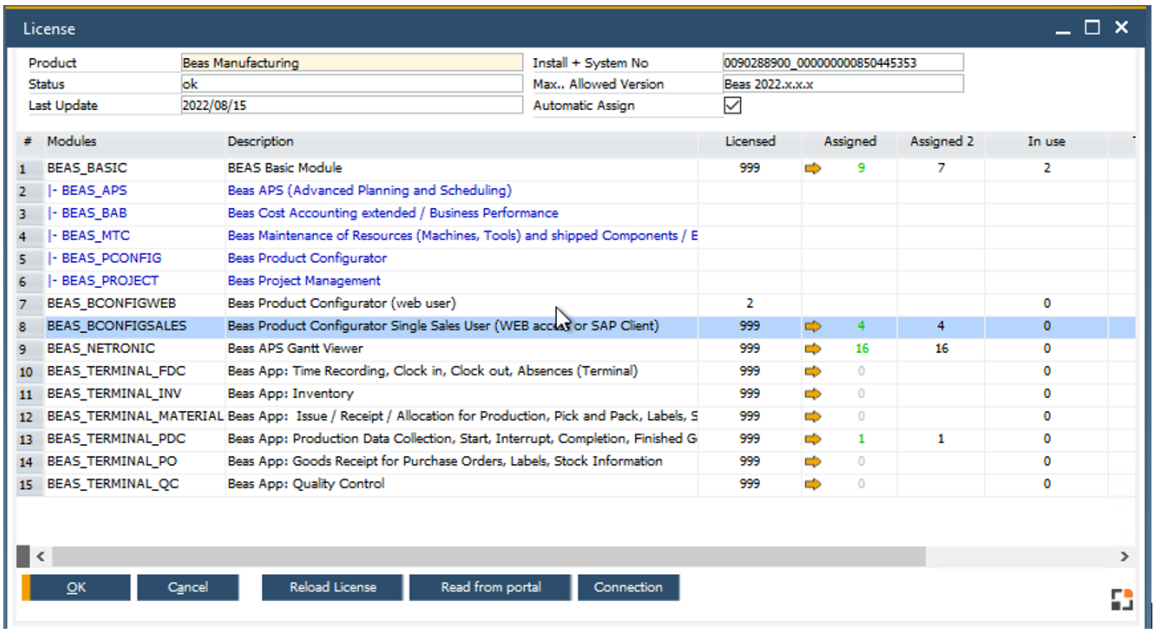
Beas Cost Accounting extended / Business Performance	Beas Basic	Yes	Yes	No	Zero or exactly Parent Quantit

License Rules

User assignment

An SAP user without a Beas basic license could be assigned to this license to give access to the product configurator from the SAP Quotation or Sales orders. The assigned licenses will have exclusive use of the assigned user from the SAP Sales documents, the rest of the licenses not assigned will have use by concurrency in the Web Configurator.



#	Modules	Description	Licensed	Assigned	Assigned 2	In use
1	BEAS_BASIC	BEAS Basic Module	999	9	7	2
2	|- BEAS_APS	Beas APS (Advanced Planning and Scheduling)				
3	|- BEAS_BAB	Beas Cost Accounting extended / Business Performance				
4	|- BEAS_MTC	Beas Maintenance of Resources (Machines, Tools) and shipped Components / E				
5	|- BEAS_PCONFIG	Beas Product Configurator				
6	|- BEAS_PROJECT	Beas Project Management

15	BEAS_TERMINAL_QC	Beas App: Quality Control	999	0		0

© 2026 Boyum IT Solutions A/S

Example:

A customer acquires 10 "Beas Product Configurator Single Sales User (Web access or Sap Client)" licenses: 3 of them are assigned to SAP Users, 7 will be available for the use of the Web Configurator access.

If 3 sales employees connect to the web access, 4 of the 7 licenses will be available. When all the web licenses are occupied at the same time, the eighth user will not be able to access it.

Note: The assigned licenses are excluded from the availability for web access, so if a salesperson has an SAP User license assigned for Sales orders, and accesses through the Web Configurator, the web access will be consumed as an additional license each time they access it.

Managing the concurrence of Users

The assignment and release of the Web Configurator licenses will be carried out identically to license application in the WebApps terminal.

User login blocks a Web Configurator license, and these licenses are released for use again once the user logs out.

There is no limit in the number of users to access the Web Configurator, but they can access it only up to the available licenses at a time. Following the example of our customer with 7 licenses available for the Web Configurator, they could create 20 users but only up to 7 will be able to access the Web Configurator at a time. However, consider that the web application was designed for sales employee access and is not intended to be a B2C or E-commerce solution with high user concurrency.

ATTENTION: If a user closes the Web Configurator without logging out, the system keeps the license in use for 10 minutes. After that the system automatically releases the license.

Concurrence of users (User, Customer, Employee). Every Session takes one license.

WebApps: The user must choose "Logout", otherwise it can take up to 10 minutes before the License is free for other sessions.

3.5.6.4 Product Configurator (Web User)

Description

Incorporates a web portal for Product Configurator, enabling sales representatives and customers to configure their own products and generate SAP Sales Orders instantly.

Note: Consider that the web application was designed for sales employee access and is not intended to be a B2C or E-commerce solution with high user concurrency.

© 2026 Boyum IT Solutions A/S

IMPORTANT: From Beas Manufacturing 2022.09, the "Web User" license is unified with BEAS_BCONFIGSALES (Product Configurator Single Sales User), and is to disappear from the Beas portal list at the end of 2022.

See article: Changes in the Web Configurator License.

Requirement

"Beas Product Configurator" license.

ID

BEAS_BCONFIGWEB

License Rules

Same quantity as “Beas Basic” quantity.

3.5.6.6 APS Gantt Viewer

Description

Graphical visualization of the APS scheduling on a Gantt chart, with features for displaying schedule per work orders or per re- sources, viewing of resources' workload, and for manually adjusting the work orders’ scheduling on a time line.

Requirement

“Beas APS (Advanced Planning and Scheduling)” license.

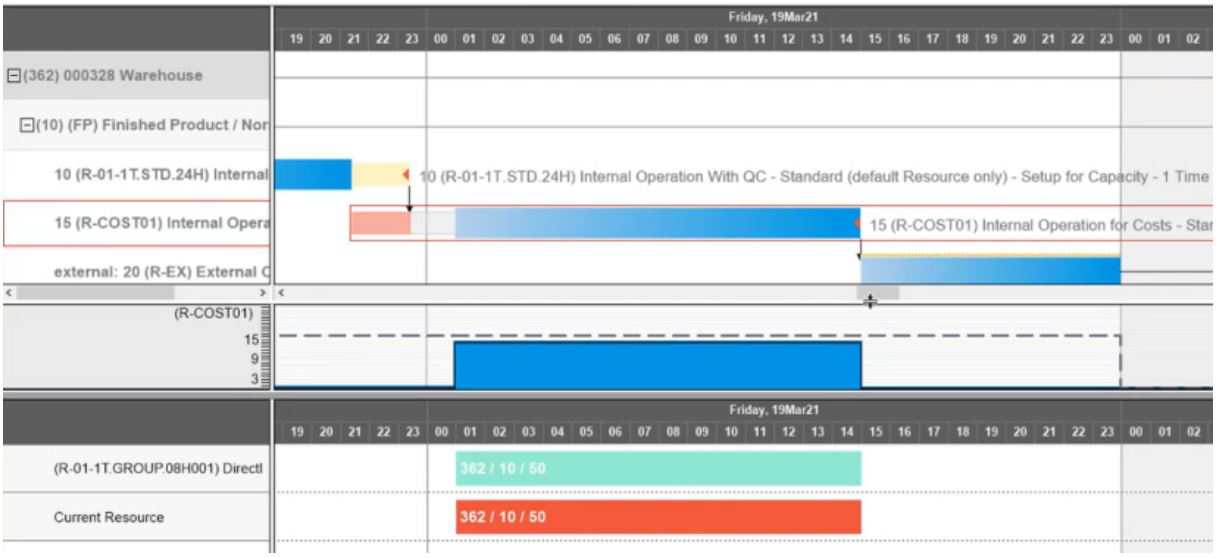
ID

BEAS_NETRONIC

License Rules

License per Station-ID.

The station must be defined in Administrate license assignments



© 2026 Boyum IT Solutions A/S

3.5.6.7 Maintenance of Resources

Description

Fully integrated maintenance solution that includes features for internal and external maintenance scenarios, maintenance plans for preventive (calendar based) and predictive (productivity based) maintenance, corrective maintenance, maintenance for produced and sold items with serial numbers, registration of maintenance transactions from terminal application, calculation of maintenance costs based on maintenance orders, maintenance material planning integrated to MRP, and automatic creation of interruptions for maintenance, enabling APS to consider maintenance when scheduling production.

Requirement

"Beas Basic" license.

ID

BEAS_MTC

License Rules

Same quantity as "Beas Basic" quantity.

3.5.6.8 Cost Accounting

Description

Advanced cost accounting integrated to production data, allowing the creation of dynamic distribution rules according to production activity, different rules for processing and analyzing financial transactions from SAP Business One, budgeting, profits and losses statement, and specific reports for analyzing transactions related to cost centers and cost elements. This module also incorporates an Absorption Costing function, which enables the distribution of the actual accounted cost to the produced items, recalculating their costs according to real transactions instead of using fixed cost rates on resources and personnel.

Requirement

Columns

Column	Description
Module	Name of module / License type For example BEAS_BCONFIGWEB (Web Configurator), BEAS_PROJECT (Beas Project management) . You can see only active licenses. Blue Modules (APS, Cost Accounting and so on) managed by Beas Basic License. Means: This Licenses are activated or not. But only User with Beas Basic License can use it. For more information on the different license types ***see*** License types.
Description	The description of the module, for example "Web Configurator" for BEAS_BCONFIGWEB.
Licensed	The number of in Boyum portal licensed licenses. If all licenses are in use or assigned, the entry is red, otherwise black.
Assigned	Administrate the assignment to the user or station
Assigned 2	Count of licenses that are assigned, but not in use. ***Example:*** Manager has a license (defined in assigned), no additional user Assigned = 1, Assigned 2=1, in Use = 0 Now manager starts Beas and logs in to the program. In this moment the system takes the assigned license. Assigned = 1, Assigned 2=0, in Use = 1
In Use	Count of currently used licenses. BEAS BASIC: this is the count of licenses, which are in use, not count of sessions. ***Example:*** User 1 starts Beas on Station A and user 2 starts Beas on Station B. In this case, "in Use" is 2.

© 2026 Boyum IT Solutions A/S

Column	Description
	User 1 starts Beas on Station A 2 times. In this case, "in Use" is 1, but "Total" is 2. User 1 starts Beas on Station A and Station B. In this case, "In use" is 1 and "Total" is 1, because the system moves the active license to Station B.
Total	Total number of connections (see in Use)

Functions

Button/right-click function	Description
Cancel	Close window without saving changes.
Read license from portal	Click this button to read your licenses from the Boyum Portal. Note: Internet connection must be available and the system need the possibility to access boyum-it.com sides (check firewall).
Reload license	Reload the list of licenses from current database (or refresh, example after changing any assignments)
Connection	Show active connections
Delete license	Delete license information from current Database With this function you can disable the license system in the current database. You can click on "Read from portal" if you want to read the license information from the Boyum portal.

See article on License administration questions and answers.

3.5.7.1 Administrate license assignments

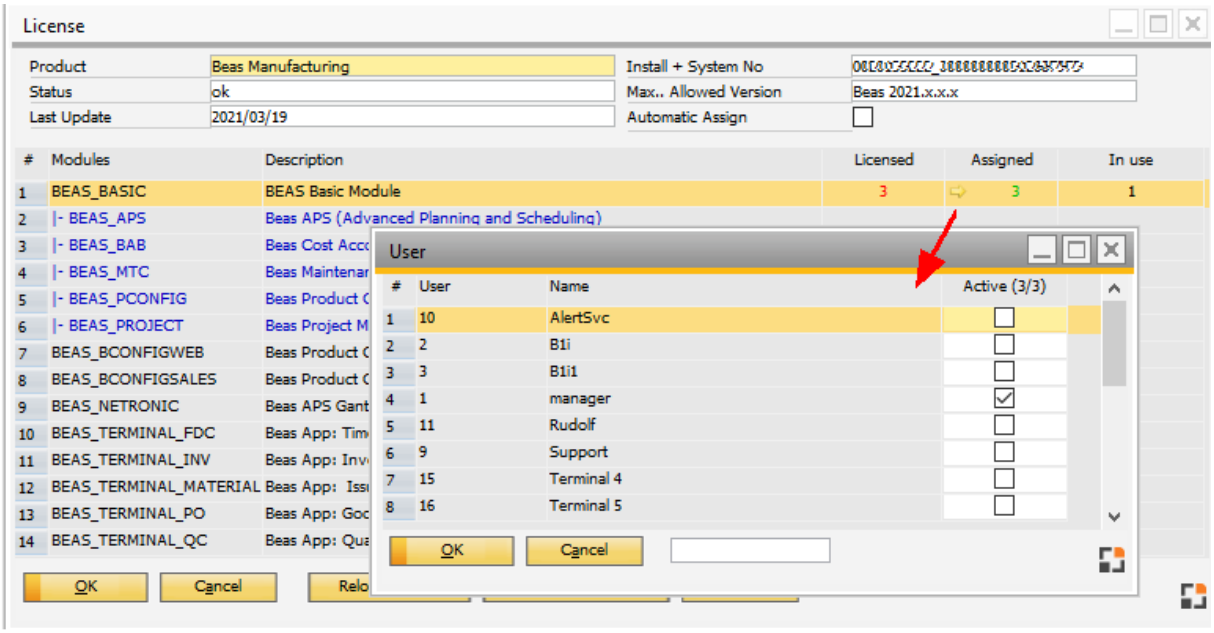
With a click on the yellow arrow in the assigned column you can assign the User/Personnel/Station and so on.

© 2026 Boyum IT Solutions A/S

Basic License / Product configurator (single sales user)

You can define the user, for which you want to reserve the license.

Only Basic License: if "Automatic Assign" is active, the system assigns a license to a user automatically if a license is free.



Window system_lic_userbrowse.psr

Beas APS Gannt Viewer

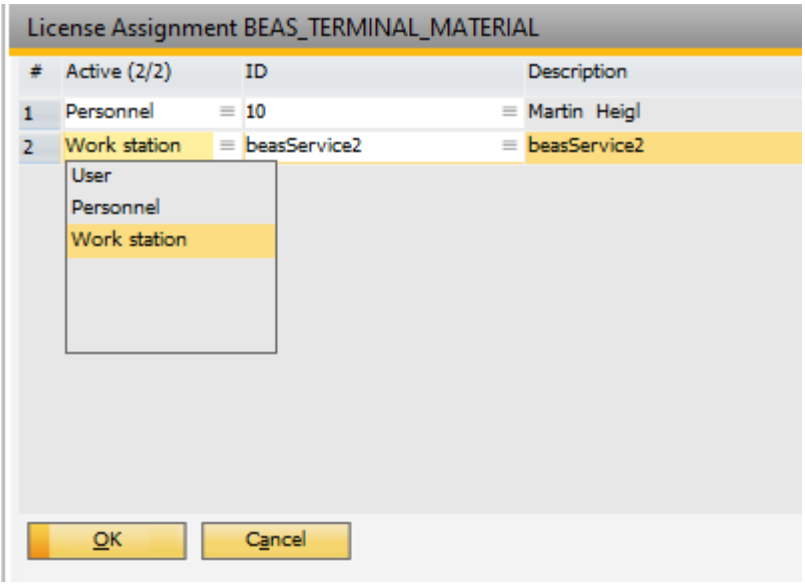
The Viewer assignment is per Station. The station is managed in the Station Setting Wizard. If Beas is started on a new station for the first time, the system creates an entry in the Station setting wizard automatically.

If you click on the yellow arrow in the column "Assigned", the system opens a form, in which you can choose the stations.

App Licenses / Terminal

For this type of license it is possible to reserve license for a user, personnel entry or station.

© 2026 Boyum IT Solutions A/S



- User: Only Terminal desktop: The user, which is used for the program start.

- Personnel: The user that wants to use the app.

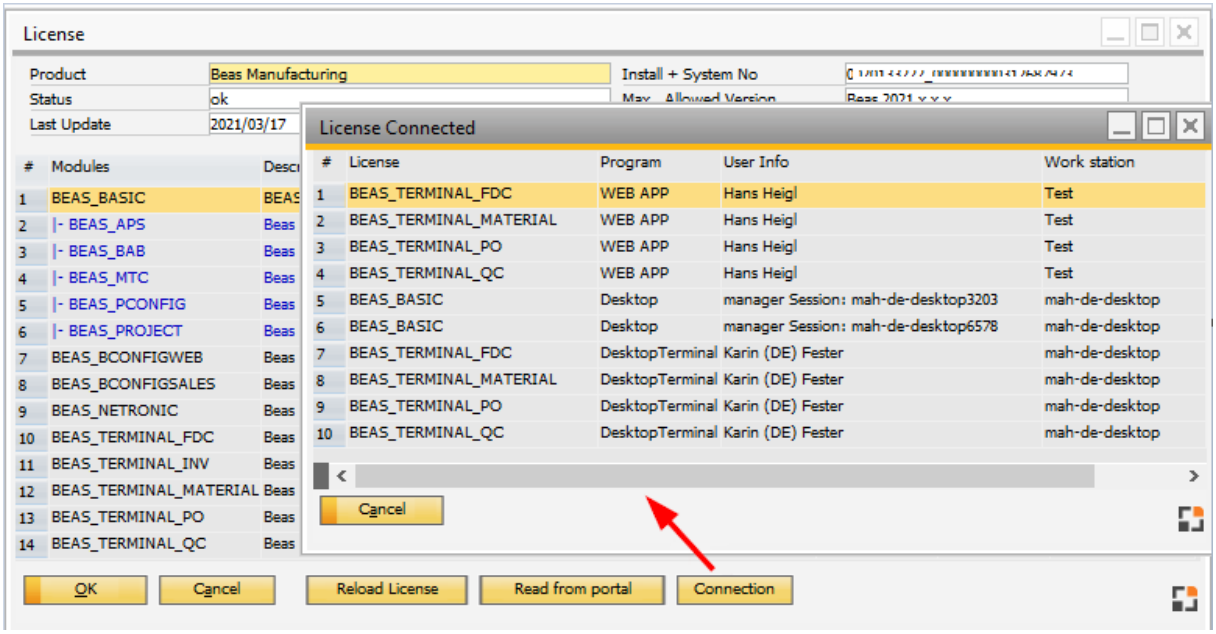
- Work station: Terminal desktop: The Windows station ID; WEB APP: the location defined in the login mask (optional).

Priority:

For login the system searches for the Work station first, then the User, and then for the Personnel reservation.

3.5.7.2 Connections

In the connection page you can see all current connections.



© 2026 Boyum IT Solutions A/S

Field	Description
License	The license ID which is in use.

Type of Connections

Type	Description
Beas Basic	If you start Beas, the system searches for Beas Basic License. If available, the system checks whether the license is used on another station. If yes, you can move the active license to the current station. The user can start Beas on one station more than once without additional licenses, but only on one station at a time. In this case you can see 2 entries, for every start. For this, Beas creates a unique Beas Session ID for every Beas session. On the right side of the User you can see the used Session ID.
BEAS Product Configurator (Single Sales user) Beas APS Gannt Viewer	The system checks if the license reservation exists, but it does not create a license reservation. You cannot see an entry in the connections.

© 2026 Boyum IT Solutions A/S

Field	Description
	<table><tr><th>Type</th><th>Description</th></tr><tr><td>Beas Product Configurator (Web User)</td><td>This is is used for the WEB Configurator. You need a license for every Session (not User or Employee). In "Connection" you can only see the Session ID. Note: The user must click on "logout", otherwise the license is not free. It takes up to 10 Minutes for deleting the license reservation.</td></tr><tr><td>Beas Terminal License</td><td>WEB APP: The system reserves the license if you connect to the WEB APP, and disconnects the reserved licenses if you click on "Logout". IMPORTANT: If you don't click on "Logout", it takes up to 10 Minutes before you can use the license again. Desktop: The system reserves the license only while you are logged in.</td></tr></table>

© 2026 Boyum IT Solutions A/S

Field	Description
	For more information about license ***see*** license types.
Program	The program type which uses the license Desktop: Beas Standalone or SAP integrated. Desktop Terminal: Beas started as Terminal. WEB APP: Web Application.
User Info	The User Name (Basic License) or Name of personnel (Terminal / App license).
Work station	The Work station ID (if available) If remote session: the computer name of the terminal server + windows login name of current Windows user.

Functions

Function	Description
Disconnect	Disconnect the License. Note: This can take up to 10 Minutes before the license is removed from the station. If available, the related station tries to take another free license directly.
Refresh	Refresh the connection list.
Disconnect all	Disconnect all connections Note: All clients try to reconnect if license is available. This can take up to 10 Minutes.

Additional fields (window settings)

Field	Description
User ID	SAP User ID of the current connection
User Name	Name of SAP User from the current connection
Windows Login	Login Name of current windows session

© 2026 Boyum IT Solutions A/S

Field	Description
Personnel	Personnel ID from current Connection (Beas Personnel entry)
Personnel Name	Name of the Personnel
Work station ID	Work station ID (or Windows User, if remote Session)
Work station Name	Work station Name (must be defined in Work station setting wizard.
Work station Location	Location of Work station (must be defined in Work station setting wizard.
Session	Unique Session ID Note: Every Beas Start or WEB Application has its own Session ID.
Life time	At this time the connection will be removed if the session does not refresh it.
Ping	Last connection from the session to the license system.
Assigned	If active, the license is in use from the current session.

See article on License administration questions and answers.

3.5.8 Terminal License concept

Beas supports different Terminal types:

Beas Desktop Terminal
Beas WebApps 2.1
Beas WebApps 1.0 (only for compatibility)

All use the same license pool with the same concept:

In **Terminal Functions > Edit Group > Choose apps** you can see the License needed for the apps.

Concurrence of users

IMPORTANT: User login blocks all licenses that are assigned to the user! These licenses are released

© 2026 Boyum IT Solutions A/S

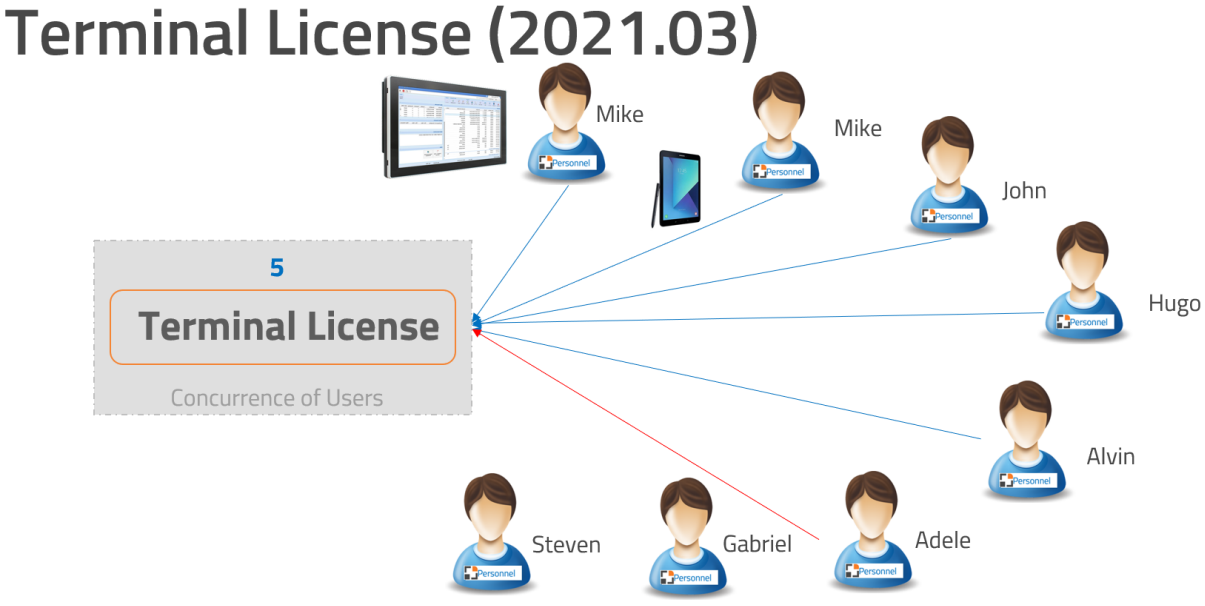
for use again once the user logs out.

Licenses can be reserved by user, machine or Beas operators.

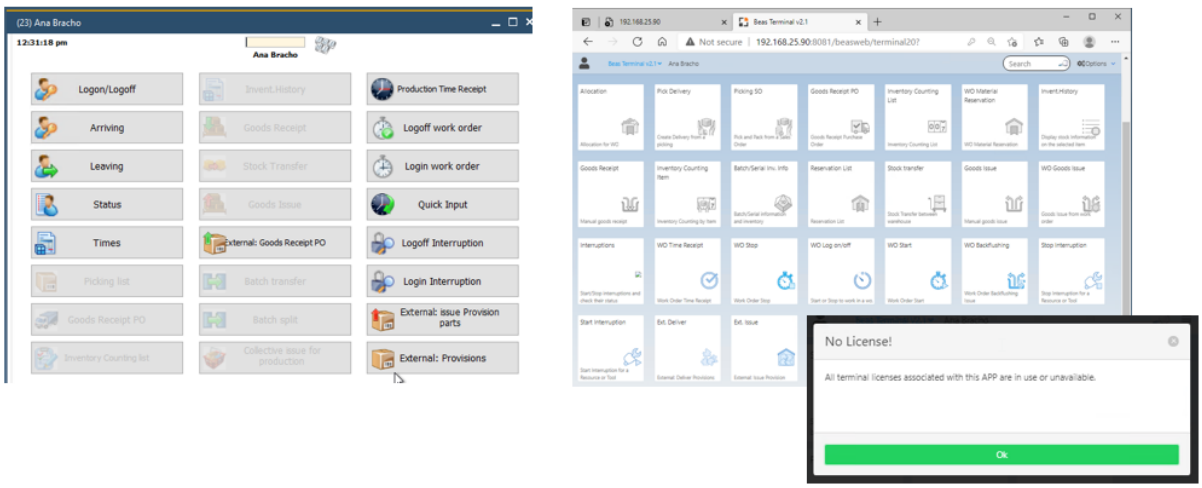
See License Administration (Beas)

Article on License administration questions and answers

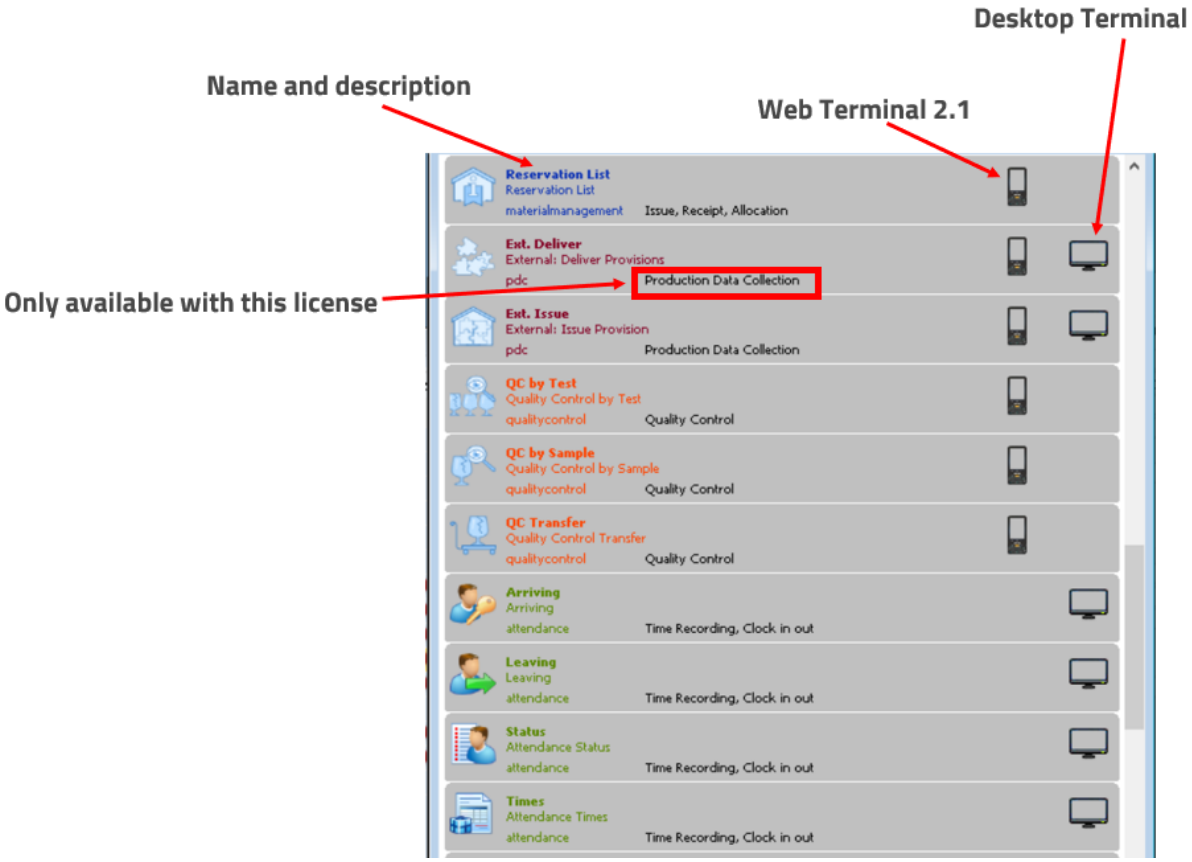
Example: A company has 5 Terminal licenses. Five users are using the 5 licenses each - therefore, the number of available licenses is 0.



Apps that are not available for the user in lack of license are grayed out (disabled).



© 2026 Boyum IT Solutions A/S



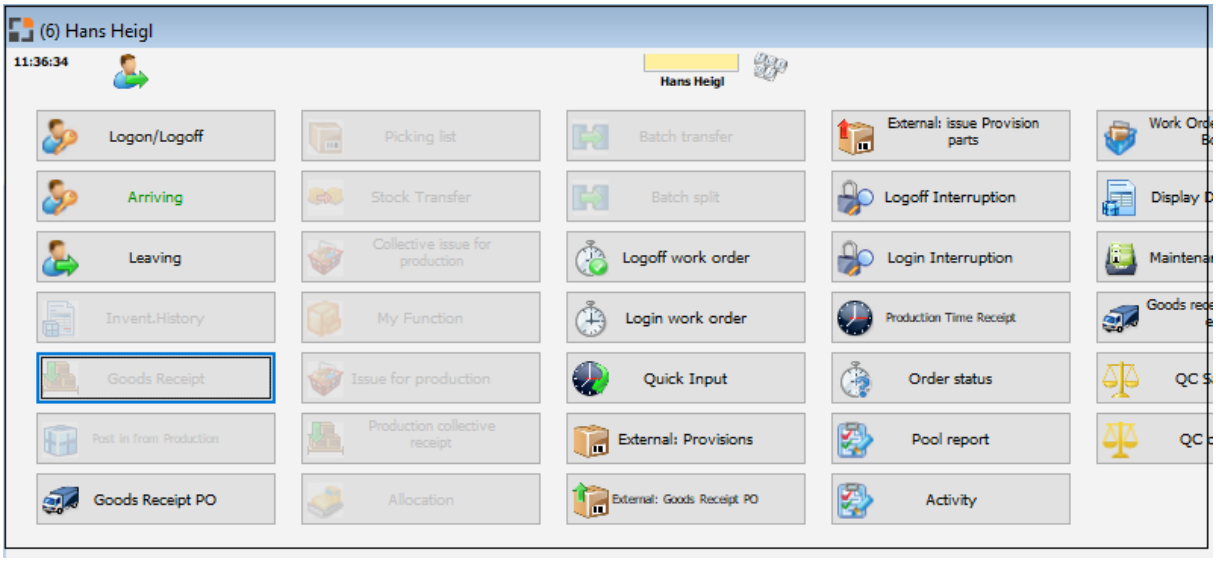
NOTE: Upon login all available licenses related to the authorization groups will be set as "In Use".

Desktop Terminal

If you start the Desktop Terminal, you do not need any license.

If you login in Desktop Terminal, the system tries to use needed licenses. If available, the license will be reserved. If not, the app needing the license is grayed out. If you hover the mouse over or click on the button, you can see the info that the license is not available.

© 2026 Boyum IT Solutions A/S



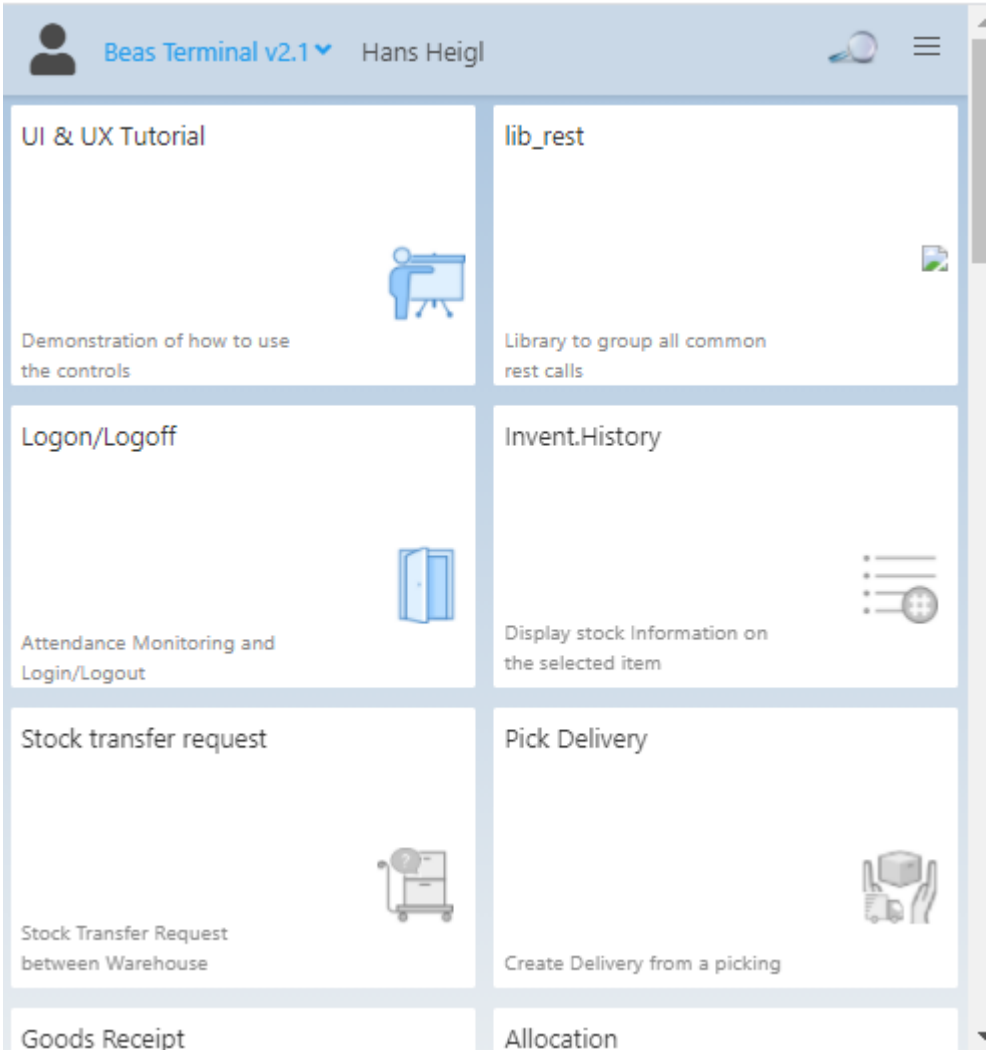
WEB APP

In WEB APP the license is reserved in the moment of Login.

> Note: The user must choose "Logout", otherwise other users cannot use the license up to 10 Minutes.

If the license is not available, the system displays the APP in gray.

© 2026 Boyum IT Solutions A/S



Note:

Do not try to manipulate the system. If you delete the license information, the back-end will not work correctly.

ATTENTION: If you close WebApps without logging out, the system keeps the license in use for several minutes. After that the system automatically releases the license.

3.5.9 Concurrence of Users

Concurrence of users

IMPORTANT: User login blocks all licenses that are assigned to the user! These licenses are released for use again once the user logs out.

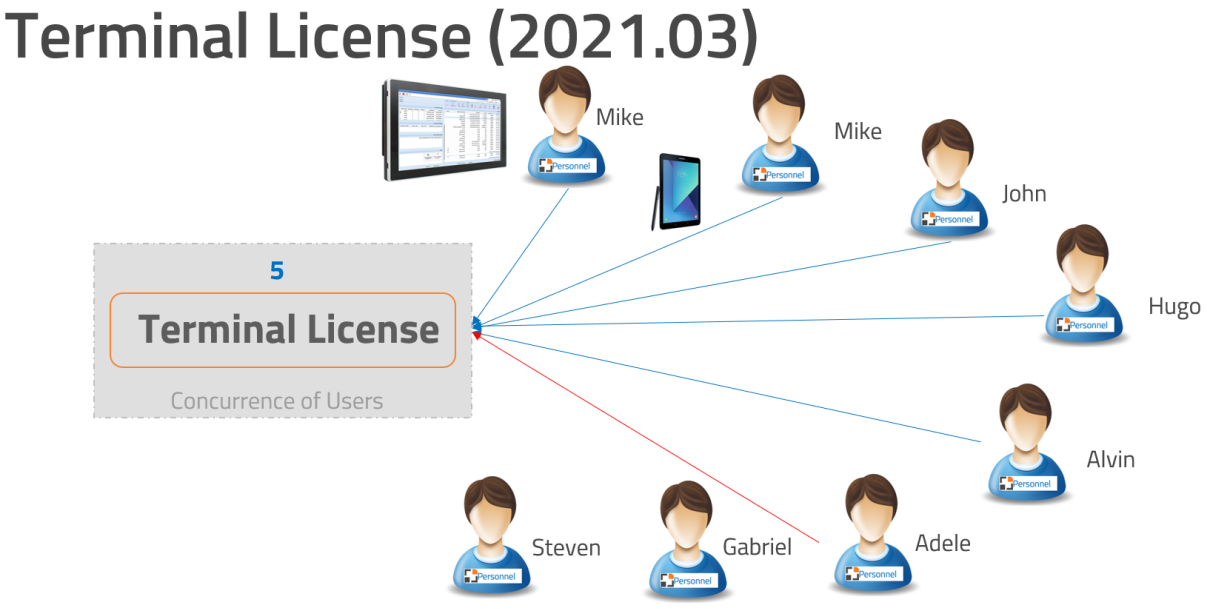
Licenses can be reserved by user, machine or Beas operators.

See License Administration (Beas)

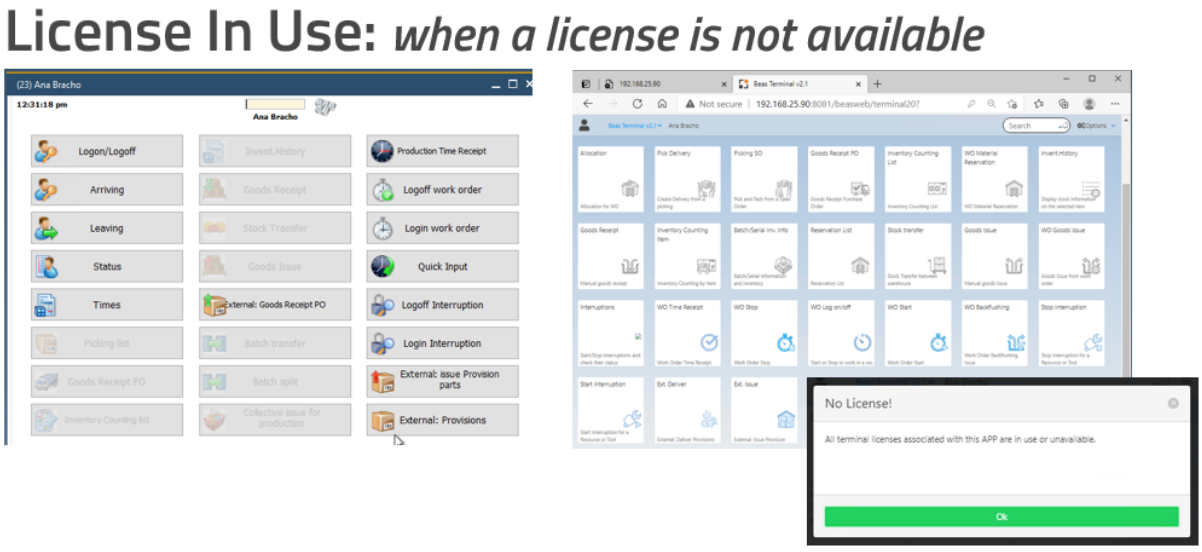
© 2026 Boyum IT Solutions A/S

Article on License administration questions and answers

Example: A company has 5 Terminal licenses. Five users are using the 5 licenses each - therefore, the number of available licenses is 0.



Apps that are not available for the user in lack of license are grayed out (disabled).



3.5.10 Customization and Licenses

In Beas it is possible to create your own WEB APPs or Windows.

In Beas every end-user interface (App or Window) must describe, which License it needs for using.

© 2026 Boyum IT Solutions A/S

The system reserves the license (Terminal license) or checks if the necessary License is available (for example Beas Basic License).

If the window/app tries to use the Beas functionality, the system checks if defined/reserved License is available. If not, the system returns a license error for this customization App/Window.

Type	Description
Beas Terminal and WEB APP	If you create your own apps, you must define which License is necessary for your app. You can define this in field "License", for example: "BEAS_TERMINAL_FDC", "BEAS_TERMINAL_MATERIAL" and so on. Choose only 1 License. ***See*** License setting in Program groups development app editing.  *Window webprogram_edit.psr* IMPORTANT: If the license is not defined, the App cannot use the back-end functionality.
Own Windows	Own windows created with Powerbuilder, JBS or Beas Script: Please contact Beas support if you create windows for using Beas Back-end functions.

3.6 Add-ons

In this menu entry you can manage different Add-Ons.

Add-On manager (Beas)
Beas Usability Extension
B1 Usability Package

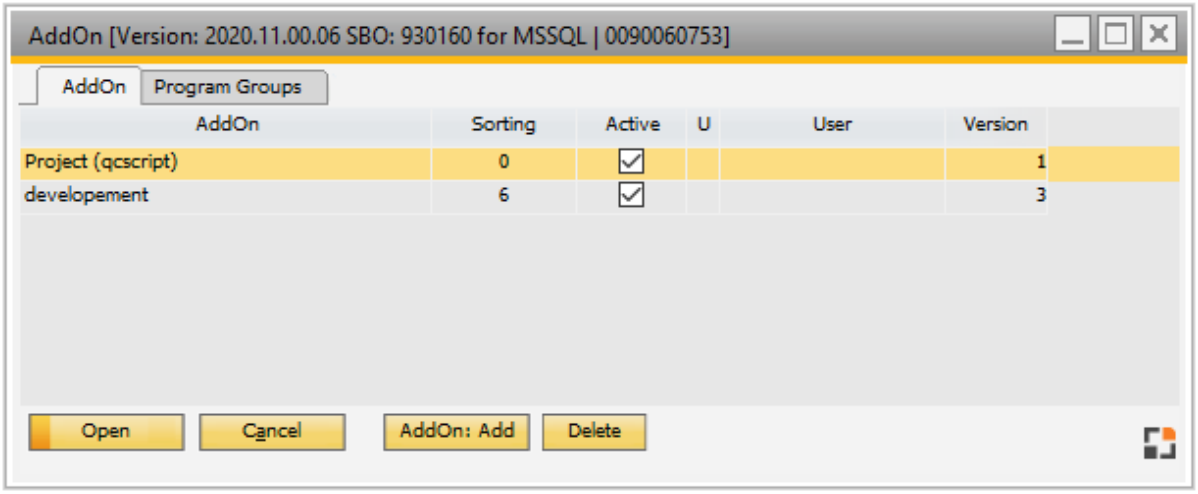
© 2026 Boyum IT Solutions A/S

Produmex WMS Integration

3.6.1 Add-on manager (Beas)

PATH: Administration > Add-Ons > Add-on-Manager (Beas).

Beas has its own Add-On-administration. Every partner can develop their own customized Add-Ons and install them at customers. These can be adapted for all customers.



Window system_addon_browse.psr

All installed Beas-Add-Ons are displayed in a list.

Field	Description
AddOn	Name of the Add-Ons.
Sorting	Ordinal number of sorting (sorted by priority).
Active	Check mark if Add-On is active.
U	An icon will is displayed in case not all users have access to this extension.
User	List of users for whom the extension is loaded. Set up by double-clicking the field.
Version	Number of installed versions.

Functions

Button	Description
Open	Edit the currently selected Add-On – opens the editing window. It can be edited only at the first entry.

© 2026 Boyum IT Solutions A/S

AddOn: Add	Create new Add-On.
Delete	Delete currently selected Add-On.
User	Determines the user to load the extensions for. Note: The user definition only applies to the Add-Ons folder. It does not apply to the Project folder of the customer.

3.6.1.1 Customer-specific Adaptation

Beas can be adapted customer-specifically:

- Insert additional function buttons anywhere in Beas forms and SAP Business One forms
- Insert any functionality in Beas and SAP Business One forms on the basis of any events
- Insert new lists, windows and reports
- Block any fields and buttons on the basis of any events and/or specifications

All functions, changes, forms and reports are stored as files in a special directory on the server and then copied locally to the clients.
Alternatively a central folder can be set up to which the clients have access. ***See*** **Configuration wizard >** System

For detailed information on customizations ***see*** Script Documentation.

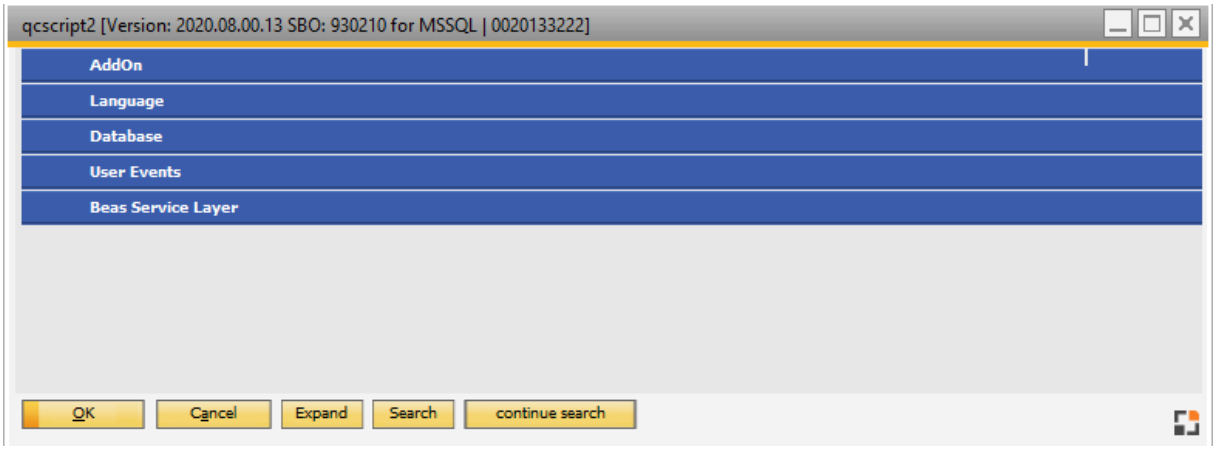
see:
Editing window for Beas Add-Ons
Folder for customized extensions
Change objects in Beas
Data window-syntax
Insert own fields in personnel edit window

3.6.1.1.1 Edit beas AddOns

PATH: Administration > Add-Ons > Add-on-Manager (Beas) >

1. Select Addon >
2. Click **Open** button.

© 2026 Boyum IT Solutions A/S



Window system_ option_ struktur.psr

Button	Description
Customized extension	Enter name and location of the Add-Ons.
Folder	Open the central project folder Only visible if working with a central project folder: Open the windows explorer in this folder.
Block client update on this station	Prevent an automatic update on the project folder Only visible if you do **NOT** work with a central project folder: Prevent adjustment of the local project folder. ***Use example:*** The extensions are developed at this station. This option can be activated for preventing an "overwriting" accidentally through an adjustment.
Request a client update	Request update of the project folder for all clients Only visible if **NOT** working with a central project folder: As soon as the clients restart Beas, the project folder is updated. The entry "version" is increased in the project folder on the server in the file "version.ini".
Distribute local changes	Distribute the local project folder to all clients Only visible if you do **NOT** work with a central project folder:

© 2026 Boyum IT Solutions A/S

	All changes in the local folder are copied to the server > project folder and a distribution is requested to all clients. As soon as the clients restart Beas, the project folder is updated. The entry "version" is increased on the server in the project folder in the file "version.ini". Note: All files are copied but not deleted.
Local document	Open the local project folder Only visible if you do **NOT** work with a central project folder: Open the file explorer on the local client.
Server document	Open the project folder on the server Only visible if you do **NOT** work with a central project folder: Open the file explorer on the local client.
Language	Language settings

Language table	The translation in the project folder is saved in the file "lanuage.psr" and updated when: a) The addon is registered, b) The language is updated, c) Something is changed in this window.
Messages	Own messages for own extensions can be stored here for all user languages. The translation in the project folder is saved in the file "message.psr" and is updated if: a) The addon is registered, b) The language is updated, c) Something is changed in this window.

Database	Database settings Define own Database Fields

© 2026 Boyum IT Solutions A/S

	Edit table extensions: Edit database extensions. These are saved in db.ini. ***See*** "structure of the DB.INI" Edit rights: Edit further authorizations which are displayed in the user rights administration.
User events	Customer-specific functions Beas allow to insert additional functionality in the business logic. This is not window related and the scripts running complete in back end - in Beas Desktop / Terminal / WEB solution, Beas Service Layer and Data Integration hub. The following areas are available: Addon: Edit details with BeasScript editor. Menu: Edit details with BeasScript editor. MRP: Edit details with BeasScript editor. QC: Edit details with BeasScript editor. Calculation: Edit details with BeasScript editor. Stock management: Edit details with BeasScript editor. Work orders: Edit details with BeasScript editor. APS: The **Details** button opens the script editor with the file APS.SRC and creates the function or jumps to the existing function. For more Information ***see*** BeasScript documentation – User events
Beas Service Layer	By clicking on the button "**Details**", you can insert the additional functionality for Beas Service Layer. For more information ***see*** Beas Service Layer documentation.

back to Customized Extensions

© 2026 Boyum IT Solutions A/S

3.6.1.1.2 Distribution

Distribution is only necessary if no central folder for customizations was set up. ***see*** setup folder for customizations

If you do not have a central project folder, the following rule applies:

All development work is stored locally in the directory **%programdata%\beas\project\[name]**

Once completed, the contents of this directory are copied manually to the server:
\\[servername]\b1_shr\beas\project\[name]

Finally, via **Extra / Add-on Management / Development / Customer-Specification "Force client update"** the clients are instructed to perform an update.

Note:
For clients, the directory **\\[servername]\b1_shr** must be specified as the program server directory.
This is done either during the client installation or
a) Beas without starting SAP Business One
b) In the login window "Option" under "Program server"
The download is only performed when the application is restarted.

see setup folder for customizations

back to customer specific adaptation

3.6.1.1.3 beas script editor

Beas can be customized easily and in different ways.
Beas has its own script language called BeasScript.

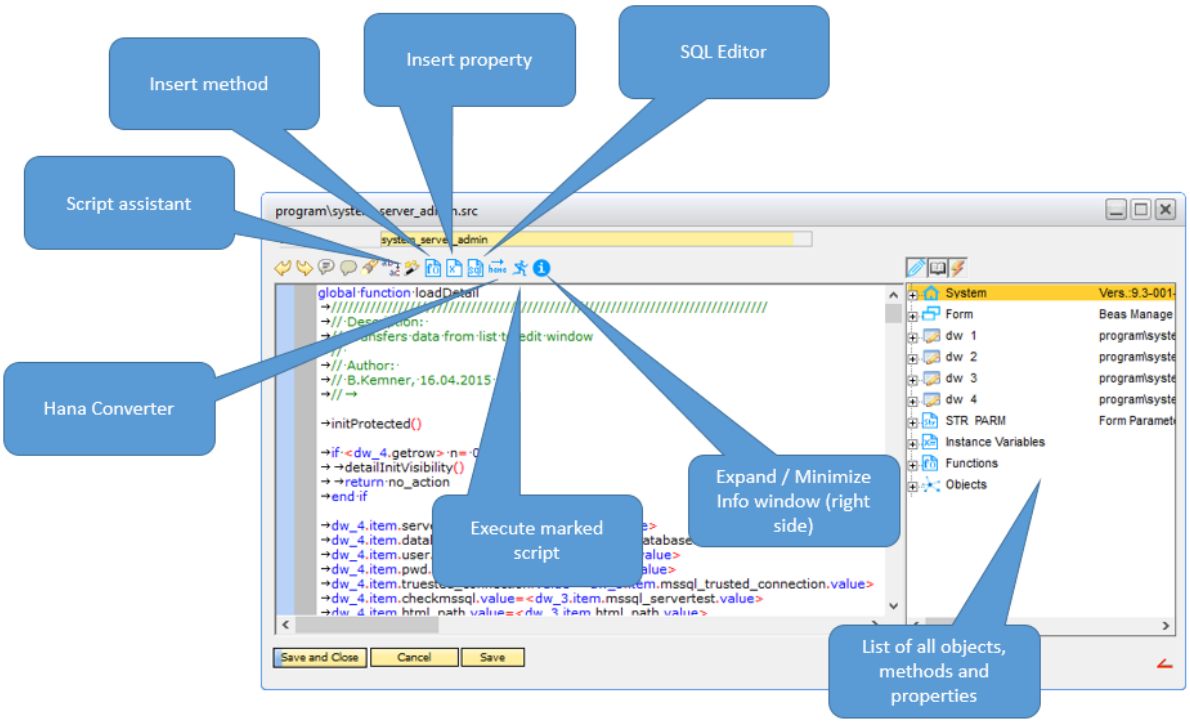
With the integrated script editor it is simple to create customization with BeasScripts.

User rights:
Validate if the user has rights to open the SQL screen. ***See*** Right management SQL.

Examples for using Beas script editor:
- window-related – tools – extensions for clients

© 2026 Boyum IT Solutions A/S

- Beas usability extensions – universal function – Beas script



The script assistant helps you to start with BeasScript. ***See*** BeasScript assistant.

Videos:
Display content of a datastore

3.6.1.1.3.1 beas script assistant

Starting programming with an empty page is a complex task.
The idea of a script assistant is that it inserts an example script that can be modified.

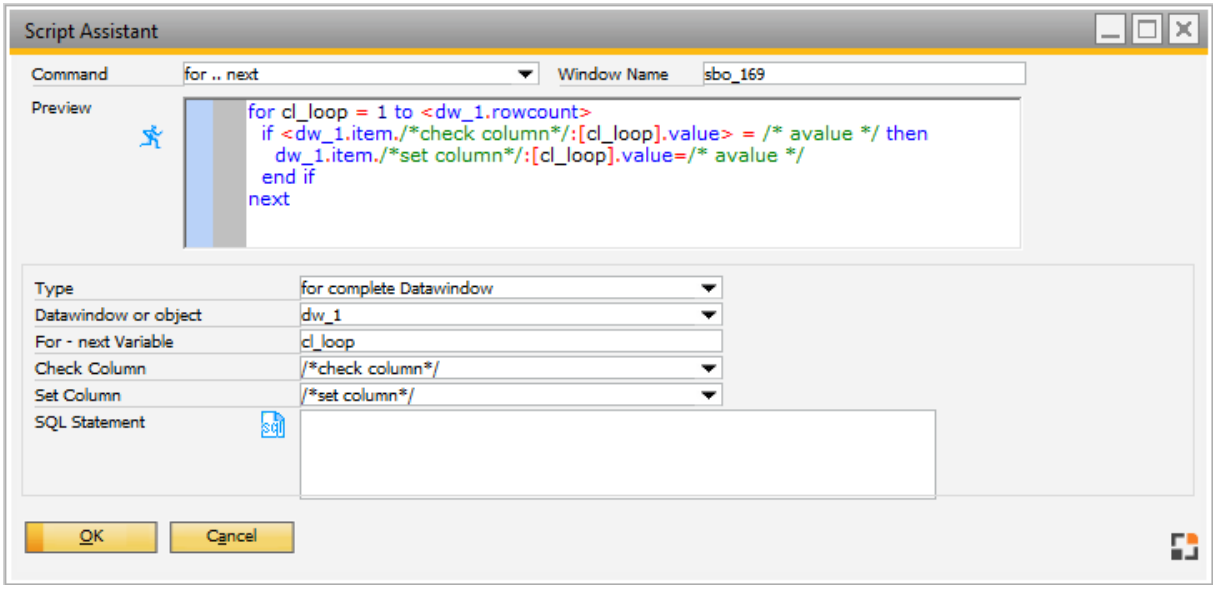
Open the script assistant in BeasScript editor – by clicking the / icon to assist the creation of a script.

In the Command you can choose the area, e.g. "for ... next" from a drop-down menu and you can see the generated script directly in the Preview section.

Related to the chosen command, there are additional parameters.
If you change the values, Beas generates the correct script automatically.

© 2026 Boyum IT Solutions A/S

Do not change the generated script on this place.



Window sys_script_assistent.psr

If you click "**OK**", Beas inserts the generated script in the Beas script editor or in the editor from which you executed it.

Here you can start custom development.

3.6.1.2 Add-on management

Beas Manufacturing 2026.04 includes proprietary add-on management. This allows every partner to develop their own customer-specific add-ons and install these for any number of customers. These can then be adapted in turn for each customer. It is also possible to create chargeable add-ons.

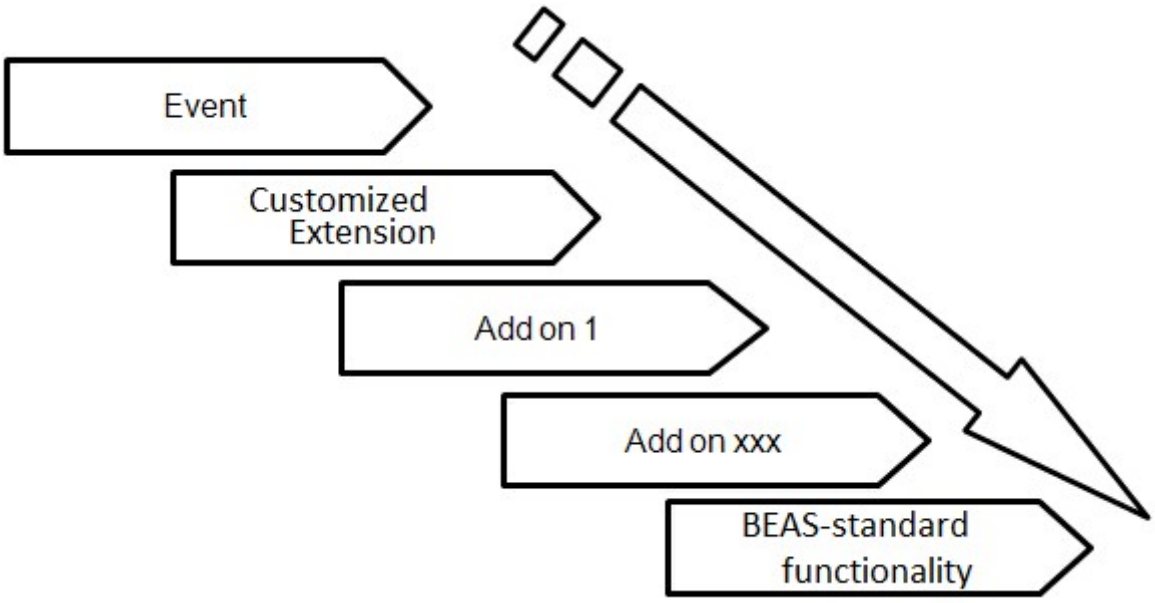
Overview of functions

- Add-ons can be installed as necessary in Beas
- Add-ons can provide new functions in Beas
- Add-ons slow beas either insignificantly or not at all
- Add-ons have minimal memory requirements
- Add-ons can be adapted on a customer-specific basis
- Customer-specific adaptations (project directory) are treated as an add-on but with the highest priority

Event handling

When an event is triggered in Beas, it is processed as follows:

© 2026 Boyum IT Solutions A/S



Creating add-ons

Add-ons are programmed in BeasScript. The corresponding windows are created with Powerbuilder or Infomaker.

All events are also accessed using BeasScript. At the end, it is all saved in an .src file which you can then simply copy for distribution.

Possibilities when creating add-ons using BeasScript:

- Proprietary rights management
- Proprietary report management (multilingual messages)
- Proprietary window-related translation
- Add-ons can be created in any language
- Proprietary installation, initialization, program ending and de-installation of scripts (also BeasScript)

3.6.1.3 CKS.DMS Software

CKS.DMS for SAP Business One: Document management system of company C.K Solutions

The document management system (CKS.DMS) is integrated in a way that an OCR process (text recognition) and creation of keywords is started automatically after scanning and printing a document in the background . Via document or business partner you can access all documents in a preview, which also provides a search feature over the complete archive.

© 2026 Boyum IT Solutions A/S

To archive other documents (e.g. Office Documents or images) there are simple archiving features available. These documents are included in the indexing, to achieve better results.

Use CKS.DMS to archive item master data, work orders, complaints, and QC-orders.

IMPORTANT:
Click here to see how to add a User.

See CKS.DMS Addon Installation

3.6.1.3.1 CKS.DMS Addon Installation

Installation prerequisites:

For CKS-DMS Addon at least beas version 9.1-004-056-000 is required, CKS.DMS at least in version 3.2.0.3.
Proceed to: **Administration > Add-ons > Add-on Manager (beas)**

Click on "**add**" and select "CKS.DMS" from list of AddOns. Activate CKS.DMS to install.

3.6.2 Produmex WMS integration

The Produmex WMS integration to Beas Manufacturing provides better manufacturing management capabilities to Produmex WMS users, and extends logistic support for Beas customers - especially companies requiring serialization.

Beas - WMS integration information package
Click the above link to find out about the latest changes and improvements of the integration. The details described in this documentation are updated upon each version update of both software products.
You can also access the documentation linked on the Beas helpsite: http:\\help.beascloud.com.

Current versions:

Produmex WMS 2026.04

See

Pick list for production work flow

Picking for production work flow

Pick list for Production window description

3.6.2.1 Picklist for production workflow

In this workflow, Beas provides the material requirements to Produmex WMS for a work order position to create a WMS Pick List.

Prerequisites

- In Produmex WMS the PMX SBO Notification Listener process must be installed and running.
- In Beas the Common Interface must be running.
- It is recommended to have the Reservation system active.

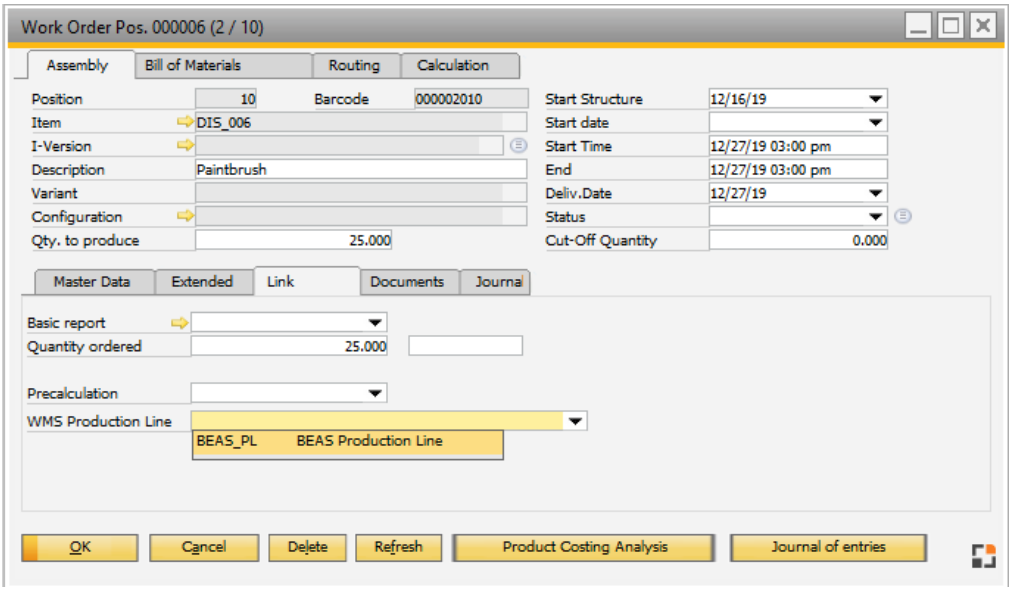
Limitation:

WMS picking process does not support Beas I-Version control.

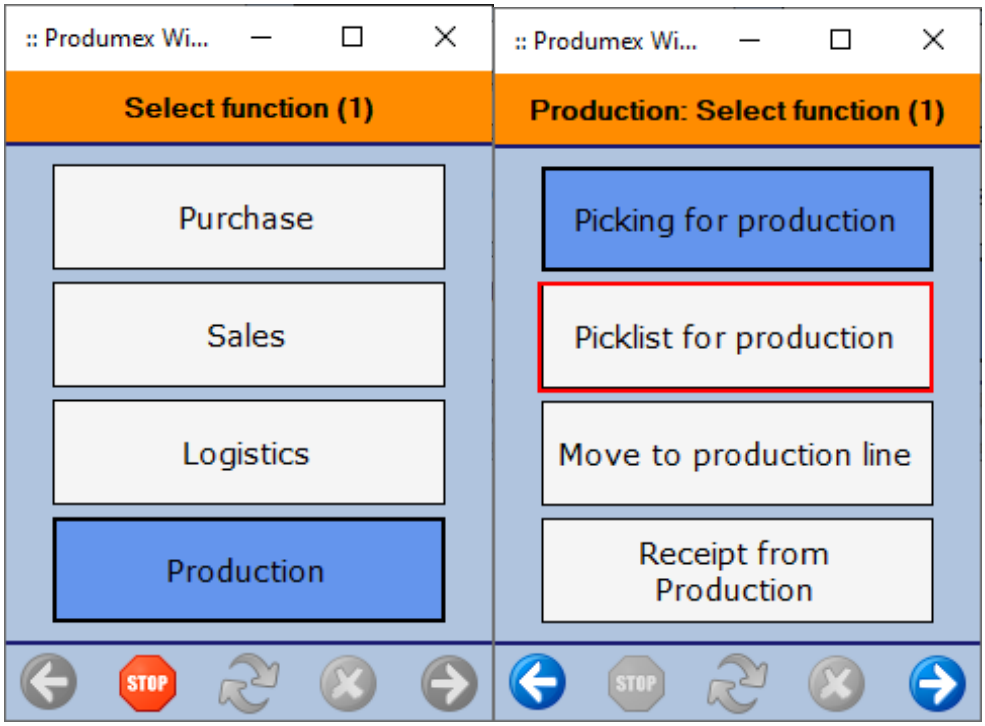
Workflow

1. **Produmex WMS:** Create a Beas type production line in Produmex WMS.
2. **Beas:** Create a work order in Beas and link the WO positions to the Beas production line in Produmex WMS.

© 2026 Boyum IT Solutions A/S



3. **Beas**: Send the proposal picking list to Produmex WMS from a WO/BoM position or multiple positions.
   See Picklist for production window description and Picklist for production - Partial picking Beas > WMS video demonstration.
4. **Produmex WMS:** Start picking for production using the WMS mobile client.



5. When the items are picked to the location, Produmex WMS communicates this to Beas and the items are reserved in the Beas reservation system. Then they can be consumed for production.

© 2026 Boyum IT Solutions A/S

3.6.2.2 Picking for production workflow

Produmex WMS

In this workflow, the mobile client of Produmex WMS is used to go through the picking for a work order position in Beas.

Prerequisites

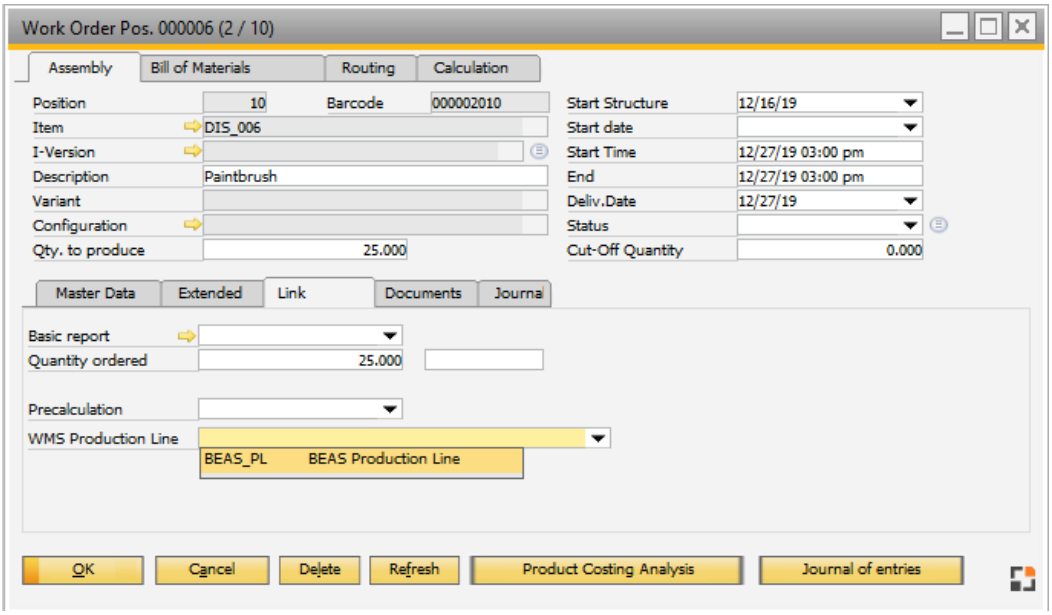
- On Produmex WMS, the PMX SBO Notification Listener process must be installed and running.
- On Beas, the Common Interface must be running.

Limitation:

WMS picking process does not support Beas I-Version control.

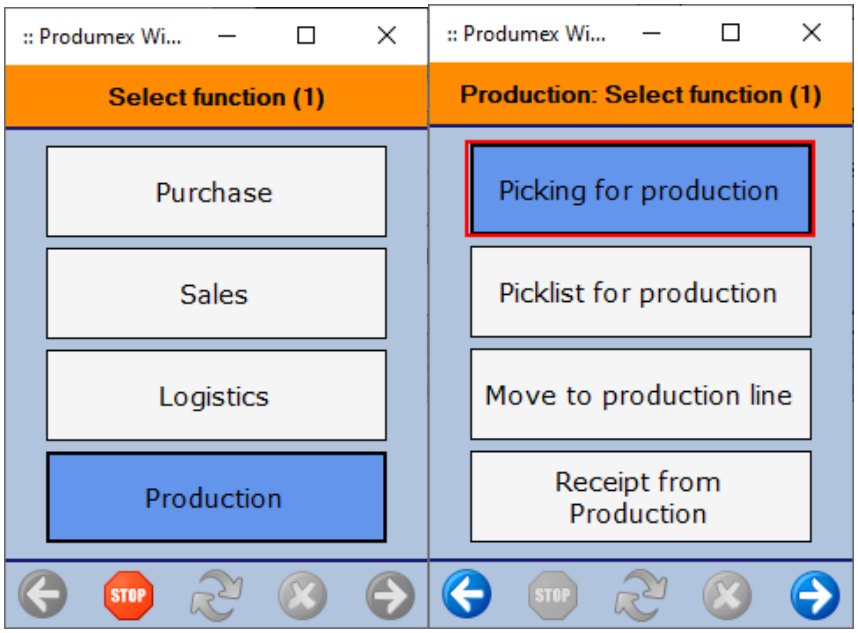
Workflow

1. **Beas:** Create a work order.
2. **Beas:** Link a Produmex WMS production line to the WO positions.



3. **Produmex WMS:** Use the Produmex WMS mobile client Picking for production option to view all the Beas production lines.

© 2026 Boyum IT Solutions A/S



4. **Produmex WMS:** Select the line and start the picking as usual.

3.6.3 beas usability extension

PATH: Administration > Add-Ons > B1 Usability Package > B1 Usability Config.

With the Beas usability extension you can easily change the behavior and structure of windows.

For example Beas enables you to:

- Define buttons and right-click menu entries,
- Add new fields and objects or change them,
- Set input fields to "input mandatory",
- Hide fields etc.

The Beas Usability Package requires:
- B1UP License (separate tool),
- Access rights to B1UP functionality (SAP user rights settings),
- Activation of Beas usability extension,
- Beas 9.3 or later

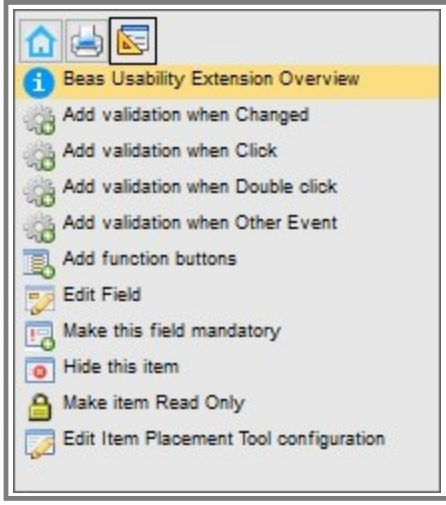
see Beas usability extension

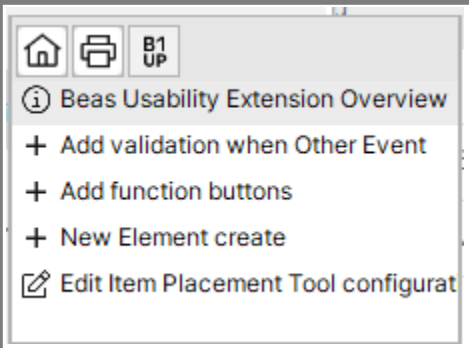
The Beas Usability Package functions are available via:

© 2026 Boyum IT Solutions A/S

PATH: Administration > Add-Ons > B1 Usability Package > Module Configuration > Beas Usability Extension Overview

- **Right-click inside of a window > Click on the icon** / B1 UP

Traditional style	Boyum Style
	




Functionality Overview

Field	Description
Beas Usability Extension Overview	Opens the setup window of all extensions for the current window. The overview shows all function buttons, validation definitions, and configuration options that have been created by this window. Furthermore, the setup window enables the user to add more definitions. If user-specific settings are being used, the edit windows must be opened through the administration window.  *Window sys_trigger_browse.psr* ***See*** Beas Usability Extension Overview.

© 2026 Boyum IT Solutions A/S

Field	Description
Validation Configuration	The New Validation button allows you to create a new functionality to determine when and what kind of functionality should be executed to validate your data. You can add validation of data as per events and conditions which you can pre-configure in this window. ***See*** Validation Configuration.
Edit function buttons	Adds function buttons above, to the right, below or as a right-click entry.
Adjust Elements	Edits properties of the current field directly. This function directly opens the Item Placement Tool and adds the current field to the list of altered fields. If the field is already present in the list the Item Placement Tool will jump right to it.  *Window sys_itemplacement_edit.psr* Item Placement Tool
Make this field mandatory	Defines the current field as mandatory field. The Item Placement Tool opens and the selected field is added. The property "mandatory field" is set automatically. Go to Item Placement Tool – Mandatory Field. This function is only available for input fields (Columns). Mandatory fields are displayed with a red background if they are empty. Saving or adding is not possible until all mandatory fields are filled.

© 2026 Boyum IT Solutions A/S

Field	Description
	Note: It is not possible to validate the formatting of numbers and dates.
Hide this item	Makes a field invisible The Item Placement Tool opens and the selected field is added. The property "Hide" is set automatically. ***See*** Item Placement Tool - hide To make the field visible again, simply remove the corresponding field definition in the Item Placement Tool or deactivate the property "hide" Special feature for input fields: When an input field is hidden all associated fields are hidden as well. Make item read only	Activates the write protection for this field The Item Placement Tool opens and the corresponding field is added. The property "read only" is automatically set. ***Go to*** Item Placement Tool - read only Read only items are not changeable and grayed out.
Item Placement Tool setup	Opens the Item Placement Tool where you can make changes to the window The Item Placement Tool can be opened directly. For example in order to change or delete existing configurations or add new ones. Tip: If user-specific settings are necessary, the Item Placement Tool must be opened via the Setup Overview.

© 2026 Boyum IT Solutions A/S

3.6.3.1 beas Usability Extension Overview

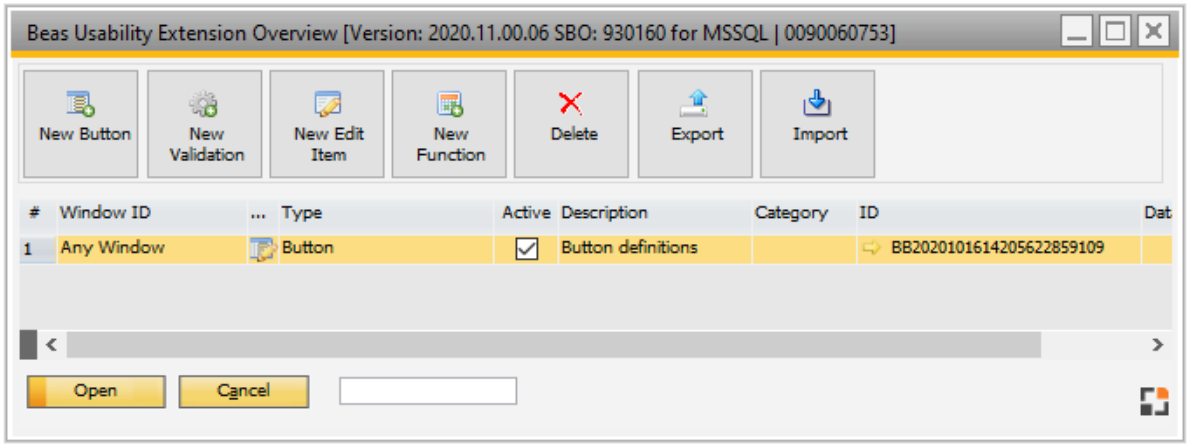
Authorization: Universal functions (BOY_B1UP_UF).
Window Settings are supported.

This window can be opened via:

1. Right-click > Beas Usability Package Icon / B1 UP > Beas Configuration Overview

2. Administration > Add-Ons > B1 Usability Package > Module Configuration > Beas Usability Extension: "Beas Customizing Administration" window.

If the window is opened by right-clicking, only the settings associated with the current window are displayed.
If the window is opened via the Add-Ons menu, all settings are displayed. The corresponding entry can be opened by double-clicking on the line.



Window sys_trigger_browse.psr

Boyum Style button design:

Field descriptions

Field	Description
New Button	Creates a new Function Button – Definition.
New Validation	Creates a new Validation Configuration.
New Edit Item	Creates a new Item Placement Tool definition.

© 2026 Boyum IT Solutions A/S

Field	Description
New Function	Creates a new Beas Universal function.
Delete	Deletes the specified definition.
Export	Export marked line in clipboard. You can import the clipboard to another database or can copy the information in an email.
Import	Import from current clipboard. Overwrite all existing entries with same ID.

3.6.3.2 Validation Configuration

By using the Validation Configuration, an action can be triggered based on a condition.

- Introduction

The Validation Configuration can be opened in the following ways:

- Right-click, Usability Package Icon **/** **> "Setup Overview" > "New Validation".**

Administration > Add-Ons > B1 Usability Package > Module Configuration > Beas customizing Administration.

A validation configuration is always window-related. Therefore, the corresponding window must be open.

Options for Validation Configuration:

- Actions while loading, saving, adding, or deleting data, e.g. checking whether an entry is correct.
- Actions while editing a field e.g. checking content.
- Actions by mouse-clicks (Left, right, and double-click with Shift, Ctrl, or a combination of both).
- Actions by key stroke, also in combination with Shift, Ctrl, or both.

Furthermore, non-window related processes are customizable.

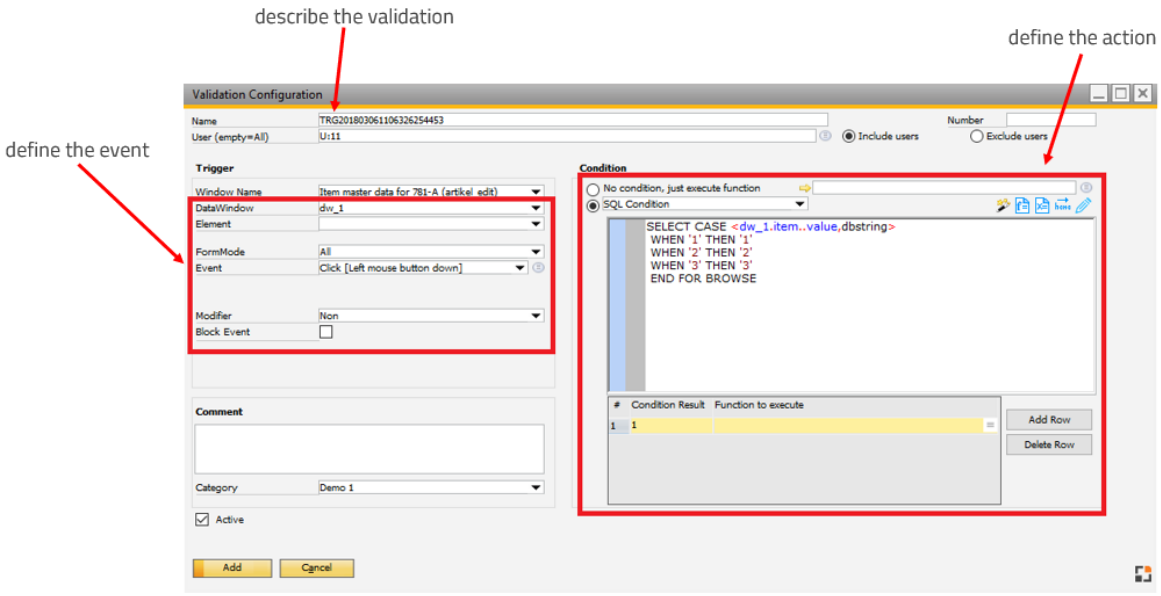
- Customization of processes e.g. creating work orders or time receipts in work orders.
- Determination of accounts, cost types for WIP (Work In Progress) bookings etc.

Window Structure

A validation consists of 3 areas:

© 2026 Boyum IT Solutions A/S

1. Description of the validation (describe the validation),
2. Description of the event to be monitored (define the event),
3. Description of the activity that has to be executed (define the action).



Window sys_trigger_edit.psr

How Is A Validation Created?

1. Create a new validation by right-clicking, then click on the Usability Package Icon / B1 UP via "Setup Overview" and then "New Validation".
2. Select the window that is related to this validation.
3. Enter a name that describes the valuation configuration.
4. Select the event.
5. Select the the remaining fields according to event type.
6. Define the action that has to be executed.

For more information ***see***: Form, Datawindow, Items.

Validation Definition

Field	Description
ID	Unique ID for for the validation – Definition. If an ID is not set manually, the system assigns one automatically.
Window ID	ID of the window for which the defined validation should apply.

© 2026 Boyum IT Solutions A/S

Field	Description
	Tip: The window specified here must be open in order to change its properties. ***See*** Form, Datawindow, Items.
Description	Text field where the validation can be described in further detail.
User (empty=All)	Defines to which users the definitions specified here will apply. You can indicate the validity of the definition / users in the Item Placement Tool, function buttons, and validation configuration. **The following rule applies:** Field is empty: There is no check Incl. User: The definition is only valid for the specified users Excl. User: The definition applies to all users except for the users specified here **A user can be:** - SAP User - SAP user group - Personnel (**Menu: Human Resources > Personnel**) In the selection window the corresponding user can be defined and taken over by the ("transfer button")

© 2026 Boyum IT Solutions A/S

Field	Description
	 *Window bde_personal_browse.psr*
Category	Defines the related category.

Trigger

Field	During event	Description
DataWindow	Item Event, DW Event	Determines which DataWindow should be checked. dw_1, can be dw_2.... dw_7, dw_master For buttons, right-click popup menu or toolbar: always "dw_master"
Element	Item Event	Determines which element should be checked. ***See*** event "click" and basic introduction Form, Datawindow, Items. **Buttons, right-click popup menu, tool bar** For Buttons use the object name of the Button. You can see the object name in the Debug window. Insert in DataWindow always "dw_master" and in Element the object name of the Button / Function, example "edit:" for open entry

</table>

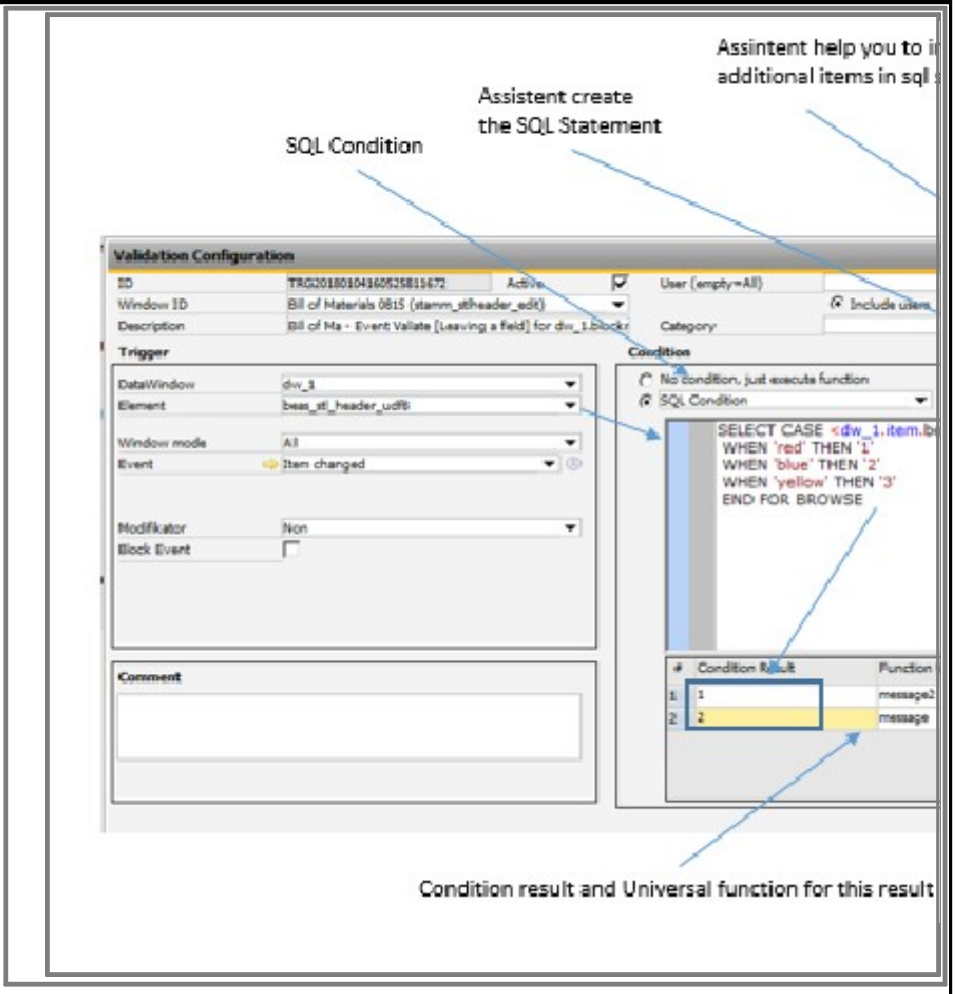
Condition

Field	Description
No condition, just execute	With this setting the Universal Function that should be executed can be directly selected. Both a Beas function and a B1UP Universal Function can be selected.

© 2026 Boyum IT Solutions A/S

Field	Description
function	
Script	A script can be run directly. BeasScript The Beas script defined here will be run directly.  This is the easiest way to respond to events: BeasScript. As soon as the event occurs, the code stored there is executed directly. Various wizards facilitate the creation of the script. Return: If the script ends with "`return failure`", then the subsequent processes in the event is not executed and the entire event is aborted (e.g. Delete, Update, Close) SQL Script Principle: by returning an SQL statement, it is determined which universal function should be called. 1. First the universal function has to be defined. 2. An SQL statement is defined, which returns a value depending on the condition. Using the "Magic Wand" function makes the SQL statement easy to create. 3. The table below defines which universal function should be executed.

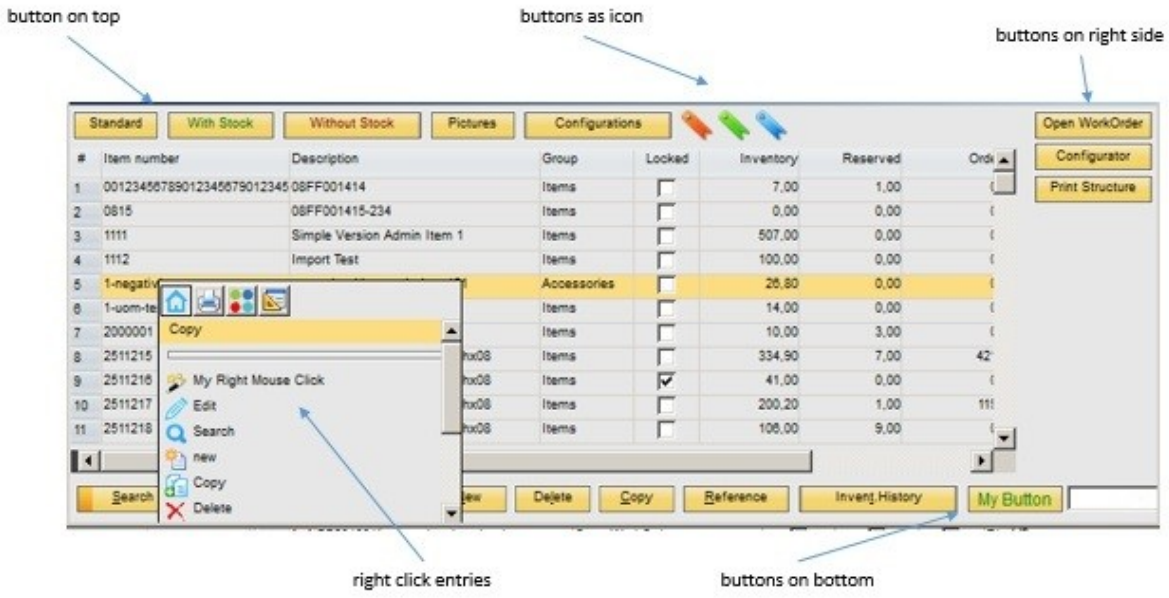
© 2026 Boyum IT Solutions A/S

Field	Description
	


3.6.3.3 Function Buttons

Buttons, icons, and right-click entries can be defined in various layouts in the following way:

© 2026 Boyum IT Solutions A/S



Introduction

Buttons can be created on top, on the right side, on bottom or via right-click. Furthermore, a function can be linked to the button.

- Select template
- Execute print macro (e.g. label printing)
- Execute Beas or B1UP Universal function (e.g. lists, reports, or dashboards)
- Execute direct scripts (e.g. open window)

The function Button Definition can be accessed via:

PATH: Administration > Add-Ons > B1 Usability Package > Module Configuration > Beas Usability Extension: Beas Customizing Administration window > Edit function buttons,

- Right-click > Beas Usability Package Setup Overview > New Button. An existing entry can be edited hereafter,

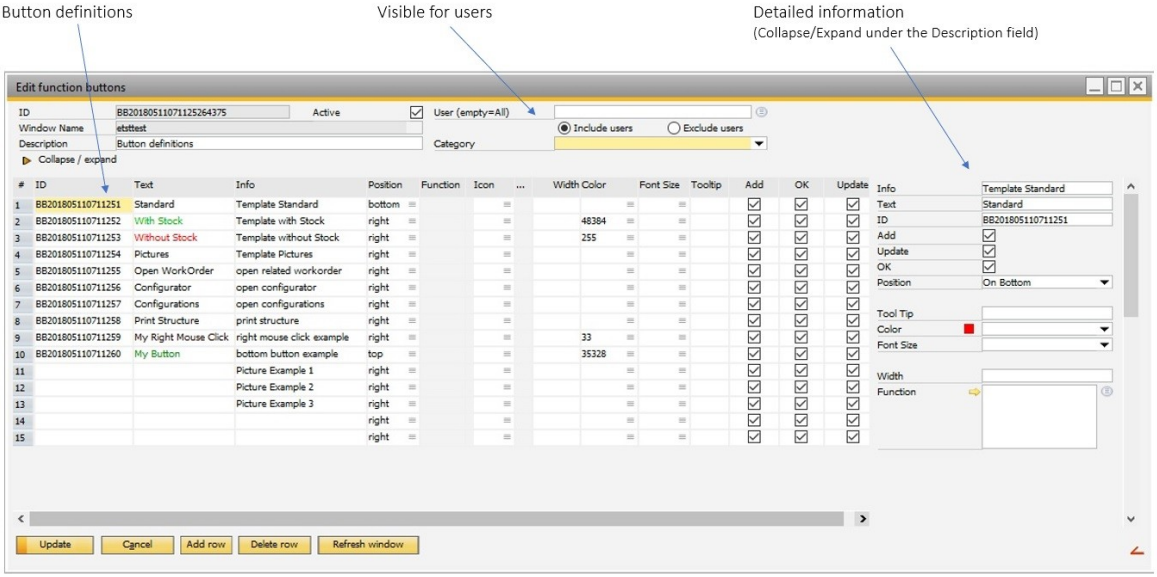
- Right-click > Beas Usability Package Icon * / B1 UP > Beas Usability Extension Overview,

- Right-click > Beas Usability Package Icon * / B1 UP > Add function buttons,

IMPORTANT: If there are buttons already created, instead of "Add Function Buttons", the right-click menu reads as "Edit Function Buttons".

*In **Boyum Style** this icon is: B1 UP

© 2026 Boyum IT Solutions A/S



Window sys_button_edit.psr

Add Button

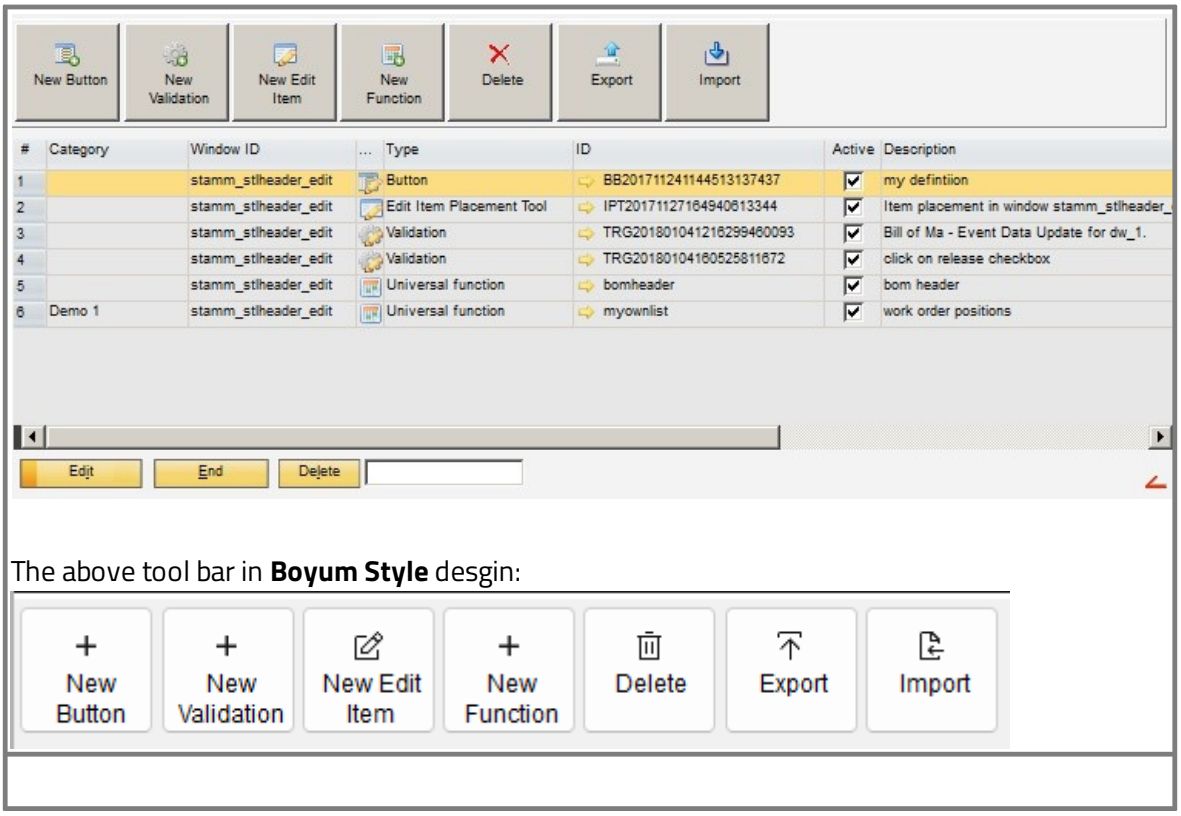
1. Add function buttons – right-click to open window.
2. Button "**Add row**".
3. Fill in the field "Text" for the button.
4. Select position (top, bottom, right, or right-click).
5. Define functions and associated parameters.
6. Add row.
7. Close the original window and reopen it.

User Specific Definition

Several button definitions can be made, e.g. user-specific. ***See***: User.

In this way, all active button definitions corresponding to the user rule are considered always. If more than one definition exists, they must be opened via **right-click > Beas Usability Package Icon > Setup Overview**. There is possibility for further definitions to be made or changed here.

© 2026 Boyum IT Solutions A/S



Window sys_trigger_browse.psr

Field	Description
ID	Unique ID for the function buttons – Definition. If an ID is not set manually, the system assigns one automatically.
Window ID	ID of the window for which the defined validation should apply. Tip: The window specified here must be open in order to change its properties. ***See*** Form, Data window, Items.
Description	Text field where the validation can be described in further details.
Active	The function buttons definition is only considered when this box is checked.
User (empty=All)	Define the users to whom the hereby specified definitions apply. You can indicate the validity of the definition / users in the Item Placement Tool, function buttons, and validation configuration. **The following rule applies:**

© 2026 Boyum IT Solutions A/S

Field	Description
	Field is empty: There is no check Incl. User: The definition is only valid for the specified users Excl. User: The definition applies to all users except for the users specified here **A user can be:** - SAP User - SAP user group - Personnel (**Menu: Human Resources > Personnel**) In the selection window the corresponding user can be defined and taken over by the ("transfer button")  *Window bde_personal_browse.psr*
Category	Select a category for the function button from drop-down menu.

Fields to set in the right window section:

© 2026 Boyum IT Solutions A/S

Field	Description
Info	Optional information or remarks.
Text	Label of the button or text by right-clicking.
ID	Unique ID. If an ID is not set manually the system assigns one automatically.
Add/Update/OK	Check boxes to define whether the button should be visible in the selected mode. Note: The check only takes place while opening the window. If the mode is changed in the window (e.g. from OK to UPDATE or back), there is no reloading or new validation of the buttons.
Position	Defines the position of the button. The button position – top, right, bottom, or in the right-click menu – can be selected here. It is not possible to indicate precisely where the button should be positioned. The button is either placed to the right of or under the previous button. The width is calculated automatically based on the text content but can be manually adjusted by inserting another value in the field "Width". Right-click entries are always displayed at the top of the right-click menu. Icon	Buttons can be displayed either with both a text and an icon or with an icon only. For buttons in the position either above or to the right, the size is fixed and cannot be changed. The button is only displayed as an icon. The caption (text) is placed on top of the button and the width (number of characters) is therefore limited to the width of the icon.

© 2026 Boyum IT Solutions A/S

Field	Description
	Position below: Icon width is not limited by the dimensions of other bordering/adjoining icons. Right-click: Icon is displayed to the left of the text.
Tool Tip	Shows more information when the cursor is placed over the button Here a description or extended information can be added. This is displayed as a "speech bubble" (tooltip), when the cursor is placed over the button. Note: This is not possible for right-click entries. ***Example:*** Tooltip with text "Additional information" is displayed, when the cursor is placed over the button. Color	Defines the font color for the button (not possible for right-click entry). You can select and calibrate color tones with sliding bars: Font Size	Defines the font size for the button (not possible for right-click entry).
Font Format	Defines font format (not possible for right-click entry).
Width	Defines the width of the button. Position right: Buttons always have the same width by default. Position below or above: Button width is calculated automatically. Right-click: Width is constrained by the width of the right-click menu and cannot be changed.

© 2026 Boyum IT Solutions A/S

Field	Description
	The calculated width can be overwritten.
Function Parameter Script	This defines the function that should be executed when clicking this button.  **Available function:**

Universal function	It is possible to select a universal function. It can be either a Beas universal function or a B1UP universal function. If the selection icon is clicked in the parameter, the corresponding selection list will be opened. By clicking the golden arrow the universal function can be opened directly. Note: B1UP Universal functions only work within the SAP environment. If Beas is started outside of the SAP environment, e.g. in a terminal solution, then the B1UP - universal function cannot run. Universal functions are often window-related. Therefore, you should only select the universal functions which can be used in the considered window.
Choose template	Switches to the specified template: Templates can be defined in lists. Switching from one template to another is only possible either via the Beas icon or by right-clicking. The option to use buttons is the best option. Here you can select the template which should be used when clicking this button.
BeasScript	A BeasScript can be stored for e.g. opening windows, creating transactions, or procedures.

© 2026 Boyum IT Solutions A/S

Field	Description
	Macro Print Macro Preview Macro Excel Macro PDF: Macros can be defined for each window, e.g. print work order report, print label, or create list as PDF. If macros have been defined, this execution can be stored for a button. Here, printing, preview, excel, and PDF export are available. All other settings are made in the macro itself.

3.6.3.4 Item Placement Tool

PATH: Administration > Add-Ons > B1 Usability Package > Module configuration > Beas usability extension > **New Edit Item** button.

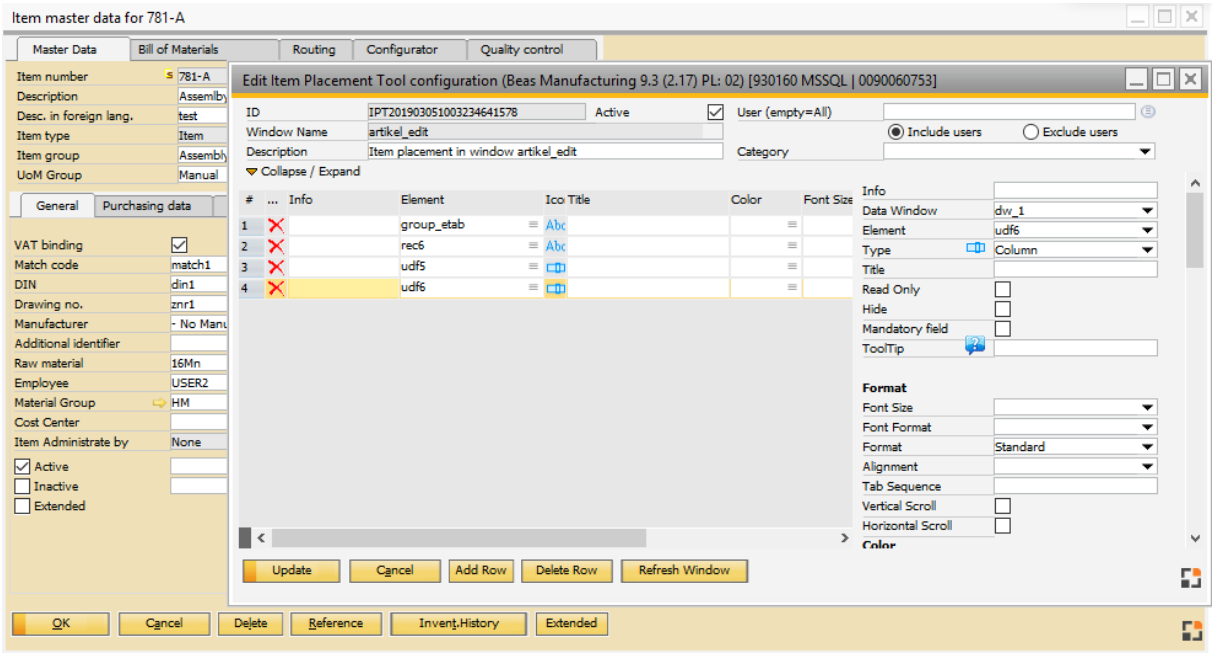
Configurations of window layout can be changed by using the Item Placement Tool

The Edit Item Placement Tool configuration window consists of three main sections:

Top section: Serves as a definition of the environment.

Bottom left section: Lists the changed fields of the given window.

Right window section: Editable properties of the fields listed on the left.



Window sys_itemreplacement_edit.psr

© 2026 Boyum IT Solutions A/S

See Overview

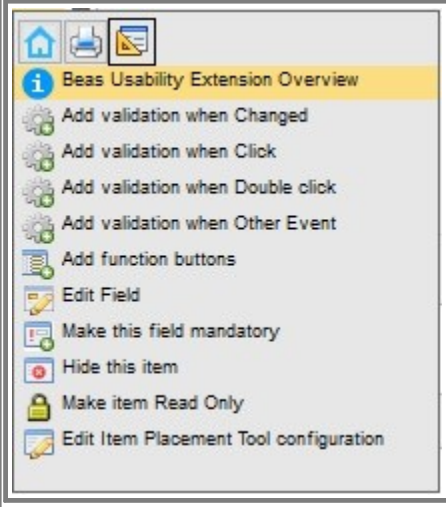
Introduction

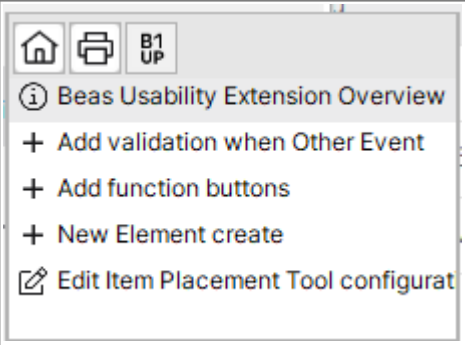
The Item Placement Tool can be accessed in the following ways:

- Ctrl + double-click on a field which should be edited.

- Right-click, select the tab with the beas Usability Package Icon / "Setup Overview". This displays all available Item Placement Tool configurations.

Choose the Item Placement Tool configuration you would like to work on by double-clicking on the line, or by highlighting the line and clicking on the edit button.

Tradition style	Boyum Style
	




The window to be edited should not be closed while being edited in the Item Placement Tool.
The field to be edited is marked with a "frame" and is highlighted in the Item Placement Tool (line 4 in this example) and the details of this field are displayed to the right of it.

The window to be edited is displayed with a yellow background which indicates that it is in "edit mode" (***See*** image above)
If a setting is changed in the Item Placement Tool this is immediately visible in the original window. Automatic preview is not possible. To create the correct result, click "Refresh window". In the original window the default color is displayed and can be edited and checked normally.

© 2026 Boyum IT Solutions A/S

When clicking on the Item Placement Tool window, it automatically comes into focus and the original window automatically returns to "edit mode".

Moving / Resizing a field

Change the mode to "edit mode" (yellow background) in order to move a field.

You can only move or resize the element which has the actual focus (big border).

Moving an Object: If the element does not have the large border, hold Ctrl and double-click on this element.

If the top left corner from the border of the moved item inside the other item, the system places it on the bottom of the other item.

If only the bottom left corner of the border of the moved item is inside the other item, the system places it on top of the other item.

It is also possible to move a field with Key Left/Top/Right/Button.

User Defined Fields (UDF)

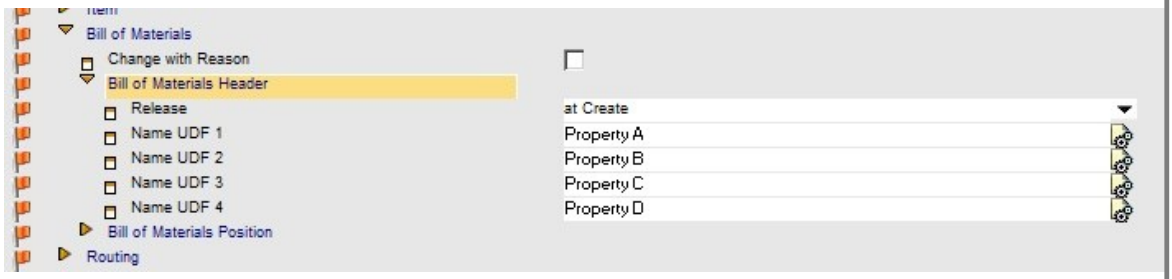
Unlike in SAP Business One it is not possible to define one's own UDF's in Beas. However, in most windows UDF1 to UDF4 of the type: "string" are available, furthermore also UDF5 to UDF15 e.g. in Bill of Materials, work plan, article version, and many others.

Special feature UDF1 .. UDF4

These are defined in the setup wizard and are immediately active and correctly positioned in all corresponding windows.

UDF1-4 are area-related and not window-related e.g. Routing Position: These are relevant for "Routing Catalog", "Routing" (List and edit window), Work order routing plan (List and edit window), as well as Precalculation. Formatting and definition of further properties is done directly via the setup wizard and also stored in the setup wizard. Definition of user dependencies is not possible.

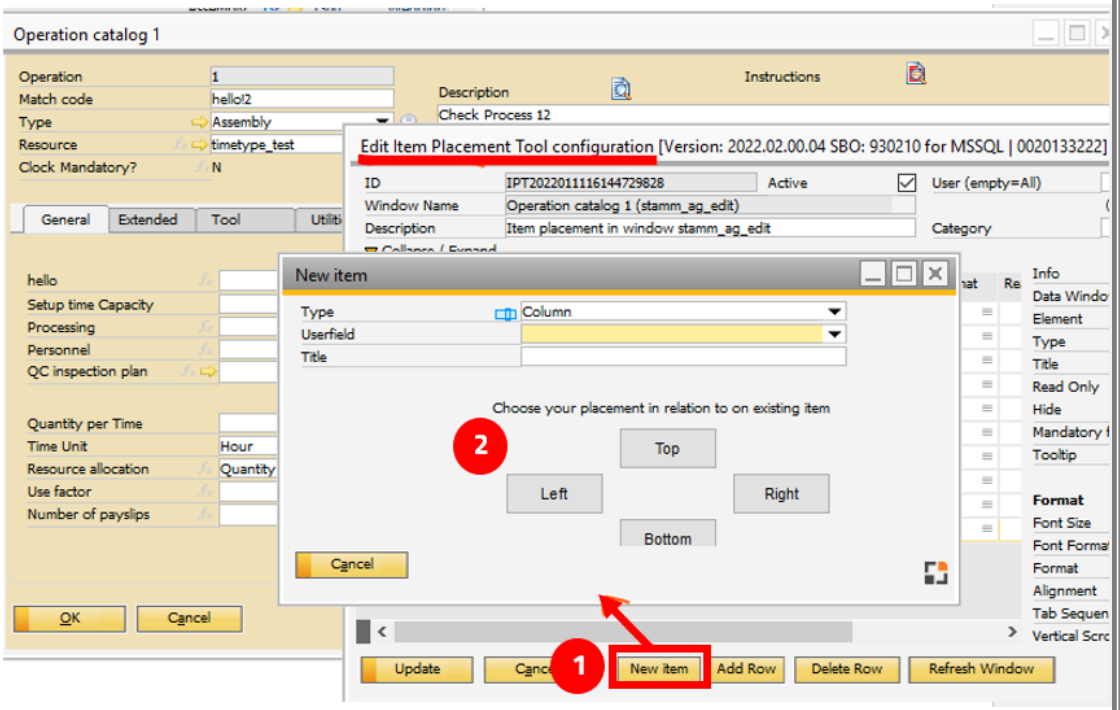
Example: **Configuration Wizard > Bill of Materials > Definition UDF1–4**



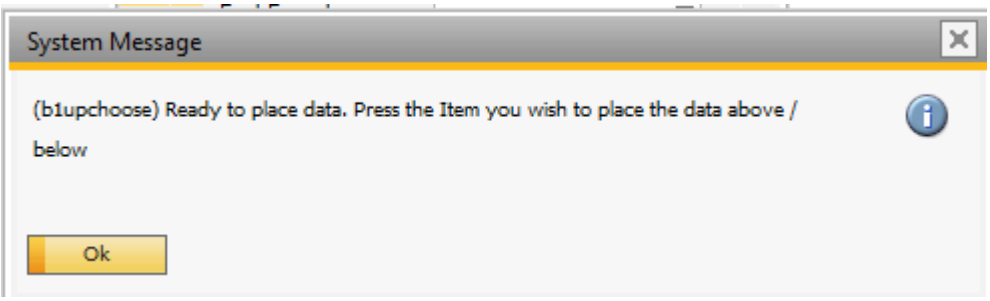
Create a New Item - Utilization UDF 5–15

© 2026 Boyum IT Solutions A/S

1. Click on the (1.) **New item** button.
2. Select the type: Column, text, Compute (= formula field), button, bitmap.
3. Insert all needed parameters (Userfield, Title or other related to the type) and click on one of the (2.) **Top/Right/Left/Bottom** Buttons to move it to the desired window section:



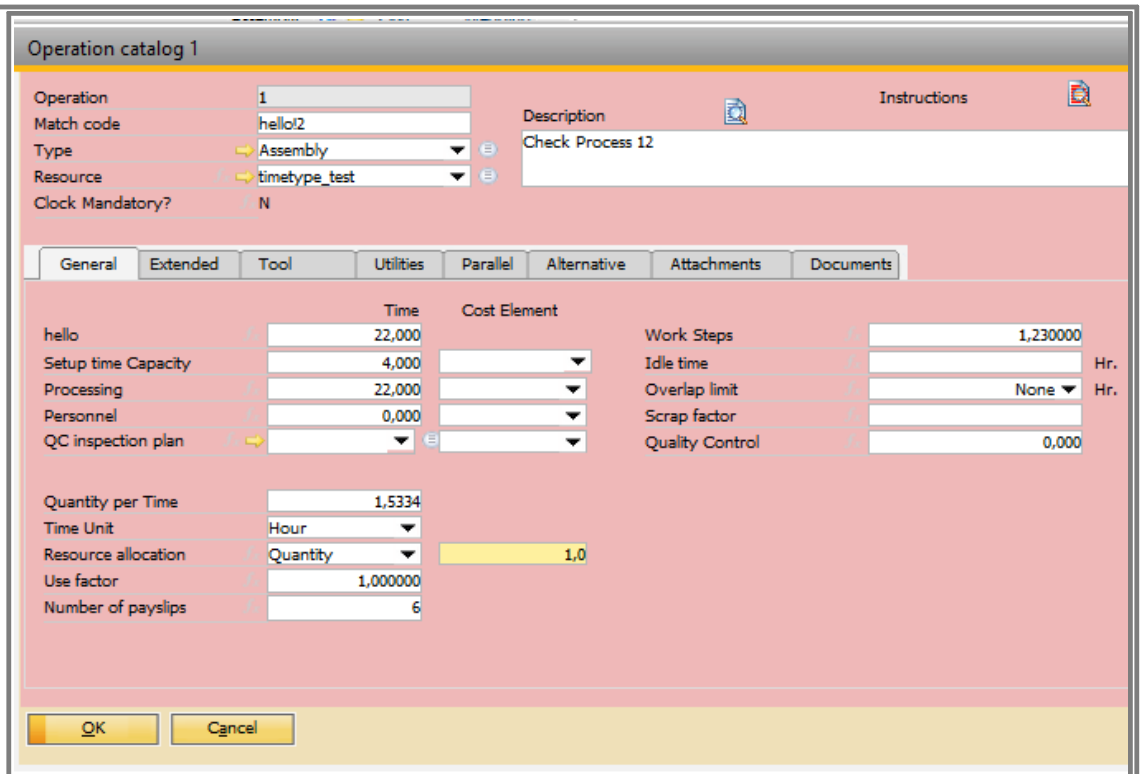
4. A pop-up message is displayed:



Click **Ok** and the window changes the color to "Click" mode:

The original window changes the color and is in “Click” Mode.

© 2026 Boyum IT Solutions A/S



Click on the element, on which you want to place your new element.
Do NOT click on label. Click on the element (the edit field) if you place a new column top/bottom of another column, then click on the edit field and NOT on the label of this field.
The system displays the new element directly and you can change additional properties of this new field.

Limitation:

This works only on simple forms. Sublists, windows with different subforms or ribbon bars are not changeable.

Change property inside the edit item placement tool window

You can only select the field which is currently visible in the view.
You can choose the item in the drop-down list or via Ctrl+double-Click in the related window.

NOTE:
If Edit item placement tool window is not opened and you make a Ctrl+double-click on an item, the system opens the tool window automatically and allows you to change this item.

Using template fields

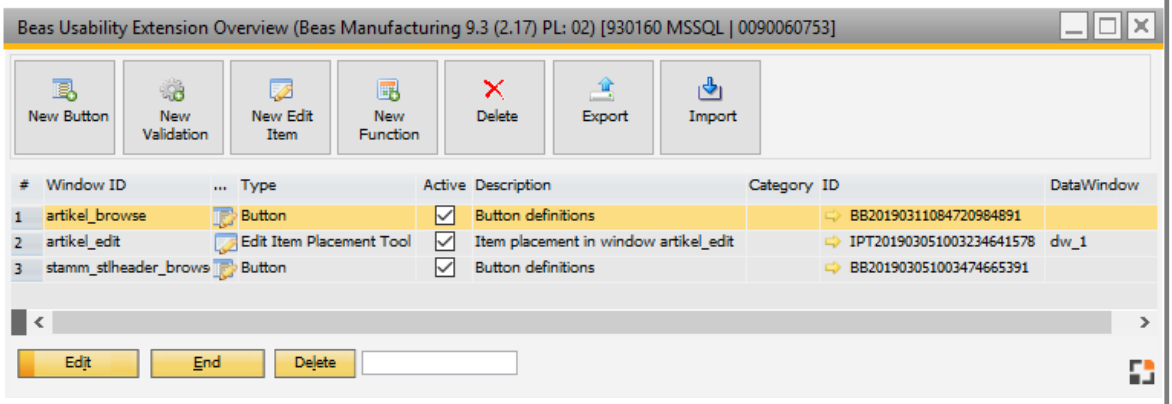
© 2026 Boyum IT Solutions A/S

In some windows Templatefield1 .... Templatefieldx are available. These sometimes have different lengths and types. These fields are not linked to the database and can be used for a wide variety of purposes.
They can be integrated in the same way as UDF fields.
However, loading and saving must be defined individually. This can be done via Validation Configuration – Event: select "Form Load" / "Form Add" / "Form Updated" from the drop-down.

User-Dependent Definition

There can be more than one configuration, e.g. user-dependent go to: User
All configurations that fall under the user rule and are active are always considered here.

If more than one definition exist, they must be opened via Right-click – beas Usability Package – Integration Icon / B1 UP – Setup Overview. Here more definitions can be made or existing ones can be changed.



Window sys_trigger_browse.psr

Boyum Style button design:

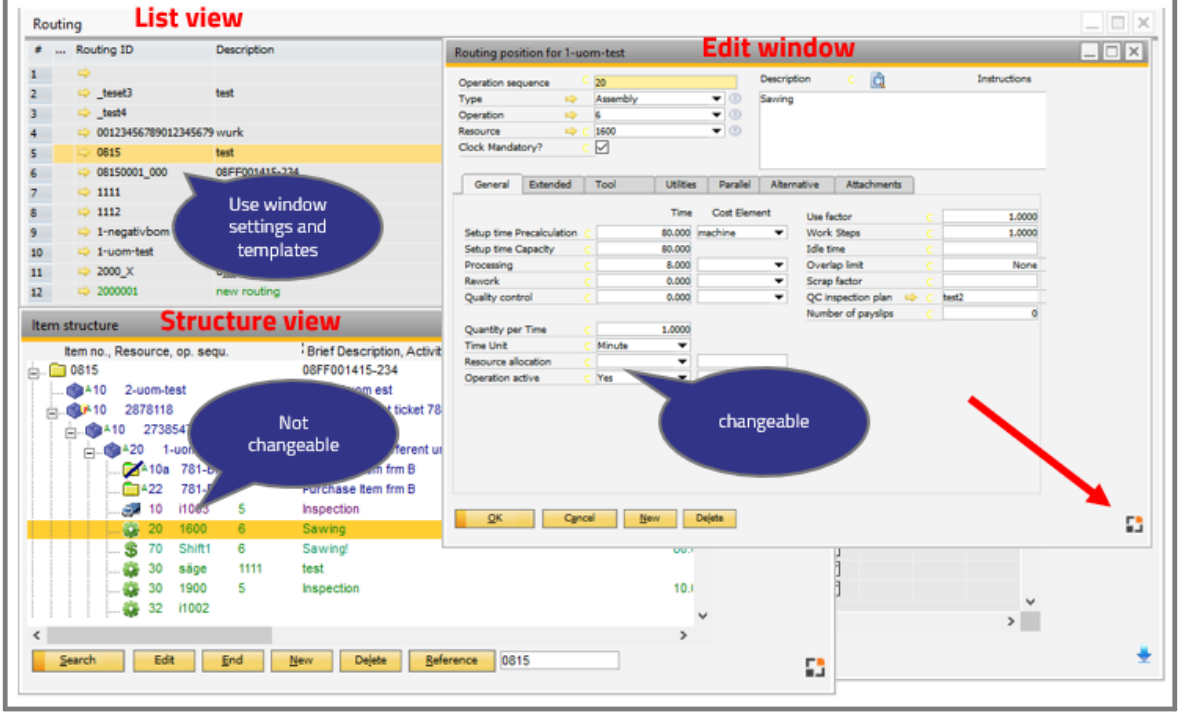
Note: If additional logic is behind the window, for example: "Bin location is only visible in case of bin managed warehouses", then this logic has higher priority than the definition set in the item placement tool.

© 2026 Boyum IT Solutions A/S

A configuration is linked to a window. You can define more than one configuration for a window. A definition can be e.g. user-dependent.

Limitations

- B1UP license is required.
- Only Beas windows can be changed. Beas windows can always be recognized by the Beas logo in the bottom right corner. In **Boyum Style (Beta)**, the logo is in the top left window header.
- The UDF fields 1–4 cannot be changed here.
- Windows of the type "List" or "Structure" cannot be customized .



Field descriptions of the Edit item Placement Tool

Header:

Field	Description
ID	Unique ID for the Configuration – Definition. If an ID is not set manually the system assigns one automatically.
Window ID	ID of the window for which the defined changes should apply. Tip: The window specified here must be open in order to change its properties.
Description	Text field where the configuration can be described in further detail.
Active	The configuration is only considered if the field is active.

© 2026 Boyum IT Solutions A/S

Field	Description
User (empty = All)	Define the users to whom the hereby specified definitions apply. You can indicate the validity of the definition / users in the Item Placement Tool, function buttons, and validation configuration. **The following rule applies:** Field is empty: There is no check Incl. User: The definition is only valid for the specified users Excl. User: The definition applies to all users except for the users specified here **A user can be:** - SAP User - SAP user group - Personnel (**Menu: Human Resources > Personnel**) In the selection window the corresponding user can be defined and taken over by the ("transfer button")

© 2026 Boyum IT Solutions A/S

Field	Description
	 *Window bde_personal_browse.psr*
Category	Defines the category. Configuration groups can also be defined here.

Field Description for further properties

Field	Available for	Description
Info	All	Optional information or remarks.
Data Window	All	Data Window where the field is located (dw_1 .. dw_7).
Element	All	Field ID If you want to create a new field (Bitmap/Text field, Computer field), you can define an own ID. It is not possible to create a new ID for an input field. You must choose an existing field. If the field is visible, you can change it, but you cannot insert a field 2 times.

Column:
Field description, displayed to the left of the field. For this purpose, a second field is generated with the ID of the element "_t", e.g. "UDF" field gets a title field (Text field) "UDF_t".
This text field gets the text that has been entered here.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Available for	Description
		 **Text:** Text that should be displayed. **Compute:** The formula from which the result should be displayed. Data Window Style. **Button:** Button text.
Font Size	All	Defines the font size: very small – small – normal – large – very large.
Font Format	All	Defines font format: normal, bold, italic, bold and italic
Read Only	Column	When active, the input field cannot be edited.
Hide	All	Visibility of field When active, the field is no longer visible. If it is a field of the ty "Column", the associated text and bitmap fields are also made invisible. The following fields are affected by this: **Title**: fieldname + "_t" **Arrow**: fieldname + "_pp" **Dropdown Icon**: fieldname+"_ppp"  **Note:** The "Hide" process is only validated when the form is op

© 2026 Boyum IT Solutions A/S

Field	Available for	Description
Mandatory Field	Column	If active, an entry in this field is mandatory. Otherwise, any kind of change or addition is blocked.
Focus ALT +	Column	If a letter has been saved, the field can be accessed directly via: "ALT" + the given letter (Hotkey).
Tooltip	All	If a text is specified here, it is displayed as a tool tip in this field.
Bitmap	Bitmap	Icon to be displayed.
Format	Column, Compute	Determines in which format the content should be displayed. Note: For the type "Column" this has an effect on the content check which can be specified during the validation. In numeric format, the alignment is automatically set to the right.
Alignment	Column, Compute, Text, Button	Determines the alignment of the text or the content: Left, Right, or Centered.
TAB Sequence	Column	Determines the TAB order.
V Scrollbar	Column	Enables vertical scroll, automatically scrolls down to the next line if the end of the line is reached by the cursor.
H Scrollbar	Column	Enables horizontal scroll; if the cursor reaches the right side of the column, the text will automatically be shifted to the right and the additional letters can be added.
Color	All	Determines the color of the field.
Background	Text, Column, Compute	Determines the background of the field.
Error Color	Column	Determines the background of the field if the content contains errors.
Empty Color	Column	Determines the background of the field when the field is empty and when an input is mandatory.
Tab Object	All	Determines the name of the TAB Object .

© 2026 Boyum IT Solutions A/S

Field	Available for	Description
		Here you can select the tab object in which the field should be located. If the field is moved to a tab area using drag & drop the field are filled automatically.
TAB tab	All	Determines the name of the TAB tab of the tab object selected in "Tab object". This can either be selected or set automatically if a field is inserted using drag & drop.
Position x/y	All	Determines the x and y position relative to the 0 point of the current data window. Define the X-/Y - Position from the field in PBUnit. 0 Point is the left/top position of the current formula (dw_1, dw_2..). or if the field inside a tab, then 0 position is left/top position from the tab object. PBUnit: Is a Formula unit. The size of one Unit is related to the current Zoom factor and default Font size.
Length, Height	All	Determines length and height of the field. Defines the length and height of the field in PBUnit. Default Height is always 60. PBUnit: Is a Formula unit. The size of one Unit is related to the current Zoom factor and default Font size. If a drop-down is inserted or the field is moved below another field with a drop-down, it may occur that the field length was not determined correctly. By using the arrows, the field length can be increased or decreased to match the length of the drop-down.

© 2026 Boyum IT Solutions A/S

Field	Available for	Description
		Text Distance	Column	Distance between title and input field . Determines the distance between the text field and the input field (Column). This is automatically set if the field is moved using drag & drop. It is also possible to set the value manually. The default value of 200px is used, when there is no manual value set for this parameter. If this is changed to a low value, the text might not be visible, due to the field overlapping the text. This is only considered if there is no position specified for for the text field separately. Rotation	All	Rotate the field Input is in 1/10th of a degree°, e.g.450 = 45°. Caution: The tex will be changed. For input fields, the display is rotated but the input is still displayed in 0°. ***Example***: Rotation 90°, red background with white text.

© 2026 Boyum IT Solutions A/S

Field	Available for	Description
Drop-down	Column	Defines a drop-down or selection list for this field For details click ➪ Go to: Drop-down. Golden Arrow	Column	If a script has been stored, a golden arrow is displayed to the left of the input field. If the golden arrow is clicked, the script stored here is executed.
Click	All	A script can be saved here. It is executed when clicking on the field.
Validation Type Value	Column	Activates a check of the input. 
© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Available for</th><th>Description</th></tr>
<tr><td></td><td></td><td>
The check of a field can be activated directly here.
The following checks are possible:
<table>
<tr><td>no Check</td><td>No check takes place.</td></tr>
<tr><td>between</td><td>The value must be between two values. Value 1 represents the lower value and value 2 represents the upper value. Therefore, the input value must be greater than 1 and smaller than 2.</td></tr>
<tr><td>smaller</td><td>Content must be smaller than the specified value.</td></tr>
<tr><td>bigger</td><td>Content must be bigger than the specified value.</td></tr>
<tr><td>contains</td><td>A list of values is displayed. Comma is used as a separator.
Example:
<code>red,blue,yellow</code>
In this case, only one of these 3 values is allowed.</td></tr>
<tr><td>SQL Script</td><td>The check is performed via a SQL statement. Information can be specified via the placeholder <dw_1.item.fieldname.value>.
Return: -1 = Input is faulty.
Return: 1 = Input is correct.
If the SQL statement returns anything other than -1, the input is also considered to be correct.</td></tr>
<tr><td>beas script</td><td>A BeasScript is executed.
If the script ends with "<code>return failure</code>", the input is incorrect.
If the script ends with "<code>return success</code>" the input is correct.</td></tr>
</table>
The check depends on the specified format.
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Available for</th><th>Description</th></tr>
<tr><td></td><td></td><td>
<table>
<tr><td>String</td><td>A string check takes place. Here the following rules apply:
<code>A < B</code>
<code>A1 < A2</code>
<code>1 < 9</code>
<code>1000 < 90</code>, since the input is always checked character by character and no numeric check is performed.

If the field is of the type "Date" it is converted into the format <code>yyyy/mm/dd</code> e.g. <code>2018/05/30</code></td></tr>
<tr><td>Numeric</td><td>There is a numerical comparison with 6 decimal places.

If the field is a date field, the date is converted to numeric format e.g. <code>2018/05/30</code> is converted to <code>20180530</code></td></tr>
<tr><td>Datum</td><td>A comparison of dates takes place.
The input of the the values to compare must be inserted in the format <code>yyyy/mm/dd</code> e.g. <code>2018/05/30</code>

If the field is of the type "String", it will be converted to a date type Datumstyp
If the field is of the type "Numeric" comparison is not possible.</td></tr>
</table>
If the field is a different type than the specified format, it will be converted to the appropriate format

Example field type = String, Format = Date
The content is automatically converted to <code>yyyy/mm/dd</code>. If it is empty it will be set to <code>1900/01/01</code>
</td></tr>
</table>

	 *Window sys_itemplacement_edit_dropdown.psr*

3.6.3.4.2 User

You can indicate the validity of the definition / users in the Item Placement Tool, function buttons, and validation configuration.

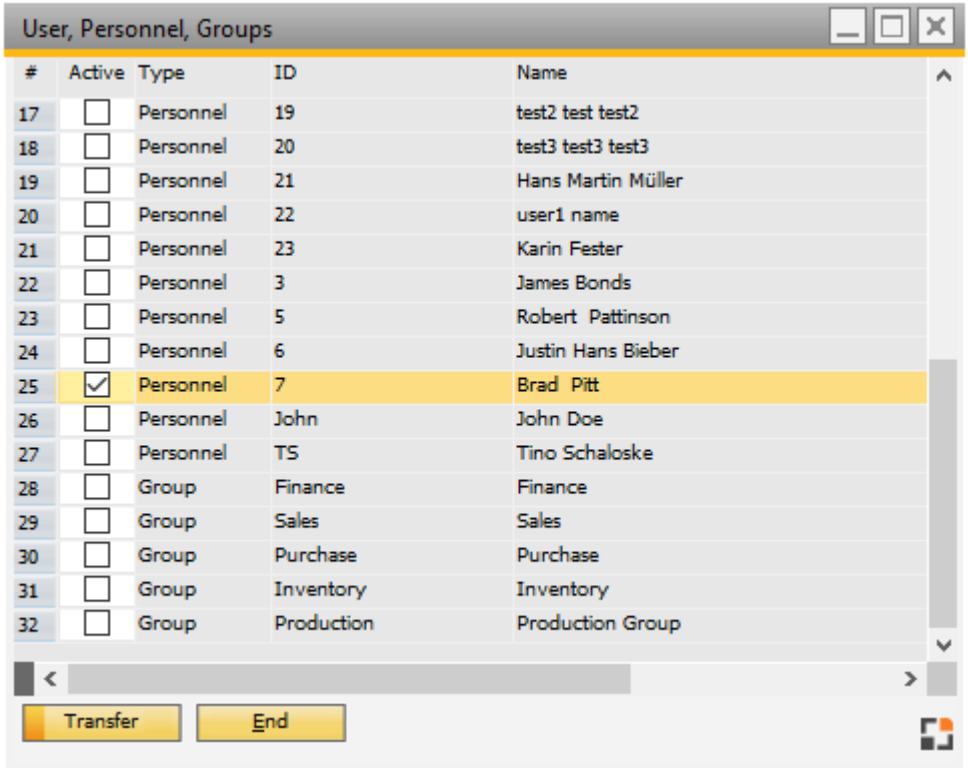
The following rule applies:

Field is empty: There is no check
Incl. User: The definition is only valid for the specified users
Excl. User: The definition applies to all users except for the users specified here

A user can be:
- SAP User
- SAP user group
- Personnel (**Menu: Human Resources > Personnel**)

In the selection window the corresponding user can be defined and taken over by the ("transfer button")

© 2026 Boyum IT Solutions A/S



Window bde_personal_browse.psr

3.6.3.5 beas Universal Function

Via Universal Functions different functions can be created. These functions can be stored in the window or in menus.

Beas Universal Functions can be used within the SAP Business One – environment, as well as outside the SAP Business One – environment (e.g. Terminal)

B1UP Universal Functions can only be used inside the SAP Business One – environment.

Therefore, to use Beas Universal Functions, you must first install B1 Usability Package (2018.05 or later) and Beas 9.3 or later.

The administration of Beas Universal Functions can be accessed in the following manner:

Path for Universal Functions that apply to a window:

> Administration > Add-Ons > B1 Usability Package > Module Configuration > Beas Usability Extension: "Beas Customizing Administration" window.

Path for Universal Functions that apply to a button:

> Right-click in the window > Beas Usability Package > Integration Icon / B1 UP – Setup Overview.

© 2026 Boyum IT Solutions A/S

The Beas Customization Administration window lists all the existing Universal Functions in the system. ***See*** Beas Usability Extension Overview.
To add a new function, click on the New Function button and the Beas Universal Function window pops up.

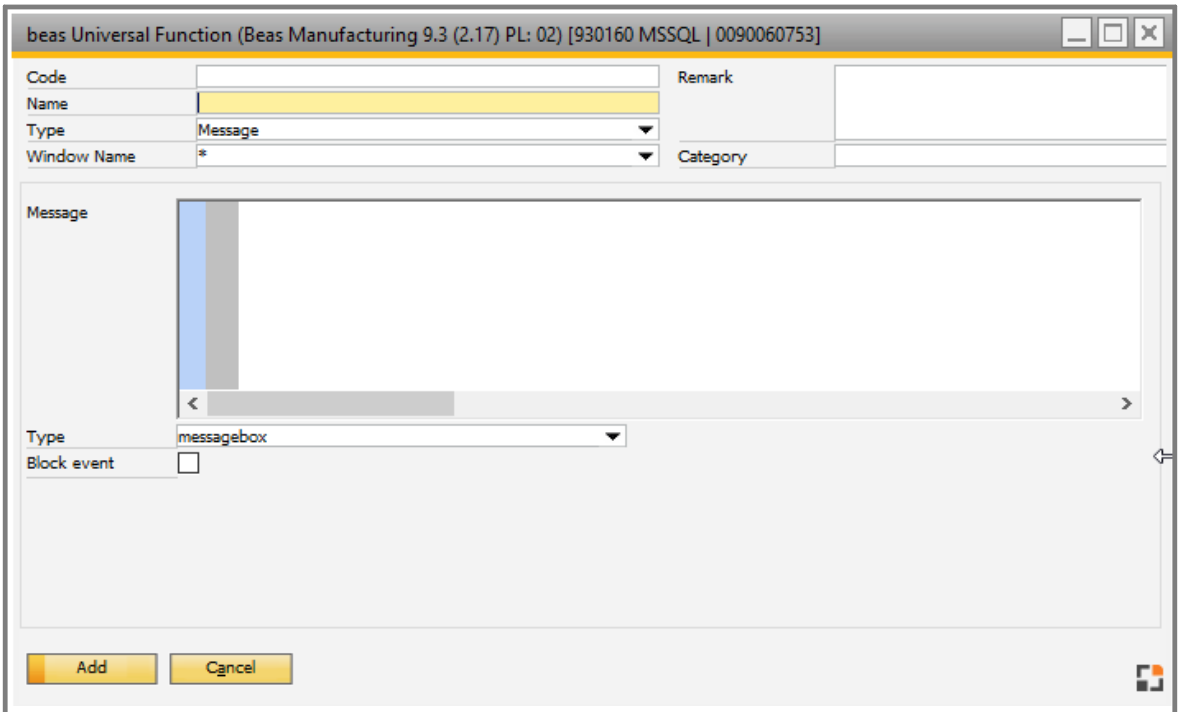
IMPORTANT: The Beas window used in the function must be opened in the background in order for Beas to automatically set the window name in the Universal Function. Otherwise, the user must type it manually.
The reason Beas does not have a drop-down list is that it has a large number of windows. If there is a Universal Function which is not window-related, there is the option for the Window Name called "Any Window" and no window should be opened in the background.

Note:
B1UP logic is executed when a screen is opened and not in any other moment.
Example:
You set a button to be displayed when you activate a certain tab. This means that all previous definitions are overridden, and the only way to "hide" this button is with BeasScript in any event when the button changes its status.

Adding new Universal Functions with the Beas Customizing Administration.

Open the Beas Customizing Administration window and click on "**New Function**" button to create a new function.
IMPORTANT: There is an access directly from the Edit Function Button window to create a function: **Beas Customizing Administration > Edit function buttons > Edit button.** Just click on the icon right of the Function field on the right and a new window opens. Click **New**.
The following window is displayed:

© 2026 Boyum IT Solutions A/S



–

Window sys_button_edit.psr

The window consists of two parts:

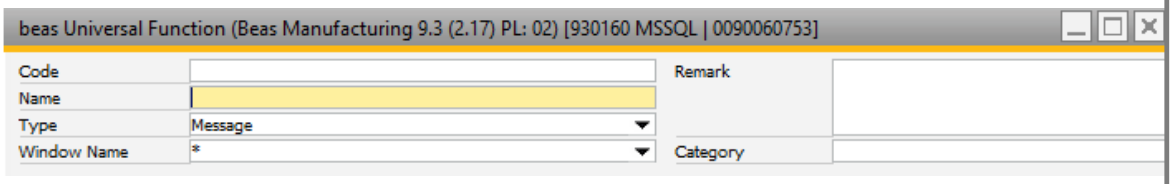
Header: Definition of the Universal Function,

Bottom: The appropriate input fields depending on the selected Type (SQL Report, Script, Message, or External Launcher).

The fields are described by type in details in the following table:

Universal Function Definition

The Header window section:



Field	Description
Code	This is a unique value. If this field is not set manually, the system automatically assigns a unique code when you click "Add". It is recommended to use the code assigned by Beas.
Name	Field used to define a name to the function.

© 2026 Boyum IT Solutions A/S

Field	Description
Window Name	Window where the function should be created. The window must be open. All open windows are available for selection. It is filled in automatically when creating the UF with a right-click in a Beas window. **Attention**: This field appears empty if the user creates the UF from the Beas Customizing Administration functionality.
Type	Determines which type of Universal Function should be created. The following 4 types of universal functions can be created: SQL Report: Enables the creation of lists. ***See*** UF SQL Report. Script: Executes scripts. ***See*** UF Script. Message: Displays message, error message, information etc. ***See*** UF Message. External Launcher: Runs external programs, display web pages or other media, direct printing of documents via Windows commands. ***See*** UF External Launcher
Remark	Field used to include a short description of the function.
Category	Field used to set a category defined in B1UP. Configuration groups can also be defined here.

3.6.3.5.1 UF SQL Report

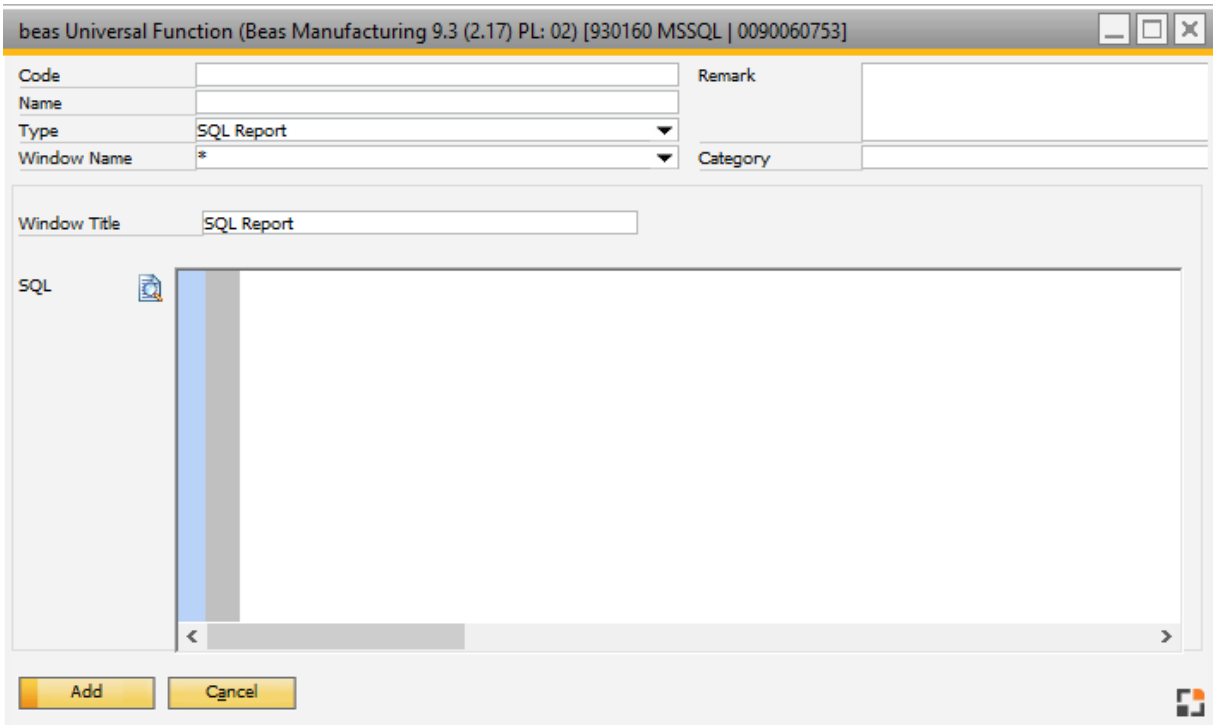
PATH: Administration > Add-Ons > B1 Usability Package > Module configuration > Beas usability extension >

1. Click **New Function** button >
2. select "Type": SQL Report.

The SQL Report Universal Function enables the creation of lists.

For field descriptions of Header ***See***: Universal Function Definition

© 2026 Boyum IT Solutions A/S



Window sys_function_edit.psr

Field descriptions highlighted:

Field	Description
Window Title	Field used to add a description for the report.
SQL	Field used to add the SQL report to be executed once the function is used. To create an SQL report, just click on the icon, to open the extended SQL Editor. The tool converts SQL code to HANA code only, not reverse.
Block Event	Check box option. You can set if the event should be blocked and cannot be executed. This can be a useful feature when validating data. For further details ***See*** Validation Configuration.

3.6.3.5.2 UF Script

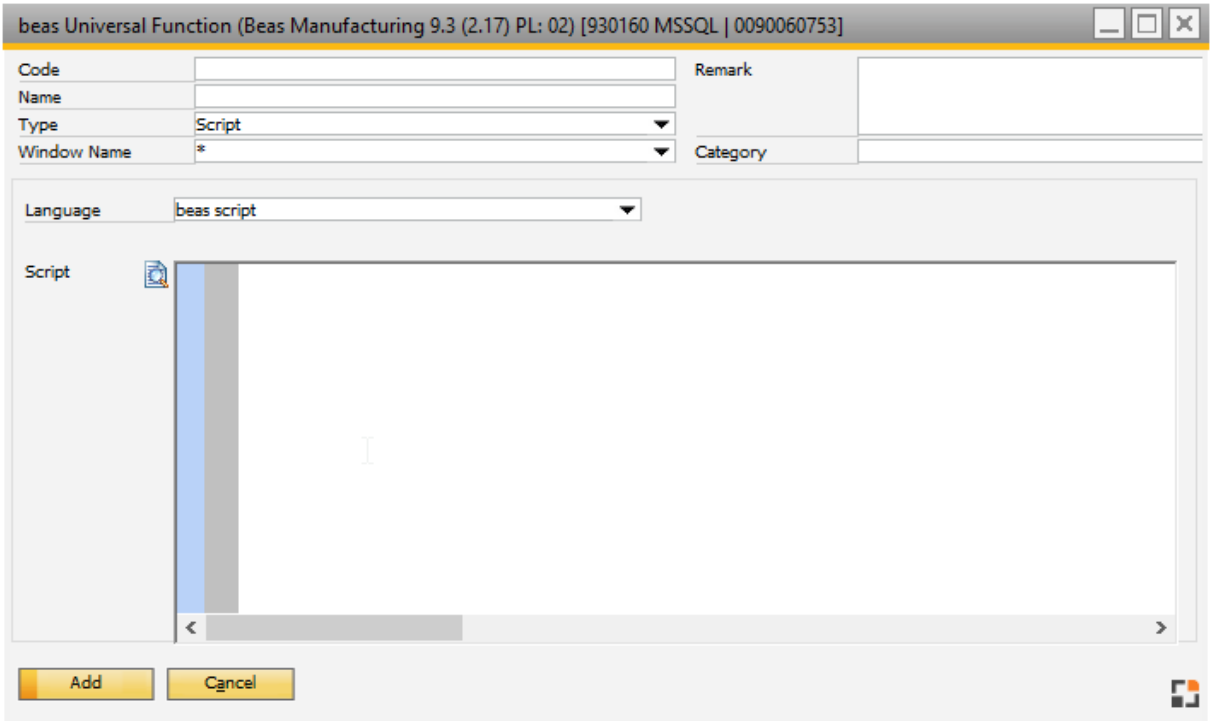
PATH: Administration > Add-Ons > B1 Usability Package > Module configuration > Beas usability extension >

© 2026 Boyum IT Solutions A/S

1. Click **New Function** button >
2. select "Type": Script.

With the help of the Script Universal Function you can enable the execution of scripts.

For field descriptions of Header ***See***: Universal Function Definition



Window sys_function_edit.psr

Field descriptions highlighted:
Language: Select in which language the script is to be written. Currently, only BeasScript is available.
Script: Field used to add the script that will be executed once this function is used. To start writing the script, click on the icon, then click on the Create Script Assistant icon in the beas script Editor. ***See*** Beas Script assistant

3.6.3.5.3 UF Message

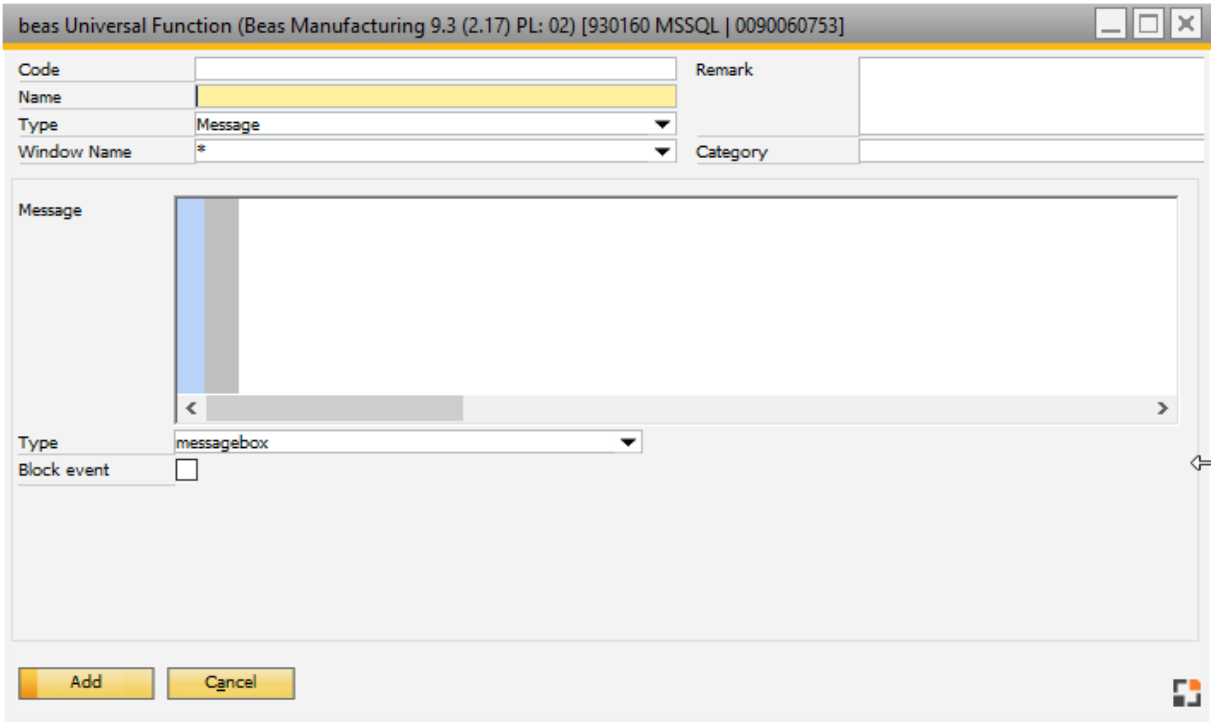
PATH: Administration > Add-Ons > B1 Usability Package > Module configuration > Beas usability extension >

© 2026 Boyum IT Solutions A/S

1. Click **New Function** button >
2. select "Type": Message.

The Message Universal Function lets you add text to various types of message windows.

For field descriptions of Header ***See***: Universal Function Definition



Window sys_function_edit.psr

Field descriptions highlighted:

Field	Description
Message Text	Field used to add the text to be shown in the message pop-up screen (e.g. message, error message, information etc.)
Type	Select the type of message you want to be displayed from a drop-down menu (Message box, Status bar success, Status bar Warning, Status bar Error or Question)
Block Event	Checkbox option. You can set if the event should be blocked and cannot be executed. This can be a useful feature when validating data. For further details ***See*** Validation Configuration.

© 2026 Boyum IT Solutions A/S

- Creating a UF Message:

To create a UDF, open a window e.g. work orders.

Right-click anywhere in the window > click on the / icon, and then click on  to open the Beas Customization Administration window.

Here you can see a list of all UF functions and buttons associated with the original window you opened.

Click on the New function button to create a new UF message for this window.

Example:

You might want to add a new message to be displayed for certain invalid figures. Fill in the Header and also select how you want the message to be displayed at the Type field.

Click on Add, your new message function will be added to the list of all functions associated with this present window.

3.6.3.5.4 UF External Launcher

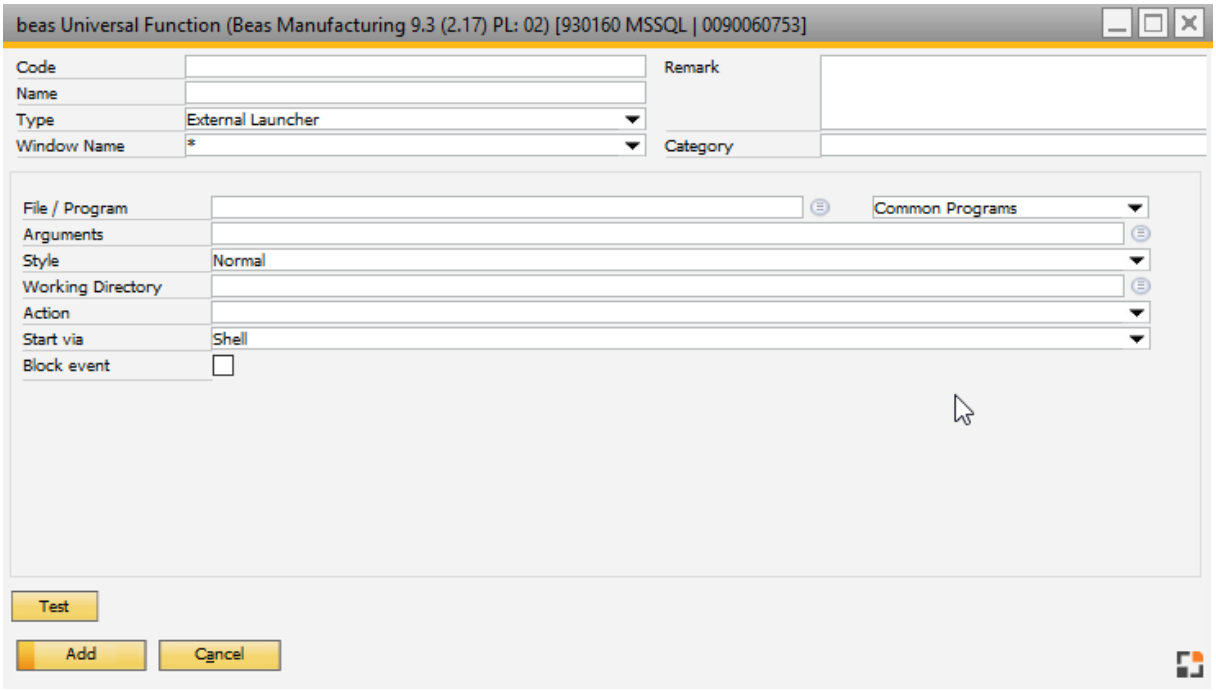
PATH: Administration > Add-Ons > B1 Usability Package > Module configuration > Beas usability extension >

1. Click **New Function** button >
2. Select "Type": External Launcher.

With the External Launcher Universal Function you can run external programs via Windows commands.

For field descriptions of Header ***See***: Universal Function Definition

© 2026 Boyum IT Solutions A/S



Window sys_function_edit.psr

Field	Description
File / Program	Clicking on opens an explorer window where you can select an .exe file on your system to be launched from B1 after the setting. The other option is making a selection from "Common programs". ***See*** next field description.
Common Programs	Select a common program to run With this drop-down menu you can select a common program (MS Word, Excel, Powerpoint, Firefox, Google Chrome, Internet Explorer, Skype, Acrobat Reader, Terminal server or Webpage) to be launched from B1. By making this selection, the "File / Program field is automatically filled and some other program-specific options are also filled or prompted automatically in the other fields. ***Example***: a word file will be used. The user must select the path where the word file is located (server or local) and the type of document used. (in this case, a Word document) The File / Program field is added automatically.

© 2026 Boyum IT Solutions A/S

Field	Description
Arguments	You can define the arguments you would like to run the program in, or, by clicking on you can add the path of the selected program.
Style	From a drop-down menu you can select how the screen should open for the program: Normal, Minimized, Maximized or Hidden.
Working Directory	By clicking on you can specify where the file is located. Once selected, it is automatically filled by Beas.
Action	With this drop-down menu you can choose the action you would like the selected program to perform: edit, explore, find, open, print or no action.
Start via	Select how to open and run the program With this drop-down menu you can select how the program should open and run. There are 3 options available: Run, Shell or Run and wait. - Shell: This option opens the file under what it is registered at. This is very useful if the user does not have certain programs installed and only needs to display the document. - Run: This option opens the program. - Run and wait: This option opens the program but freezes beas until the program is closed.
Block event	Check box option. You can set if the event should be blocked and cannot be executed. This can be a useful feature when validating data. For further details ***See*** Validation Configuration.

Test: Button used to test the defined function.

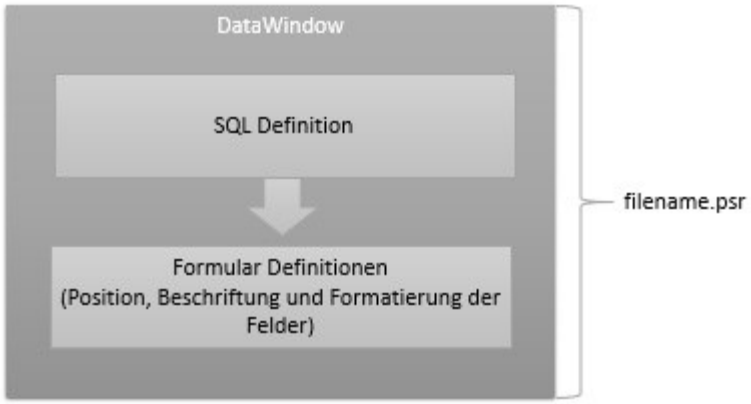
3.6.3.6 Form, DataWindow, Items

Introduction

In Beas the windows are defined similar to HTML contents and are saved in a file
Beas uses the form system "DataWindow", an object from the programming language "Powerbuilder" (C) Appeon, in order to achieve this. Which is similar to "Crystal".
There is a SQL designer and a Form designer available, which makes the creation on new windows very easy.

© 2026 Boyum IT Solutions A/S

The Window ID is the name of the form, i.e. the file with the extension ".psr", e.g. "article_browse.psr" for the article list.
in order to open this window only the name has to be provided, e.g. in BeasScript:
`opennewwindow=artikel_browse.psr`

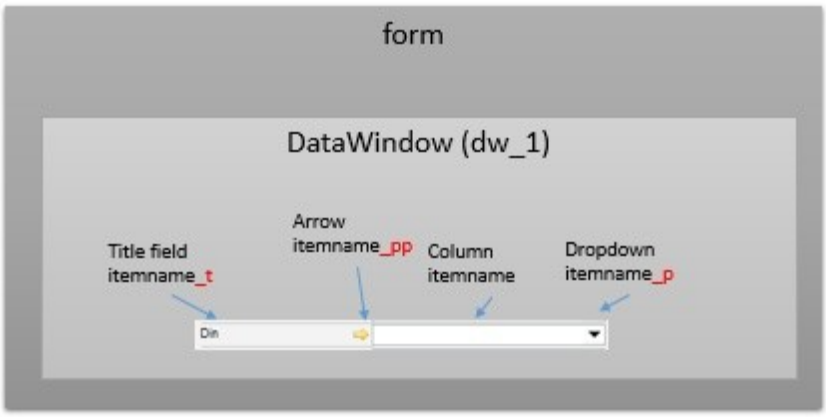


If a window (form) is loaded, it contains a form (DataWindow) with the name dw_1
There are windows which have several forms e.g. the MRP view. These windows are then addressed with dw_2, dw_3 etc. A maximum of 7 forms can be loaded.
The name of the window is always the same as the name of the forms in dw_1

When a form is loaded, the SQL statement is executed and stored in the SQL container. The content of the SQL container is shown in the items of the form.
If the field content is changed it will immediately be written back (Syncronized) to the SQL container. During an update, the contents of the SQL container can be written directly back to the database.

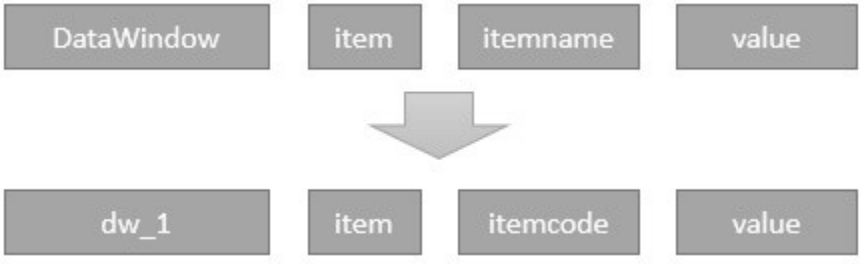
A form has the following structure:

© 2026 Boyum IT Solutions A/S



Scripts and events are always executed within the form.
Scripts are stored in a file for this purpose: name of form in dw_1 + extension: ".src"
For validation configuration, function buttons, Item Placement Tool and universal functions it must also be specified for which window (name of the file) they apply.

Within a script, a field is addressed as:



How to change a value in the field ItemCode:
dw_1.item.itemcode.value="new value"

In order to determine the value, the same syntax is used
in beas Script < and > is used in order to do this

<dw_1.item.itemcode.value>

"item" is a property of dw_1. This also has other properties such as x-Position, y-Position, length, width, and much more
e.g.
`dw_1.x=100` moves the form to x-Position 100

© 2026 Boyum IT Solutions A/S

`<dw_1.rowcount>` returns how many result rows there are in the form

the "item" is however also a separate object with properties. e.g. "value" is the content
Other elements are: x, y, width, color etc.
`dw_1.item.itemcode.x=1000` moves the field to the x-Position 1000 within the form

A list can contain several result rows. The line number must be specified accordingly
this is done with the following syntax (BeasScript):

<dw_1.item.itemcode:[line number].value>

e.g. for line 5
<dw_1.item.itemcode:5.value>

Variables should be enclosed in brackets
e.g.

```
setvar=linenumber=5
messagebox=<dw_1.item.itemcode:[linenumber].value>
```

Formatting

If a field should be inserted into a SQL statement, it must be formatted.
Formatting is defined as follows:
<dw_1.item.itemcode:[linenumber].value,format>

The following formats must be used in the SQL statements:

Format	Syntax	Example
String	dbstring	`select * from "OITM" where "ItemCode"=<dw_1.item.itemcode.value,dbstring>`
Number	num(x)	`update U_myTable set "Quantity"=<dw_1.item.quantity.value,num(6)>`
Date	dbdate	`update U_myTable set DeliveryDate=<dw_1.item.deliverydate,dbdate>`

Within the script another formatting takes place

Format	Syntax	Example

String		`if <dw_1.item.itemcode.value> = "A001" then`
		`  ...`
		`end if`

© 2026 Boyum IT Solutions A/S

Format	Syntax	Example

Number	#0.000000	`if <dw_1.item.quantity.value,#0.000000> n> 10 then`
		`  ...`
		`end if`

Date	yyyy/mm/dd	`if <dw_1.item.deliverydate.value,yyyy/mm/dd> <`
		`<today,yyyy/mm/dd> then`
		`  ....`
		`end if`

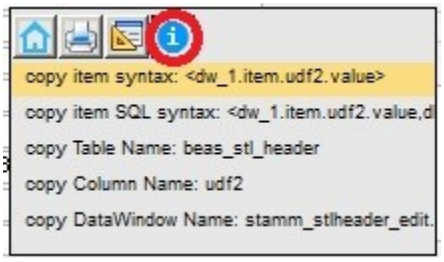
How can a field name be determined in a form?

There are several options to do this:

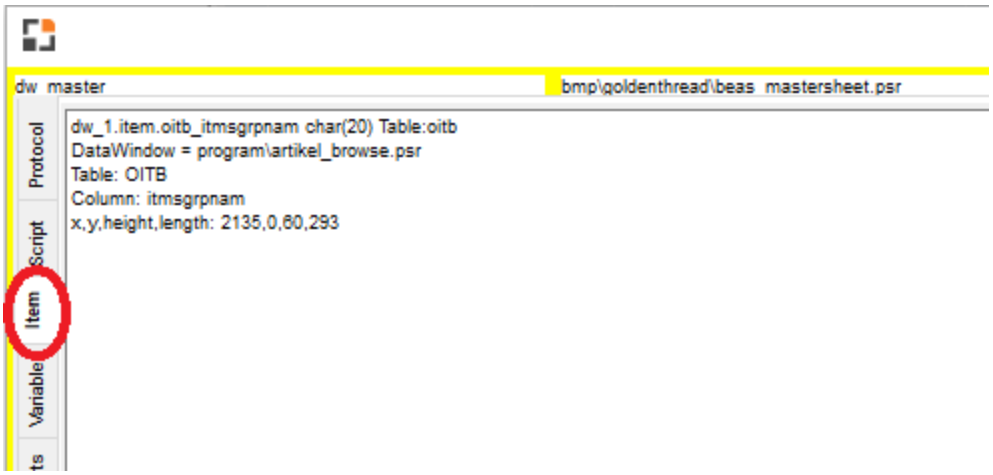
Go to: **View > System Information** (Ctrl + Shift + i).

If this is active: **Right-click > Tab** .

Here the field name can be copied to the clipboard.



Or in the opened debug window 2: click on the Item-tab, hold the Ctrl key and place the cursor over the corresponding field, then release the Ctrl key:



3.6.4 B1 Usability Package

The following topics instruct you how to use the B1 Usability Package with Beas:

© 2026 Boyum IT Solutions A/S

Open Form

Beas placeholder

Menu entries

B1 UP Usability package Documentation

Script / Customizing Documentation 2026.04.0

3.6.4.1 B1 openform

With macro function "openform" you can open most Beas forms:

```
openform(BEAS:[formname]|Parameter|Parameter);
```

Example:

The following command opens the work order window:

```
openform(BEAS:Workorder|500);
```

> Note: In Beas many windows you need more than one parameter, for example: the Work order position window needs Document Number | Line Number

Example:

The following command opens the work order position window:

```
openform(BEAS:Workorder|500|10);
```

You can work with Stores

```
@store1=500|10;
openform(BEAS:Workorder|@store1);
```

For more information ***see*** Script / Customizing Documentation 2026.04.0

3.6.4.2 B1 beas placeholder

In Beas, placeholders are defined with `<fieldname>` syntax , whereas in B1UP the placeholder syntax is `$[x]`.

It is possible to read fields from a Beas window with the `$[x]` syntax.

Syntax: `$[BEAS:x]`

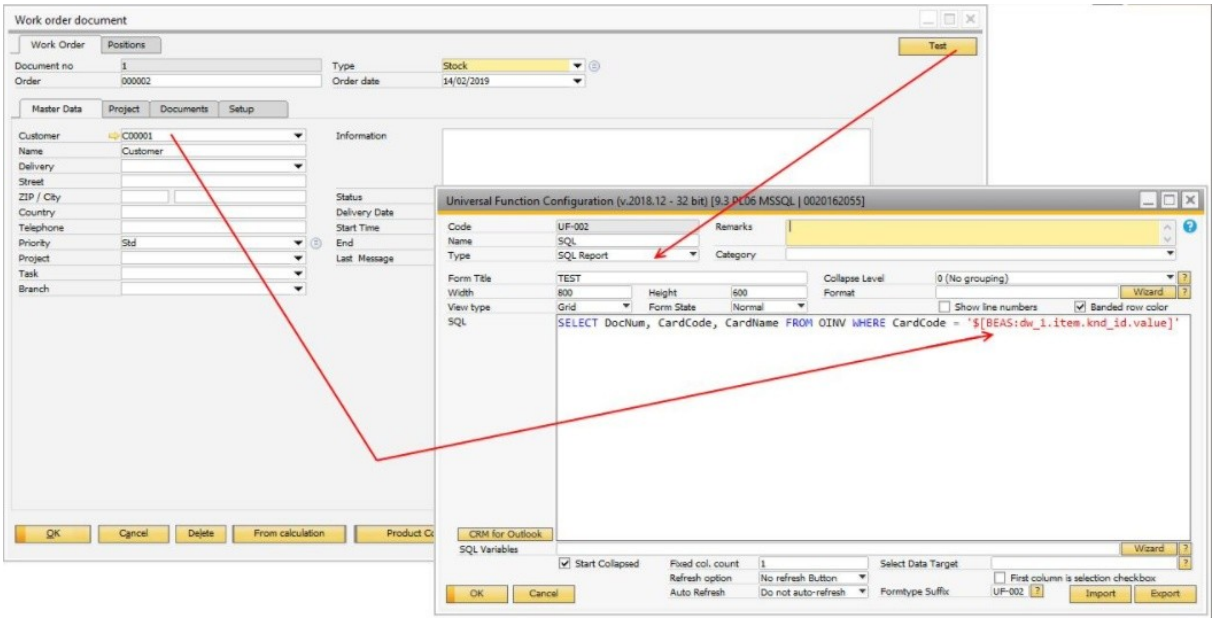
Example: `'$[BEAS:dw_1.item.itemcode.value]'`

You can use Beas Format functions, for example format "dbstring" for SQL format:

© 2026 Boyum IT Solutions A/S

```
select "ItemName" from "OITM" where "ItemCode"=
'$[BEAS:dw_1.item.itemcode.value,dbstring]'
```

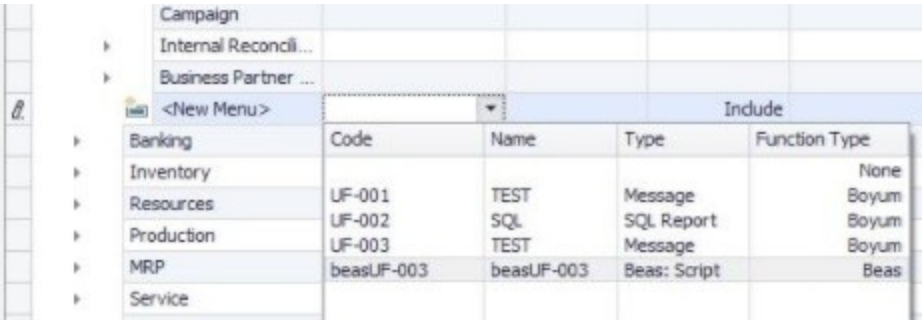
See Form, DataWindow, Items



3.6.4.3 B1 Menu entries

You can insert Menu entries with B1UP.

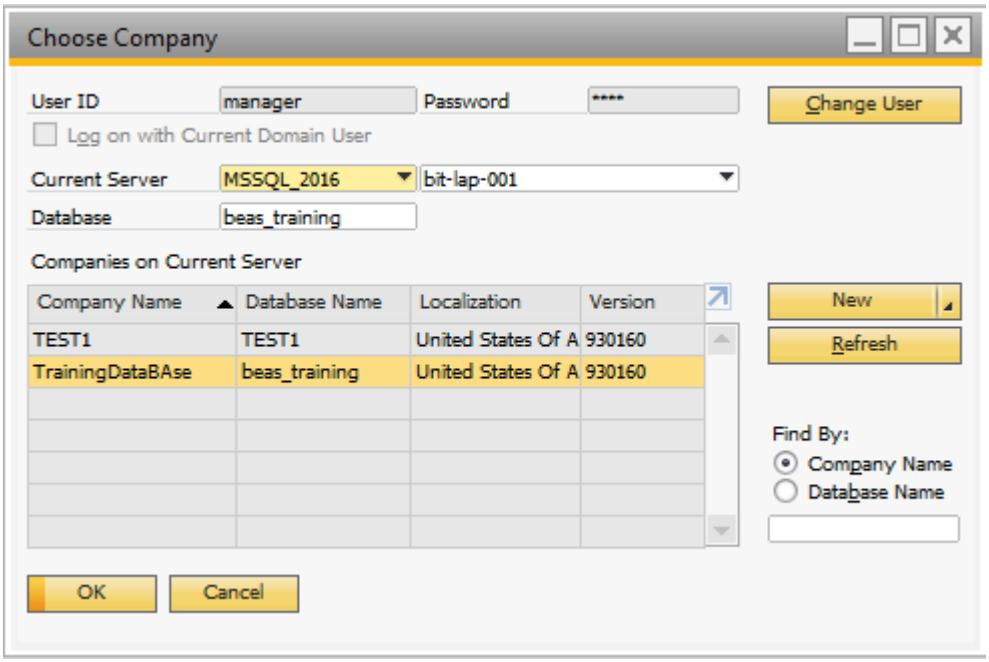
It is also possible to call Beas universal functions.
Beas universal functions always start with "Beas", for example "beasUF-003".



3.7 Change company

With this function the company or user can be changed without restart. The system allows managing different databases without closing SAP. Beas is restarted.
You can access the screen below after clicking the "**Change Company**" button on the SAP B1 login screen, or by selecting it from **Administration > Choose Company**.

© 2026 Boyum IT Solutions A/S



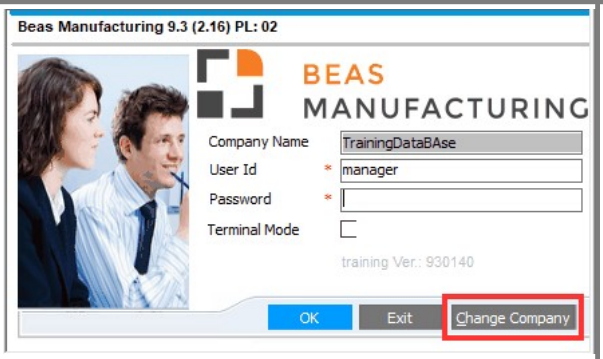
Window beasgui_sbo.psr

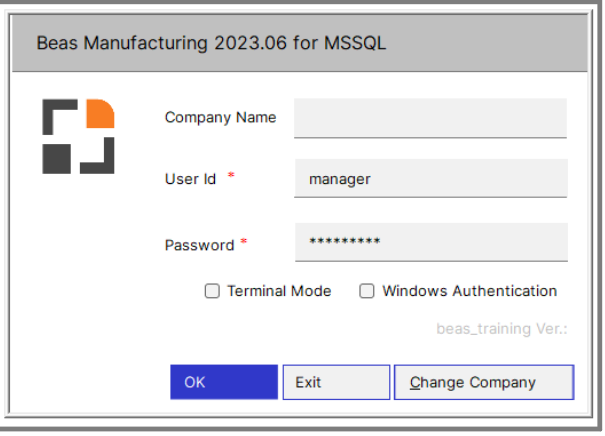
When working with different servers, perform steps in this order:

1. Choose the SERVER to work on.
2. Select the database.

If you start in Beas standalone, it will open the Beas Logon Screen.

Click on "**Change company**" if you want to log on to another Database.

Traditional style	Boyum Style
	




© 2026 Boyum IT Solutions A/S

3.8 Events

Events can be defined to trigger certain activities. You can combine them with milestones to monitor your projects.
Beas has an own event control system that can generate a message or action about any event that can occur in SAP or Beas.
An action is not just a message. It also provides the possibility to make up to three different decisions, e.g. to grant a release, to provide more information or simply as a confirmation.
See News

For certain events, the event control can also have a direct influence on the action, e.g. block or influence an operation.

Which events can Beas react to:
- any type that is associated with capturing data
- any type that is associated with not capturing data

How can Beas react:
- SAP Business One text message
- SAP Business One activity with decision-making functions
- beas activity with decision-making functions
- user-defined action

Beas is supplied with a catalog of predefined events. This also suggests sensible interactions that simplify setup.

What can be represented?
Here are a few examples:
- A person changes something in the item master. Another person must be informed and s/he checks the changes.
- Work order is printed: Message to the production manager, who has to release this for production.
- delivery date of the production order is changed. delivery date as per contract can no longer be met: message to the sales department
- production order is registered for the first time. Message to the sales department and to the customer via email.
- Block work order completion message if full quantities were not reported, including message and release options
- Email to customers when supplying delivery note

© 2026 Boyum IT Solutions A/S

- Message to production manager when goods arrive in the goods receipt
- Message to organization manager when an action occurs in a work sequence connected to a milestone or a milestone is exceeded.
- Message incl. actions when warehouse stock is exceeded

An action can also generate another action, whereby a work flow can also be represented.
Because everything can be freely defined in this area, all requirements can be represented.

What can the system not do?

SAP Business One offers a release approval procedure. All entries (e.g. the order) are saved as draft documents and must be released by another person. The draft document is saved as the correct order.
This kind of release approval procedures are not possible here. Processes can be saved but "intermediate storage" of the entries and changes is not possible.

Training slides on event control

3.8.1 Event control

What shall happen at an event, for example create a message.
Setup: **Administration > Utilities > Events**

Columns

Field	Meaning
ID	Unique number for the activity.
Active	Activity set to active?
Day of the week	
Event	Id of the event causing the activity.
Description	Description of the activity.

Functions

Field	Meaning
Edit	Edit current activity.

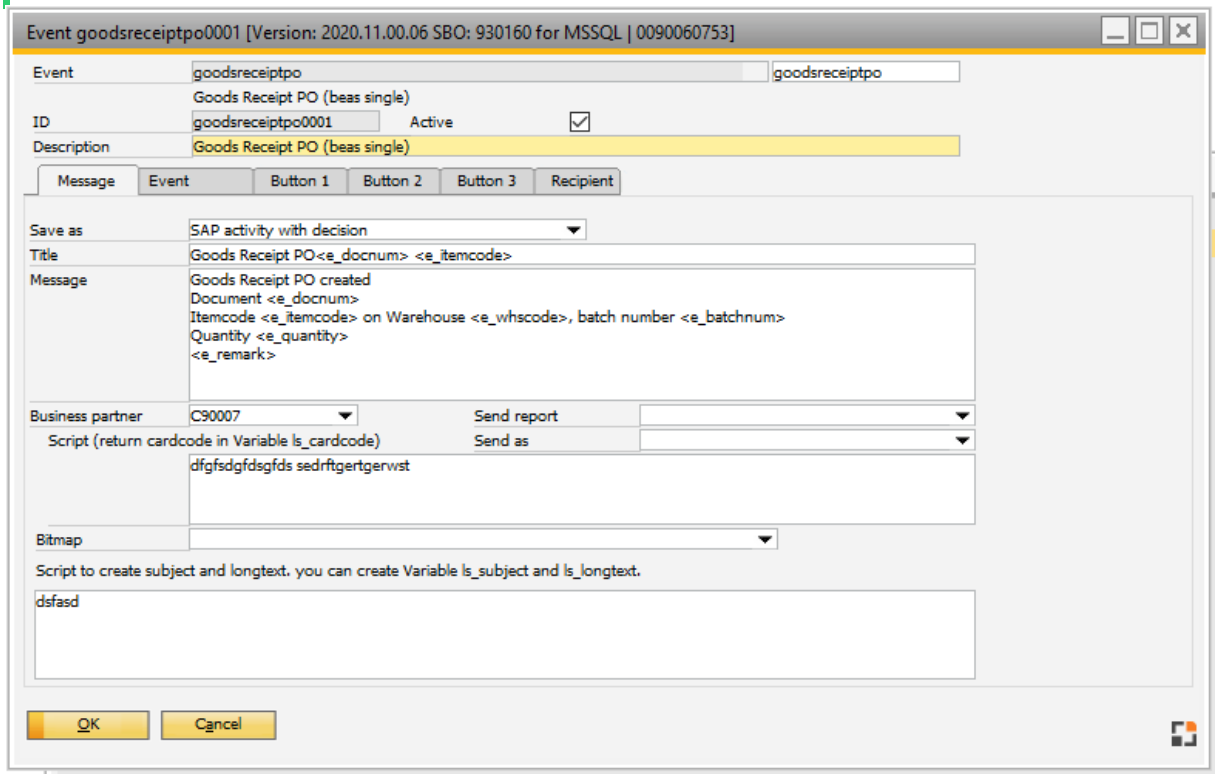
© 2026 Boyum IT Solutions A/S

New	Create new activity.
Delete	Delete activity.
Export	Export all activity settings: these are copied to %programdata%\beas\project\<customer directory\eventsetup.psr
Import	Import all activity settings. Same directory as for export is used.

3.8.1.1 Setup activity

Event activities are defined in this window.

PATH: Administration > Utilities > Events "**Open**" an event.



Window system_event_setup_edit.psr

Field descriptions

Field	Meaning
Event	The event of the activity.
ID	Unique ID of this definition.
Description	Description of this definition.

© 2026 Boyum IT Solutions A/S

Tabs

Field	Meaning
Message	Setup the type of message to be created and what to display.
Event	Under which conditions the activity is created.
Button 1...3	Up to three buttons can be defined which is displayed in the message/activity.
Acceptor	The person to receive the message.

Message tab

Field	Meaning
Save as	Which kind of message is created? For further information ***see*** separate table "Message types" below.
Title	Message title (Email, activity...)
Message	Message text. Place holders are allowed. If the event is linked to a window, all information from this window can be accessed. Available variables are displayed at the bottom of the window.
Business partner	If an SAP Business One-activity is to be created, enter the business partner ID.
Script (return cardcode)	Business partner can also be determined per script, and it is returned in variable ls_cardcode ***Example***: Update customer order. `setvar=ls_carcode=<select cardcode from ordr where docentry={documentparams_docentry}>`
Bitmap	If the message is saved as "beas event with decision" a bitmap can be displayed.
Send report	Access to macro system, select the macro to be executed.
Send as	Determines how the macro is executed; select from email, fax, excel, pdf, preview, print.
Script to create subject and long text	The title and long text can be created by using script. Title is returned in Variable ls_subject Message is returned in Variable ls_longtext

© 2026 Boyum IT Solutions A/S

	Per default these variables are loaded with the text stored in "Title" and "Message" ***Example***: `setvar=ls_subject=hello world`

Message types

Save as	Meaning
Beas event with decision	A Beas-message with up to three buttons (decision). It can be processed in the message window quickly.
SAP Business One-activity with decision	SAP Business One-activity with up to three buttons. Advantage: integrated into the SAP Business One-activity system. Disadvantage: no quick processing. In parallel this message is also displayed in the Beas-message screen. If the message is closed there, the SAP Business One-activity will also be closed.
Command	Only the script entered in command-tab is executed.
Message without decision	Only a pure Beas-message is created without decision criteria

Event tab

Field	Meaning

Event Script	Script checks if the activity shall be executed.
	Use "return false" to block the creation of an activity.
	Example: (itemchange): the activity shall be created only for material group "A500"
	`select u_gruppe from oitm where itemcode='<e_itemcode>'`
	`if <wert1> <> A500 then`
	`  return false`
	`end if`

From, To	The period to create the activity ***Example***: if during late shift (from 18:00 - 23:59) only a message shall be created: Entering a period exceeding midnight (e.g. 18:00–6:00) is not possible. In that case, two activities are required (e.g.: 18:00–23:59 and 0:00–6:00)
Sunday ... Saturday	Select the day(s) to create this activity. ***Example***: Daily event: the message shall be created only on Wednesday. Remove the check mark for all other days.

© 2026 Boyum IT Solutions A/S

Do not send messages to yourself	If you create an event which causes an activity, you can select not to receive the message. ***Example*** itemchange: create message only if item was changed by someone else.
Show every message only once	If for example 20 changes are made for one item, this would lead to 20 messages. Activate this option to create only one message (if there are no other unconfirmed messages).

Button tab

If the message is defined as "Beas-message with decision" or "SAP Business One-activity with decision" up to three buttons can be displayed.

There, these buttons are defined and filled with functions.

Field	Meaning
Name	Button name (displayed in activity).
Visible	Select button to be visible.
Activity close	If enabled, the activity is closed after clicking this button.
Execution Script	By clicking the Update button, the script is executed. **Important:** There is no reference to the event or the affected window. For this reason only variables `basenr1`, `basenr2` and `basenr3` are available. `basenr1` is of type "`Char`", `basenr2` and `3` of type "`Integer`" The content of these variables depends on the event. ***Example***: Event with reference to work order. In variables the work order document number is stored. Task: Call work order document. `openwindow=fert_fthaupt_edit.psr=belnr_id:<basenr1>`
Bitmap	If the message is saved as "Beas event with decision" a bitmap can be displayed.
Visibility Script	Define the button visibility. The script is executed at the moment the activity is created. All variables and reference to the current

© 2026 Boyum IT Solutions A/S

	window are available. If the script is ended with "`return false`" the button is not visible any more.

Recipient tab

Field	Meaning
Recipient 1...3	Up to 3 recipients can be selected. Not all selected recipients get the message. Beas decides over the recipients according to the following principle: 1. is recipient 1 currently logged on in Beas (program registration, not attendance) If yes, then he is the recipient. If no: 2. is recipient 2 logged on ? If yes, then he is the recipient. If no: 3. is recipient 2 logged on ? If yes, then he is the recipient If not, message is sent to recipient 1, even if not logged on.
Recipient-Script	Use script to determine who will get the message. `ousr.internal_k is` returned in variable "`value`". ***Example***: manager to get the message (User_code=manger) `select internal_k from ousr where user_code='<manager>' setvar=value=<wert1>`

Command tab

This tab is only visible if in **Message > Save as "Command"** was selected. Upon the selection, the Button tabs + Acceptor tab disappear.

Field	Meaning
Script	Window to enter any script.

3.8.1.2 Standard events

The following events are available by default.

System

© 2026 Boyum IT Solutions A/S

Field	Meaning
System: daily unique event at the first start Beas	Event is executed at the moment beas is started for the first time at any work station. The event is executed only once a day.

Materials management

Field	Meaning
item: item changed	If an item is changed via SAP Business One master or the Beas-item master, this event is called. **Important:** there is no direct reference to a window. You can´t determine what exactly was changed. This can only be determined in the History-window of SAP Business One

Production

Field	Meaning
workorder: login	Called, when a work order is logged in. As additional condition a milestone can be stored. If no milestone is stored the event is called.
workorder: logout- can not close with min-quantity	Is called when an operation sequence is logged off, the user tries to close the operation without having reported the full planned quantity. Prerequisite: in the affected operation the option "Extended - Block closing with less quantity" is enabled.
workorder: check milestones	Event is executed once a day at the moment Beas is started for the first time at any work station. Messages are created depending on the milestones stored in operations, the stored dates and numbers of days (alerts) in the activity. These events can also be managed in milestone administration.

3.8.1.3 Own events

Next to standard events you can add own events. ***Example***: change of customer data, project, assembly posting etc. Some basic knowledge of BeasScript is necessary.

How to:

With an event (in Beas script use windowsevent) the event system can be called up.
The event system is called:

© 2026 Boyum IT Solutions A/S

```
tools=createevent=<Ereignisname>=<filter>=<basetyp>=<baseref1>=<baseref2>=<baseref3>
```

Command	Meaning
createevent	Function, controlling the event system.
Filter	Additional filter condition.
basetyp	Arbitrary delimitation e.g. for I item Item, C for customer. This command makes certain that messages are unique (Option: each message only once). It may be left empty. Important: Max. 1 character.
baseref1	Reference (e.g. customer order, item number, document number etc.) Type "String", can also save numbers.
baseref2	Second reference – e.g. work order item number. Only number.
baseref3	Third reference – e.g. operation. Only number.

This event is now available. Under **Administration - Events** a new activity definition can be created and the event can be entered under "events".
To make it more easy to use, create an XML file in the project directory in which the event is defined.
In this file, the name of the event, the description and template for new creation is saved directly.

Example customer change

1. Call SAP Business One Business partners.
2. Change business partner, open the debug screen, save changes.
   Now all events are set and the variables are displayed.
3. Open **customized extensions.**
4. Enter the following script with the given information.

```
windowevent update
setvar=e_cardcode=<businesspartnerparams_cardcode>
tools=createevent=cardcodechange==C=<businesspartnerparams_cardcode>
end event
```

Now an activity definition can be created for the event "`cardcodechange`"

For further simplification of this event can be made permanently available.

© 2026 Boyum IT Solutions A/S

For this, in the project directory a file event.xml is created.

Configuration must be the same as the file in c:\program files\beas software\beas\program\event.xml

Important: in the area of event definition no comment lines or empty row may be added.

Important areas

Area	Meaning
info	Info on this file
events	Selection list of available events Configuration: `Event name=Event ID` Event name may be arbitrarily long Event ID may only have 20 characters at most. Only this is saved in activity definition
<eventkennung>	In this area the event itself is defined. Example: `<cardcodechange>....</cardcodechange>`

Definition of an event

The following settings affect the screen **Administration - Events**.

Area	Meaning
eventinfo	Text information on this event.
key	Additional key for filter (activates the field event key). The name of the filter or field is defined here `<key>Milestone</key>`
eventkey2 ... eventkey6	Enables up to 5 additional entry fields for definitions `<eventkey2>Alarm Days</eventkey2>`
setupdisplayscript	Script is executed if at new creation the event was selected or an existing definition was opened. Additional possibility do manipulate the definition window. ***Example***: A drop-down list in key field for mile stones `post=item.eventkey.dropdown.select= milestone from beas_milestone order by milestone`

© 2026 Boyum IT Solutions A/S

	To manipulate the list of recipients, a global function ca be defined, which is called when the recipient page is opened.
	The following script adds entries to the selection list of recipients
	`global function user_getuser`
	`dw_1.item.senduser1.dropdown.addvalues=<spr:Projektleiter> 1=-10`
	`dw_1.item.senduser1.dropdown.addvalues=<spr:Projektleiter> 2=-11`
	`global end`
	
	Example:
	`<cardcodechange>`
	`<setupdisplayscript>`
	`messagebox=hello world`
	`</setupdisplayscript>`
	`</cardcodechange>`

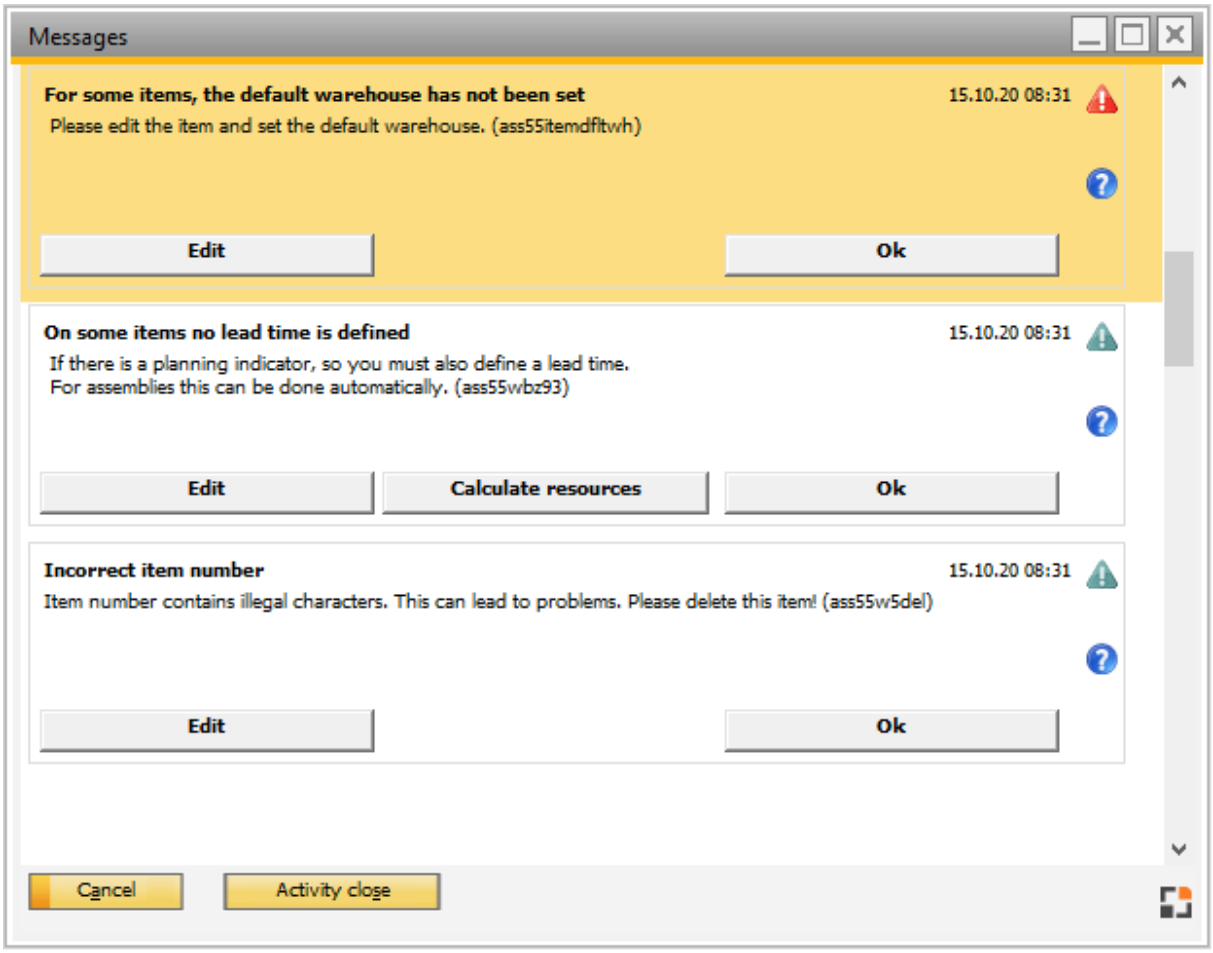
3.8.1.4 Management of many activities

The advantage of the SAP activity is that it runs over the SAP message system and thus guarantees uniform operation.
However, if many actions are generated, the SAP system is not optimized for this enhancement. A high number of mouse clicks are necessary to process an action.

Therefore, a Beas message window is available in parallel:

© 2026 Boyum IT Solutions A/S



Window system_event_browse.psr

This list presents the actions as a list, including direct editing possibility and allows the actions to be processed more quickly.

If a purely Beas action is generated, the window opens automatically as soon as a new Beas action is available to the recipient.

4 Financials

The Business performance is included in this module.

Branches
Business Performance

4.1 Branches

The multi-branch solution is supported by Beas 9.0 from patch 4.
In Beas documents you can select the target warehouse. Thus, the branch is determined.

The following extensions are integrated:
- In a great number of lists a column "branch" is available which can be used for sorting or filtering. You can also create templates with different branches. ***See*** Templates.
- Stocktaking can only be created for several warehouses if they are of the same branch.
- In the personnel master you can store a branch which is only for information purposes.
- Currently there are no other rules stored. Note: The correct warehouse should be selected when posting goods for work orders.

Note: Beas does not check if the correct warehouse was used at posting. Correct WIP accounting requires all postings to be made in one branch for one work order.

As of 11/24/2014

4.2 Business Performance

Beas administrates profit centers and accounts from the financial cost centers and cost elements.

Cost Accounting for Manufacturing Organizations
Settings in Beas and SAP BusinessOne - Absorption costing

The module enables the creation of business performance and simulations for a forecast.
The business performance module contains the following functions:

- Administration of any number of clients or statement cycles per client
- Cost element accounting
- Cost center accounting
- Calculation of cost and surcharge rates for cost control
- Managing a budget business performance
- Each differentiated by fixed and variable or target and actual costs with different fiscal years

Note: This Module only works with 1 dimension. Please note that you cannot activate "Use multidimensional" in SAP B1 if you want to use the Business Performance module.

Business performance - Introduction to Absorption costing

Topics:

- Understand the integration of Business performance
- Transfer bookings into Business performance
- Create an expense distribution sheet

When creating master data the order below should be followed:

1. Create Profit Center in SAP Business One.
2. Create Chart of Accounts (cost elements).
3. Create Statement Cycle.
4. Create Cost Centers (without key).
5. Create Distribution Key.
6. Assign Key to Cost Centers.
7. Assign SAP Profit Center to Business performance Cost Centers.
8. Create Cost Elements and Assign Keys.
9. Assign Cost Elements to SAP Cost Elements.

4.2.1 Cost Accounting for Manufacturing Organizations

Before diving into absorption costing and reviewing how Beas Manufacturing works with it, in this chapter you can read about some fundamental concepts of cost accounting that will play a key role in guiding you through this whole set of definitions and processes. Otherwise, it could be difficult to

© 2026 Boyum IT Solutions A/S

rationalize why certain processes must take place and their importance for enhancing a company's decision-making capability by providing indispensable costing information.

Cost Accounting for Manufacturing Organizations

In a business environment, costs represent a decisive factor in the companies strive for survival and growth. If a company has a non-competitive cost structure, it will ultimately become unfeasible to operate, as its profits will fall below acceptable levels, or its prices will soar above what the market is willing to pay for its products. Additionally, even when cost structures are competitive, incorrect costs appropriation might overburden some of the companies' products while unburdening others, turning profitability analysis into a difficult and inaccurate task, and possibly leading to wrong business decisions. Therefore, understanding costs and being able to distribute them properly across the products is critical to success in a competitive environment.

If we think on retail or wholesale organizations, costs seem straightforward and are clearly identifiable in the products. Companies can easily tell for how much they purchased their goods and pricing decisions are generally not complicated, as administrative expenses are either common to the entire company or related to product divisions and therefore easily linked to the goods. In this scenario, lowering purchasing prices and reducing structural costs have a direct impact on profitability, and understanding current profits does not require much effort.

For manufacturing organizations, on the other hand, costs have a much higher degree of complexity, which arises especially from the fact that many manufacturing-related costs cannot be directly linked to a particular product. Nevertheless, instead of jumping straight into the tools we have for solving such problems and transforming complicated data into reliable and accurate costing information, let's have a look at the components and definitions of cost for manufacturing companies.

There are three categories in which manufacturing costs are normally divided:

- **Direct material:** the costs of all direct materials consumed for manufacturing a product. If we think on a machined sandblasted metal piece, the direct material costs would come from how much metal we used to produce it, whereas other materials (such as sand wasted in the sandblasting process, drill bits, and end mills) whose measuring results impossible for that piece are treated as manufacturing overhead;
- **Direct labor:** all costs associated to the workforce physically and directly involved in the process of manufacturing a certain product. This accounts for machine operators and assemblers, but not for indirect labor, such as production supervisors, maintenance technicians and quality control operators;
- **Manufacturing overhead:** all other manufacturing costs which do not fall into the categories of direct material and direct labor are manufacturing overheads. This category includes costs of

© 2026 Boyum IT Solutions A/S

indirect materials (cleaning supplies, disposable safety equipment, disposable tools, fittings and fasteners, etc.), maintenance staff, quality control staff, equipment depreciation, utilities, factory rental, property taxes on the production facilities, production managers and supervisors, and many others. Manufacturing overheads do not include, however, administrative expenses not related to production—only indirect production costs can be considered as overheads.

Although it is fairly easy to measure direct materials and direct labor for manufacturing a product, understanding how much overhead costs each product should receive is always a complicated endeavor. For example, consider a company who produces liquid chemical products. Do all chemicals require the same reaction times on reactors and have the same viscosity? Not at all, and both higher reaction times and viscosity might represent a higher burden on maintenance and cleaning activities after production, as these products could wear the reactors faster and occasionally cause clogs which can be hard to clean. Besides, if the company constantly switches between different types of products using the same production resources, more cleaning and machine preparation times might be required than when producing multiple times the same product, which also increases manufacturing overheads significantly.

Using the traditional costing method, all manufacturing overheads would be summed and divided by the amount of a particular cost driver (which are the factors responsible for generating manufacturing costs), like the number of produced units, processed kilograms, or labor hours. Then, each and every product receives a share of manufacturing overheads based on how much of that same cost driver it contributed to increase. However, considering the existing variables in real production environments, should all products receive the same share of manufacturing overheads? If we produced 100 kilograms of a very difficult to process chemical, should it receive the same costs as 100 kilograms of an easily processable chemical? When the goal is to achieve a more accurate profitability analysis, the answer is no. And this leads to our next and fundamental question: how to make sure that each product receives a fair share of the correct manufacturing overheads?

For this question, the answer comes from one of the alternative methods to appropriate manufacturing overheads to products called absorption costing, which is precisely our next topic in this article. Using absorption costing, companies can base their costs appropriation on the costs related to direct or indirect manufacturing cost centers and on how much they affected production.

See:

Absorption Costing - Setup

Absorption Costing - Introduction

Absorption Costing - WORKFLOW

Absorption Costing Report - Concept

© 2026 Boyum IT Solutions A/S

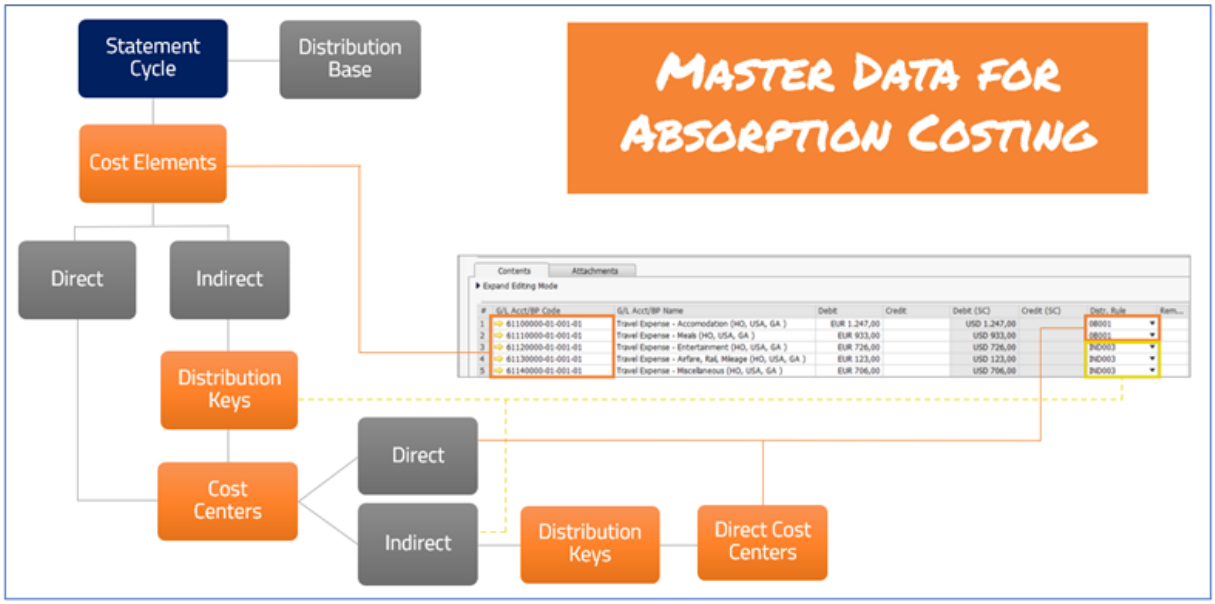
4.2.2 Settings in Beas and SAP BusinessOne - Absorption costing

Even though absorption costing is part of Beas Manufacturing, the initial settings begin in SAP Business One, where you must create all direct and indirect cost centers, cost pools (only if desired, as cost pools are not mandatory), and distribution rules. Below, you can find examples of how to set-up the required data in SAP Business One.

Absorption Costing - SAP Business One Setup

Absorption Costing - Beas Setup

Steps of setting up Beas for Absorption Costing:



See:

Absorption Costing - Concept

Absorption Costing - WORKFLOW

Absorption Costing Report - Concept

4.2.2.1 Absorption Costing - SAP Business One Setup

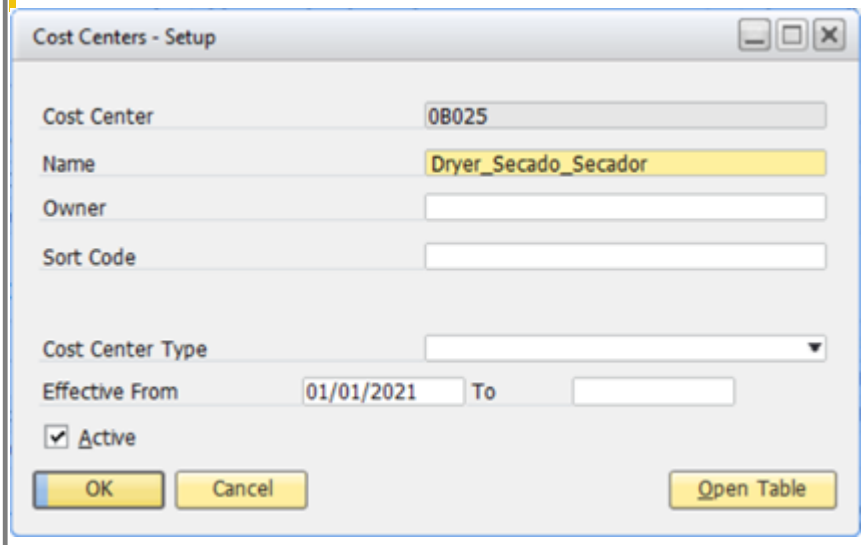
These are the settings of Absorption costing to be made in SAP Business One:

- Cost Centers setup

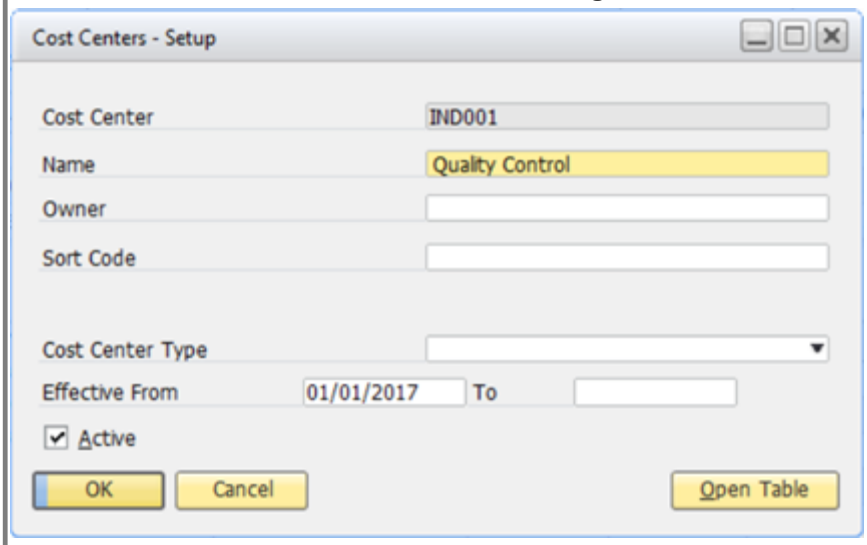
1.) Create **Cost Centers** for all production resources (direct manufacturing costs), considering both machines and labor.

© 2026 Boyum IT Solutions A/S

Important note: You cannot activate the "Use multidimensional" parameter in SAP Business One's General Settings if you want to use the Business Performance module, as it is not compatible with multiple Cost Center dimensions.

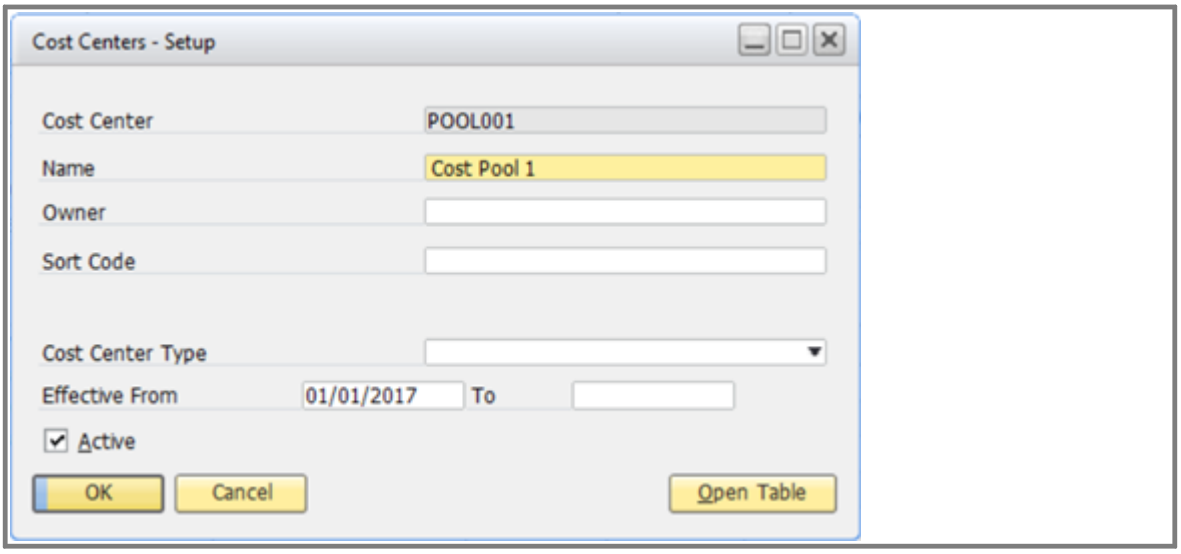


2) Create Cost Centers for indirect manufacturing costs.



3) If necessary, create **Cost Centers** to represent desired **cost pools** if you wish to book costs directly into them, although this is an optional step, as it is perfectly possible to execute absorption costing without having any cost pools. Costs related to cost pools will suffer a first distribution to direct and indirect Cost Centers before the costs from indirect Cost Centers are distributed to the direct ones.

© 2026 Boyum IT Solutions A/S

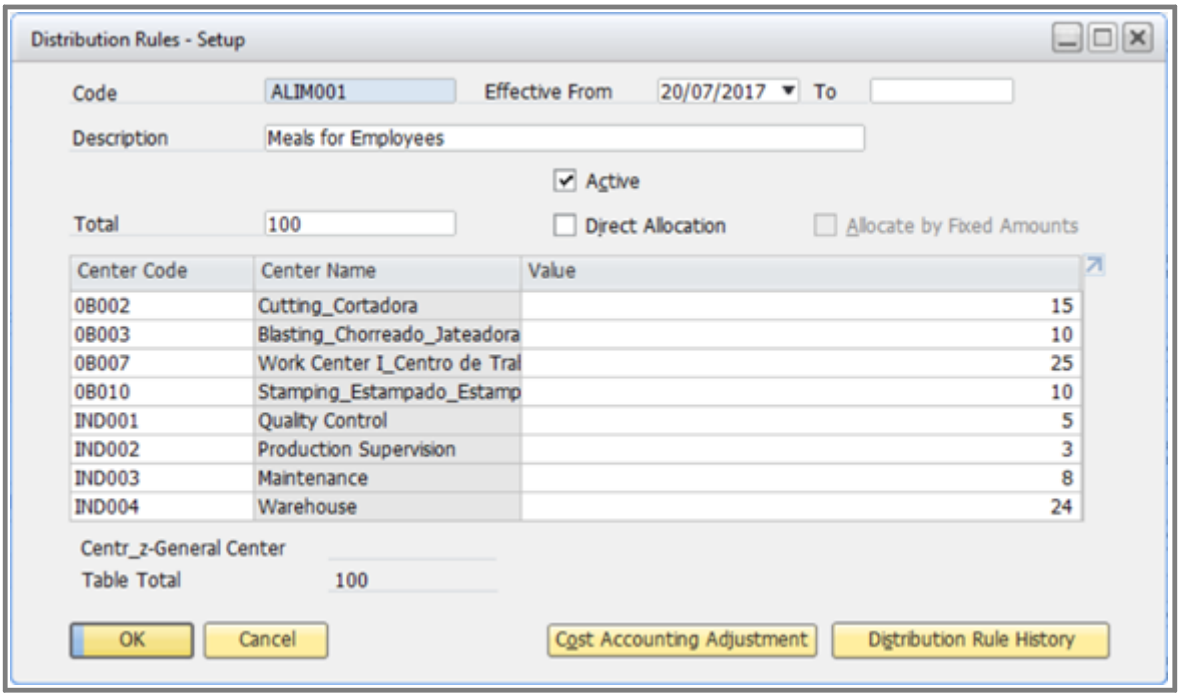


- Distribution Rules setup

Define **Distribution Rules** for costs requiring distribution amongst several Cost Centers. A typical example of cost distribution is in how to deal with meals for employees or corporate cafeteria. When all employees receive a share of a global expense, this expense affects several departments and might need to affect product costing as well. So, the first step is to split meals expense across different accounts, one related to administrative departments and one (or multiple) reflecting production department(s). Next, a Distribution Rule can be set to assign parts of these costs to each Cost Center based on a pre-defined criterion (like number of employees per department, for instance).

Important note: The absorption costing function of Beas Manufacturing is not compatible with "manual" distributions to Cost Centers (allowed by SAP Business One); so, make sure that all your documents with distributed values have a Distribution Rule assigned.

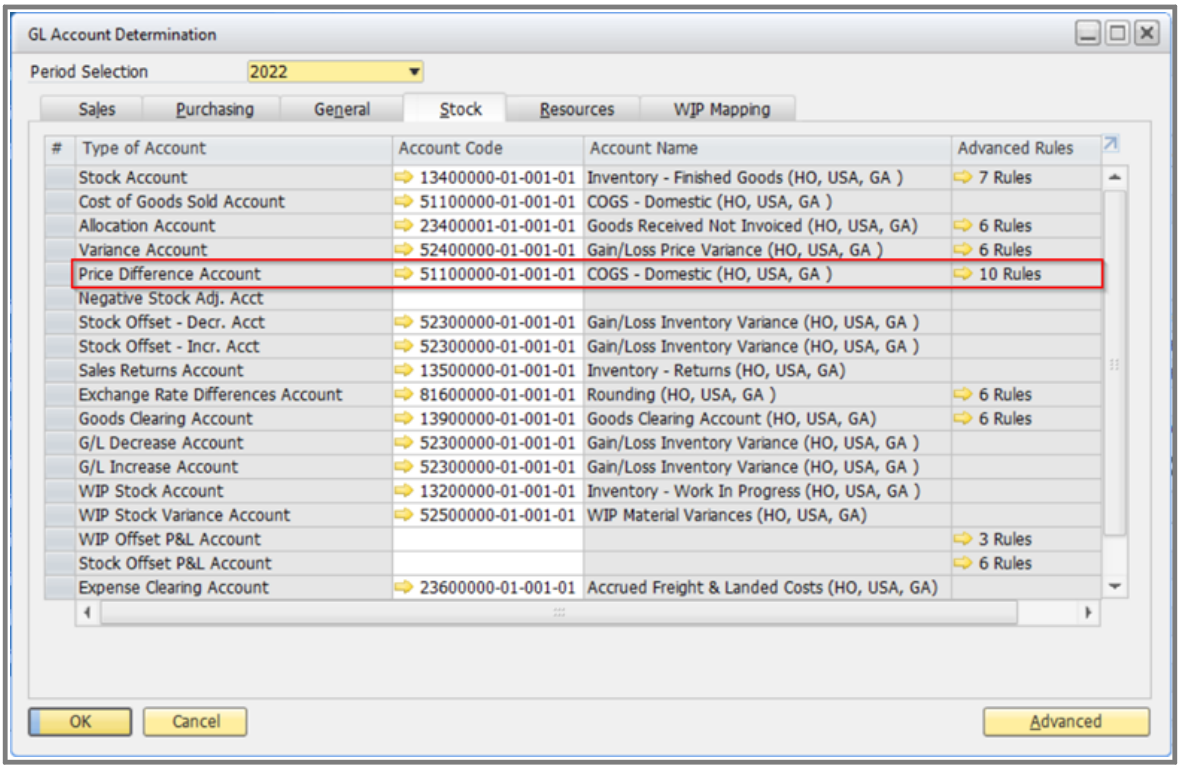
© 2026 Boyum IT Solutions A/S



- GL Account Determination setup

Configure the **Price Difference Account** to match the corresponding COGS (Cost of Goods Sold) account, using simple or advanced GL Account Determinations. The last steps of the absorption costing process generate Stock Revaluations to change the stock value of products according to the appropriated costs. However, if the products are not in stock anymore (sold during the month), COGS should be adjusted to reflect the correct costs, and SAP Business One uses the Price Difference Account to register Stock Revaluation values when the products are partially or completely out-of-stock.

© 2026 Boyum IT Solutions A/S



#	Type of Account	Account Code	Account Name	Advanced Rules
	Stock Account	13400000-01-001-01	Inventory - Finished Goods (HO, USA, GA)	7 Rules
	Cost of Goods Sold Account	51100000-01-001-01	COGS - Domestic (HO, USA, GA)	
	Allocation Account	23400001-01-001-01	Goods Received Not Invoiced (HO, USA, GA)	6 Rules

See Beas Manufacturing setup for Absorption costing

4.2.2.2 Absorption Costing - Beas Setup

Beas Manufacturing holds the thick part of absorption costing settings and its entire processes. Below you can find a review on how you can set-up Beas Manufacturing for executing absorption costing in your company.

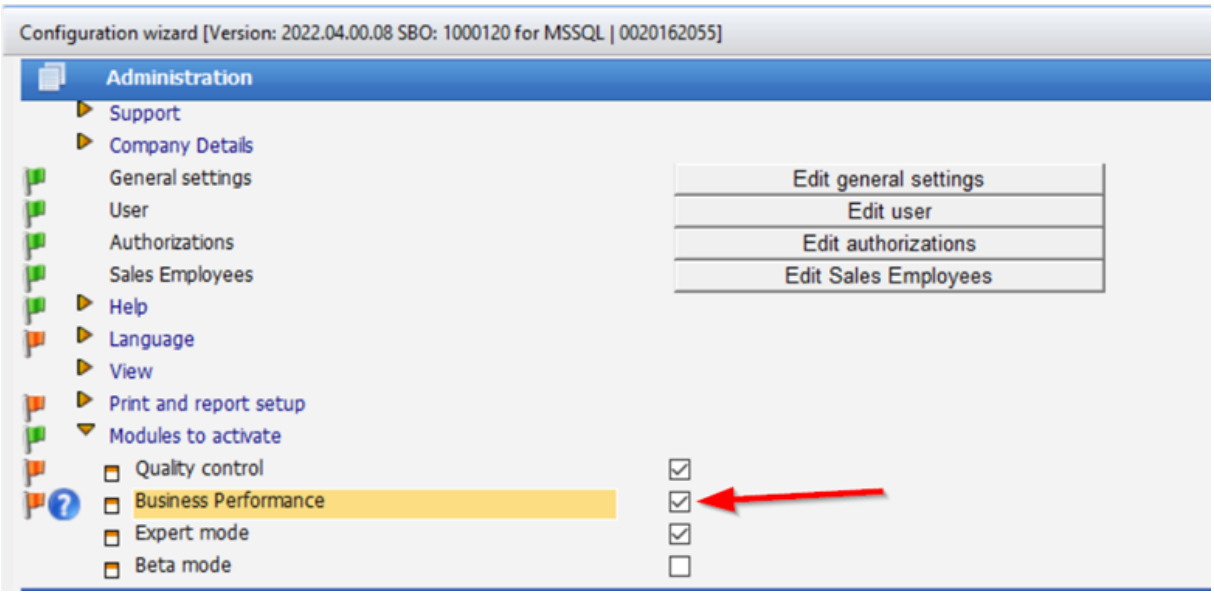
Configuration wizard setup
Statement Cycle setup
Cost Centers setup
Distribution Keys Setup
Cost Elements setup
Cost Element assignment setup
Resources setup

See SAP Business One setup

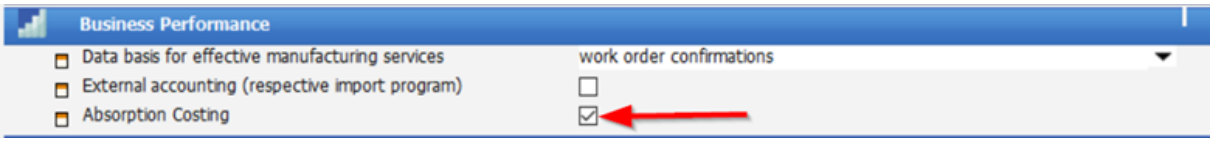
© 2026 Boyum IT Solutions A/S

4.2.2.2.1 Configuration wizard setup

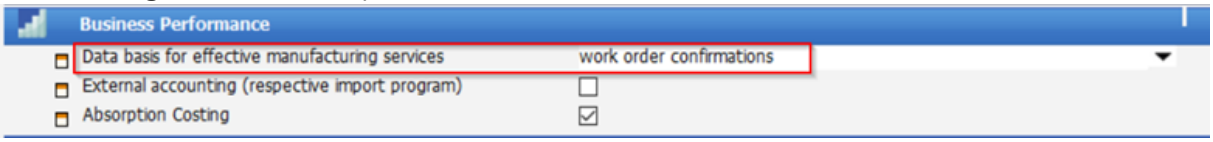
Activate the **Business Performance module**. Business Performance, a separately licensed module for Beas Manufacturing, is the module which contains the absorption costing functionality. Activating Business Performance is the first step to use absorption costing in a company:



Activate the **absorption costing functionality:**



Set the "**Data basis for effective manufacturing services**" as "**work order confirmations**". This parameter ensures that Beas Manufacturing distribute manufacturing costs according to production data (coming from Time Receipts).



See other Beas settings for Absorption Costing

back to Absorption costing settings (SAP and Beas)

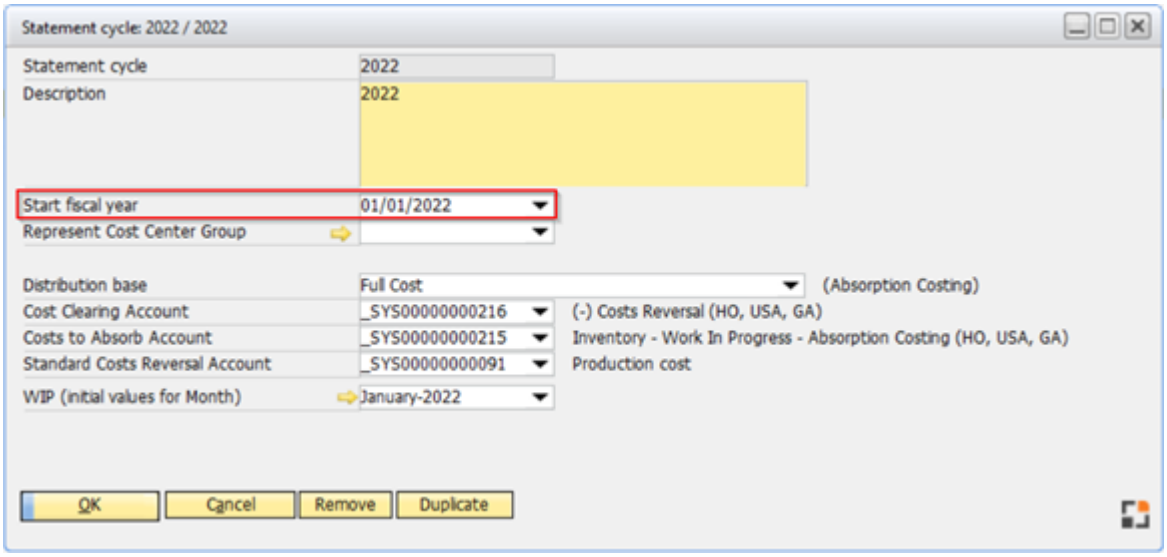
4.2.2.2.2 Statement Cycle setup

The **Statement Cycles** are a mandatory master data for Business Performance and have a similar logic to Posting Periods in SAP, except that they are always annual and, when working on multi-branch databases, have to be branch-specific. Here is how to create them.

© 2026 Boyum IT Solutions A/S

NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.

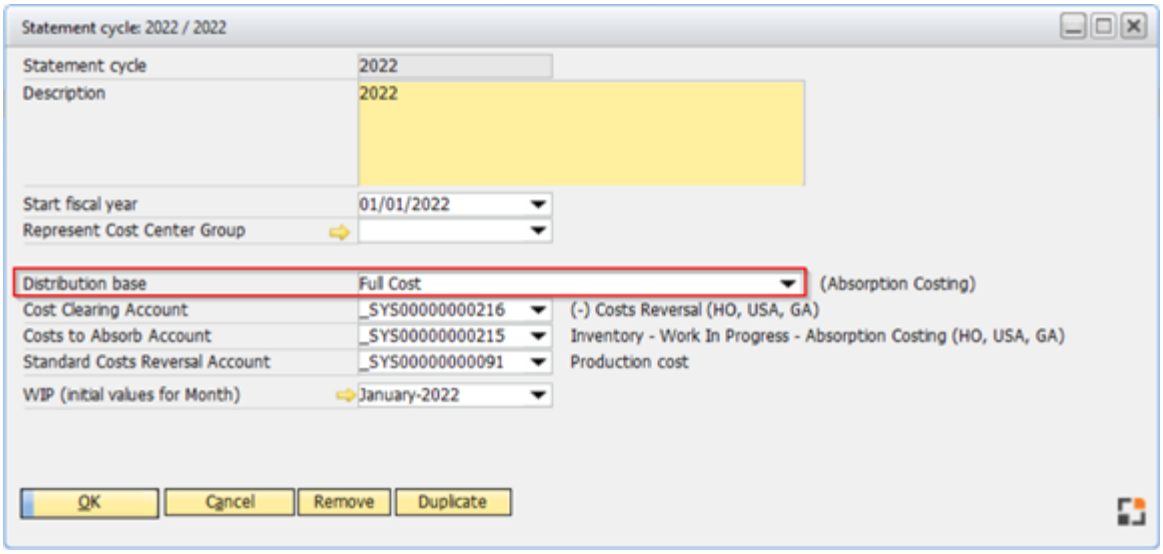
1) Create a **Statement Cycle**, define starting date for the year and set the related branch (only if using multi-branch):



Window bab_abrid_edit.psr

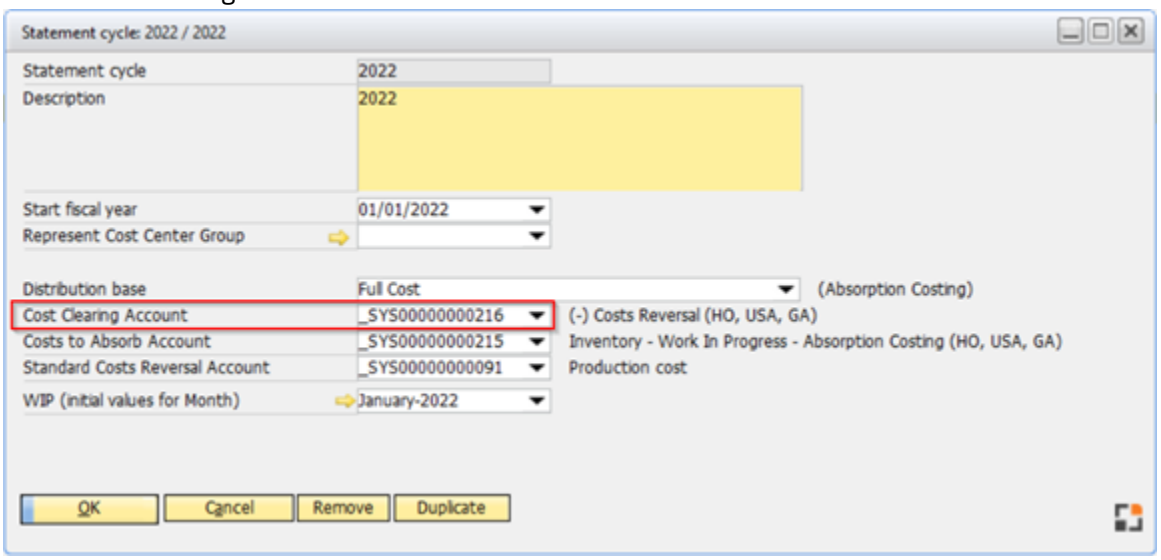
2) Set the **Distribution Base** for absorption costing. The Distribution Base defines how the costs coming from direct Cost Centers (after all distributions are processed) should be carried over into the manufactured products. Distributions can happen either based on production hours, on marginal costs, or on full costs. It is recommended to always use marginal or full costs to base absorption costing distribution, as they represent the multiplication between production hours and the resource cost rates (which are set to represent the average costs per minute or hour for each machine or work center). If only using hours, products going through inexpensive resources for a large number of hours will receive more costs than products going through very expensive resources for a small number of hours.

© 2026 Boyum IT Solutions A/S



Window bab_abrid_edit.psr

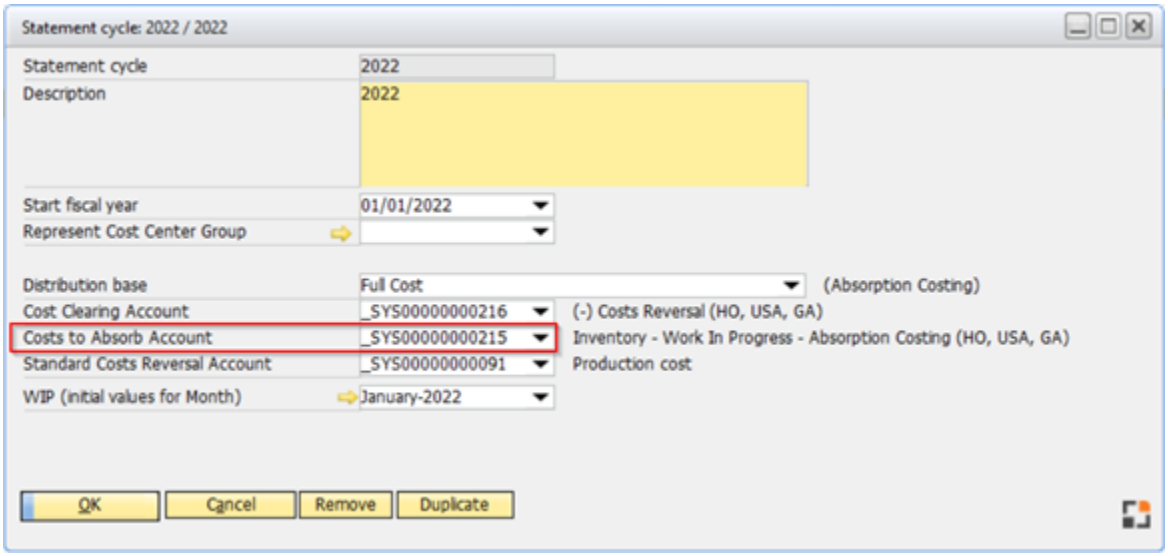
3) Set the **Cost Clearing Account** for absorption costing. This is a contra account to all manufacturing expenses (except direct materials, as direct materials are always directly appropriated into the manufactured products and are never part of an absorption costing process), turning their total amount to 0 after executing the first absorption costing step, called “Booking Cost Transfer”. You can create this account in your Chart of Accounts just below the accounts related to direct labor and manufacturing overheads. This account will receive a credit value.



Window bab_abrid_edit.psr

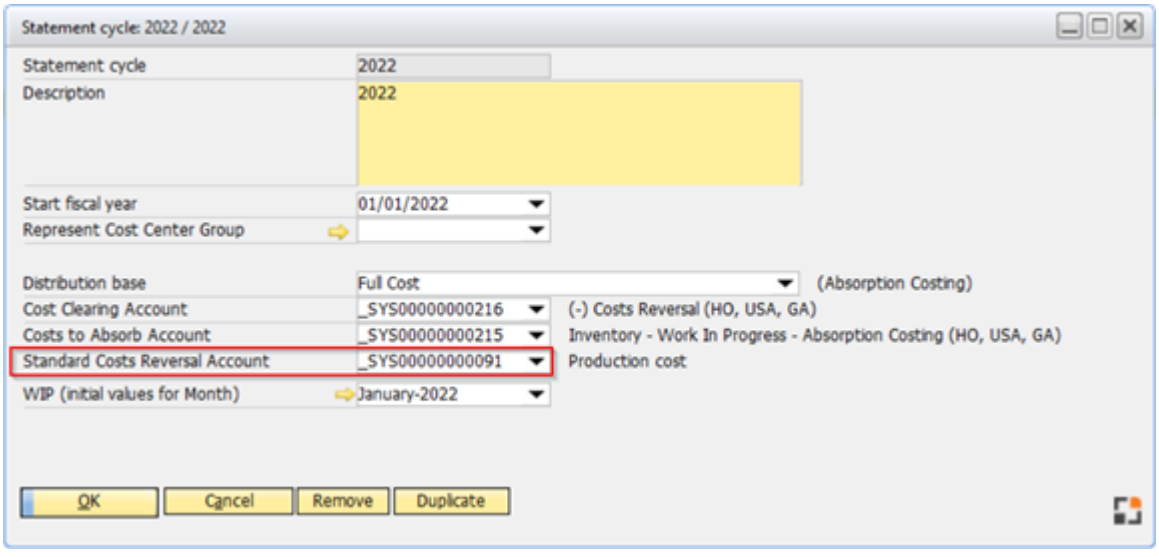
4) Set the **Costs to Absorb Account** for absorption costing. This asset account offsets the Cost Clearing Account by receiving a debit value during the first absorption costing step, called “Booking Cost Transfer”, holding the total amount of costs to absorb during absorption costing execution. Its nature is similar to a work-in-progress account, as it represents inventory-to-be.

© 2026 Boyum IT Solutions A/S



Window bab_abrid_edit.psr

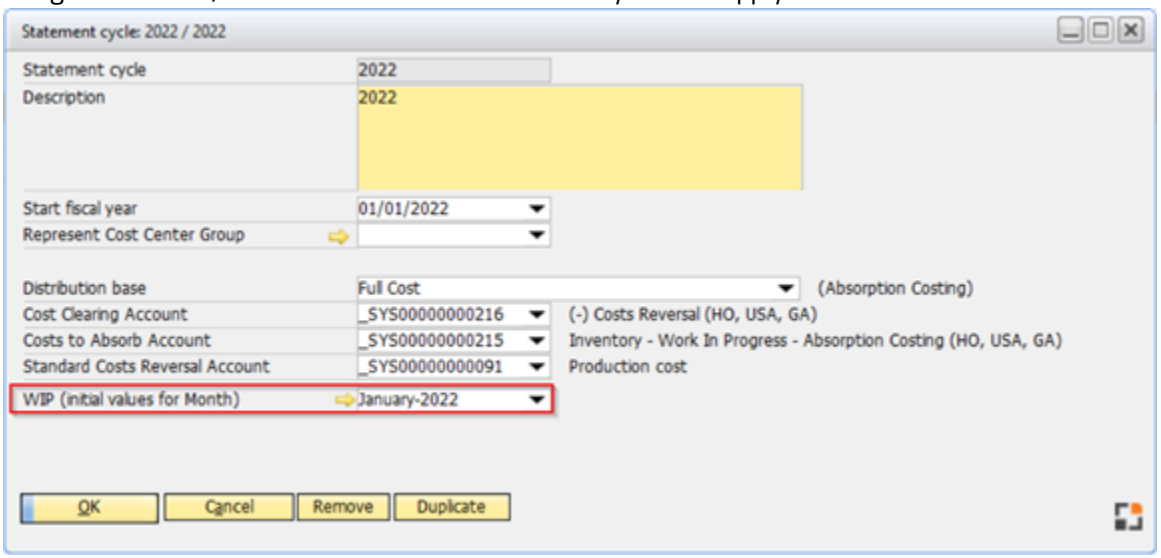
5) Set the **Standard Costs Reversal Account**. Throughout the month, when manufacturing goods, Beas assigns manufacturing costs to products according to the cost rates of resources, which are set in a way to represent historical average costs per hour or minute but will never match exactly the actual manufacturing expenses. While helpful in minimizing differences between before and after absorption product costing, these costs cannot remain on the products after absorption costing, or the products will have duplicated costs (one calculated based on the resource rates and another coming from absorption costing). This field defines in which account the reverted values coming from costs calculated based on resource costs rates should be booked and is a contra account to the accounts set in the Beas Calculation Schemas or Production Cost Elements.



Window bab_abrid_edit.psr

© 2026 Boyum IT Solutions A/S

6) If there are open values from previous absorption costing processes before implementing Beas Manufacturing, you can set the initial values under "**WIP (initial values for Month)**" (by clicking on the golden arrow) and define for which month they should apply.

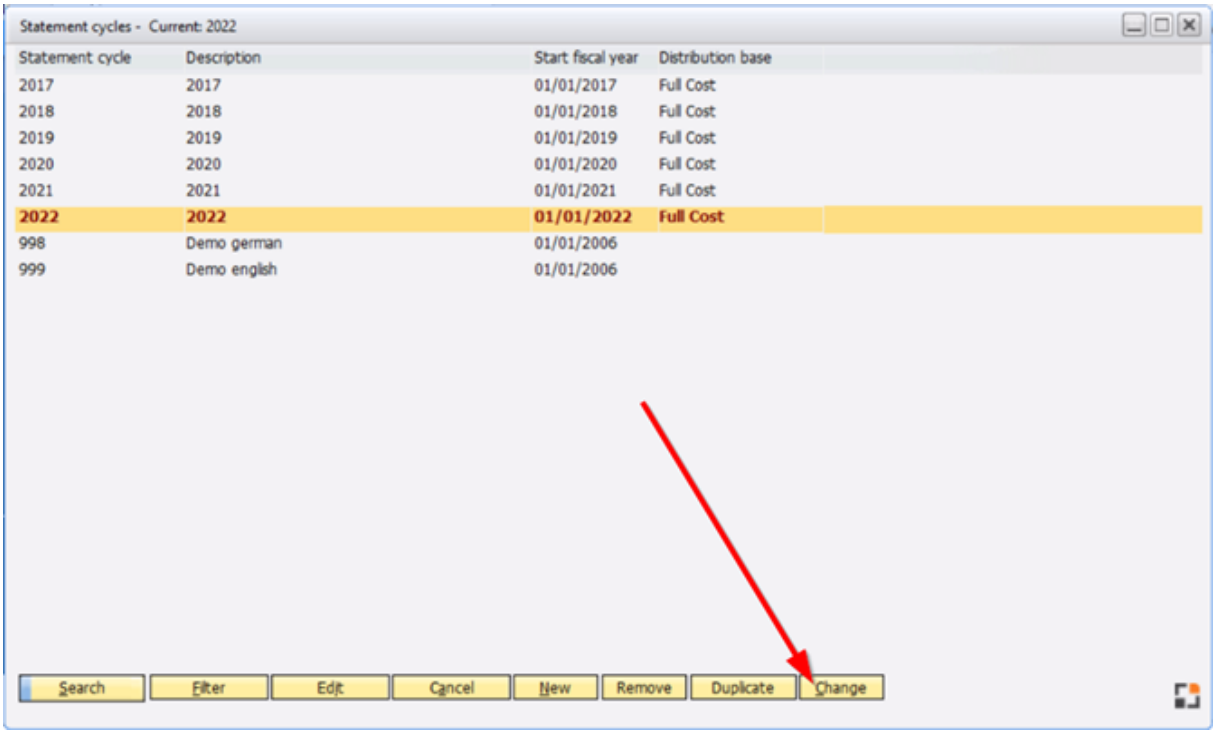


Window bab_abrid_edit.psr

7) The last step, after creating the Statement Cycles, is to choose in which one you want to work, as all master data and processes belong exclusively to the selected Statement Cycle. When not using a multi-branch database, you only need to create one Statement Cycle per year and choose it just after the year starts. If using multi-branch, you will need to configure master data and perform absorption costing for each branch individually and choose the Statement Cycle corresponding to

© 2026 Boyum IT Solutions A/S

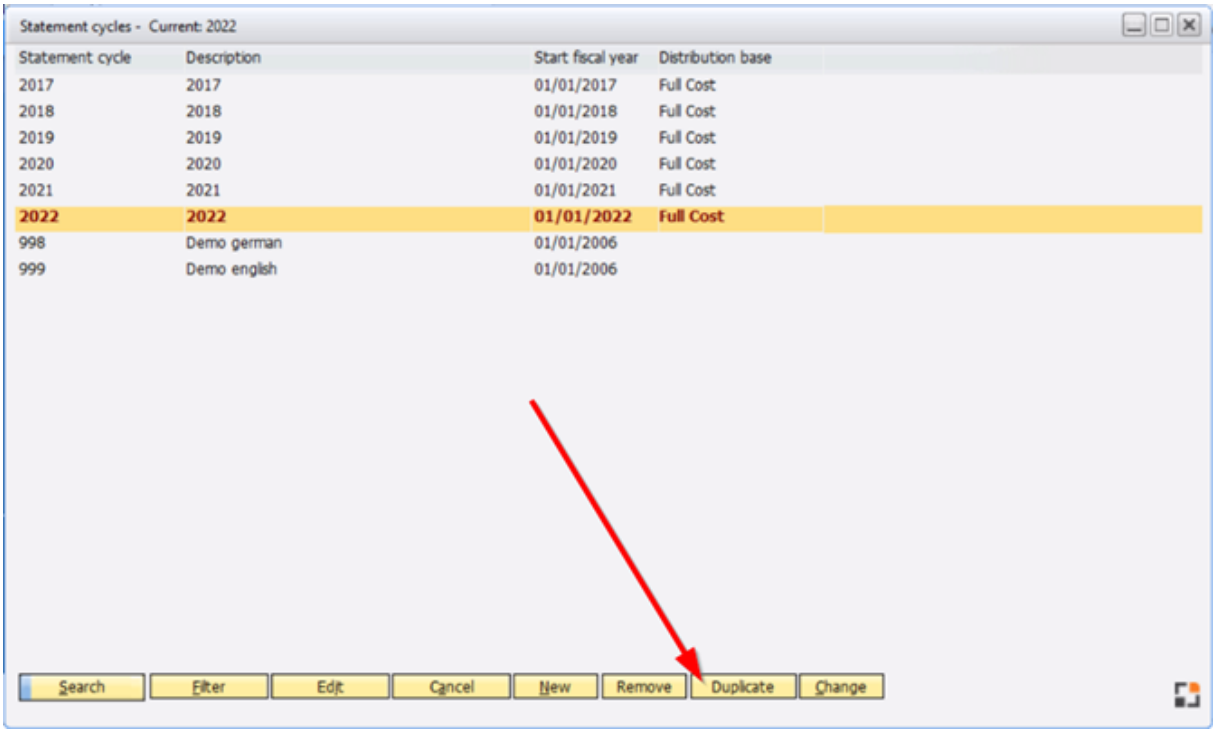
the branch in which you want to work.



Window bab_abrid_browse.psr

Important note: As Business Performance master data is related to Statement Cycles, whenever you create a new Statement Cycle by clicking on the "**New**" button, it will come empty. If you have already defined another Statement Cycle previously and just want to create a new period for it (maintaining the same master data), you can choose the previous Statement Cycle and click on the "**Duplicate**" button instead. This will duplicate all master data related to the Statement Cycle to create a new one.

© 2026 Boyum IT Solutions A/S



Window bab_abrid_browse.psr

See other Beas settings for Absorption Costing

back to Absorption costing settings (SAP and Beas)

4.2.2.2.3 Cost Centers setup

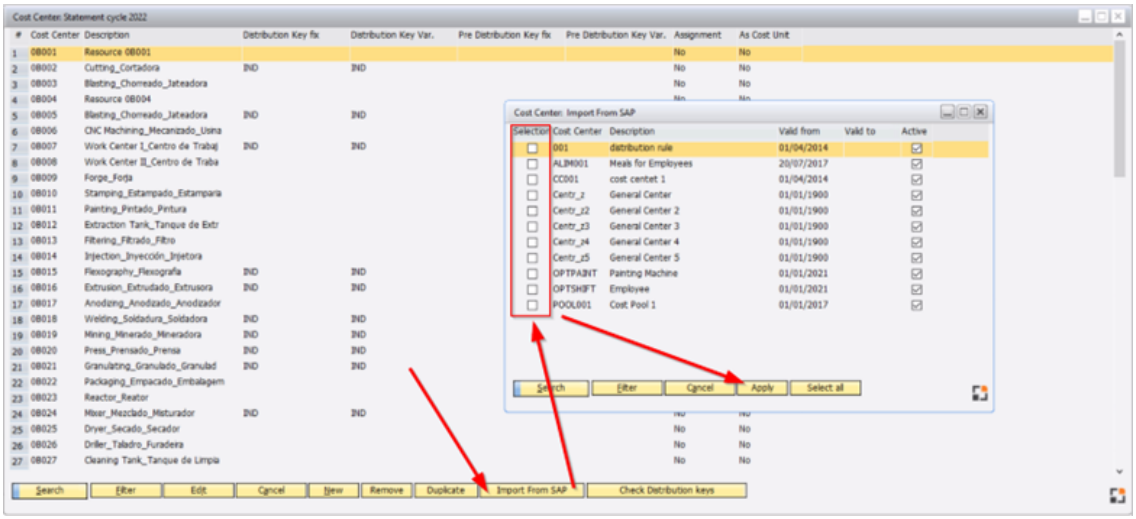
Before coming into this part, all your direct and indirect manufacturing Cost Centers should already exist in SAP Business One. If not, make sure you create them there first, as you can just import them in this step to make your progress faster. However, even though you can import SAP's Cost Centers into Beas Cost Centers, they are not directly connected, and you can have different Cost Centers in both places (which is not a recommended practice for manufacturing-related Cost Centers, as your efforts will be higher for analyzing data and for connecting SAP's transactions to Beas Financial Data). One of the few reasons for having Cost Centers only in Beas is for handling fictional Cost Centers, like the ones representing cost pools when they're not having direct financial bookings. In such a situation, the values coming from indirect Cost Centers could have a first pre-distribution into cost pools, then a further distribution into direct Cost Centers. Here is how to create Cost Centers.

Important note: Creating Cost Centers in SAP Business One does not create Cost Centers in Beas, as well as creating Cost Centers in Beas does not create Cost Centers in SAP Business One. Keep in mind that there is no automatic synchronization and data must be manually created on both sides (or imported from SAP Business One into Beas).

© 2026 Boyum IT Solutions A/S

NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.

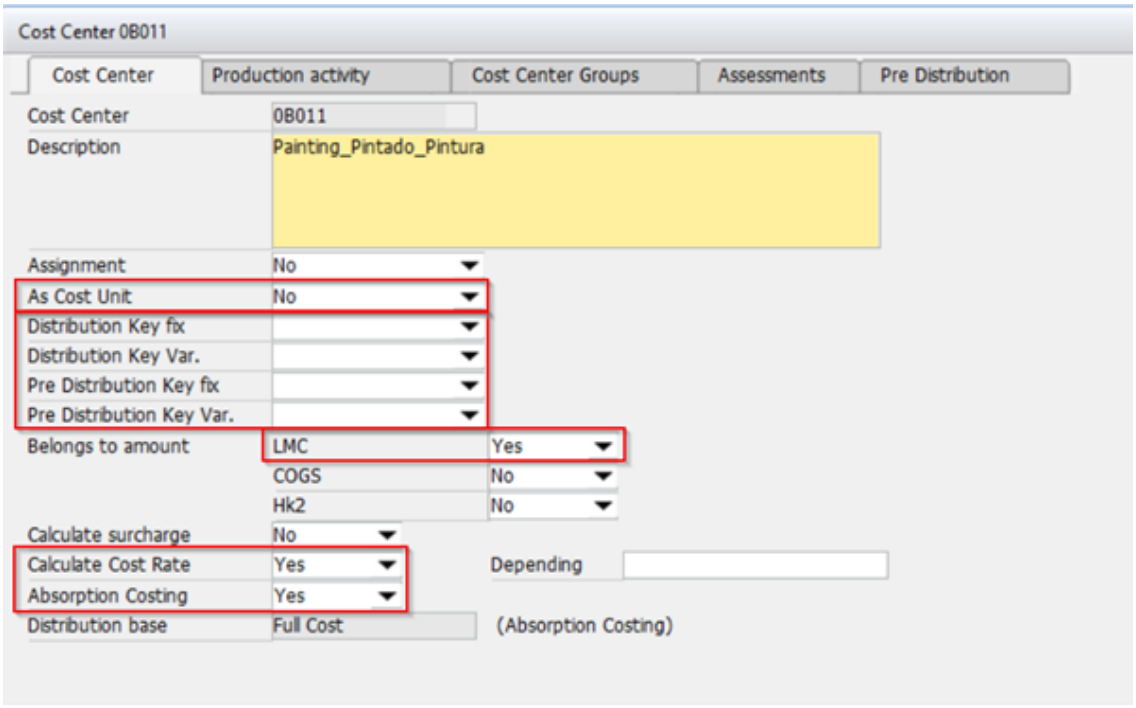
1) **Import direct and indirect Cost Centers** from SAP Business One. Although importing the Cost Centers is an optional step, if you skip it, you'll have to create all your Cost Centers manually. Remember to only import Cost Centers directly or indirectly related to production; administrative Cost Centers must not be imported, as their value should not be part of absorption costing (for absorption costing, only direct labor and manufacturing overheads are relevant).



Window bab_kst_browse.psr

2) Configure **direct Cost Centers**. Direct Cost Centers must not have Distribution or Pre-Distribution Keys assigned to them (unless in very specific circumstances, explained later in this guide), and require a set of specific configurations showed below.

© 2026 Boyum IT Solutions A/S



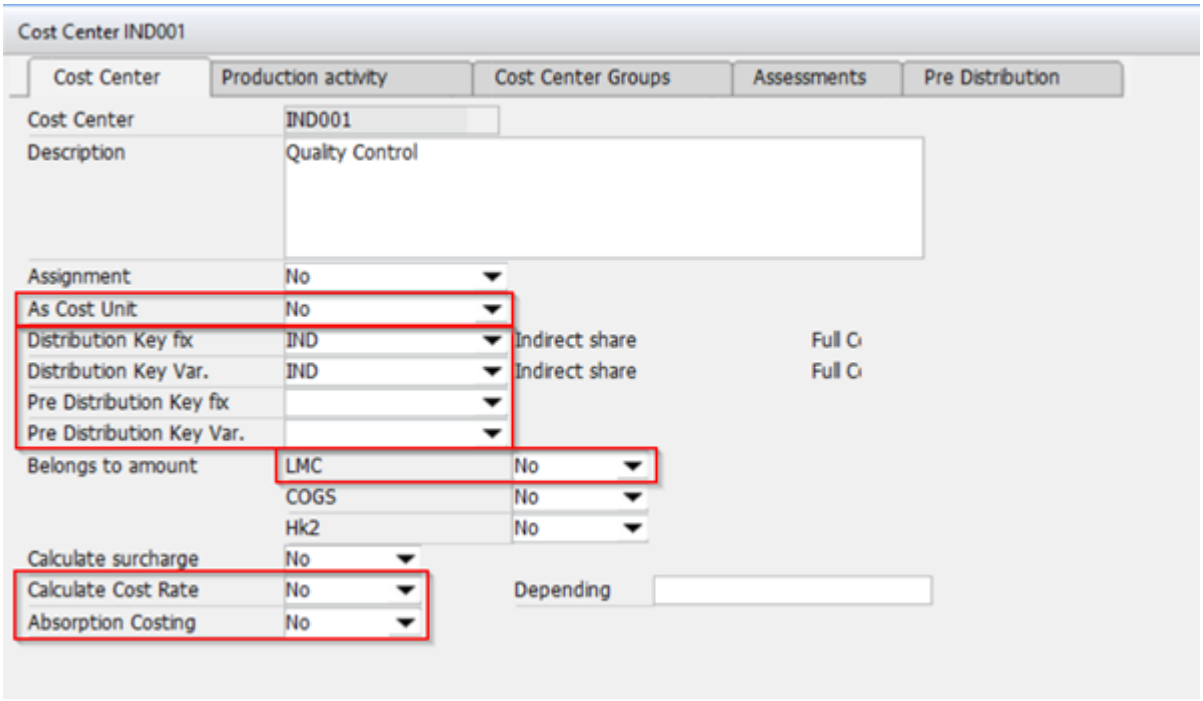
Window bab_kst_edit.psr

3) Configure indirect Cost Centers. Indirect Cost Centers require either Distribution or Pre-Distribution Keys (Pre-Distribution should only be used in cases like having cost pools, as Pre-Distribution runs prior to Distribution, moving the costs from cost pools to other indirect Cost Centers before they are carried over into the direct Cost Centers - If this is not the case, leave all Pre-Distributions empty). The general recommendation is to always use the same Distribution Key in both fields for Distribution or Pre-Distribution ("fix" and "var."), although you could use different Distribution Keys for handling different ways of distributing costs if they come from Cost Elements set to contain variable or fixed costs. Indirect Cost Centers must also have the parameters shown below.

Important note: Distribution Keys are explained in the next topic of this guide. You will need to create Distribution Keys before you can complete the setup of indirect Cost Centers. Besides, you must choose between using Pre-Distribution or Distribution Keys, as it is impossible to set both to

© 2026 Boyum IT Solutions A/S

the same Cost Centers.



Window bab_kst_edit.psr

See other Beas settings for Absorption Costing

back to Absorption costing settings (SAP and Beas)

4.2.2.2.4 Distribution Keys Setup

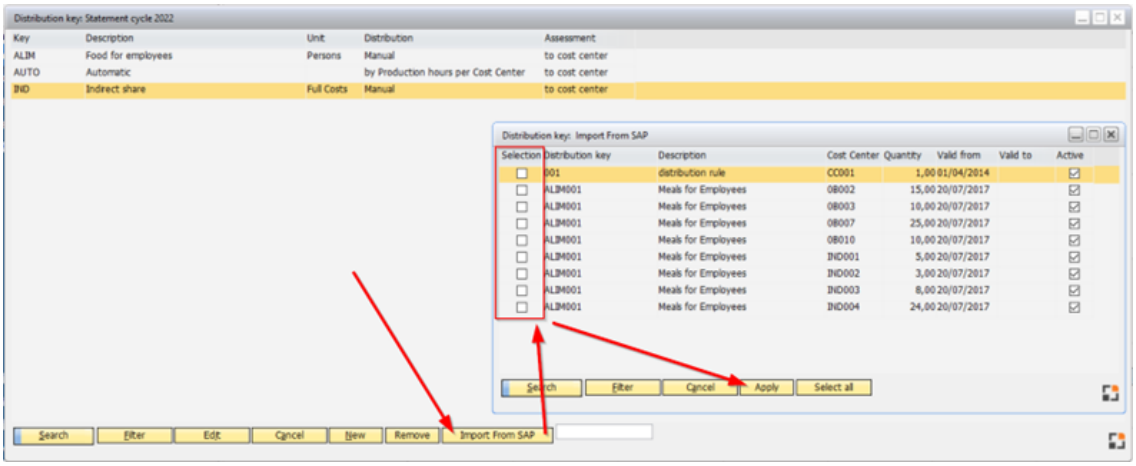
If you use or want to use Distribution Rules in SAP Business One transactions, you'll probably also want to create your Distribution Rules in SAP Business One first before creating Beas Distribution Keys, to easier the creation process and to ensure a common cost accounting in between the two systems (which, by the way, is not mandatory if you intend to have different cost accounting for the financial department, but keep in mind that Beas will always distribute values according to its own Distribution Keys, no matter which Distribution Rules you select in SAP Business One transactions). Nevertheless, if your only intention is to distribute costs from indirect Cost Centers to direct Cost Centers (and not from, let's say, a Journal Entry into multiple Cost Centers), you don't need to create Distribution Rules in SAP Business One, as you will only use Beas Distribution Keys.

NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.

1) **Import Distribution Rules** from SAP Business One. As explained in this topic's introduction, this step is only relevant if you plan to use Distribution Rules in SAP Business One transactions. If not, you can just create the required Distribution Keys in Beas and don't need

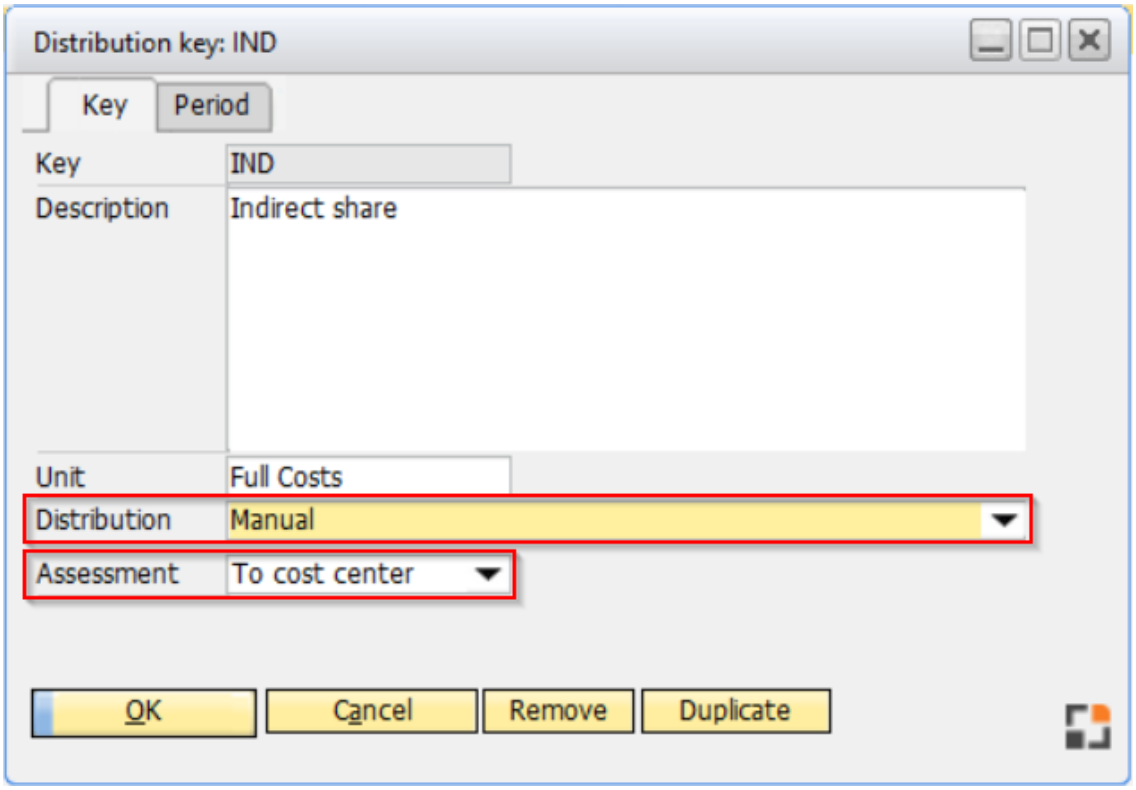
© 2026 Boyum IT Solutions A/S

to have them reflected in SAP Business One. Additionally, this step is only valid for the first time that you create your Distribution Keys. After the first time, a double effort will be required to maintain Distribution Rules and Distribution Keys in both sides, as Beas allows Distribution Keys to have month-specific distribution criteria and SAP Business One does not, requiring you to create a new Distribution Rule if you want to change distribution criteria keeping historical data.



Window bab_vgr_browse.psr

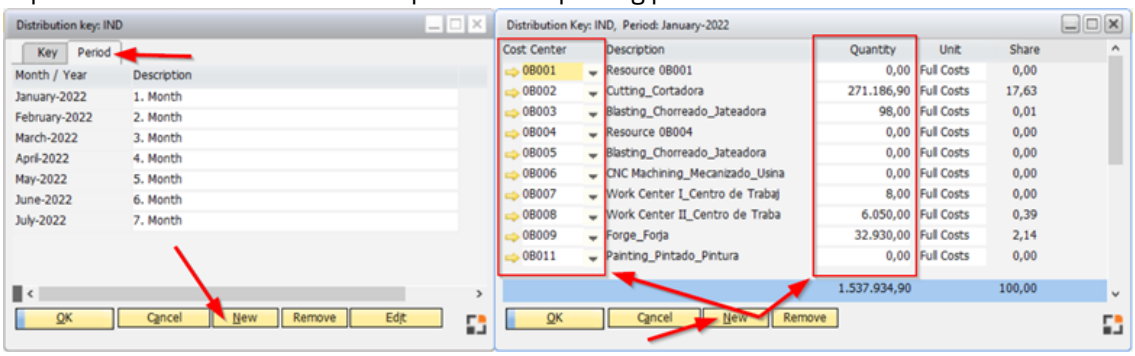
2) Create or edit **Distribution Keys**. When creating a new Distribution Key or editing an imported one, the "Distribution" and "Assessment" fields must be set as shown below.



© 2026 Boyum IT Solutions A/S

Window bab_vgr_edit.psr

3) Define **distribution per period**. After the initial settings, you must set how distribution will happen for each month of the year (or you can choose "STD" if the distribution should be the same for all months). You are free to set the distribution basis according to what makes more sense for your Cost Centers, and Beas will calculate the corresponding proportion (field "Share"). For example, if you wish to distribute energy costs to the direct Cost Centers representing your machines, you can use kW consumed by each one of them as distribution base. However, if you don't know which criterion fits you best, or don't want to create multiple criteria to avoid overloading your team with further maintenance during the following months, you can base your distribution on the amount of marginal/full costs generated by each resource, which will normally result in a fair appropriation, as these costs come from cost rates including all costs related to the resources. This strategy will be explained in more details in the topic about importing production activities.



See other Beas settings for Absorption Costing

back to Absorption costing settings (SAP and Beas)

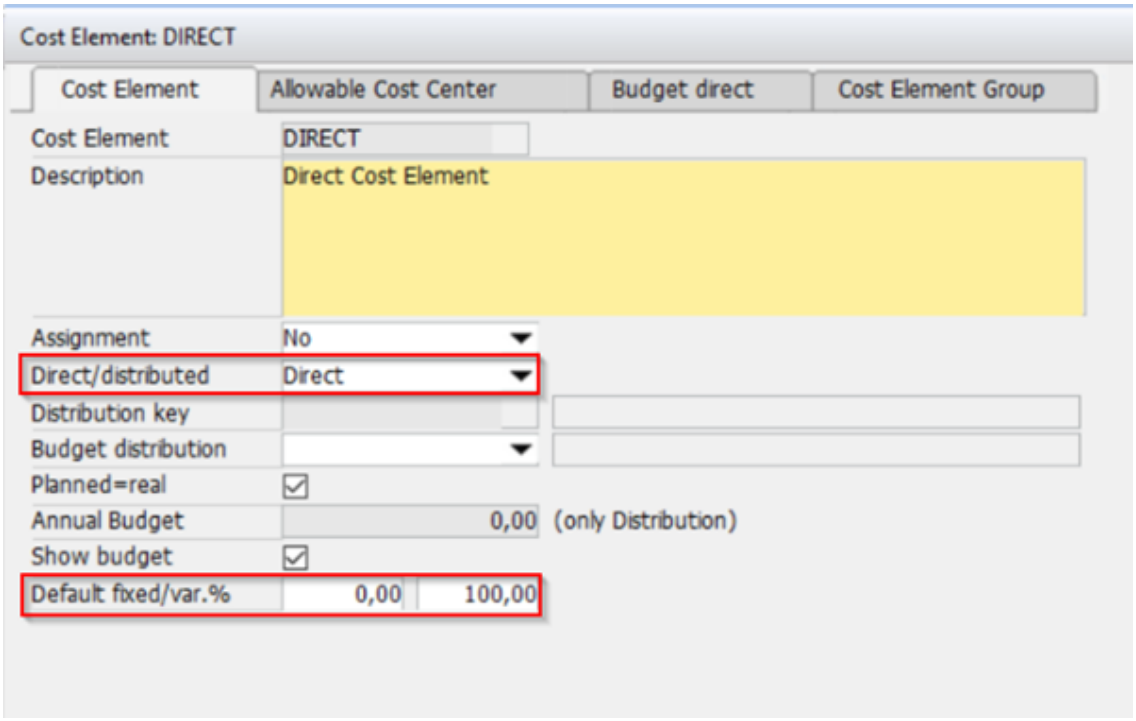
4.2.2.2.5 Cost Elements setup

Cost Elements are the link that holds together SAP Business One Chart of Accounts and Beas Manufacturing Business Performance. Using Cost Elements, you can define which accounts you want to be part of an absorption costing process and set criteria for distributing their values into multiple Cost Centers. There is no option to import Cost Elements, and it is recommended to create as minimum Cost Elements as possible. As a general rule, you need a single Cost Element for all non-distributed accounts and one Cost Element for each account that requires specific distributions using Distribution Keys. Nevertheless, when creating new Cost Elements, you have the option to choose a Chart of Accounts' account from the drop-down for its ID; this makes the assignment process (covered in this guide's next topic) easier, but in overall adds unnecessary extra complications to the process and increase maintenance burdens in the long run.

© 2026 Boyum IT Solutions A/S

NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.

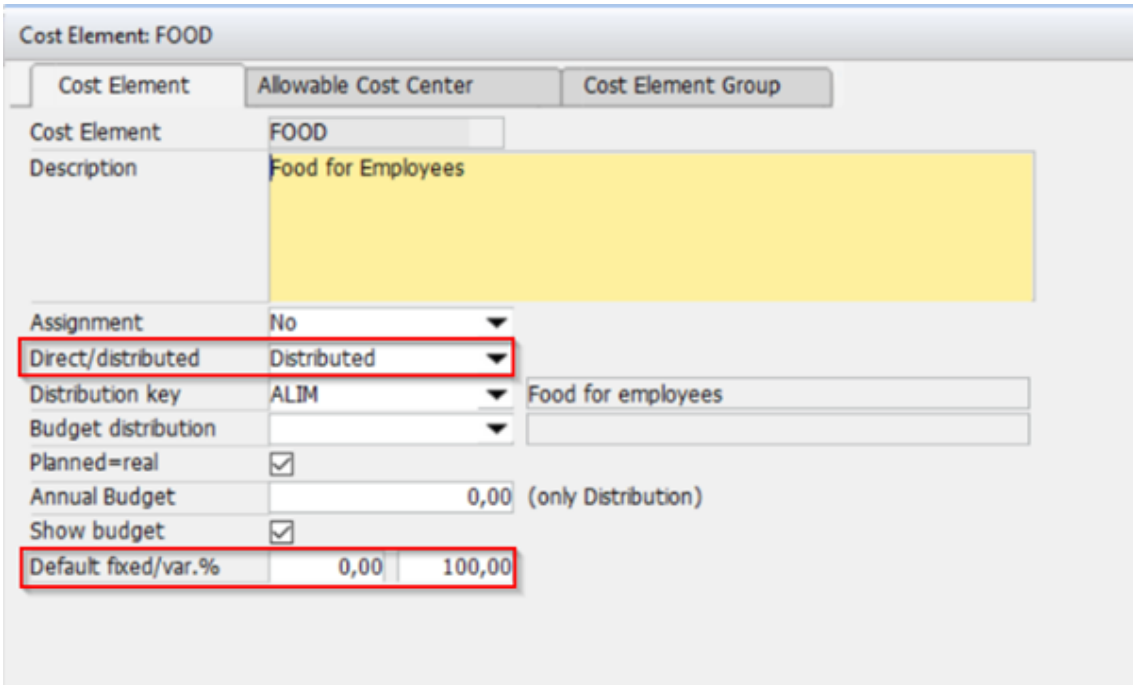
1) Create **Cost Elements** for non-distributed accounts. If you're planning to assign this Cost Element to accounts directly related to particular Cost Centers (not Distribution Rules), you need no more than the settings showed below.



Window bab_ka_edit.psr

2) If needed, create **Cost Elements** for distributed accounts. This step is only required in case you're planning to assign this Cost Element to accounts related to Distribution Rules instead of Cost Centers. Examples for this, as explained before, could come from transactions related to meals for employees or energy for the factory, which are expenses that hold costs for multiple Cost Centers. You will need to set the Cost Element as "Distributed" and define the corresponding Distribution Key (as explained before, Beas will not use Distribution Rules from SAP Business One and will follow its own rules for distributing values—if you wish both places to have the same distributions, you must replicate Distribution Rules as Distribution Keys).

© 2026 Boyum IT Solutions A/S

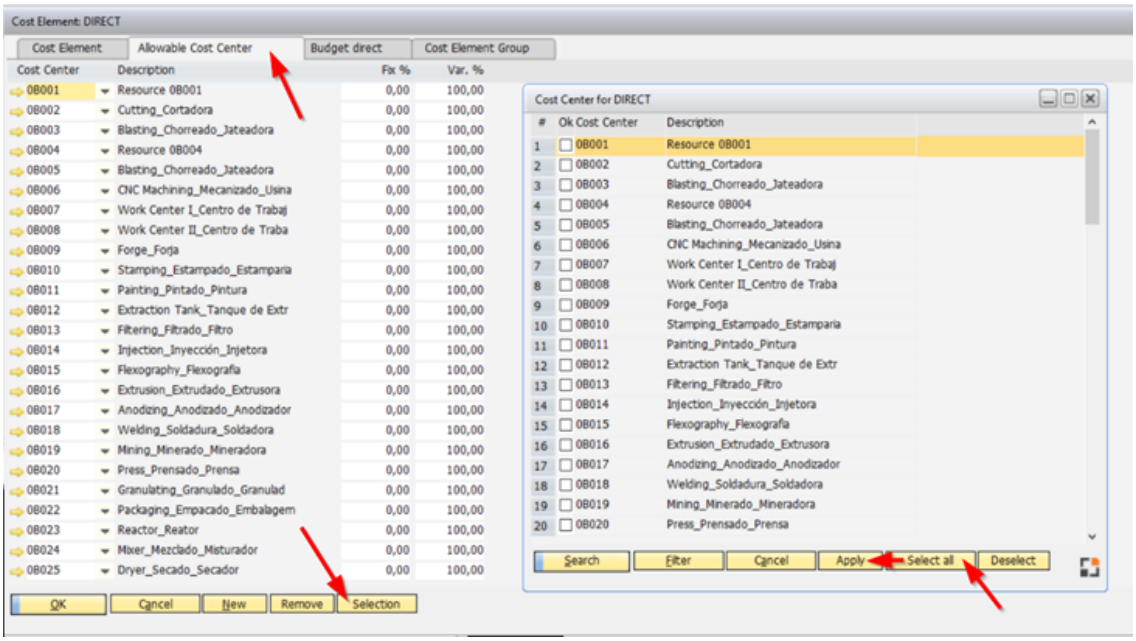


Window bab_ka_edit.psr

3) Set **Allowable Cost Centers** for all Cost Elements (individually). Although you can choose specific Cost Centers as allowed to receive values from a particular Cost Element, the general recommendation is to always set all Cost Centers as allowed, or some financial transactions might not be imported into Beas Business Performance for absorption costing if the Cost Center to which they are linked isn't allowed (and you will probably want all manufacturing costs' transactions correctly imported). The easiest way is to press the "**Selection**" button, then "**Select all**" and "**Apply**", which will apply all Cost Centers as allowed for the Cost Element. The "Fix %" and "Var. %" come from the "Default fixed/var.%" set in the Cost Element and are only useful when you define different Distribution Keys for fixed and variable costs (and this is not a normal recommendation, so you can just set all Cost Elements as 100% variable costs). Without specific Distributions Rules for fixed and variable costs, the calculated

© 2026 Boyum IT Solutions A/S

values will be exactly the same regardless of the proportions defined in these fields.



See other Beas settings for Absorption Costing

back to Absorption costing settings (SAP and Beas)

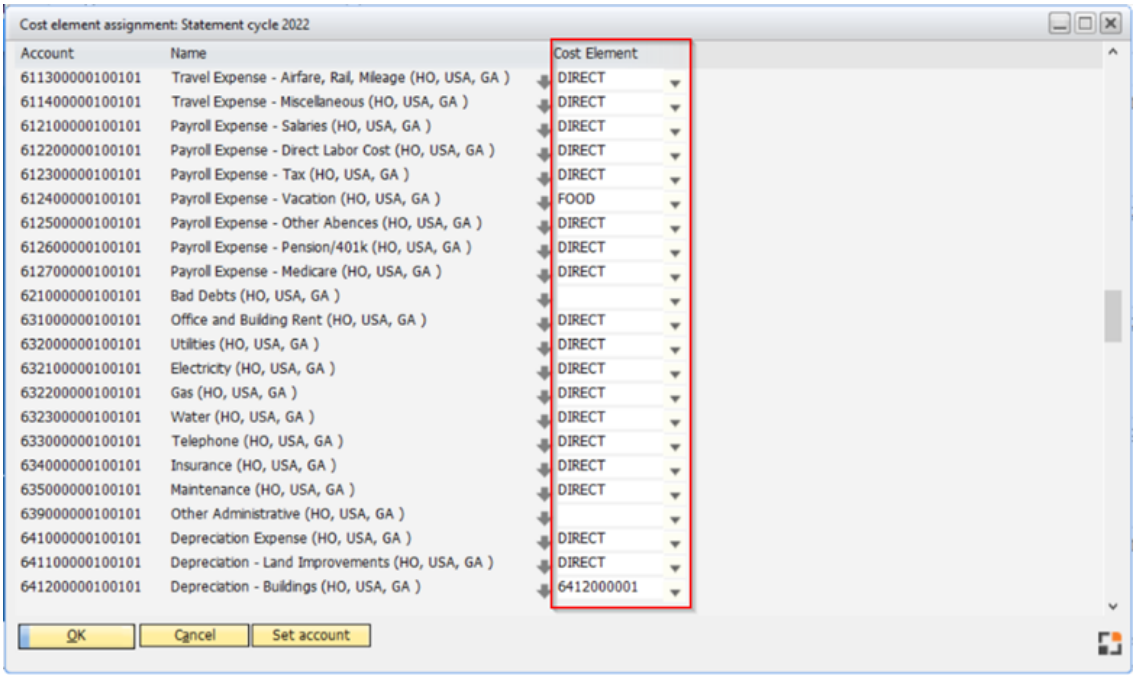
4.2.2.2.6 Cost Element assignment setup

The **Assignment** is the process in which you effectively choose which accounts should be part of Beas absorption costing, as only transactions coming from accounts linked to Cost Elements will be imported into Business Performance's financial data (covered later in this guide). Remember that you should not select any account related to administrative expenses, as only manufacturing-related costs should base absorption costing.

1) Link Cost Elements to the accounts you want as part of the absorption costing process. If you have created the Cost Elements with the same IDs as the accounts' IDs, you can press **"Set**

© 2026 Boyum IT Solutions A/S

Account" for an automatic assignment.



Window bab_konto_kstst_edit.psr

See other Beas settings for Absorption Costing

back to Absorption costing settings (SAP and Beas)

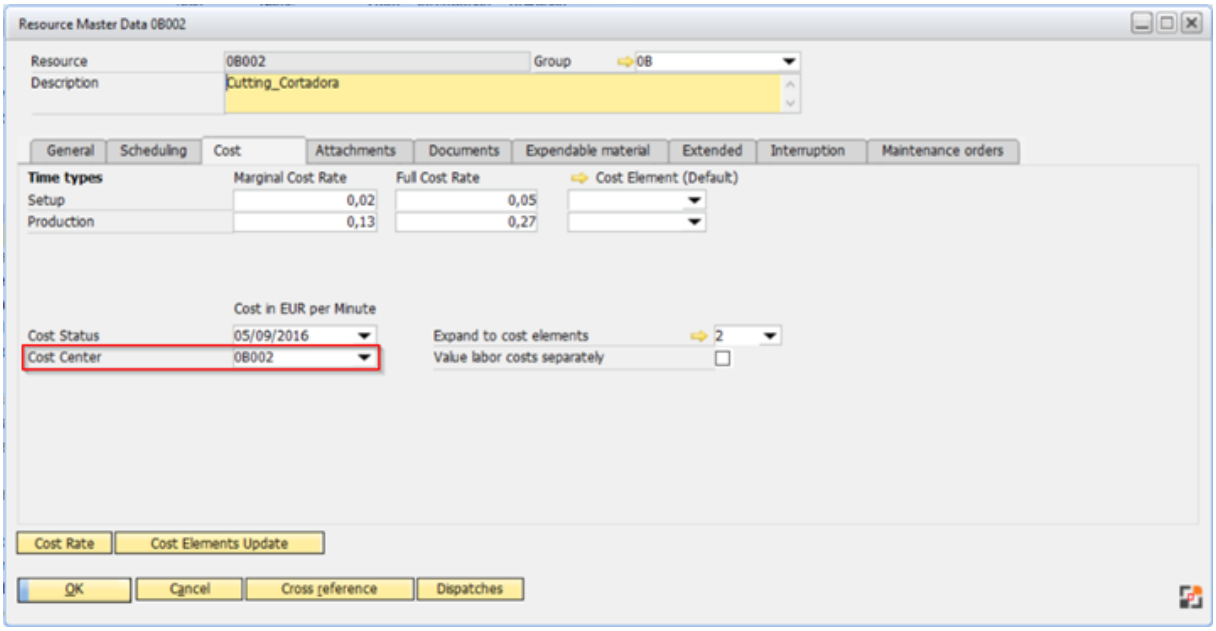
4.2.2.2.7 Resources setup

For Beas to allocate the correct Cost Centers to the Time Receipts, it is necessary to set the corresponding direct Cost Center to each resource, as well as define, in the Configuration Wizard that Cost Centers must be read from Resources. Ideally, each resource should have its own direct Cost Center (unless the resource belongs to a group of similar resources sharing the same costs), since Beas will suggest new cost rates for each Cost Center after running absorption costing (and you can easily update the resources' cost rates based on the latest absorption costing executing using Data Integration Hub).

NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.

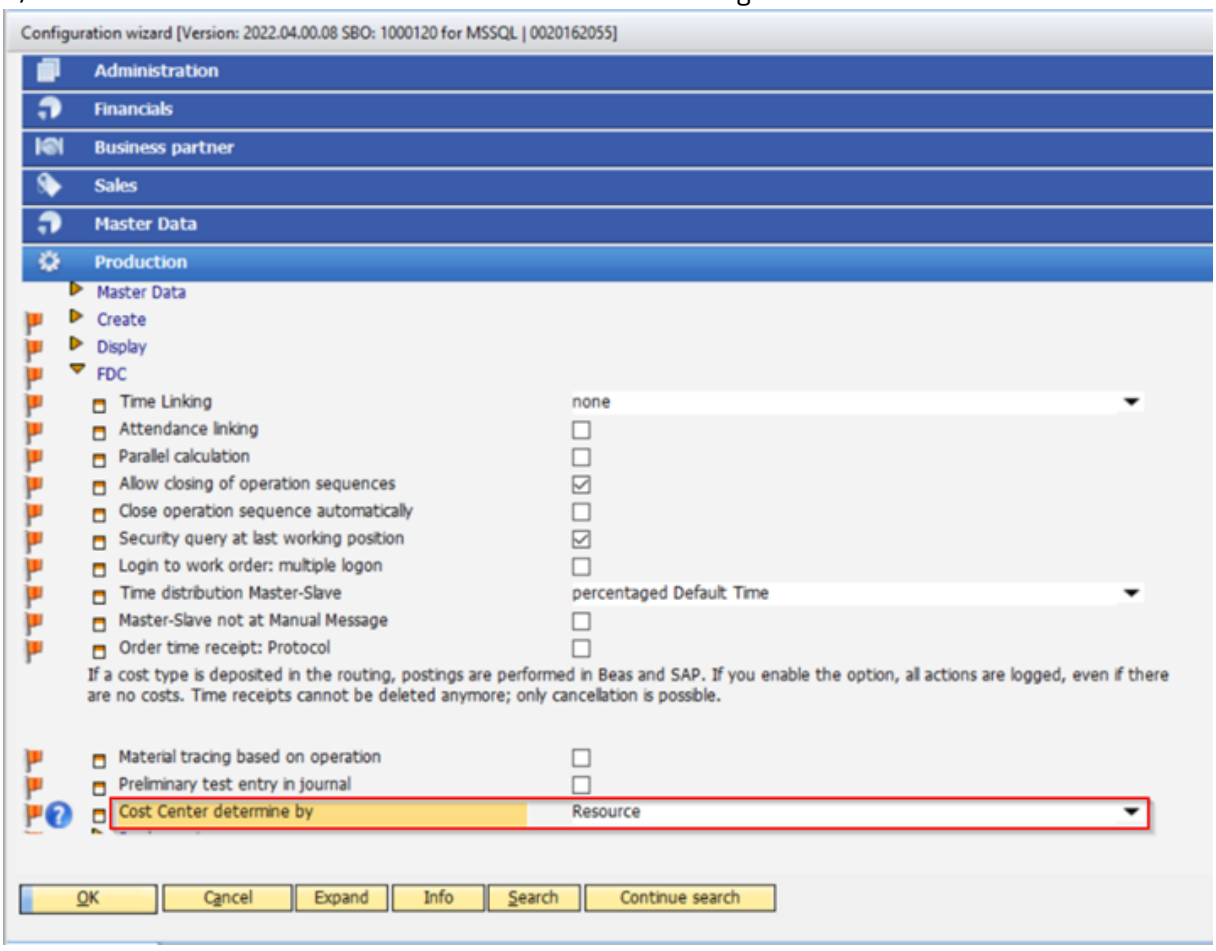
1) Choose the corresponding Cost Center in the resources master data.

© 2026 Boyum IT Solutions A/S



Window stamm_arbplatz_edit.psr

2) Set Beas to read Cost Centers from Resources in the Configuration Wizard:



© 2026 Boyum IT Solutions A/S

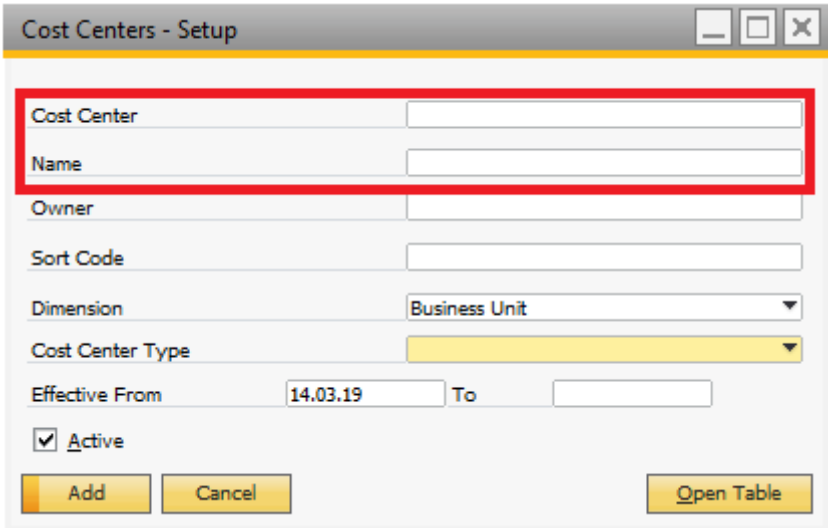
See other Beas settings for Absorption Costing

back to Absorption costing settings (SAP and Beas)

4.2.3 Creation of master data (step by step)

When creating the master data, the order below should be followed:

Create a Cost Center in SAP Business One

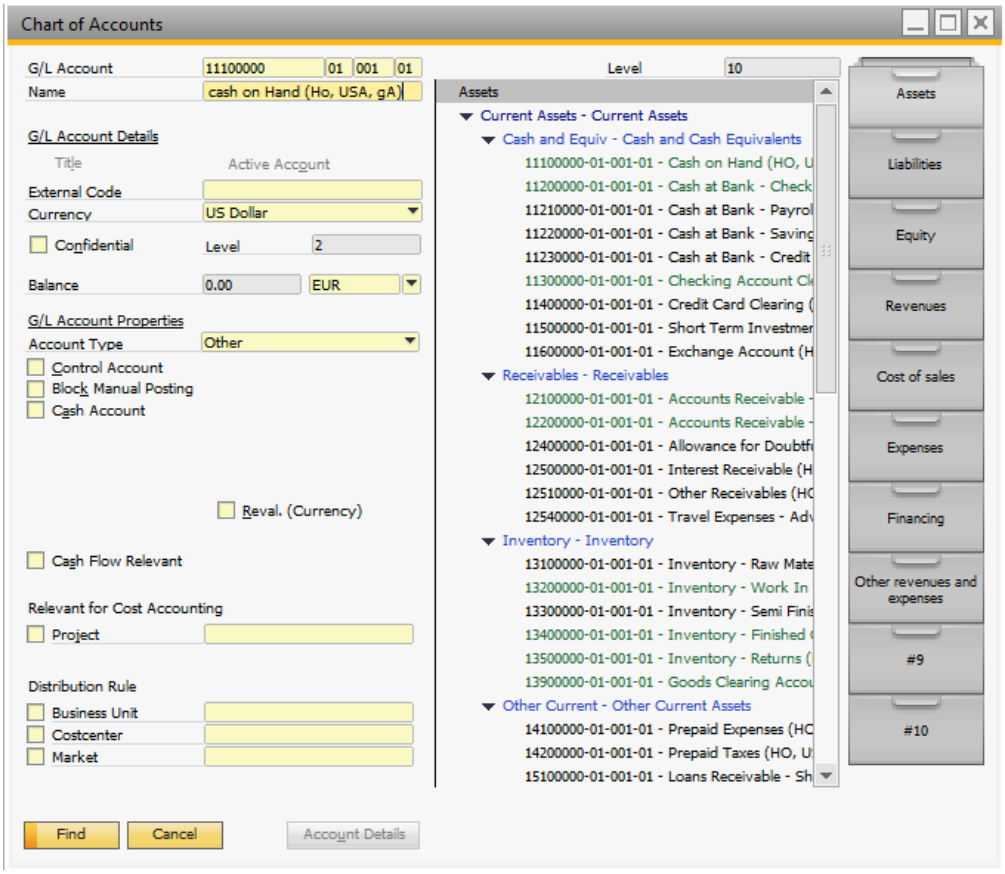


Window beasgui_sbo.psr

Create Chart of Accounts (cost elements)

PATH: Financials > Chart of Accounts.

© 2026 Boyum IT Solutions A/S

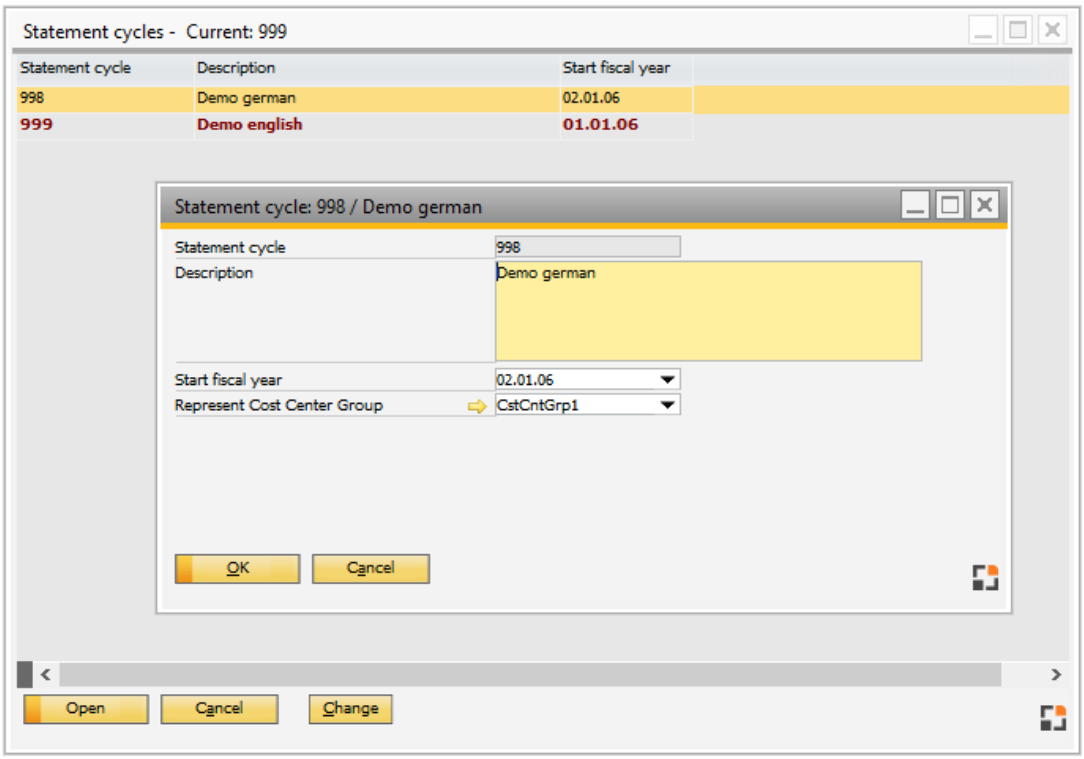


Window beasgui_sbo.psr

Create Statement Cycle

PATH: Financials > Business Performance > Master Data > Statement cycles > "**Open**" entry.

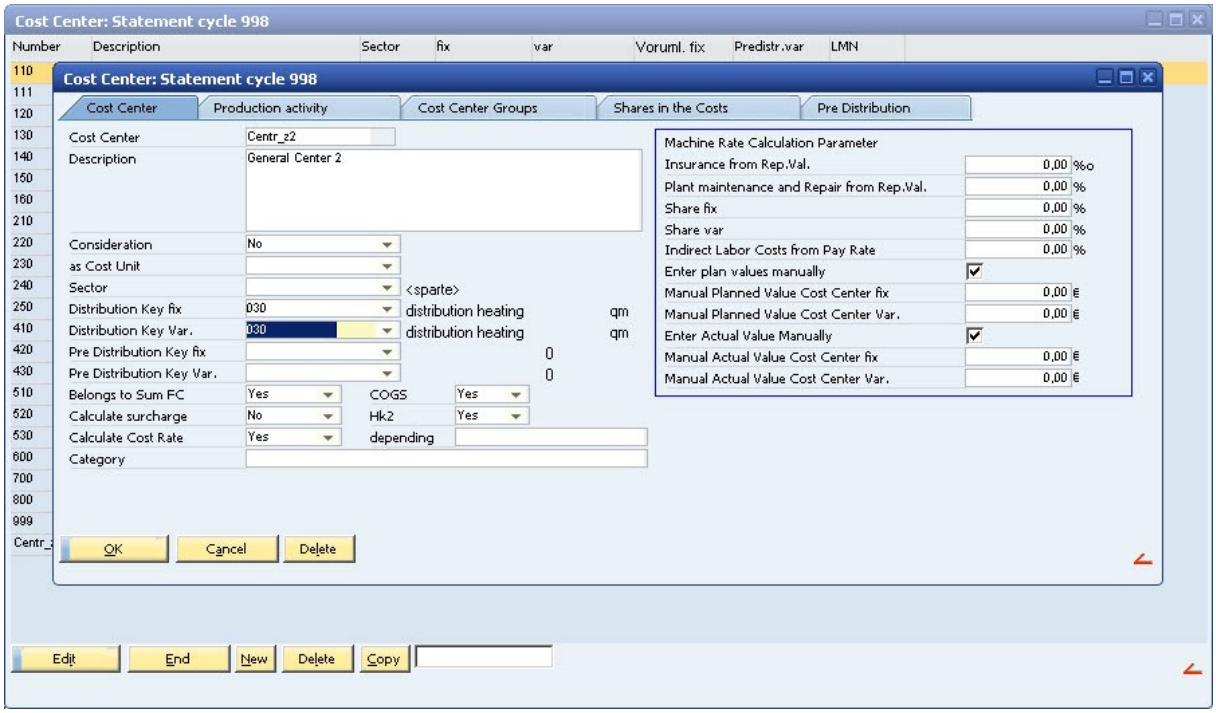
© 2026 Boyum IT Solutions A/S



Window bab_abrid_edit.psr

Create Cost Centers (without key)

The cost centers created here are assigned to the profit centers.



© 2026 Boyum IT Solutions A/S

Create Distribution Key

The keys can be assigned used to assign cost centers or cost elements.

4.2.4 Absorption Costing - Introduction

Usage is only possible if "Absorption Costing" for Business Performance is defined in the Beas Configuration wizard.

QUICK GUIDE FOR THE 2020.12 RELEASE OF ABSORPTION COSTING MODULE IN BEAS

Business performance - Introduction to Absorption costing

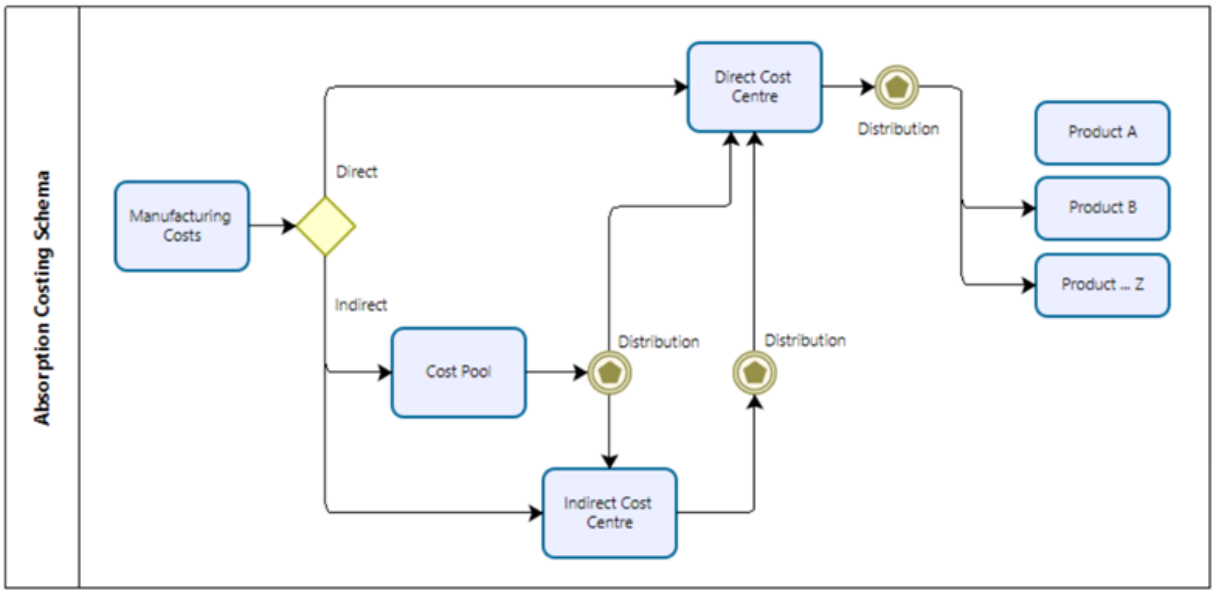
An Introduction to Absorption Costing

Absorption costing is a costing method targeted at distributing manufacturing overheads to the manufactured items and appropriating these costs into inventory, where they will remain until the company sells them. After selling, the products' costs, now including manufacturing overheads distribution, will be recognized as COGS (Costs of Goods Sold) and affect the Profit & Losses financial statement. It is important to note that, apart from being an extremely useful tool for accurate per-product profits calculation, absorption costing is a mandatory requirement for publicly

© 2026 Boyum IT Solutions A/S

traded companies who need to follow GAAP and/or IFRS standards, and required by tax laws in the United States, Brazil, and many other countries.

When using absorption costing, the companies book all their manufacturing costs to cost centers, which can be direct or indirect. Direct cost centers represent manufacturing units directly related to production, like production equipment and work centers. Indirect cost centers, on the other hand, can represent either manufacturing units indirectly related to production (such as maintenance, production supervision, and quality control) or cost pools, which are intermediate cost centers that collect multiple costs before a further distribution into other direct or indirect cost centers. Afterwards, distribution rules will set the basis for sharing the costs contained in indirect cost centers across the direct cost centers, which will later be carried over into the products.



However, absorption costing can be an extremely complicated and time-consuming task without a powerful and integrated ERP to support it. In fact, several companies give up on absorption costing or treat it just like a burdensome obligation due to the simple fact that they lack the proper tools to calculate it properly. After all, for absorption costing to be successful, it needs to combine information coming from finance, production, maintenance, and many other departments, which can all have their own systems and require extensive manual work to match an immense amount of data in spreadsheets and input the results into the ERP. Nevertheless, when using Beas Manufacturing, you can be just a few clicks away from accomplishing a full absorption costing process, as it integrates manufacturing data to financial information coming from SAP Business One, automatically calculates the distributions of costs in between cost centers and products, and reevaluate the goods based on their new calculated costs.

SAP B1 and Beas Financial Integration

© 2026 Boyum IT Solutions A/S

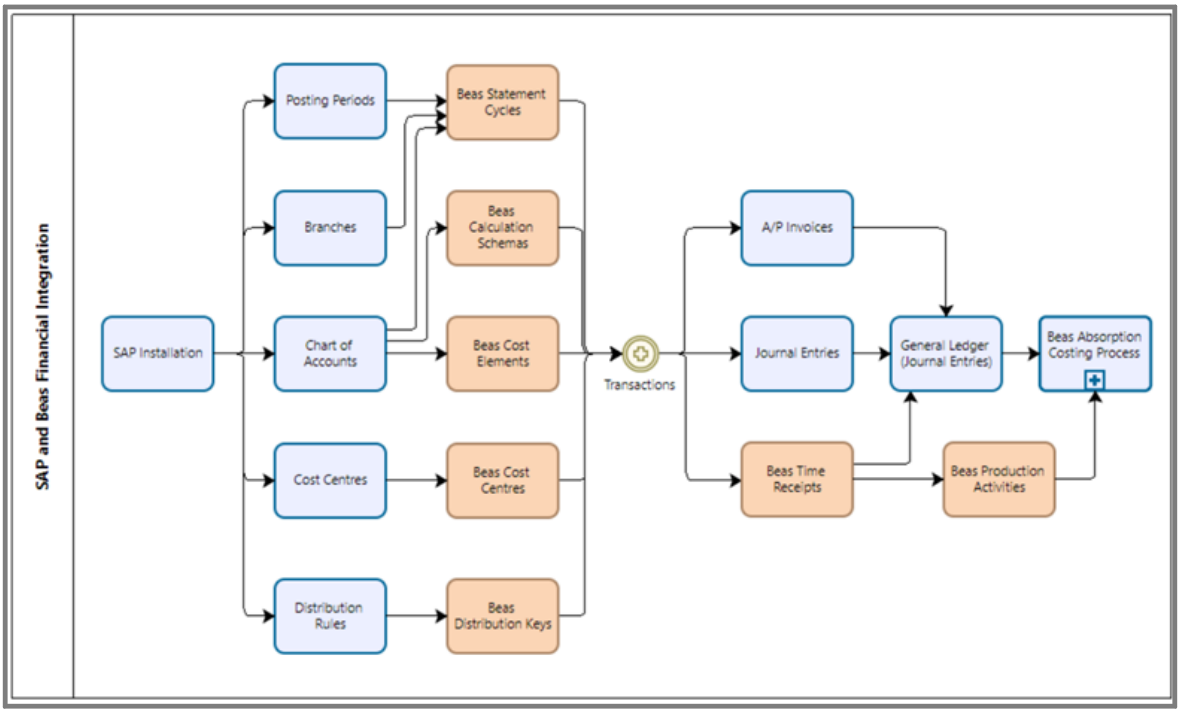
In an SAP Business One installation, the typical implementation process includes basic financial definitions such as posting periods, company branches (in the case of having multiple subsidiaries in the same database), chart of accounts, cost centers, and distribution rules (responsible for sharing values across multiple cost centers in certain transactions). Every time a user creates a transaction with inventory or financial implications, this transaction will trigger a journal entry containing manually selected accounts or automatically defined accounts based on accounting determinations, besides cost centers selected by the user or linked to the accounts.

For using absorption costing in Beas Manufacturing, extra definitions are required, like statement cycles mapped to the branches and posting periods, cost elements associated to the desired accounts from the chart of accounts, cost centers for direct and indirect manufacturing costs, and distribution keys reflecting SAP's distribution rules. The linking in between manufactured items and direct cost centers happens through time receipts, which are the transactions generated to record processing times from factory workers and machines, and will later compose the production activities, or the list of manufactured goods to receive absorption costing appropriation.

Time receipts also trigger journal entries for labor and machine costs according to pre-defined resources and operators' cost rates, in order to keep manufacturing costs as close as possible to the costs after absorption costing. These costs are automatically reverted as part of the absorption costing process (preventing double-costing on products, as they will receive labor, machine, and overhead costs from absorption costing) and, based on absorption costing results, output new recommended cost rates for production resources.

The flowchart below illustrates the integrations between SAP Business One and Beas Manufacturing for generating transactions and processing absorption costing.

© 2026 Boyum IT Solutions A/S



Beas Business Performance - Absorption Costing

Beas Manufacturing, through its module Business Performance, provides an absorption costing functionality capable of distributing manufacturing costs (labor and overheads) to the produced goods, including distributions from cost pools and indirect cost centers to direct cost centers, detailed control of open absorption costing values for unfinished production orders at the month's end, and redirection of sub-assemblies' appropriations to the products who consumed then. Absorption costing affects inventory values, expenses, and costs of goods sold (if the products to reevaluate were already sold during the month) by moving production-related expenses into inventory. This means that, after executing absorption costing, the company's profits will be higher unless it has sold all its produced inventory, as manufacturing costs are only recognized as expenses in the form of COGS.

As mentioned before, absorption costing is a mandatory requirement for publicly traded companies who need to follow GAAP and/or IFRS standards, and required by tax laws in the United States, Brazil, and many other countries. By having Beas Manufacturing in place, your company can transform the burden of fulfilling tax requirements or complying to financial standards into a powerful and automated analytical tool for understanding costs and profits, requiring a fraction of the effort normally required by the traditional manual calculation methods.

See:

Absorption Costing - Concept

Absorption Costing - Setup

© 2026 Boyum IT Solutions A/S

Absorption Costing - WORKFLOW
Absorption Costing Report - Concept

4.2.5 Absorption Costing - WORKFLOW

Here you can find the steps of the complete Beas Absorption costing workflow.

The workflow steps are to be performed in the following order:

1. Financial Data workflow
2. Production Activities workflow
3. Cost Calculate workflow
4. Absorption Costing workflow
5. Absorption Costing - Finishing steps

See:
Absorption Costing - Concept
Absorption Costing - Setup
Absorption Costing Report - Concept

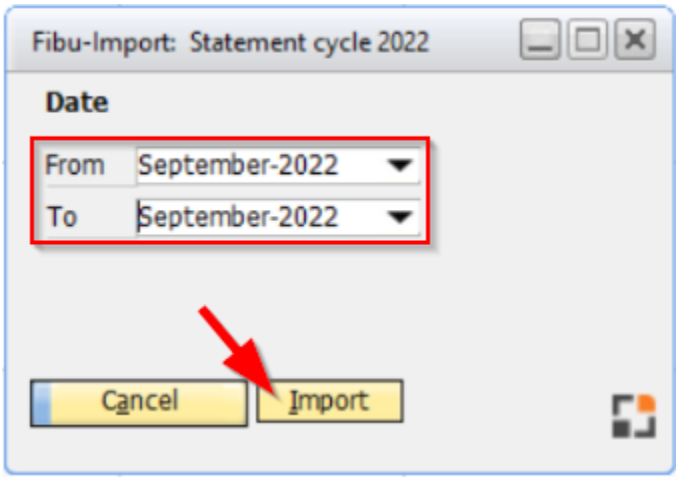
4.2.5.1 Financial Data - Workflow

The Beas Business Performance **Financial Data** keeps all financial transactions that will feed the absorption costing process. Importing financial data is the first step for executing absorption costing after you have successfully completed the required setup. As it relies on transactions created in SAP Business One, make sure that all documents and journal entries are already posted before you import the financial data, as data is not automatically synchronized in between the two systems.

> NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.

1) Define starting and ending month to import **Financial Data** for the currently active Statement Cycle. Remember that Business Performance will ignore all transactions related to accounts not assigned to Cost Elements. Besides, all transactions must be linked to Cost Centers or Distribution Rules, and the chosen Cost Centers must be defined as allowed for the Cost Elements, or you will receive errors during the importing process.

© 2026 Boyum IT Solutions A/S

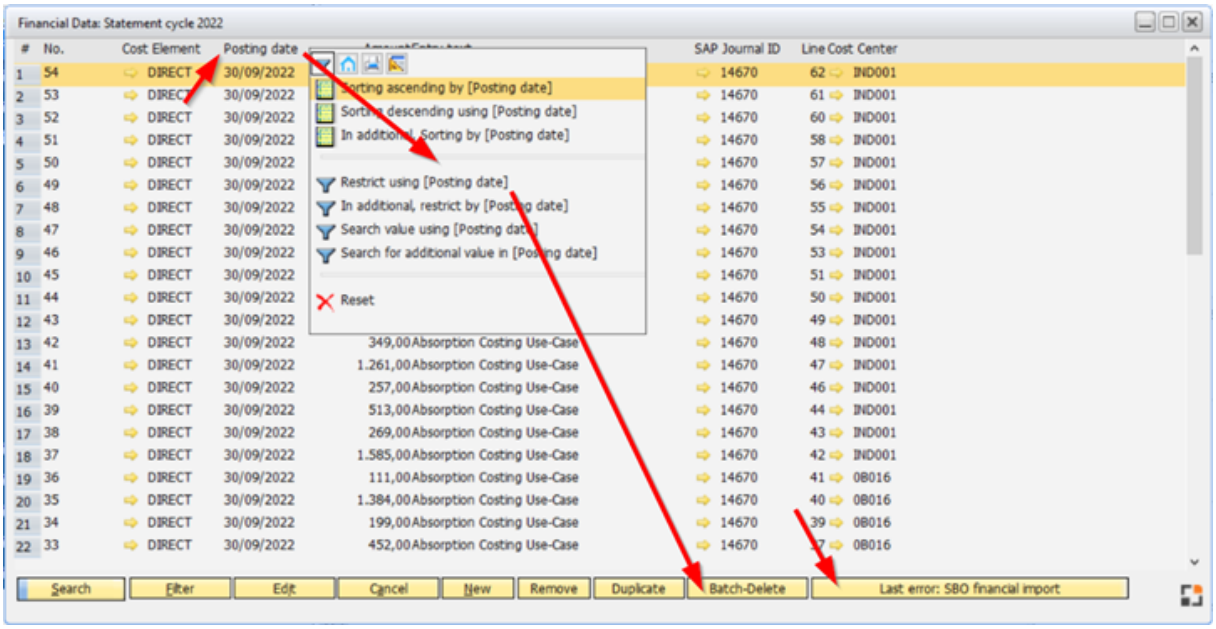


Window bab_fibuimport_start.psr

2) Open the **Financial Data** window and check if there were any errors related to the previous importing. After you fix the errors, you need to delete the existing financial data for the month before you import it again, or the data will be duplicated (Beas does not check if the data exists before importing, it will just re-import everything). To delete the data, you can right-click the "Posting date" column, choose "Restrict using [Posting date]", select the month in which the error happened, and click on "Batch-Delete" (batch-delete only affects the data currently visible on the screen—if you filtered correctly, this will not affect transactions from other periods).

Important note: Although there is a "**New**" button on the screen, don't use it for the purposes of absorption costing, or you'll overburden your products with non-existent costs. This button exists for other functionalities related to the Business Performance module, not for companies using absorption costing. All financial transactions must be created in SAP Business One and imported into Beas.

© 2026 Boyum IT Solutions A/S



Window bab_fibu_browse.psr

see next step: Production Activities - workflow

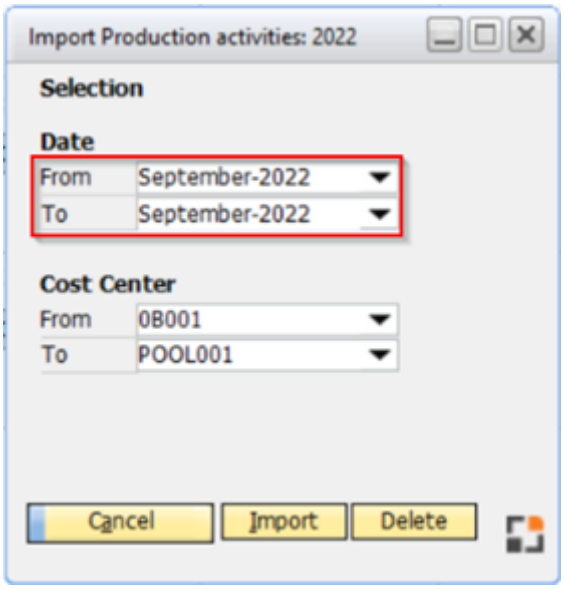
4.2.5.2 Production activities - Workflow

All production transactions generated in Beas are reflected in Business Performance - Production Activities. Production activities include the production items, quantities, times, and costs per Cost Center and are the base for distributing costs from direct Cost Centers into the manufactured goods. Additionally, since this feature also summarizes all manufacturing costs per Cost Center (calculated according to the existing resource cost rates), it can also be a guide to set-up Distribution Keys for indirect manufacturing costs.

> NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.

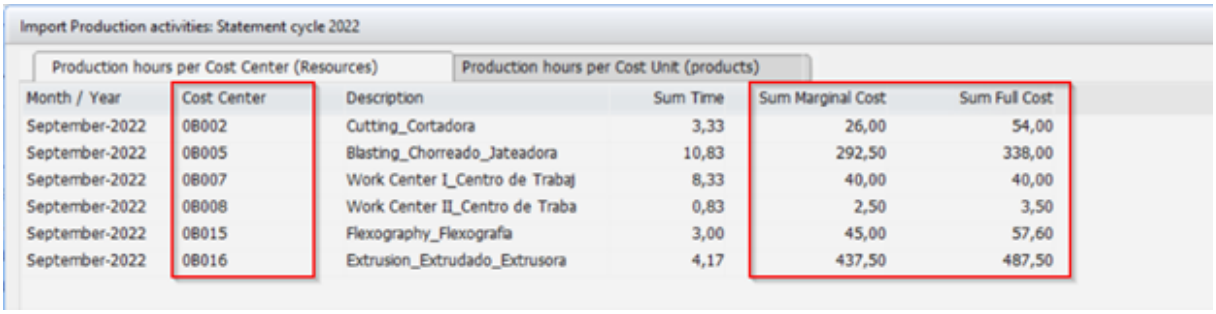
1) Define starting and ending month to import **Production Activities** for the currently active Statement Cycle. You can leave the Cost Centers filter untouched and import data for all Cost Centers, as production activities, in contrast to financial data, are always erased when re-importing data for the same months (so, you will never get duplicate production activities.

© 2026 Boyum IT Solutions A/S



Window bab_fertigungsleistungen.psr

2) After importing production activities, you will be presented with a summary screen, including marginal and full costs per Cost Center.

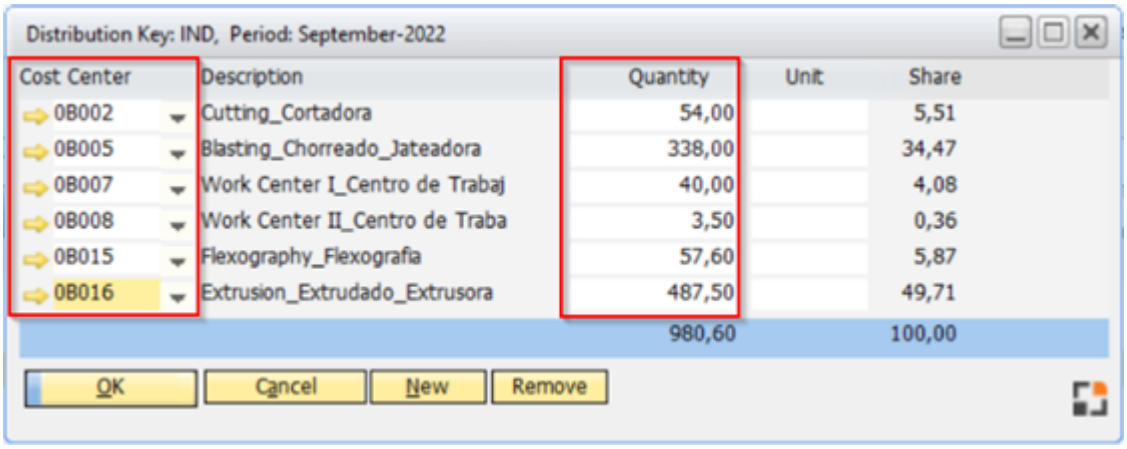


Month / Year	Cost Center	Description	Sum Time	Sum Marginal Cost	Sum Full Cost
September-2022	0B002	Cutting_Cortadora	3,33	26,00	54,00
September-2022	0B005	Blasting_Chorreado_Jateadora	10,83	292,50	338,00
September-2022	0B007	Work Center I_Centro de Trabaj	8,33	40,00	40,00
September-2022	0B008	Work Center II_Centro de Traba	0,83	2,50	3,50
September-2022	0B015	Flexography_Flexografía	3,00	45,00	57,60
September-2022	0B016	Extrusion_Extrudado_Extrusora	4,17	437,50	487,50

Window bab_fert_leist.psr

This is a very useful data if you are not sure which is the most appropriate criteria for distributing costs from indirect to direct Cost Centers, as it represents which resources (direct Cost Centers) generated more costs for your company. To use this data as distribution base for indirect Cost Centers, can just copy the information from this screen into a Distribution Key and link it to the desired indirect Cost Centers.

© 2026 Boyum IT Solutions A/S



Window bab_vvgr_browse.psr

After you press "**Apply**", the results screen close.

see next step: Cost calculate workflow

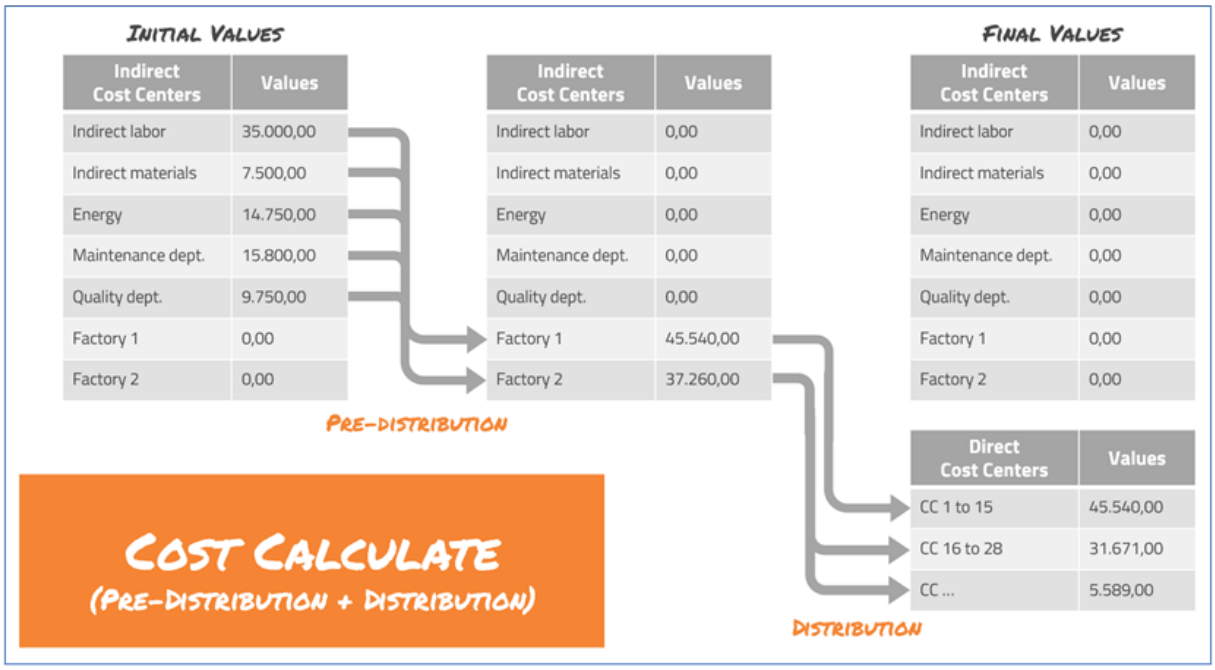
4.2.5.3 Cost calculate - Workflow

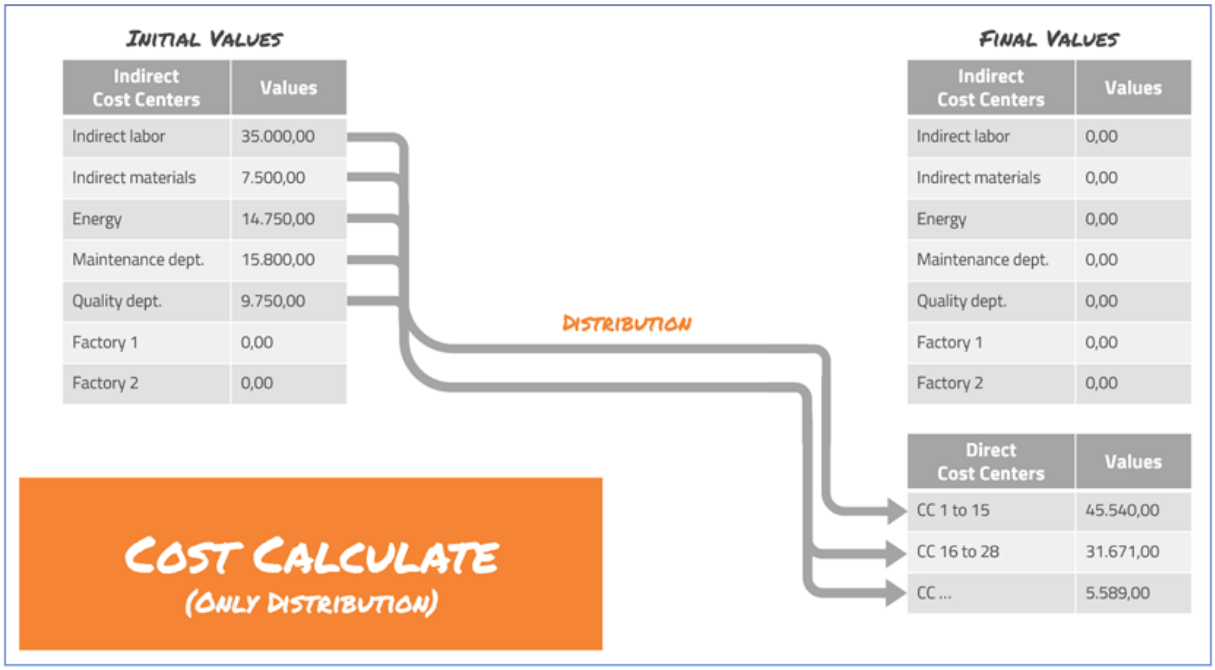
When both financial data and production activities are imported, the next step is to process the distributions in between Cost Centers through the Cost Calculate function. Distributions are processed in two steps:

I. **Pre-distribution**: distribute values from indirect Cost Centers (including cost pools) to other Cost Centers, either direct or indirect. Cost Centers receiving values from the pre-distribution phase can also have Distribution Keys set to them for further distributions. If no Cost Centers have Distribution Keys set for pre-distribution (normal scenario, as pre-distribution is only useful in very specific situations), this step is skipped.

II. **Distribution**: final distribution step, taking values from the indirect Cost Centers into directs. If any costs remain undistributed, it will not be carried over to the manufactured goods, reason for which you must make sure that all indirect Cost Centers have Distribution Keys assigned and that they are configured to send values only to direct Cost Centers. In the two images below, you can see how Cost Calculate behaves when having pre-distribution plus distribution, or distribution only. Next, there is an explanation about running the Cost Calculate process.

© 2026 Boyum IT Solutions A/S





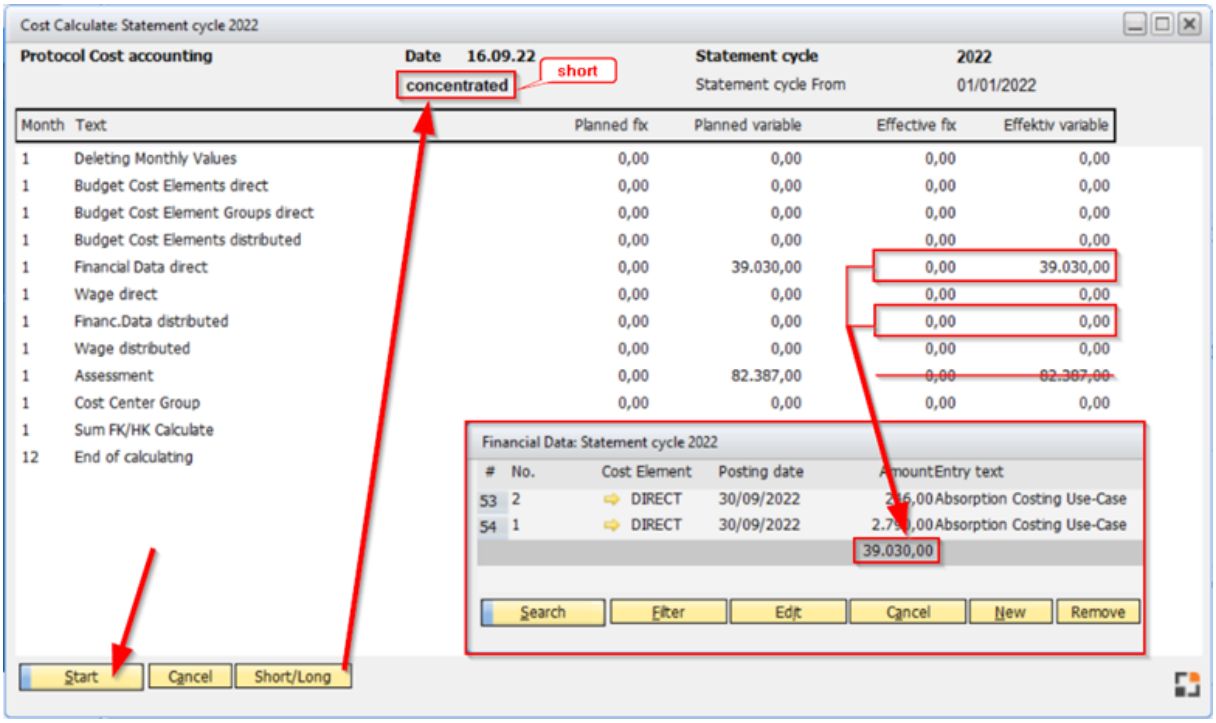
1) Execute **Cost Calculate**. Switching between short and long views has no impact on the calculation process itself, only on how you see data on the screen. The recommendation is to always use the short view, as there is no real benefit from using long view and it really slows down the calculations. If you wish to double-check whether your calculated values are correct or wrong, verify if the sum of “Financial Data direct” and “Financ.Data distributed” matches the total amount

© 2026 Boyum IT Solutions A/S

of financial data for the whole Statement Cycle. The values for “Financ.Data distributed” will only differ from 0 when you have distributed Cost Elements; if not, it will be 0 even when you have values on indirect Cost Centers with Distribution Keys assigned (and you shouldn’t worry about where this screen displays the values).

Important note: “Fix” and “Variable” values depend on whether you set your Cost Elements as related to fixed or variable costs for the Cost Centers. Regarding the “Assessment” field, you can safely ignore its value.

NOTE: The below screenshot in this chapter is using the "Old System (Deprecated) style" set in the Configuration wizard.



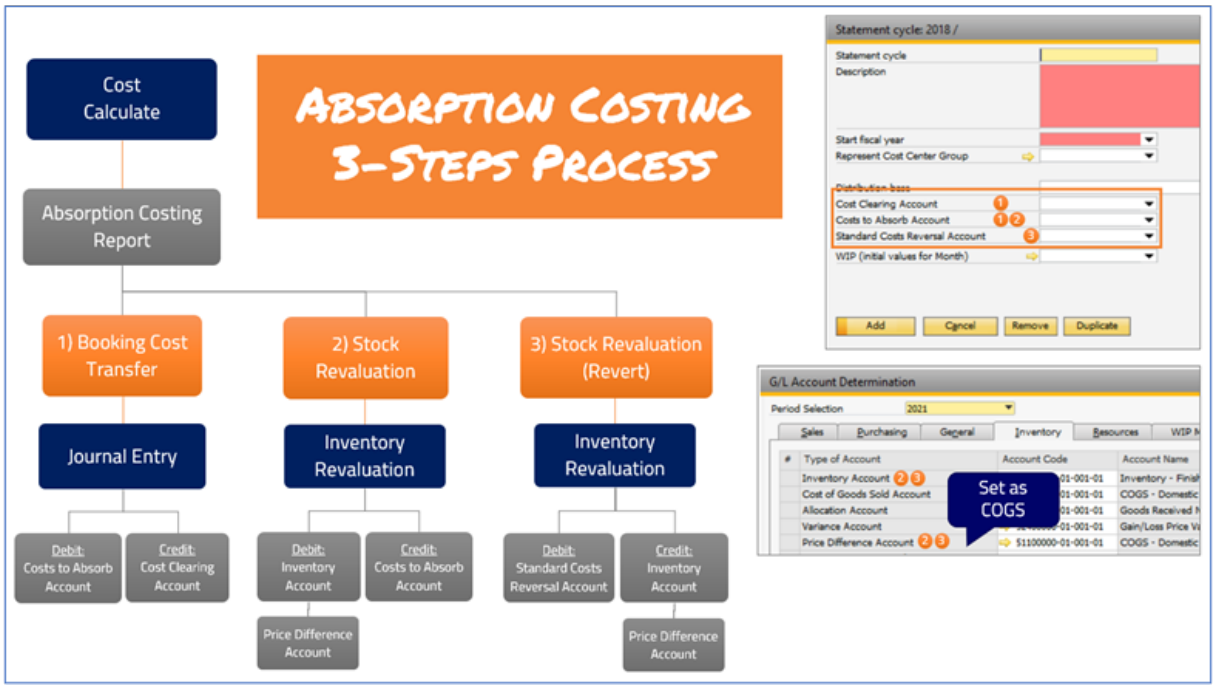
WIndow bab_berechnen.psr

see Absorption costing workflow

4.2.5.4 Absorption Costing - Workflow

After completing the verifications and making sure that all data is correct (if not, please fix everything before going forward), you can proceed to execute absorption costing. Executing it requires three major steps, illustrated in the image below and explained further in this topic. The circled numbers represent the accounts used in each step.

© 2026 Boyum IT Solutions A/S



Important notes:

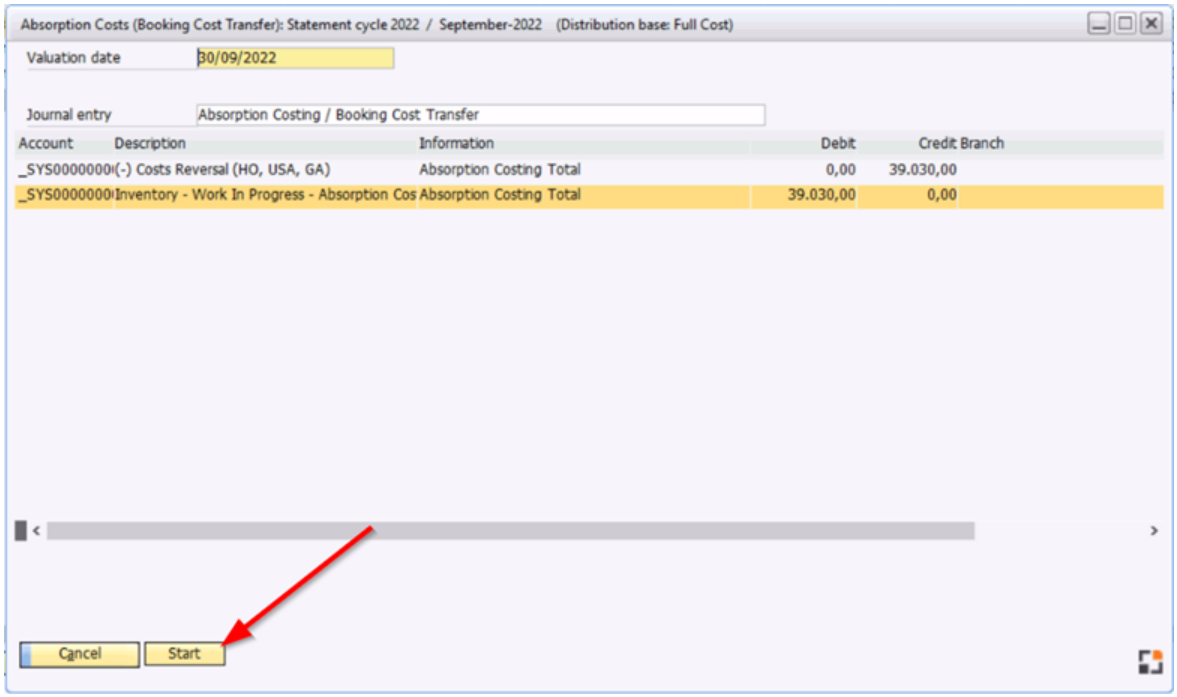
- After the absorption costing processes of Stock Revaluation and Stock Revaluation (Revert) are executed for a Statement Cycle, they cannot be performed for the same Work Orders again. Be sure that all values are correct before starting the three major steps.
- There is no cancellation option for the absorption costing process. Whenever absorption costing transactions need to be reverted, you must create new inverted Stock Revaluations in SAP (manually or using DTW) to correct the values. Stock Revaluations created manually or using DTW will not display on the Absorption Costing report.
- Due to an SAP Business One's limitation, the Stock Revaluation transactions can only be done considering the stock available at the moment in which they are being executed. As the available stock influences how much of the values will go into stock or COGS accounts, it is recommended to execute the Absorption Costing process as soon as possible after the month ends.

NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.

1) Execute **Booking Cost Transfer**. Whenever you book manufacturing costs in SAP Business One, being them related to labor or overheads, they will go to costs or expenses accounts and be part of your Profit and Losses Statement. Using absorption costing, however, those costs only affect your Profit and Losses Statement in the form of COGS after the products are sold. In this first step, all your manufacturing-related costs are credited from the "Cost Clearing Account" (expenses contra account) and debited to the "Costs to Absorb Account" (asset

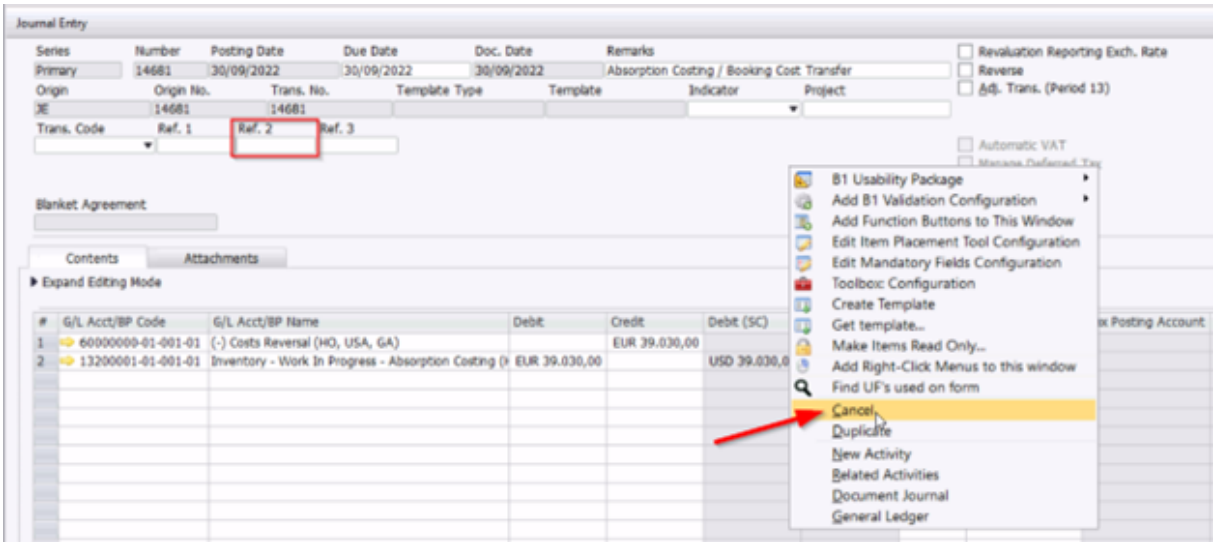
© 2026 Boyum IT Solutions A/S

account) set in the Statement Cycle.



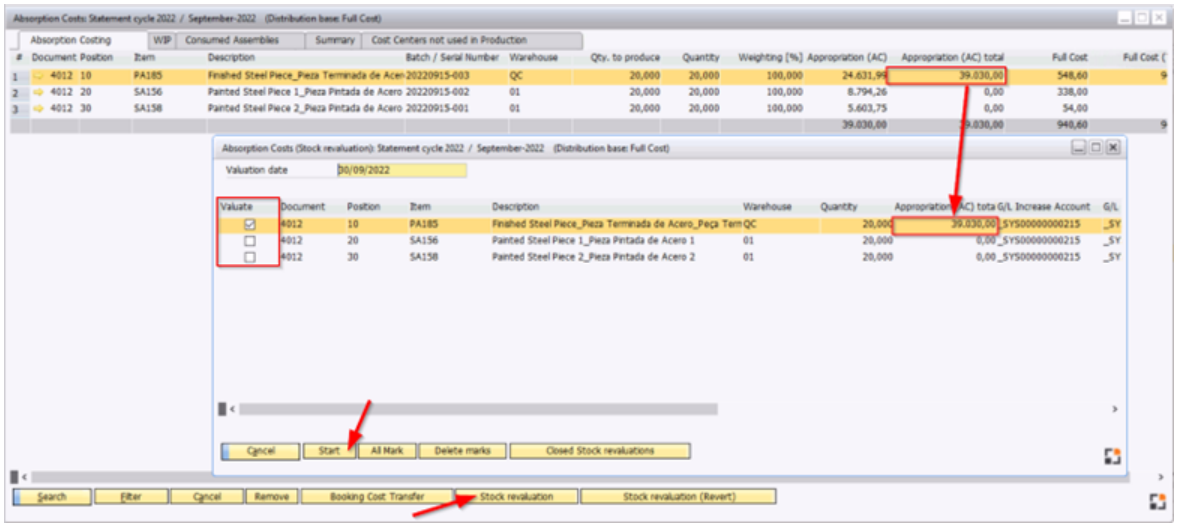
Important note: This is the only step with a relatively easy cancellation procedure if you detect a mistake in your absorption costing process. Therefore, make sure everything is correct before proceeding. If you ever need to cancel a Booking Cost Transfer process, follow these steps:

Open the Booking Cost Transfer journal entry, erase the content of "Ref. 2", update and then cancel it using the same posting date as the date in which Booking Cost Transfer was originally posted. This will enable you to perform Booking Cost Transfer again.



© 2026 Boyum IT Solutions A/S

2) Execute **Stock Revaluation**. This is the moment in which Beas really appropriates costs into the products, taking values from the "Costs to Absorb Account" and moving those values either to the products' stock accounts or COGS (if there is not enough stock during the revaluation). If there are any products for which you don't want to appropriate values now, you can deselect the "Valuate" column, and they will remain open in the list after you run the Stock Revaluation step. This column is automatically selected for items with values to appropriate and deselected for items with 0 appropriation value.



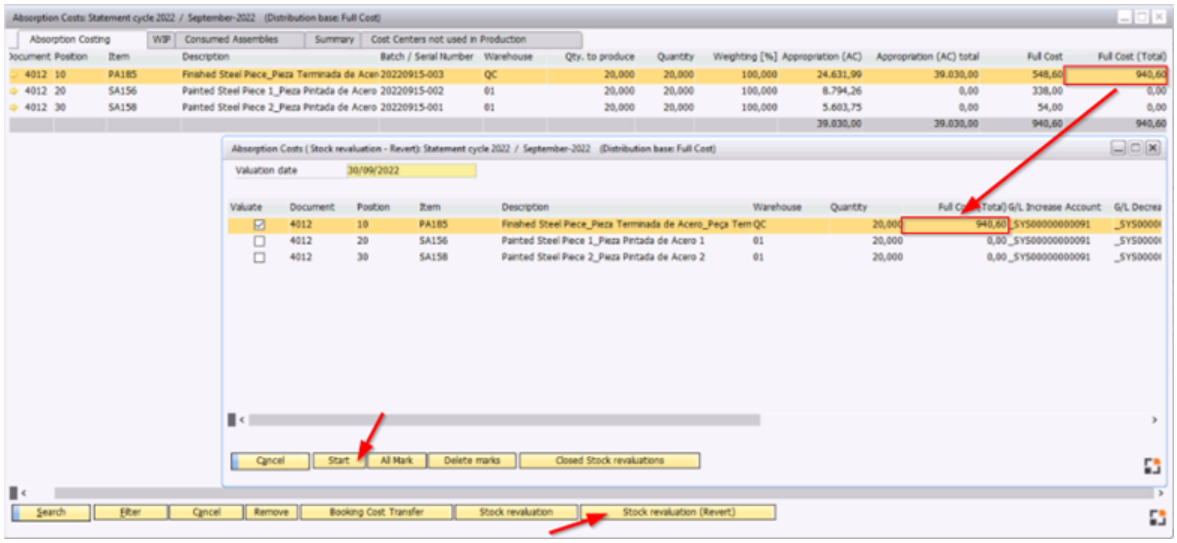
Here is a summary of SAP's possible bookings for the Stock Revaluation process:

Reevaluation Amount	Reevaluation Quantity	Quantity in Stock	Stock Variation	COGS Variation
+1.000,00	100	100	+1.000,00	0,00
+1.000,00	100	50	+500,00	+500,00
+1.000,00	100	0	0,00	+1.000,00

Important note: There is no cancellation option in SAP Business One for Stock Revaluations. If you ever need to cancel an absorption costing process, you can only do so by performing opposite revaluations through DTW.

3) Execute **Stock Revaluation (Revert)**. This is **not** an optional step. You **must** execute Stock Revaluation (Revert) in order to complete the absorption costing process. This step removes from the manufactured products the costs added during the Beas's manufacturing products using the resources' cost rates. These costs are useful to keep the costs as close as possible to the costs after running absorption costing, but cannot remain afterwards, or products will have double costing.

© 2026 Boyum IT Solutions A/S



Here is a summary of SAP's possible bookings for the Stock Revaluation (Revert) process:

Reevaluation Amount	Reevaluation Quantity	Quantity in Stock	Stock Variation	COGS Variation
+1.000,00	100	100	+1.000,00	0,00
+1.000,00	100	50	+500,00	+500,00
+1.000,00	100	0	0,00	+1.000,00

Important note: There is no cancellation option in SAP Business One for Stock Revaluations. If you ever need to cancel an absorption costing process, you can only do so by performing opposite revaluations through DTW.

see Absorption costing - Finishing steps

4.2.5.5 Absorption Costing - Finishing steps

This chapter explains the final steps after executing absorption costing successfully for your company. If absorption costing did not bring successful results, please review the previous topics and make sure that you haven't forgot anything, as any detail left behind can represent potential unwanted differences in your accounting numbers.

When the three absorption costing steps are completed, you can stop right where you are if this is your decision—all product costs should be correct and the only remaining open values should be due to active work orders without production receipts in the month. However, going through a few more steps can guarantee a more accurate system for the future. After all, now that you know

© 2026 Boyum IT Solutions A/S

exactly how much each one of your direct Cost Centers cost you for all their manufacturing activities, why not updating their cost rates so to keep your products even closer to the actual costs when closing the next months? Understanding the resources' actual costs rates after absorption costing and updating them according to the new rates is precisely what we will review in this topic.

1) Open the **Cost Rate Trend** report. This report brings the actual appropriated cost for each direct Cost Center and dividing it by the number or work hours gives you their actual hourly rates for marginal and full costs (columns "Hourly Rate (MargCosts)" and "Hourly Rate (Full Costs)"). For comparison purposes, you can check the costs according to their current hourly rates on "Lmc-real (MargCosts)" and "Lmc-real (Full Costs)".
Important note: If you want Beas to calculate actual cost rates for each resource, you must link each one of them to a specific direct Cost Center.

Cost Rate Trend: 2022

#	Cost Center	Accounting month	Month/year	Marginal Cost	Full Cost	Hours	Hourly Rate (MargCosts)	Hourly Rate (Full Costs)	Lmc-real (MargCosts)	Lmc-real (Full Costs)
1	08002	9	September-2022	5.603,75	5.603,75	3,33	1.682,81	1.682,81	26,00	54,00
2	08005	9	September-2022	8.794,26	8.794,26	10,83	812,03	812,03	292,50	338,00
3	08007	9	September-2022	0,00	0,00	0,00	0,00	0,00		
4	08008	9	September-2022	4.497,44	4.497,44	0,83	5.418,60	5.418,60	2,50	3,50
5	08015	9	September-2022	9.421,60	9.421,60	3,00	3.140,53	3.140,53	45,00	57,60
6	08016	9	September-2022	10.712,95	10.712,95	4,17	2.569,05	2.569,05	437,50	487,50
7	08028	9	September-2022	0,00	0,00	0,00	0,00	0,00		

2) Create the following SQL View on your database. SQL Views are an easy way to pre-set queries to retrieve data again and again without having to rewrite them. So, you can select data directly from the SQL View and it will bring values related to all the tables inside it:

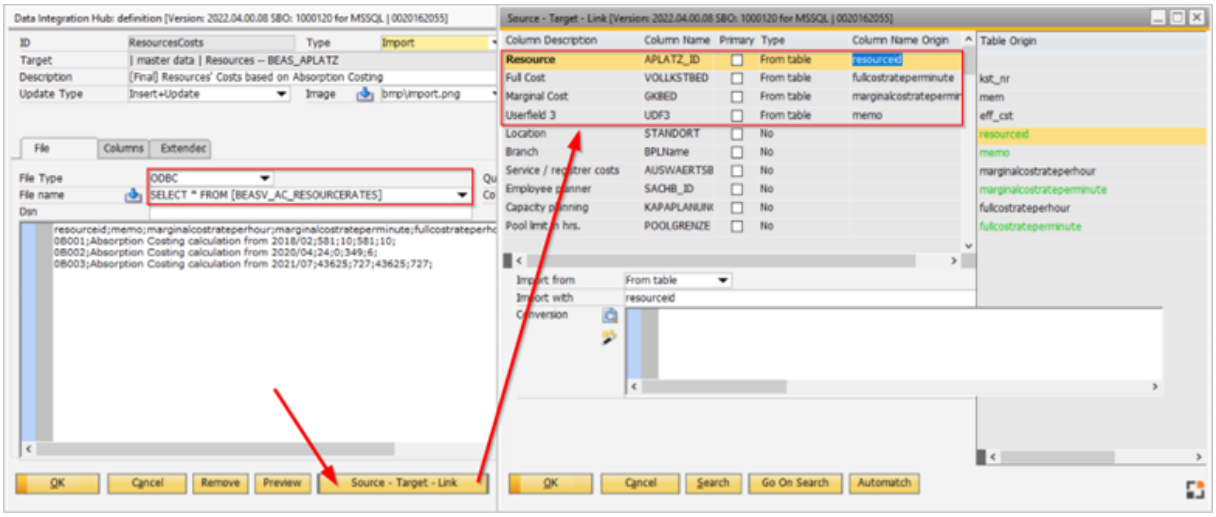
```
CREATE VIEW [dbo].[BEASV_AC_RESOURCERATES] AS
     SELECT
     T0."ResourceID",
     CONCAT('Absorption Costing calculation from ',T0."Memo") AS "Memo",
     COALESCE(T0."MarginalCostRatePerHour",0) AS "MarginalCostRatePerHour",
     COALESCE(T0."MarginalCostRatePerMinute",0) AS "MarginalCostRatePerMinute",
     COALESCE(T0."FullCostRatePerHour",0) AS "FullCostRatePerHour",
     COALESCE(T0."FullCostRatePerMinute",0) AS "FullCostRatePerMinute"
     FROM
     (SELECT
     "APLATZ_ID" AS "ResourceID",
     (SELECT CONCAT(RTRIM(T0."ABR_ID"),CONCAT('/',RIGHT(CONCAT('00',T0."MONAT"),2))) FROM
     "BEAS_BAB_KOSTENSAETZE" T0 WHERE CONCAT(T0."ABR_ID",RIGHT(CONCAT('00',T0."MONAT"),2))=(SELECT
     MAX(CONCAT(T1."ABR_ID",RIGHT(CONCAT('00',T1."MONAT"),2))) FROM "BEAS_BAB_KOSTENSAETZE" T1 WHERE
     T1."EFF_STD">0 AND T1."VK">0 AND T1."KST_NR"=T0."KST_NR") AND T0."KST_NR"="BEAS_APLATZ"."KSTST_ID")
      AS "Memo",
     (SELECT CASE WHEN T0."EFF_STD">0 THEN T0."VK"/T0."EFF_STD" ELSE 0 END FROM "BEAS_BAB_KOSTENSAETZE"
     T0 WHERE CONCAT(T0."ABR_ID",RIGHT(CONCAT('00',T0."MONAT"),2))=(SELECT
     MAX(CONCAT(T1."ABR_ID",RIGHT(CONCAT('00',T1."MONAT"),2))) FROM "BEAS_BAB_KOSTENSAETZE" T1 WHERE
     T1."EFF_STD">0 AND T1."VK">0 AND T1."KST_NR"=T0."KST_NR") AND T0."KST_NR"="BEAS_APLATZ"."KSTST_ID")
      AS "FullCostRatePerHour",
     (SELECT CASE WHEN T0."EFF_STD">0 THEN T0."VK"/T0."EFF_STD"/60 ELSE 0 END FROM
     "BEAS_BAB_KOSTENSAETZE" T0 WHERE CONCAT(T0."ABR_ID",RIGHT(CONCAT('00',T0."MONAT"),2))=(SELECT
     MAX(CONCAT(T1."ABR_ID",RIGHT(CONCAT('00',T1."MONAT"),2))) FROM "BEAS_BAB_KOSTENSAETZE" T1 WHERE
     T1."EFF_STD">0 AND T1."VK">0 AND T1."KST_NR"=T0."KST_NR") AND T0."KST_NR"="BEAS_APLATZ"."KSTST_ID")
      AS "FullCostRatePerMinute",
     (SELECT CASE WHEN T0."EFF_STD">0 THEN T0."VK"/T0."EFF_STD" ELSE 0 END FROM "BEAS_BAB_KOSTENSAETZE"
     T0 WHERE CONCAT(T0."ABR_ID",RIGHT(CONCAT('00',T0."MONAT"),2))=(SELECT
     MAX(CONCAT(T1."ABR_ID",RIGHT(CONCAT('00',T1."MONAT"),2))) FROM "BEAS_BAB_KOSTENSAETZE" T1 WHERE
     T1."EFF_STD">0 AND T1."GK">0 AND T1."KST_NR"=T0."KST_NR") AND T0."KST_NR"="BEAS_APLATZ"."KSTST_ID")
      AS "MarginalCostRatePerHour",
     (SELECT CASE WHEN T0."EFF_STD">0 THEN T0."VK"/T0."EFF_STD"/60 ELSE 0 END FROM
     "BEAS_BAB_KOSTENSAETZE" T0 WHERE CONCAT(T0."ABR_ID",RIGHT(CONCAT('00',T0."MONAT"),2))=(SELECT
```

© 2026 Boyum IT Solutions A/S

```
MAX(CONCAT(T1."ABR_ID",RIGHT(CONCAT('00',T1."MONAT"),2))) FROM "BEAS_BAB_KOSTENSAETZE" T1 WHERE
T1."EFF_STD">0 AND T1."GK">0 AND T1."KST_NR"=T0."KST_NR") AND T0."KST_NR"="BEAS_APLATZ"."KSTST_ID")
 AS "MarginalCostRatePerMinute"
FROM "BEAS_APLATZ") T0
WHERE
COALESCE(T0."FullCostRatePerHour",0)>0 OR COALESCE(T0."MarginalCostRatePerHour",0)>0
GO
```

3) Create a Data Integration Hub scenario for resources master data retrieving information from the SQL View ("SELECT * FROM [BEASV_AC_RESOURCERATES]") and match the highlighted fields (choose between rate per minute and rate per hours according to how you configure your resource cost rates).

NOTE: Screenshots in this chapter are made with the "Old System (Deprecated) style" set in the Configuration wizard.



Window importkopf_edit.psr, import_fields_browse.psr

4) Check the **Preview** (if desired) and process the data importing. Remember that if you have more resources linked to the same direct Cost Center, their costs will also be updated even if they have not taken part in the absorption costing process. This can be avoided by having one direct Cost Center for each resource.

Window import_defpreview.psr

4.2.6 Master data

The current client and/or the desired statement cycle is selected and/or administered at master data/statement cycle.
All additional master data and reports refer to the currently selected statement cycle.

A statement cycle must first be created or selected. Twelve months can be administrated per statement cycle, with twelve months normally corresponding to one fiscal year. The various months are continuous ly rolled forward, unless a change of year is introduced at year end or a new client is created and processing continues in the new year with this client.

Master data overview:
Statement Cycles
Distribution Key
Cost elements
Cost Center
Cost Element Groups
Cost Center Groups
Cost Center Assignment
Cost Element Assignment
Settlement Structure for P/L Statement

See Absorption Costing - Setup

4.2.6.1 Statement Cycle

Use the statement cycle browser and the "**Change**" button to specify which area you would like to work with. The selected area will be listed in bold.

Unit	Enter a unit, for example '€'. This unit is used only for identification; it is not processed in computation.
Distribution	Percentage distribution **manually:** - defined by user **automatically:** - by production hours per Cost Center - by production hours per Cost Unit
Assessment	Select shares in the cost:

© 2026 Boyum IT Solutions A/S

Field	Description
	- to cost center - to cost object

Initially, a key master record is defined independent of cost element/cost center. It contains all cost centers that receive their share of costs from this key. The keys can be assigned to multiple cost elements (distribution) or cost centers (shares).

Tabs	Description
Key	Definition of distribution key.
Period	Allocation of cost centers to months of statement cycle.

Buttons/Functions

Button/Function	Description
Open	Open Distribution key editing window.
Add	Create a new distribution key definition
Remove	Remove selected distribution key.
Import from SAP	Import Cost center definitions from SAP in the window that opens. Select any or all entries, click Apply and close the window. Import window - Field descriptions

Field	Description
Selection	Select cost center to import.
Distribution key	Distribution key of the cost center.
Description	Description
Cost Center	Cost Center ID
Quantity	Open value that can be used as a basis for distribution (to calculate the % of the distribution)
Valid from/to	The From – To dates of validity of the Distribution

Button/Function	Description

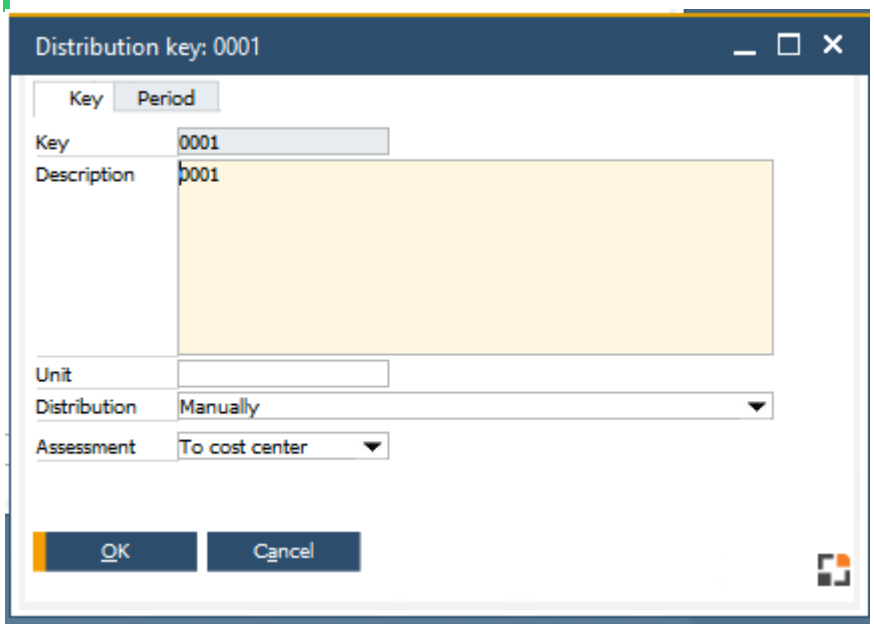
Field	Description
	key.
Active	Radio box is checked if Distribution key is active.
Apply	Click this button to import selected cost center definitions from SAP.
Select All	Select all entries in the window.

Window bab_kst_vgr_import_from_sap.psr

4.2.6.2.1 Distribution Key - Edit

Keys required for distribution of cost elements and allocation of cost centers are defined in this area.

PATH: Financials > Business Performance > Master Data > Distribution key > **Open** entry.



Window bab_vgr_edit.psr

Tab "Key"

© 2026 Boyum IT Solutions A/S

Field	Description
Key	Code of the key master record.
Description	Text field for the description of the key.
Unit	Text field to designate the type of key. For example: "%" for percentage distribution, "qm" for distribution per square meters. Unit is used only for identification, it is not processed in computation.
Distribution	percentage distribution **manually:** defined by user **automatically:** determined by SAP Business One
Assessment	Select a distribution key as cost unit.

Tab "Period"

Window bab_vgrmonat_browse

Field	Description
Month/Year	Definition of month (STD: means "standard". All 12 months of the statement cycle The Standards (STD) can be administered separately if you wish to administrate monthly values on an individual basis.
Description	Text field for description.

Button/Function

Field	Description
Open	For the collection of cost centers which incur costs using this key. Access to this data is also possible from Cost centers. The data always refer to the selected key and selected month. Click **Open** to access distribution per the selected period:

© 2026 Boyum IT Solutions A/S

Field	Description
	 *Window bab_vvgr_browse.psr* **Field descriptions** **Field** / **Description** Cost Center / Cost Center Description / Text field for description. Quantity / Quantity Unit / Unit Share / The distribution among the costs received in the cost center.
Add	Insert a new period. Select a month from the dropdown of the opening window. *Window bab_vgrmonat_browse_new.psr*
Duplicate	Duplicate current distribution key. Add new ID in the pop-up definition window.
Entry delete	Remove current distribution key.
Preceding/Next entry	Navigate up and down in the list of distribution keys with the green arrows.

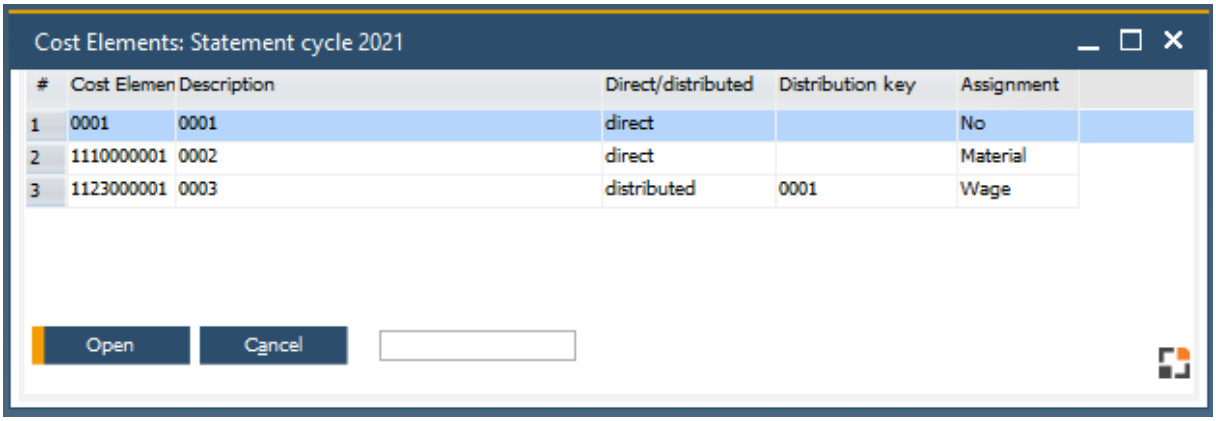
4.2.6.3 Cost Elements

This area is used to collect all cost elements contained in Business performance.

Settings: Absorption Costing - Setup

PATH: Financials > Business Performance > Master Data > Cost Elements

© 2026 Boyum IT Solutions A/S



Window bab_ka_browse.psr

Field descriptions

Field	Description
Cost Element	Name of Cost Element.
Description	Text field for the description of the key.
Direct/distributed	Assignment (in brackets, value in database): direct (D) distributed (V) Auto (automatically) (A)
Distribution key	Designation of distribution key.
Assignment	Assignment (in brackets, value in database): Material (M) Volume of sales (U) Wage (L) No (N)

Buttons/Functions:

Field	Description
Open	Opens the Cost Element: XX editing window.
Add	Add a new cost element.
Duplicate	Duplicate selected cost element.
Remove	Remove selected cost element.
Financial Data Summary	Open the Financial Data Summary window to see the financial data related to the selected Cost element.

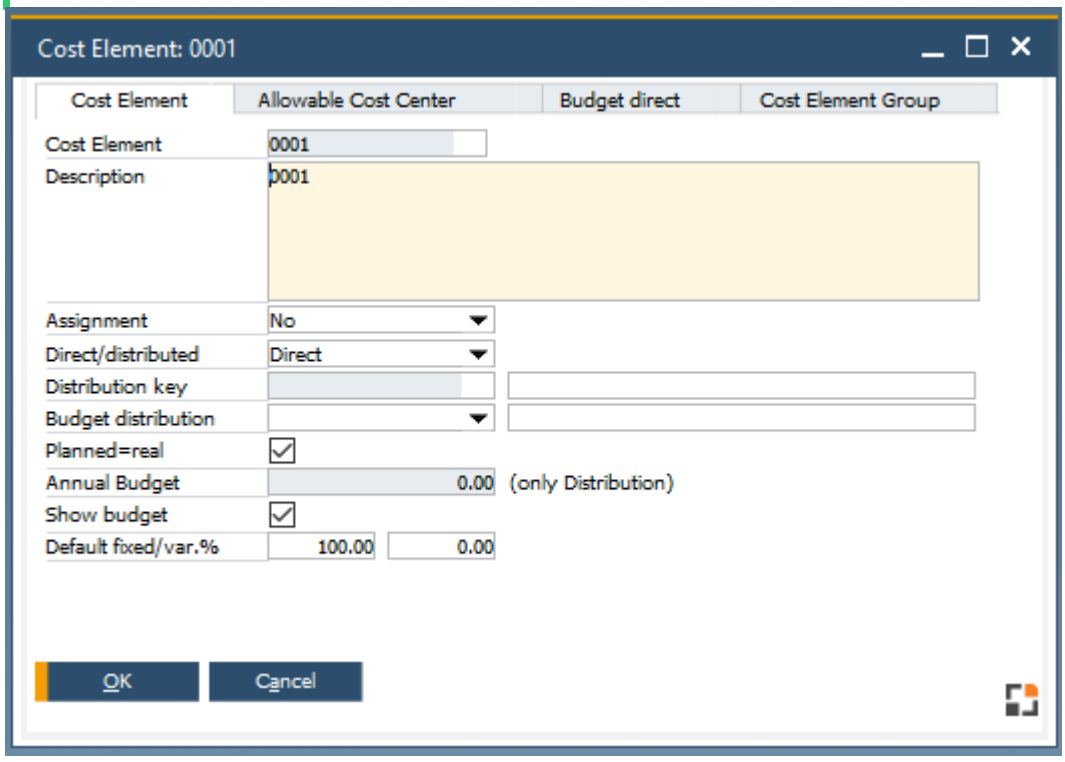
Window bab_babwerte.psr

Window settings are supported.

4.2.6.3.1 Cost Elements - Edit

In this window you can edit cost elements.

PATH: Financials > Business Performance > Master Data > Cost Elements > **Open** an entry.



Window bab_ka_edit.psr

Tabs

Tab	Meaning
Cost element	Definition of cost element.

© 2026 Boyum IT Solutions A/S

Allowable Cost Center	Definition of fix and variable parts per cost center.
Budget direct	Direct budgets.
Cost Element Groups	Shows which cost center groups this cost center belongs to.

Tab "Cost element"

Field/Function	Meaning
Cost Element	Identifier number, does not need to match the account number in financial accounting.
Description	Description of cost element.
Assignment	Specifies the assignment of the cost element: ■ Wage: Direct wage costs, ■ Material: Direct material ■ Volume of sales ■ No
Direct/distributed	Determines whether this cost element should be booked directly to the cost center or distributed using a key or defined automatically . If it is distributed using a key, this can be selected here. An appropriate key must be defined first in Distribution Keys.
Distribution key	Enter the distribution key master number for the cost distribution of this cost element. The name from the key master record is displayed.
Budget distribution	Identification code of a table to distribute the annual budget to the months. These tables are administered in Cost allocation. If the field remains empty, the annual value is divided into twelve equal parts.
planned=actual	planned costs = actual costs Defines whether cost differences between budget and actual values will be displayed.
Annual budget (only Distribution)	Annual budget available for this cost element when distributed using a key. Budgets which can be distributed directly are assigned to appropriate cost centers using the “Budget direct” function.
Show budget	Selection: Budgets to be displayed.

© 2026 Boyum IT Solutions A/S

Default fix/var. %	Defines the defaults occurring while registering fixed and variable shares per cost center.
Add	Right-click function to create a new Cost element.
Duplicate	Right-click function to create a new Cost element by copying the values of the current one.
Remove	Right-click function to delete current Cost element entry.

Tab "Allowable Cost Center"

Field/Function	Meaning
Cost Center	Code of the cost center for which the shares should be defined.
Description	Description of the cost center.
Fix %	Percentage share of the fixed costs of the cost element. Note: Line total for Fix and Var % must be 100.
Var %	Percentage share of the variable costs of the cost element. Note: Line total for Fix and Var % must be 100.
Update	
Selection	
Add	Right-click function to add a new cost element.
Remove	Right-click function to remove currently selected cost element.
Cross reference	Right-click function to open the posted amounts regarding the actual cost element.  *Window bab_babwerte.psr*

Tab "Budget direct"

Field	Meaning

© 2026 Boyum IT Solutions A/S

Cost Center	Code of the cost center for which the shares should be defined.
Description	Description of the cost center.
Budget	Defined direct budget.

Tab "Cost Element Group"

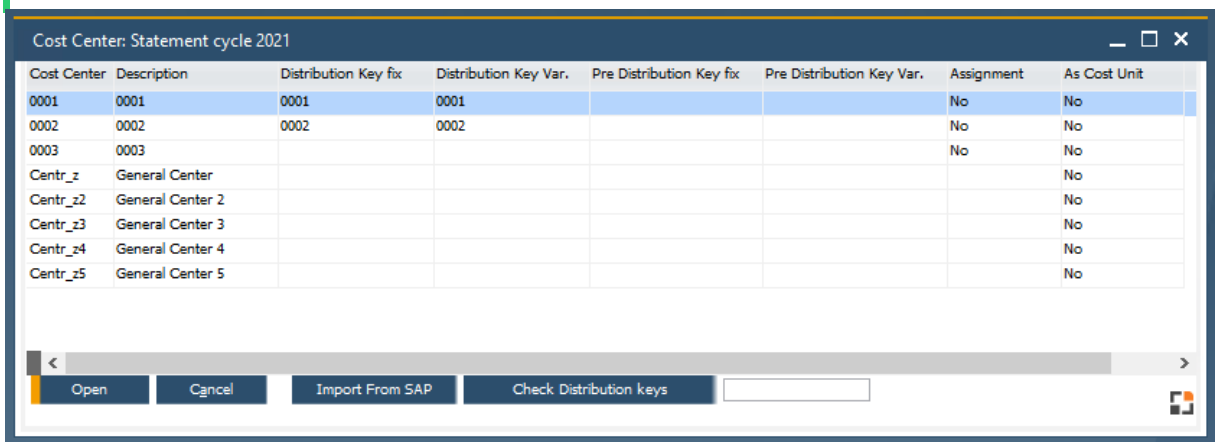
Field	Meaning
Cost Element Group	Code of the Cost Element Group for which the shares should be defined.
Description	Description of the Cost Element Group.
Position	Position.

4.2.6.4 Cost Center

This sub-program is used to record all cost centers.

Settings: Absorption Costing - Setup

PATH: Financials > Business Performance > Master Data > Cost Center.



Window bab_kst_browse.psr

Buttons/Functions

Check Distribution keys	Perform master data checks and correct errors in the opening window if necessary. Note that the master data checks will be run by Beas also at the time the AC calculation report is executed. If the above rules are not respected, a blocking message is displayed, and the AC Cost report IS NOT CALCULATED. You must correct the master data before you can run a new Absorption Costing calculation.
Add	Create a new cost center.
Remove	Remove selected cost center.
Duplicate	Create a duplicate of the selected cost center.
Reports	Open Reports.
Cancel	Close window without saving changes.
Search field	Search for cost centers in the list.

Field Descriptions

Field	Description
Cost Center	Master code of cost center.

© 2026 Boyum IT Solutions A/S

Field	Description
Description	Text field for describing the cost center.
Distribution key fix	Distribution key: fixed. Distribution keys for distributing fixed costs shares. The keys must have previously been defined in Distribution Keys. The cost center will not be distributed if no key is defined. **Note:** A cost center **cannot** have a distribution and a pre-distribution key at the same time! A cost center with either a distribution or pre-distribution key **must be** set to "As Cost Unit" = No. ***See*** setting below. A cost center **cannot** have a distribution or pre-distribution key that distributes to the cost center itself.
Distribution key var.	Distribution key: variable. Distribution keys for distributing variable costs shares. The keys must have previously been defined in Distribution Keys. The cost center will not be distributed if no key is defined. **Note:** A cost center **cannot** have a distribution and a pre-distribution key at the same time! A cost center with either a distribution or pre-distribution key **must be** set to "As Cost Unit" = No. ***See*** setting below. A cost center **cannot** have a distribution or pre-distribution key that distributes to the cost center itself.
Pre-Distribution key fix	Pre-distribution key: Fixed master code of the distribution keys for the appropriate cost elements. These distribution keys need to be defined before in the Distribution Keys The cost center will not be pre-distributed if no key is defined. **Note:** A cost center **cannot** have a distribution and a pre-distribution key at the same time! A cost center with either a distribution or pre-distribution key **must be** set to "As Cost Unit" = No. ***See*** setting below. A cost center **cannot** have a distribution or pre-distribution key that distributes to the cost center itself.
Pre-Distribution key .var	***See*** above (same for variable costs).

© 2026 Boyum IT Solutions A/S

Field	Description
	Note: A cost center **cannot** have a distribution and a pre-distribution key at the same time! A cost center with either a distribution or pre-distribution key **must be** set to "As Cost Unit" = No. ***See*** setting below. A cost center **cannot** have a distribution or pre-distribution key that distributes to the cost center itself.
Assignment	Possible Assignments: - Labor Cost (only direct labor costs) - Material (only direct material costs) - No (no allocation).
As Cost Unit	Definition whether this cost center shall be a cost unit. (Y/N) For Absorption Costing purposes, it is recommended to set all Center Centers with setting "As Cost Unit"⇤ No. If you are using the other Business Performance features, you might set it to yes when needed.

Pre-distribution defines whether costs can be distributed to a cost center with a main cost center code or subordinate cost center code, and whether these costs are redistributed by the cost centers in the main distribution.

4.2.6.4.1 Cost Center - Edit

In this window you can edit a cost center.

PATH: Financials > Business Performance > Master Data > Cost Center > **Open** an entry.

© 2026 Boyum IT Solutions A/S

Pre-Distributions	Display of received cost center.

Tab "Cost center"

Field	Description
Cost Center	Cost center ID
Description	Text field for describing the cost center.
Assignment	Identification of the type of costs assigned to this cost center: - Labor Cost (only direct labor costs)

© 2026 Boyum IT Solutions A/S

Field	Description
	- Material (only direct material costs) - No (no allocation).
As Cost unit	Definition whether this cost center shall be a cost unit.
Distribution key fix	Possibility to assign a fixed distribution key. **Note:** A cost center **cannot** have a distribution and a pre-distribution key at the same time! A cost center with either a distribution or pre-distribution key **must be** set to "As Cost Unit" = No. ***See*** setting below. A cost center **cannot** have a distribution or pre-distribution key that distributes to the cost center itself.
Distribution key var.	Possibility to assign a variable distribution key. **Note:** A cost center **cannot** have a distribution and a pre-distribution key at the same time! A cost center with either a distribution or pre-distribution key **must be** set to "As Cost Unit" = No. ***See*** setting below. A cost center **cannot** have a distribution or pre-distribution key that distributes to the cost center itself.
Pre Distribution key fix	Possibility to assign a fixed pre-distribution key. **Note:** A cost center **cannot** have a distribution and a pre-distribution key at the same time! A cost center with either a distribution or pre-distribution key **must be** set to "As Cost Unit" = No. ***See*** setting below. A cost center **cannot** have a distribution or pre-distribution key that distributes to the cost center itself.
Pre Distribution key var.	Possibility to assign a variable pre-distribution key. **Note:** A cost center **cannot** have a distribution and a pre-distribution key at the same time! A cost center with either a distribution or pre-distribution key **must be** set to "As Cost Unit" = No. ***See*** setting below. A cost center **cannot** have a distribution or pre-distribution key that distributes to the cost center itself.

© 2026 Boyum IT Solutions A/S

Field	Description
Belongs to amount of LMC costs	Defines whether the costs of the cost center should be added into the base for manufacturing costs. As a rule, this applies only to manufacturing cost centers.
Belongs to amount of production costs (COGS)	Defines whether the costs of the cost center should be added into the base for production costs. As a rule, this applies only to materials and production cost centers.
Belongs to Sum of production costs 2 (HK2)	Defines whether the costs of the cost center should be added into the base for production costs 2. Production costs 2 are an additional surcharge base.
Calculate surcharge	Here you can specify the value for the surcharge calculation in the Business performance run. All costs of this cost center are set in relation to: **Wage**: Total cost of the cost center – Direct labor cost – manufacturing materials / direct labor cost * 100 **Material**: Total cost of the cost center – Direct labor cost – manufacturing materials / manufacturing materials * 100 **Non Material Mfg Cost (LMC)**: Total cost of the cost center / base manufacturing costs * 100 **Production Cost (COGS):** Total cost of the cost center / base production costs * 100 **Production costs 2 (HK2):** Total cost of the cost center / base production costs 2 * 100 'No' no calculation of a surcharge
Calculate Cost Rate	**"Yes"** To calculate a (service) hourly rate (total costs of the cost center/sum of total recorded service hours of the cost center) **“No”** No calculation of a (service) hourly rate on the basis of Text field for storing a base for the cost rate calculation, for example “piece” or “hour”. Additionally, this field defines the base the cost rate calculation refers to.
Absorption Costing	Usage of the Cost Center of Absorption Cost.

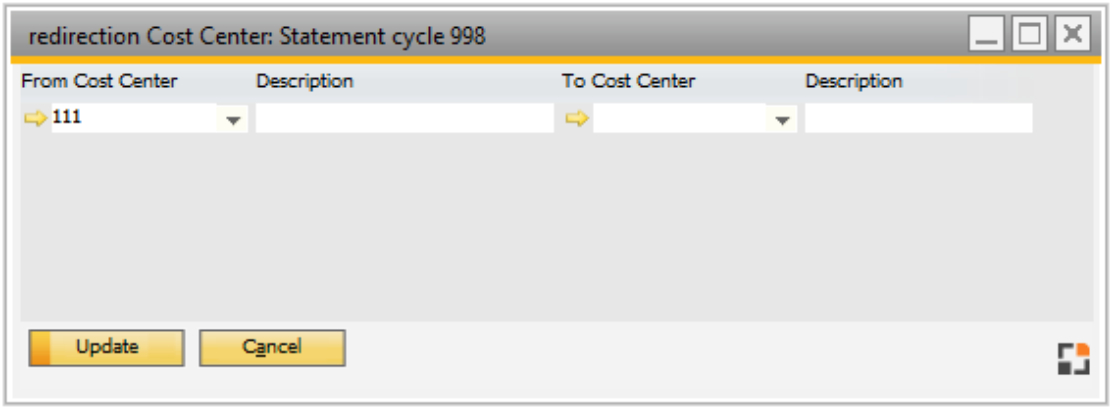
4.2.6.7 Redirection Cost Center

The assignment of SAP Business One accounts to Business performance cost elements (if enabled in the options) takes place here.

If no cost element is assigned, the postings from the external finance accounting solution are ignored. Each error code resulting from this outside assignment will be automatically indicated after every Business performance run. Account codes can be summarized by consolidating them with other account codes in a cost element. The conversion takes place when data from payroll or financial accounting records in the subroutine “monthly values” are imported.

PATH: Financials > Business Performance > Master Data >



Window bab_kst_zu_browse.psr

Field/Function descriptions

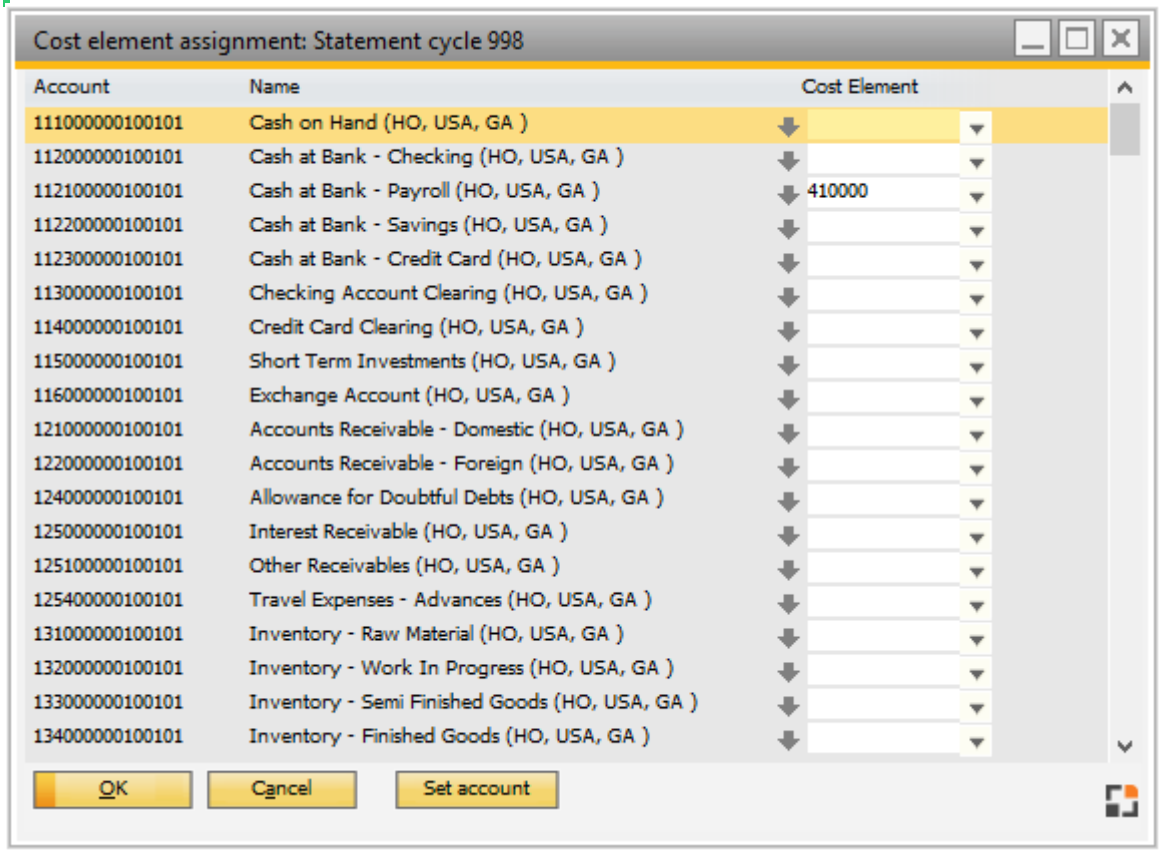
Field	Description
from Cost center	Cost centers or payroll codes, which are administered by finance or payroll accounting programs.
Description	Description "from cost center".
To cost center	Code of a Business performance cost center created in cost centers subroutine as a master record. This designation is displayed automatically. If the "To Cost Center" field is not filled in, accounting records for the cost centers are not included.
Description	Description "to cost center".
Update	Button to save changes.
Add	Right-click function to add new cost center assignment.
Remove	Right-click function to delete selected cost center assignment.

© 2026 Boyum IT Solutions A/S

4.2.6.8 Cost Element Assignment

The assignment of SAP Business One accounts to Business performance cost elements (if enabled in the options) takes place here.

PATH: Financials > Business Performance > Master Data > Cost element assignment.



Window bab_konto_kstst_edit.psr

If no cost element is assigned, the postings from the external finance accounting solution are ignored. Each error code resulting from this outside assignment will be automatically indicated after every Business performance run. Account codes can be summarized by consolidating them with other account codes in a cost element. The conversion takes place when data from payroll or financial accounting records in the “monthly values” subroutine are imported.

Field/Function descriptions

Field	Meaning
Account	Account code which is administered in the finance or payroll accounting program.
Name	Description of "cost center".

© 2026 Boyum IT Solutions A/S

Cost element	Cost element set up as a master record in the cost elements. The description of the cost element is shown. If this field is not filled in, the records for the accounts will not be imported.
Set account	Set Cost Element Account The button opens this window to set  *Window bab_konto_kstst_batch.psr* **Start:** For the specific situations in which the Cost Elements are created with the same ID as the accounts from the Chart of Accounts, it is possible to perform an automatic match between the Chart of Accounts and the Cost Elements. This window allows the user to select an account interval for which Beas will define the corresponding Cost Element to each account within it. Select the 2 values to match and click the **Start** button.

4.2.6.9 Settlement structure for P/L statement

For Beas-profit / loss statement you need to define rows (with cost centers, cost elements, sums) and columns (with cost units and sums), which later will present results in a matrix. Various schemes allow customized displays.

PATH: Financials > Business Performance > Master Data > Settlement structure for P/L statement.

Selection	Via "right-click" the following selection is available. **- Budget:** Display budgets of the defined cost unit **- Current:** Display currently determined values of the defined cost unit.
Description column	Text field to define row description in P/L statement.

4.2.7 Monthly Values

Here, data from financial accounting, wage and payroll accounting can be taken from the interface, corrected, distributed across multiple months and cost centers or recorded manually. The interface and rate description is configured in the help program "Administer Program Parameters" / "Manage Business performance Parameters". When performing Business performance, the data is checked for correctness and the result is documented in the error list. There is no such check in the interface itself. Financial accounting or wage / payroll account code to the cost element is allocated in the subroutine “Allocation account code > Cost element” of the master data record administration.

Settings: Absorption Costing - Setup

Field	Description
No.	Counter, automatically assigned.
Cost element	Cost element ID, to which these costs are assigned to. The cost element must be stored as master data set in Cost elements. Importing data from SAP Business One the assignment to cost element is done in **Assignment account number > cost element** of master data administration.
Posting date	Day/Month/Year Booking date from financial accounting.
Amount	Booked amount.
Entry text	Additional text and remarks to this booking.
SAP Journal ID	SAP Journal ID
Line	
Cost Center	Cost center selected
Branch	Branch information

Buttons/Functions

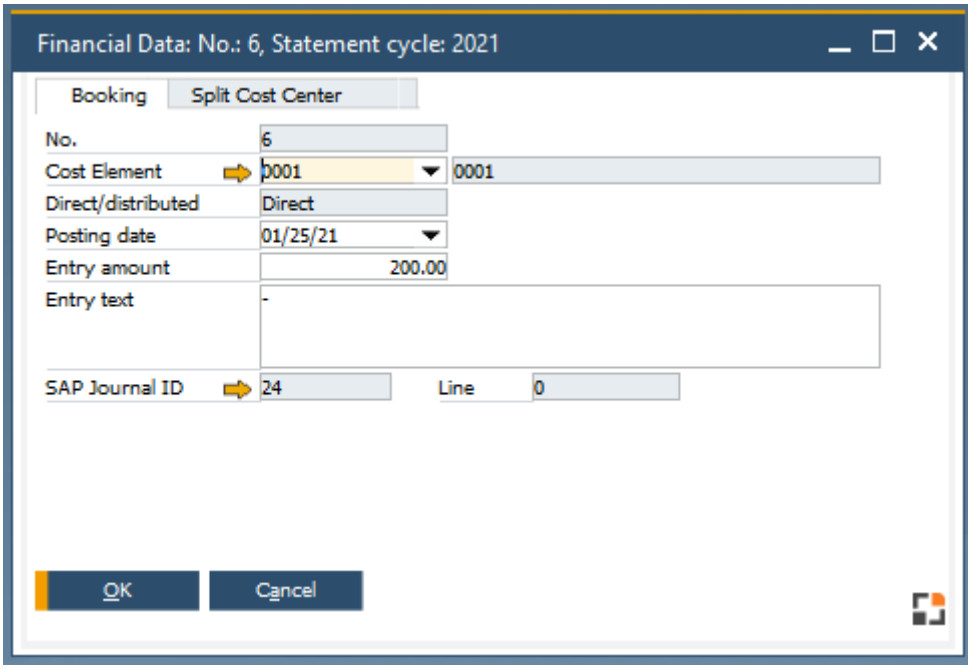
Button/Function	Description
Open	Open selected entry.
Search	Search list by Cost element number/name or Memo.
Add	Add a new entry by providing a new ID.
Duplicate	Duplicate selected entry by providing a new ID.
Remove	Delete selected entry.
Batch-Delete	If already imported data are to be imported again, they needs to be deleted, otherwise there would be two data sets. Use this function to delete a complete range of data.
Last error: SBO financial import	This button displays the last error in SBO financial import.

4.2.7.3.1 Financial Data - Edit

In this window you can record data for financial accounting manually.

PATH: Financials > Business Performance > Monthly Values > Financial Data > **Open** an entry.

© 2026 Boyum IT Solutions A/S



Window bab_fibu_edit.psr

Booking tab

Field	Description
No.	Counter – automatically assigned.
Cost element	Cost element ID to which these costs are assigned to. The cost element must be stored as master data set in Cost elements. Importing data from SAP Business One the assignment to cost element is done in **Assignment account number > cost element** of master data administration.
Cost unit	Cost unit to which these costs are assigned.
Direct/Distributed	Selection: **direct:** the function Distribution of cost centers is activated automatically. If the cost element is **distributed** using a key, no direct distribution on cost centers is possible.
Posting date	Day/Month/Year Booking date from financial accounting.
Entry amount	Booked amount.
Entry text	Additional text and remarks to this booking.
SAP Journal ID	SAP Journal ID. The orange arrow opens the linked SAP Journal.

Buttons/Functions

All other users should exit the program during calculation to rule out changes to the data.

"Fix" and "Variable" values depend on whether you set your Cost Elements as related to fixed or variable costs for the Cost Centers:

Field Descriptions

Field	Description
Month	The month subject to calculation.
Text	Free text.
Planned Fix	Planned fixed cost
Planned variable	Planned variable
Actual fix	Actual fixed cost
Actual variable	Actual variable

Functions

© 2026 Boyum IT Solutions A/S

Function	Description
Start	Integrated option to check the assignment of Distribution Keys. The button checks: - if inserted distribution key exists, - if there are incorrect cost center assignments in the distribution key, - If distribution keys were also defined for 'Production hours per Cost Center', - the usage of either only distribution keys or pre-distribution for a cost center.
Short/Long	Controls generation of the protocol in short (concentrated) or long (detailed) form.

4.2.8.1 Cost calculation procedure

The table below details the steps of cost calculation procedure.

Step 1	Deletion of old monthly values.
Step 2	Evaluation of distribution rates. This rate corresponds to the share of the cost center distributed according to the key master data record on 'Total amount distributed' and/or according to the total amount of the key to be allocated.
Step 3	Booking of financial accounting, wages and payroll accounting data records from the “Monthly values” subroutine. The amounts are allocated to a cost element. The master data record "Cost element" contains the data that determine if the costs are to be distributed via a key or posted directly. **Distribution:** All amounts are first totaled for each cost element. In the next step the distribution is completed.
Step 4	Distribution of the cost elements to the cost centers Beas Business performance reads the distribution percentage rates from the 'Distribution rates' subroutine. Then the amount to be distributed is

© 2026 Boyum IT Solutions A/S

Step 1	Deletion of old monthly values.
	calculated and booked to the cost centers which are defined under “Cost elements -> Cost centers”.
Step 5	Calculation of the cost rate before distribution.
Step 6	Pre-distribution and distribution of the cost centers. All processes are taken from the subroutine "(Pre-) distribution cost centers-> Cost centers". Beas Business performance reads the (pre-) distribution rates from the “Distribution key” subroutine, values the amount to be allocated and reports this amount
Step 7	Calculation of the total cost rates. Previously, in the subroutine “Cost centers” you specified whether a surcharge rate and/or cost rate is to be calculated for the given cost center.
Step 8	Determining the variation of the calculation of the work and machine hourly rate Excess or shortage of cost = volume dependent variation. **Calculation:** Sum of all machines belonging to this cost center (work and machine hourly rates from the subroutine “Calculation of machine hourly rates” weighted with the actual hours) - Actual total costs of the cost center according to the cost center sheet in each case to full and marginal costs.
Step 9	Report of the cost center and cost center groups by summing up the respective values of the positions.
Step 10	Output error log.

4.2.9 Results

Overview of Reports/Lists:

- Calculate Business performance
- Business performance procedure
- Business performance lists
- Structure display
- Execute change of year

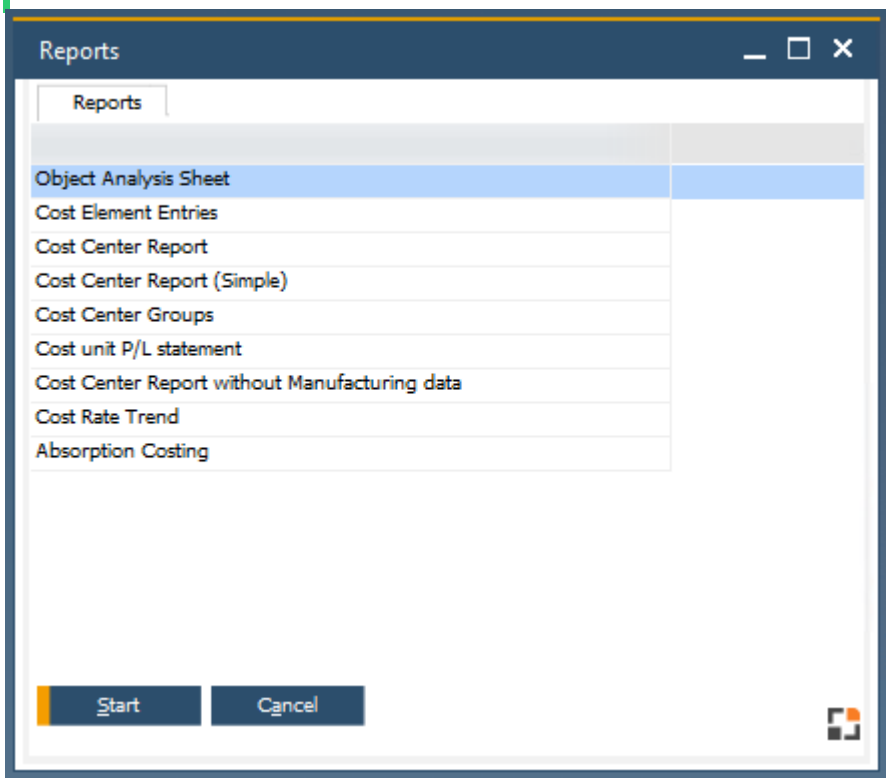
4.2.9.1 Reports (Analyses)

The following Reports are available for Business Performance:

PATH: Financials > Business Performance > Results > Reports.



Window report_makro_start.psr

Object Analysis Sheet

After selecting the period and cost center area, the Business performance is created and displayed in the print preview.

(***See*** Object Analysis Sheet)

Cost Element Entries

All postings that issue a cost element in the selected master number range and period. Costs are differentiated by fixed and variable, target and actual.

(***See*** Cost Element Entries)

Cost Center Report

All postings that receive a cost element in the selected master number range and period. Costs are differentiated by fixed and variable, target and actual.

© 2026 Boyum IT Solutions A/S

(***See*** Cost Center Report)

Cost Center Report (simple)

Simplified form of cost center report

(***See*** Cost Center Report (Simple))

Cost Center Groups

All bookings containing cost center groups within the selected period and number range. Costs are differentiated by fixed and variable, target and actual.

(***See*** Cost Center Groups)

Cost unit P/L statement

Display results, determined from definition of the settlement structure for P/L statement

(***See*** Cost unit P/L statement)

Absorption Cost

(***See*** Absorption Cost)

4.2.9.1.1 Cost unit P/L statement

Display results, determined from definition of the settlement structure for P/L statement

Field	Meaning
Schema	Selected schema; data is displayed in lower area.
Period from	Beginning of related period.
Period to	End of related period.
Description	Description of data row.
various columns	Additional columns defined in settlement structure for P/L statement. This may be budgets, current values or sums.

Window bab_absorpt_wip2.psr

Process:

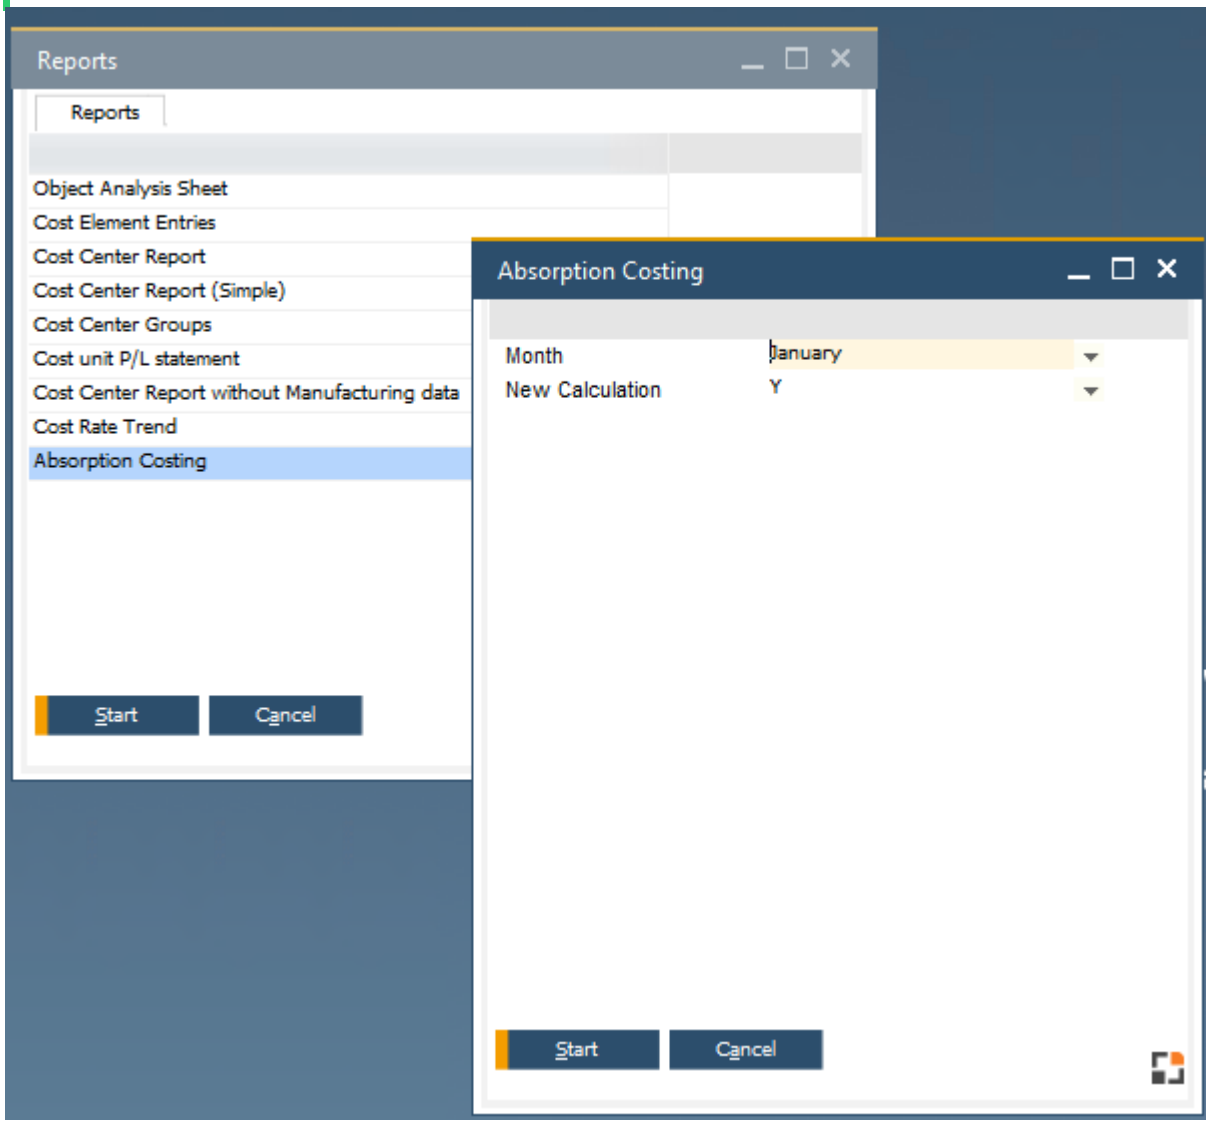
1. Click the **Start** button to select a month for Absorption costing.

© 2026 Boyum IT Solutions A/S

2. In the selection window choose a month, select "Y" to launch a new calculation, and click **Start** .

3. The **Absorption Costs: Statement Cycle XXX / Month-2021 window** opens.

PATH: Financials > Business Performance > Results > Reports > "Absorption Costing".



Window system_ auswahl.psr

4.2.9.1.8.1 Absorption Costing Report - Concept

This part of the guide is focused on helping you to understand the Absorption Costing report, where you will find all data related to absorption costing and the functions which will later perform its execution. Before you can get into the report, however, there are several rules you must follow to prevent some common mistakes, as they can hinder your progress if Beas identifies them in your setup.

© 2026 Boyum IT Solutions A/S

Absorption Costing setup
Absorption Costing workflows

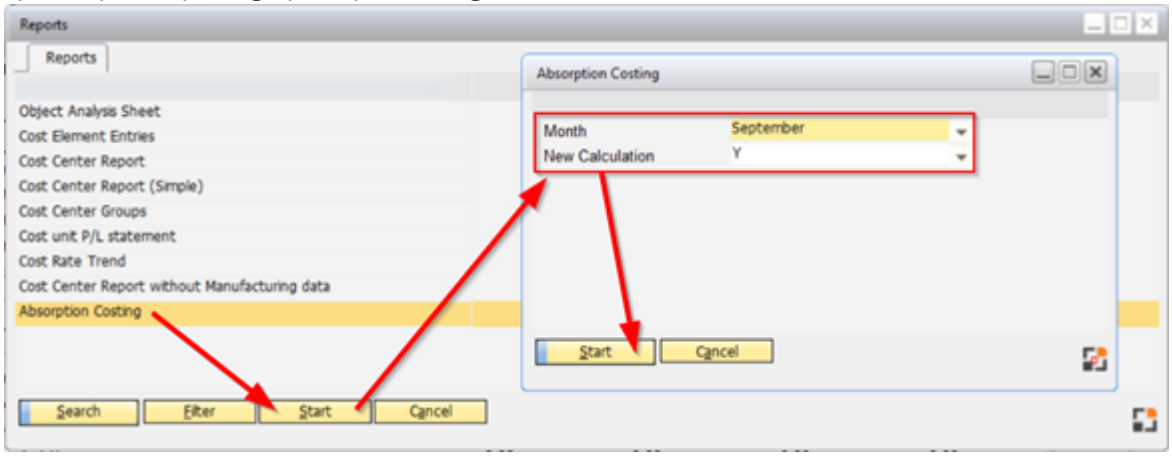
IMPORTANT SETUP RULES:

- Cost Centers cannot have both Pre-Distribution and Distribution Keys at the same time.
- Cost Centers with either Pre-Distribution or Distribution Keys must have the field "As Cost Unit" set to "No". As a general recommendation when using absorption costing, all Cost Centres must have "As Cost Unit" set to "No".
- Cost Centers cannot have Pre-Distribution or Distribution Keys distributing values back to themselves.

Additionally, there are two extra recommendations for absorption costing. These recommendations will not prevent you from running absorption costing but may trigger additional warning messages.

- Direct Cost Centers receiving values either directly or from Distribution Keys should have production activities linked to them (if not, you might want to link a Distribution Key to them to prevent having non-absorbed values).
- Cost Centers with associated production activities should not be linked to Distribution Keys (as their values will go to the manufactured goods).

1) Run the **Absorption Costing report**. You need to select the month (remember that it is always within the selected Statement Cycle) and, if not done before, leave "New Calculation" as "Y" for Beas to process the distributions between direct Cost Centers and manufactured goods, which happens according to the Distribution Base set in the Statement Cycle. If you have already processed it, you can set "New Calculation" to "N" on the next time you open the report, as it will speed up the opening by not processing new calculations.

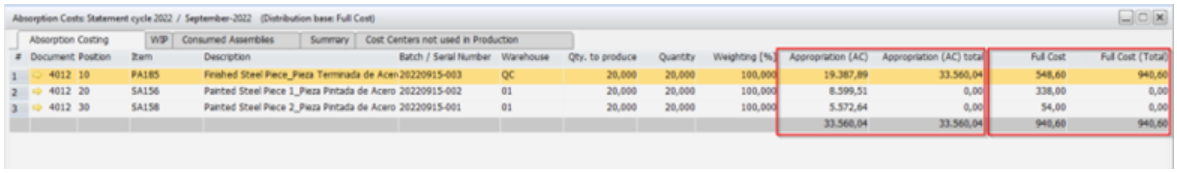


Window report_makro_start.psr

2) **Analyze** the report. The absorption costing report presents you with a list of all manufactured goods within the selected month, as well as the calculated appropriations and costs to revert for

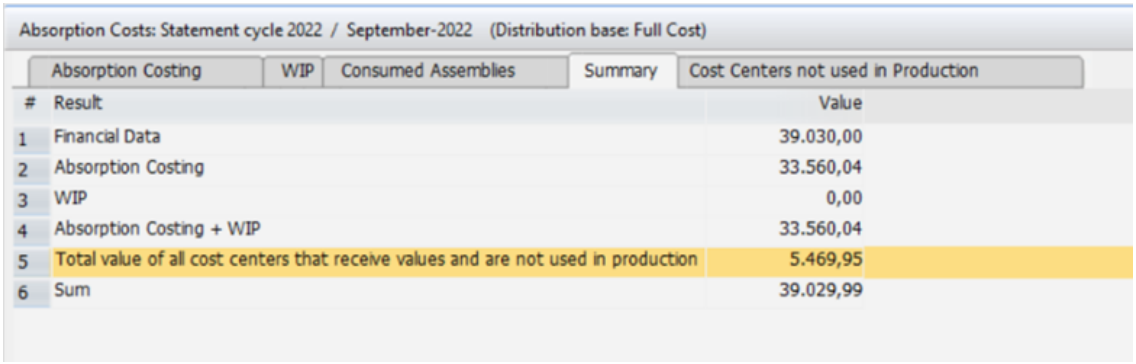
© 2026 Boyum IT Solutions A/S

each one of them. Remember that appropriations come from financial data distributions, and costs to revert from costs booked to the goods according to the resource cost rates. The difference between non-total and total columns is that non-totals represent values before discounts and additions due to "Consumed Assemblies" (explained in 6) and totals represent values after applying these discounts and additions.



Window bab_absorpt_wip2.psr

3) Check the **Summary** tab. Through the summary, you can understand how your financial values are distributed to your manufactured products in three main groups:
   - **Absorption Costing**: values that Business Performance can absorb into the products during the absorption costing execution for the selected month, as the goods were processed and received on stock.
   - **WIP**: values kept open for future months because the goods were not received on stock (production process incomplete).
   - **Absorption Costing + WIP**: if everything is correct, this value will be exactly the same as the financial data, since all manufacturing costs must be appropriated to production. One common source of differences is because direct Cost Centers receiving costs were not used in production, so they have no production orders to distribute their contained values. If this happens, you will see a value different from 0 under "Total value of all cost centers that receive values and are not used in production.

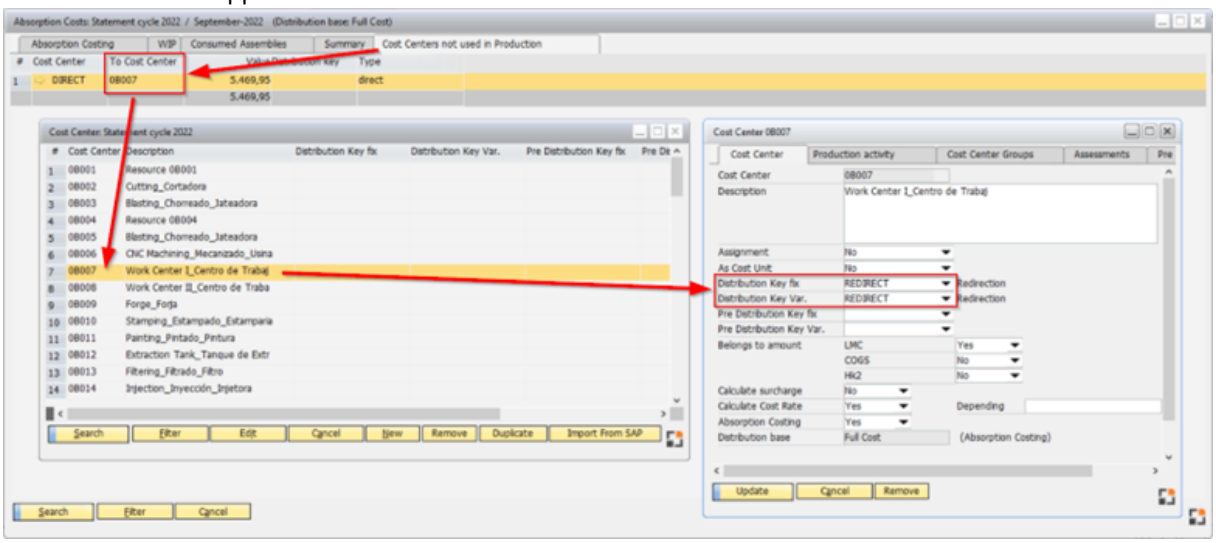


Window bab_absorpt_wip2.psr

4) Whenever you have a value different from 0 under "Total value of all cost centers that receive values and are not used in production", check the tab "Cost Centers not used in Production" to find out who they are. Then, assign them Distribution Keys (not Pre-Distribution, or values received from indirect Cost Centers might remain on them) to redirect their values to the other direct Cost Centers. Remember to erase this Distribution Key from the Cost Centers' master data after you complete the absorption costing run.

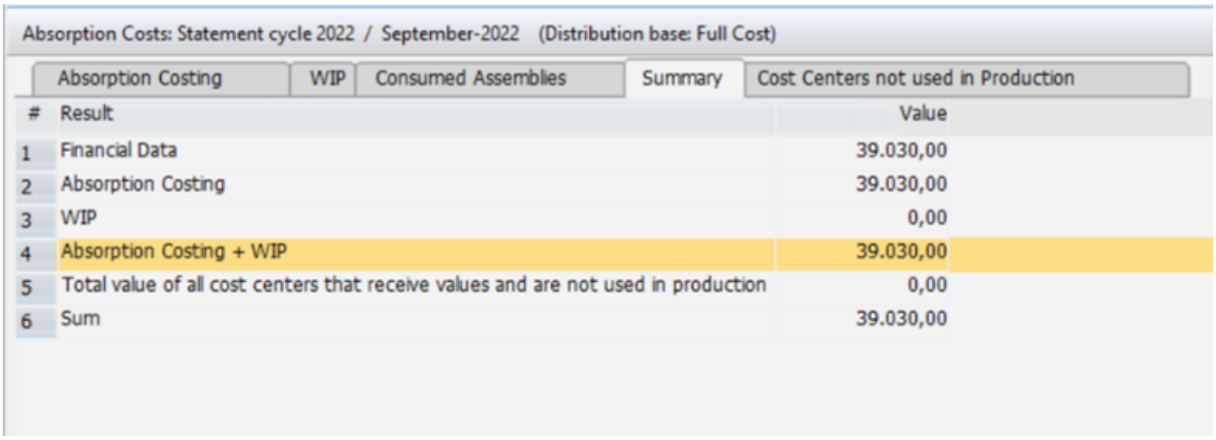
© 2026 Boyum IT Solutions A/S

Important note: After setting the Distribution Keys, you must execute the Cost Calculate process again and reopen the Absorption Costing report with "New Calculation" set to "Y". If not, no values distribution will happen.



Window bab_absorpt_wip2.psr

If you followed all these steps correctly, the Summary report should now show the full financial value under "Absorption Costing + WIP".



Absorption Costs: Statement cycle 2022 / September-2022 (Distribution base: Full Cost)

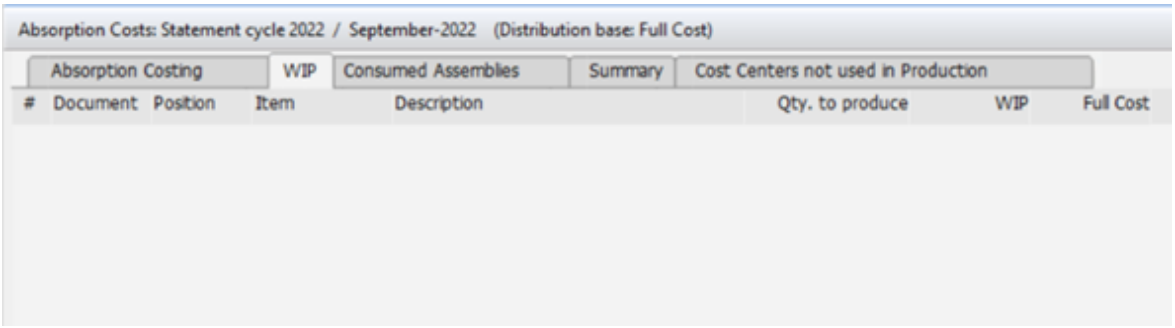
Absorption Costing | WIP | Consumed Assemblies | Summary | Cost Centers not used in Production

#	Result	Value
1	Financial Data	39.030,00
2	Absorption Costing	39.030,00
3	WIP	0,00
4	Absorption Costing + WIP	39.030,00
5	Total value of all cost centers that receive values and are not used in production	0,00
6	Sum	39.030,00

Window bab_absorpt_wip2.psr

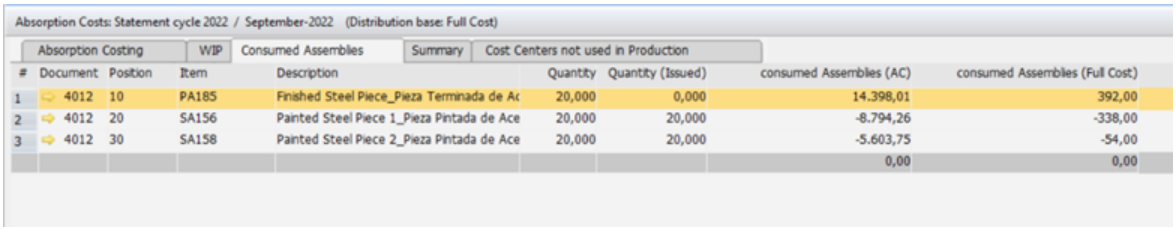
5) The **WIP** tab contains all production orders for products whose manufacturing process could not be completed during the month. These products consumed production resources, thus requiring a share of the total manufacturing costs, but are not on stock so to be reevaluated. Beas, in this case, will keep them open until the next periods when they are finally received on stock, a situation in which you will see values coming from previous months to increase appropriation amounts. If all your items in production were received on stock until the end of the month (at least through partial receipts for the work done), WIP will be empty.

© 2026 Boyum IT Solutions A/S



Window bab_absorpt_wip2.psr

6) The **Consumed Assemblies** tab details all sub-assemblies that were produced and consumed during the month to be incorporated into other products. This is needed to prevent these assemblies from receiving a direct appropriation, which would send values to COGS due to the items not being on stock anymore. With this behavior, Beas can roll up manufacturing costs throughout assemblies until the last level is received on stock. You will see negative amounts for consumed sub-assemblies and positive amounts for the assemblies who consumed them.



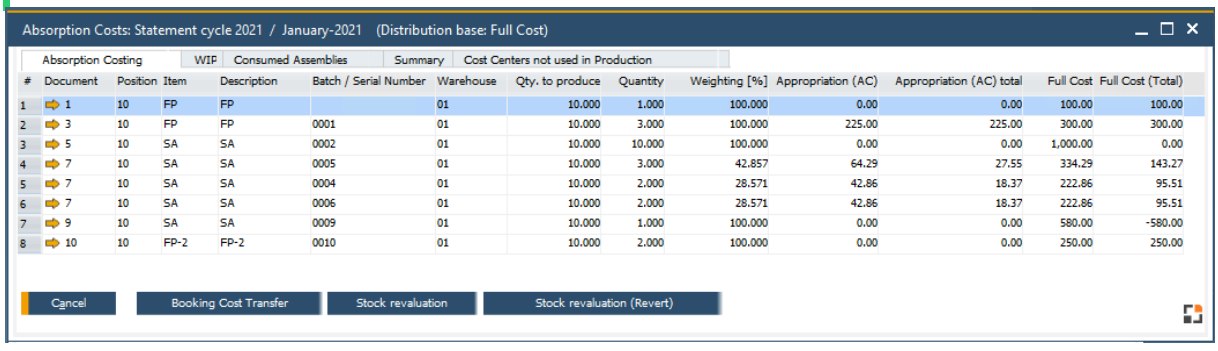
Window bab_absorpt_wip2.psr

4.2.9.1.8.2 Absorption Costing

This tab shows all items / work orders for which the costs will be appropriated in the currently calculated month.

Window settings are supported.

PATH: Financials > Business Performance > Results > Reports > "Absorption Costing" > Absorption costing tab.



Window bab_absorpt_wip2.psr

Field Descriptions

Column	Description
Document	Work order number.
Position	Work order position.
Item	Item code.
Description	Item description.
Batch/Serial number	Item batch or serial number. If the item is not receipted, the column is blank.
Warehouse	Code of the warehouse, where the item is stored. If any stock transfers are created for the items after their production, the transactions are identified to calculate the final balance in each warehouse.
Qty. to produce	Planned quantity of the work order.
Quantity	Quantity produced or transferred to the warehouse in the selected line.
Weighting(%)	Percentage of the product in each warehouse in relation to the total produced quantity.
Appropriation (AC)	Calculated value appropriated to each work order multiplied by weighting.
Appropriation (AC) total	The total appropriated value for the item: values from the previous month, value kept open for the next month, discounts and additions.
Marginal Cost/Full Cost	Production costs linked to the selected work order in the current month. ***See*** Marginal and full costs concept.
Marginal/Full Cost Total	Production costs linked to the selected work order in the current month + the cost of work orders from the previous months, discounting work orders that were consumed in other productions, and summing up the assemblies that those work orders consumed. ***See*** Marginal and full costs concept.

Buttons

Button	Description
Booking Cost Transfer	Function to book the clearing of the cost accounts and register the values to appropriate in the costs to absorb account. After this is executed for a branch, it cannot be executed again for the same branch. After pressing start, the journal entry is created.
Stock revaluation	Function to absorb the costs into the produced items. After this is executed for a branch, the absorption cannot be performed for the same work orders again.

© 2026 Boyum IT Solutions A/S

Button	Description
	If any of the items are not receipted, the Appropriate (AC) value is displayed as 0 and the value is kept for future months. At the moment of the revaluation, SAP Business One checks the inventory and absorb the values into the item stock account or into the price difference account (that should be defined as COGS). SAP Business One always considers the current inventory to calculate what value should go into stock or into the price difference account, therefore, it's recommended to execute the absorption costing process as soon as the month ends, in order to avoid stock differences between the stock at the end of the month and the stock at the date when the revaluations are performed. Click the Closed Stock Revaluation to review the revaluations already performed.
Stock revaluation (Revert)	Function to revert the standard production costs automatically appropriated into the work orders. After this is executed for a branch, the standard costs reversal cannot be performed for the same work orders again. If any of the items are not receipted, the value to revert is displayed as 0 and the value is kept for future months. At the moment of the revaluation, SAP Business One checks the inventory and reverts the values from the item stock account or from the price difference account (that should be defined as COGS). SAP Business One always considers the current inventory to calculate what value should be reverted from stock or from the price difference account, therefore, it's recommended to execute the absorption costing process as soon as the month ends, in order to avoid stock differences between the stock at the end of the month and the stock at the date when the revaluations are performed. Click the Closed Stock Revaluation to review the revaluations already performed.

4.2.9.1.8.3 WIP

This tab shows work orders with production data (time receipts) and no stock receipts for the currently calculated month, whose values will be kept open for the calculations in the following months.

Window settings are supported.

5 Sales - AR

In the sales module you can find the Beas function Precalculation integrated.

Quotation, Sales order
- Deliver
- Capable-to-Promise (CTP)
- Available-to-Promise (ATP)
- Print SAP Document

Precalculation
- Edit Precalculation
- Pre-calculation extended view
- Lot Size and View per

All Purchase documents support the
- Macro Print solution
- Project / Tasks
- Item Version
- Beas Bin Location system
- Product configurator (Sales order / Quotation)
- Configurator (Sales order / Quotation)
- Work order creation (Sales Order)

and many more

Extended functions in sales and purchase areas

The following functions are available for all document types:

Function	Description
Inventory history	Call up inventory history for the current row.
Item master extended	Open Beas – item master sheet.
Entry and final remark	In this window (Form Id 60072) you can enter a text in RTF form using right-click. In the stored Crystal document set up printing the remark as RTF for these fields.

© 2026 Boyum IT Solutions A/S

Function	Description
	Note: SAP Business One does not support RTF. That is why in SAP Business One – Window "Entry and final remark" the text is not displayed correctly. If you set up everything correctly, the printout will also be correct.

Training unit 09 Calculation

5.1 Quotation, Sales order

SAP Business One window. Only the additional Beas functions are described. Right-click on a item row opens the right-click menu:
Macro Print solution supported

- Additional functions are available, but they are displayed only under the following conditions:

Functions for copy and edit are available only if the document exists: "Copy calculation" is possible only if a calculation was stored before.

In the Configuration wizard you can set up the visibility of various features. ***See*** Configuration wizard – Sales.

Using customer-specific script in postopen-event of the respective document type you can disable features:

setvar=ib_confignew=false	Configuration: new.
setvar=ib_configfromnew=false	New from configuration.
setvar=ib_configedit=false	Configuration: edit.
setvar=is_treetype_list	Treetype-list for item. Items with treetype S,T,A forbidden for the configurator via right-click-menu (standard).

© 2026 Boyum IT Solutions A/S

setvar=ib_calcnew=false	Precalculation: new.
setvar=ib_calccopy=false	Precalculation: copy.
setvar=ib_calcedit=false	Precalculation: edit.
setvar=ib_calcprice=false	Calculate price. Additional settings in `il_calcprice`.
setvar=il_calcprice=0	Define the price field. 0=normal, 1=gross profit base
setvar=ib_deliver=false	Deliver sales order.
setvar=ib_reservation=false	Reserve.
setvar=ib_project=false	Define project assignment.

Example

Sales order – disable all Precalculation features:

```
windowevent open
setvar=ib_calccopy=false
setvar=ib_calcedit=false
setvar=ib_calcnew=false

// Treetype "T" (Template), call of Configurator via right-click-menu allowed
setvar=is_treetype_list=S,A
end event
```

Notes on setup of SAP Business One

Beas needs to access some fields in quotation or sales order. These fields must be visible and editable.

Affected fields:

Field	Description	UDF Name
Configuration	Used for product configuration.	beas_vri
Variant	Used for variants A-Z.	beas_shortvariant

© 2026 Boyum IT Solutions A/S

Calculation	Enter the calculations number here.	beas_precalcnr
Drawing number	Used when working with a document specific drawing number.	beas_znr
Task	Used for Project – task assignment.	beas_prjud
I-Version	Used for item versions.	beas_ver

If one of these fields is required but not available in the view, an error is displayed:
Error in SAP FORM. Details: Col. Name: .... SAP ERROR: Item – Form item is not editable ...

To enable editing, open in the respective window "**Window settings" > "Table**" – select the fields and switch to visible and editable.

Available functions

Overview of all additional Beas functions inside Sales Order and Pre-Invoice.

Column License: This function is only available if one of the following licenses is active:

Function	License	Document type	Meaning
Inventory History	Beas basic	all	Opens the inventory history for this item. ***see*** Inventory history
Extended Item master	Beas basic	all	Opens the extended item master.
Deliver	Beas basic	Sales Order	Opens the delivery menu for external operation. Deliver reserved items A simplified "deliver" window is opened. Batches, Serial numbers and bin location are supported. This feature is available only if goods has been reserved (reservation system needs to be enabled). Note Available functions for delivery: - Delivers all the reserved goods - Use SAP B1 Pick List and Beas WebApp "Pick&Pack" - Use Beas WebApp Pick Delivery

© 2026 Boyum IT Solutions A/S

			see Deliver
Reservation	Beas basic	Sales Order	Fix reservation of goods Function is only visible if - Reservation system has been activated - the sales order was saved and is not open or canceled - Variable `ib_reservation` is not `false` (use to disable the function) This function runs in parallel to the SAP Business One-reservation function with the following features: - Reservation of planned inflow (work orders) - Support of scanners - Easy reservation down to batch/serial number/bin level, as well as, for simple items Reserved goods can be used only in Beas-delivery function. ***See*** function Deliver. **IMPORTANT:** This option is not available when Produmex WMS is installed in the system. ***See*** Reservation system Reservation list Configuration wizard – Reservation Production – Link **Reservation with deactivated reservation function** If the reservation system is disabled and you need to withdraw goods from the warehouse, the required quantity can be entered to the field "withdraw from warehouse".
Configuration: new	Product configurator	Sales Order	Open the configuration window (product configurator)

© 2026 Boyum IT Solutions A/S

	or Product Configurator sales	Sales Quotation	 *Window prd_links2.psr* This only works if a configuration definition was created for the selected item first. ***See*** Product Configurator If you created a configuration, beas writes back in the sales document (related to settings). - Item Description, Price, Configuration Id and Long description. - if you create a new item for this Configuration, beas writes back only the item code, but not the configuration id. Reason: The configuration is defined for the original item (example Sofa) and not for the created item. For using this, you must make the fields in Sales Order / Quotation visible: - Item Description (Column 3) - Unit Price (Column 14) - Configuration (Column U_beas_vri) - Free Text (Column 163)

© 2026 Boyum IT Solutions A/S

			 *Window beasgui_sbo.psr* ***See*** Product Configurator
Configuration: edit	Product configurator or Product Configurator sales	Sales Order Sales Quotation	Open the stored configuration. ***See***: New configuration.
Calculation: New	Beas basic or Product Configurator sales	Sales Order Sales Quotation	Creates a new pre-calculation for order related items. **Working with Precalculation** The Precalculation allows to calculate an existing item or to build up a complete new calculation. You have full access to the BoM, the routing and the planning data of the item, it is copied here and can be changed completely, without having an impact on the master data. You can perform a quotation costing from SAP Business One. To do so, a calculation can be opened directly from an SAP Business One offer. After having configured and calculated the proposed item, the price is determined and can be entered in the offer. If the offer is accepted, a production order can be created from the calculation.

© 2026 Boyum IT Solutions A/S

			The customer number, item number, quantity and item description are transferred to the Precalculation from the Sales order. If the calculation is saved and closed, the calculation price of the first lot size is entered to the sales order. In field "Calculation" the "Calculation number 2" is entered, and thus linked to the sales order line. Product configurations and variants are supported. If you save the calculation, the system asks "Enter 500 as sales price in sales document?" The system uses the price saved in calculation schema position "Sales price", type "Sales price according to input" ***See*** Product Configurator Variant **Note:** Function is only available if no calculation number was entered in the field "calculation". To create a new calculation, simply remove the number from that field. If this is an item with a configuration, calculation can be created only AFTER the configuration definition. **Note:** Using the calculation, the item can be adapted for a specific sales order. Therefore, the item is produced customer-specific and order-related. For this reason, no Precalculations for stock-related assemblies can be created from here. For stock-related items the function is hidden. ***See*** Precalculation

© 2026 Boyum IT Solutions A/S

Calculation: copy	Beas basic or Product Configurator sales	Sales Order Sales Quotation	Copy the existing calculation, save it with a new number and open the calculation window with the new calculation.
Calculation: edit	Beas basic or Product Configurator sales	Sales Order Sales Quotation	Open the stored Calculation.
Calculate price	Beas basic or Product Configurator sales	Sales Order Sales Quotation	Create a pre-calculation and transfer the price Function can be called only if: • assembly is order related (Item-scheduling ID = order related) • in quotations or sales orders • no precalculation exists • no product configuration definition was stored, or a configuration which has been calculated already exists • the document was not closed **Customization:** If you define variable `ib_pricecalc` with false, the option will not be available Function starts as invisible in the background; Precalculation determines a price and enters it in the price field. Use variable `il_calcprice` to determine where to enter the price: 0 (= Standard): unit price 1 = Gross Profit Base Price

© 2026 Boyum IT Solutions A/S

			Variables can be stored in an open Event of the respective document.
			
			Example: disable function
			`windowevent open`
			`setvar=ib_calcprice=false`
			`end event`

Work order: new	Beas basic or Product Configurator sales	Sales Order Reserve Invoice	Create work order for the selected row. Function is available first after saving the sales order. By right-clicking outside the table you can create work orders for all rows of the sales order. The window "Sales order to work order" opens. This is only available if you have a Beas basic license. Conditions for work order creation: - sales order must be saved - item is a production item - Configuration wizard > Sales > Work order was not disabled. - It is not a Sales-item, Template-item or Assembly (OITM.TreeType may not be S, T or A) - the user has access to create work orders Notes: **SBO Production BoM**: Even if no SAP Business One Production BoM was stored, it is not considered in Beas **Production Warehouse**: Warehouse is selected according to the standard rules for the work order warehouse logic used in the sales order to work order functionality.
Work order: edit	Beas basic	Sales Order Reserve Invoice	Open or edit assigned work order. If a work order for the respective row was already created, it is displayed.

© 2026 Boyum IT Solutions A/S

			Function is available only if it was not disabled in Configuration wizard > Sales and the access for the production has been granted.
Work order: display	Product Configurator sales	Sales Order	Displays a work order.
Project Assignment	Beas Project	Sales Order	Assign the sales order line to a Project Activity.

Additional fields:

Field	Meaning
Item No.	Provide Item number. **IMPORTANT:** The default I-Version in the Item Master Data is **NOT** assigned automatically in sales/purchase documents. To insert I-Version automatically, use the standard SAP "Formatted search" function: **Automatic I-Version insertion:** Variant simple	Determines which type of variant to use. Only supported for order-related manufacturing. ***See*** Variants *rdr1.U_beas_shortvariant*
Configuration	Selected configuration. ***See*** Product configurator *rdr1.U_beas_vri*
Calculation	Number of Precalculation linked to the sales order line. ***See*** Function "new calculation" *rdr1.U_beas_precalcnr*

© 2026 Boyum IT Solutions A/S

Field	Meaning
Priority code	Affects the order recommendation report. It has a higher priority than the code in item master. ***See*** Configuration wizard > MRP wizard > Computation Order recommendation report *rdr1.U_beasprior*
Desired delivery date	For production planning: desired delivery date. *rdr1.U_beas_requestdel*
Confirmed delivery date	For production planning: delivery date confirmed Allowed values: Y=Yes, N=No *rdr1.U_beasdelconfirm*
withdrawal from warehouse	Take stock from warehouse for order related items If you want to deliver an order-related item from a warehouse, you must define this amount here. Otherwise the system attempts to deliver this from an order-related work order. ***Example:*** You need 10 Pcs from an order-related item. You want to deliver 6 from stock and want to produce 6. If you deliver 6 Pcs from Stock, the system wants to produce 10 Pcs. Only if you define "withdrawal from warehouse" = 6, the system calculates correctly: We need additional 4 Pcs.

Language:

SAP Business One does not support multilingual setting for UDF Fields. It is only possible to define one language per database.

If the wrong language was defined, you can change this in the Configuration wizard.

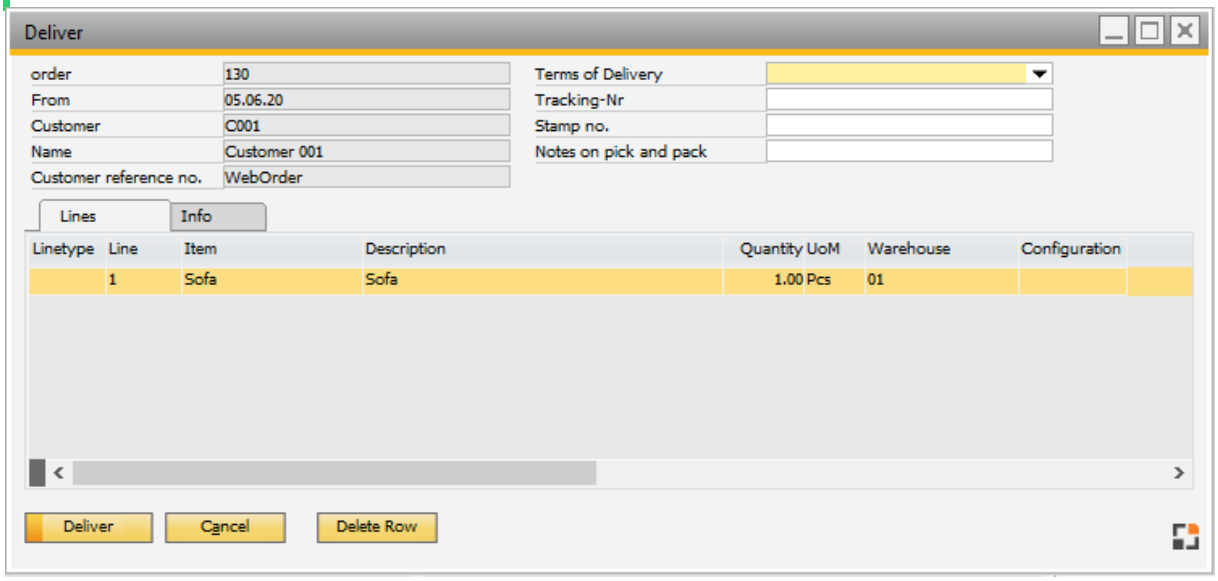
5.1.1 Deliver

In Sales order > right-click > "Deliver", you can deliver reserved items.

Additional information for the delivery can be entered here, which will then be transferred to the subsequent document.

© 2026 Boyum IT Solutions A/S

PATH: Sales > Sales order > right-click on an item > "Deliver"



Window shipping_ delivery_ header.psr

Field	Description
Order	Order number
From	Creation date
Customer	Customer ID
Name	Customer name
Customer reference no.	Customer reference
Terms of Delivery	Selection from stored conditions
Tracking Nr.	Tracking number for shipping
Stamp no.	Stamp number
Notes on pick and pack	Remarks for picking and packing can be entered here

The bottom view lists the items to be delivered for this shipment.

Additional remarks can be stored in the "Info tab".

Buttons

Field	Description
Deliver	A Delivery note is created. The information entered here will be transferred there.
Cancel	Close the window without saving changes.

Limitations:

Preassigning quantities for batch/serial-managed items is not supported. We recommend using WebApp Pick Delivery for that purpose.

Reservations are not checked by the system.

No combination of several sales orders to one delivery note.

No SAP or WMS Bin support.

See:

Quotation, Sales order

Reservation list

Reservation

Cross reference

5.1.2 Capable-to-Promise (CTP)

With the Capable-to-Promise, the expected delivery date can be determined based on forward resource-scheduling and consideration of existing resource reservations.
This function is only available with active APS License.

What does Capable-to-Promise System (CTP System) mean?

A capable-to-promise (CTP) system is a system that helps companies anticipate demand and match it to their peak production and capacities. Using a CTP system allows a business to create a balance between what it can produce and what customers and clients are requesting.

CTP is a global way of looking at demand and capacity.
The system takes into consideration a lot of factors including raw materials for products, inventory, transportation, labor and supply chain issues.

Considering all these, the CTP system helps to deliver accurate predictions for a given company.
The system was named "Capable-to-Promise" because it measures the capability of a company to promise reliable results to a buying community.

The difference between Available-to-Promise (ATP) and Capable-to-Promise (CTP)

The basic dfference between the two systems is that while ATP looks at the availability of materials, ignores time reservation,
CTP assesses the extra components, considers labor availability, the capability of the business fleet and how materials work through a supply chain.

© 2026 Boyum IT Solutions A/S

To achieve this, CTP may consult several production departments for useful information to assess delivery possibilities.
For details on Available-to-Promise in Beas ***see*** next chapter, ATP.

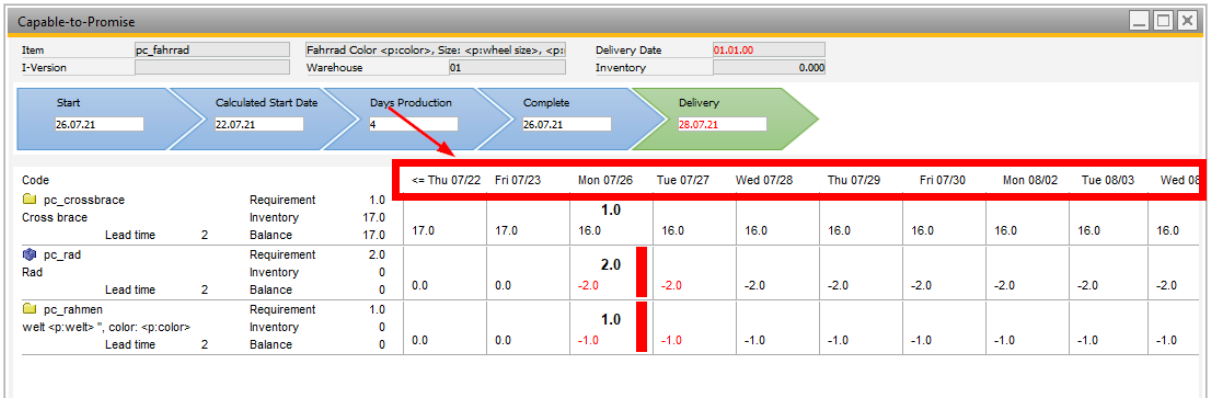
For Configuration ***See*** Configuration Wizard > Sales.

PATH: Sales – A/R > Sales Order/Sales Quotation > right-click on an item > select "Capable-to-Promise".

The information in the right window section is grouped by Days/Weeks based on the calculated value of the "Days Production" field in the process flow bar in the top section.
Days Production: Displays the number of days necessary to complete production of an item.

"Days production" < 15: The information is grouped by days.
"Days production" > 15 * 7: The information is grouped by Months.
"Days production" > 15 AND < 15*7: The information is grouped by Weeks.

In the below example, grouping is according to days:



Window atp_view.psr

The Beas CTP:

- Creates a forward calculation for the assembly.
- Checks availability of resources and material for the complete order-related sub-structure of the assembly.
- Displays the possible delivery date.
- Displays material- and resource information needed for this assembly.

© 2026 Boyum IT Solutions A/S

What you need for using CTP:

APS License
Correct planning data inside the system
Actual MRP

Limitations

The CTP uses the Default MRP function to calculate lead time.
It is a resource planning tool.
The CTP cannot determine the actual delivery date. It is only an auxiliary tool for the seller. A more precise statement can be determined using the APS.

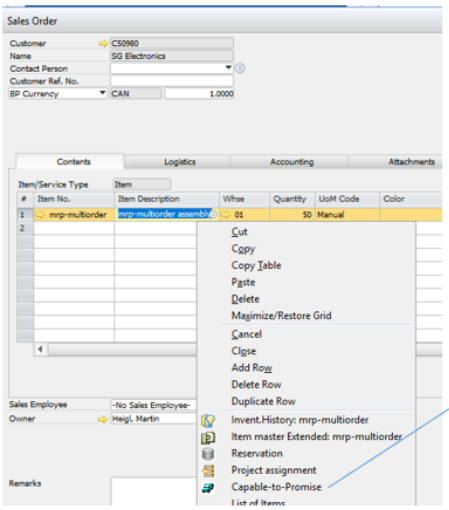
The CTP
- Ignores Variants (Formulas and Scripts), Configurations and Precalculation, but supports Short Variant (A-Z) and Item Version control.
- Ignores formulas inside Bill of Materials and Routing positions.
- Ignores routing related Bill of Materials Positions.
- Ignores resource reservation from other sales order if work order does not exist.
- Material check is based on last MRP run and it does not check the actual material situation.

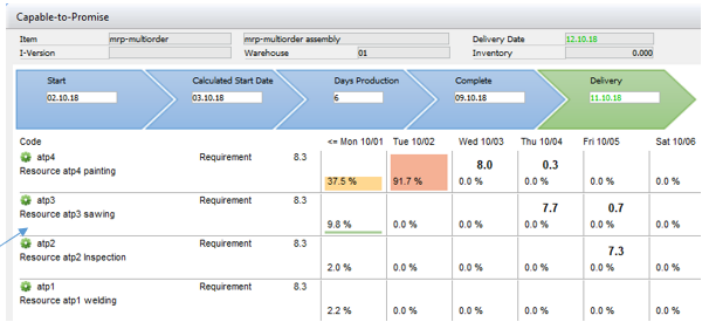
Before you start:

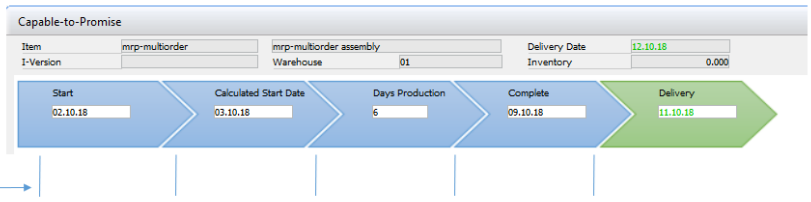
- CTP can deliver correct information only if all data are correct.
- Define a default MRP (***see*** Configuration wizard) and calculate this every day.
- Calculate work orders in APS every in day and use forward calculation. If resource reservations are in the past, the result cannot be correct.

The CTP working process:

© 2026 Boyum IT Solutions A/S







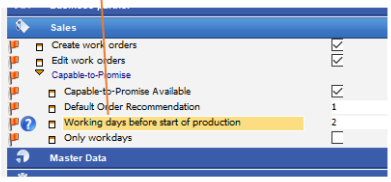
today

Date available for the needed first resource and material position

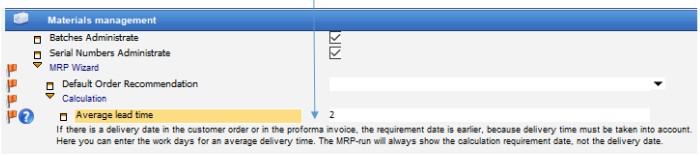
Production end

Delivery Date =
Complete date + Avg lead Date

Duration time for complete production

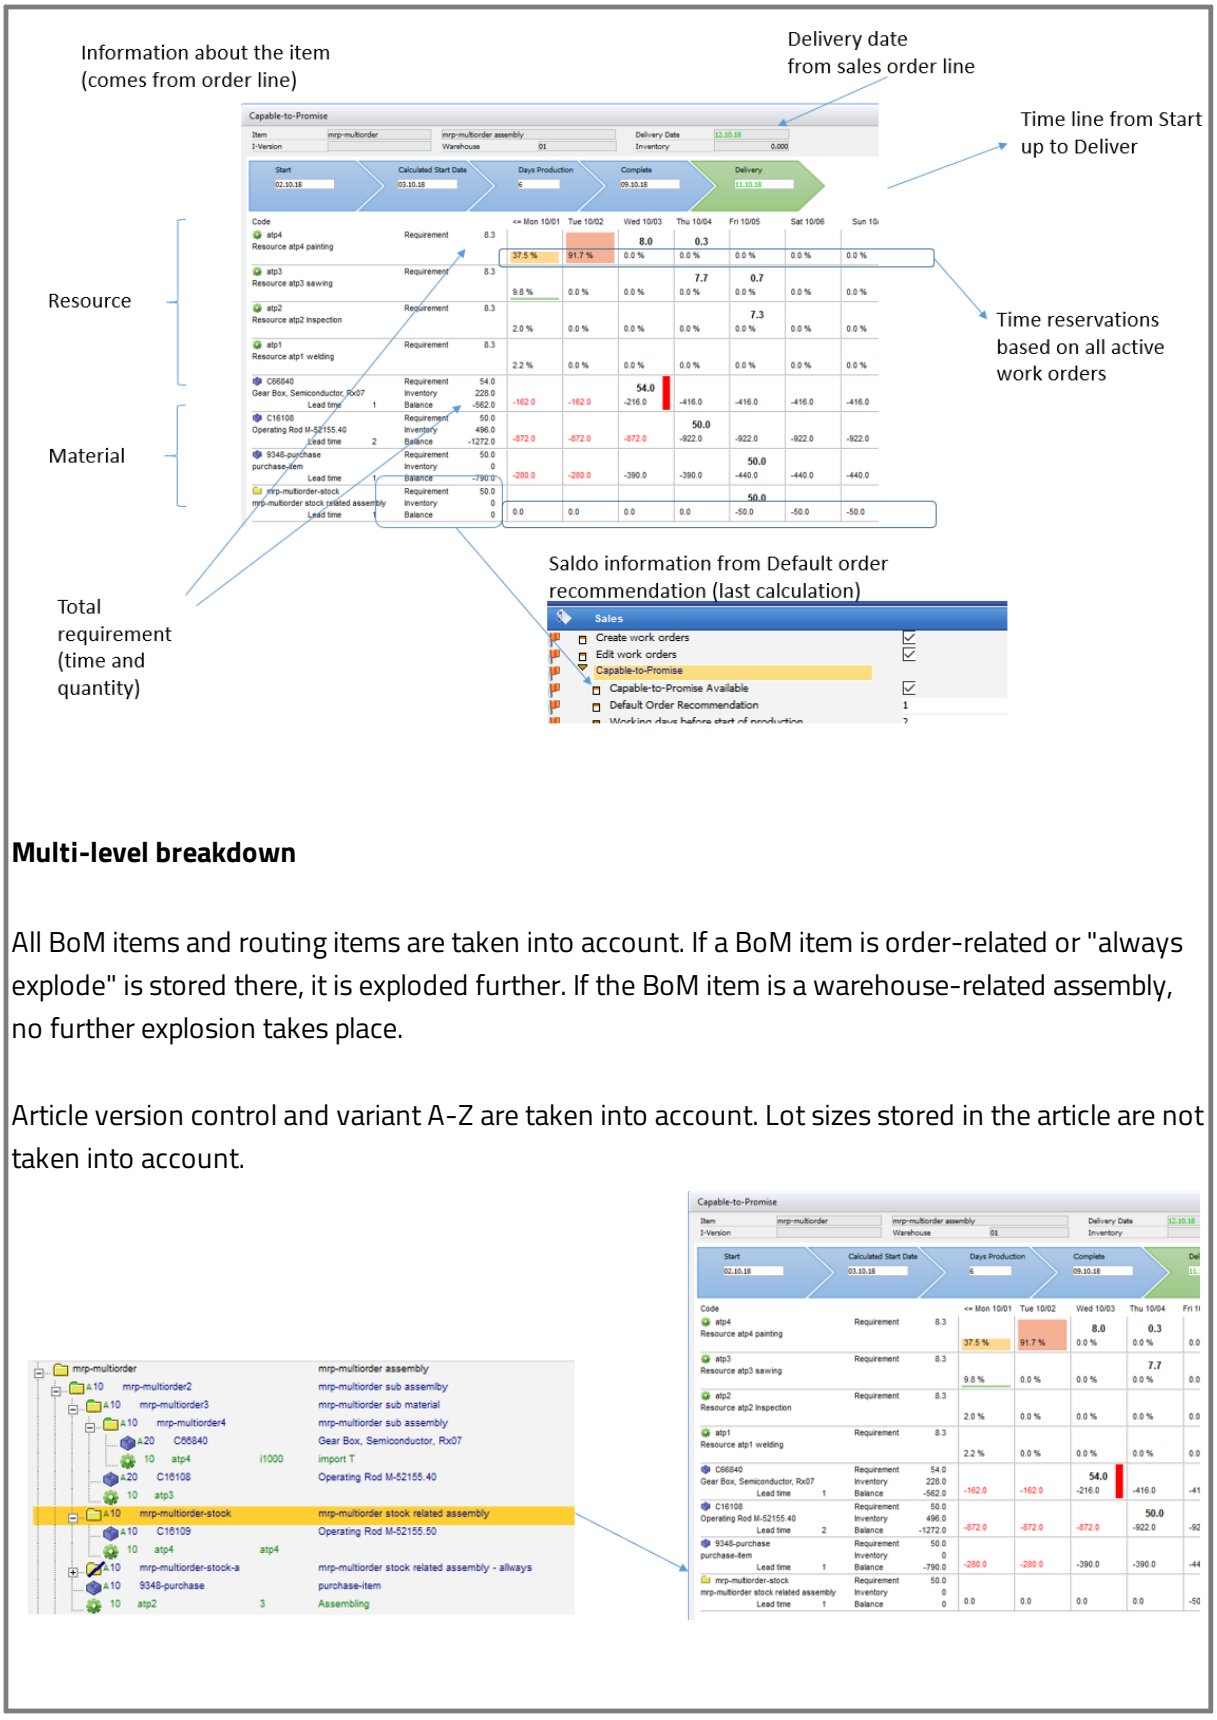


Days counted in workdays; based on beas factory basis calendar.



Days counted in workdays; based on beas factory basis calendar

© 2026 Boyum IT Solutions A/S



Multi-level breakdown

All BoM items and routing items are taken into account. If a BoM item is order-related or "always explode" is stored there, it is exploded further. If the BoM item is a warehouse-related assembly, no further explosion takes place.

Article version control and variant A-Z are taken into account. Lot sizes stored in the article are not taken into account.

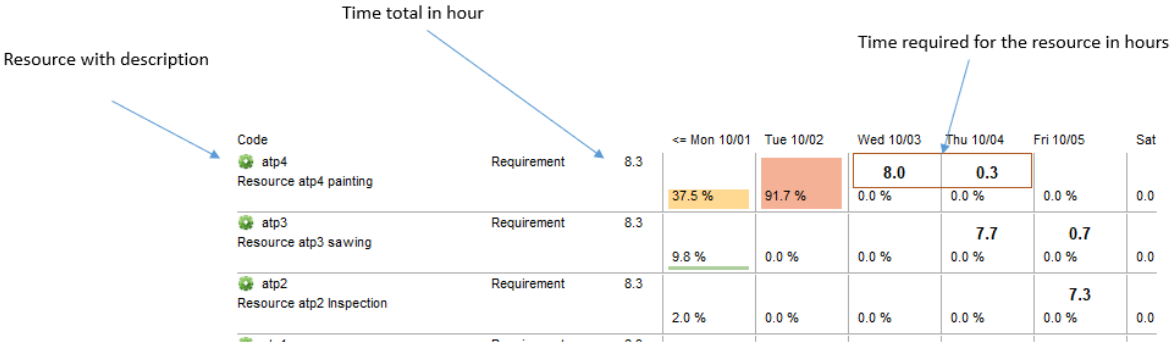
© 2026 Boyum IT Solutions A/S

Forward Calculation

Forward scheduling with consideration of existing production orders (in production, planned orders etc.) is used. It is not planned to infinity (= CTP). Forecast or existing sales orders are not taken into account here (MRP2).
The original APS forward scheduling is used. The default settings are not changeable. It always uses forward calculation.
The default is the routing. All stored rules and optimization functions are considered, including parallel tools and resources and resource optimization.

Sub-assemblies are expanded first. You can only expand the assembly when all sub-assemblies have been completed.

Resource View in CTP



Time reservation from active work orders in this time period
(first column is all from past up to this date)

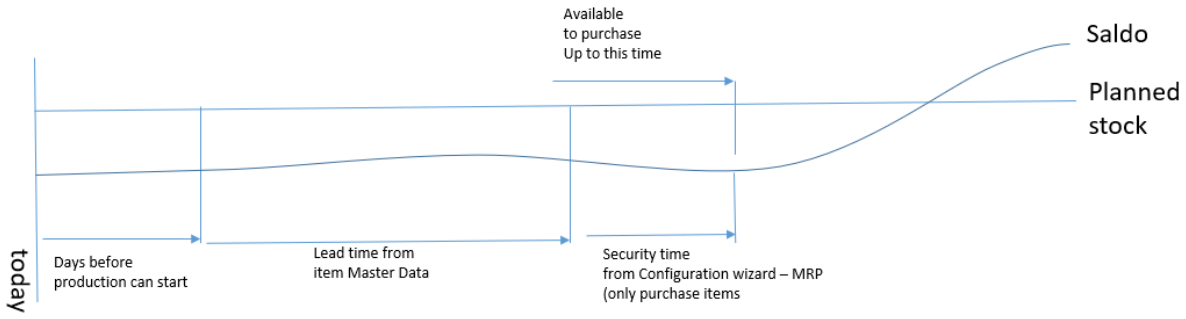
All in %, related to Plan capacity for this time period (day, week, month)
if reserved time > 100%, beas display 100%.

Color: Green ≤ 20%, Yellow ≤ 80%, Red > 80%

© 2026 Boyum IT Solutions A/S

Material consideration

The CTP takes the availability of the material into account. The Reference is the result of the last material requirements calculation of the MRP definition stored in the CTP.
Depending on the MRP definition, sales orders and forecasts are taken into account. You can use the same MRP as the reference that is used in the item history.
If an Item (Material or stock-based assembly) is not available, the lead time stored in the item is used.



All days in work days based on basic factory calendar

C66840		Requirement	54.0			**54.0**			
Gear Box, Semiconductor, Rx07		Inventory	228.0						
Lead time	1	Balance	-562.0	-162.0	-162.0	-216.0	-416.0	-416.0	-416.
C16108		Requirement	50.0				**50.0**		
Operating Rod M-52155.40		Inventory	496.0						
Lead time	2	Balance	-1272.0	-872.0	-872.0	-872.0	-922.0	-922.0	-922.
9348-purchase		Requirement	50.0					**50.0**	
purchase-item		Inventory	0						
Lead time	1	Balance	-790.0	-280.0	-280.0	-390.0	-390.0	-440.0	-440.
mrp-multiorder-stock		Requirement	50.0					**50.0**	
mrp-multiorder stock related assembly		Inventory	0						
Lead time	1	Balance	0	0.0	0.0	0.0	0.0	-50.0	-50.0

Saldo time line

RED Color : Material not available AND not possible to deliver
Black: Material available OR there is enough time to purchase this item
Red rectangle: This material is the reason of the delay

5.1.3 Available-to-Promise (ATP)

With the Available-to-Promise, the expected delivery date can be determined based on forward resource-scheduling and consideration of existing resource reservations.
This function is for all companies without APS License.

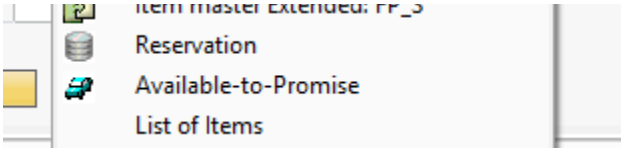
▣ What does Available-to-Promise System (ATP System) mean?

An available-to-promise (ATP) system is a system that helps companies anticipate demand and match it to their peak production and capacities. Using a ATP system allows a business to create a balance between what it can produce and what customers and clients are requesting.

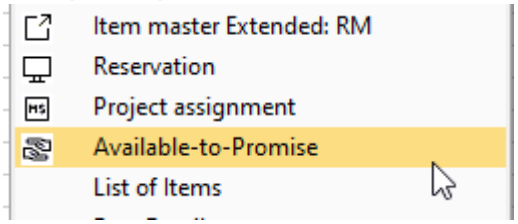
© 2026 Boyum IT Solutions A/S

ATP is a global way of looking at demand and capacity. The system takes into consideration a lot of factors including raw materials for products, inventory, transportation. Considering all these, the ATP system helps to deliver accurate predictions for a given company.

You can access ATP in SAP Business One if you do not own an APS License by opening a **Sales Order/Sales Quotation > right-click** on an assembly line:



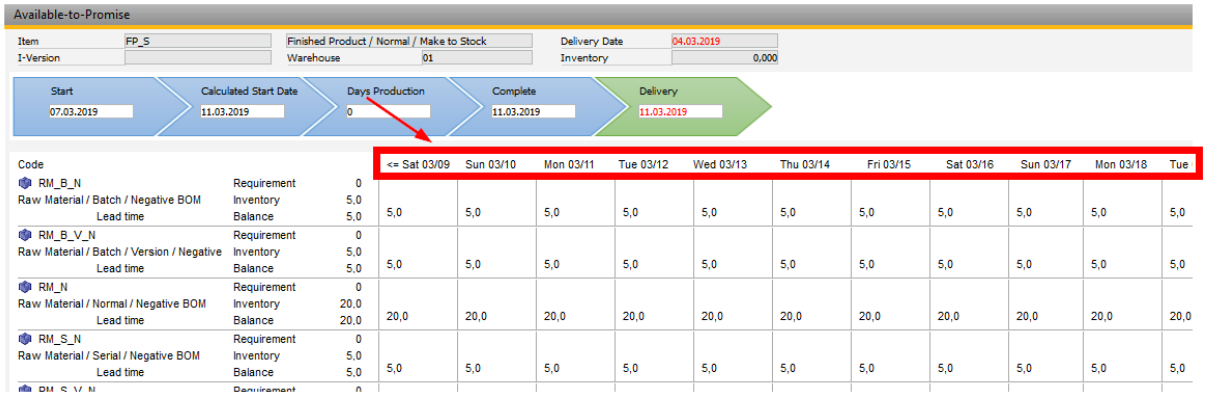
in **Boyum Style**:



The information in the right window section is grouped by Days/Weeks based on the calculated value of the "Days Production" field in the process flow bar in the top section.
Days Production: Displays the number of days necessary to complete production of an item.

"Days production" < 15: The information is grouped by days.
"Days production" > 15 * 7: The information is grouped by Months.
"Days production" > 15 AND < 15*7: The information is grouped by Weeks.

In the below example, grouping is according to days:



Window atp_view.psr

© 2026 Boyum IT Solutions A/S

For further details on differences between Capable-to-promise (CTP) and Available-to-Promise (ATP) functions, ***see*** CTP vs. ATP in previous chapter.
For Configuration ***See*** Configuration Wizard > Sales

The Beas ATP:

- Creates a forward calculation for the assembly.
- Checks availability of resources and material for the complete order-related sub-structure of the assembly.
- Displays the possible delivery date.
- Displays material- and resource information needed for this assembly.

What you need for using CTP:

No APS License
Correct planning data inside the system
Actual MRP

Limitations

The ATP uses the Default MRP function to calculate lead time.
It is a resource planning tool.
The ATP cannot determine the actual delivery date. It is only an auxiliary tool for the seller.

The ATP
- Ignores Variants (Formulas and Scripts), Configurations and Precalculation, but supports Short Variant (A-Z) and Item Version control.
- Ignores formulas inside Bill of Materials and Routing positions.
- Ignores routing related Bill of Materials Positions.
- Ignores resource reservation from other sales order if work order does not exist.
- Material check is based on last MRP run and it does not check the actual material situation.

Before you start:

- ATP can deliver correct information only if all data are correct.

© 2026 Boyum IT Solutions A/S

- Define a default MRP (***see*** Configuration wizard) and calculate this every day.
- Calculate work orders every day and use forward calculation. ***See*** APS. If resource reservations are in the past, the result cannot be correct.

For more information on the complete process ***see*** CTP.

5.1.4 Print SAP Document

Beas has an own framework to print SAP transaction documents as Quotation, Sales Order, Purchase order or Invoice.
Use Beas Print System only,
- if SAP integrated system is not optimal.
- if you cannot use B1 Print & Delivery

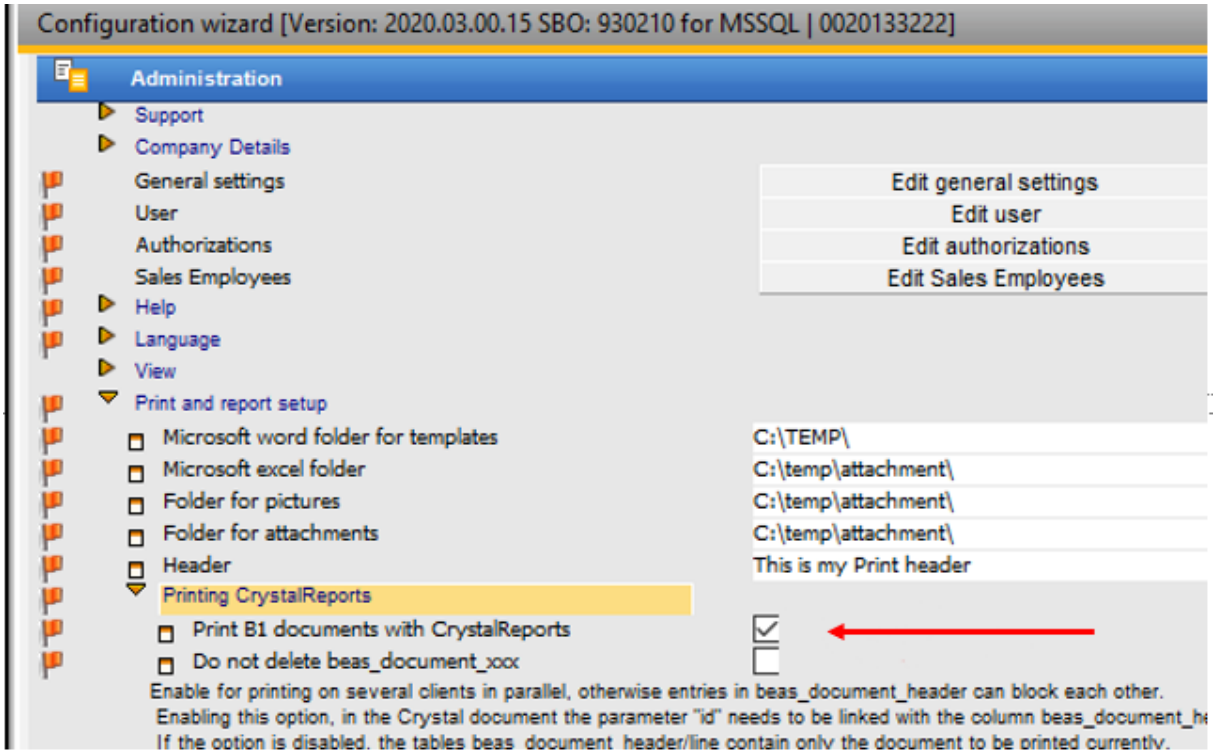
What is special in Beas Print solution?

Advantages:
- Multi-language support
- Possible to use only 1 report for all documents
- Simple Crystal report creation
- All macro functionalities are inside

Disadvantages :
- This module is "in maintenance": We support this, but are not working on a new functionality, because we have the product B1 Print & Delivery with more functionality.
- The document must be saved before you can print it.

How to use:
1. Activate Beas Print solution

© 2026 Boyum IT Solutions A/S



2. Now the system is activated.

if you click on Preview icon in SAP document, the system displays the Crystal report.

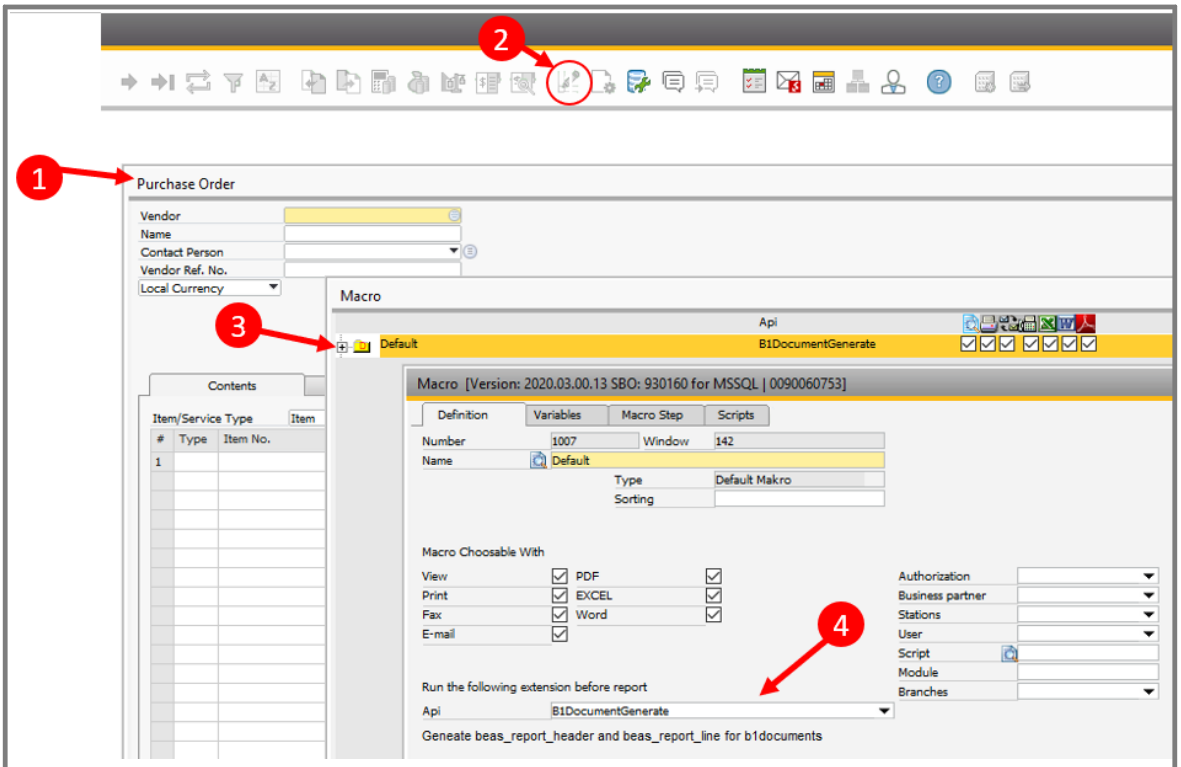
Configuration

The Report is a normal Beas Macro.

You can change it if you click on this icon.

Special: You must define the API "B1DocumentGenerate". If this is activated, the system generates the table "BEAS_DOCUMENT_HEADER" and "BEAS_DOCUMENT_LINE". You can find all relevant information about the current document in both tables.

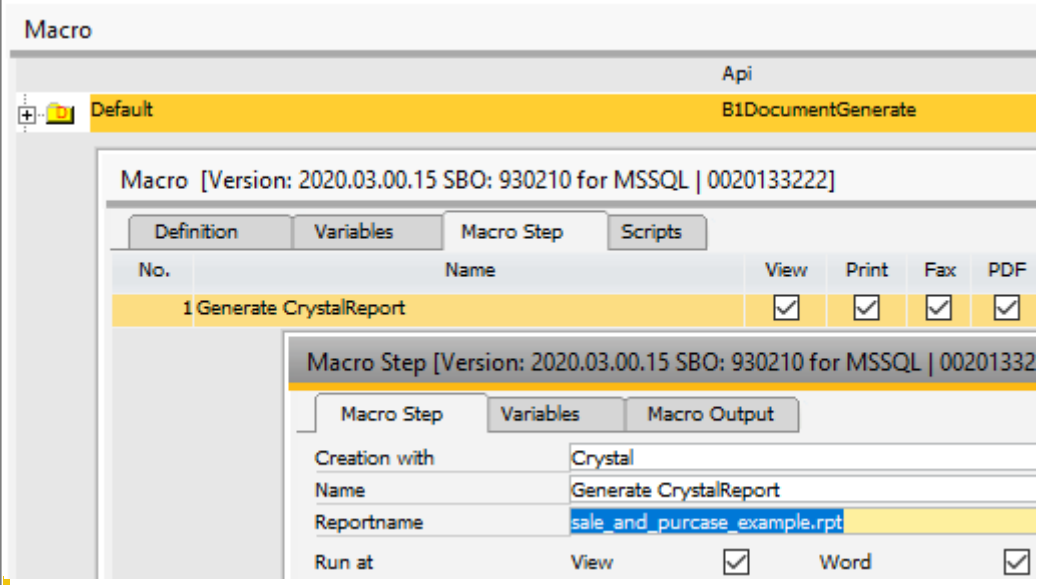
© 2026 Boyum IT Solutions A/S



The Default macro use the report "sale_and_purchase_Example", saved in folder **c:\program files(x86)\beas software\beas\program\report**

You can copy this to the project folder and can change this report.

If you change the file name, you must insert the new name in the Report name of the default report.

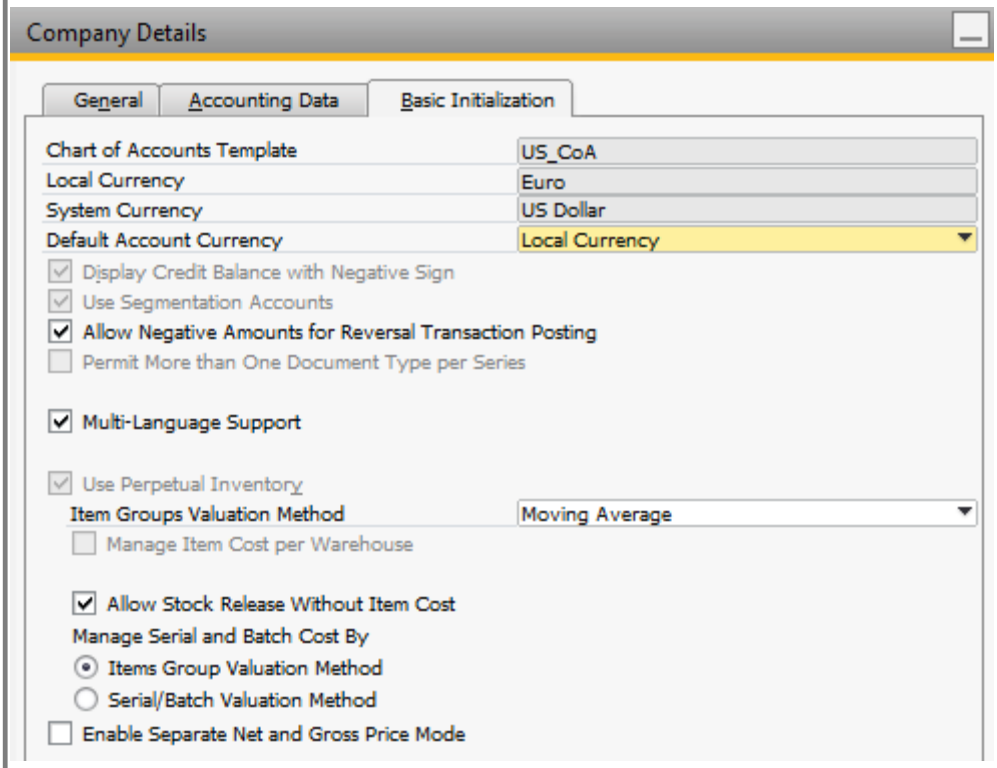


Note: Default macros are not replaced after Program update. This macros are changeable.

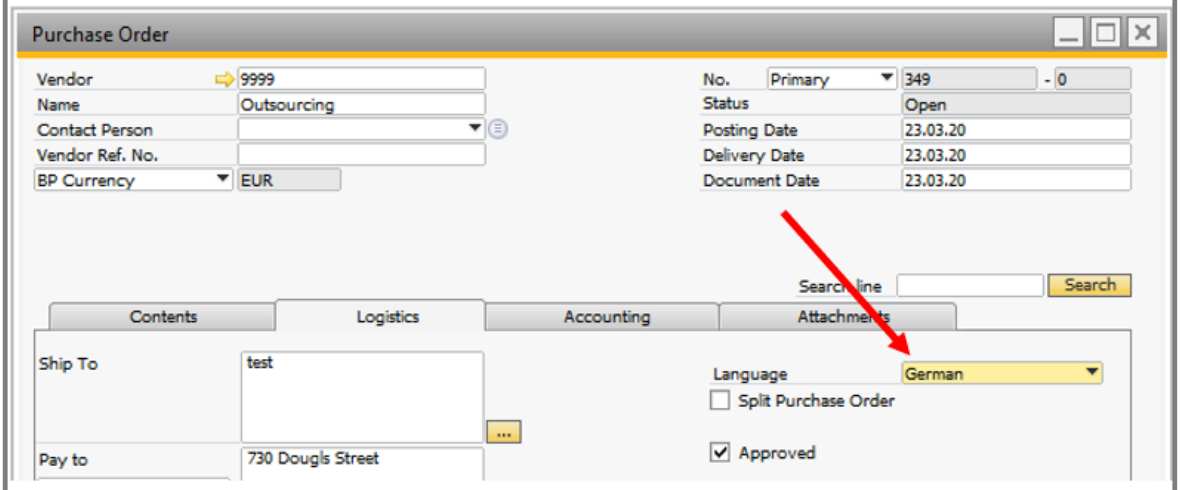
© 2026 Boyum IT Solutions A/S

- Multi language

SAP Business One Multi-language is supported.

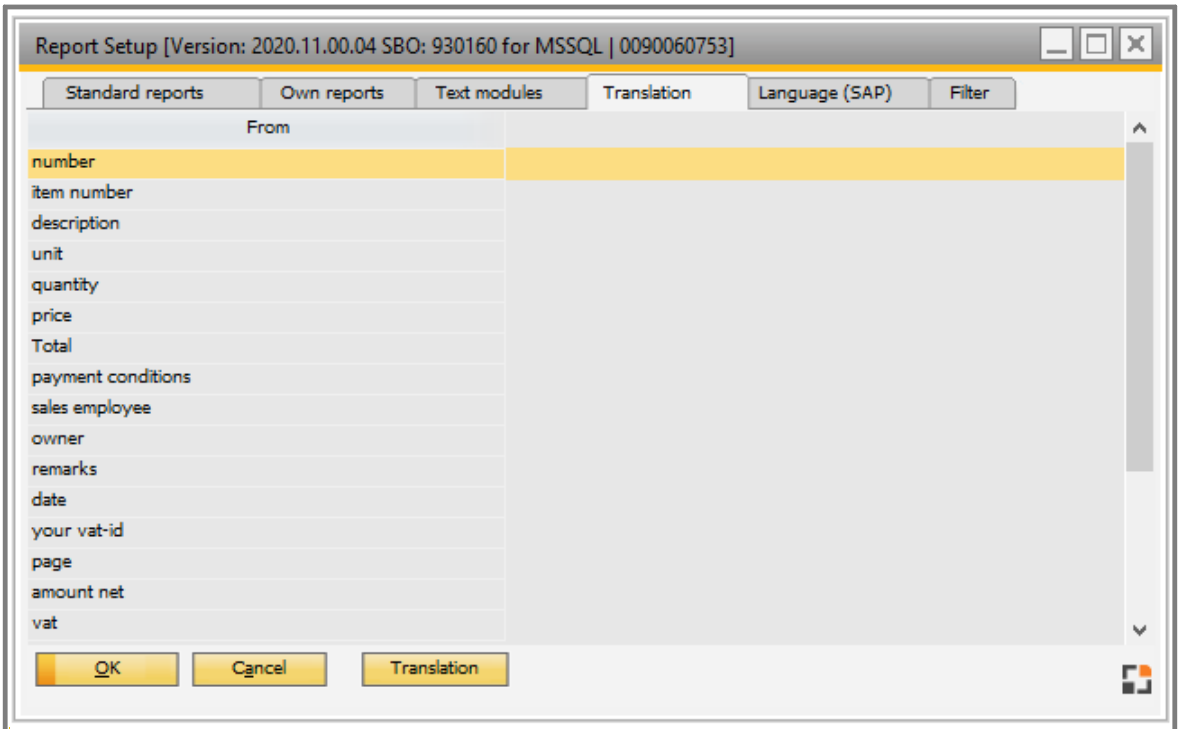


The report will be printed in the language defined in **Purchase Order > Logistics tab > "Language":**



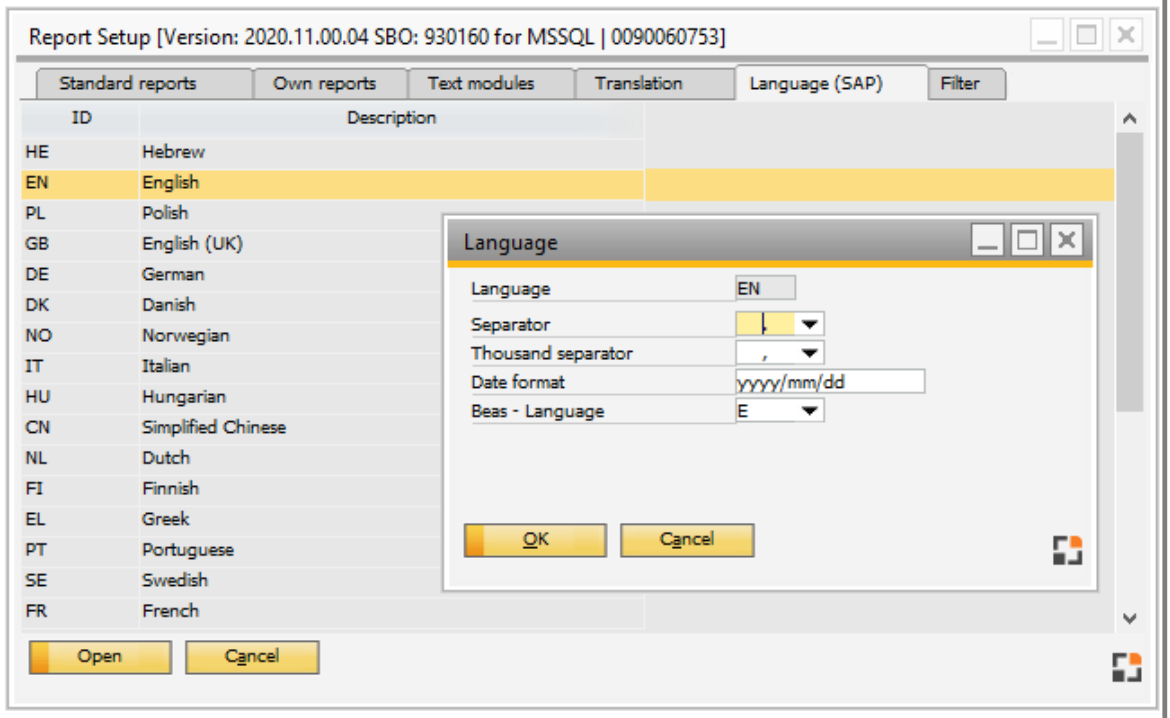
In Report setup you can define the translation from your own pool of expressions:

© 2026 Boyum IT Solutions A/S



Note: Beas always translates from German to other languages. If you use keywords in another language, you must define it here in this window.

In tab language (SAP) you can define the Beas translation language, number and date format.



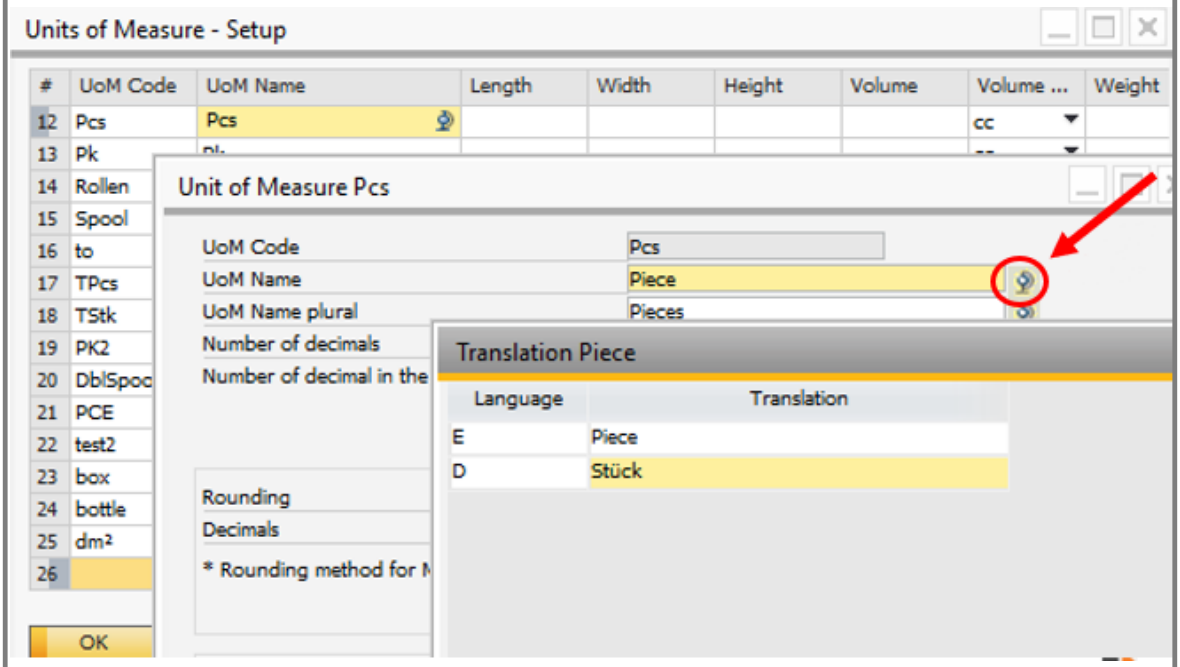
For more information ***see*** Date and Number format.

© 2026 Boyum IT Solutions A/S

Translate Unit of Measurements

Open **Units of measurement > right click > extended > click on translate icon**

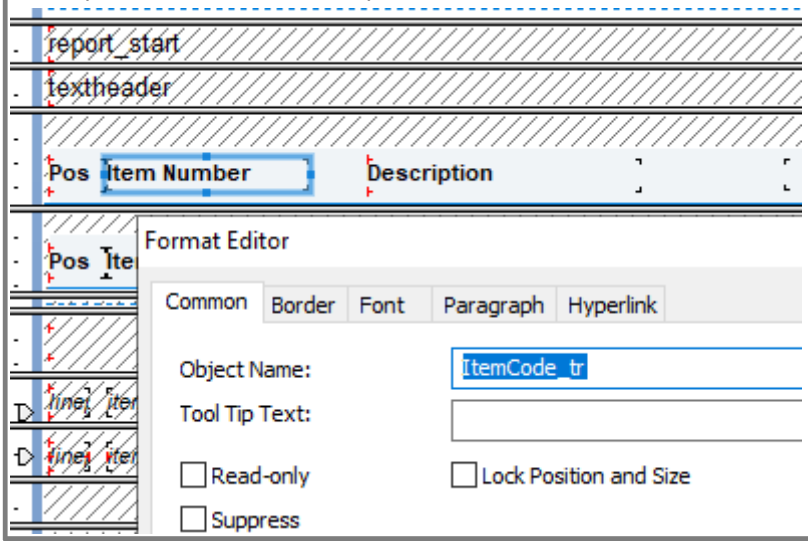
Here you can define the translation from UoM Description in all other languages.



Crystal Report

In Crystal report all text objects must have an object name with Postfix "_tr"

If this postfix is defined, the system tries to translate this word.



© 2026 Boyum IT Solutions A/S

5.2 Precalculation

PATH: Sales – A/R > Precalculation.

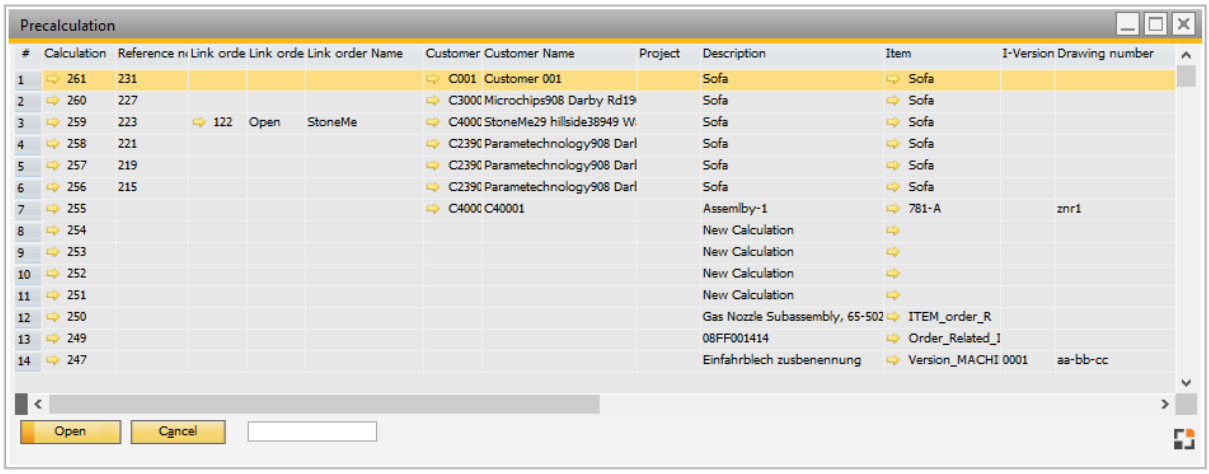
In the Precalculation list you see all created precalculations

See Concept Precalculation

Precalculation: Introduction

Window settings and templates supported. You need access to create Precalculation. It is part of the Basic or the Configurator License.

From this window you can create new calculation, can edit or delete entries.



Window pk_haupt_browse_alle.psr

Field	Meaning
Calculation	Continuous calculation number.
Reference no	Reference number If a calculation is created from a quotation or a sales order it receives a separate reference number which is stored in the quotation/order in this field. The reference number is saved in "Calculation" *(RDR1.U_BEAS_PRECALCNR)* **Note:**

© 2026 Boyum IT Solutions A/S

Field	Meaning
	As long there is a reference (link), the calculation may not be deleted. To remove the link, delete the reference number in sales order or quotation.
Link order Link order Name Link order Status	Information from linked sales order If a sales order is linked to the calculation via reference number, the link is displayed here. Column "Calculation" *(RDR1.U_BEAS_PRECALCNR)* Use the yellow arrow to open the sales order. "Name" is the customer name "Status" the current status of the sales order Fields can be enabled via Window settings. *beas9.1-004-068-000*
Customer	Customer.
Customer Name	Customer Name.
Order	Order number.
Description	Item description.
Item	Item number.
I-Version	Item version.
Drawing number	Drawing number.
Customer Item	Customer's Item number.
Customer Drawing number	Customer's Drawing number.
Info	Free text.
Changed by	Employee, who made changes.
Change date	Date of change.
Change reason	Reason for change.
Schema	Calculation schema.
Project	Project.
Variant	Variant, if available.

© 2026 Boyum IT Solutions A/S

Field	Meaning
Variant Description	Short description of the used variant.
Configuration	Configuration ID.

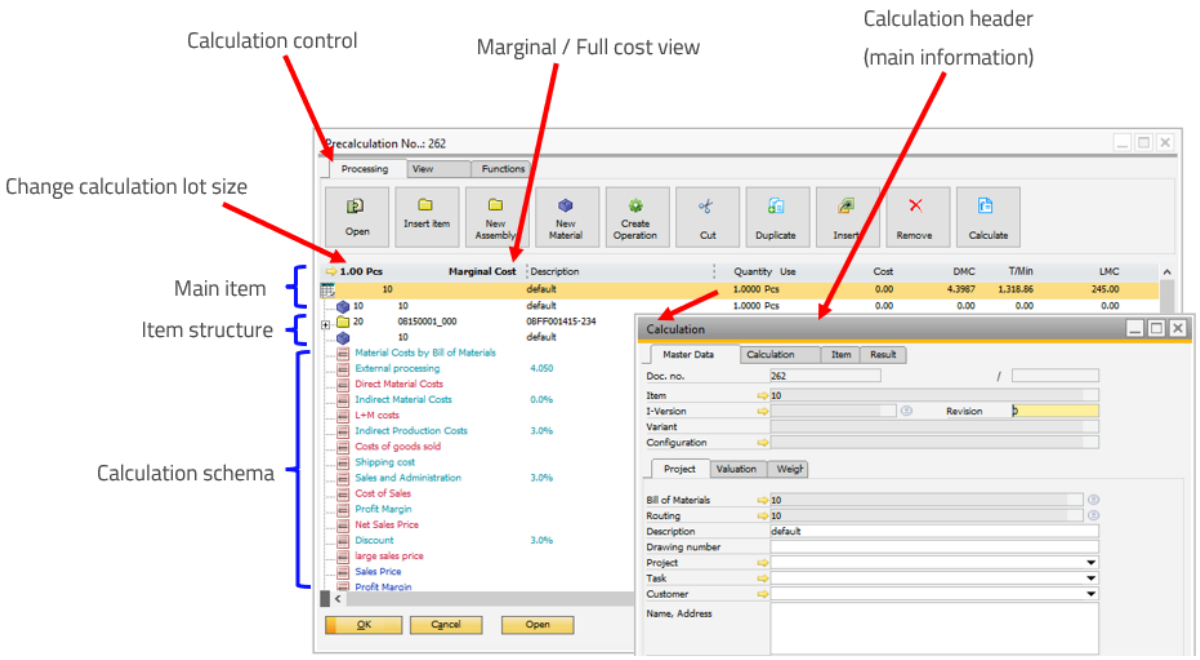
5.2.1 Edit Precalculation

This is the main calculation window, which you can open from different places (***see*** Precalculation)

This is a structure view.

First line is the item, which you want calculate. Behind this line all calculation settings defined. ***See*** Precalculation header

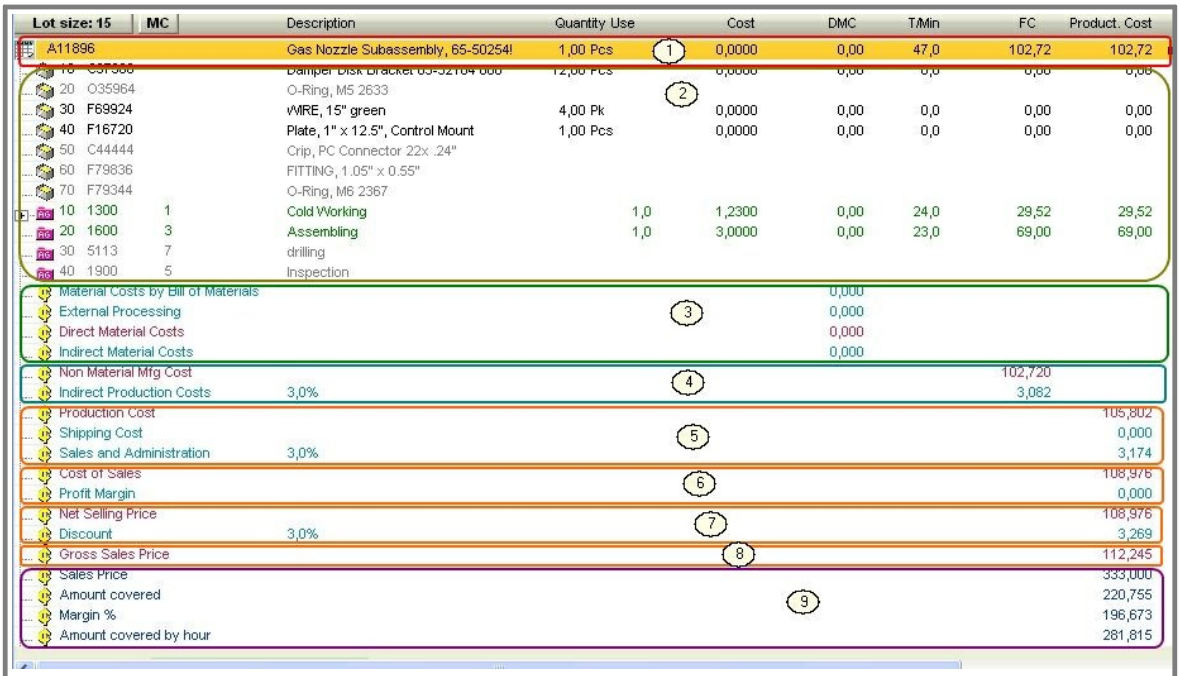
All control elements are available in the Ribbon bar. ***See*** Precalculation Control



Structure of Precalculation

A calculation consists of multiple areas.

© 2026 Boyum IT Solutions A/S



Areas

1	Item to be calculated. The details of the calculation can be edited here. After double click the master data of the item is displayed and the calculation parameters. ***See*: Header**:
2	**Detail area**: BoMs, routing positions, external operations, tool, etc. A BoM position can also be an assembly. In this case, this has no purchase price, as it consists of the sum of its BoM and routing. All material prices and costs from the routing positions are added up here. Surcharges are not considered here. **Material**: Click on a position to open the editing window for material. **Operation sequence**: open a copy of master data to edit. The system does not use count of decimal place defined in unit of measurements. ***See*** Rounding concept Gray lines: Item is not active or the quantity is 0. Note: Beas processes max. 6 decimal places. If the calculated quantity is smaller, the row is displayed as inactive.u ***Example:*** Quantity 0.003 per 100 000 pieces = 0,000 000 03, is rounded to 0 in this case.
	The calculation schema takes effect from this position.

© 2026 Boyum IT Solutions A/S

1	Item to be calculated. The details of the calculation can be edited here. After double click the master data of the item is displayed and the calculation parameters. ***See*: Header**:
	For each area, a sum can be created separately and reused in multiple areas (price list creation, assembly valuation, etc.).
3	**Material cost area**: display of the calculated material costs, external operation costs, and material surcharges. The individual sums do not have to match the total material figure from area 2, as individual areas (e.g. material costs without external operation costs, which are added at material costs) can be displayed separately in the calculation schema.
4	**Non Material Mfg Cost**: All production costs or parts thereof (time types, time type groups) are added here. The material costs are not included in the sum.
5	**Production Cost**: The production and material costs are calculated from here. Any further surcharges can be defined here.
6	**Cost of Sales**: The surcharges on the calculated cost of sales are defined from this area. Cost of sales = production costs (material + production + surcharges) + surcharges on the production price.
7	**Net Selling Price**: Further total.
8	**Gross Sales Price**: Further total.
9	**Price from Offer**: The sales price, which can be entered in the header (double-click in area 1). A conversion to Per hour or Sales income is performed here.

If somewhere in the structure three dots are displayed instead of a number, that means several cost rates have been stored.

Columns

Field	Description
Description	Describes the entry (item description, operation description).
Quantity	Quantity/requirement converted Displays required total Quantity in Production UoM per "View Per" setting, calculated by defined Lot size

© 2026 Boyum IT Solutions A/S

Field	Description
	 Count of decimal places: ***See*** rounding concept In Bill of Materials window the Quantity is in Input UoM. The Factor define the conversion to Production UoM, which is used in the Structure view. *Beas 2020.06 and earlier:* This is the Quantity from Material * View per. All other settings are ignored.
Costs	Direct costs (material, resource costs per time unit).
DMC	Total material costs per display unit.
T/Min	Total time requirement in minutes per display unit.
LMC	Total production costs per display unit.
COGS	Sum of material and production costs in detail area.
Drawing Number	Drawing number of the item.
Match Code	Match Code.
DIN	DIN .
Material Group	Material Group.
Raw Material	Raw Material.

Supported functions

The Beas Precalculation supports the following functions:

- Short item versions
- Item version control
- Configurator

© 2026 Boyum IT Solutions A/S

- Variant system
- Tool calculation
- Standard price list, extended and special price list, different valuation methods
- Create work order from Precalculation

Note: You cannot create a new item / item structure from Precalculation.

Customization:
The structure view is not customizable. But you can create own calculation objects

Rounding, Unit of measurement

Rounding in calculation

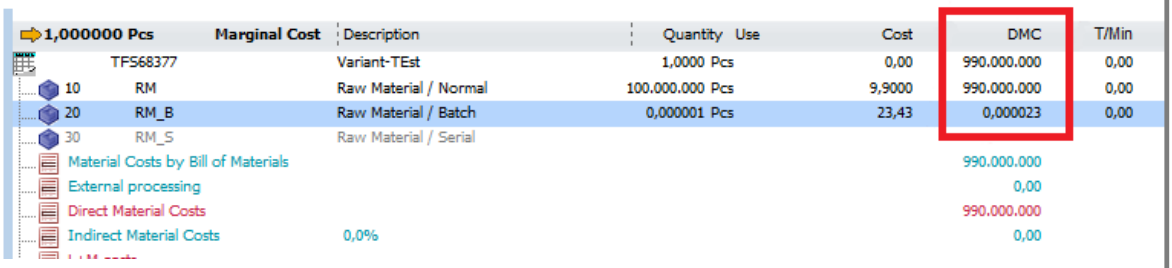
The calculation calculates all values and consistently rounds them to 6 decimal places.

Display

As figures are displayed in different units (e.g. per 1 or per 1000) and the prices that are stored e.g. per 1000 must also be displayable per 1,
the required number of decimal places is calculated for each number separately for the view.
For values under 0.1, a view is displayed with up to 6 decimal places. For values over 1 million, no decimal places are displayed, allowing both small values and large values to be displayed with optimal use of space.

Why:

The Precalculation is a structure view. It is not possible to change the size of fields. The space for every field is limited.
With this concept it is possible to display high and low prices optimally in a limited space.



1,000000 Pcs	Marginal Cost	Description	Quantity Use	Cost	DMC	T/Min
TPS68377		Variant-TEst	1,0000 Pcs	0,00	990.000.000	0,00
10 RM		Raw Material / Normal	100.000.000 Pcs	9,9000	990.000.000	0,00
20 RM_B		Raw Material / Batch	0,000001 Pcs	23,43	0,000023	0,00
30 RM_S		Raw Material / Serial				
Material Costs by Bill of Materials					990.000.000	
External processing					0,00	
Direct Material Costs					990.000.000	
Indirect Material Costs		0,0%			0,00	

Example:

Operation 1, job time: 3 minutes per 10000 pieces, costs: 1 € per minute
Operation 2, job time: 20 hours, costs: 65 € per hour

View setting: 2 digits

© 2026 Boyum IT Solutions A/S

Calculation view per 1 piece:
Op 1: Price = 0,0003 €
Op 2: Price = 1300,00 €

Calculation view per 100 000:
Op 1: Price = 30,00 €
Op 2: Price = 130.000.000 €

In this example you can see that depending on the amount or view the number of decimal places is of high importance.
In the chemical industry, where values well below 1/1000% are used, the correct view is imperative.

Rounding decimals:

> 9,999,999	0 decimal place
> 10	2 decimal places
>= 1	4 decimal places
0 - 1	6 decimal places

- Limitations and Performance

A structure view is not customizable. Column width is only changeable left of Description and Quantity.
Direct excel export is not possible

The calculation is a complete In memory solution. With many additional optimization concept the system can calculate entries in very short time
It support up to 10 000 Lines without performance issue. If you must calculate more items, it's better to deactivate the online calculation.

Important: Beas does not support UoM Price lists in Precalculation.

5.2.1.1 Precalculation Controls

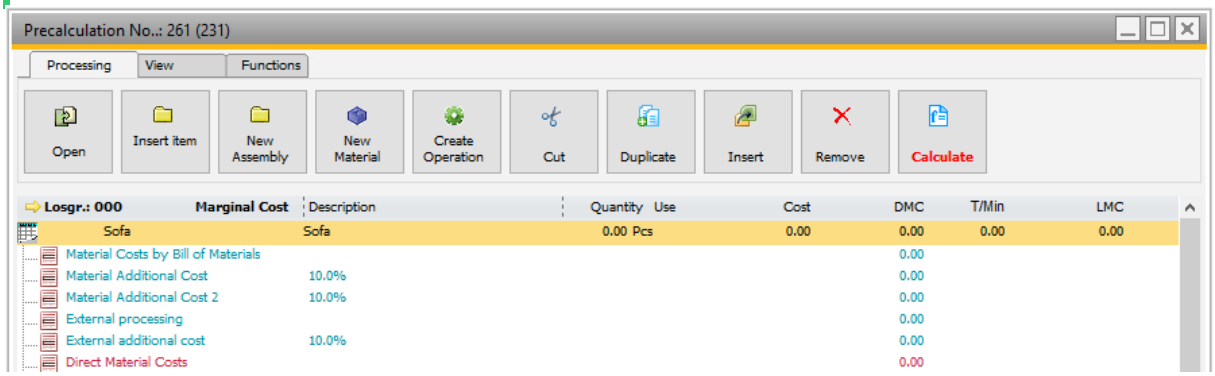
The main functions for precalculation can be called with the button bar in the header.

The following tabs are available:

© 2026 Boyum IT Solutions A/S

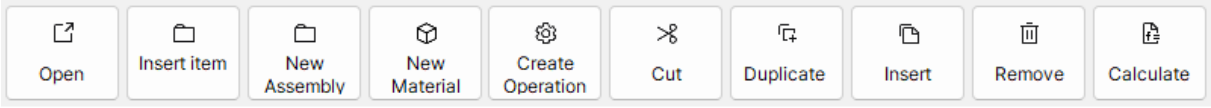
Name	Meaning
Processing	Edit the current calculation (add, change, delete, etc.)
View	View functions (lot size, view by chose quantity, full / marginal costs, etc)
Functions	Valuation, Calculation, Import

PATH: Sales – A/R > Precalculation > **Open** precalculation.



Window pk_struktur.psr

Boyum Style design:



Buttons below:

Button	Description
OK / Update	OK: Save and close the window. Update: If change were made in the calculation, the text changes to "update". Clicking on it, everything is completely recalculated and saved - even if the automatic calculation is turned off. Then the text is reset to "OK". Exception: if the calculation is called from the item master page, this button is hidden.
Cancel	Close window without saving changes
Open	Open current precalculation edit window.

Processing tab

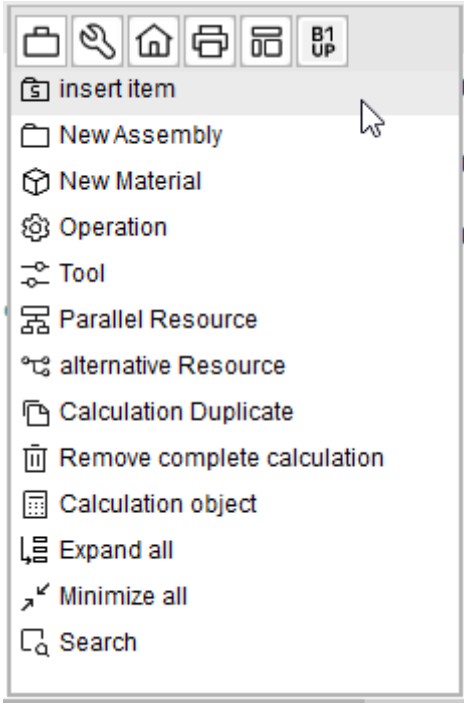
© 2026 Boyum IT Solutions A/S

View tab
Functions tab
Right-click menu > second tab
Buttons in the bottom of the window

5.2.1.1.1 Processing tab

This first tab of the precalculation edit window has the controls for changing BoM, Routing related components of the calculation and remove the calculation itself.

The right-click menu can be called from any BoM or Routing line in the Precalculation structure.



Field/Function	Meaning
Open	Button to edit the currently selected item (corresponds to double-click on an item or push button "open entry") in the structure. Special feature: When editing the first entry, the window for calculation details opens. This option is disabled if the calculation was called from item master.

© 2026 Boyum IT Solutions A/S

Field/Function	Meaning
Insert Item	Opens a item selection window. The items selected (and possibly their substructure) are inserted at the current position.
New assembly	Insert a new assembly, which does not yet exist in the item master.
New material	Insert a new purchase part, which does not yet exist in the item master.
(Create) Operation	Insert new operation for the material.
Tool	Add new tool to the selected operation.
Parallel resource	Add a parallel resource to the selected operation.
Alternative resource	Add an alternative resource to the selected operation.
Cut	Cut the selected position and its substructure. It remains at a new location as long as it is not inserted.
Duplicate	Copy the selected position and its substructure.
Insert	Insert the previously cut or copied position.
Remove	⊟ Delete row, structure or calculation **Cursor on first row** If the cursor is on the first row, the complete calculation is deleted. Deletion is prevented if: - there is a reference (via reference number) to a sales order or to a quotation - calculation is linked to a work order position - the variable "`e_kalkdel`" was set to "N" - `windowevent userdel` returns "return failure" or sets the variable "value" to -1 Before deletion there is a double security query also in case of master/slave relation. Alternative, parallel resources and tools are removed along with removing an operation. **Cursor on a different row:**

© 2026 Boyum IT Solutions A/S

Field/Function	Meaning
	Current row or its substructure is deleted.
Remove complete calculation	Delete the entire calculation structure.
Calculate	Recalculate the entire calculation.
Calculation Object	Opens the Calculation objects list of the actual Calculation Schema. Click **Choose** after selecting an object to add it to the precalculation structure. *Window pk_typen_search.psr*
Expand/Minimize all	Expand/Minimize the complete Precalculation structure
Search	Open the Search query window

See

View tab

Functions tab

Right-click menu: 2nd tab

Right-click menu: 3rd tab

5.2.1.1.2 View tab

This tab has the controls for the Precalculation view.

Field descriptions

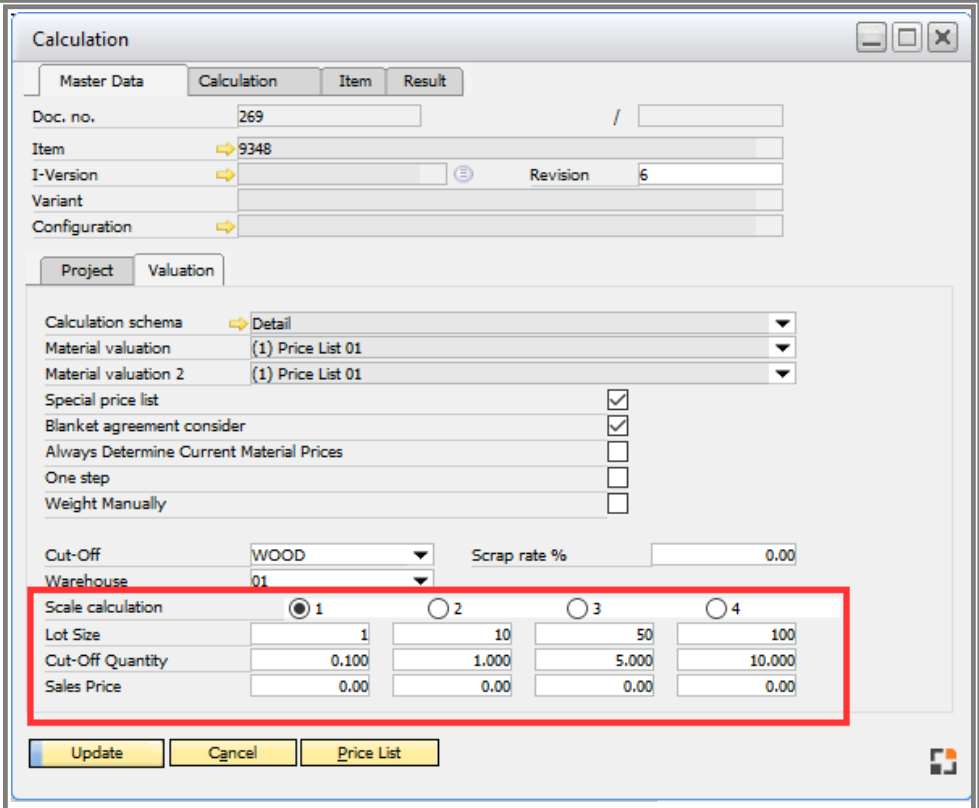
Field	Meaning
Expand	Expand structure
Minimize	Minimize structure
View Default/Extended	Toggle between standard and extended view. Function is only available if "calculation schema per assembly" has been activated in the calculation schema. The default view displays standard calculation without showing additional costs. The extended view displays the results that were deposited in the calculation schema in the "View" tab. For more information ***see*** Pre-calculation Extended view.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	 *Window pk_struktur.psr* **Boyum Style design:**  Calculation per assembly webinar.
Full / Marginal Costs	Toggle between full and marginal costs. Only available in Default view.
Lot size	View / Calculate at lot size (toggle between 4 different lot sizes).
Inactive visible/invisible	Show/hide inactive calculation objects
View per Lot Size	Switch between max. 4 defined lot size and define the View A calculation can be made simultaneously in a maximum of 4 lot sizes. The default lot size is the calculation lot size as per the item master - Calculation. If the calculation is called up from a quotation or an order, the quantity stored there is the lot size. For further information on lot sizes ***see*** Lot size - concept. This is the maximum individual quantity that can be produced without interruption.

© 2026 Boyum IT Solutions A/S

Field	Meaning



View per

With "View per" you can define, for which count you want to see the price.

Example 1:

You must create a quotation for 1, 10, 50 and 100 and need the price per 1.

1. Define Lot size 1,10, 50 and 100
2. Define View per to 1

Now you can display the cost per 1 for different quantities.

Example 2:

You have a max. lot size for 100 Pcs and must create a quotation for 1000 Pcs and you need the total price for 1000

1. Define Lot size 100
2. Define View per to 1000

Now you can the the total costs for 1000

In this case the system multiplicity the setup times, fix times and fix surcharges with 10, because you must produce this product 10 times to deliver 1000 Pcs.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	Switching between lot sizes and view Change Lot size - in calculation view on text "Lotsize" (1) - in tab "view" - Lotsize (2) Change View In tab "view" click on - (3) "View per Lot size": display always total costs by lot size - (4) "View per x": you can insert the count of Pcs, for which you see the price, example "1" means: Display the price per Pcs.  If the subassembly has a lot size, too, this will be considered under following conditions:
Zoom IN / OUT	Zoom into / out of the view by magnifying or diminishing the screen content.

Functions

Field/Function	Meaning
Open	Button to edit the currently selected item (corresponds to double-click on an item or push button "open entry") in the structure. Special feature: When editing the first entry, the window for calculation details opens. This option is disabled if the calculation was called from item master.

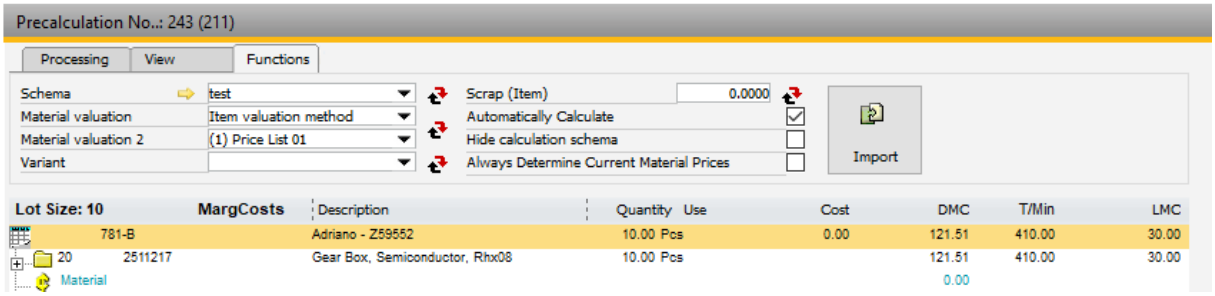
© 2026 Boyum IT Solutions A/S

Field/Function	Meaning
Update	Save changes made in the precalculation structure.
Insert Item	Opens a item selection window. The items selected (and possibly their substructure) are inserted at the current position.
New assembly	Insert a new assembly, which does not yet exist in the item master.
New material	Insert a new purchase part, which does not yet exist in the item master.
Operation	Insert new operation for the material.
Tool	Add new tool to the selected operation.
Parallel resource	Add a parallel resource to the selected operation.
Alternative resource	Add an alternative resource to the selected operation.
Cut	Cut the selected position and its substructure. It will remain as long as it is not inserted at a new location.
Duplicate	Copy the selected position and its substructure.
Insert	Insert the previously cut or copied position.
Remove	Delete row, structure or calculation **Cursor on first row** If the cursor is on the first row, the complete calculation is deleted. Deletion is prevented if: - there is a reference (via reference number) to a sales order or to a quotation - calculation is linked to a work order position - the variable "`e_kalkdel`" was set to "N" - `windowevent userdel` returns "return failure" or sets the variable "value" to -1 Before deletion there is a double security query also in case of master/slave relation. Alternative, parallel resources and tools are removed along with removing an operation.

© 2026 Boyum IT Solutions A/S

Field/Function	Meaning
	Cursor on a different row: Current row or its substructure is deleted.
Remove complete calculation	Delete the entire calculation structure.
Calculate	Recalculate the entire calculation.
Calculation Object	Opens the Calculation objects list of the actual Calculation Schema. Click **Choose** after selecting an object to add it to the precalculation structure. *Window pk_typen_search.psr*
Expand/Minimize all	Expand/minimize the complete Precalculation structure
Search	Open the Search query window

5.2.1.1.3 Functions tab



Field descriptions

Field	Meaning
Schema	Change or update the calculation schema. Double-click the yellow arrow to edit the calculation schema.
Material valuation	Change or update valuation. Use the "replacement" icon . to read in prices new. All further settings are considered as Material valuation 2. ***See*** Precalculation – Material – Purchase price **Note**: Beas only supports price list with numbers 1–99. Price lists with internal id > 99 are not supported.

© 2026 Boyum IT Solutions A/S

Field	Meaning
Material valuation 2	Second valuation method in case the first one does not return a price. If there is still no price determined, the row is marked red and a warning message is issued. ***See*** Configuration wizard – Precalculation *beas9.0-000-003-010*
Variant	Change variant. If the Configuration Wizard – Master Data – Item – Variant **per item** is disabled and below this setting under "Variant" a calculation schema or alternative pricing is stored, then changing the variant in the calculation, the calculation schema and valuation may also be changed.
Scrap (Item)	There you can change the scrap for all items.
Automatically calculate	If this option is disabled, no automatic calculation will be performed when something is changed in the calculation. In this case, the re-calculation can be started manually. (**Tab Edit > button Calculate**)
Hide calculation schema	If this check box is selected, the calculation schema is hidden.
Always determine current material price	Current determination purchase price. If active, the material price and the price for external service are always determined using the current price list. The setting is applied from calculation schema. Note: The current determination of the prices takes a lot of time. For this reason, the calculation does not start automatically. For this you have to click the button "Calculate" after a change. Precalculations use actual price ***See*** Calculation schema

Boyum Style "Import" button icon:

Button	Function

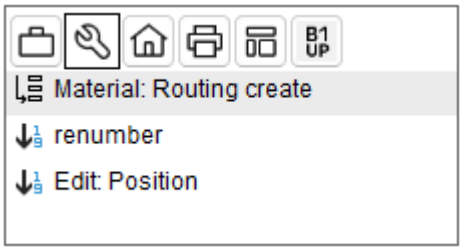
Import	Import BoM from text file
	Imports BoM and routing positions from a simple text file.
	Setup of the import file:
	
	Corresponds a CSV format
	Column separator:Char 9 (Tab)
	Row separator: Char 13+ Char 10 (CrLf)
	
	The columns are independent from the line types. The line type will be defined in the first column. The line type "BoM position" is used if no line type is stored.
	
	BoM:
	`Linetyp = B <char 9> ItemCode <char 9> Quantity`
	Or
	`ItemCode <char 9> Quantity`
	
	Routing position
	`Linetyp = O <char 9> RoutingId <char 9> SetupTime <char 9> WorkingTime`
	
	Click to select a text file in following format: Item (Tab) Quantity (linefeed) Item (Tab) Quantity.
	(Tab) = Ascii-character "9" (linefeed) = Ascii-character 13 and 10.

© 2026 Boyum IT Solutions A/S

Button	Function
	Note: BoM items are inserted to the current position. If the cursor is on an assembly, the BoM is inserted to that assembly. If the cursor is on a BoM item, imported items are inserted before that position. After import, the complete calculation BoM is renumbered and prices are read in again according to the set up pricing. If an assembly is stored in the import file, the assembly is broken down during import. If an item was not created before it is imported nevertheless.

5.2.1.1.4 Right-click menu: 2nd tab

Right-click menu: 2nd tab

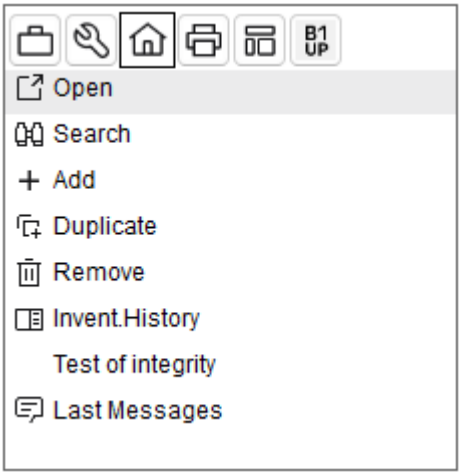


Function	Description
Material: Routing create	Create routing for the current BoM For this a new window opens. For each material position, multiple operations can be defined. The existing routings are removed and the new ones are inserted after the selection.
Renumber	Routings and BoM's are renumbered.
Edit position	Activate / deactivate the direct input of position number in structure view Alternatively: Double click on the position number Hereby, you can assign the position number in the structure directly. These are alpha numeric and do not determine the order. The order can be changed via Drag&Drop. Precalculation Position Number

© 2026 Boyum IT Solutions A/S

5.2.1.1.5 Right-click menu: 3rd tab

Right-click menu: 3rd tab



Function	Description
Open	Open the current entry for editing. Select the first line for editing details.
Search	Full text search over the entire calculation.
Add	Insert New Object - depending on the current position. **Note:** In the surcharge area an object can only be inserted if it was enabled by the current calculation schema.If the first row selected, this button has no function.
Duplicate	Copy the selected position and its substructure.
Invent.History	Opens the inventory history for the selected item.
Test of integrity	The opening window displays differences between master data definition and calculation object. **Important:** Validation is only executed when precalculation does not have a defined BoM list or Routing. In this case, the system checks the master data of main item to verify if the master data has a BoM or Routing list definition.

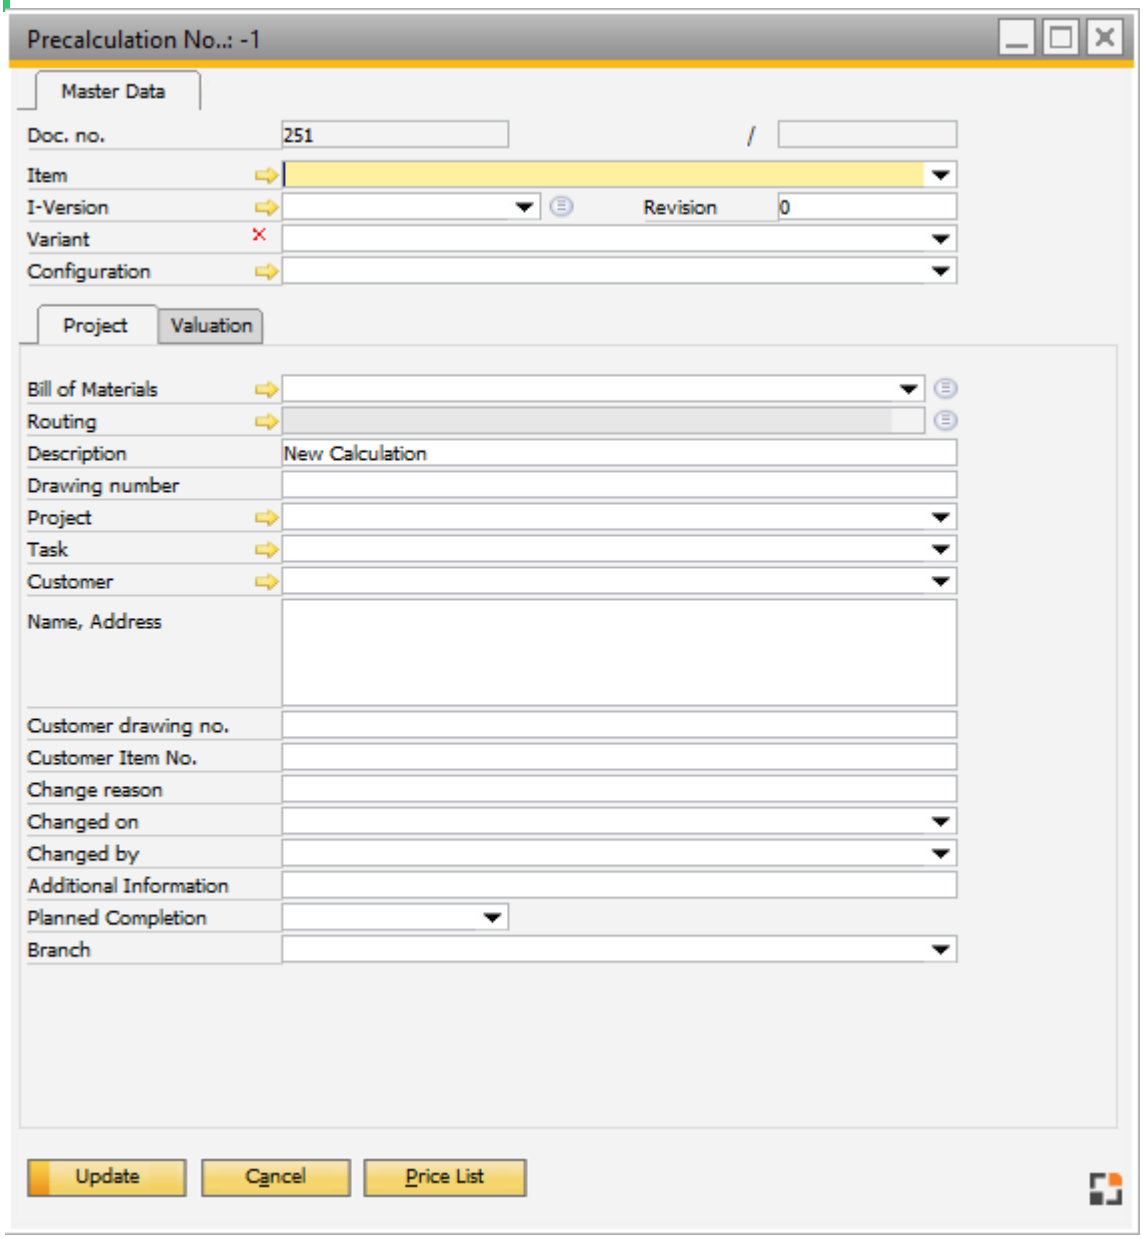
5.2.1.2.1 Project

Insert project related information for the Precalculation.

PATH: Sales – A/R > Precalculation > **Open** precalculation > **Open** calculation.



Project tab

Field	Description
Bill of Materials	The BoM to be used for the breakdown

© 2026 Boyum IT Solutions A/S

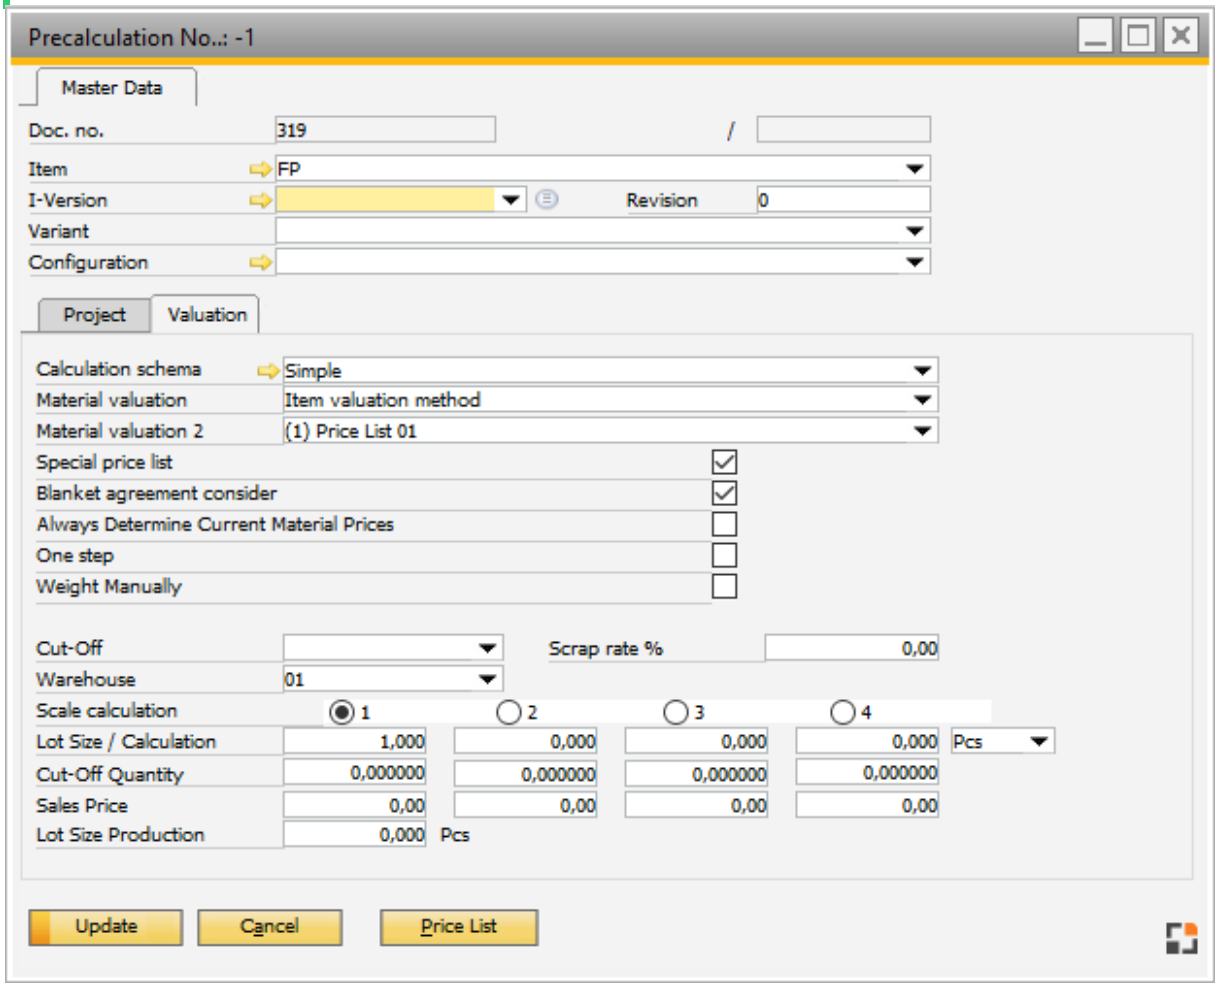
	The BoM to be used for the breakdown of the assembly can be selected in this field. It is stored in the item or item version. This fields is only visible if Item version control was activated. This field can only be edited when a new calculation is being created.
Routing	Routing to be used for breakdown The Routing to be used for breakdown of the assembly can be selected in this field. It is stored in the item or item version. This fields is only visible if Item version control was activated. This field can be edited only when creating a new calculation and and the Routing directly selectable option is enabled.
Description	Item description or description of the item version.
Drawing number	Item drawing number or drawing number of the item version.
Project	Link to a project.
Task	Link to a task.
Revision	Revision number.
Customer	Drop-down field for a customer number.
Name, Address	Display or input field from customer master data.
Description	Item description.
Drawing Number	Drawing number from master data. This field is editable
Customer drawing number	Input field for text.
Customer item	Input field for text.
Change Reason	Input field for text.
Changed on	Date selection drop-down.
Changed by	Drop-down field.
Additional Information	Input field.
Planned completion	Date selection drop-down.
Branch	Assigned branch (only with activated multi-branch solution)

5.2.1.2.2 Valuation

Insert valuation related information for the Precalculation

© 2026 Boyum IT Solutions A/S

PATH: Sales – A/R > Precalculation > **Open** precalculation > **Open** calculation > (lower) Valuation tab.



Window pk_haupt_edit.psr

Field	Description
(Calculation) Schema	The calculation schema to be used. The default schema is the calculation schema defined in the item master data, then, if no schema is set, the Configuration Wizard setting is used. **Configuration Wizard > Calculation > Precalculation** If no schema is specified, the default schema Std is used. The calculation schema specifies how the costs are summarized and which surcharges should be added. For more information ***see*** Costing objects.
Material valuation	⊟ Determine material valuation

© 2026 Boyum IT Solutions A/S

	Determines the material valuation used. The default schema is defined in the Configuration Wizard. ***See*** Configuration wizard – Material pricing. This can only be set up when creating a new calculation. Subsequent change is possible in the main Pre-caluation window > "Functions" tab. Does not affect valuation for external operations. These are set up in the Configuration Wizard. For concept pricing, ***see*** Precalculation material purchase price.
Special price lists	Consider special price lists? For a new calculation the setting from the configuration wizard applies and can be changed for each calculation separately. Note: The setting does not affect valuation for external operations. These are set up in the Configuration Wizard. ***See*** Configuration wizard – Special price lists Precalculation – Material – Purchase price
Consider blanket agreements	Determines whether blanket agreements are taken into consideration.
Always determine current price of material	Determines, whether the pricing of material is always determined according to the current price list. The settings are read from the calculation schema. ***See*** Calculation schema
One Step	Activates One Step calculation mode If activated, a single-level calculation is performed, that is, sub-assemblies are not further broken down. *Off*: Calculates the assembly and all sub-assemblies. The complete calculation is expanded.

© 2026 Boyum IT Solutions A/S

	On The calculation expands only the top level of the item structure and calculates sub-assemblies as materials.  **Attention**: This option is only changeable when a new calculation is created and cannot be modified in existing calculations. *beas 9.3 PL 1*
Weight manually	Enables to enter the weight manually, otherwise it is calculated automatically If activated, the weight can be entered manually as net and gross in the Weight tab. If disabled, the calculation uses the weight from the item master data. Cut-off	Cut-off flag, copied from the item master. A different flag can also be selected. For more information on scrap, ***See*** Scrap. If the scrap is changed, the scrap quantities are automatically recalculated. The scrap value is only considered for the assembly to be calculated. For sub-assemblies, their scrap value is not considered as this is lot size-dependent on the sub-assembly, which is not always specified.

© 2026 Boyum IT Solutions A/S

Scrap %	Scrap factor stored in the item master. If this is changed, the scrap quantities are automatically recalculated.
Warehouse	If Price per warehouse is enabled during initialization, the warehouse indicated here is used as default, as long as no withdrawal warehouse is defined in the BoM. ***See*** Precalculation – Material – Purchase price
Calculation with scales	Up to 4 different lot sizes can be specified. Specify the lot size the result is to be displayed for. Calculations are always performed with all lot sizes in the background.
Lot size / Calculation1...4	Up to 4 lot sizes can be stored that costs, material and time is calculated for The first lot size corresponds to the calculation lot size stored in the item master data. It is possible to define Lot size in Production UoM or Inventory UoM. If you change to "Inventory UoM", the system automatically calculates the lot size based on Production UoM. You can switch between both units every time without losing Lot size Information. ***See*** Concept Lot size
Cut-off quantity 1...4	For every lot size, the scrap quantity dependent on quantity, is calculated automatically using the scrap flag and scrap factor. The scrap quantity does not affect the quantity to be calculated. It only affects the material requirement and resource time, and therefore the costs. Scrap quantities are only considered for in-house production. They are ignored for purchased items.
Sales price 1...4	A sales price can be entered for every lot size. This is required for the breakeven analysis. It is also possible to input the sales prices in the Calculation tab, as the calculated sales price is already displayed here.
Lot Size Production	Define the Lot size Production for main level. ***See*** Concept Lot size

© 2026 Boyum IT Solutions A/S

5.2.1.3 Bill of Materials

It is possible to add new materials to a precalculation or edit existing entries.

PATH: Sales – A/R > Precalculation > "**Open**" precalculation > "Processing" tab
> "New Material" to create a new entry for material, which current not exists

or > "New Assembly" to create a new entry for assembly, which current not exists

or > "Insert Item" to insert Material or Assembly, which currently exists

or > double-click on a material line

or > **Open / Add** new entry button

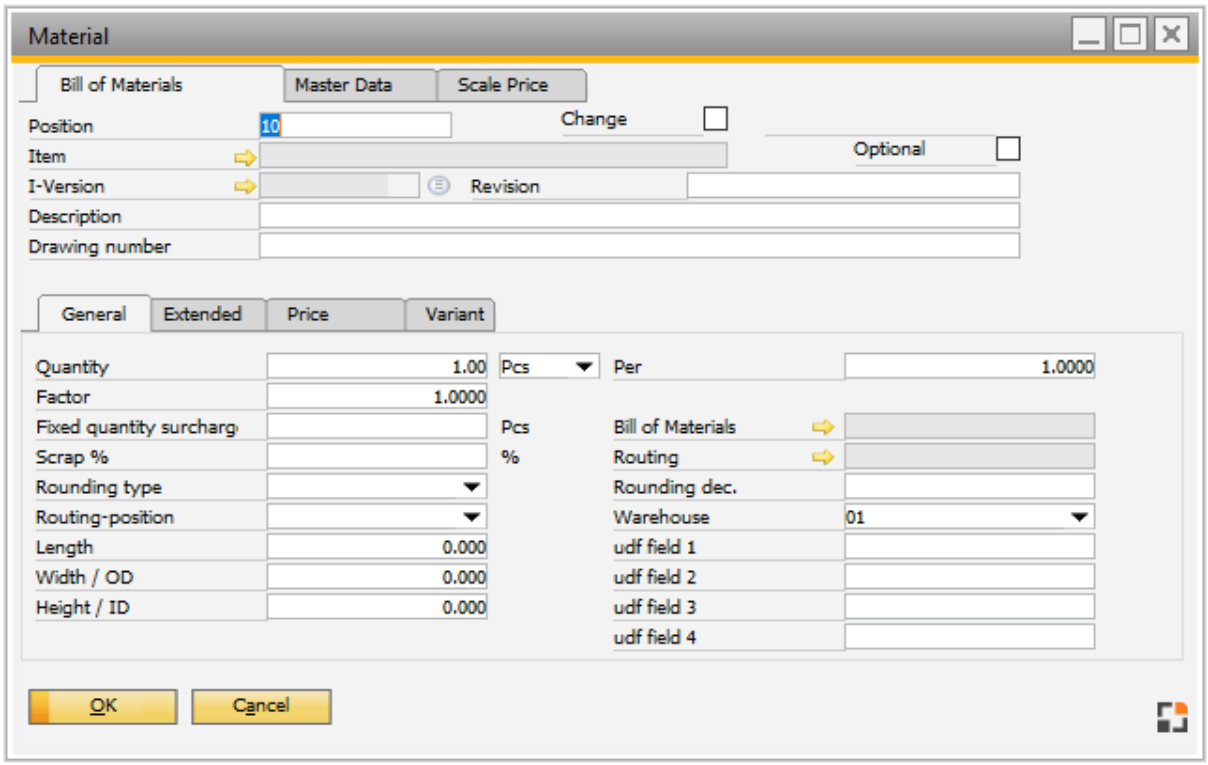
5.2.1.3.1.1 Bill of Materials General



Window pk_material.psr

Field descriptions

Field	Description

Quantity	Requirement in Input units
	Determines the requirement in input UoM per assembly in input unit (***See*** Input UoM , Units of measure)
	
	Calculation of total quantity
	The total quantity is always in inventory UoM
	Calculation is
	
	`total quantity = input UoM`
	`* Conversion factor to production UoM`
	`* Scrap % (formula: see scrap%)`
	`* Conversion factor to inventory UoM`

© 2026 Boyum IT Solutions A/S

Field	Description

```
* (Quantity from work order position * Conversion factor to
inventory UoM)
: Quanity per (see per)
+ fixed quantity surchase
```

IMPORTANT: When an UoM Group is defined for an item, the UoM Conversion is applied based on SAP definitions and NOT the conversions defined in Beas.

- Not planned Material position (Quantity = 0)

  You can define Material position with Quantity = 0

  Example: For Material positions which you need only in processes related to the business work flow or production processes of a company.

  Valuation

  In precalculation / post calculation you can define if Beas should valuate this Plan/Real cost. ***See*** Configuration Wizard Value negative quantity.

- By-products, coproducts, disassembly (negative quantity)

  Sometimes the user needs to indicate that several products are a result of a work order. These products can be:

  - Co-product: Usable product, automatically generated during the production of the main product.
  - By-product: A product that occurs incidentally or undesirably during the manufacturing of the main product.
  - Dismantling: Disassembling of assemblies and returning components to the inventory.

  In these cases, the BoM quantity is entered as a negative entry.

  Negative BoM quantity behavior

Procedure or module	Negative Bom quantity is treated as
Order recommendations	Planned receipts.
Backflushing	Posted automatically or manually.
Work order structure	Displayed in the same color as assemblies but with another icon. Displayed positive (as receipt).

© 2026 Boyum IT Solutions A/S

Field	Description

Procedure or module	Negative Bom quantity is treated as
Posting	Manually, backflushed or posted in via collective receipt. ***See*** Collective receipt.
Merging work orders	Individual receipts are inserted as negative BoM items and posted correctly to the WIA account.
Sales order	Negative items can be reserved for sales orders.
Pre-calculation	Valued according to Configuration wizard > Precalculation > Value negative quantity.
Post-calculation	Valuation based on post-calculation is not possible.

Order related sub assemblies

A Bill of materials position can be a sub-assembly with own Bill of materials list and Routing position.

How to manage this in the areas:

Procedure or module	Result
Pre-calculation	Bill of materials defined as receipt (negative costs) Valued according to Configuration wizard > Precalculation > Value negative quantity. Routing positions cannot produce negative costs. These are always zero.
Post-calculation	**Planned cost:** Bill of Materials: negative costs Routing position: zero **Real costs:** Bill of Materials: Sum of all transactions Routing position: Sum of all time receipts. It can only be positive value.

Configuration example for disassembling:

For disassembling, there is no main product. Use a service item (not storage-

© 2026 Boyum IT Solutions A/S

Field	Description

related) and define the resulting products in the BoM. Expected quantities are entered as negative.

```
Service item
|_ Product 1
|_ Product 2
```

Configuration example for a by-product:

For by-products indicate a main product on top level. This way you can work with off-cut and reuse waste material.

```
Main item
|_ Material
|_ By-product
```

Information on field names

Area Master Data

Quantity input UoM	BEAS_STL.INPUT_QTY If the stored value is NULL, MENGE_VERBRAUCH will be used. In th entry window, INPUT_QTY is entered, using INPUT_FACTOR the column MENGE_VERBRAUCH is calculated.
Input UoM	BEAS_STL.INPUT_UNIT Input UoM
Factor	BEAS_STL.INPUT_FACTOR Conversion factor from input unit to production UoM
Quantity Production UoM	BEAS_STL.MENGE_VERBRAUCH Requirment in production UoM. Reference quantity for all following calculations
Production UoM	OITM.U_me_verbr Production UoM from item master
Quantity warehouse	BEAS_STL.MENGE_LAGER Requirement in Inventory UoM – Information only
Inventory UoM	OITM.InvNtryUom

© 2026 Boyum IT Solutions A/S

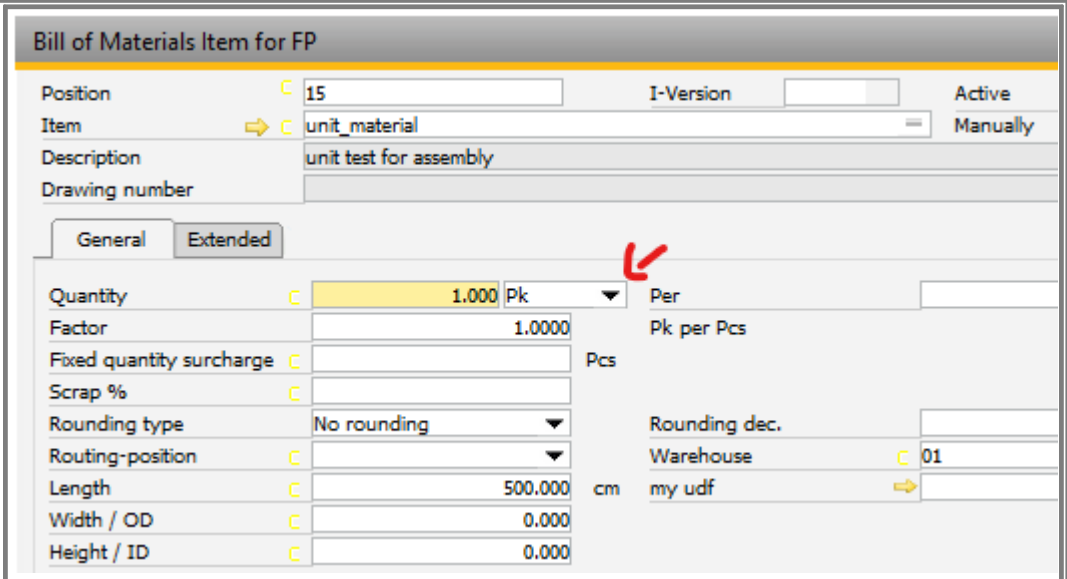
Field	Description
	<table><tr><td></td><td>Inventory UoM as per item master</td></tr></table> *INPUT_QTY, QUANTITY_USE* Note: If an issue or receipt document is created for this position or the position has order-related sub-assemblies, it is not possible to change the quantity. *INPUT_QTY, QUANTITY_USE*

Quantity per ..	Defines in which unit the quantity specification takes.
	
	The quantity specification relates to the assembly quantity x the factor specified here.
	At quantity 2 and "Quantity per 10 pieces", 2 pieces are needed per 10 assemblies. The default for "Quantity per" can be stored in the options.
	
	Requirement (quantity per) means: how much material is needed per assembly (quantity given in "quantity per")
	Assembly quantity "1" relates to the consumption unit of the assembly
	BoM quantity relates to the consumption unit of the BoM item
	
	Quantity per = 0
	`Entered quantity = Total quantity`
	Note: It is recommended to use "fixed quantity surcharge" instead of 0.
	
	Quantity per = 1
	`Entered quantity * Assemblies to be produced in Production UoM`
	
	Quantity per > 1
	`Entered quantity * Assemblies to be produced in Production UoM`
	`: Quantity per`
	MENGE_JE

Unit	Determines the unit of the quantity to be entered This is the field right of Quantity without title. Here you can choose the Unit of Measurement, in which you want to define the needed Quantity (***See*** field Quantity) Standard is Production UoM ***See***: Units of measure

© 2026 Boyum IT Solutions A/S

Field	Description



Inventory / Bill of Materials

It is possible to change this field every time and to every UoM which is defined in the Unit of measurement.

UoM Group is defined in defined item

If a Unit of Measurement Group is defined in the Master Data of this Material, you can choose only an UoM defined in the UoM Group. It is not possible to change the Factor in this window.

Related to the conversion formula and current values of this BoM Position, the system calculates the Quantity in Production UoM and then the Inventory UoM.

UoM Group is not defined in the item

If the item does not have a UoM Group, you can choose every UoM.

You can define a factor between this input unit and production unit only if the defined UoM is not the Production UoM of this item.

Note: Beas ignores length/width/height change as these are part of the Conversion factor - formula.

If you change the UoM factor in the item master data, or if you change the formula in the UoM, it does not affect the existing Bill of materials positions. The system takes the conversion factor defined in this window.

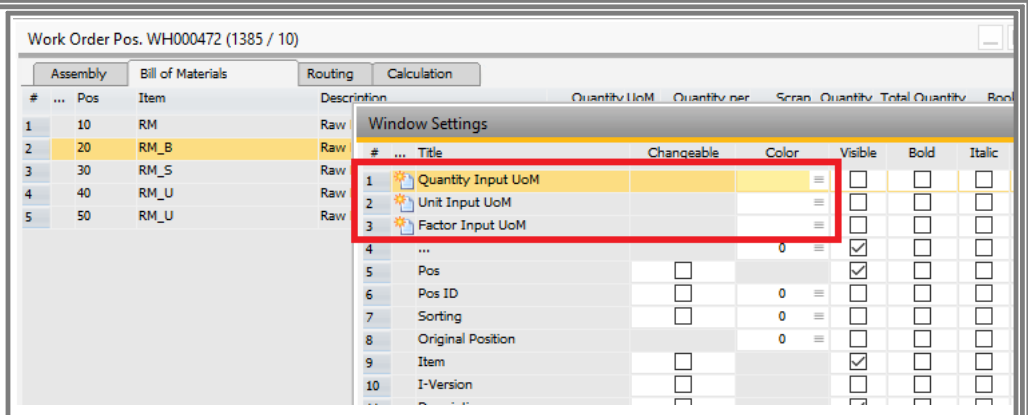
If you create a work order and the UoM Group is not defined, the system ignores

© 2026 Boyum IT Solutions A/S

Field	Description
	the UoM and UoM Factor definition, and always works with production UoM. Related to the conversion factor, the system calculates the Quantity in Production UoM and then the Inventory UoM. Precalculation It is possible to change this field every time and to every UoM, which is defined in the Unit of measurement. if a Unit of Measurement Group is defined in the Master Data from this Material, you can choose only an UoM defined in the UoM Group. Note: It is important that a UoM Conversion factor is defined in UoM Conversion. Related to the conversion formula and current values of this BoM Position, the system calculates the Quantity in Production UoM and then the Inventory UoM. Work order In **Work order > Bill of Materials** the input unit is only changeable: - if no transaction exists - a Unit of Measurement Group is defined in the Master Data from this Material You can choose only UoM if - Defined in the Unit of Measurement Group - UoM Conversion exists for this UoM and Inventory UoM If you change the Input unit, the Quantity will be calculated based on quantity in production UoM and on the Conversion formula defined in the UoM Conversion. If you change the Quantity in input UoM, the system calculates the quantity in production UoM and in inventory UoM based on UoM Conversion. If you change the quantity with BeasScript or import hub, the system overwrites the Input Unit with Production UoM. If you refresh the work order, the system overwrites the Input Unit with Production UoM. In Work order Bill of Materials you can activate the Input Unit via window settings. But this fields is not changeable.

© 2026 Boyum IT Solutions A/S

Field	Description



If you change the quantity in Production UoM, the system overwrites the Input unit with Production UoM.

UoM Conversion

If Unit of Measurement Group is defined in the Master Data of this Material, the system tries to use the conversion factor defined in the UoM Group.

If it is not stored there, the system searches the UoM Conversion table. If it does not exist, the system searches the opposite in the same table and creates the formula

"1 : [the defined formula]

If the opposite does not exist, the system returns an error and continues with Conversion factor 1.

Note on UoM Groups

In Bill of Materials you can define the Quantity in Input Unit. This will be converted in Production UoM and this in Inventory UoM.

Problem: If the Production UoM is not the same as the Inventory UoM and the Input UoM is not Production UoM, the system cannot find an entry in the UoM Group. In this case, the system searches for the conversion in the UoM Conversion table to convert the quantity from Input Unit to production Unit.

Unit factor and UoM Tool tip

In the work order position, the system displays the unit in green which means that the unit factor is inside (***see*** image below). Moving the mouse over this field, the system displays a tool tip with information on the factor and the UoM (***see*** image below).

The system can calculate with 20 decimals rounded up to 6 decimals for display.

© 2026 Boyum IT Solutions A/S

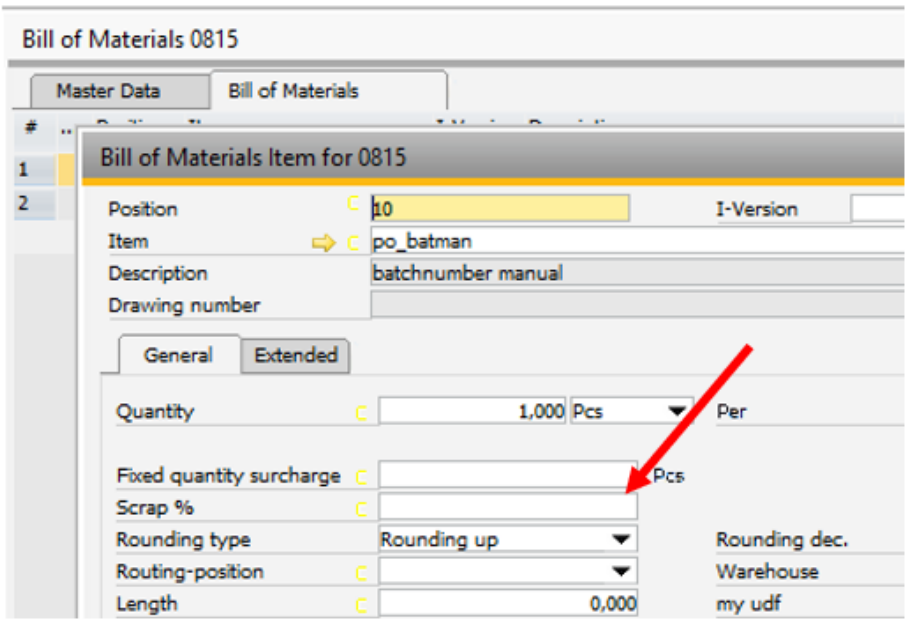
Field	Description
	 When you change the UoM, the system calculates the Quantity and the factor automatically (***see*** image below). The new Quantity is based on the current production unit. NOTE: This is only possible if a Conversion factor was defined previously). ***Example:*** Conversion: 1 TPcs =1000 Pcs Old Qty = 2000 Pcs Change UoM to TPcs. The System display Quantity = 2 TPcs If the Quantity in TPcs is changed, the system calculate the Production UoM and from this the Inventory UoM If length/width/height, density or item code self is changed, the base quantity is always the quantity in Production UoM and the system always calculates the quantity in the Production UoM and Inventory UoM.
Factor	Conversion factor between entry unit and consumption unit Only in Master Data and Precalculation: Displayed only if consumption unit and entry unit are different. Enter the conversion factor between the quantity indicated here and the consumption unit. Quantity is divided by the indicated factor.

© 2026 Boyum IT Solutions A/S

Field	Description
	12 decimal places are supported. ***Example*** Quantity 10, Factor 5 Results in a Requirement of 2 in consumption units of the material position per consumption unit if the assembly. Note: The "Exceeding planned quantity allowed" production configuration setting affects the Conversion factor: The Minimum/Maximum percentage is calculated based on total quantity. ***see*** Configuration setting. *BEAS_STL.INPUT_FACTOR*
Fixed Quantity surcharge	Defines a fixed and unique quantity surcharge Share of the surcharge – used for the Precalculation and production. The scrap factor at assemblies relates not the assembly, but only to its material requirement. The scrap is calculated per lot size: ***Example:*** Assembly lot size 500, required 1000, scrap 1 in assembly equals to 1 per 500 = 2 There is a total requirement of 1002 if a material 1x per assembly is required This value will be calculated in production and cannot be changed.
Scrap %	Determines Percentage of scrap Indicate material scrap which is added to the calculated requirement.

© 2026 Boyum IT Solutions A/S

Field	Description



Note:

This field is visible in Master Data and Precalculation.

In Work orders you can see the calculated scrap.

Set the formula to be used in the Configuration Wizard.

Available formula definitions:

`Scrap = Quantity * ( Scrap % )` (= default setting)

`Scrap = Quantity / ( 1 - Scrap%/100 )`

Example:

Definition with `Scrap = Quantity * ( Scrap % )`

Requirement: 10 Pcs

Scrap: 10%

Total requirement: 11 Pcs

Definition with `Scrap = Quantity / ( 1 - Scrap% / 100 )`

Requirement: 10 Pcs

Scrap 10%

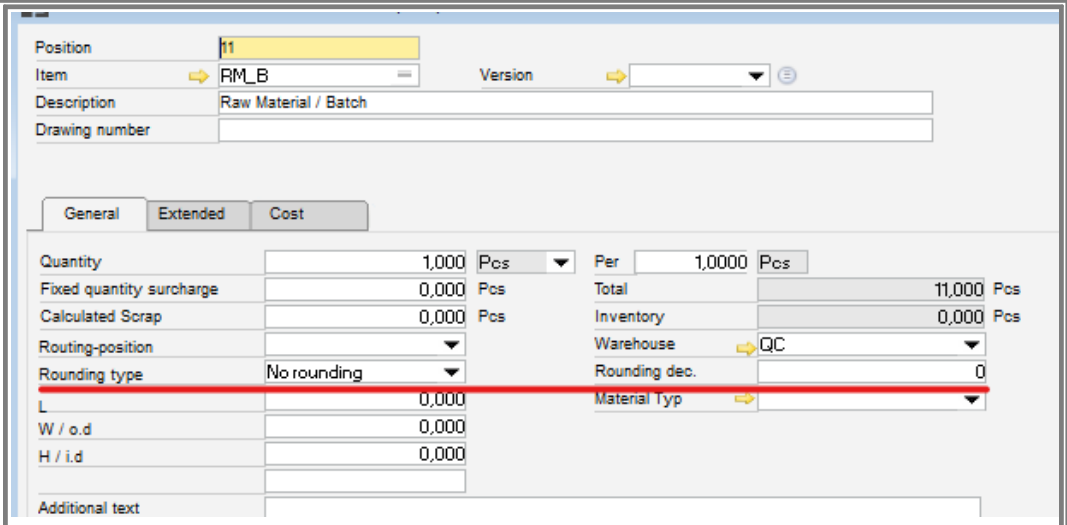
Total requirement:

© 2026 Boyum IT Solutions A/S

Field	Description
Scrap %	Calculated from scrap values This value is calculated when the work order is created. It cannot be changed; it is a one-time surcharge. (Assembly quantity * BoM quantity) + "calculated scrap" If the assembly quantity is changed, the "calculated scrap" does not change. To re-calculate, a Work order update is required. ***See*** - scrap factors in routing, ***see*** Routing - material scrap - scrap of superordinate assembly or phantom assembly, ***see*** Scrap - offcut factor of superordinate assembly or phantom assembly, ***see*** Offcut factor For purchase parts additionally - scrap as per master data, ***see*** Scrap - off-cut factor as per item master, ***see*** Offcut factor Note: If in BoM position "Do not post scrap" is activated, scrap will not be determined. ***See***: Master data – edit BoM Offcut Option consider offcut
Rounding type Rounding dec.	Determines the rounding rule The rounding rule can be defined here:

© 2026 Boyum IT Solutions A/S

Field	Description



Available settings:

No rounding	There is no rounding defined.
Round up	The number is rounded up. The exact decimal place can be defined in "Rounding Dec." ***Example:*** You have defined 1 piece per 18: the factor is then = 0.055556 If you multiply 0.555556 x (17+1) = 1.000008 After this you apply a round up --> The final result is 2.
Round off	
Rounding at 5	From 0,5 (1 Decimal place) or 0,5 (2 Decimal places) will be rounded up. Lower will be rounded off ***Examples:***

Requirement	Decimal place	Rounded
1,45	2	1,45
1,45	1	1,50

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>
<table>
<tr><th>Requirement</th><th>Decimal place</th><th>Rounded</th></tr>
<tr><td>1,45</td><td>0</td><td>1,00
Note: Only the last decimal place is considered. Thus, there is no rounding up of the second decimal place.</td></tr>
<tr><td>1,49</td><td>0</td><td>1</td></tr>
<tr><td>-1,5</td><td>0</td><td>-2</td></tr>
<tr><td>-1,45</td><td>0</td><td>-1</td></tr>
<tr><td>-1,45</td><td>1</td><td>-1,5</td></tr>
</table>
</td></tr>
<tr><td>multiple of</td><td>Always the multiple will be formed, which will be indicated in "Rounding Dec."
Example:
Multiple order of 4
4, 8, 12, 16 is counted
At quantity 3 is rounded to 4
At quantity 4 the quantity 4 remains unchanged
At quantity 5 is rounded to 8

Example:
Multiple order of 10
10,20,30,40 is counted
At quantity 1 is rounded to 10
At quantity 10 the quantity 10 remains unchanged
At quantity 11 is rounded to 20</td></tr>
</table>

Example 1:
A palette per 100 pieces is required
Quantity of requirement corresponds 0.01 palette per piece. But at least one palette has always to be required and from 101 pieces even 2 palettes. The BOM position will be adjusted as following for this:
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
	Quantity: 0,01 Rounding type: multiple of Rounding Dec. 100 ***Example 2:*** A half piece is required. because there is no half piece. It must always be rounded up to 0 decimal place because there is no half piece. Thus a requirement of 0,8 will actually be rounded up to 1 piece. The following setting occurs: Rounding type: round up Rounding Dec: 0 Note: Negative statement of decimal places are not supported. Rounding results are always in Inventory UoM.
Routing-position	Determines the routing position for which the material is required For backflushed material, the material is issued on receipt of this routing position. The MRP run and APS consider the start date of this operation when calculating the material requirement. **Phantom assembly group:** Routing-assignments work with restrictions for nested phantom assemblies: The routing assignment of the above located main assembly group always applies instead of the phantom assembly group assignment within a sub-phantom assembly group. **Master data:** Which routing is to be used can be defined in the BOM. The routing with the same ID will be used if none have been defined. A checking of the assignment is not possible because a routing can be assigned to multiple Bill of materials. The assignment will not be checked even at a change of a routing.

© 2026 Boyum IT Solutions A/S

Field	Description
	Production: Assignment is always done at the routing of the current production position.
Total	Calculated total quantity in Inventory UoM Only in Work order Bill of Material window More information see concept "Total Quantity"
Inventory	Current Inventory in Inventory UoM on Warehouse, which defined in field "Warehouse". Only in Work order Bill of Material window

Warehouse	Default warehouse for planning and backflushing
	If a warehouse is specified, the material is issued from this warehouse by default when backflushing. Warehouse information is mandatory.
	You can choose any warehouse defined for this item, and active on item-warehouse side and active on warehouse side.
	It is allowed to select a warehouse, which is locked for issue transactions.
	
	MRP checks the warehouse defined in the BoM Position.
	Precalculation: It is possible to select locked warehouses.
	
	If the material position is an order-related sub-assembly, the system creates a new work order position for this sub-assembly but does not take the warehouse from the Bill of materials position.
	For the new work order position, the system uses the standard rules for warehouse definition. ***See*** warehouse rules.
	Example:
	Assembly A, default Warehouse 01
	BoM Order-related Assembly B, default Warehouse = 01, Bill of Materials Warehouse 07
	
	If you create a work order:
	`Work order Position 10: Assembly A = Warehouse 01`
	`Bill of Material Position 10: Warehouse 07`
	`Work order Position 20: Warehouse 01`
	
	Note: At "Production backflushing" you can specify an issue warehouse which has a higher priority.
	See Production backflushing

© 2026 Boyum IT Solutions A/S

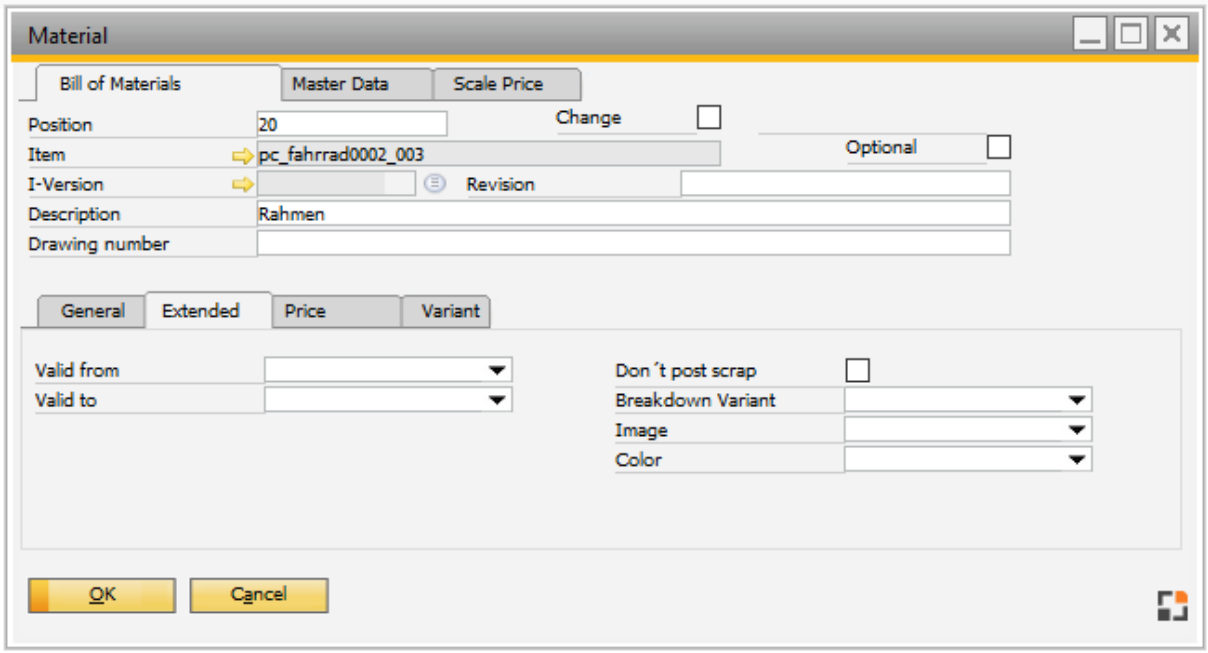
Field	Description
Bin Location	Bin location number - available for bin-managed warehouses. Only valid "Bin Locations" for the selected warehouse are allowed. After changing the warehouse, the bin location content is set to empty in this field. **Work Order BoM and Precalculation:** A work order created from an Item, or Precalculation copies this field automatically for the BoM. If there is not enough stock to pre-assign quantities from this, pre-defined bin location, Beas continues to pre-assign them from further bin locations based on the sorting rules.
Length Width / OD Height / ID	Length, width, height or outer/inner diameter Determines the measurements of the materials. The requirement of the consumption unit can be indicated. The required quantity in warehouse unit can be defined in Quantity unit - Conversion The measurement can be indicated in the conversion. e.g. Requirement: 100mm (Consumption unit) Conversion to piece: 1 piece = 1000mm A requirement of 0.1 piece is then determined.
Completed	Production: defines the position as "completed" It is set automatically according to the settings if the default quantity has been reached. The completed BOM positions are no longer considered in the material requirement list and MRP.
Info	Any information This field is unnamed in the basic installation. The name of the field can be configured in **Configuration Wizard > Master Data > Bill of Materials > View > Info Field**.
Closed	Close this Bill of Materials position Only available in Work order Bill of Material position Displays if the Position is closed or not if this position not closed, you can close this position

© 2026 Boyum IT Solutions A/S

Field	Description
	If you want to reactivate this Bill of Material position, you must choose "right mouse click" – "Position re-activate"

5.2.1.3.1.2 Bill of Materials Extended

In this tab you can define validity of the material, scrap and variant related information and define display features.



Window pk_material.psr

Field descriptions

Field	Description
Valid from - to	Set validity of the material If no date was entered, it is valid always, otherwise only in the specified period. **Precalculation:** Precalculation date serves as reference. In Precalculation, all BoM positions are displayed but only the valid ones are valued.

© 2026 Boyum IT Solutions A/S

Field	Description

	Production
	
	Depending on **Configuration wizard > Production > Capacity planning > Default calculation method**
	
	Calculation backwards:
	Delivery date serves as reference. It is checked only at work order creation. If the delivery date is changed subsequently, there is no second check as long as the work order is not updated.
	
	Item-Processing time:
	The Delivery date of the respective assembly serves as reference. The item-processing time of the respective assembly will always be used for the calculation of the completion date of a sub-assembly *(beas 9.1 PL: 08)*.
	
	Creation via ue_api_wo
	The parameter "validdate" can be defined additionally, if the work order will be created via the API. *(beas 9.1 PL: 08)*
	`declare=wo=ue_api_wo`
	`wo=set=validate=<mydate>`
	`// .. normal script to create or refresh a work order`
	
	Sales order in Order recommendation
	At breakdown of the assemblies the delivery date of the sales order is used, minus the average delivery time, stored in the Configuration wizard.
	
	Special case: **Configuration wizard > Production > Capacity planning > Default calculation method = Default calculation method**
	The calculated date of requirement of the respective sub-assemblies is used as reference date for sub-assemblies.
	
	Example 1
	A supplier changes the item number from a given date

© 2026 Boyum IT Solutions A/S

Field	Description
	Pos 10: previous item number until date x Pos 20: new item number from date x+1 ***Example 2*** At date x additional material is required. If larger changes are needed, we recommend to use item version control.
Don't post scrap	☐ If enabled, scrap quantity is not taken into account If this option is enabled, the scrap or offcut indicated for this position will not be taken into account. ***Example of use:*** Production position Quantity100, Scrap/Offcut 10 100 pieces in the package In BoM next to components the packaging size can be indicated. Scrap shall not refer to packaging but only to the components. In this case enter: 1 package per 100 pieces, Activate "Do not post scrap" *beas9.1-004-067-000*
Breakdown Variant	☐ Define the short variant for order related sub assembly If you define a short variant (A-Z), the system uses this for complete order-related sub-structure With this flag you can overwrite the Short variant Information from previews level This field is only visible if the Item of this Bill of Materials position is an order-related assembly. ***Example:*** Sales Order A001 with Variant B BoM SubA002 (order related Item) "Breakdown with Variant" = empty

© 2026 Boyum IT Solutions A/S

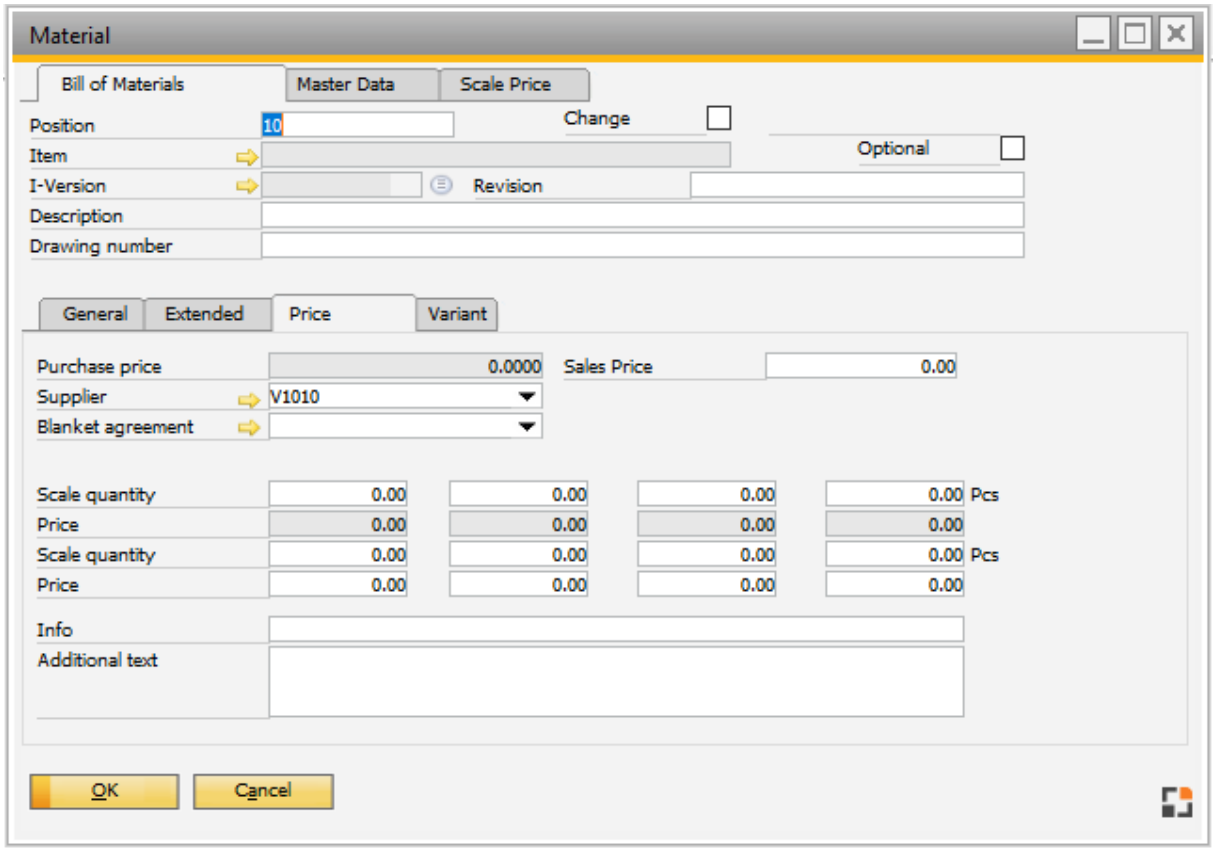
Field	Description
	In this case the system uses Variant B for breakdown "SubA002" Sales Order A001 with Variant B BoM SubA002 (order related Item), "Breakdown with Variant" = C In this case the system uses Variant C for breakdown "SubA002" *beas 9.3 PL 2*
Image, Color	Define a bitmap icon and font color for the material to be displayed in the precalculation structure.

back to Precalculation Header

5.2.1.3.1.3 Bill of Materials Price

In this window the price and additional information related to a Bill of materials position can be defined.

© 2026 Boyum IT Solutions A/S



Window pk_material.psr

Field	Description
Purchase price	Purchase price of material in system currency. Determined at the moment of calculation according to the defined pricing. Prices in other currencies are converted to home currency. If pricing returns 0, a second pricing can be stored. ***See*** Configuration wizard – Material pricing Scale prices If a scale price is stored, it has a higher priority. ***See*** Material scale prices Special price lists If special price lists are taken into account and a supplier was selected, they have a higher priority. ***See*** Configuration wizard – Special price lists Blanket agreements Blanket agreements are considered, if

© 2026 Boyum IT Solutions A/S

Field	Description
	a) Agreement type is "specific" and confirmed, b) Special price lists are considered, c) In Configuration wizard consideration of blanket agreements was enabled . ***See*** Configuration wizard – Calculation – Precalculation. Price per warehouse If "price per warehouse" was defined in the basic initialization, and "item valuation method" was selected for pricing, the following priority rule applies: 1. warehouse as per BOM item. 2. warehouse as in calculation (***see*** header). 3. default warehouse of the item. UoM Prices Note: Beas supports Item Unit Groups in the following way: **Price list: last purchase price** *(Beas 2022.09)* Item without Unit Groups always takes price in Inventory UoM. Item with Unit Groups: In the Item Master data you can define the Purchase Unit, Pricing unit and Inventory unit. You can create a purchase order in many different UoMs and SAP saves the last purchase price for every UoM separately. This means: You can have many different last purchase prices. Beas supports price definition in a different unit of measure than the inventory unit. *(Beas 2025.04)* If a last purchase price exists in the pricing unit of this item, it has higher priority. Beas converts this price automatically to price in Inventory unit. **Other price lists, special price lists** Beas does not support property "Pricing Unit". The system ignores all

© 2026 Boyum IT Solutions A/S

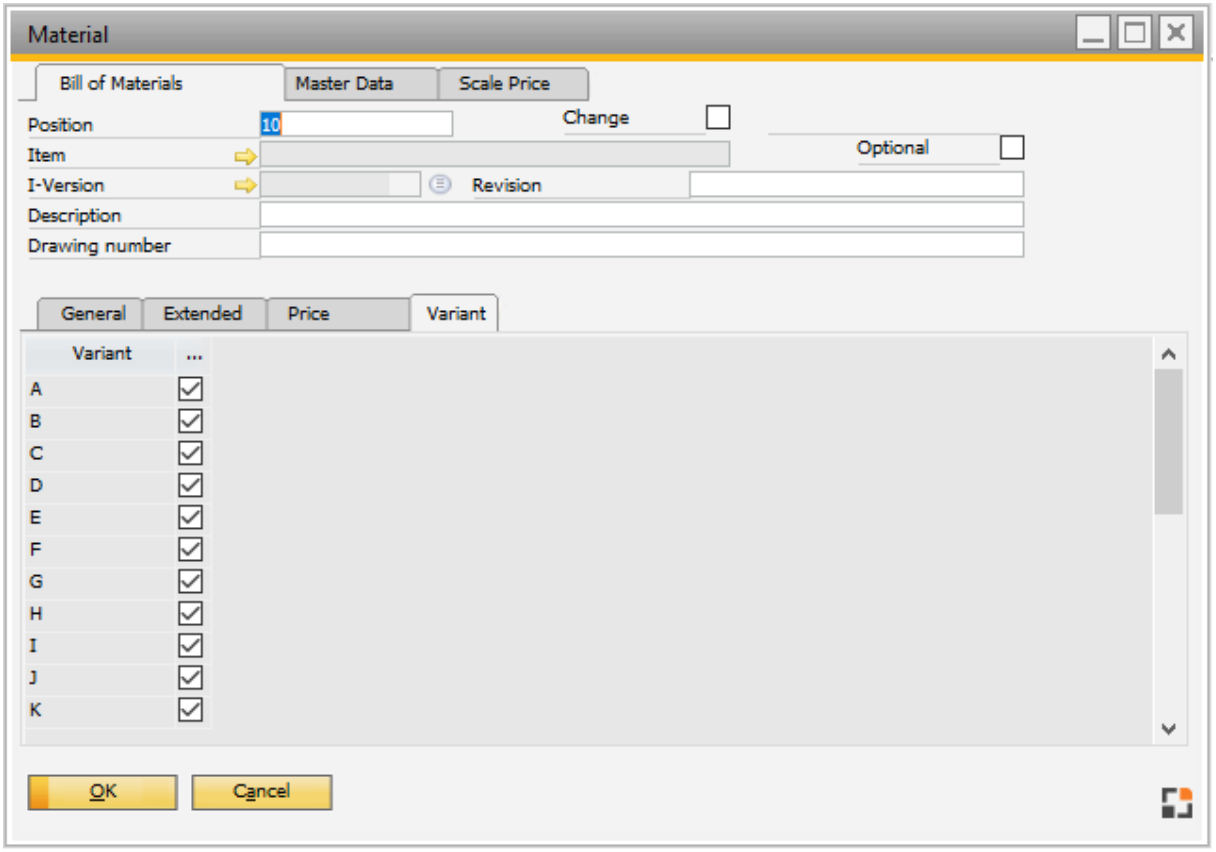
Field	Description
	special price lists if the pricing Unit is not the stock unit. Beas reads a price from a price list or special price list only if Item-Pricing Unit, Item-UoM Code and Price list UoM Code are the same.  Update prices Prices are determined at the moment of calculation and they are not changed anymore. This makes a manual correction possible. You can nevertheless change the pricing subsequently and read in the prices again: ***See*** Precalculation controls – valuation. Negative BoM items Negative BoM items have a different pricing, which can be set up. Configuration wizard – Material pricing negative BoM.
Sales price	
Supplier	Select supplier from the drop-down list.
Blanket agreement	Link to blanket agreement.
Scale quantity	The system also displays the UoM, in which you have to define the Scale quantity. ***See*** image on top. The Unit is always the Inventory UoM of this Material.
Price	After the calculation is completed, customer prices are saved in these price fields.

© 2026 Boyum IT Solutions A/S

Field	Description
	Attention: When Consider Price list setting is active in the Configuration wizard, only the first 8 values of customer definition are saved here. All other prices defined in the customer are ignored. When Always determine current material price setting is active, you need to click Calculate manually to see the updated prices.
Info	Free information field.
Additional text	Free text field.

5.2.1.3.1.4 Bill of Materials Variant

In this tab you can define for which Variant the Bill of Materials position is active.



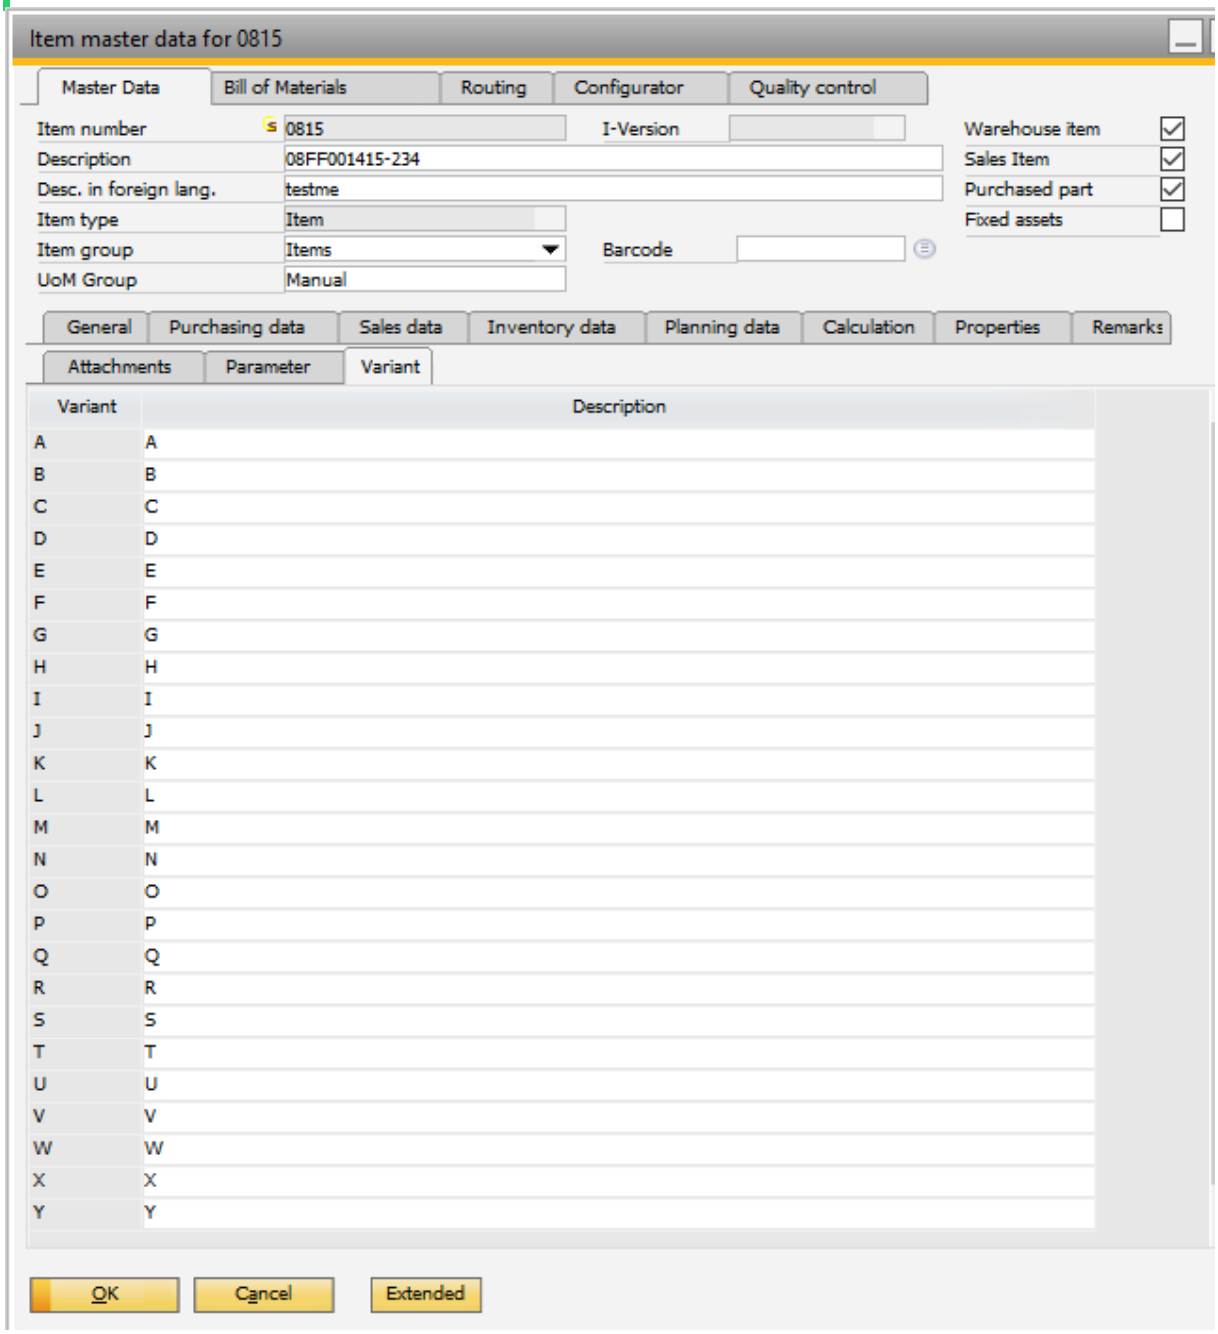
Window pk_material.psr

In this window you can define up to 26 variants. It is accessible from the Item Master for XXX window.

© 2026 Boyum IT Solutions A/S

Example:

PATH: Inventory > Item report > Item Master Data > "Master Data" tab > "Variant" sub-tab.



Window artikel_edit.psr

Tab "Variant"

Field	Description

© 2026 Boyum IT Solutions A/S

Variant	Possible variants (A–Z).
Description	Description of the variant.

Before you can select variants for BoM and Routing, you must enable them in the view: **right-click > Window settings.** Scroll down in the new window and select the variants you want to have displayed. These settings apply globally and not per item, that means even if you only have 5 variants of an item, you must always enable the maximum number of options.

Select then the BoM or Routing tab, to create the different BoMs or Routing positions for each variant. Using check boxes you can assign each BoM item or operation to the variants. All BoM items can be added or removed to any variant.

Tab "BoM" and "Routing"

(only visible when enabled in window settings).

Field	Description
V-A	Variant assignment (BoM for "A").
V-B	Variant assignment (BoM for "B").
.....	
V-Z	Variant assignment (BoM for "Z").

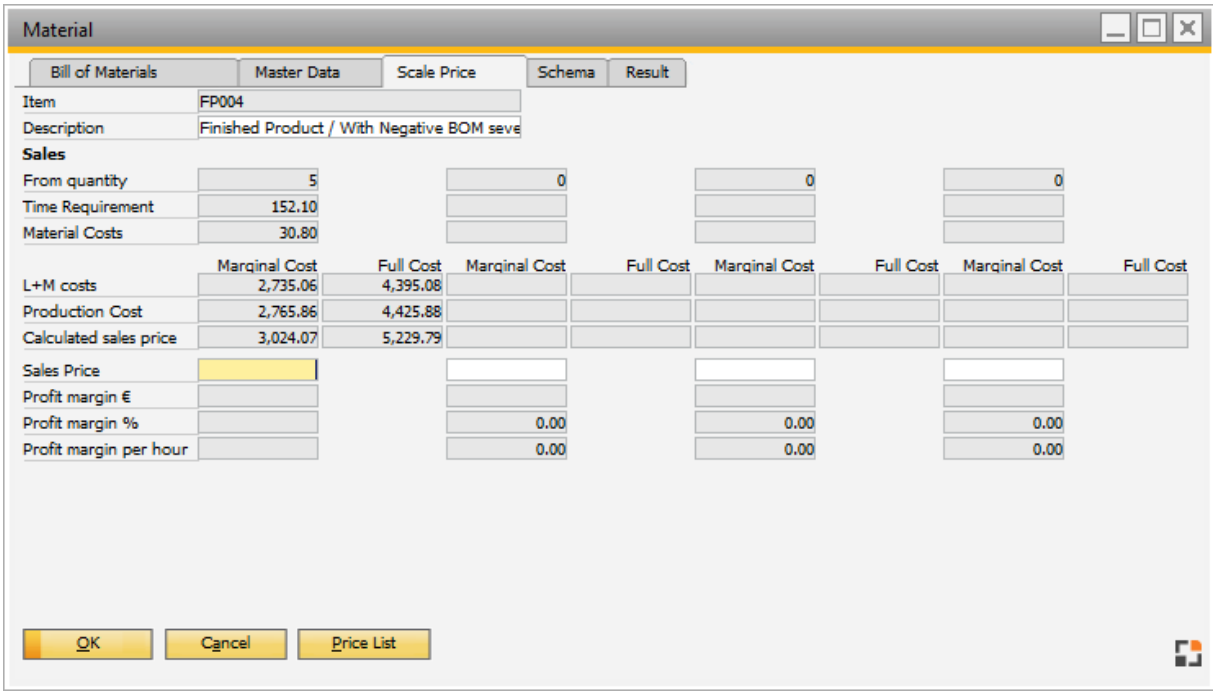
back to Item Master

5.2.1.3.1.5 Material Scale Price

Display of scale prices. The selected item is displayed. Only the item designation can be changed here.

Below the deposited scale prices are displayed.

© 2026 Boyum IT Solutions A/S



pk_material_staffel.psr

Note:

Only visible if

- "Calculation schema per assembly" was activated in the currently used Calculation schema.
- The current Bill of Materials position is an assembly.

The system displays the result in the same unit as defined in Lot size.

Display calculated Costs based on the current schema for all defined lot sizes.

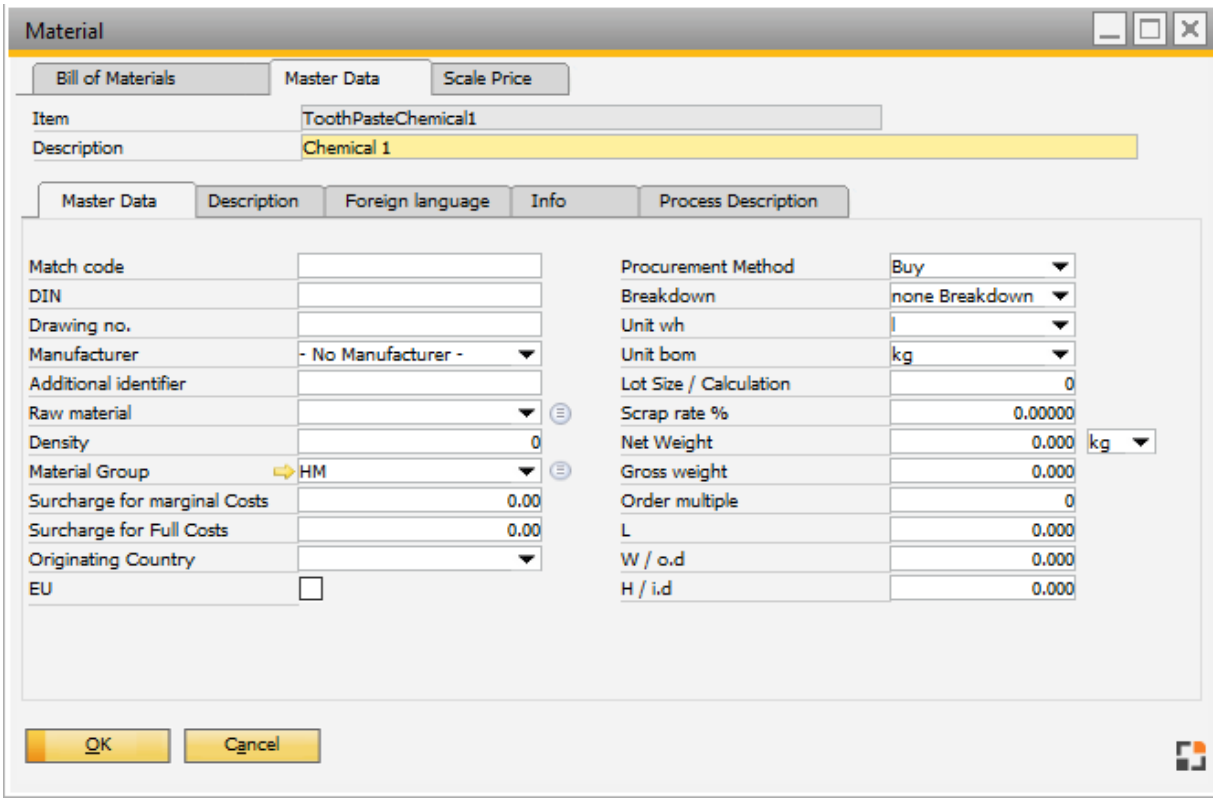
It is also possible to insert the sales price for this assembly lot size.

back to Precalculation Material

© 2026 Boyum IT Solutions A/S

5.2.1.3.2 Material Master Data

A copy of operation master data is displayed. Any changes made here only affect the calculation.



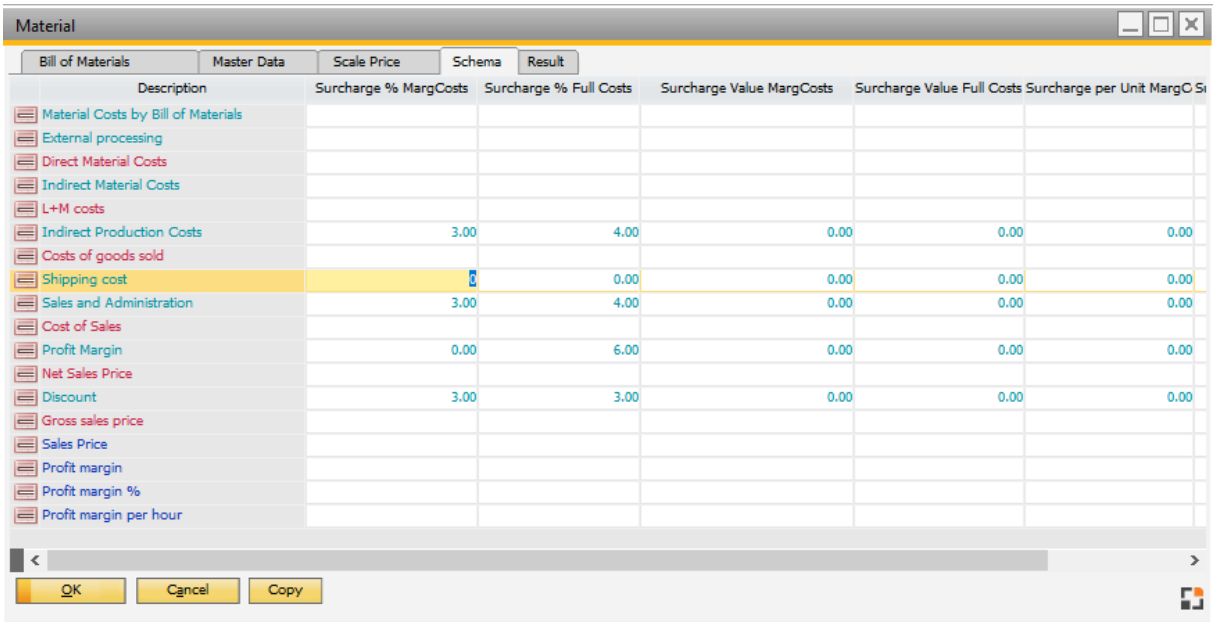
pk_material_s2.psr

back to Precalculation Material

5.2.1.3.3 Material Schema

In this window you can change Surcharge for every Schema object related to the assembly from the chosen Bill of Materials position.

© 2026 Boyum IT Solutions A/S



pk_material_schema.psr

Note:

Only visible if

- "Calculation schema per assembly" was activated in the currently used Calculation schema.
- The current Bill of Materials position is an assembly.

© 2026 Boyum IT Solutions A/S

5.2.1.3.4 Material Result

pk_material_schema_result.psr

Note:

Only visible if

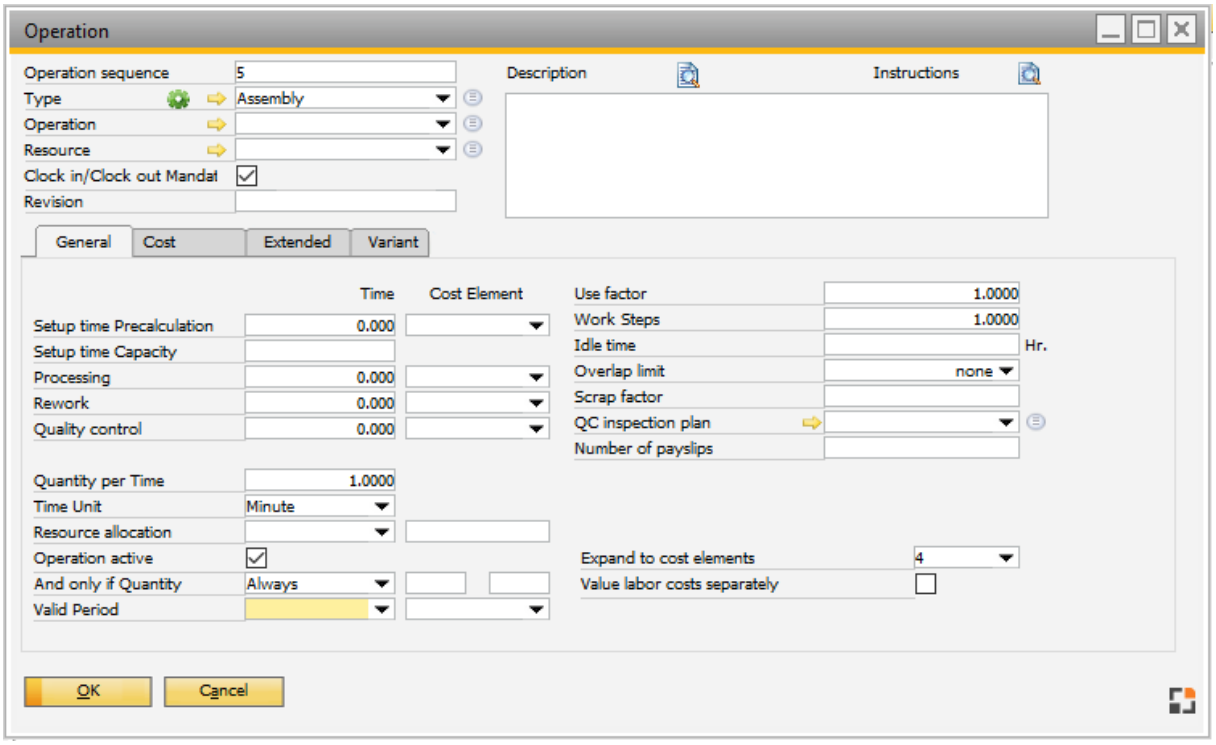
- "Calculation schema per assembly" was activated in the currently used Calculation schema.
- The current Bill of Materials position is an assembly.

5.2.1.4 Operation

In this window you can edit an operation position in Precalculation.

PATH: Sales A/R > Precalculation > **Open** Precalculation > "**Create Operation**" function

© 2026 Boyum IT Solutions A/S



Window pk_arbplanos.psr

Header

Field	Description
Operation sequence	Position number The position number is counted in increments of 10. ***See*** Configuration wizard to set up. The field is alphanumeric with 20 digits. **Note** The order is not related to a position number, but defined in the list of BOMs by Drag&Drop. It reflects the order of entry by default. Position number cannot be unambiguous. The field "internal position number" (BEAS_APL.POS_ID) shows the internal, continuous and unique ID. **Operation catalog:** In the operation catalog there are no operation numbers, only a catalog ID.

© 2026 Boyum IT Solutions A/S

	Precalculation, routing and work order: In these functions you can edit the alphanumeric and the numeric position number. *BEAS_APL / BEAS_FTAPL.POS_TEXT* Variants with script Left of the position field you can open the script window by clicking the formula icon ("display formula fields") Call-up is also possible via right-click – script. **The following variables are available:** **Variable** / **Description** `e_belnr_id, e_belpos_id` – Work order, Work order position `e_aktiv` – Routing position active J/N `e_routingid` – Routing Id `e_itemcode` – Itemcode `e_quantity` – Quantity in regional format `e_source` – "routing" `e_info1` – Info for current routing position ***See*** Variant generator – Script. Note: This function is only available if the Variant generator was activated in the Configuration wizard.
Type	Select a type from the drop-down. The / icon opens the Operation types editing window.
Operation	Select an operation from the drop-down.The / icon opens the operation catalog definition. This can be used to adopt the information stored in the master data/operation, thus accelerating input.
Resource	The work station, personnel group, machine or machinery group or also external operation supplier or person on or through which the operation

© 2026 Boyum IT Solutions A/S

	is conducted. The / icon opens the Resources editing window. In routing and work order routing, it is mandatory to specify a resource. In operation catalog the resource is optional. ***See*** Resources.
Active	Only in Work order routing position > Operation sequence XXX editing window.
Clock in/Clock out Mandatory?	Defines whether clocking (factory data recording) is mandatory. Check box. This is important when calculating the last operation. Definition: The last operation is the position in which "Clocking mandatory" is active for the last time. If, for instance, the finished assembly is entered at the last operation (depending on the setting), it can be determined this way (necessary if the last operation is "Take down", for instance, but it is not clocked). If the last operation is NOT reportable, receipt is performed here for the last reportable routing, and not for the "Receipt for last routing" option. ***Example***: 10 not reportable 20 reportable 30 reportable 40 not reportable First operation is position 20 and position 30 is the last position. To the other position a report is possible, but not mandatory. Therefore these are not taken into account at the checking of rules.
Revision	Add text - only for information.
Description	Description of the activity. It is possible to add several lines, (max. 16 000 characters). An external editor is opened by double-clicking the field or single-clicking the / icon next to "Description".

© 2026 Boyum IT Solutions A/S

You can insert formulas which create your description while creating a work order:

Customizing the routing description, Item name or additional BoM text

In addition, in the operation description, additional information on the BoM, or item, information from a formula or variant can also be stored in the description of a routing.

Placeholders can be inserted into routing descriptions for this purpose. These placeholders begin with < and end with >. All variables as well as separate formulas, tables, types of origin, etc. can be inserted.

The origin itself is defined in the placeholder using **origin type** and "**:**".

The type "Script" is used if the type of origin is not specified.

TYPE	Description
f:	Origin is a formula, e.g. <f:MyFormula>
t:	Origin is a table, e.g.. <t:tab4711>
i:	From assembly – item master: e.g. <i:itemname> = Item name
v:	Variable which can be defined as necessary: e.g. <v:var0815>
c:	Beas-script. Can be defined as a type of origin definition, e.g.: <c:e_belnr_id> Document number from work order, <c:e_aplatz_id> = resource ID of the routing position
p:	Parameter from a variant. <p:so_sofa_length>

Example of an operation description.

```
<c:e_quantity> * Cutting to size according to drawing numbe
Color: <v:u_color>, length: <v:length>, width: <v:width>
```

with:

© 2026 Boyum IT Solutions A/S

	e_quantity: e.g. from beas Script the value "5" gives u_dnr: Drawing number, e.g. "ZN 078 12345" u_color: e.g. red length: e.g. 20 width: e.g. 10 the following information results in the field "Description": 5 * Cutting to size according to drawing number ZN 078 12345 Color: red, length: 20, width: 10 **External operations** For external operations the entered text is transferred to the service description. For further information ***see*** collective order – description. Format needs to be considered.
V-A ... V-X	Short variants. Set hooklet to make this row available as variant Right-click on the title row: - selection: all - selection: delete This is to select/deselect the check boxes for all lines.
Instructions	Additional text field. The instructions field can be edited in Routing position using clicking the icon. The icon is displayed red when any text is stored. You can use different a text format, set up in Configuration wizard. **Note**: Changing the text format in the Configuration Wizard has no effect in existing entries.

Note: The prices on sub-assemblies with negative quantity is set to zero for operations (including parallel operations).

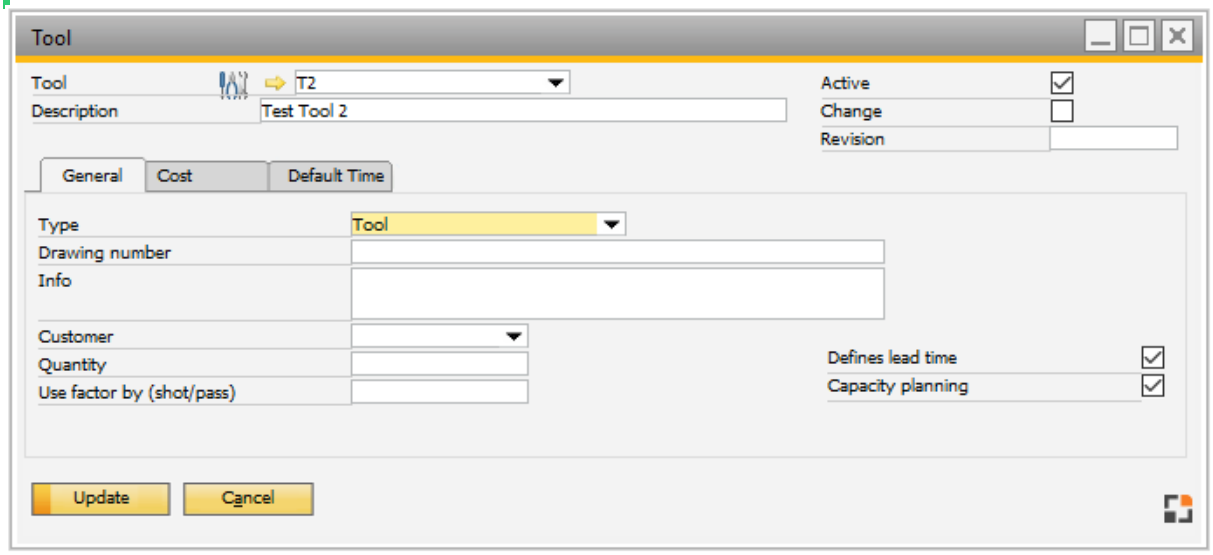
back to Precalculation

5.2.1.4.1 Precalculation Tool

In this window you can add a tool to a Precalculation operation.

© 2026 Boyum IT Solutions A/S

PATH: Precalculation > Open a calculation > Precalculation structure > right-click on an operation >"Tool"



window pk_wkzpsr

Header

Field	Description
Tool	Field used to assign the tool to perform this operation. This field is mandatory. When selecting "Auxiliary tool", the tabs disappear, as they are not considered in cost calculation or in capacity planning. ***See*** Tool Administration
Description	Field used to display the tool description. This field cannot be changed because it automatically comes from the chosen tool.
Active	Check box field used to set the tool as active in the routing. Enabling the active flag makes the tool available for selection at productions operation. If it is deactivated, selection is not possible. If it is still in use, it is blocked in planning together with its use.
Change	Activate check box to allow changes.

© 2026 Boyum IT Solutions A/S

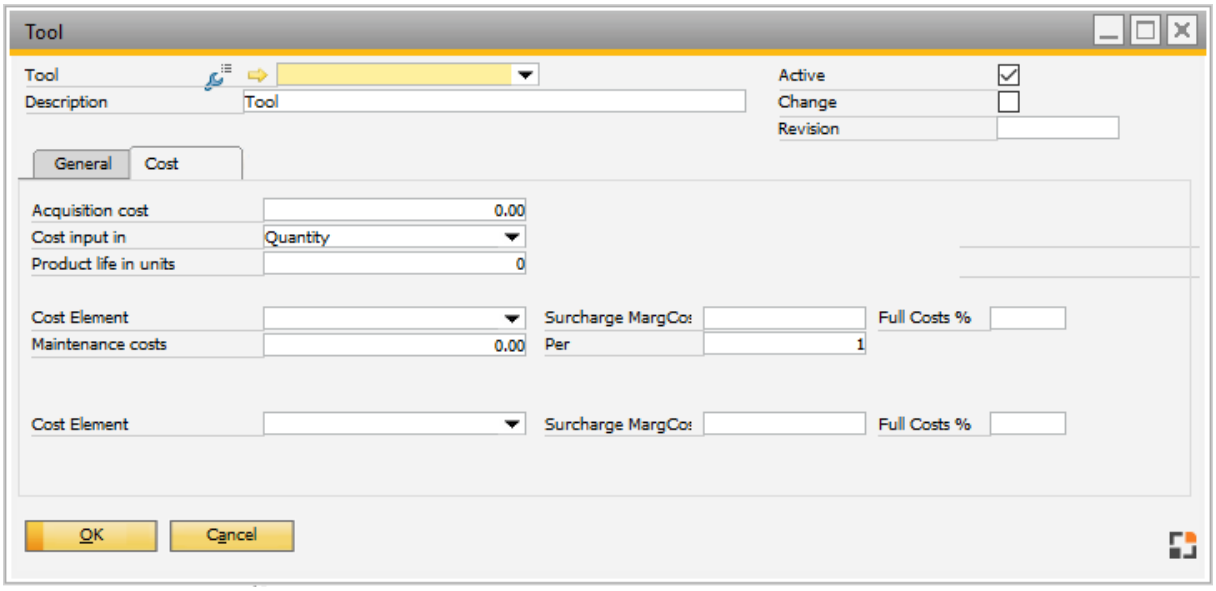
Field	Description
Revision	Version ID for information. E.g. "Tool Revision 1", "Tool Revision 2" etc.

General tab Default tab

Field	Description
Type	Type of tool. Selected automatically based on which tab the in **Inventory > Tool Administration** the tool was created: Tools or Utilities.
Drawing number	The technical drawing number. This field cannot be changed because it is read from the chosen tool.
Info	Additional free text information on the tool entry.
Supplier	Select a business partner if the tool belongs to a customer, was sent to a provider, or is used to manufacture parts that will be sold to a specific customer.
Quantity	Enter quantity of tools.
Defines lead time	Activate to define lead time for the tool. If enabled, the "Default tab" appears to enter time/unit and cost element related information.
Capacity planning	Activate to consider the tool in capacity planning.
UDF 1–4	User-defined fields.

Cost tab

© 2026 Boyum IT Solutions A/S



window pk_wkzpsr

Field	Description
Acquisition cost	Purchase or production costs in home currency. The allocation of a tool's depreciation to the goods that were manufactured using it.
Cost input in	Defines whether the maintenance interval specifications refer to time or quantities.
Product life in units	Defines the lifespan per Production UoM of the assembly to be produced.
Cost Element	Cost element to which the tool costs should be written in the calculation and costing analysis.
Surcharge MargCost	Determines the marginal cost rate per "Cost per".
Full Costs %	Determines the full cost rate per "Cost per".
Maintenance costs / per	Refers to "Maintenance Costs". Defines the factor that the maintenance costs refer to.

Default time tab

This tab is only visible if **General tab > "Defines lead time"** radio box was activated.

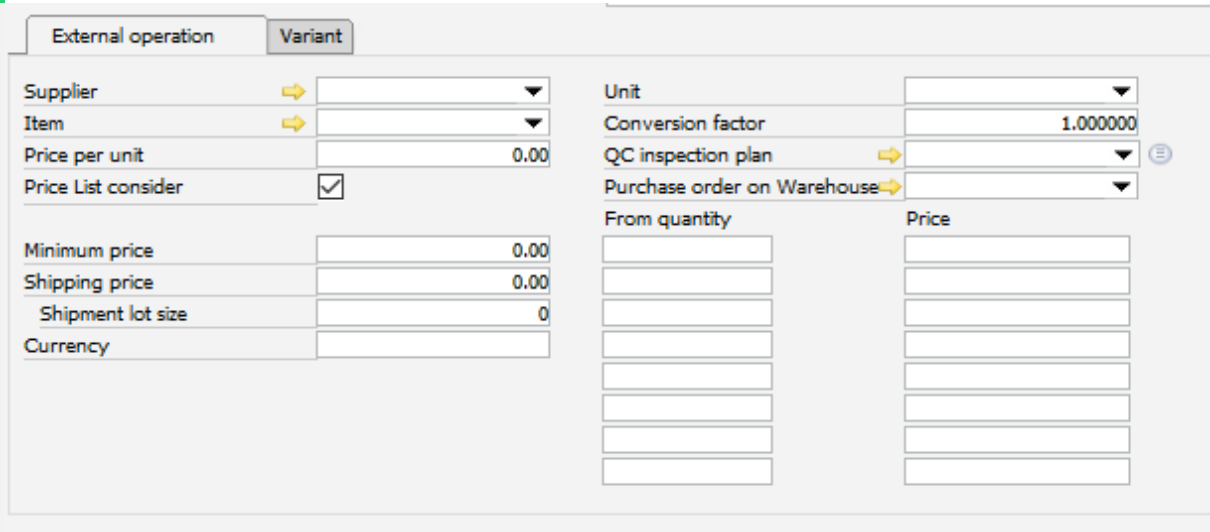
See field descriptions in **Routing > General tab**.

See Tool Administration

© 2026 Boyum IT Solutions A/S

5.2.1.4.2 External Operation

PATH: Sales A/R > Precalculation > **Open** Precalculation > "**Create Operation**" function > External tab



Window pk_arbplanos.psr

The "External Operation" tab is only visible if an external operation has been selected as a resource. An external operation can consist of a pure service (the entry is then on this page only) and / or possess a proprietary throughput time and debit the capacity of a resource, as well as allow costs to arise (entry in General tab)

For further information ***See*** External production.

Field	Description
Supplier	Default supplier Assign the supplier linked to this external operation If specified, it is loaded by default in purchase orders or quotations. Pricing considers the special price list of the supplier if no price was specified for unit price. Suppliers are available depending on settings "select supplier" Clicking on the will open the Business Partner Master Data window. Note: By default, Beas allows to predefine an item for purchase order creation. If the field is filled, it is protected in the purchase order.

© 2026 Boyum IT Solutions A/S

Field	Description
	Pricing depends on **Production > External production > Purchase and provision.** - Pricing for purchase - supplier selection - consider special price list
Item	Assign a non-warehouse item to manage all external operation transactions like purchase orders. If no unit price is specified, pricing is carried out for this item. Clicking on the will open the Item Master data window. Specify service item Only non-inventory-managed items are used for purchasing a service. No material is posted except when provision parts are used. Pricing: ***See*** Pricing for purchase. In purchase, the unit of the item is used. Note: The system ignores UoM Group definition of this item. It is always allowed to choose any UoM for the routing position.
Price per unit	Set the price for purchase orders. Service price per price factor. ***See*** Pricing for purchase.
Price List consider	Check box. Allows Beas to consider pricing, extended price lists, special price lists and blanket orders. ***See*** Pricing for purchase.
Price factor	Include a factor to be used according to the price per unit defined. **Note**: If "Price list consider" is enabled, "Price factor" is hidden, as prices in price list are always stored per Inventory UoM of the service item.
Minimum price	Set a minimum price for the purchase order If the total unit price is below the minimum price, the value specified here is used. ***Example***: €10 € per 1000 units, minimum €30.

© 2026 Boyum IT Solutions A/S

Field	Description
	For 1000 units €30 is calculated (minimum price). For 10000 units €300 is calculated (unit price higher than minimum price).
Shipping price	Transport surcharge Set the transportation price to be included in the total price. Payable per transport lot size. ***Example***: €10 € per 1000 units, minimum price €30, transport price €100, lot size 5000 1000 units are €30 + €100 transport price = 130 € For 10000 units: €300 € €200 € transport price (2 x lot size) = €500 .€
Shipment lot size	Set the lot size that can be shipped. ***See*** transport price. ***Example:*** 10€ per 1000 units, minimum price 30€, transport price 100€, lot size 5000 1000 units are 30€ + 100€ transport price = 130€ For 10000 units: 300€ + 200€ (transport price x 2 lots) = 500€
Currency	Specifies the currency in which the amounts are expressed. If no currency is used, the local currency is used.
Cost element	Change the account in which the standard costs from the external operation is booked. If a cost element is stored, and in the cost type an account is stored, costs arising at goods receipt are booked to the WIP account. ***See*** External operation goods receipt, Cost types.
Unit	Unit in which the purchase is registered Usually you purchase in units of the service item as prices are stored in this unit. ***See*** next Field description in this table titled "Conversion factor".
Conversion factor	Conversion factor between time receipt unit and assembly unit In the purchase the warehouse unit of the service item is usually indicated. There you can define the conversion factor between consumption unit of the item to be produced and the warehouse unit

© 2026 Boyum IT Solutions A/S

Field	Description
	of the service item. ***Example*:** Production UoM of the assembly: `pieces` Inventory UoM service item: `kg` Conversion factor: `3` For a requirement of `60 pieces, 20kg` of service items `(60 : 3)` needs to be purchased. **Note:** By default, Beas allows to predefine a conversion factor for purchase order creation. If the field is filled, it will be protected in the purchase order. For more Information ***See*** Collective Purchase Order – Quantity.
QC-inspection plan	Define if this external operation has to be inspected by the quality control team when producing the item or performing the task and link to stored QC-inspection plan. Clicking on the opens the the editing screen of the selected plan, and clicking the opens the list of QC inspection plans.
Purchase order on Warehouse	Define the warehouse for purchase order. If you create the purchase order, the system takes this warehouse for the purchase order. This is the own warehouse for the invoice or/and ship back warehouse. For more Information ***see*** Collective Purchase Order.

Additional fields in Precalculation

Warehouse	Determines the warehouse of the service item. This is required for pricing, if you work with "price per warehouse".
from Quantity / Price	Only visible if "consider price list" was activated. Up to 4 quantity-dependent prices can be entered. Quantities are given in units of the service item.

© 2026 Boyum IT Solutions A/S

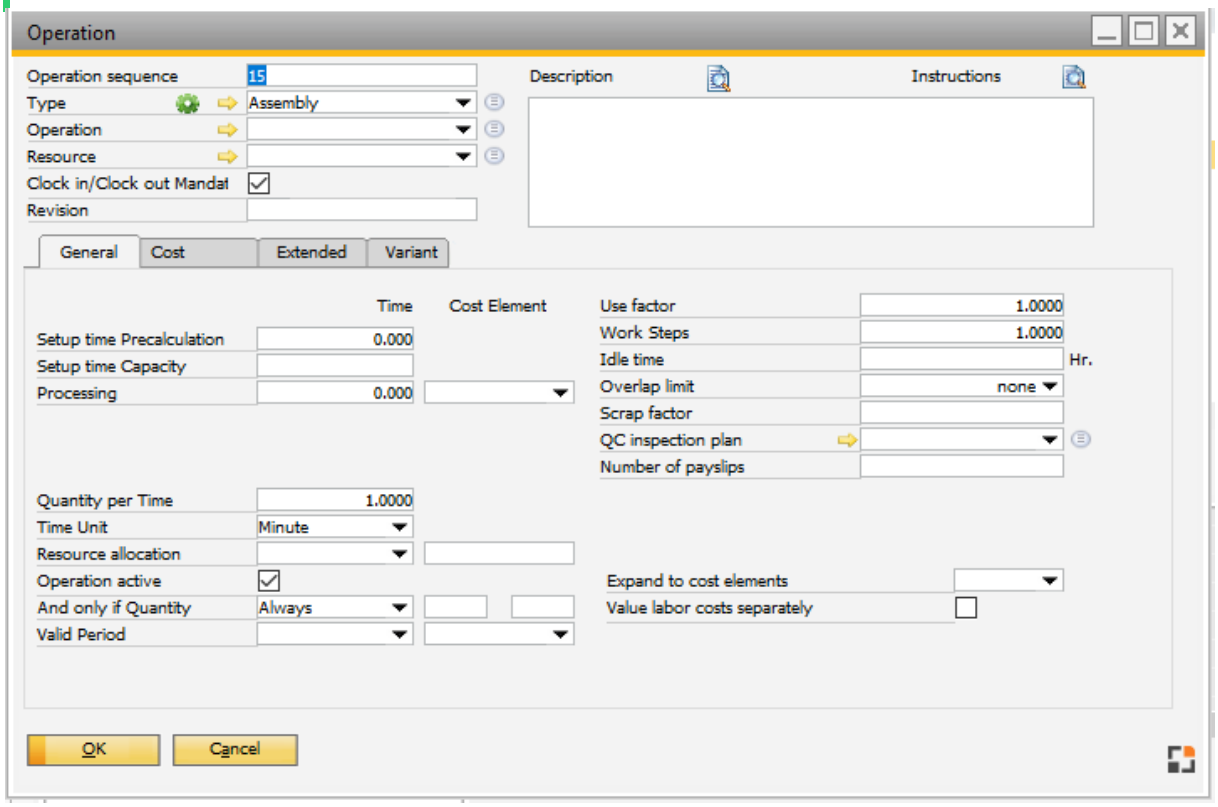
See

Collective Purchase Order

5.2.1.4.3 General

In this tab you can perform general settings for an operation position in Precalculation.

PATH: Sales A/R > Precalculation > **Open** Precalculation > "**Create Operation**" function > General tab



Window pk_arbplanos.psr

Field	Description
Setup time	Setup time for Pre- and post-calculation The setup time in hours or minutes is taken into account in production and costing analysis as well as in Precalculation. Note: Designation can be changed in Configuration wizard – Resource –

© 2026 Boyum IT Solutions A/S

	Definition Time types. **Precalculation and Lot size** Setup time is calculated per calculation lot size. ***Example:*** Lot size 10, setup time=5 minutes, calculated: 19 pieces Result: total setup time 10 minutes or 0,52 per piece If a sub-assembly has its own calculation lot size, it will be taken into account. ***See*** Precalculation – View and lot size. **Production and lot size** If a work order is created automatically (e.g. via order recommendation report or sales order to work order, a separate work order position per item-lot size is created. The setup time indicated here refers to the lot size in item master. **Separate reporting of setup times** If "Extend to cost elements" was set to 2 or more in the Resource, the setup time can be reported separately via FDC and evaluated separately in calculation. Enter the cost element to which the accrued costs are posted.
Setup time Capacity	The set-up for scheduled capacity in hours or minutes is considered in capacity planning and throughput time calculation. This setting has an effect on calculation of target time.
Mach+Labor Time/unit	The actual processing time per work step. The field designation can be changed in **Configuration wizard > Master Data > Resources > Time types** or via Ctrl+ double-click in the text field. Times are specified in units "Times in ..." (hour/minute) and refer to "Times per .. " finished parts taking account of the utility and work steps in units of usage of the assembly. The Cost Element field specifies the cost element for which the planned or accumulated costs should be totaled, facilitating detailed analysis. Tools that determine the throughput time and also alternative operations

© 2026 Boyum IT Solutions A/S

	can only influence the job time (processing time). ***See*** Calculation of planned time.
Secondary, main time	Secondary time and main time. In addition to the job time, two other secondary processing times can be specified if "Extend to cost element" is set to 3 or 4 in the resource. The secondary processing times are designated in Configuration Wizard or via Ctrl+Double click in the text field. ***See*** Concept Time types.
Quantity per Time	Determines the assembly quantity the time refers to. Enter to which assembly quantity (Production UoM) the time refers to. Thus you can indicate even short lead times correctly. ***Example:*** Lead time 0,0001 minutes per piece To make it more readable, you can enter 1 minute per 10000 pieces If it is a fixed time, enter 0 at "quantity per", that means this time is needed only once per lot size. Same effect as for setup time. ***Example:*** Lot size 10 Production 50 pieces Time = 2 Minutes per 0 Total time: 5 lot sizes a` 2 minutes = 10 minutes **Fix Quantity: Quantity per Time = 0** This means you need the time per lotsize ***Example***: 3 Minute per 0, you produce 100 Pcs. The System calculates 3 Minutes for all 100 Pcs. For additional information on lot sizes ***see*** Precalculation – Display and lot sizes.

© 2026 Boyum IT Solutions A/S

Time Unit	Unit of time in which times are stored – hours or minutes. The default can be stored in the options.
Resource Allocation	The extent of utilization of a resource. Determines the utilization of the available resource capacity.  ***See*** Default Calculation type: Reallocate forward.  **Type** / **Description** Number: Number of resources used (subject to the prerequisite that the resource exists more than once, e.g. if the resource is a group of persons. Where 2 is input for 5 persons, the resource of 2 persons is scheduled at most. Note: If this is not 1, the system uses the calculation method Exploit Full capacity for this routing position. Percent: Percentage utilization of the resource.

© 2026 Boyum IT Solutions A/S

Type	Description
	Example 1: Group of 6 persons. At a utilization of 50% the resource of 3 persons is used at most. ***Example 2***: Machine which is only partly utilized. To extend the throughput time, a lower utilization can be specified here. If 20% is specified, throughput time is quadrupled while costs remain the same. Note: If this is not 100%, the system uses the calculation method Exploit Full capacity for this routing position.
Simple	Default setting: For "Simple", only one resource is 100% utilized.

Note:

For Detailed planning (i.e. a resource should be planned to the minute) the option must be set to "Simple".

Operation active

Determines whether the operation is active and can be used

You can set here whether the operation should be included. Apart from Yes/No, a condition is also possible, such as production quantity greater, in between or smaller than a specification defined here.

Example: The operation in which a small machine has been defined should only be used when the production quantity is smaller than 30. If it is greater, an operation should be used in which a large machine with a respectively higher set-up time but smaller mach+labor time is stored. Quantities refer to "per units of usage" of assembly.

Note: This switch is only visible if in the Configuration wizard – Routing – Operation field show is activated.

Operation catalog:

In operation catalog this field is not available.

Routing:

In routing it can be set up depending on the quantity:

© 2026 Boyum IT Solutions A/S

Yes: Always active.
No: Not active.
Quantity bigger: Only active if quantity exceeds the given value.
Quantity smaller: Only active quantity falls below the given value.
Quantity between: Only active if the quantity is between two given values.

Thus you can activate a routing depending on the quantity.

Example:
Depending on the quantity, a certain resource is to be used.

until 10 kg (active quantity < 10 kg): Resource "small bowl", planned duration: 10 minutes
from 10 kg (active quantity > 10 kg): Resource "big bowl", planned duration: 20 minutes

Field description
The value is saved in `aktivformel` with the following configuration `Id=Value1=Value2`
G = "Quantity bigger"
K = "Quantity smaller"
Z = "Quantity between"
N = "Not active"
J = "Active" (Default)

If the field is empty, the entry is treated as active.
Example: Only active for quantity between 10 and 20 "`Z=10=20`"

Note regarding variants / formulas

Only the following values may be returned here if a formula has been stored via the – icon: Y for "Active" or N "Not active". "bigger", "smaller" or "between" are not allowed via the formula system.

Generate Work order

© 2026 Boyum IT Solutions A/S

By defining value "N" in the formula, the system does not insert the routing position in the Work order. This is to be activated in **Configuration wizard > Production > Create >** Apply inactive work order sequence.

Generate Precalculation

In Precalculation the system always transfers inactive routing positions. *(beas 9.3 PL 2)*

Generate new Item (Product Configurator)

By defining the value "N" in the formula, the system does not insert the routing position in the Work order. This is to be activated in **Configuration wizard > Production > Product Configurator >** Apply inactive work order sequence *(beas 9.3 PL 2)*

Active field as Script

If you click in field Pos on – icon, you can define all fields with `setvar=e_[fieldname]=value`

If you want to disable a routing position, use the following script: `setvar=e_aktiv=N`

With *beas 2020.02* the Variable "`e_aktivformel`" is not supported.

Pre-calculation

In Precalculation there is an active-field and an "only if quantity" .... The second field has the same meaning as in routing. The operation is only active if the condition is met.

Work order

Only active routing positions are transferred to the work order. If you make a selection in the Configuration wizard to accept inactive routing positions as well, these will be transferred to the work order, and deactivated.
You cannot log on to these operations and they do not cause time

© 2026 Boyum IT Solutions A/S

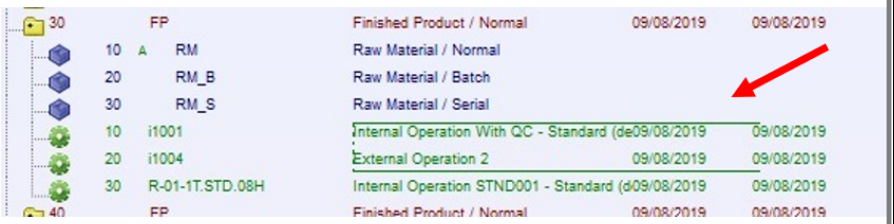
	demand. This switch can be disabled manually.
Valid Period	In Precalculation Operation: Select the From - To dates of a validity period.
Use factor	Determines the use factor of the operation If several parts are produced with only one work step, the use factor is higher than 1. ***Example*** Cut a plate with a saw Duration: 1 minute Result: 2 plates, per 1 plate, only 30 seconds are required. Use factor in this case:2 ***Example 2:*** Injection molding with 12 nozzles. One process creates 12 parts, the use factor is 12 in this case. ***See*** Calculation of planned time.
Work steps	Works opposite to the use factor. Define how many work steps are needed for one part If several steps are needed to finish one part you can enter the number here ***Example:*** Tighten 10 screws. Per screw, 15 seconds are needed. Piece time is `15 seconds` Work steps `10` Total time `15 * 10 seconds = 150 seconds` ***See*** Calculation of planned time
Idle Time	Idle time in hours in which the semi-finished part must not be further processed, e.g. drying time, cooling etc. `|--- Transfer time --| |-- Planned time --| |--- Idle`

© 2026 Boyum IT Solutions A/S

	time---| The resource is available at this time for other orders. There are no arising costs . Forward Scheduling: The next sequence of operations can begin only after the idle period. The idle time should not be used for the extension of lead times. It is recommended to use transit time (***see*** resources). By default, factory calendar and resource calendar are not considered. These can be taken into consideration by changing the settings in the Configuration wizard.
Overlap Limit	The overlap time to the next operation is stored in hours. By using overlap settings, you can define the delay for the subsequent work sequence or define to start it in parallel. Unlike parallel resources, the subsequent work sequence can be moved freely. You can define the overlap limit in **Routing position > Overlap limit**. Choose "Parallel", "No" or insert the number of hours/minutes manually. If this is defined in Position 10, the next position will be parallel. This means: "Clocking mandatory" must be disabled, because you can start with Position 20 before closing Position 10.  *Window fert_arbplanos_edit.psr*

In Item Structure view you can see parallel / overlap limit information in this way:

In this example in Position 10 the "Overlap limit" is defined:



Note:

Overlap calculation runs correctly only with forward calculation.

Value	Meaning
0	No overlap.
Parallel	Next Routing position will have same or next possible start date Forward calculation The earliest start date of the following operation can be the same as the first one or the next possible start. The next possible start may also be earlier than the one of the previous operation. ***Example 1 :*** Pos 1 is defined as parallel, so Pos 2 can start parallel to Pos 1 
© 2026 Boyum IT Solutions A/S

Value	Meaning
	View in Beas  Start of 3. routing position is after the end of the latest parallel routing position. ***Example 2***: Pos 2 needs less time than Pos 1.  View in Beas  Start of next routing position is always after the end of the latest parallel routing position.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	Example 3: *Scenario:* Position 3 is parallel to Position 2, but after Position1 finishes, resource for Pos 2 is not available. For example Resource is reserved by another work order. If the resource is not available immediately, the routing position starts at the next available time. In this example, the position 3 can start **BEFORE** the first position:  ***Example 4:*** Scenario: 2 work order positions. Both WOs have defined the 2. operation as parallel. Start date is same. First operation has different resource, but the second parallel operation has same resource for both WOs. Explanation: The parallel resource uses the start date, on which the resource is free. For the first WO this is the time when operation 1 starts. In the second work order position you see that the start date of second operation does not start together with the first operation. The reason is that WO 1 already occupies the

© 2026 Boyum IT Solutions A/S

Value	Meaning
	resource. So the second operation of WO can only start after the operation 2 of WO 1 stopped. In that case the the second operation does not start parallel but delayed:  You can set parallel-defined operations to always run in parallel in the Configuration wizard. Result with setting "Overlap limit = fix" Start date of Pos 40 on Resource i1001-1 start later, because the next resource i1004 is not available before.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 ***See*** APS fix parallel routing positions Backward Calculation The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration. Parallel resource: The system calculates the following:  If duration of Pos 2 is less than that of Pos 3, then Pos 1 ends with the start of Pos 2.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 In this case, the system is working different from forward calculation. If you work with backward calculation, the first parallel position must have the longest duration. Differences between parallel resource and parallel operation Parallel resource: - is always parallel - 100 % - Parallel resource have always same start / end time - Use Parallel resource, if you don't need this resource 100% (Example: A worker is the "parallel resource", but is working on 4 machines in parallel. In this case he must invest only 25% for his time for this operation) Parallel Operation: - is not always parallel. Only if the resource of parallel operation is available - can have different work time - can work with resource optimization - can have own parallel resource, tools and so on
> 0 Overlapping	Overlap of the following routing position or assembly if it is the last routing position. Forward Calculation

© 2026 Boyum IT Solutions A/S

Value	Meaning
	The Overlap time define, when the next operation can be started. The time, which you define, is the delay in hours/minutes, until the next operation starts. The defined time is the earliest time. **Example:** 2 hours means, the next operation can start - 2 hours after start current operation or after end of this current operation (if the current operation is less than 2 hours) - if resource of next operation is not available after 2 hours, then at the time, when the resource is available. **Example:** In this scenario the start date of the third routing position is the real start date of the second routing position + defined overlapping time in hours, here 1 hour.  An overlap is specified in hours – based on a 24-hour day. The specified overlap always applies to the following routing position. The overlap time is not bound to a resource calendar. This is purely hour-based time excluding time reservations or other factors.

© 2026 Boyum IT Solutions A/S

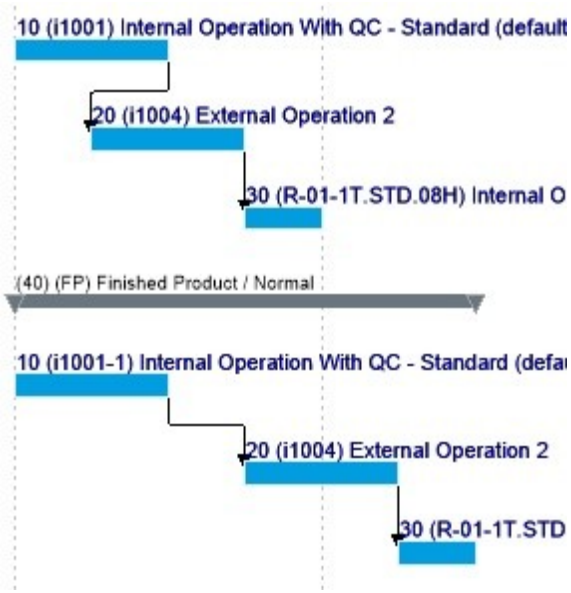
Value	Meaning
	The overlap time begins AFTER the transit time. The next routing position cannot possess a transfer time, otherwise it will be appended to the transfer time.

Example:

Scenario: 2 Work orders, same routing plan. In first operation different resources. Overlap limit = 0.5 hours

First work order: Position 20 start 0.5 hours after start of position 10

Second work order: Position 20 start later, because the time is reserved from first work order



© 2026 Boyum IT Solutions A/S

Value	Meaning
	If you want, that the overlap have always exact the same overlap time, a setting is available. ***See*** Configuration wizard ***Example:*** Scenario: Work time of second work order position is less than the work time of the first operation. In the first operation, overlap time is defined:  In this case you're ready with second routing position before you're ready with first routing position. But you can start with third routing position only, if all parallel / overlapped routing positions are done. In this case after end of Routing position 10. Backward calculation In a simple example the result of backward calculation is same as forward calculation Example: Work time 1 hour, overlap 0.5 hour in first operation  But is the duration of second operation is not same as first operation, then the result is different

© 2026 Boyum IT Solutions A/S

Value	Meaning
	to forward calculation: The system calculate backward: First 30, then 20 - from 20 the overlap is calculated (Start time from Operation 20 + Overlap time from Operation 10 = End time from Operation 10.  Alternative for backward calculation is "forward late as possible" Note: The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration.

Note:

The last operation corresponds to the last "reportable operation".

If an overlap is also configured in the last operation, Beas does not recognize this as the last operation.

However, the automatic assembly receipt or adjustment of the backflushed material depends on this.

Overlapping using assemblies

Assemblies can also overlap in an order-related structure.

Example:

```
        |- Main assembly -|
|--- Subassembly -|
```

© 2026 Boyum IT Solutions A/S

	Start date of the main group is normally the end date of the last routing position of the subassembly. If this last routing position has an overlap, this is also considered. ***Important***: If an overlap is entered in the last routing position, it is no longer recognized as the "last routing position" in the backflushed posting transactions.
Scrap Factor	Scrap factor related to this routing position in % In this field an additional Scrap factor on routing position level can be defined. This is calculated as (Mach+Labor) / 100 * Scap Factor Example: Production 8 Pcs Setup Time = 60 Minute Labor Time = 10 Minute Scrap Factor = 5 % Total Time = 60 + (8 * 10) + (8 * 10 : 100 * 5) = 144 Min.
QC Inspection Plan	Store a QC-inspection plan in operation If a QC-inspection plan is stored, – depending on the settings – a QC order will be created. ***See*** Configuration wizard Measured values can be registered via QC-order, Terminal or WEB-Apps. If respective rules are defined, the release of the next operation may depend on that. ***See*** Configuration wizard – FDC – login rules ***See*** QC-inspection plan Quality control order
Number of payslips	Information field – if applicable, for information on number or pay slip

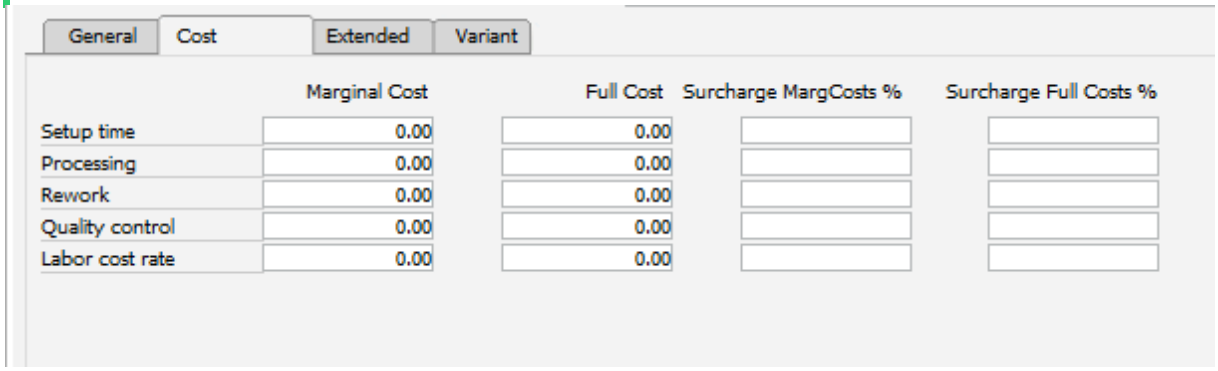
© 2026 Boyum IT Solutions A/S

	printouts.
Expand to Cost Elements	In Precalculation Operation: Select the number of cost rates. The default is one cost element (processing time), which can represent a mixed calculation of machinery and personnel costs. Select the number of cost elements you are to use in Precalculation, update the window, and the selected cost elements appear in the Costs tab. ***See*** more details in Costs.
Value Labor costs separately	In Precalculation Operation: If this option is activated, a separate cost rate can be stored for personnel costs and the "Labor cost rate" field appears in the Cost tab. ***See*** also Costs.

5.2.1.4.4 Cost

In this tab you can define Marginal and Full cost of the cost elements selected in the General tab. You can also provide the surcharge marginal cost rates and surcharge full cost rates per each cost element.

PATH: Sales A/R > Precalculation > **Open** Precalculation > **Create Operation** function > Cost tab



Window pk_arbplanos.psr

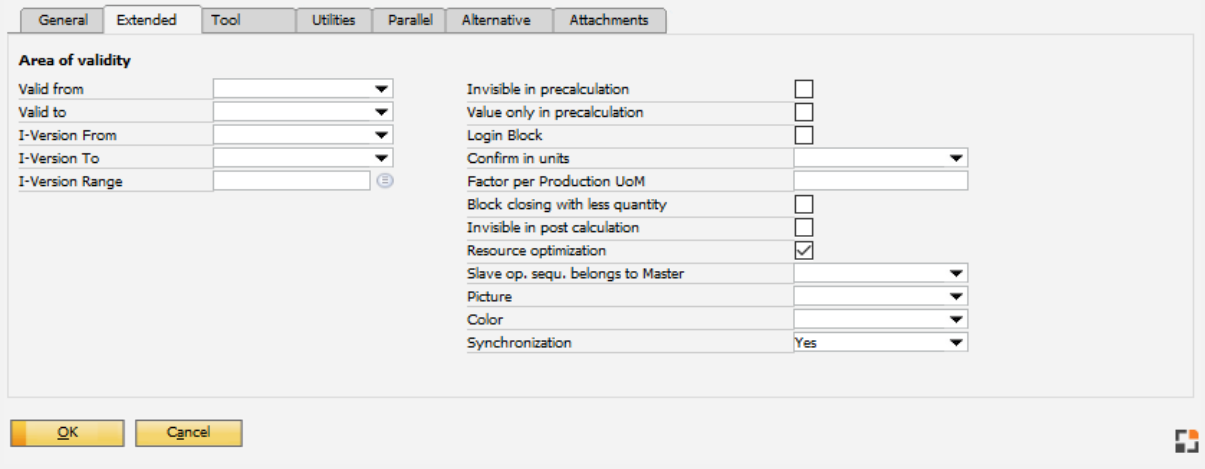
See Concept Marginal Costs and Full Costs.

5.2.1.4.5 Extended

In this tab you can perform extended settings for an operation position in Precalculation.

PATH: Sales A/R > Precalculation > **Open** Precalculation > "**Create Operation**" function > Extended tab

© 2026 Boyum IT Solutions A/S



Window pk_arbplanos.psr

Field descriptions

Field	Description
Valid from / to	Define the Valid Date Area. If no date was entered, it is valid always, otherwise only in the specified period. **Precalculation:** Precalculation date serves as reference. In Precalculation, all BoM positions are displayed but only the valid ones are valued. **Production** Depending on **Configuration wizard > Production > Capacity planning > Default calculation method** Calculation backwards: Delivery date serves as reference. It is checked only at work order creation. If the delivery date is changed subsequently, there is no second check as long as the work order is not updated. Item-Processing time: The Delivery date of the respective assembly serves as reference. The item-processing time of the respective assembly will always be used for the calculation of the completion date of a sub-assembly *(beas 9.1 PL: 08)*.

© 2026 Boyum IT Solutions A/S

Field	Description

	Creation via ue_api_wo
	The parameter "validdate" can be defined additionally, if the work order will be created via the API. *(beas 9.1 PL: 08)*
	`declare=wo=ue_api_wo`
	`wo=set=validate=<mydate>`
	`// .. normal script to create or refresh a work order`
	
	Sales order in Order recommendation
	At breakdown of the assemblies the delivery date of the sales order is used, minus the average delivery time, stored in the Configuration wizard.
	
	Special case: **Configuration wizard > Production > Capacity planning > Default calculation method = Default calculation method**
	The calculated date of requirement of the respective sub-assemblies is used as reference date for sub-assemblies.
	
	Example 1
	A supplier changes the item number from a given date
	Pos 10: previous item number until date x
	Pos 20: new item number from date x+1
	
	Example 2
	At date x additional material is required.
	If larger changes are needed, we recommend to use item version control.

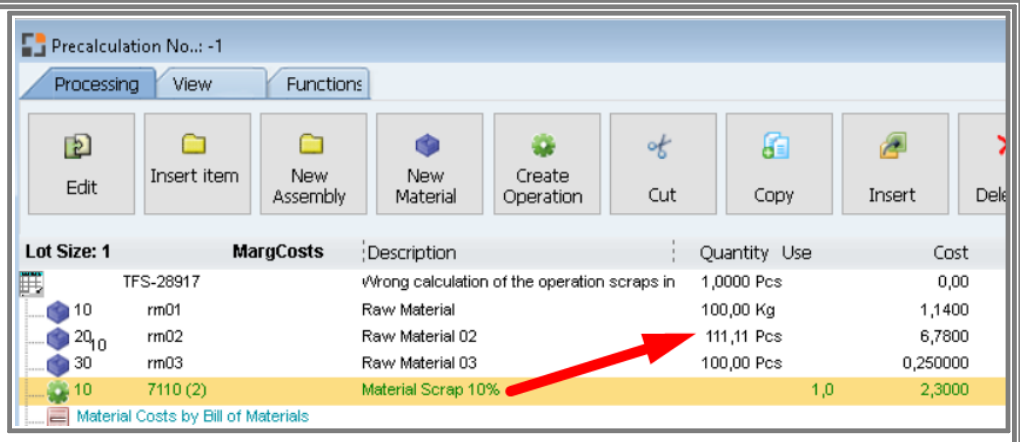
I-Version From	Field used to select the first I-Version to be taken into account in a range.
I-Version To	Field used to select the last I-Versions to be taken into account in a range.
I-Version Range	Field used to select the specific I-Versions to be taken into account. Clicking on the will open the Multiple selection window to choose several versions.
Scrap of Material %	Material scrap % In **Routing position > Extended** you can define the Scrap of Material related to a

© 2026 Boyum IT Solutions A/S

Field	Description
	routing position. ***Example:*** You must produce and fill 6 kg of paste. 15% is lost during filling. Now you must calculate how many liters of paste are needed. **Calculation** Correct formula is: Quantity: (100 – Scrap %) * 100 If you need 6 kg of finished product, you need 6 kg : (100 - (0.15) * 100 = 7.059 kg paste If you see the opposite: I fill 7.059 kg paste and lose 15% = 7.059 - (7.059 / 100 * 15) = **6 kg** In the **Configuration wizard >** "Behavior for Routing Scrap of Material % affects" you can define how the program should work. The "Exceeding planned quantity allowed" affects BoM position - material scrap: The Minimum/Maximum percentage is calculated based on total quantity. ***see*** Configuration setting. The following settings are available: Only the linked material is affected by the Scrap % setting Result see this example:

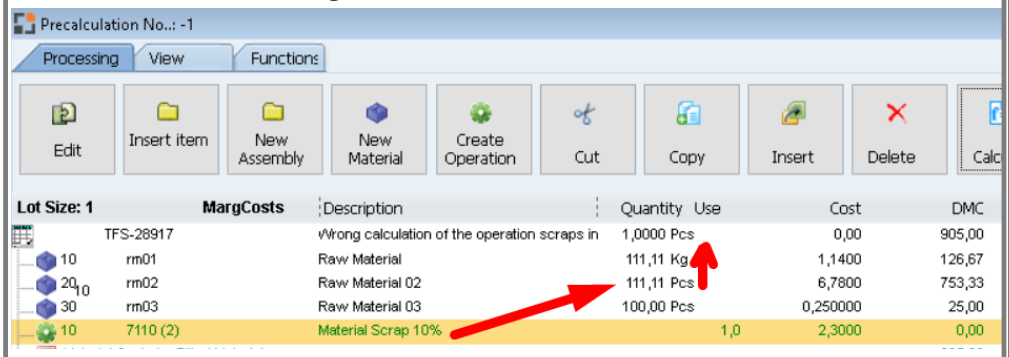
© 2026 Boyum IT Solutions A/S

Field	Description

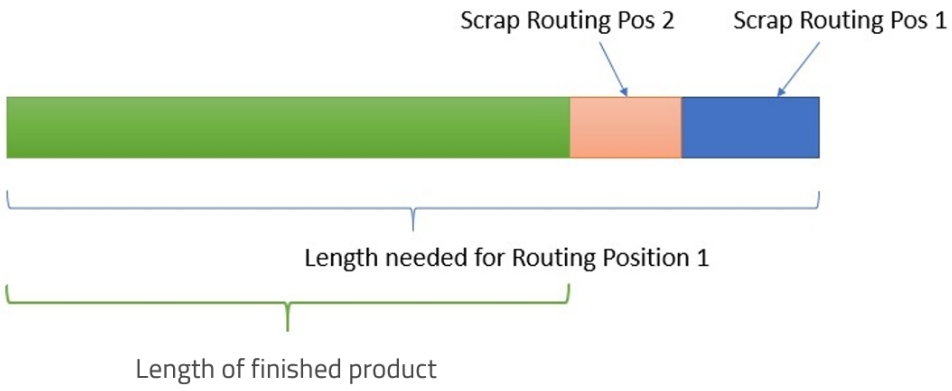


All materials under the last linked materials are affected

This is the Standard setting



Example: When a bar is sawed, a scrap rate of 10% may incur. If the material is ground, the bar becomes even shorter, that is a longer length must be cut beforehand,



Example:

© 2026 Boyum IT Solutions A/S

Field	Description

We need a finished product with a length of 250 mm.

We start with 308.65 mm - sawn : scrap 10% = 277.78.
Continue with 277.78 mm - ground : scrap 10% = 250 mm.

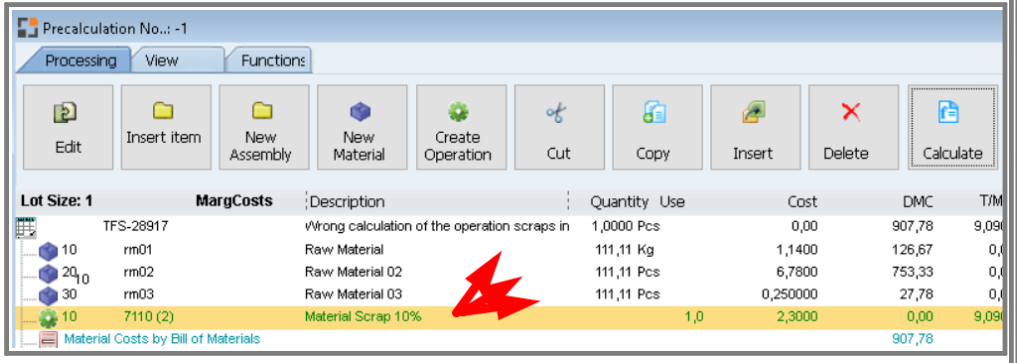
Routing Position	Material	Quantity	Scrap %
10 sawed	bar	308.65 mm	10
20 ground		277.78	10
30 QC		250 mm	

Calculation

Correct formula is: Quantity : (100 – scrap%) * 100

Position 20 we need 250 : (100 – 10) * 100 = 277.78
The value is entered into the production BOM item, column "calculated scrap" as fix value.

All materials are affected by the Scrap % setting



Notes:

- This field is only visible when the parameter in **Configuration wizard > Master data > routing > "operation related material scrap**" is enabled.
- The Item Report – Item Structure report does not support Material Scrap factor on Routing Level.

© 2026 Boyum IT Solutions A/S

Field	Description
	• Enable this option only if absolutely necessary; the computation will take considerably longer. • In Work orders this field is blocked, because scrap of material is determined only at the moment of creating the work order. • When checking which routing positions are considered, the following criteria apply: - Validity date - Active (no formula, no quantity check) - Variants (A–Z) Not checked: - Variants formulas, Product configurations
Personal allowance %	Define the rate of personal allowance. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Recovery time %	Define the rate of recovery time. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Efficiency Rate %	Define the rate of Efficiency rate. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Invisible in Precalculation	Control the visibility The position is inserted in the calculation but not valued and also not displayed, i.e. these are available here but completely invisible. Creating a work order from calculation, this operation will be inserted. Different behavior applies to "blocked operations". These are not included into the work order. *Field in Document: precalc_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 2* *Example:* *0*00000 = Pos 1 = 0 = Off *1*00000 = Pos 1 = 1 = On
Value only in	Control the Visibility "only in pre-calculation" If this option is active, the position is only valued in the Precalculation, but is not

© 2026 Boyum IT Solutions A/S

Field	Description
Precalculation	transferred to the work order and is also ignored in the scheduling function in the material requirements list. *Field in Document: workorder_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 2* *Example:* *00**0**000 = Pos 2 = 0 = Off* *01**1**0000 = Pos 2 = 1 = On*
Block Login	Block the login or receipt of order times If active, the affected resource is not reserved and a logon/logoff or time-related message of any type is blocked (the "Clocking mandatory" option must be deactivated). *Field in Document: workorder_lock* *Field in Database: BEAS_FTAPL.FLAGS, Pos 3* *Example:* *000**0**00 = Pos 3 = 0 = Off* *001**1**000 = Pos 3 = 1 = On*
Confirm in units	Confirm in Units Determines in which UoM quantities will be reported for this operation sequence via the terminal. ***Example***: Production Unit = kg Confirm unit = Liter, Factor = 1.2 If you create a time receipt with 1 Liter, you confirm 1,2 kg in production unit This is considered in Production Time Receipt External production - Collective Purchase Order.
Factor per Production UoM	Unit conversion factor Determines the conversion factor between time receipt unit and the production unit of the Assembly ***Example:*** Example: Production Unit = kg Confirm unit = Liter, Factor = 1.2

© 2026 Boyum IT Solutions A/S

Field	Description
	If you create a time receipt with 1 Liter, you confirm 1,2 kg in production unit
Block closing with less quantity	If active, the planned quantity needs to be posted If this option is enabled, the operation can only be completed with a time receipt if: - the full planned quantity was reached - the reported quantity of the previous operation (mandatory to report) was reached, the quantity is larger than 0 and the previous operation is closed. Note: The operation can be closed at any time. *Field in Document: workorder_minqtylock* *Field in Database: BEAS_FTAPL.FLAGS, Pos 4* *Example:* *000**0**00 = Pos 4 = 0 = Off* *000**1**00 = Pos 4 = 1 = On*
Invisible in post-calculation	Define the visibility on post-calculation. If active, the position is hidden in the post-calculation – for planned and actual cost calculation. *Field in Document: postcalc_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 5* *Example:* *00000 = Pos 5 = 0 =*
Resource optimization	Activate resource optimization. If enabled: If the stored resource is part of a resource group, at scheduling, the resource is automatically selected from the group with the shorted lead time. Note: Option can only be changed if the APS has been licensed. ***See*** Resource group Alternative Resources *Field in Document: resourcenoptimization*

© 2026 Boyum IT Solutions A/S

Field	Description
	Field in Database: BEAS_FTAPL.FLAGS, Pos 6 *Example:* *000000 = Pos 6 = 0 = Optimization is on* *000001 = Pos 6 = 1 = Optimization is off*
Slave op. sequ. belongs to Master	Define which operation is the master-operation for this operation It is possible to define a master operation. An order time receipt is done automatically on all operations if a quantity or time has been receipted via the master operation. Thus a receipt can be done for multiple operations at once. ***Example:*** Master-operation 10 Slave-operation 20 Slave-operation 30 If an order time receipt is done on master-operation 10, so is an receipt done on position 20 and 30, as well. Important: A concatenation of multiple operations is not possible, which means that a master-operation cannot be a slave-operation at the same time. **Notes:** Master-Slave operations are not connected to or affect parallel resources or parallel working. Not supported in WebApps and by the "Open QC Order after transaction" setting. **Master-Slave operations - time receipt creation** **IMPORTANT NOTE:** When the user defines Master-Slave operations when creating a Time receipt for a "master" operation, Beas first generates all Time receipts for the slave operations, and *then* the time receipt for the master operation. Due to this sequence, if something fails during the time receipt process of the master operation, the previous Time receipts are **not** rolled back.

© 2026 Boyum IT Solutions A/S

Field	Description
	Working with master slave ***See***: Configuration wizard - Master-Slave
Not selectable	Only operation catalog: If active, the entry is hidden and can no more be selected.
Image	Image for this operation, for better recognizability ***See*** Image selection.
Color	With this color the operation is displayed in all screens. ***See*** Color selection.
Synchronization	Determine the behavior at import At import or inserting a routing position, the routing is always deleted completely and re-imported. Use the settings to manipulate the behavior on routing position level. **yes:** Position will be deleted before the import **do not delete:** Position will not be deleted, but can be overwritten **no:** Position will not be deleted and cannot be changed.

5.2.1.4.6 Variant

In this tab you can select up to 26 variants of the item to be considered in the Precalculation process.
All variants are loaded in a Precalculation at all times. In the header of the calculation, the variant to be calculated currently can be selected. All BoM positions and routing positions not belonging to the currently selected variant are grayed out and not evaluated.
It is not possible to change Variant settings in the Precalculation.

PATH: Sales A/R > Precalculation > **Open** Precalculation > "**Create Operation**" function > External tab

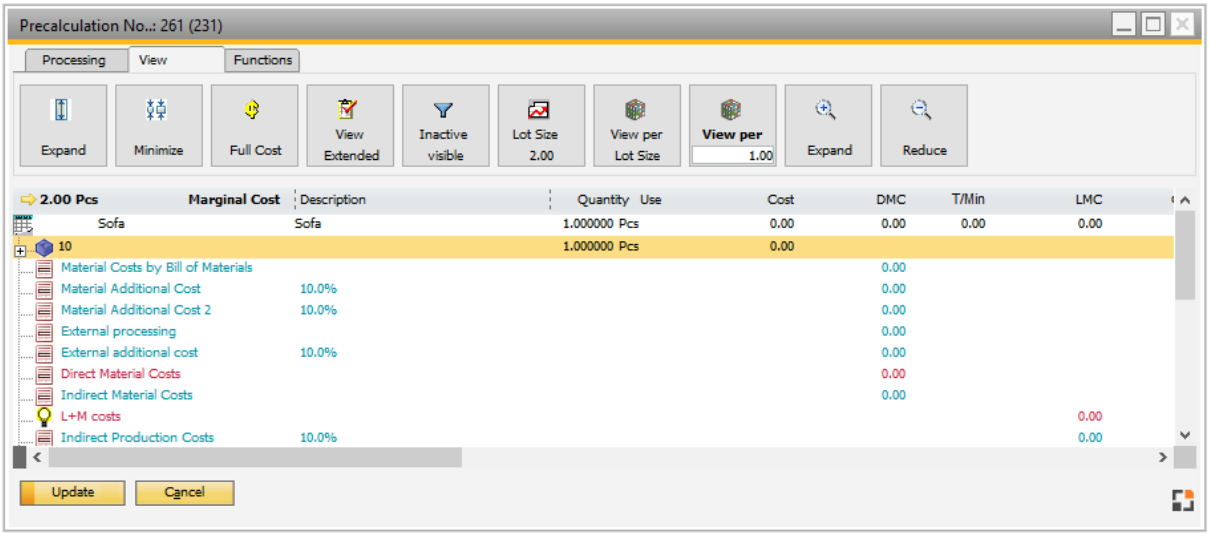
Variants production

5.2.2 Pre-calculation extended view

With the "Precalculation extended view", all results of the calculation schema can be displayed per assembly in a horizontal arrangement.

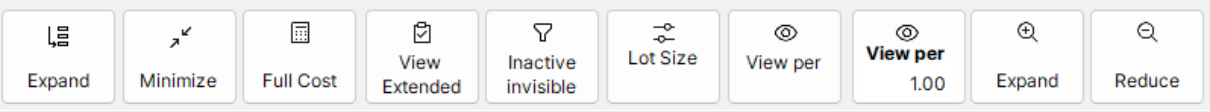
PATH: Sales – A/R > Precalculation > **Add** > select "View" tab. > click "View Extended" button.



Window pk_struktur.psr

© 2026 Boyum IT Solutions A/S

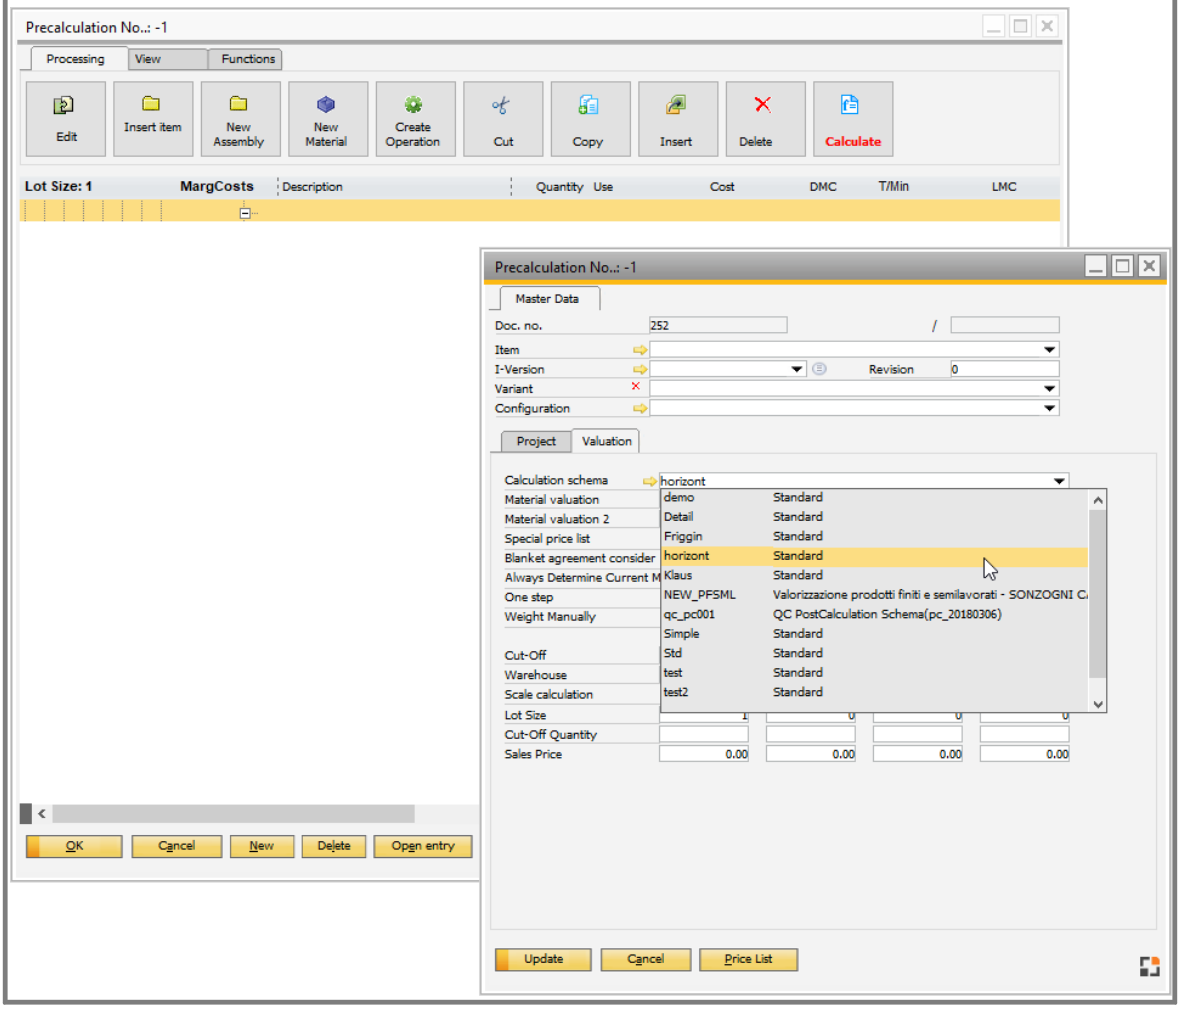
Top bar function icons in Boyum Style design:



To see the desired cost objects in the Extended view, the following steps are required:

1. Select a Calculation schema for the calculation.

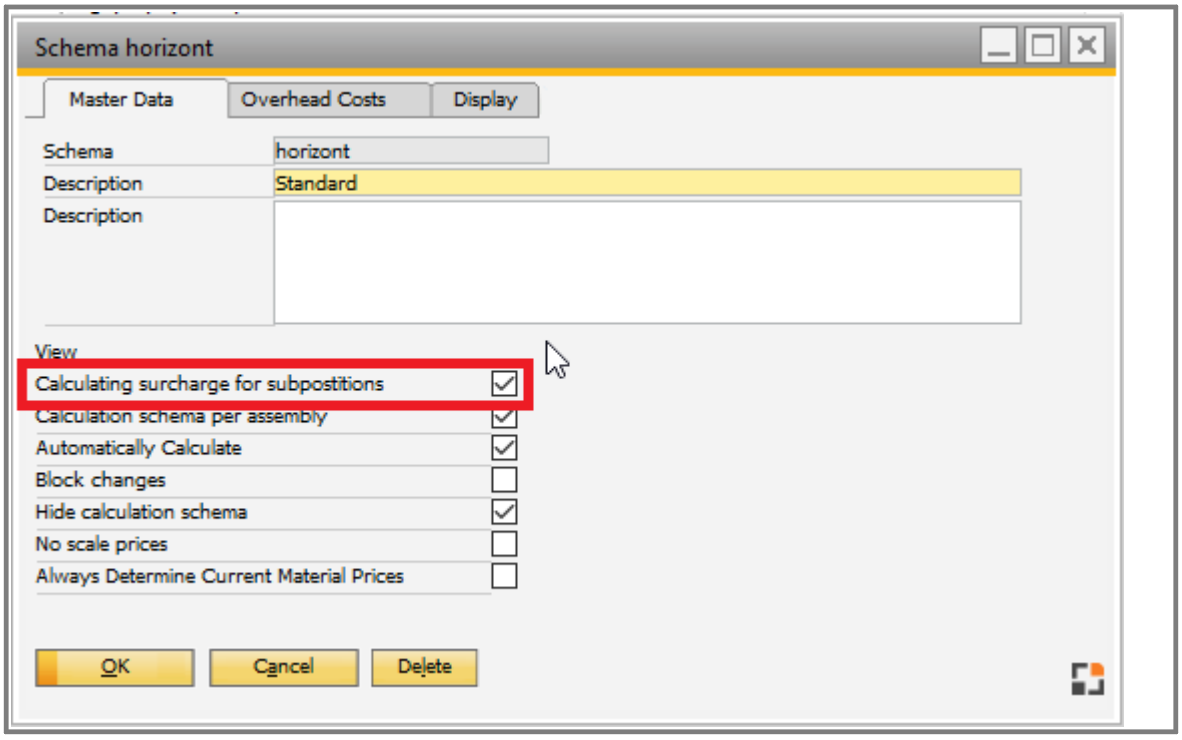
After adding a new Precalculation, select a Calculation schema from the drop-down field in the "Valuation" tab.



2. Enable "Calculating surcharge for sub-positions" in the Calculation schema.

Click on the yellow arrow left of the Calculation schema drop-down (***see*** point 1. above), and enable the calculation of surcharges in the Schema edit window:

© 2026 Boyum IT Solutions A/S

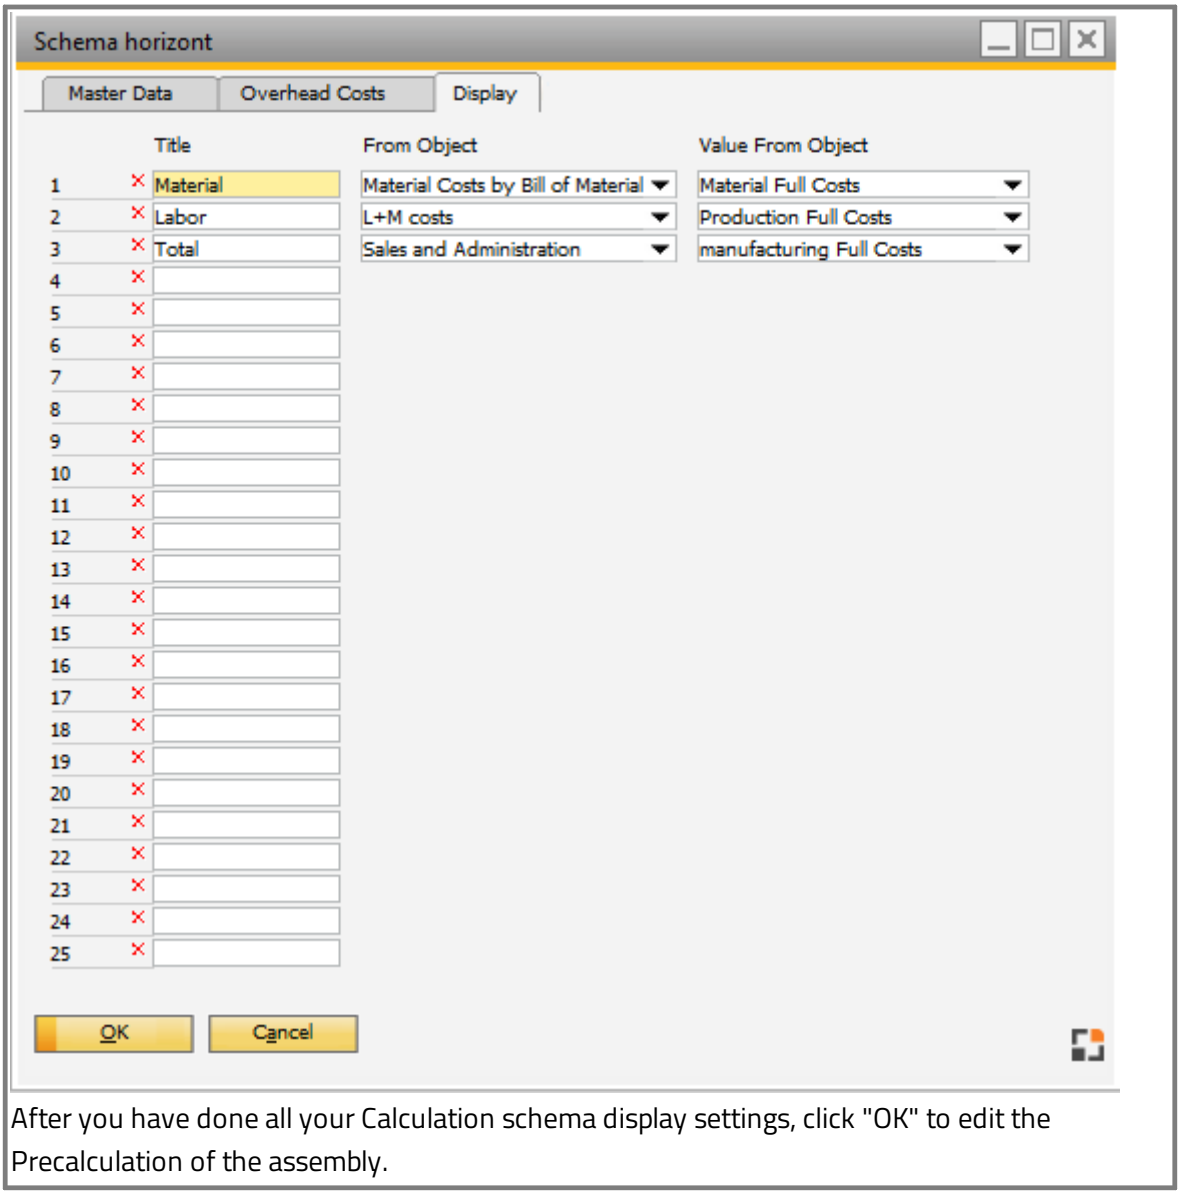


3. Define values to be displayed in Calculation schema > Display tab.

The objects that you select in **Calculation schema > Display** (***see*** image below) appear in the Precalculation extended view.

In this example below, we select Material, Labor and Total costs with their additional costs to be displayed:

© 2026 Boyum IT Solutions A/S



After you have done all your Calculation schema display settings, click "OK" to edit the Precalculation of the assembly.

4. Add item(s) with the "Insert item" button from the header.
5. Switch to "View Extended" in the **Precalculation > View** control bar.

Example:

In our example (***see*** above: **Image 1.**) we are displaying the precalculation details for two assemblies – the two versions of the item "VA-Level2-Sep".
By double-clicking an assembly, you can edit Calculation schema details separately for each item in a separate window "Material".

See:

Beas Calculation per Assembly Webinar

© 2026 Boyum IT Solutions A/S

Example display tool:

The tool costs have to be shown separately in the result list of the batch-precalculation or batch-postcalculation:
1. Entry in result field 1: "Tool costs"
2. Creation of the cost type
3. Assign the tool costs in this cost type (Tool administration)
4. Calculation schema: New overhead costs object type "Cost type", cost type "Tool" select, save as "Tool costs"

From all tool costs will be displayed in the column "Tool costs".
See: Tool

See

Calculation schema – Surcharge calculation per item
Precalculation – Extended view
Calculation schema

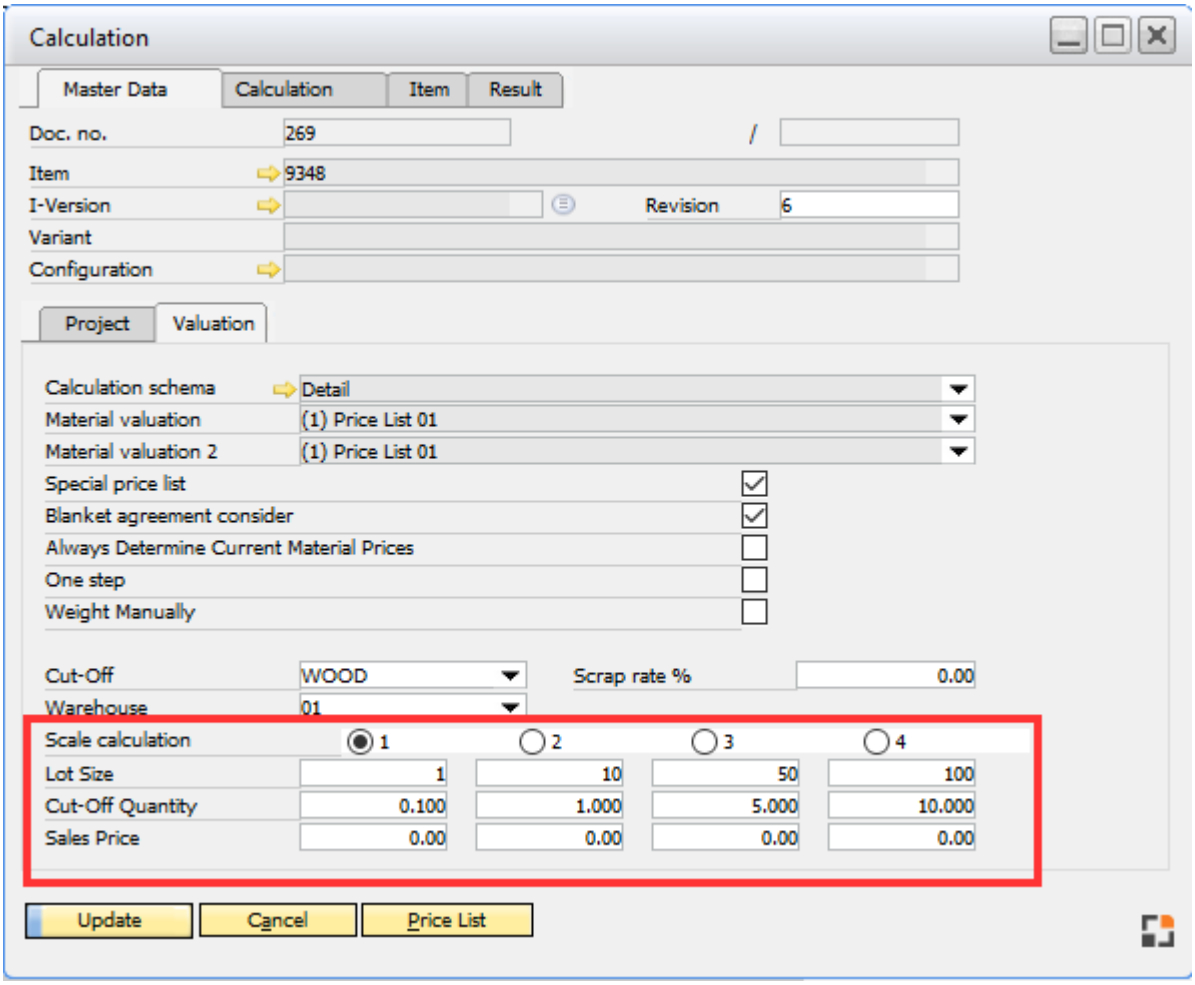
back to Precalculation

5.2.3 Lot Size and View per

A calculation can be made simultaneously in a maximum of 4 lot sizes. The default lot size is the calculation lot size as per the item master - Calculation.
If the calculation is called up from a quotation or an order, the quantity stored there is the lot size.
For further information on lot sizes ***see*** Lot size - concept.

This is the maximum individual quantity that can be produced without interruption.

© 2026 Boyum IT Solutions A/S



View per

With "View per" you can define, for which count you want to see the price.

Example 1:

You must create a quotation for 1, 10, 50 and 100 and need the price per 1.

1. Define Lot size 1,10, 50 and 100
2. Define View per to 1

Now you can display the cost per 1 for different quantities.

Example 2:

You have a max. lot size for 100 Pcs and must create a quotation for 1000 Pcs and you need the total price for 1000

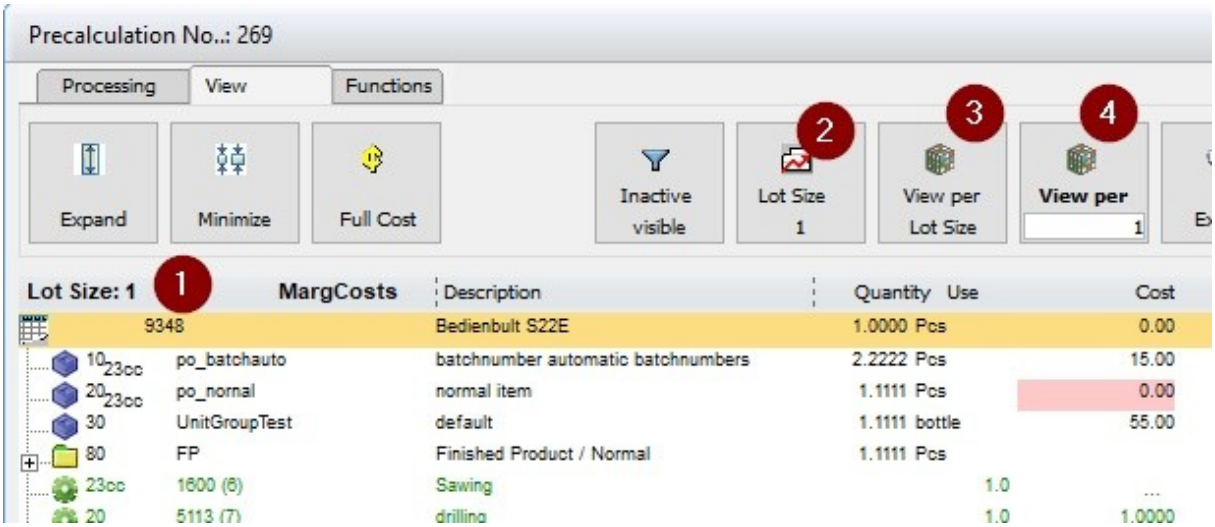
1. Define Lot size 100
2. Define View per to 1000

© 2026 Boyum IT Solutions A/S

Now you can the the total costs for 1000
In this case the system multiplicity the setup times, fix times and fix surcharges with 10, because you must produce this product 10 times to deliver 1000 Pcs.

Switching between lot sizes and view

Change Lot size
- in calculation view on text "Lotsize" (1)
- in tab "view" - Lotsize (2)
Change View
In tab "view" click on
- (3) "View per Lot size": display always total costs by lot size
- (4) "View per x": you can insert the count of Pcs, for which you see the price, example "1" means: Display the price per Pcs.



If the subassembly has a lot size, too, this will be considered under following conditions:

© 2026 Boyum IT Solutions A/S

6 Purchase - AP

Purchase order (SAP)
Goods Receipt PO
Supplier complaint

All Purchase documents support the
- Macro Print solution
- Project / Tasks
- Item Version
- Beas Bin Location system

Extended UDF's

Beas adds additional UDF's into documents, which are filled when the document is created in Beas.

Field	Description
Personnel	Personnel number (currently logged on in Terminal, WebApps or linked Personnel-SAP-User
Beas Version	Beas Versions used for the posting
Origin	Origin type **Kind** / **Meaning** B – Goods receipt Purchase PM – Purchase Material PS – Purchase External operation

6.1 Purchase order (SAP)

Beas insert extended functions inside SAP Purchase order.

Additional options for purchase orders pop up via right-click.

© 2026 Boyum IT Solutions A/S

If the material is linked to an external operation, the right-click pop-up menu displays two new entries:

- (1) External procession details: [material] (wo/position/routing)
- (2) External processing details

(1) Open a new window with information for all materials

(2) Open a new window with information for the selected line only

PATH: Purchasing – A/P > Purchase Order.

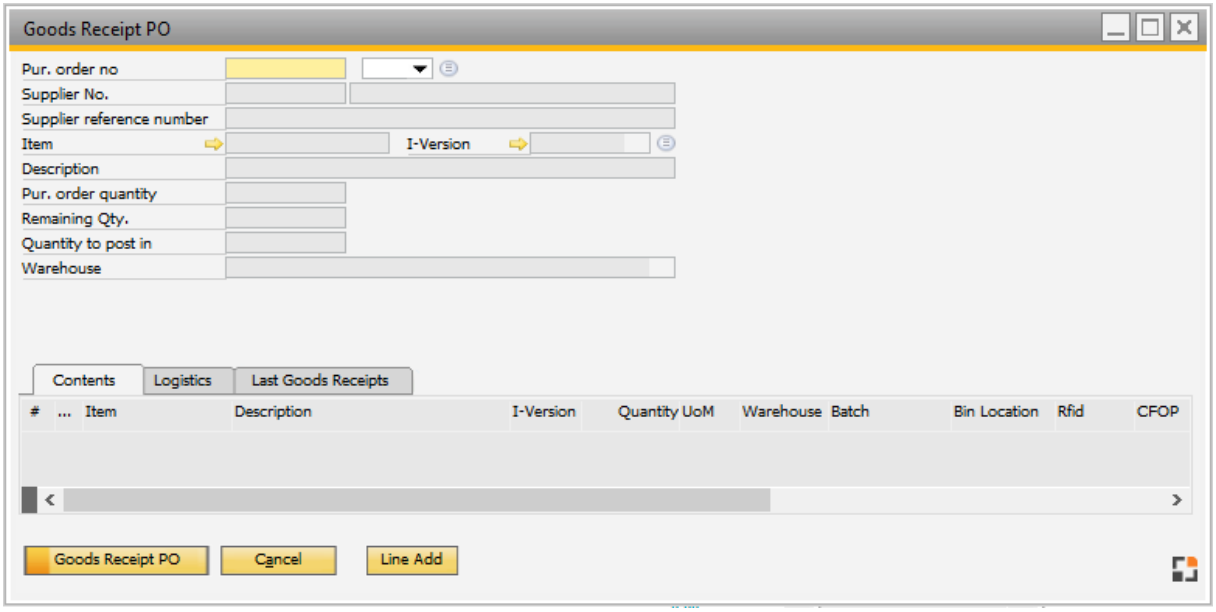
Window beasgui_sbo.psr

For more information ***see*** Production – external work order process

6.2 Goods Receipt PO

Goods receipt is a replacement function for SAP Business One – **Purchase > Good receipt PO**. This function is ideal to be employed directly at the goods receipt location and supports, apart from supplied parts lists, optimal batch support and serial numbers support, quality control, label printing and some other important functions. Goods receipt creates a regular goods receipt delivery note in SAP Business One.

Multiple Goods Receipt purchase window (default)



Window mw_goodsreceiptpo_edit.psr

© 2026 Boyum IT Solutions A/S

Special Functions:

- Several purchase order rows can be posted in with one goods receipt document
- Posting in several batches, only one goods receipt row is created.
- Summary of different purchase orders is not possible
- All good receipts which has been created on this station via this window are displayed in tab "previous good receipts". Own good receipt function created via SAP B1 or good receipts, which has been created on other stations, are not be displayed here.
- Support Beas, SAP and WMS Bin Management

Single Variant

There are two functions: You can set up the one to be used in **Configuration wizard > Materials management > Goods receipt > Goods receipt type.**

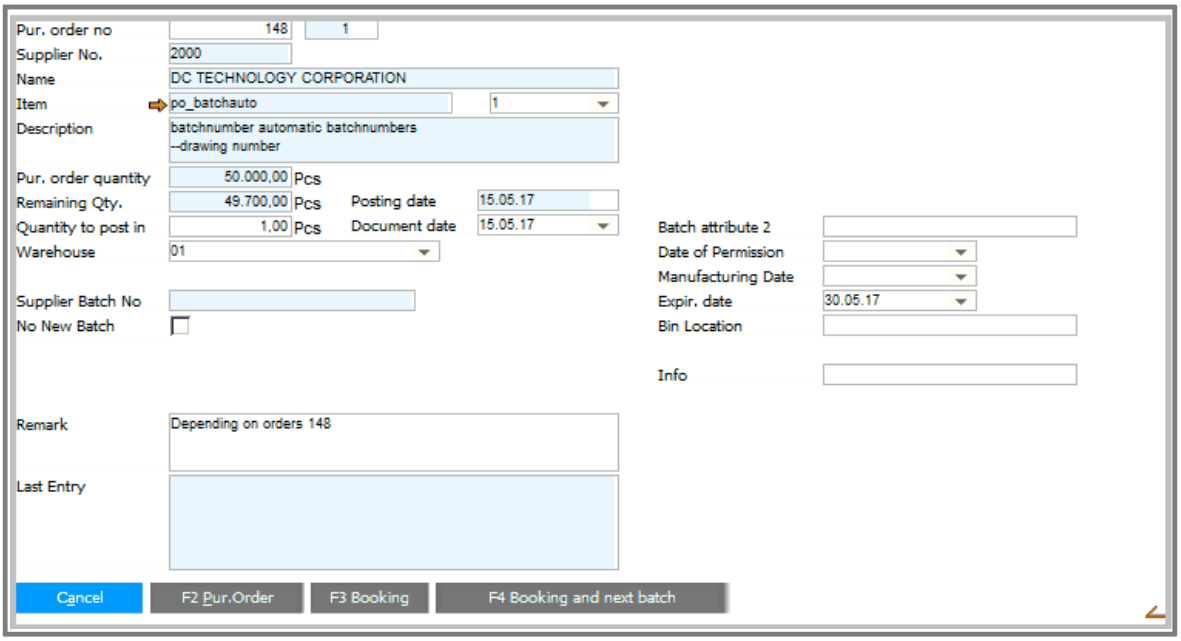
Attention:

Do not use this Variant. This window is in maintenance and this will not be supported in the future.

This is still available only for reasons of compatibility and will be replaced by the "Multiple".

- Per purchase order row one goods receipt is created.
- For each batch a goods receipt is created.
- Several serial numbers can be posted in with one goods receipt.
- **SAP functionalities newer than SAP 9.0 are NOT supported.**

© 2026 Boyum IT Solutions A/S



Field description

Apart from the order information, additional fields are shown – depending on the item type.

Window settings are available

Note: Localization in this window is not supported.

Field	Meaning
Purchase order number	Select from open purchase orders or purchase requests (switch on the right to open the window open purchases) You can insert the number manually or you can choose this from a list. If you insert the number manually, you can insert only a Purchase order, not Pre-Invoice or Quotation number. If a Document number exists more than once, Beas uses the last document.
Supplier number	Supplier number
Supplier reference number (only for GO type multiple)	Free text
Name	Supplier name

© 2026 Boyum IT Solutions A/S

Field	Meaning
Item	Item
Item description	Item description
Pur. order quantity	Purchases quantity
Remaining quantity	Remaining quantity
Quantity to post in	Quantity to be posted in now. **Warning:** All quantities are shown in the purchasing UoM. The number of decimal places depends on Master data – Units of measure. If per line serial numbers are entered, this field displays the current total quantity according to the sum of all quantities from entries below. Notes on serial numbers: In item master series tab you can set up whether serial numbers are generated automatically or not. Serial numbers are generated manually. If serial numbers are entered per line, these fields show the current total quantity. Automatically generated serial numbers. The quantity can be specified. Serial numbers are generated only at the moment of goods receipt. Number generation is set up in Configuration wizard – Materials management - Goods receipt – Serial numbers.
Date of entry (Only type "single")	The date for the entry. It is normally the current day. Depending on the settings (goods receipt type simple or multiple) this field is to be found under logistics tab.
Reference date	Corresponds to Tax date in SAP document.
Warehouse	Target warehouse Warehouse stored in purchase order.

© 2026 Boyum IT Solutions A/S

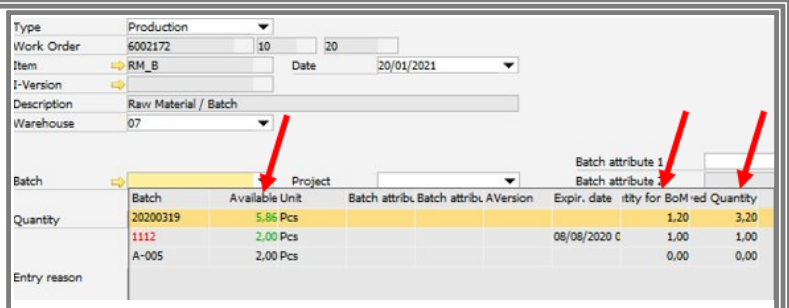
Field	Meaning
	Representing the primary inventory. Depending on the setting, the quality control warehouse is set up automatically. If a goods receipt warehouse is defined, depending on the rules the associated goods receipt warehouse is entered. Limitations: - SAP Bin Warehouse supported. But it is not possible to make a receipt on different Serial- or Batch Numbers with the same base document line. - Beas Warehouses: The same base line purchase document cannot be received in 2 different bin locations. - WMS bin warehouses are supported, but the same base line purchase document cannot be received in 2 different bin locations. - WMS Warehouses: System creates separate lines for each entry, which means that only 1 entry can be assigned for each base line. ***See***: Configuration wizard – Quality control – Goods receipt Edit warehouse master data
Bin location	Determines to which bin location the goods are posted at receipt. Supported: Beas and SAP Bin Management ***See*** Receipt on bin location Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3) The field has the following components: **Arrow icon** /

© 2026 Boyum IT Solutions A/S

Field	Meaning
	List of all bins where the item is located. **Selection (Drop-down)** A list opens to select the desired bin location.  **The selected drop-down option displays the following information in receipt documents:** • Bin Location • Warehouse Area • First item in this bin location • Stock of the first item in this bin location The list can be modified in the Configuration wizard. **The selected drop-down option displays the following information in issue documents:** • All stock information of all bin locations with batch- and serial number information. • ⊟ Reserved Batch quantities information  The drop-down contains information on reserved quantities in 3 columns:

© 2026 Boyum IT Solutions A/S

Field	Meaning



The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

Select or List - Icon

By using the selection icon, an adjustable selection list opens. Window settings and templates are supported.

- Notes: Beas Bin Warehouse

© 2026 Boyum IT Solutions A/S

Field	Meaning

	The Definition of the bin location is mandatory.
	Notes: SBO Bin Warehouse
	If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type.
	This is entirely managed by SAP Business One.
	
	Drop-down for volume or weight is not supported. Columns are always 0.
	beas 9.3 PL 2
	Notes: WMS Bin Warehouse
	Bin location is mandatory.
	Drop-down for volume and weight not supported.
	Customizing of the drop-down list in Beas 9.3 PL 2 or newer release
	This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.
	
	The following priorities are considered:
	1. Window-related customization (`windowevent setbindropown`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	In the `e_bindropdownbsl` variable, the ODATA command can be defined.
	It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.
	
	The standard functions for receipt and issue are as folows:
	`file stockmanagement.src`
	`function binreceiptdropdown`

© 2026 Boyum IT Solutions A/S

Field	Meaning

```
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$mask=1
end function

function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,
BatchAttribute2,ExpirationDate&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered by
OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$select=BinLocation/BinCode,BinLocation/BinColor
,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where OnHand >
0 of the selected ItemCode, ordered by OnHand
descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand
desc, BinLocation/BinCode asc
end function
```

Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

© 2026 Boyum IT Solutions A/S

Field	Meaning

	The following priorities are considered:
	1. Window-related customization (`windowevent`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	Window-specific adjustments:
	Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.
	
	Example:
	`windowevent setbindropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end event`
	
	Note: This window event is supported in every window where the selection field is available.
	
	General adjustment
	Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.
	
	`file stockmanagement.src`
	`function binreceiptdropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end function`
	
	LIMITATION: The receipt process linked with a purchase order is not able to create receipt for the same line into 2 different bin locations at the same time. As a workaround for this, the user can generate the receipt document in 2 steps or receipt full quantity in one bin location and move the required quantity to a different location after the receipt is created.

© 2026 Boyum IT Solutions A/S

Field	Meaning
Expiry date	Only possible for batch or serial number items. Determines the expiration or end of warranty date. This date is calculated automatically. Setup in Item master > batch tab or Serial number tab
Supplier Batch No	Only possible for batch or serial number items. A supplier batch number can be specified here. At batch: Entered in the field Supplier batch of the batch. If the field "No new batch" is active, the batch entered here is also used as internal batch number. For serial number: Next to the serial number, the batch is entered in the field "Batch".
Serial number	Different depending on selected "Type "in Configuration wizard. ⊞ Goods receipt type single There are three options: 1. Automatic generation If there is no entry, the numbers are generated automatically. Automatic number generation is set up in Configuration > Materials Management. 2. Manual entry The numbers can be separated with commas, e.g. 10004,100023,100Z3 etc. 3. Manual determination of the automatic generation A template is defined which determines the structure of the serial numbers. *The counter is enclosed by { and } . Example of piece count 3: {0010} results in 0010, 0011, 0012 A5-3{002}X results in A5-3002X,A5-3003X,A5-3004X ⊞ Goods receipt type multiple **1. Automatic generation** No serial number can be entered. Quantities > 1 not possible. Serial numbers are generated with the document.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	2. manual determination Serial numbers are entered or scanned and confirmed with TAB/ENTER. Jump to next entry. Quick entry If a lot of serial numbers are to be entered, numbers can be added one by one: after one click the next serial number is added as a new line. Using bar code scanners, the scanner can be configured for adding a key after each read. Then, the user only needs to read all bar codes – no more action is necessary. After the reading has been finished, click on the "**goods receipt**" button to create the document. This function is only allowed with the following parameters: poincomingtyp set to "M". It works with manual serial items only, because for automatic serial items the window does not show a message with the complete serial number information.
Batch	Entry of the batch This field is only visible if "Manual batch entry" or "Batch according to material" has been set in the Batch tab of the item master. The batch number for the item to be posted can be defined here. The quantity and the batch are indicated on "Add row" and then the next batch is captured if multiple batches are posted. Capture of more batch attributes 1. Right-click on the list. 2. Select Window settings. 3. Fields "Batch attribute 1" as well as all other fields, which are

© 2026 Boyum IT Solutions A/S

Field	Meaning
	required are set to "Visible" and "Changeable" . 4. These fields can now be edited directly in the list.
No new batch (Only type "single")	Only for batch items. No automatic generation of the batch number takes place if this is activated. Instead, the batch number entered in delivery batch No. is used. Otherwise the next number is automatically generated. For more on the batch number ***see*** Batch Management.
CFOP	CFOP Tax code Affects only Brazilian localization. The field is displayed only if a code was stored (table OCFP).
Remarks	Input field for remarks.
Last entry	Last posting entry.
UDF 1–15	User-defined fields Note: The information entered in these fields is saved in the table "BEAS_PLANDOCUMENT_LINE", but not in any other UDFs in Beas. Modification is available by customization.

Only displayed for Goods receipt type "multiple"

Lower tabs

Content: Previously entered items which are to be posted in with the same document.

Archive: Previous goods receipts created on this work station.

Logistics:

Field	Meaning
Posting date	The date for the entry. It is normally the current day.
Document date	Creation date of the selected document.
Remark	Free text.
Label	Only for compatibility reasons. Can be used for own Macros.

In the lower list items selected for posting are displayed. With a click on the deletion icon they

© 2026 Boyum IT Solutions A/S

can be removed. Click the goods receipt button to perform the posting.

Functions

Function	Meaning
Line Add	To post in a second item. Previously entered values are displayed below, the upper fields are emptied for new entries. If for a document row more than one inflow was added (e.g. a second batch) the second entry is locked and the selected stock of the first row is used, because for a goods receipt only one warehouse may be selected per document line.
Goods receipt PO	Execute the posting.
Cancel	Close window without saving changes.
Post and new batch	Only for Goods receipt Type "single" and batch-managed items. If an item was entered after posting, the screen not reset. You can easily record the next batch for the same order.

Process

1. Select the order with F2.
2. Enter posting quantity.
3. Execute the order by pressing F3.

(Note: In SAP Business One-environment F-keys cannot be used. These are available only when Beas is started outside SAP Business One)

If a provision parts list exists, it is queried afterwards.

See Provision parts.

Quality control

If a quality control order is stored in the item, it is created immediately after completing the goods receipt. Depending on the settings in Configuration wizard - Quality control - Goods receipt the quality control order is opened immediately.

Automated document printing

Right-click menu > Layout

© 2026 Boyum IT Solutions A/S

Field	Meaning
Preview	Via preview the last printed document can be viewed and printed.
Layout	Opens the Macro window. If in this window a Macro named "default" is stored, it is printed automatically after the goods receipt has been finished. Usually, API "B1DocumentGenerate" is used to access the table "beas_document_header/beas_document_line". If you do not want to use this API, read the internal document number from variable "e_docentry".

Additional Macro parameters for document printing

e_cardcode	Business partner
e_docentry	Internal goods receipt document number (docentry)
e_itemcode	Item number
e_batchnum	Generated batch number
e_whscode	Warehouse
e_quantity	Quantity
e_remark	Note
e_qcorder	Quality control order

Manual document printing

For document printing a corresponding document must be deposited in the Macro settings. The name can be freely assigned.

After creating the goods receipt document, via preview or print icon the last created document can be printed.

Extended fields in purchase

The following fields are filled in SAP Business One – delivery note

Field	Description
Personnel	Personnel number (currently logged on in Terminal, WEB Apps or linked Personnel-SAP-User
Beas Version	Beas Versions used for the posting

© 2026 Boyum IT Solutions A/S

Origin	Origin type. For goods receipt via beas always "B"

See

Provision parts

Configuration wizard - Quality control - Goods receipt

Configuration wizard - Materials management - Goods receipt

6.2.1 Provision parts

In this window provision parts defined in item master are issued.

Process:

This function is similar to the external operation concept of Beas. It can be processed without a work order.

1. Auxiliary material is posted to a suppliers account (manually), which may be a normal warehouse used as "external warehouse".
2. A purchase is created for the finished part.
3. The external supplier produces the finished part and delivers it.
4. Goods receipt – the finished part is posted in. Provision parts are issued from the warehouse (the external one) indicated in the BoM.

Provision parts are defined in the item master by setting the scheduling ID to "provision part" and adding the needed material to the BoM.

IMPORTANT:

Provision parts:

- do not support Beas, SAP and WMS Bin management.
- do not support batch numbers or serial numbers.
- are only available in single goods receipt.
- is in maintenance. End of development.
- not available in multi-line goods receipt PO or in web app solution.
- Beas does not calculate MRP Sub-assembly requirements for items defined as "Provision parts".

© 2026 Boyum IT Solutions A/S

See

Goods receipt with provision

6.2.2 Open purchase orders

Selection window for open purchase orders and reverse invoices. In the selection window, next to the purchase orders, now reserve invoices can be accessed, sort by clicking the column header.

Field	Description
#	Number in list
Type	Purchase / advance invoice
Document	Document number
Line	Document line
Supplier	Supplier number
Name	Supplier name
Date of purchase	Date of purchase
Supplier Ref. no.	Supplier's reference number
Item	Item number
Description	Item description
Quantity	Total purchase quantity in warehouse units
Unit	Warehouse unit
Open	Remaining quantity, without goods receipt
Delivery date	Date of delivery of the purchase order
Calendar week	Calendar week of delivery date (format YYYY/WW (Y=Year, W=Week) referring to the Factory calendar.
Match code	Match code
DIN	DIN
Drawing number	Drawing number from purchase order or advance invoice. If nothing was stored, drawing number from item master
Catalog	Business partner catalog number

Use the search field on the bottom for full text search in columns:

7.1 SAP Item Master Data

This documentation is to describe the complete Item Master Data Window with all SAP- and Beas functions.
You can set up the SAP window view with integrated Beas functions in the Configuration wizard as default.

© 2026 Boyum IT Solutions A/S

As of Beas 2020.12 Beas always opens the SAP Item Master Data if you click on a yellow arrow linked with Item master data in Beas Forms and SAP Forms.

The Advanced Production tab in the SAP Item Master Data window is a collection of all Beas functions integrated inside the SAP functionality. The window also includes a right-click menu with Extended production options.

Data Validation:

The validation and deletion of related Beas Tables is possible without Beas running.

Field	Description
	orders. If item version is defined, it is mandatory to define the default version in this field. This field is protected if the current item is not a batch- or serial-managed item. **Compatibility:** In old Beas versions it was possible to use Item Version control for all item types. We disabled this functionality, because a stock-managed control by Item Version is only possible for Batch- and Serial-managed items. If you use Item Version Control for other items, the field "Item Version" is not protected. But for these items the system does not check the correct Item Version in transaction documents. Note: If you delete Item Versions and the item is not Serial/Batch managed, the system protects the Item Version field. If Item Version is active, it is not possible to switch Item Administration from "Serial/Batch" to "Normal". MRP can return wrong result if you work with item version and non-batch/serial managed items. ***See*** Datacheck. ***See*** VIDEO: Item Master Data - I-Version field VIDEO: Item Master Data - I-Version field Edit versions/variants (I-Version)
Barcode	Input of the European item Number (EAN) or item bar code. Any other bar code can also be printed. The bar code can have up to 16 digits. When a bar code is entered, the program checks if it already exists in other items. In this case, it is not allowed to leave the field. You need to enter a unique bar code to save

	it. Note: In case you wish to use bar code scanning in WebApp Terminal 2.0, you must set up 14-digit GTIN (EAN) bar codes. ***See*** WebApps 2.1 GS1-128 bar code support GTIN (EAN-14) bar codes
Description	Input of the description of the item This is the Item Name which you can see in every window If Item Version is activated and you create a document, the Item Name defined in the Item Version will be used. If Variant Generator is activated and this item is part of the Bill of Materials, the system replaces all placeholder <...> from the description. ***See*** Variant description
Description in foreign language	Input of the description of the item in a foreign language. This description can be copied to documents for foreign language business partners.
Item type	Select from the following options: • Item - Use this option to define items in SAP Business One. • Work - Use this option in the service module to calculate the time required to perform a task. • Travel - Use this option in the service module to calculate the time that a service engineer is on the road. • Fixed assets (not available for selection in Beas) Note: Beas has its own resource administration. Item types "travel" and "work" is not used and therefore not supported. "Fixed asset" items are hidden in Beas, a processing is only possible in the fixed assets module.

© 2026 Boyum IT Solutions A/S

Field	Description
Item Group	Divide items into groups Each item is only assigned to one group. The accounts to be charged are stored in the item group, when item group specific account definition is activated. The Item Group field is used later for reports and analyzes. If the user has extended authorization for routing of BOM this field is blocked. ***See*** User authorizations - extended.
UoM Group	Unit of measure group. ***See*** Concept UoM Group
Warehouse Item	Determine whether the item is inventory-controlled The corresponding item can be used in warehouse management by selecting the Warehouse Item option. For example, inventory transactions such as transfers can only be performed for warehouse items. If an item is only defined as a warehouse item, this item cannot be sold or purchased. Note: To define an item as a non-warehouse item, remove the flag for warehouse items. Typical non-warehouse items are e.g. services, electricity or personnel costs. The additional costs incurred by non-warehouse items are listed in the production order. The default valuation method must always be used for non-warehouse items; in addition, an expense account must be assigned to these items (except in the case of an item group). Warehouse items can be converted into non-warehouse items and vice verse, as long as: • No transactions have been posted for the item • No documents exist for the item, e.g. quotations, sales orders, purchase orders, incoming or A/R down payment requests, or draft documents Note: Series or batch items cannot be defined as non-warehouse items.
Sales Item	A sales item is sold to a customer. If an item has been defined as a sales

© 2026 Boyum IT Solutions A/S

Field	Description
	item, a sales order can be created for a customer. This category also includes services, as these are neither purchased nor warehoused.
Purchase items	Purchase items are bought by a supplier. If an item has been defined as a purchase item, a purchase order can be created, for example.
Fixed Assets	Select this option to define an item as a fixed asset, i.e. as an item which can only be bought. Not changeable in this form. Please use Extended (SAP Business One Item window)
UDF	It is possible to activate 4 UDF fields in the Configuration wizard. Note: The item master data is not a Beas table. You must link an SAP UDF field. For more information see Configuration wizard.

7.1.2 Extended Production Right-Click Menu

This right-click menu stores all Beas functions that are relevant for the item. The functions that appear in this right-click menu are equivalent to the different tabs and functions of the Beas item master window.

This menu is available with basic license.

You can only see functions and fields which are available for this item type and which are activated in the Configuration wizard.

PATH: Inventory > Item Master Data > right-click menu > **Extended Production** > entries

Overview of right-click functions

Function	Description	Visibility
Invent. History	Opens the inventory history for the item.	Always
Used In	Opens the "Used In" Beas window of previous versions, but with 2 tabs: - "Bill of Materials" - "Documents"	Always
Bill of Materials	Definition of Bill of material for Production.	Rules Procurement Method is

		and In **Administration > Setup > General > Users > right-click > Extended > Extended** you can define additional rules for access to BoM and Routing. The user must have access. If case of no definition, the user always has complete access.
Extended Description	Additional Remarks, Pictures and Attachments for the current item.	Always
Quality Control	Store and manage QC inspection plans.	Always
Parameter	With user-defined parameters you can add further details to the item.	**Configuration wizard > Master data > Item > Display > Item master > Manage parameters.**
Product Configurator	Store configurations for an item.	Visible when the Product Configurator module is available for the user.
Variant	Define names for Variant A-Z	Visible when **Configuration wizard > Production > Activate Variants Generator** parameter is active and in "Confirm" Mode in SAP BusinessOne.
Variant Script	Allow to define Bill of Materials and Routing positions by script.	Visible when defined in Script for Item variant.

back to Item Master Data
go to Advanced Production tab

© 2026 Boyum IT Solutions A/S

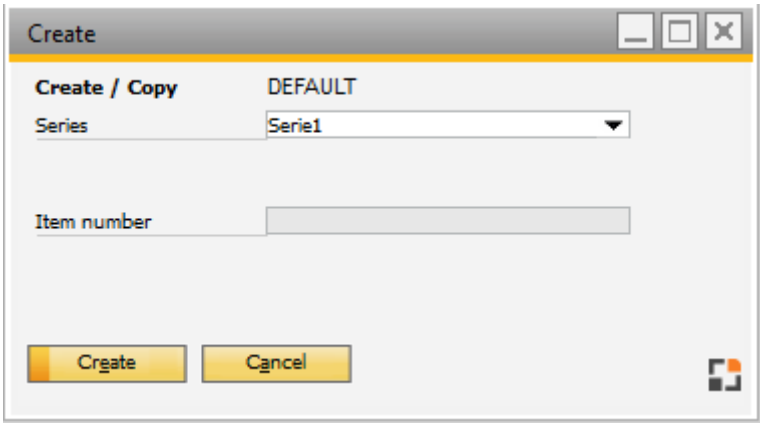
7.1.2.1 Advanced duplicate / item creation

PATH: Inventory > Item Master Data > right-click menu > Advanced duplicate / item creation

In this window you can create or copy new items.

When creating an item, Beas always makes a copy of the item and copy all item information linked to it e.g. Bill of materials, routing, quality control information, warehouse information, but no stock.

The base item is defined in **Configuration wizard > Master data > Item > Default item**
In this way it is possible to work with templates.



Window artikel_new

Field	Meaning
Series	Choose the Document Numbering of item generation In SAP Business One **> Administration > System Initialization > Document Numbering > Setup** you can define the Series for an item  The field "Series" is only visible, if additional Series are

© 2026 Boyum IT Solutions A/S

	defined. If you choose a series, the field "item number" is locked, because Beas will create the next number automatically.
Item number	Item number of the new item Selecting series, no entry of item numbers is possible. Note: Not all characters are allowed. ***See*** key fields.

Working with Item Generation

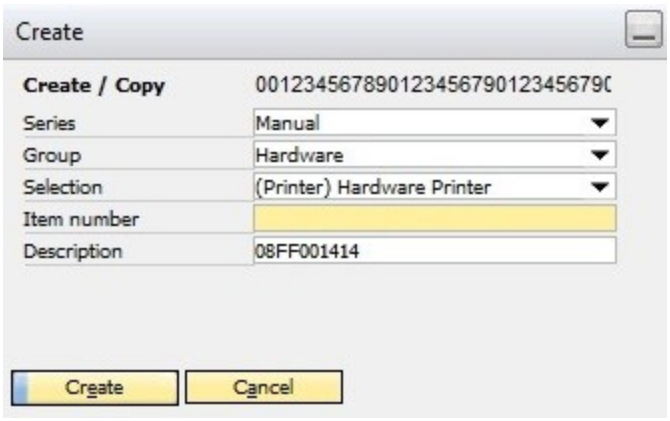
With the item generation function it is possible to define templates or item number / description generator.

See Generate Item

With this item generation the creation of items can be more automated.

Example: Generate item numbers and description related to a 2-Level item number generation.

Additionally, it is possible to use another template item related to the chosen Group/Selection.



Window artikel_new

Additional fields related to Item generation settings:

Field	Meaning
Group	The Item Generation Group
Selection	The Second Level for Item Group

© 2026 Boyum IT Solutions A/S

Description	The new description

Technical information

Beas uses the DI-API. The copy function does not exist.
Beas exports the source item to XML and imports this XML via DI-API.

It is not compatible with Item Version Control. It makes only a copy of the Bill of materials and Routing which have the same number as the item number.

Beas copies the following tables:
OITM, BEAS_STL, BEAS_APL, BEAS_APL_WKZ, BEAS_STL_HEADER, ABEAS_APL_HEADER, BEAS_ITEM_VERSION, BEAS_OITM_PARAMETER, BEAS_OITM_PRODUKTKONFIGURATOR, BEAS_QSVERWEIS

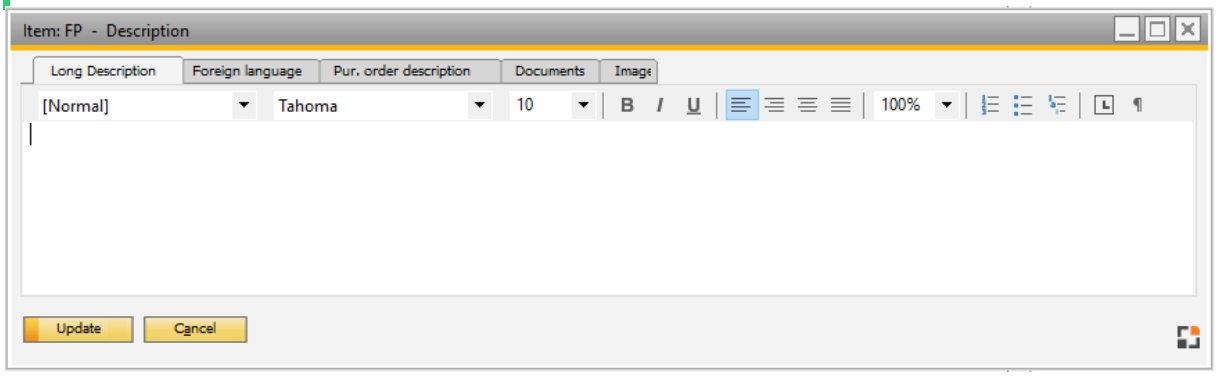
See Item generation

Limitation: SAP Item master attachments are not copied together with the Item Duplication functionality in Beas.

7.1.2.2 Extended Description

In this window you can provide additional description for the item in text or RTF format.

PATH: SAP Item Master Data > right-click > Extended Production > Extended Description.



Window artikel_description.psr

Tab descriptions

Tab	Description
Long Description	A long description of the item, which can also be entered in RTF format

© 2026 Boyum IT Solutions A/S

Tab	Description
	(**Configuration Wizard > Master Data > Item > Use of RTF input fields**). This text can also be printed on sales documents. Extended information relating only to the rich text entry objects is only active as long the text is edited; it is not saved. **Important**: SAP Business One cannot read RTF format. If long description is entered in RTF format, it can only be displayed in Beas layouts and documents.
Foreign language	Long description for foreign languages. Can also be printed on sales documents in the case of a foreign language. Input in RTF format is also possible here.
Pur. order description	Long description for output on order forms, which can also be entered in RTF format (**Configuration Wizard > Master Data > Item > Use of RTF input fields**).
Attachments tab	⊟ Three documents or images can be stored. The pictures/documents stored here are available in the FDC terminal. The last used folder is opened. This is saved per window and workstation. Use the Pre-view window to view the first attachment. **Important**: In order for every SAP user to have access to the attachments, it is necessary to place the attachments in a shared folder and give the users rights to access the folder. Beas only creates a link to the attached file.
Documents	Any number of documents can be stored. The reference to the document (directory, document name) is stored, not the document. If a document was added here, it can be called from from different windows e.g. logon order (after WO selection), Pool list – logon work order or via app "Display documents". ⊟ **Details** Beas supports two kinds of documents: - Documents stored in SAP Business One (only view) - Documents stored in Beas You can add new documents, add remarks – these documents are not visible in SAP Business One

© 2026 Boyum IT Solutions A/S

Tab	Description
	Important: the documents must be in a released network directory. Note: Attachments saved in the SAP Business One screen are displayed in the Beas window (extended master data). They can be opened, but not renamed or deleted. Files attached in the Beas window are not displayed in the SAP Business One window. Sorting and filtering by cross reference is available. **Field and button descriptions** **Fields** **Field** / **Description** No. — A unique serial number is assigned to the document. The field is editable. **Behavior** When you add a new line, the numbering continues from the highest value. ***Example:*** You have 5 documents in line 1–5. If you change line No. "2" value to "53", the value of the next added line will be "54". Info — Free, editable field to provide further, short information on the linked document. Cross Reference — File path - Directory and file name - of the linked document. Available — Radio box for information: - **Active**: Reference is valid, the file is available. - **Inactive**: Reference is invalid,

go to Advanced Production tab

7.1.3 General

In this tab you can manage general, item-related information.

PATH: Inventory > Item Master Data > General

Field	Description
Tax Liable	Flag to identify whether the item is taxable. If this option is selected, the tax group can be defined on the Purchase Data tab.
Do Not Apply Discount Groups	Defines whether the item is submitted for discount definitions. For more information ***see*** SAP Documentation.
Manufacturer	Enter a manufacturer if the item is a brand product. You can assign an item to only one manufacturer.
Additional Identifier	Enter additional information about the item.
Shipping Type	Enter the means of transport and mode of transport to be used to perform the shipment.
Serial and Batch Numbers - Manage Item by	Method to receive and release items: Defines how to use batches or serial numbers material issue or material receipt documents. material issue and material receipt in producti • None (Default): Method if the item has neith batch. • Serial Numbers: Method for managing the s • Batches: Method for managing the batches **Limitation:** - Only "Management Method "On Every Tran - Primary issue: Only by "Serial and Batch Nu - Modifications of "Manage Item by" are **not** are created with the existing type of item.

© 2026 Boyum IT Solutions A/S

Field	Description
	 General settings – Stock Only the following combinations are supporte Manage Method "On Every Transaction" Issue Primary by "Serial and Batch Numbers" Unique Serial Numbers by "Serial Number"  **Notes:** It is not possible to change this field - If Item Version is activated - Stock is available - Batch- or Serial number related items are cr
Track Location of Serial Numbers	Activate Track location of items with serial numbers (Disable it!)

© 2026 Boyum IT Solutions A/S

Field	Description
	PRODUMEX WMS - Only visible if Produmex WMS is running. If it is checked, Produmex keeps track of the location of items with serial numbers (both SAP serial numbers and Produmex serial numbers) by forcing the stock to be on an SSCC. The serial number is linked to that SSCC. Note: To enable "Track location of Serial Numbers" in the Item master data, a LUID is mandatory otherwise the production goods receipt will not be possible.
Active	Period in which item is active. Remarks: add any further information.
Inactive	Period in which item is inactive.
Advanced	Opens both upper switches (if disabled, only one is available).

Note: The following fields appear in the Beas Item Master Data for purchase items, but they are **NOT** visible in the SAP form:

- Withdrawal document
- Made-To-Order
- Allocate
- Gross weight

If you wish to make any of these visible, you can activate them by Ctrl+Shift+U (display UDF).

go to Advanced Production tab

7.1.4 Purchasing Data

In this tab you can manage purchasing data for the item.

PATH: Inventory > Item Master Data > Purchasing Data

© 2026 Boyum IT Solutions A/S

Field	Description
Preferred Vendor	Input of preferred supplier for the item or selection of a supplier from the list. For every recommendation, the system proposes this value automatically. Here you can define additional vendors. Enter the preferred vendor for the item, or select a vendor from the list. Each time SAP Business One creates a recommendation, it enters the value automatically. "Preferred Vendor" is used in MRP as the default supplier. Beas displays Preferred vendors always on top of lists.
Mfr. Catalog No.	Input of catalog number of the item from the default supplier catalog. This number is displayed in the purchase and sales documents.
Purchase UoM Name	Input of unit of measurement for Purchase documents SAP Business One standard does not support defined UoM Definition in item master Data. The UoM is only a name. With Beas integration, the name is the UoM ID. It must be defined in Unit of Measure Setup. Beas can work correctly only if UoM Code and UoM Name are exactly the same: Units of Measure - Setup # / UoM Code / UoM Name / Lengt 13 / Pk / Pk 14 / Rollen / Rollen 15 / Spool / Spool 16 / to / to 17 / TPcs / TPcs 18 / TStk / TStk 19 / PK2 / PK2 20 / DblSpool / DblSpool The system checks the existence of UoM Code in all UoM name fields.

© 2026 Boyum IT Solutions A/S

Field	Description
	It inserts the correct Code or make the field empty if the UoM Code does not exist. ***Example:*** If you insert "sp" + TAB, the System inserts "Spool" Use the golden button with three points to choose the UoM from the list. Note: Many Beas functions, especially MRP and Work order can only work properly if the correct UoM is defined. **Working with UoM Group** If a UoM Group is activated, the system displays two UoM fields. Beas always uses Purchasing UoM name and does not support the code.  This only works if UoM Code and UoM Name are the same. **UoM Code general** ***See*** Concept of UoM
Items per Purchase Unit	Definition of quantity per packaging UoM.
Packaging UoM Name	Input of unit of measurement for Purchase documents SAP Business One standard does not support defined UoM Definition in item master Data. The UoM is only a name. With Beas integration, the name is the UoM ID. It must be defined in Unit of Measure Setup. Beas can work correctly only if UoM Code and UoM Name are exactly the same:

© 2026 Boyum IT Solutions A/S

Field	Description
	 The system checks the existence of UoM Code in all UoM name fields. It inserts the correct Code or make the field empty if the UoM Code does not exist.  ***Example:*** If you insert "sp" + TAB, the System inserts "Spool" Use the golden button with three points to choose the UoM from the list. Note: Many Beas functions, especially MRP and Work order can only work properly if the correct UoM is defined. **Working with UoM Group** If a UoM Group is activated, the system displays two UoM fields. Beas always uses Purchasing UoM name and does not support the code.  This only works if UoM Code and UoM Name are the same. **UoM Code general** ***See*** Concept of UoM
Customs Group	If the purchased part is imported, the custom group is entered. The

© 2026 Boyum IT Solutions A/S

Field	Description
	customs duties can be calculated with this. Select custom group from the list, re-define one to create a new custom group.
Tax Type	Selection of a tax group which is used to specify the tax to be used for country-specific tax calculation: • No tax • Regular tax (default) • Use Tax
Length/Width/Height/Volume	Define Length / Width / Height and Volume for this item related to the Purchase Area (not the Inventory UoM). Enter the dimensions of the purchase item. If you defined the units of measure when you configured the system, enter the measurements and press TAB and the system automatically enters the measurements of the purchase item. In addition, enter the values for the length, width, and height to calculate the volume of the item. Alternatively, you can enter the volume value without entering the length, width, or height. The System automatically calculates the "Volume" if you change one of the other fields-  Beas uses this information for Warehouse – Bin Management – Calculate Volume. Click on "**>>**", if you want to copy this information to the Sales Area. **Attention:** If you try to modify "purchase" or "sales" dimensions by setting any of them to "0", some SAP versions return the following error: `256000267 di-api the unit of length, width, height or weight cannot be set if length, width, height or weight is 0` In this case, you can only modify these values in the standard SAP Item Master Data window.
Weight	Input of the net weight

© 2026 Boyum IT Solutions A/S

Field	Description
	Weight. Enter the weight of the item, followed by the weight measure. Note: This is used as reference weight in Beas bin location management for transactions. If used with weight calculation in bin location management, it should not be changed here.
Factor 1-4	Input of the quantity, which is a multiple of various factors. If e.g. a fence is purchased, the corresponding default dimensions must be considered. Factors 1–4 Enter the quantity which is a multiple of several factors. For example, if you buy a fence, you have to consider its measurement standards. The Factor fields are used as variables, so you can enter the proper values to calculate the appropriate quantity. The default value is one (1). The values that you enter in the item master data appear on marketing documents. The factor fields are used as variables so that the corresponding values can be entered into these fields for calculation of the relevant quantity. (1) is displayed as a suggested value. The values entered in the item master data are displayed in the documents.

go to Advanced Production tab

7.1.5 Sales Data

In this tab you can manage Sales Data for the item.

PATH: Inventory > Item Master Data > Sales Data

go to Advanced Production tab

7.1.6 Inventory Data

In this tab you can manage Inventory information for the item.
This is visible only if in case of warehouse-managed items.

PATH: Inventory > Item Master Data > Inventory

Field	Description
Set G/L Accounts By	Selection of default G/L account method from the available options for the item: • Warehouse - All G/L accounts defined on warehouse level. • Item group - All G/L accounts defined on item group level. • Item level - All G/L accounts defined on item level.
UoM Name	Defines the unit of measure of the item when it is stored and inventory is managed, e.g. crate, carton, box. Only visible when "UoM Group" is not set to Manual. If this field is left empty, the field Production UoM will also be empty, and Beas shows no decimals in the Item Structure Report and does not display the Unit of Measure field when this material is included into another item's Bill of Materials. SAP Business One standard does not support defined UoM Definition in item master Data. The UoM is only a name.

© 2026 Boyum IT Solutions A/S

Field	Description
	With Beas integration, the name is the UoM ID. It must be defined in Unit of Measure Setup. Beas can work correctly only if UoM Code and UoM Name are exactly the same:  Units of Measure - Setup | # | UoM Code | UoM Name | Lengt | | --- | --- | --- | --- | | 13 | Pk | Pk | | | 14 | Rollen | Rollen | | | 15 | Spool | Spool | | | 16 | to | to | | | 17 | TPcs | TPcs | | | 18 | TStk | TStk | | | 19 | PK2 | PK2 | | | 20 | DblSpool | DblSpool | | The system checks the existence of UoM Code in all UoM name fields. It inserts the correct Code or make the field empty if the UoM Code does not exist.  Purchasing UoM Name Manual ... ***Example:*** If you insert "sp" + TAB, the System inserts "Spool" Use the golden button with three points to choose the UoM from the list. Note: Many Beas functions, especially MRP and Work order can only work properly if the correct UoM is defined. **Working with UoM Group** If a UoM Group is activated, the system displays two UoM fields. Beas always uses Purchasing UoM name and does not support the code.  Purchasing UoM Code ... Purchasing UoM Name This only works if UoM Code and UoM Name are the same.

© 2026 Boyum IT Solutions A/S

Field	Description
	UoM Code general ***See*** Concept of UoM
Weight	Input of the net weight Weight. Enter the weight of the item, followed by the weight measure. Note: This is used as reference weight in Beas bin location management for transactions. If used with weight calculation in bin location management, it should not be changed here.
Valuation Method	This option is only relevant for continual inventory management. Selection of one of the following options: Moving average Moving average - This method is based on the calculation of the average costs for the item in each purchasing and sales transaction.SAP Business One calculates it automatically in the background. Beas returns this price at pricing, it is always calculated in home currency. Standard Standard pricing allows to select a fixed price which will be used for all transactions. The standard price is stored in Item master / inventory data / item costs. The price can be changed only as long as no journal entries exist. The price is always stored in home currency. As soon a journal entry exists, the standard price can be changed only via **Inventory > Inventory transactions > Inventory revaluation**. FIFO Another continual inventory management system in which the first goods purchased are the first sold or issued without consideration of the current goods movements.The valuation method can only be changed as long as no material has been posted. **Pricing Precalculation:** For Fifo the following formula is used:

© 2026 Boyum IT Solutions A/S

Field	Description
	Total value of all items currently in stock - valued by Fifo : total stock = average value This value is used as default for all calculations and for posting in material and assemblies. For issue Fifo principle applies. If there is no stock, the last purchase price is used as reference. Series / Batches From SAP Business One 9.1 the valuation method "Series / Batches is available. This is a moving average method per series/batch. **Pricing Precalculation:** The average price of all batches in stock is determined. This value serves as default for all calculations and for posting in material or assemblies. For issue, the average pricing per batch applies. If there is currently no stock, the last purchase price is used as reference.
Item Cost	Input of the costs of the item for the default calculation method. The value is updated and calculated for all inventory entries in the Moving Average and FIFO fields.
Manage Inventory by Warehouse	This option is used to specify the calculation method for minimum and maximum inventory quantities. If the flag is set, the total quantity of the fields Minimum warehouse stock, Req. warehouse stock and Max. warehouse stock is displayed in the warehouse table.
Inventory Level	Set of fields used to define the inventory level required to be ordered and stored. SAP Business One has three fields for determining the optimal inventory levels, Required (reorder point), Minimum, and Maximum. Fields Required and Minimum are considered by MRP for calculating the purchases recommendation. If you need to define these

© 2026 Boyum IT Solutions A/S

Field	Description
	values by Warehouse you have to do it in the Standard SAP Business One Item Master Data window, inventory tab.
Required (Purchasing UoM)	Input of the required inventory levels for this warehouse. Value deposited in purchasing unit, it is supported in order recommendation report, if no minimal stock was entered. The quantity required to reach to the minimum warehouse stock is displayed in the Required (purchasing UoM) field. If the release of warehouse stock under the minimum limit is selected in the document settings, the system issues warnings if the minimum warehouse stock is not reached. The system does not permit further input of inventory documents if the warehouse stock has reached the maximum quantity.
Minimum	Input of the minimum warehouse stock quantity for this warehouse.
Maximum	Input of the maximum warehouse stock quantity for this warehouse.

Set Default Whse: SAP function to define the warehouse as a default for the item.

go to Advanced Production tab

7.1.7 Planning Data

In this tab you can manage MRP scheduling for the item.

PATH: Inventory > Item Master Data > Planning

Field	Description
Planning Method	Determines the planning method of the item This switch must be activated if item procurement is to be verified through the MRP run (Beas). Selection of one of the following options: • Scheduling (MRP): Planning item procurement with the scheduling system • None: Item procurement is not planned via scheduling, and no production order or order recommendation is created for the item.

© 2026 Boyum IT Solutions A/S

Field	Description
	If dealing with an assembly, it is broken down independent of planning method. Its subordinated items can create a demand in order recommendation report. In BoM you can override the planning method. For more notes ***see*** BoM - Planning.
Procurement Method	Defines the mode of procurement **Make** – Scheduling creates production order recommendations for the item. All higher-level items should be defined as manufacturers so that the requirement can be calculated for the subordinate items during scheduling. In the case of a bill of materials for sales or assembly, no actual production order is output for the higher-level items, only the requirements for the subordinate items. **Buy** – Scheduling creates purchase order recommendations for the item. The Buy method should be selected for the subordinate items of the lowest level of the Bill of materials for items which are not part of the Bill of materials.
Component Warehouse	In MRP calculations, the application needs to determine the warehouse of the required component items. For more information ***see*** SAP Documentation.
Order Interval	Select one of the defined intervals or select **Define New** to open **Order Interval** – Setup window. For more information ***see*** SAP Documentation.

© 2026 Boyum IT Solutions A/S

Field	Description
Multiple order	Determine the multiple order for purchases and MRP requirement coverage calculation Enter a numeric value specifying the lot size for scheduling. Relates to inventory unit. This affects work order and purchase order generation via the MRP run. ***Example***: Multiple order = 10 Purchase order quantity 8 is input or transferred. It is not proposed to increase the quantity to 10. ***Example***: Multiple order = 10, production lot size = 5 Production quantity 8 is input or transferred. It is not proposed to increase the quantity to 10. 2 work orders are created for every 5. Multiple orders are considered in MRP - requirement coverage calculation. ***See*** MRP wizard – Breakdown replenishment – Consider multiple orders.
Minimum Order Qty	Enter a value, specifying the minimum lot size Generally, at least the specified amount is purchased. This is a default, no fixed value. Quantity is in Inventory unit Affected - Scheduling: Create purchase orders - Breakdown sub-assemblies. ***See*** MRP wizard – Breakdown replenishment – Consider multiple orders.
Lead Time	Input of the number of work days from the date of the order to the date of goods receipt. This value can be calculated automatically for in-house production. ***see*** calculate resources

© 2026 Boyum IT Solutions A/S

Field	Description
	Resource and lead time calculation video The lead time for in-house parts is calculated according to quantity in the MRP run (this can be optionally deactivated in the MRP run). You can set up lead time to be used instead of operation times in general. ***See*** Configuration wizard – Capacity planning Lead time is always specified in work days. A lead time of 0 days is marked as an "error" by the data check. For assemblies the lead is the production time of the assembly without consideration of sub-structures. ***Example:*** Given structure: - X011 with 3 days --- contains order related X012 with 2 days ------- contains storage related X013 with 4 days Lead time for X011 in sum 5 days (order related) Total lead time 9 days, if X013 is not covered from stock
Tolerance Days	Number of work days for allowed shortage In **Item Master Data > Planning Data tab** you can define Tolerance days.

© 2026 Boyum IT Solutions A/S

Field	Description
	 Related to order scheduling: If there is negative stock in the time line, the item will be shown as shortage in MRP. Here you can enter the number of days. Negative balance is tolerated. ***Example:*** Stock = 0 Sales order = 3rd May Purchase order delivery date = 6th May Material comes 3 days late  If the tolerance date for this item is defined with 3 days or more, the result is: OK If the tolerance date is < 2, MRP must display this piece of information. In MRP the filter "Only shortage" means: Display all entries which have a negative balance in the timeline.

© 2026 Boyum IT Solutions A/S

Field	Description
	 **(MRP Filter - Predefined Filter)** In this example the item has a balance of 0, but a negative balance between 3rd and 6th May MRP displays this item if the item has "tolerance days" < 3 days. MRP does not display this item if the item has a "tolerance days" > 3 days. **Negative Balance in past** Negative Balance in the past is ignored entirely. The calculation for the time area starts from the current Date. ***Example:*** Today is 5th May Sales Order is 3rd May Delivery = 6th May The system calculates: Balance is negative from 5th – 6th May = 1 day.

go to Advanced Production tab

© 2026 Boyum IT Solutions A/S

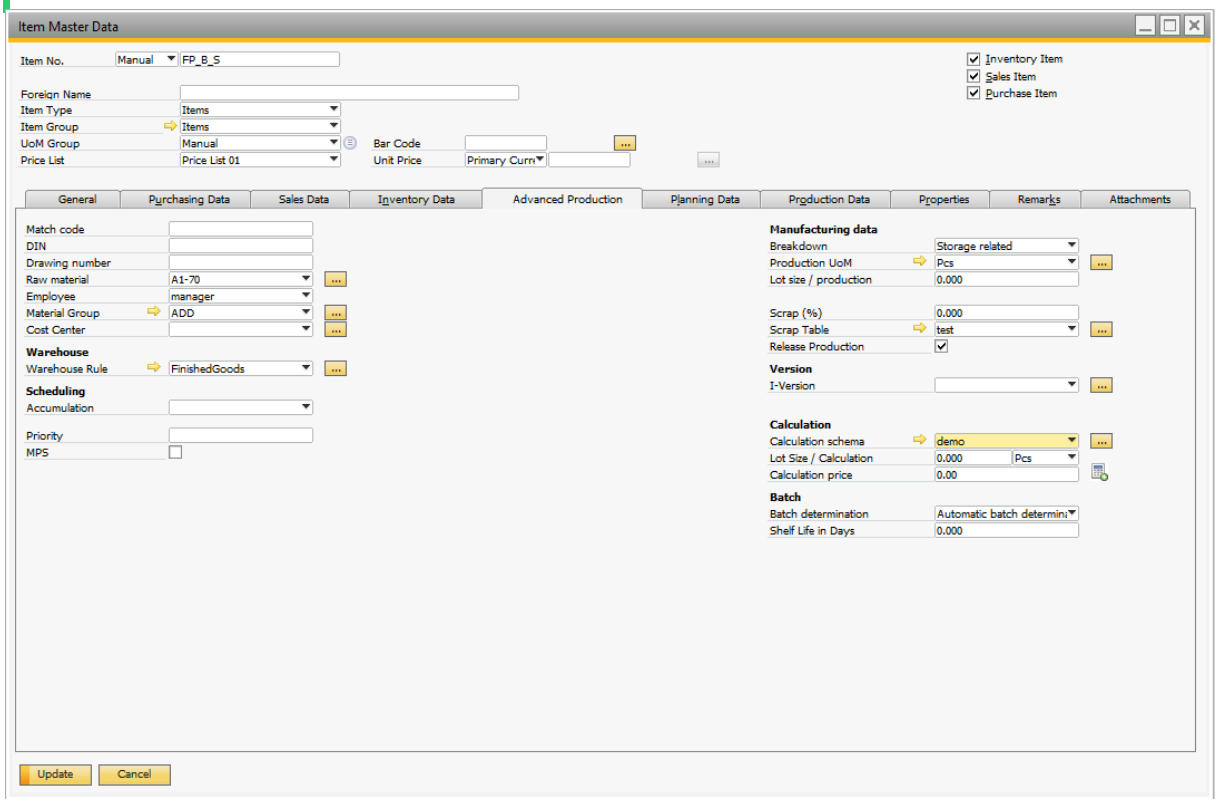
7.1.8 Advanced Production

This tab stores all types of additional Beas-specific information.
The tab becomes visible by activating SAP integration in the Configuration wizard.

The logic is to store all Beas functions in one tab.
Beas fields for these functions are grouped by areas: General, Warehouse, Scheduling, Manufacturing Data, Version, Calculation, Batches, Serials (***see*** image below.)

By choice, these related fields can be moved to any desired place in the Item Master window with the help of **SAP > Tools > "Edit form UI..."** function.
The tables of the collected functions are available in certain drop-down menus and you can access editing windows by clicking the yellow arrow left of the fields (***see*** image below.)
To access all tabs and/or functions of the old Beas Item Master Data window, ***see*** Extended Production Right-Click menu.

PATH: Inventory > Item Master Data > Advanced production



General

© 2026 Boyum IT Solutions A/S

Additional information about the item

Warehouse

Additional rules

Scheduling

Additional Planning information

Manufacturing Data

Advanced Production information

> Note: Certain entries are only visible related to Breakdown ID.

Version

All information for Item Version control

Only visible for batch- or serial-managed items.

> Note for old installations: It is possible to activate this for all item types.

Calculation

Calculation properties. Only possible for Items with **Planning Data > Procurement Method = Make**

Or if activated in Configuration Wizard - Calculation - Precalculation - Calculation purchase items.

Serial/Batch Numbers

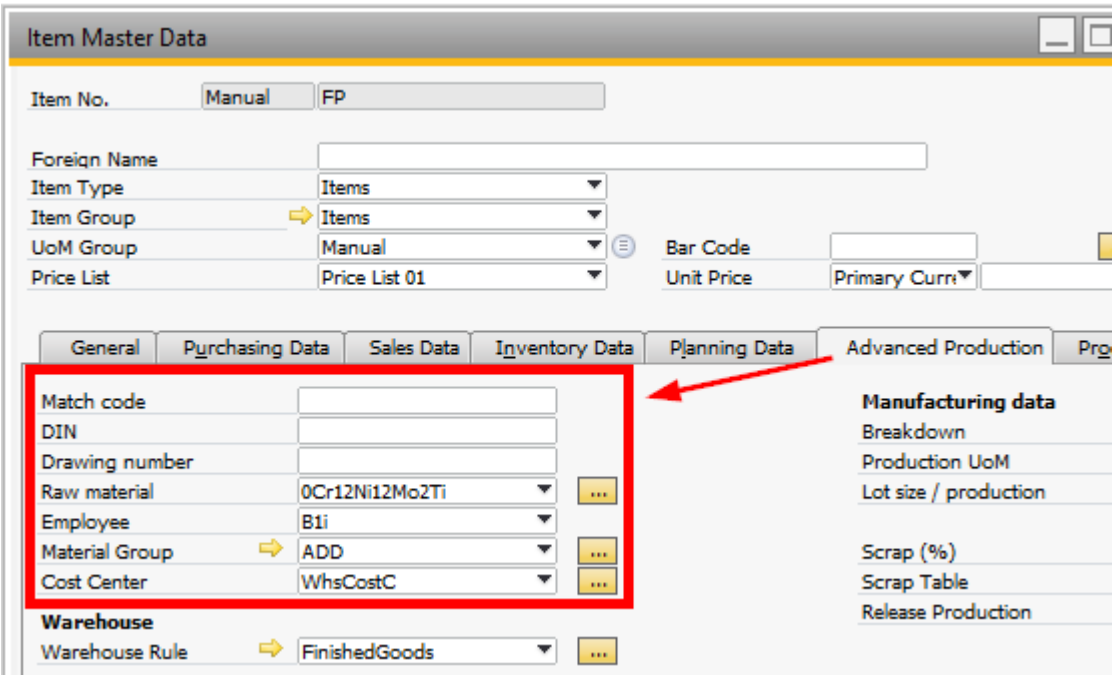
Additional Properties for Serial/Batch-managed items. Only available for these type of items.

back to Item Master Data

7.1.8.1 Advanced General

This section of the Advanced Production tab includes Beas fields associated with general information regarding the item.

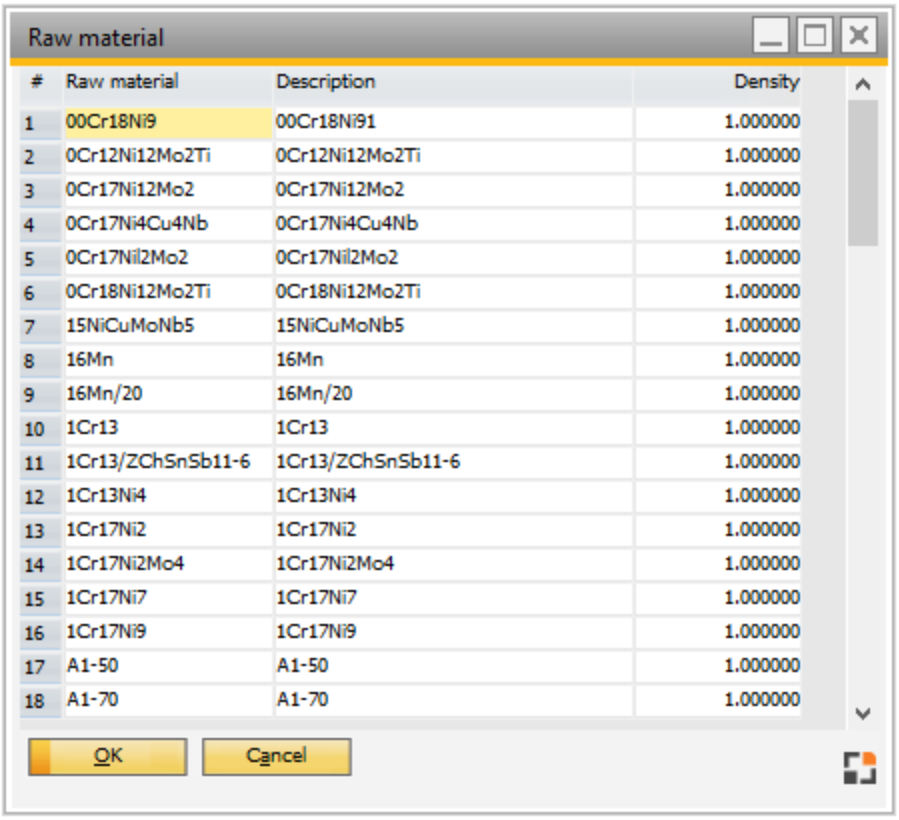
© 2026 Boyum IT Solutions A/S



Field	Description
Match Code	The match code serves as search field to sort and display the part master data according to a criterion created by the user. The match code can be an abbreviation of the initials of supplier/customer name and location or the name of a parts family. All alphanumeric symbols are allowed; the sort order is number-digit. Furthermore, the match code is the key in the info list of the part master.
DIN	This text field serves to document DIN numbers if the master part is a standard part and is registered in a standardization institute.
Drawing number	Technical drawing number. This is shown in Beas at all key locations. This field can be used for filtering and searching in several Beas windows.
Raw material	The button with [...] opens the Raw Material definition. ⊟ Raw material the item is made of Raw Material info defines the raw materials of an item. In the Raw Material definition you can define the Raw Material Id, the Description, Density, up to 4 Properties and a price. Access: Edit Raw Material, License: Basic License, Windows setting are supported.

© 2026 Boyum IT Solutions A/S

Field	Description
	You can define the raw material in the item master data and Bill of materials position.



Window basis_wst_browse.psr

Example for Raw Material:

A sheet of metal is made of aluminum or iron.

A pipe is made of plastic or stainless steel.

Used for

- Work order Variant system: Define Raw Material by formula.
- Work order Variant system: Define Machine: permitted number of rpm .
- Calculation: Calculate price by Raw Material (own formula system).
- Work order report: Report additional properties for example Melting temperature.
- Conversion between the units of quantity if the density stored in the raw material is required for this. ***See*** Unit of Measurement – Conversion.

© 2026 Boyum IT Solutions A/S

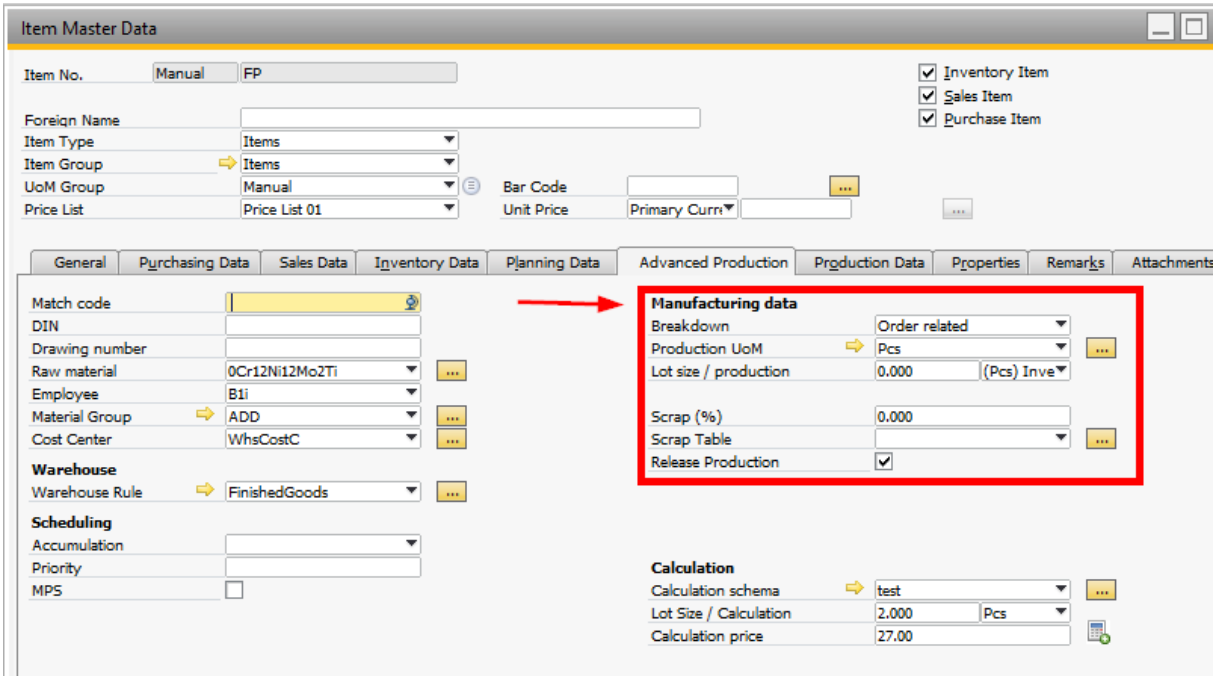
Field	Description
	Example: Pipe in a Bill of Materials Position Inventory UoM is kg Consumption is Pcs with length, height and width.  Formula: `((length * od * pi()^2) - (length * id * pi()^2) ) * density` For more information ***see*** Unit of Measures.
Employee	Employee responsible for maintaining the item master data.
Material Group	The button with [...] opens the Material group browse window. The yellow arrow left of the field opens the Material Group editing window. Divide the item into groups Beas offers a grouping possibility with the Material Group field. This group is useful for filtering, searching, production planning, programming (since it is integrated with MRP and APS on the sorting and filtering options), and for the calculation function (a surcharge rate can be linked to each Material Group). The material surcharge is stored for Precalculation. ***see*** Material Group If the user has extended authorization for routing or BoM, this field is locked. ***See*** Authorization – Extended
Cost Center	Button: Cost Center window SAP

© 2026 Boyum IT Solutions A/S

back to Item Master Data

7.1.8.2 Advanced Warehouse

This section of the Advanced Production tab includes Beas fields associated with warehouse-related information.



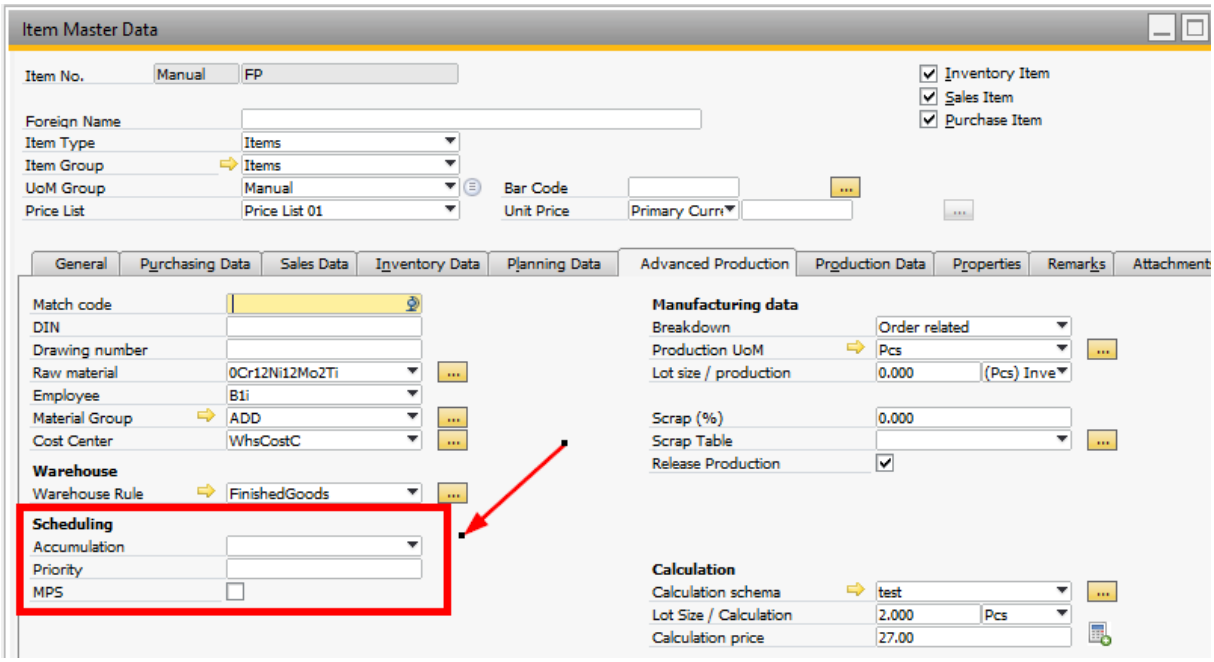
Field	Description
Warehouse rule	A group of warehouse rules can be stored. ***See*** Warehouse rules. Select a warehouse from the drop-down. Once you select the Warehouse rule, the yellow arrow appears left of the field. Click the arrow to edit the warehouse rule. Click the [...] button to open the warehouse rules list.

back to Item Master Data

© 2026 Boyum IT Solutions A/S

7.1.8.3 Advanced Planning

This section of the Advanced Production tab includes Beas fields associated with MRP scheduling.



Field	Description
Accumulation	Relates to view / calculation in the MRP run **Detail** Every requirement originator (forecast, purchase order, sales order, etc.) is displayed separately. This setting makes sense if purchasing on an order basis or in the case of high-quality goods. **Day / week / month / sum** The requirement originators are accumulated according to the period selected here: e.g. requirement per day – only the accumulated quantity issued and received per day / week / month is displayed in the MRP run in this case, not the requirement originator. Performed for "Sum" setting. If detailed specification of the requirement originator or resource is not necessary and high data volumes are incurred, this type of

© 2026 Boyum IT Solutions A/S

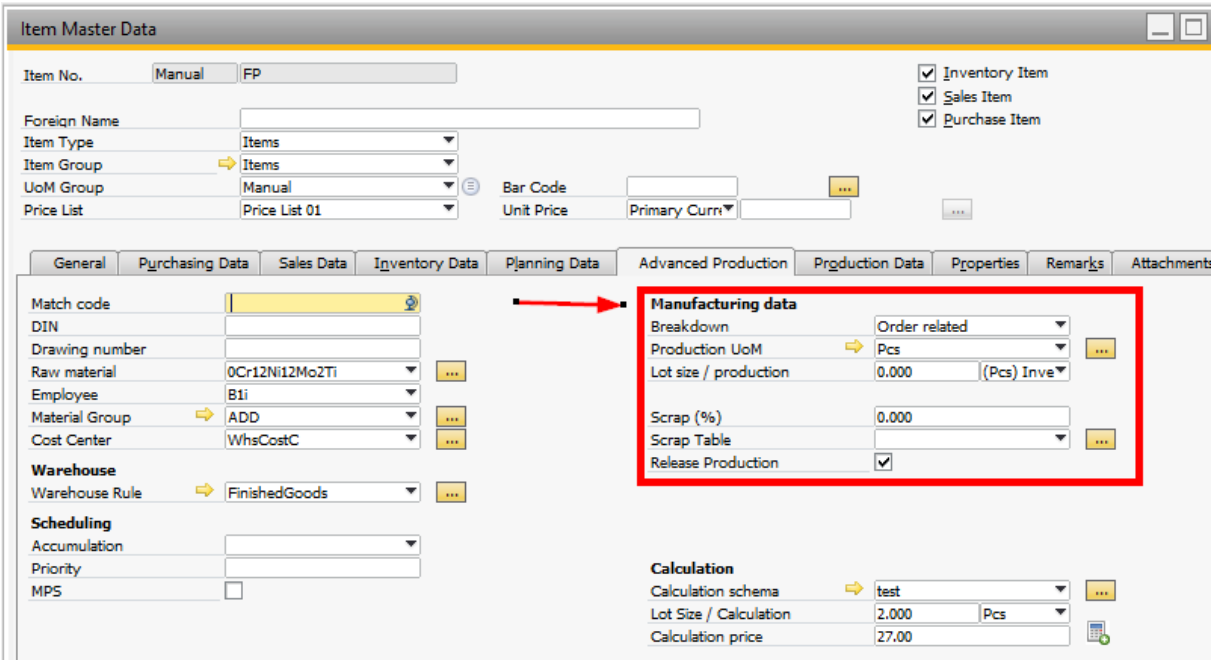
Field	Description
	accumulation is recommended. The calculation time is shortened, and the view is easier to understand. **Note** This setting is available in MRP, as well. The rule with the highest summation applies in every case. Purchase order for several instances of the same Item with different delivery dates is supported. The items therefore appear in several lines in Order recommendation. ***See* MRP scenario > Detail > Peggings**. ***Example:*** Item: Detail, MRP: Day: summed by day Item: Tag, MRP: Detail: only this item is summed by day Item: Tag, MRP: Month: summed by month ***see*** MRP Wizard – Planning scenarios – Detail Calculation duration
Priority	MRP runs can be sorted by priority. If a material has a high priority and a requirement, the requirement-originating assembly also receives the corresponding priority. You can configure whether a high or low number displays a high priority in the Setup Wizard (ascending or descending).
MPS	Activate if an item is scheduled via MPS.

back to Item Master Data

7.1.8.4 Advanced Manufacturing data

This section of the Advanced Production tab includes Beas fields associated with Manufacturing data.

© 2026 Boyum IT Solutions A/S



Field	Description
Breakdown	Define the Breakdown type. ***See*** Concept breakdown
Production UoM	The unit of measure for consuming this item when it is a component of another items bill of materials during production. ***See*** Edit item's unit of measure All other units are managed in the Purchase Data, Sales data and Inventory Data tab or centrally using the orange arrow in the "Units of Measure" window. Quantity units for production In master data the BOM quantities and the work order quantities are always indicated in production UoM The unit can be used in which material was actually withdrawn: for example storing in liters, but withdrawal in kg. In all functions, where required quantity and

© 2026 Boyum IT Solutions A/S

Field	Description
	stock are indicated, the total stock is always displayed in inventory UoM, as otherwise no comparison of planned quantity, posted quantity and stock would be possible. A special case is single material posting There, the withdrawal quantity can be given in production UoM, which is converted to Inventory UoM immediately. The conversion from inventory UoM to production UoM is defined in Quantity units – Conversion Note: All other units are managed in Purchase/Sales/Inventory tabs or using the orange arrow in window "Quantity units" The [...] button opens the SAP UoM setup table. The yellow arrow opens the Beas Unit of Measure editing window.
Lot size / production	Production lot size in warehouse unit. Define the max. Lot size for production in Inventory or Production UoM ***See*** concept Lot size **Limitations** If the lot size produces more than 10 Positions, the system asks if you want to continue. If the lot size produces more than 200 Positions, the system cancels the process with a message: *' Lot size is set to <losgr>. This corresponds to <summ> Positions created. Max. allowed are*

© 2026 Boyum IT Solutions A/S

Field	Description
	however <limit> positions. Creation is aborted (LimitLotSize)' It is possible to increate the limitation. Note on sub-structures: Lot sizes of order related sub-structures are considered only if activated separately. ***See*** Configuration wizard – Production – Create new. If the count of the created positions is larger than the limitation, the system ignores the lot size in the last position and displays an error message (*LimitLotSize)* ***Example***: 1000 Pcs, Lotsize = 1. 200 Positions created. Position 1-199 for 1 Pcs and Position 200 with 801 Pcs MRP Calculation: Ignores Production Lot size while calculating requirement based on sales order, forecast and other documents. Precalculation - Lot Size Precalculation supports Production Lot size **Lot size - Precalculation** - "Calculation lot size" is the default lot size for the calculation. - "Production lot size" is the maximum lot size and is relevant for the calculation of fix costs.

© 2026 Boyum IT Solutions A/S

Field	Description
	 *Window pk_haupt_edit.psr* The production lot size affects: - Setup times in a Bill of materials position. - Fixed times (Quantity per = 0) in routing positions. - Fixed surcharges. - Purchase prices (special price list). - Price per lot size In sub-components the calculation uses the production lot size. If you activate Configuration wizard > Production > Create > Sub-assemblies: Consider production lot size, the system uses the production lot size defined in the sub-component, otherwise the lot size of the main item. ***Example:*** Routing position 10 Min setup time, 5 Min Mach+Labor time Lot size calculation: 100, Production: 0 (ignore it) `Cost = 10 Min + 100* 5 Min = 510 Minutes * cost rate`

© 2026 Boyum IT Solutions A/S

Field	Description
	Total 100 Pcs Total 10 Min Lot size calculation: 100, Production: 30 In this case we must calculate the production `30 + 30 + 30 + 10 = 4 times`. `Cost = 4*10 Min + 100*5 Min = 540 Minutes * cost rate` Working with sub-assemblies If consider Sub Assemblies is activated, the system split the sub-assemblies too ***Example:*** Production 40 Pcs, Lot size 30 Pcs Sub assembly is order related, Production lot size = 0 Pcs (no lot size) This case is a WO position-related process. If an order-related sub-assembly has its own lot size, the system checks this, as well - but always per production level

© 2026 Boyum IT Solutions A/S

Field	Description
	from the parent item. ***Example*** : Lot size 20 Pcs In this case the setup time will be multiplicated with 4 in the sub assembly **2. Example for order-related sub-assembly:** - Main and sub-item are order related, the lot size of the main item is 50 - We need the sub-assembly 2 times per main item, the lot size of the sub-item is 90 - We want to produce 140 Units of the main item  <u>Result:</u> - We need to produce 3 lots for Main item (50 + 50 + 40) - For the first and second lot of the main item we need 2 lots of the sub-item (90 + 10) - For the last lot of the main item we need 1 lot of the sub item (80) <u>Stock-related</u> if the sub-assembly is stock-related, the sub-assembly ignores the lot size from

© 2026 Boyum IT Solutions A/S

Field	Description
	the parent assembly:  if the stock related sub-assembly has its own lot size, the system uses it without relation to the lot size of the parent item. Note: This is working differently than in Beas 2020.11 or older. If you need the old functionality, you can change this in a user event. ***See*** Script documentation.
Cut-off %	Portion of cut-off Only available when Mode of Procurement is defined as "Buy". This field is used to define a percentage of the material that is wasted when it is used as raw material for production. For example: if Cut-Off (%) is set to "10" and the item is linked to a Bill of Material with the quantity of "50", Beas changes the quantity to "55" in the position when a Work Order is created ("50" from Bill of Materials plus "5" from 10% cut-off rate). Cut-Off (%) is also considered while calculating cost in the pre-calculation functionality. Video: Scrap on Item Level ***see*** Scrap, Calculated scrap, Option consider cut-off, Production item – cut-off

© 2026 Boyum IT Solutions A/S

Field	Description
Scrap %	Portion of scrap This value is used for Precalculation. Only available when Mode of Procurement is defined as “Produce”. Scrap factor for assemblies relates to the material requirement for an assembly rather than the assembly. **Assemblies:** Scrap factor for assemblies is not related to the assembly requirement, but only to the material requirements of this subassembly. In Precalculation, there are only an information on quantity for BoM item and assembly. This creates an additional requirement for the assembly. If then a work order is created, the behavior may vary. **Phantom assembly** Scrap factor is calculated and entered as "calculated scrap" into the BoM item and taken into account. **Order-related Item** BoM Order related items do not apply the scrap factor. The system generates a work order position for the order related item and the scrap factor is applied to the sub work order BOMs only. **Purchase part:** The scrap factor is calculated in the work order as total value, added to the cut-off value and other scrap factors and entered to the BoM column calculated scrap.

© 2026 Boyum IT Solutions A/S

Field	Description
	Precalculation: entered in **Master Data > scrap** and also taken into account. Note: For using order time receipt function and reporting scrap ***See*** Configuration wizard – Backflushing Video: Scrap on Item Level ***see*** Concept Scrap, Calculated scrap, Option consider cut-off, Production item – cut-off
Cut-off / Scrap Table	Cut-off factor and cut-off surcharge of the item. Define item based scrap on table level. The Scrap defined in Scrap/Cut-Off Table The scrap factor affects: purchase parts: "calculated scrap" assemblies: material requirement of the subassembly sub-assemblies: surcharge for scrap in sub-components Note • using order time receipt function and reporting scrap ***See*** Configuration wizard – Backflushing • no consideration in Precalculation Video: Scrap on Item Level ***see*** Concept Scrap, Calculated scrap, Option consider cut-off, Production item - cut-off Click the [...] button to open the Cut-off table.
Release Production	Release for production? If disabled, no work order may be created for this item.

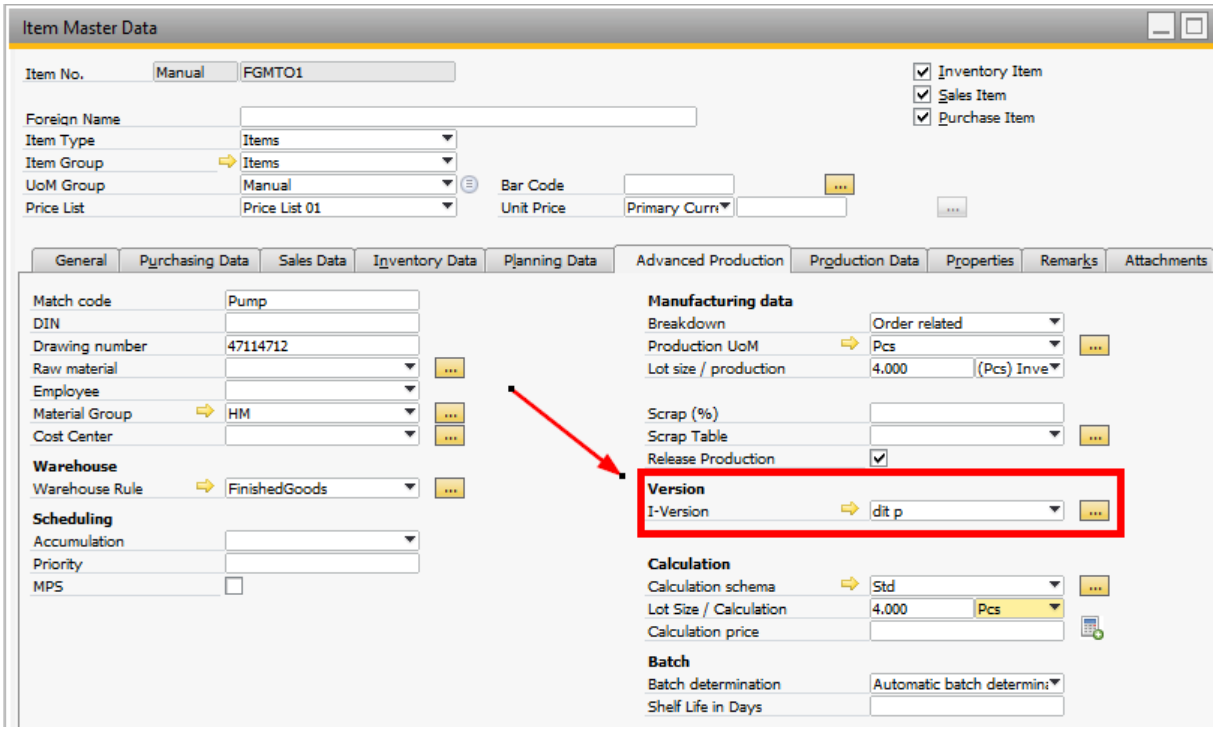
© 2026 Boyum IT Solutions A/S

Field	Description
	See WO Document position.

back to Item Master Data

7.1.8.5 Advanced - Version

This section of the Advanced Production tab includes Beas fields associated with Item-version management.



Field	Description
I-Version	Select an item version from the drop-down. The yellow arrow opens the Item version editing window. The [...] button opens the I-Version browse window with a list of existing versions of the current item.
Administration	⊟ Methods of item administration Here you can define how the BoM and routing

© 2026 Boyum IT Solutions A/S

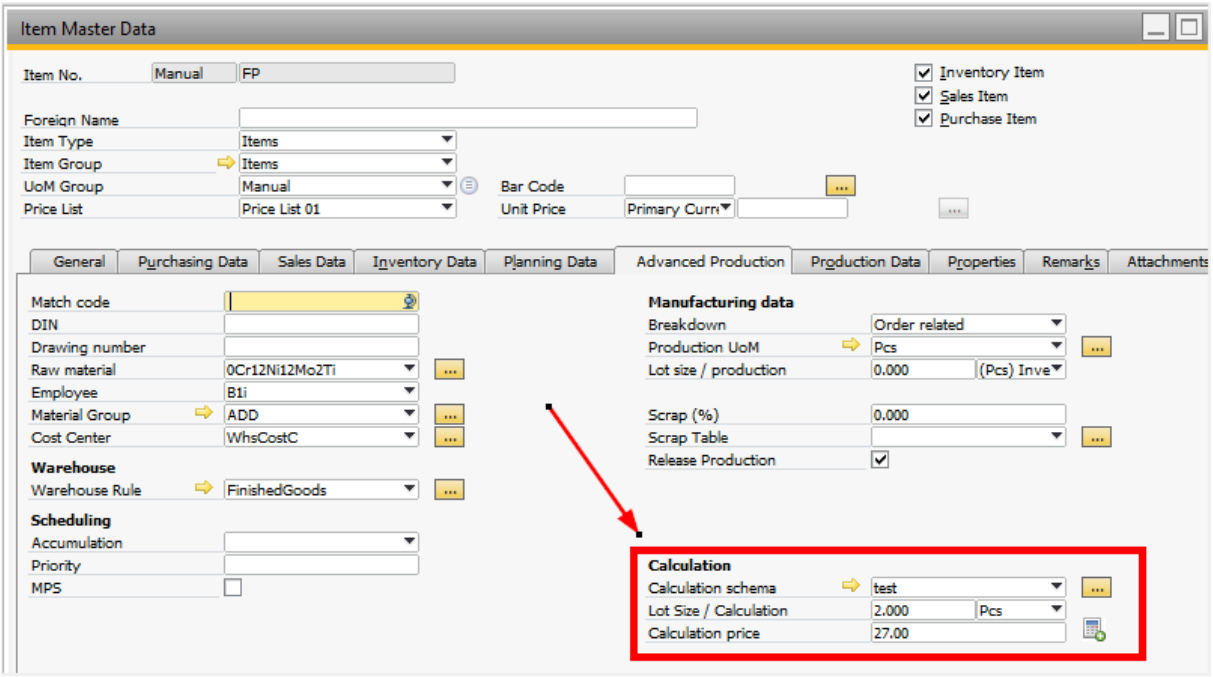
Field	Description
	are linked to the item. Only editable if an Item, a batch, or serial managed item and a Version is defined. **Default** = ID of BoM and routing are the same as the item ID. **Extended view** = like default, but in structure view the BoM / routings are displayed per version. This setting affects only the display. **Separate BOM** = Item ID, BoM ID and routing ID can be different. In the item version you store which BoM is to use for the item and for the version. In the BoM you define which routing to use. To activate this field: 1. Click icon right of Item Version – open list of all Item Versions 2. Define a version and go back to the item window 3. Choose the Administration (this field) and update the window. Now full functionality is available for this item.

back to Item Master Data

7.1.8.6 Advanced Calculation

This section of the Advanced Production tab includes Beas fields associated with Precalculation.

© 2026 Boyum IT Solutions A/S



Field	Description
Calculation schema	Default – Calculation schema. Defines which calculation schema to be used for Precalculation and work order valuation. Work order creation: If Calculation schema is defined in the Configuration wizard the Beas ignores the setting in Item Master data. If no Calculation schema is defined in the Item Master Data and Configuration Wizard, Beas uses Schema "Std". ***See*** Configuration wizard Calculation schema. The [...] button opens the window listing all existing Calculation schemas. The yellow arrow opens the Calculation schema editing window.

© 2026 Boyum IT Solutions A/S

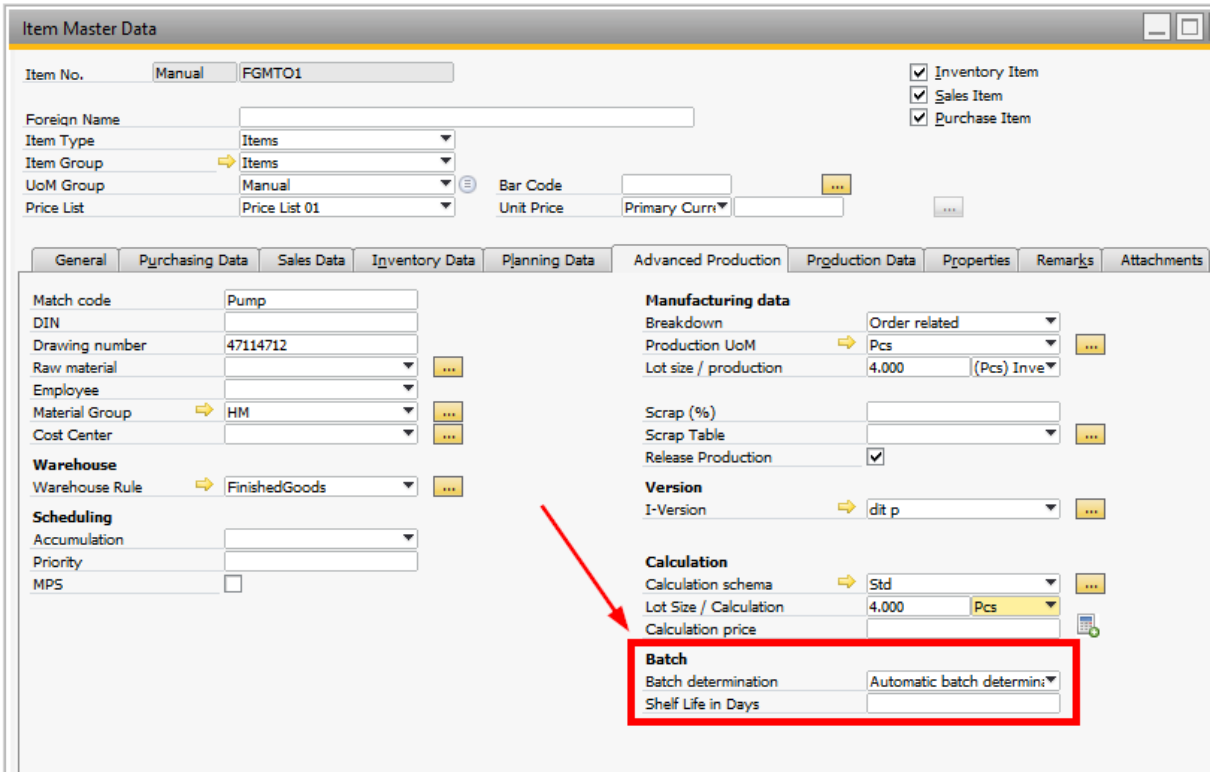
Field	Description
Lot size / Calculation	Predefined calculation lot size in warehouse units. Define a batch size for calculations. Pre-calculations can be executed using predefined batch sizes. Batch Calculation always uses the Lot size defined in this field. The Unit of measure is displayed. This can be defined per Inventory or Production UoM ***See*** Concept Lot size
Calculation price	Manually include a price to be used as reference for postings and calculations. However, after running a Batch Calculation process, Beas updates this field with the actual calculation value. The Unit of measure is displayed right of the field. ***See*** Edit batch-calculation – fill calculation price The calculator icon opens the Beas "Calculation tab" in a separate window.

back to Item Master Data

7.1.8.7 Batch

This section of the Advanced Production tab includes Beas fields associated with Batches.

© 2026 Boyum IT Solutions A/S



Field	Description
Batch determination	Determination options Set up batch determination Beas can generate the batch automatically for a receipt transaction. Here you can set up whether the batch is entered manually or generated automatically when posing in material. **Batch according to material**

© 2026 Boyum IT Solutions A/S

Field	Description
	If this option is selected, Beas creates the batch of the finished product with the same number as the batch of the last consumed material. **Example:** ***Example 1*** Assembly: "Paste y in container x" Bill of Materials: Paste y line 10 1. issue: batch aaa 2. issue: batch bbb If "Paste y in container x" is now produced and posted in, the batch number of "Paste y" of the last posting, that is batch "bbb" is assigned. ***Example 2*** Assembly: "Paste y in container x" Bill of Materials: Line 10, Material A001 (Batch-related) Line 20, Material A002 (Batch-related) Last Issue Line 20, A002, Batch aaa The System uses "aaa" as Batchnumber ***Example 3*** Last Issue Line 10 - A001, Batch aa1 and Line 20 – A002, Batch aa2 The System uses "aa1", because it is the first position **Temporary sorting issue:** At present the system is using the "BEAS_FTSTL"."POS_ID" as sorting, not the correct Sorting field "SortId". If you change the order inside the BoM, the program may not work properly. We are planning to fix this in Beas 9.3 PL 2 HF 1

© 2026 Boyum IT Solutions A/S

Field	Description
	Example: Booking according to material

© 2026 Boyum IT Solutions A/S

Field	Description
	Automatic batch determination Batches are generated automatically. Beas creates a batch number for the item based on the parameter in the Configuration wizard. **Enter batch manually** If activated, manual batch input is always performed for this item. **Attention**: Manual input is not supported at receipt creation by WEB Service. **Selection:** Manually – (*oitm.u_batchroh=M or NULL*) = Default Automatic – (*oitm.u_batchroh=N*) Batch according to material (only batches) – (*oitm.u_batchroh=J*) ***see*** Batch generation Configuration wizard – Materials management – Batch administration Configuration wizard – Goods receipt – Batches Production – Valuation and posting of the assembly – Batch administration Materials management – Manual postings – Batches
Shelf life in days	Defines the number of calendar days that are added to the items production date for calculating its expiration date. If a receipt is performed via Production or a Quality Control, release is performed, the shelf life date is reset from release. If the Manufacturing date is blank, the current date is used for calculation. If a manufacturing date is entered in the any receipt window, the date of expiry is calculated automatically (calendar days of shelf life are added to manufacturing date). ***see*** Batches to be verified

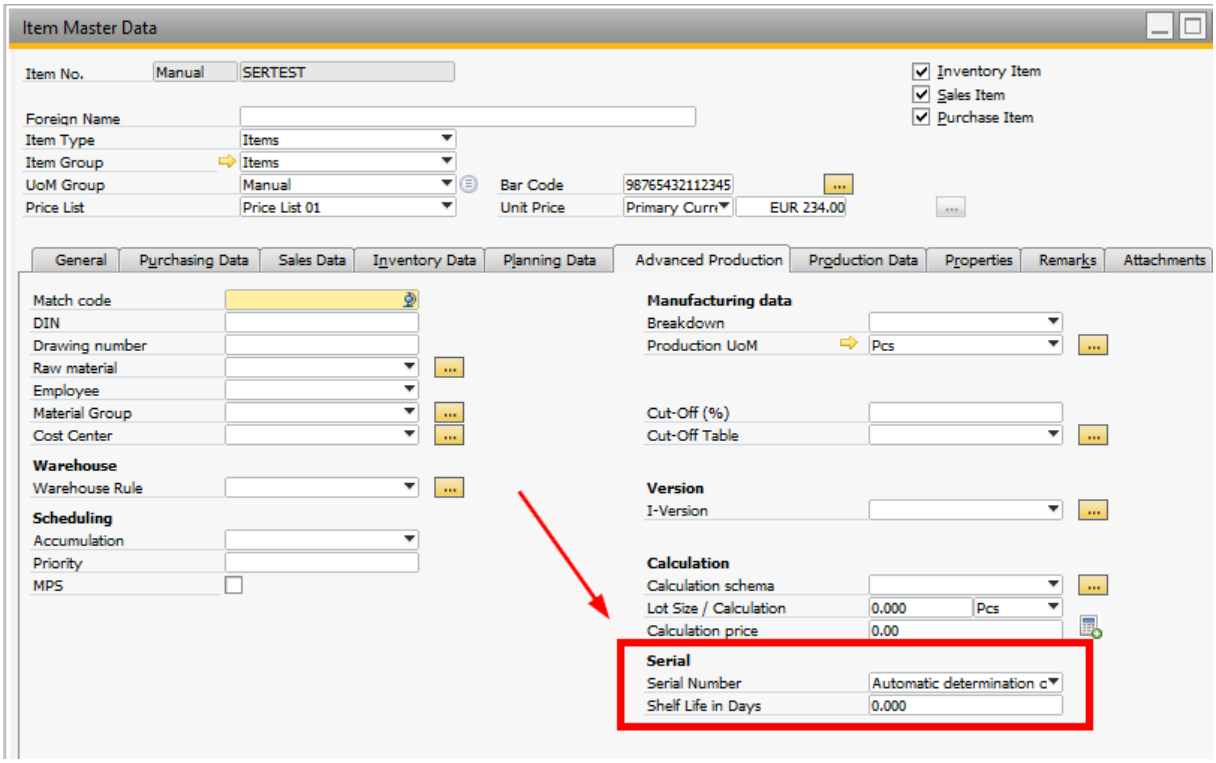
© 2026 Boyum IT Solutions A/S

Field	Description
	Calculation process: 1. Click on the calculator icon right of the field to open a calculator pop-up window. 2. Calculate the days, then click **Copy to Field** button and the result is copied in the field. 3. Click **Close** to close the calculator pop-up window.

back to Item Master Data

7.1.8.8 Serials

This section of the Advanced Production tab includes Beas fields associated with Serials.



Only visible for serial number related items.

Field	Description
Serial number	⊟ Set up determination of serial number.

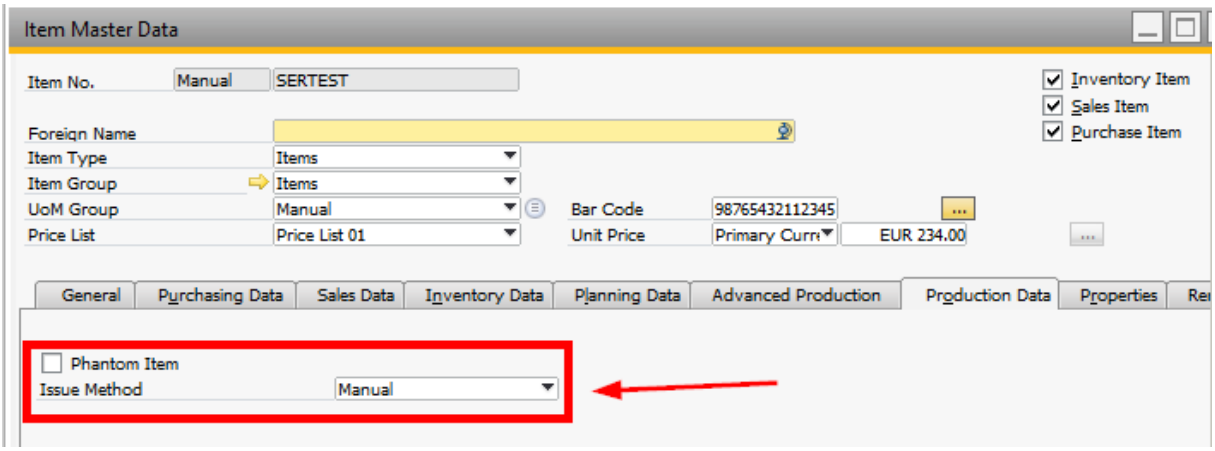
© 2026 Boyum IT Solutions A/S

	Automatic determination of serial number. Serial number is generated automatically at **Goods receipt** and **Production > Post in assembly** and in other functions. This is necessary, if working with automatic serial number reservation. ***See*** Serial number reservation For automatic generation the generation template needs to be defined in Configuration wizard. ***See*** Configuration wizard - Serial numbers Configuration wizard - goods receipt (*oitm.u_batchroh='N'*) Manual entry of serial number Serial numbers are defined manually. Automatic serial number reservation is not possible. (*oitm.u_batchroh='N'*) Default: manually (*oitm.u_batchroh='M' or NULL*) ***See*** Goods Receipt – Quantity Configuration wizard – Serial number reservation Batch generation
Shelf Life in Days	Defines the amount of days that are added to the items production date for calculating its expiration date. If a receipt is performed via Production or a quality control release is performed, the shelf life date is reset from release. Counted from production date - if empty, it is counted from today. If a manufacturing date is entered in the Goods receipt window, the date of expiry is calculated automatically. (calendar days of shelf life are added to manufacturing date).

© 2026 Boyum IT Solutions A/S

back to Item Master Data

7.1.9 Production Data



The Beas relevant fields in this SAP tab are:

Field	Description
Phantom item	Is it a phantom item? Phantom items only define the Bill of materials and routing, have no inventory maintenance and can be neither purchased nor sold. An assembly can have any number of phantom items, finally used to combine the Bill of materials and routing according to the assembly principle. **Note**: A phantom item is an item type in Bill of materials which only has a technical or structural function. Phantom items are not actual components or intermediate assemblies, so they are defined as non-warehouse items. For example, a company produces different laptops as finished good, and all different laptop models use the same set of cables: monitor connector, power connector, HDMI cable. It is easier to group the set of cables as a phantom

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>item in Beas, so you do not have to assign the cables to each Bill of materials separately. To do so, we have to create the Bill of materials with all required cables, and link the phantom item as a component of all laptop models. After creating a Work Order, Beas only includes the phantom item structure (Bill of Materials and Routing) and not the item as an assembly.</td></tr>
<tr><td>Issue method</td><td>Defines the issue method.

Defines the way the item is issued in production: backflushing (automatically) or manually.

<table><tr><th>Setting</th><th>Description</th></tr><tr><td>Manually</td><td>The components are manually output to the production order without considering the output of the product.</td></tr><tr><td>Backflushing</td><td>The components are automatically issued to the production order once completion of the higher-level item is reported. (e.g. reporting the last operation, Goods receipt of the assembly or via Materials Management – Backflush).</td></tr></table>
Serial number- or batch number-managed items cannot be set to "Backflushing". However, if this type of item should generally be removed with backflushing, it can be activated in the Configuration Wizard.
see Backflushing - Also post batches
Webinar 8/2017, Part Configuration</td></tr>

Window

Templates

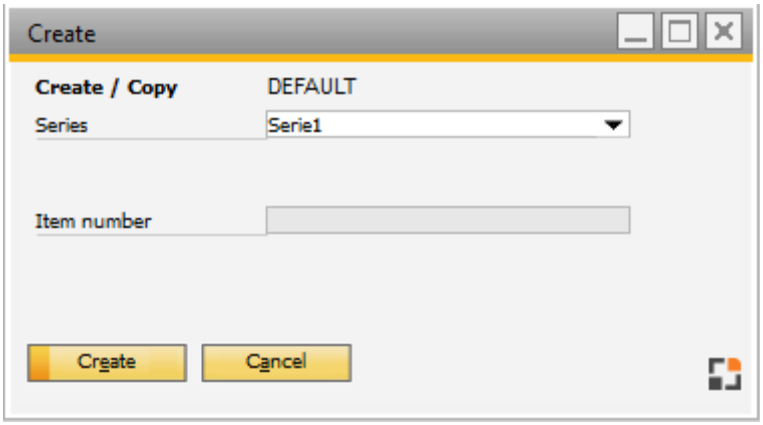
7.2.1 Create new items

In this window you can create or copy new items.

When creating an item, Beas always makes a copy of the item and copy all item information linked to it e.g. Bill of materials, routing, quality control information, warehouse information, but no stock.

The base item is defined in **Configuration wizard > Master data > Item > Default item**
In this way it is possible to work with templates.

© 2026 Boyum IT Solutions A/S



Window artikel_new

Field	Meaning
Series	Choose the Document Numbering of item generation In SAP Business One **> Administration > System Initialization > Document Numbering > Setup** you can define the Series for an item  The field "Series" is only visible, if additional Series are defined. If you choose a series, the field "item number" is locked, because Beas will create the next number automatically.
Item number	Item number of the new item Selecting series, no entry of item numbers is possible. Note: Not all characters are allowed. ***See*** key fields.

© 2026 Boyum IT Solutions A/S

Working with Item Generation

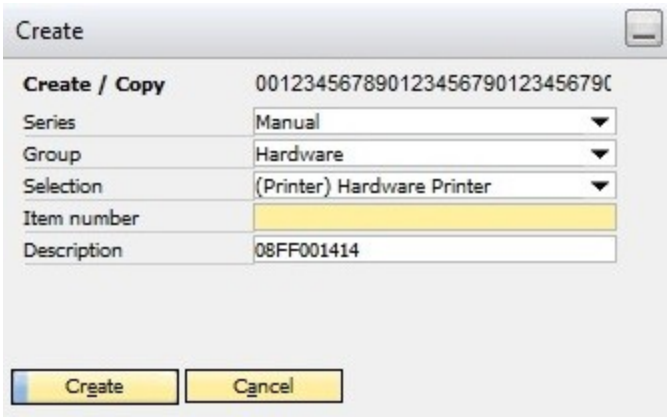
With the item generation function it is possible to define templates or item number / description generator.

See Generate Item

With this item generation the creation of items can be more automated.

Example: Generate item numbers and description related to a 2-Level item number generation.

Additionally, it is possible to use another template item related to the chosen Group/Selection.



Window artikel_new

Additional fields related to Item generation settings:

Field	Meaning
Group	The Item Generation Group
Selection	The Second Level for Item Group
Description	The new description

Technical information

Beas uses the DI-API. The copy function does not exist.
Beas exports the source item to XML and imports this XML via DI-API.

It is not compatible with Item Version Control. It makes only a copy of the Bill of materials and Routing which have the same number as the item number.

Beas copies the following tables:

© 2026 Boyum IT Solutions A/S

OITM, BEAS_STL, BEAS_APL, BEAS_APL_WKZ, BEAS_STL_HEADER, ABEAS_APL_HEADER, BEAS_ITEM_VERSION, BEAS_OITM_PARAMETER, BEAS_OITM_PRODUKTKONFIGURATOR, BEAS_QSVERWEIS

See Item generation

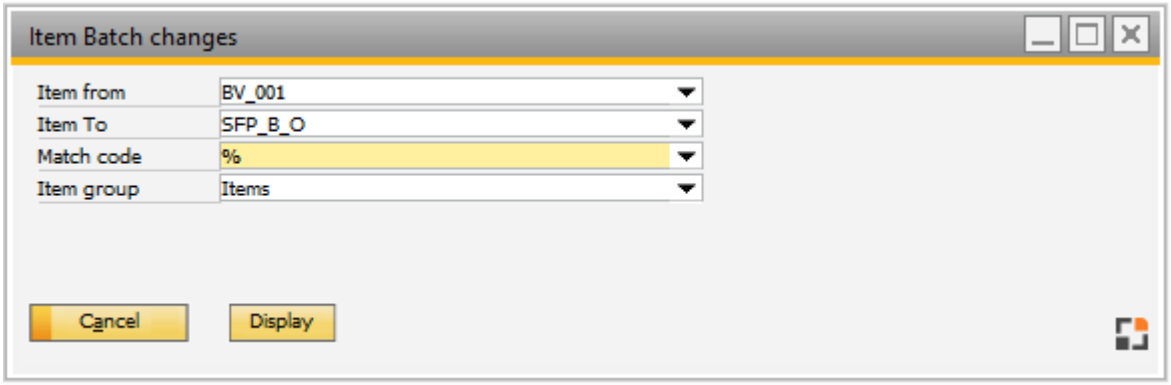
7.2.2 Item Batch Changes

The item batch change function enables changes to several properties in one go.

The sequence is as follows:

1. Setting of search criteria, dependent on item numbers
2. Selecting the item number to change
3. Defining the fields and properties to change, respectively

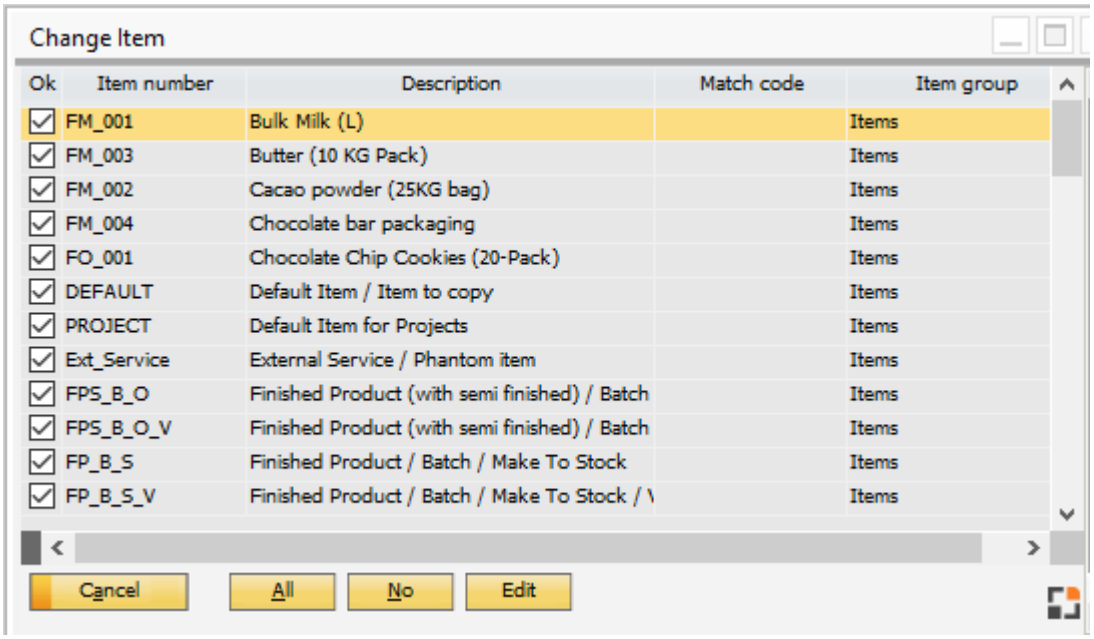
Call this function via **Master Data > Item Structure > right-click > second tab > select item batch change.**



Window artikel_batch_aend_suchen.psr

Select the items to be modified using the selection criteria, then click **Display** to list the results:

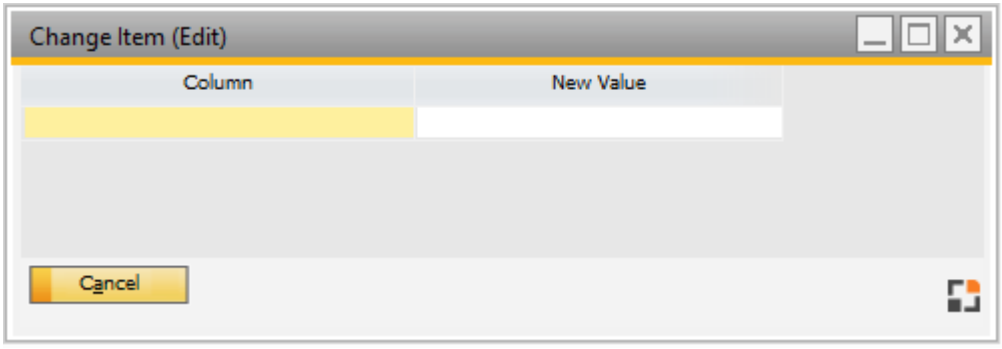
© 2026 Boyum IT Solutions A/S



Window artikel_batch_aend_auswahl.psr

Change

The items to be changed have to be selected in the result list. Then, select **Edit**.



Window artikel_batch_aend_ausfuehren.psr

In this window, select the field to be modified in the "Column" field, and select the new field value in "New Value".

Changes are possible for the following fields:

- Unit Inventory
- Unit BoM
- Item Group
- Profit Center
- Primary Inventory

© 2026 Boyum IT Solutions A/S

- Lot Size for Calculation
- Calculation Template

"Start Change" immediately performs the changes.

back to item master

7.2.3 Inventory History

The inventory history can be accessed from almost any location where items are shown.
For example:

> PATH: Inventory > Item structure > Select an item > right-click > Invent.history

Tabs

4 Notes on MRP scenario in area **5**

Note: MRP results with Item versions are not displayed in this area.

5 MRP scenario: (planning view) Result of last MRP run, which has been defined as standard MRP run.

Important: It shows the moment of the calculation. Following the rules, which have been defined in MRP wizard, customer orders are broken down, forecasts are taken into account and other parameters have effect. The result has nothing to do with the current stock and status displayed in the upper area (**1**).

View the upper area for current actual stock.

Field description current report of stock and reservations **(1)**

All Quantities in Inventory UoM

Field	Description
Warehouse stock	Inventory across ALL storage locations except blocked storage locations.
Thereof reserved	Reserved goods of type "warehouse reservation" (Beas reservation system) **WMS integration:** This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Blocked stock	Total inventory of blocked batches or in blocked warehouses. If MRP wizard in stored Standard MRP run it was set up, that blocked batches are available, these will not be displayed here. If the option is disabled, blocked batches are displayed as usual blocked stock.
Sales order	Planned issue for customer orders and reserve invoices. Determined by SAP Business One *OITM.committed*

© 2026 Boyum IT Solutions A/S

Field	Description
Thereof reserved	Reserved quantity for customer orders.
Goods issue for Production	Planned issue for production Planned quantity as per BoM, minus already posted quantity plus canceled quantity. Only work orders are considered which are visible, not completed and not blocked. Planned work orders are not considered. Note on post calculation: As reference serves the Total Quantity *BEAS_FTSTL.TOTALQUANTITY_WHSUNIT* less all already performed issues and receipts. For computation the SQL Procedure `beas_invhistory` is used. Blocked work orders *BEAS_FTHAUPT.SPERRUNG<>'J'* are considered if they are planned orders *BEAS_FTHAUPT.PLANNINGORDER=1* Planned quantity as per BOM, less already posted quantity plus canceled quantity. Only work orders are considered which are visible, not completed and not blocked. Planned work orders are not considered. Negative planned quantities are ignored. These are part of "goods receipt from production". If position is not closed and you post out more quantity than planned, it produces a negative quantity. ***Example***: Planned: 10, Post out 15 = -5
Goods receipt from production	Planned receipt from production Summary of planned receipt from production minus already posted and manually reported quantities plus canceled postings. This is the sum of Production Positions and Bill of material positions with negative quantity. Only work orders are considered which are visible, not completed and not blocked. Planned work orders are not considered.

© 2026 Boyum IT Solutions A/S

Field	Description
	If position is not closed and you post in more quantity than planned, it produces a negative quantity. ***Example***: Planned: 10, Post in 15 = -5
Goods receipt from PO	Planned receipt from purchase orders, determined by SAP Business One (Field "ordered". Use the MRP wizard to configure whether unreleased orders should be considered.
Available	Warehouse stock minus reservations plus planned receipt.

Functions

Function	Meaning
Print	Open printer selection to print the current view. Note: stock report (middle part) is not printed.
Inventory Movements List	Open Inventory Movements List.
Document open	Open the assigned document, which was marked in the lower list.

Window settings are available.

7.2.3.1 Bin Location Structure

The "Bin Location Inventory" tab is active inside the Inventory History window if bin location is active for an item.
The tab displays stock information per every warehouse and bin location in a structure view.

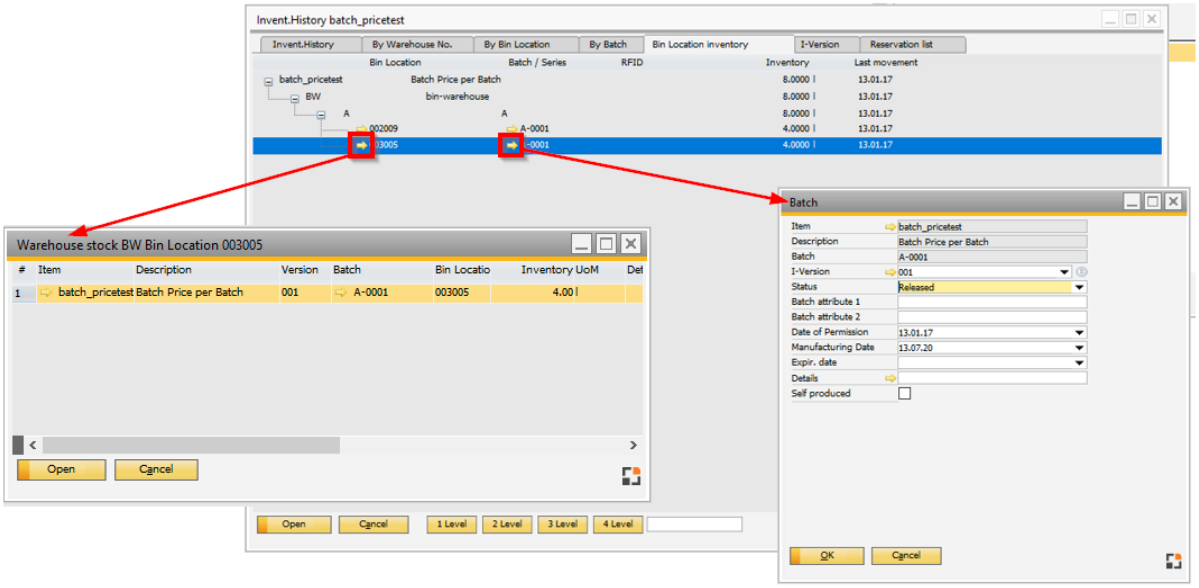
Functions:

- SAP Bin Management Support (since Beas 9.3 PL 02)
- Beas Bin Management support
- Link to Bin Location
- Link to Batch / Serial Number
- Search function by Batch / Serial number and Bin Location
- WMS Bin Management support (since *Beas 9.3 PL 02 HF2*)

With the yellow arrows you can access stock information on materials per bin location and batch/serial number details (***see*** image below).

© 2026 Boyum IT Solutions A/S

PATH: Inventory > Item structure > Select an item > right-click > Invent.history > Bin Location inventory tab



Controls:

Level 1–4: You can expand the structure view to several levels from warehouse information to bin locations and stock information (***see*** image above).

Search field: Search by batch/serial number, bin location and warehouse for stock information. (***see*** image below: Batch number "0117" is entered. Result: only the searched batch is displayed in a structure view)

© 2026 Boyum IT Solutions A/S

Date	Filter from ... to date
Sorting	Adjustable sorting (drop down)

After selecting filters, click on "Start". In the area below, results are displayed.

Field	Description
Document	Document number
Journal remark	Reason of journal entry (goods receipt, stock evaluation)
Date	Entry date
Reference	Reference
Item	Item ID
Description	Item description
Batch / Serial number	Batch / Serial number of the item
Receipt	Total quantity inflow
Issue	Total quantity outflow
Warehouse	Item warehouse
Price	Information price as per posting document. Note: only a price for information. The actual posting price cannot be determined for technical reasons.
Inventory Currency	The main currency stored in the system. The information is read from SAP's "B1_OinmWithBinTransfer.InvPLCurrency" database field.
Inventory Price	The price of the invoice when it is different than the price defined in the origin document. The information is read from SAP's "B1_OinmWithBinTransfer.InvPLPrice" database field.
Receipt Line	Calculated purchase quantity for each batch/serial item inside the document line. When you create a document line in SAP, it may contain different costs for each single unit of the line. This column together with the "Calculation price" reflect the cost applied to this number of pieces.

© 2026 Boyum IT Solutions A/S

	Make visible/hide this column using the Window settings right-click option. ***See*** **Item Master data > Inventory data tab > Valuation method** setting.
Issue Line	Calculated issue quantity for each batch/serial item inside the document line. When you create a document line in SAP, it may contain different costs for each single unit of the line. This column together with the "Calculation price" reflect the cost applied to this number of pieces. Make visible/hide this column using the Window settings right-click option. ***See*** **Item Master data > Inventory data tab > Valuation method** setting.
Currency	Currency of information price
Remark	Free text
Customer name	Customer name
Customer	Customer ID
Project	Free text
User	Registered user who performed that posting. Note: for Terminal or WEB users, normally the "manager" or "B1 APi User", who was set up in the Configuration wizard. Registered user, who made that entry
Personnel, Name, Station	Personnel number and name of the employee. If Terminal or WebApps were used for posting, the personnel number is stored in posting document. The following documents are affected: - receipt - issue - transfer - goods receipt

© 2026 Boyum IT Solutions A/S

	In this case, the Personnel number and the name is displayed of the user logged on in WEB-Apps or Terminal. Additionally, the name of the work station is displayed for these transactions.

Bin location transactions show details of a posting, which bin location, which batch etc.

Support to older Beas versions:
If you want to report entries created with older Beas versions add the following script to enable variable "lb_displayoldentries":

```
global function form_opened
setvar=lb_displayoldentries=1
return true
end global
```

back to inventory history

7.2.3.8.1 Bin location transactions

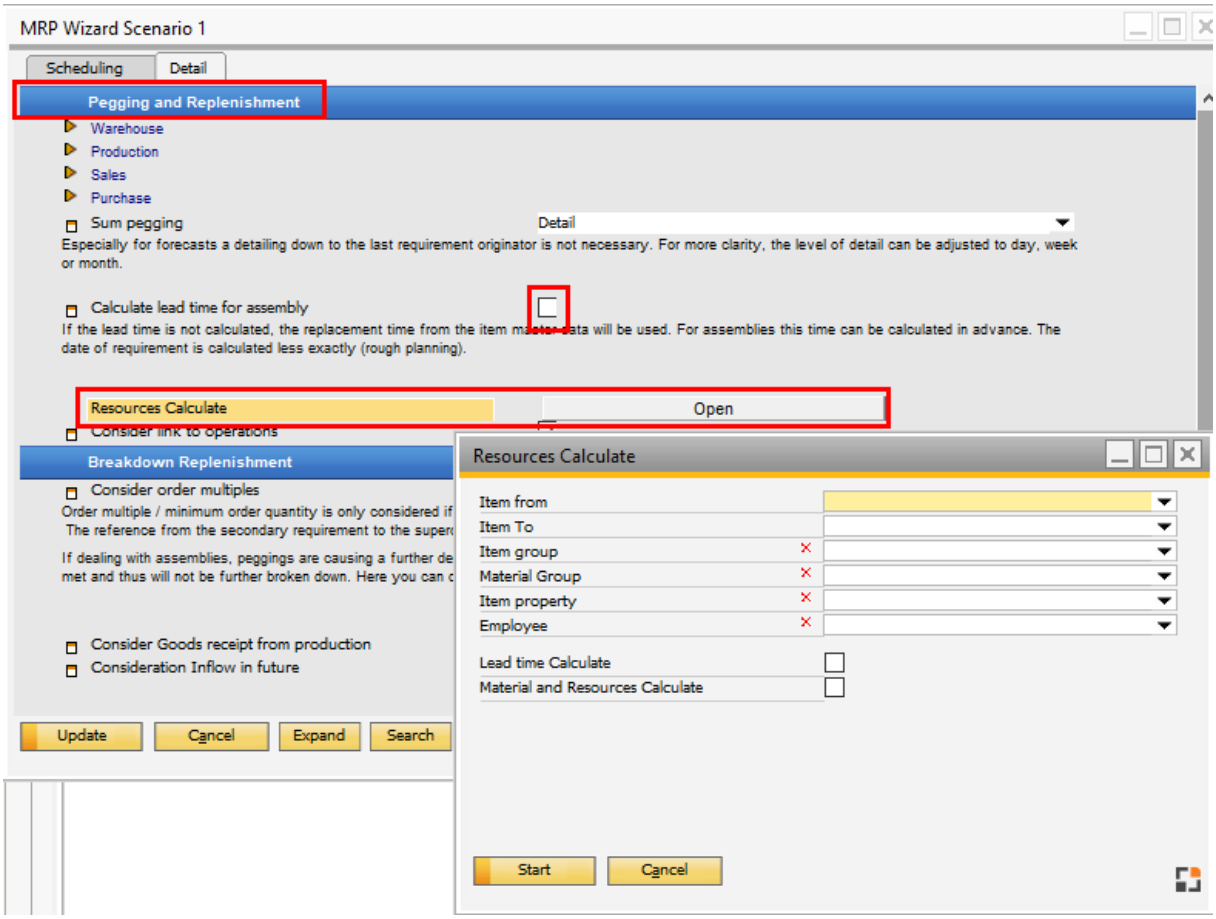
7.3.1.1 Calculation

In this window, the material and resource requirement and the replenishment time can be calculated in advance for an assembly:



artikel_resourcenberechnung.psr

This window can

- Calculate lead time for item master data
- Calculate Bill of Materials and Resource, which you need for fast forecast calculation in MRP
- Create table for Material and resource with complete material and resource requirements

Which assemblies to calculate can be selected with filters on item, item group etc using a (AND)-conjunction

Calculation lot size: The calculation lot size is the "Lot size / production", defined in the item master data.

© 2026 Boyum IT Solutions A/S

Calculation date: Every calculation needs a delivery day. The system uses today + 100 calendar days as delivery day. It uses this day to check which Bill of Materials position or Routing position is active (Field Extended / Valid from / to). It uses the resource planning for the next 100 days. Calculation is standard backward calculation. If the resource calendar is not calculated, the system performs this automatically (*beas 2020.02*)

Configuration/Variant System: Configurations and Variants (formulas and scripts) are ignored in the same way as in MRP.

Short Variant: The system always uses the short variant A.

I-Version: If item version is used, the system always uses the I-Version which was defined as default I-Version in item master data.

Function	Description
Item from / to	⊟ Selection filter for Item area Note: Only items are calculated, which - not marked as deleted - Procurement Method is "Make" - Flag "Warehouse item" is active Item group	Additional filter item group
Item property	Additional filter item property
Employee	Additional filter Employee defined in item master data
Lead time calculate	⊟ if active, it calculates the lead time for an assembly Enabled: lead time is calculated based on the stored routing of the complete work order structure (order- and stock-related). Duration is the pure "production time" in work days. The result is entered in the field "lead time"

© 2026 Boyum IT Solutions A/S

	- Stock for stock related items is not checked. The system always calculates the complete structure - Use Resource calendar from today + 100 at End of Production (Configuration wizard, default 3pm) and calculate backward. - Result is duration day in calendar days. The system converts this to work days and saves this in the field "Lead Time" in the item master data. The result is always based on "Lot size / production" Converting to work days is always based on the main calendar. Note: if either this or the Material and Resources Calculate setting (***see*** below) is not active, no calculation occurs. ***See*** item master - planning data

Material and Resources Calculate	if active, it calculates material and resource requirement
	Material requirement and resource requirement is calculated based on the stored routing of the complete work order structure related to the manufacturing lot size. The required material and resource times are calculated for the complete production.
	
	The result is saved to the following tables:
	`BEAS_OITM_MATERIAL`
	`BEAS_OITM_RESOURCEN`
	
	Quantities and times are stored scaled down per quantity unit.
	
	Note: Material requirement of the purchase parts and storage related assemblies is saved. The requirement of order related assemblies is not saved, as these are neutral for balance calculation.
	
	IMPORTANT: if either this or the Lead time Calculate setting (***see*** above) is not active, no calculation occurs.

To perform the computation on a regular basis, you can create an activity.

© 2026 Boyum IT Solutions A/S

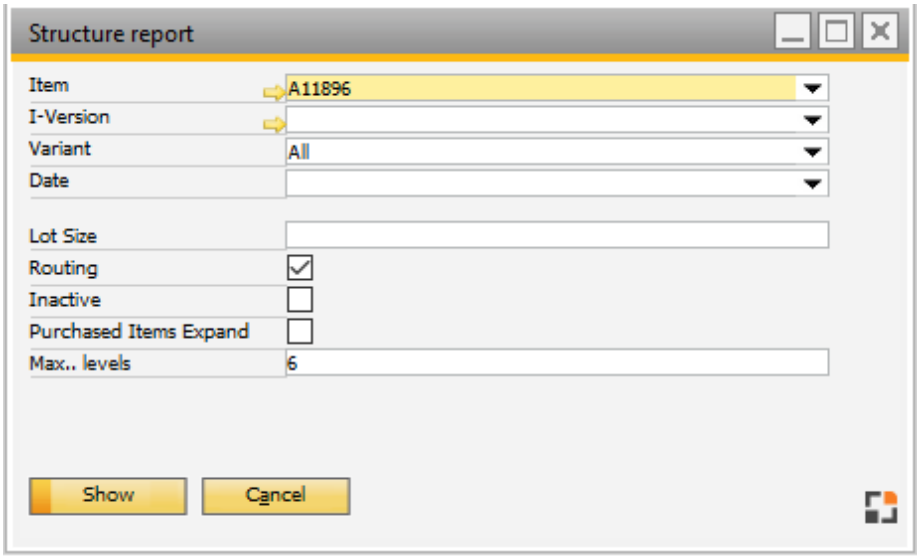
Item structure right-click menu

MRP wizard

MRP – Planning scenarios – Detail – Forecasts

7.3.1.2 Structure report

Via item list and item structure you can call up the structure report. *(beas 9.1 PL: 08)*
The report "item structure" accesses the same function.



artikel_strukturexport

Query parameters

Field	Description
Item	Select the item to display.
I-Version	Select the I-Version to display. If empty, the version stored in item will be used.
Variant	Select variant(s) to display (A-Z). ***See*** Variants
Date	In BoM and routing you can store the validity period. Here you can define the period for report creation.
Lot size	Define for which amount to create the report (usually the lot size)
Routing	How to display the routing: **no** – no display **normal** – as in item structure

© 2026 Boyum IT Solutions A/S

	no — no display **per BoM** — routing positions are displayed directly under the assigned BOM positions
Inactive	Enable check box to show inactive items in the report.

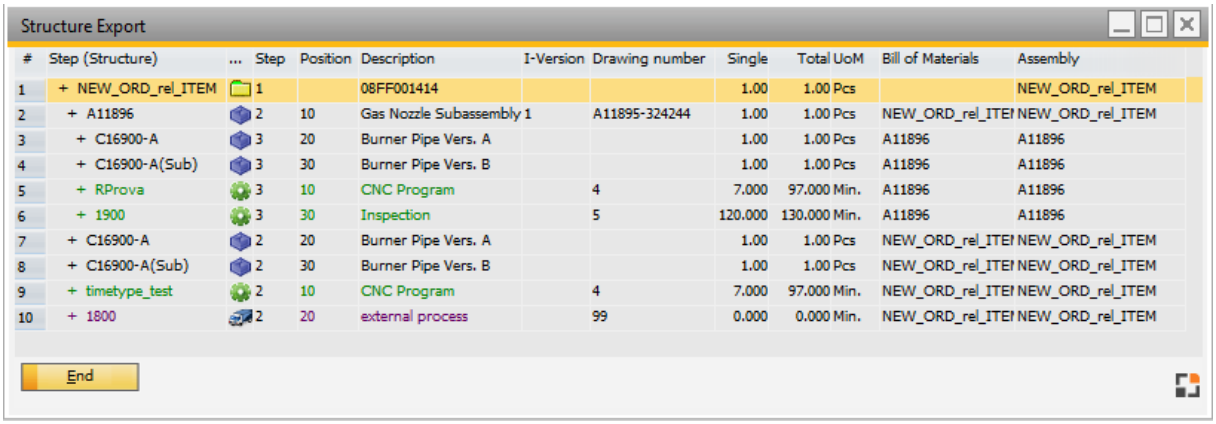
Purchase parts expand	If enabled, purchase parts with a Bill of materials will also be expanded.
	Default: off
	This setting does not affect first level.
	
	Example:
	Item "a" is a purchase item
	Item "a" has a Bill of Materials position "b" (also a purchase item)
	Item "b" has a Bill of Materials position "c" (also a purchase item)
	
	If this setting is disabled, you see
	`a +`
	`  | - b`
	
	if this setting is enabled, you see
	`a +`
	`  | + b`
	`  |  | - c`

Max. levels	Define the number of structural levels to be displayed by the report.

Report view (Structure Export)

Click the Button "Show" to view the report. Window settings and Templates are supported.

It is a table form. Structures to expand are indicated by a Plus-characters.



artikel_strukturexport_view

© 2026 Boyum IT Solutions A/S

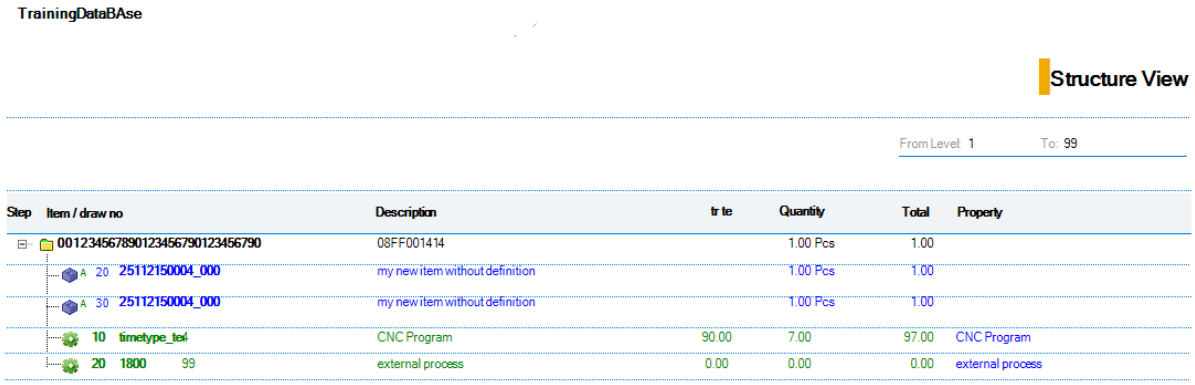
Important fields

Function	Description BOM position	Description Routing position
+	Click on + to toggle the structure depth	Display depending on selection: for BoM, material is displayed for routing, the resource
Level (Structure)	Next to the + icon (structure depth),the item number is displayed	
...	Icon stored in BoM and routing	
Level	Structure level	
Position	Alphanumeric position from BoM or Routing	
Pos Id	Internal position ID	
Item	Item number	resource ID
Designation	Drawing number from I-Version or from item	Activity
I-Version	I-Version ID according to BoM position	
Drawing number	Drawing number of item or I-Version	Operation number
Single	Requirement of a BoM position in item Production UoM per assembly unit	Job time in minutes per "Quantity per" Production UoM
Total	Total quantity per lot size Note: production lot sized in sub-assemblies are not taken into account. There may be different results than in Precalculation. Note: scrap factors are not considered.	Total required time per lot size
%	Percentage of BoM position of total quantity. Works only, if all positions have the same UoM.	
BoM	Used BoM	

© 2026 Boyum IT Solutions A/S

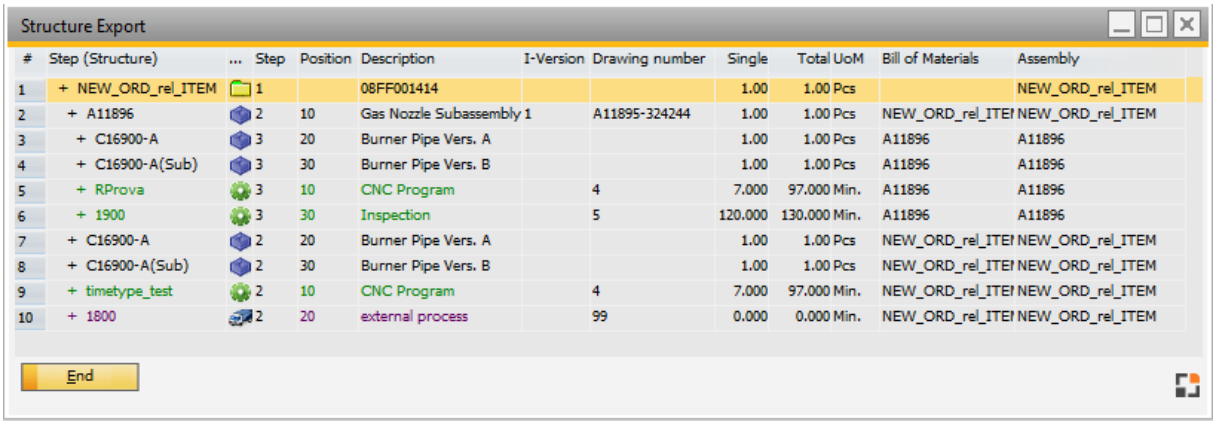
Assembly	Entry belongs to which assembly	
Type	50 = it is a BoM position	52 = routing position

Item Report as Crystal Report



Item Report as Beas Window

Item Structure > right-click > Item Structure Export



artikel_strukturexport_view

The structure export displays the total structure for one item, for one I-Version, for one period of validity or for a variant.

Further fields are available via Window settings.

- Notes:

Tools, alternative or parallel operations are not considered, the same applies for all connected rules. Scrap factors are not considered.

© 2026 Boyum IT Solutions A/S

Phantom assemblies are displayed like normal ones.
Authorizations for item and material groups are considered. If a user has no right to view a certain BoM, it is not displayed.

- Technical information

In table "BEAS_REPORTAUSWERTUNG" a report will be generated, the Variable "id" is returned. Use select * from "BEAS_REPORTAUSWERTUNG" where "ID"=<id> order by "NR" to put put the report.

ID
Art=50 = BoM position
Art=52 = Routing position

If this window is called up from a report (e.g. **Reports > Item structure**), clicking on "display" the window is closed and a Crystal report is opened.

7.4 Item master

The item master is a parallel function to SAP Business One-item master, but it provides the features for production management in separate tabs.
Beas uses this window. It can be accessed from SAP Business One item master window by right-click - Extended production.

The item master contains the following tabs:

Description of tab

Tab	Meaning
Master Data	All basic settings for an item entry.
Bill of Materials	- Item – BoM items. Tab is visible only if Item versions control was disabled (default). In this case the BoM number is linked firmly to the item.
Routing	- Definition of operations Tab is visible only if Item versions control was disabled (default). In this case the routing number is linked firmly to the item.
Configurator	Definition of the configuration for this item.

© 2026 Boyum IT Solutions A/S

Quality control	Define QC-inspection plans to be used for this item *(from beas9.0-000-003-000).*

Details are provided in the following chapters.

Continue to Master Data.

For editing item data the authorization "edit items" is required. Extended authorization control can be set up for routing and BoM.

See

User rights administration

Item versions control

7.4.1 Master Data tab

All basic settings for an item entry are made in the item master.

PATH: Inventory > Item structure/Item report > double-click an item > Item Master data for XXX.

Header

Field Description

Field	Description
Item Number	Unique item ID Define the internal item number with max. 50 characters. Limitation: Not all characters are allowed. ***See*** key fields. **Variant production**  If formula fields are set to "visible", the icon appears left to item number.

© 2026 Boyum IT Solutions A/S

</table>

Note: This function is only available if the Variant generator is activated in the Configuration wizard.

See more details in Formulas, Tables, Variables and BeasScript.
</td></tr>
<tr><td>Serial ID</td><td>Only display of the used serials (number range for new items)</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
I-Version	Version number of the item Note: Only for Serial- and Batch-managed Items Managing version controlled items allows to have multiple reviews of an item, with eventually a BoM and a routing associated to each version. It is possible to keep control over the usability of a version on different levels of the company processes and have a track record of the revision changes over time.  Default of the current item version If you work with the extended item version, indicate the item version to be used in the order recommendation report or creating work orders. If item version is defined, it is mandatory to define the default version in this field. This field is protected if the current item is not a batch- or serial-managed item. **Compatibility:** In old Beas versions it was possible to use Item Version control for all item types. We disabled this functionality, because a stock-managed control by Item Version is only possible for Batch- and Serial-managed items.

© 2026 Boyum IT Solutions A/S

Field	Description
	If you use Item Version Control for other items, the field "Item Version" is not protected. But for these items the system does not check the correct Item Version in transaction documents. Note: If you delete Item Versions and the item is not Serial/Batch managed, the system protects the Item Version field. If Item Version is active, it is not possible to switch Item Administration from "Serial/Batch" to "Normal". MRP can return wrong result if you work with item version and non-batch/serial managed items. ***See*** Datacheck. ***See*** VIDEO: Item Master Data - I-Version field VIDEO: Item Master Data - I-Version field Edit versions/variants (I-Version)
Barcode	Input of the European item Number (EAN) or item bar code. Any other bar code can also be printed. The bar code can have up to 16 digits. When a bar code is entered, the program checks if it already exists in other items. In this case, it is not allowed to leave the field. You need to enter a unique bar code to save it. Note: In case you wish to use bar code scanning in WebApp Terminal 2.0, you must set up 14-digit GTIN (EAN) bar codes. ***See*** WebApps 2.1 GS1-128 bar code support GTIN (EAN-14) bar codes
Description	Input of the description of the item This is the Item Name which you can see in every window

© 2026 Boyum IT Solutions A/S

Field	Description
	If Item Version is activated and you create a document, the Item Name defined in the Item Version will be used. If Variant Generator is activated and this item is part of the Bill of Materials, the system replaces all placeholder <...> from the description. ***See*** Variant description
Description in foreign language	Input of the description of the item in a foreign language. This description can be copied to documents for foreign language business partners.
Item type	Select from the following options: • Item - Use this option to define items in SAP Business One. • Work - Use this option in the service module to calculate the time required to perform a task. • Travel - Use this option in the service module to calculate the time that a service engineer is on the road. • Fixed assets (not available for selection in Beas) Note: Beas has its own resource administration. Item types "travel" and "work" is not used and therefore not supported. "Fixed asset" items are hidden in Beas, a processing is only possible in the fixed assets module.
Item Group	Divide items into groups Each item is only assigned to one group. The accounts to be charged are stored in the item group, when item group specific account definition is activated. The Item Group field is used later for reports and analyzes. If the user has extended authorization for routing of BOM this field is blocked. ***See*** User authorizations - extended.
UoM Group	Unit of measure group. ***See*** Concept UoM Group
Warehouse Item	Determine whether the item is inventory-controlled

© 2026 Boyum IT Solutions A/S

Field	Description
	The corresponding item can be used in warehouse management by selecting the Warehouse Item option. For example, inventory transactions such as transfers can only be performed for warehouse items. If an item is only defined as a warehouse item, this item cannot be sold or purchased. Note: To define an item as a non-warehouse item, remove the flag for warehouse items. Typical non-warehouse items are e.g. services, electricity or personnel costs. The additional costs incurred by non-warehouse items are listed in the production order. The default valuation method must always be used for non-warehouse items; in addition, an expense account must be assigned to these items (except in the case of an item group). Warehouse items can be converted into non-warehouse items and vice verse, as long as: • No transactions have been posted for the item • No documents exist for the item, e.g. quotations, sales orders, purchase orders, incoming or A/R down payment requests, or draft documents Note: Series or batch items cannot be defined as non-warehouse items.
Sales Item	A sales item is sold to a customer. If an item has been defined as a sales item, a sales order can be created for a customer. This category also includes services, as these are neither purchased nor warehoused.
Purchase items	Purchase items are bought by a supplier. If an item has been defined as a purchase item, a purchase order can be created, for example.
Fixed Assets	Select this option to define an item as a fixed asset, i.e. as an item which can only be bought. Not changeable in this form. Please use Extended (SAP Business One Item window)
UDF	It is possible to activate 4 UDF fields in the Configuration wizard. Note: The item master data is not a Beas table. You must link an SAP UDF field. For more information see Configuration wizard.

© 2026 Boyum IT Solutions A/S

Description of tab

Tab	Meaning
General	General information or definition of the item.
Purchase data	Purchase-related information on the items.
Sales data	Sales-related information on the items.
Inventory data	Entry and display of the warehouse data on the item.
Planning data	Input of planning- and production-related information.
Calculation	Storage of Precalculation data.
Characteristics	Allocation of individual features to the item displayed .
Remarks	Storage of comments on the item displayed .
QC inspection Plan	Definition of QC inspection plans *(until beas9.0-000-002) .*
Parameter	Storage of any further information and description of the product according to any user-definable parameters.
Variant	Name of the variant A-Z. is only visible, if the "Variant per item" is defined in the configuration wizard. Note: Variants are always sorted by A-Z in lists also at a definition instead by the title which is stored in the item master ***See*** variants, configuration wizard
Batch	Extended batch information
Series	Extended serial number information

Right-click menu functions

Function	Description
Report	Open a list of stored reports for master data.
Copy Bill of Materials+Routing	An assembly can be selected here. Its bill of material and/or routing is added to the active assembly. This function is not available for template and set items.
Change Log	Change log for Bill of materials and routing. Note: Changes in the item are executed via SAP Business One. That is why these are not included in Beas change log. The item change log is accessible **SAP Business One > Item screen > Menu Tools > Change log**.
Invent. History	Direct access to the Inventory movements .

© 2026 Boyum IT Solutions A/S

Function	Description
Cross Reference	Cross-reference of the item.
Formula Allocation for Active Input	Store a formula (or other parameter) in active field (or click on the orange "C") Store a formula (or other parameters) in the active field. Note: This function is only available if the Variant generator is activated in the Configuration wizard.
Display Formula fields	Display formula fields icons If variant production is activated, you can use this to activate the formula fields. Note: This function is only available if the Variant generator is activated in the Configuration wizard.
used in	Displays in which assemblies the item or the assembly is used. The complete sub-structure is checked.

	raw material is required for this. ***See*** Unit of Measurement – Conversion. Example: Pipe in a Bill of Materials Position Inventory UoM is kg Consumption is Pcs with length, height and width.  Formula: `((length * od * pi()^2) - (length * id * pi()^2) ) * density` For more information ***see*** Unit of Measures.
Employee	Employee responsible for maintaining the item master data.
Material Group	Divide the item into groups Beas offers a grouping possibility with the Material Group field. This group is useful for filtering, searching, production planning, programming (since it is integrated with MRP and APS on the sorting and filtering options), and for the calculation function (a surcharge rate can be linked to each Material Group). The material surcharge is stored for Precalculation. ***see*** Material Group If the user has extended authorization for routing or BoM, this field is locked.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Procurement Method</td><td>Defines the mode of procurement

Make – Scheduling creates production order recommendations for the item.

All higher-level items should be defined as manufacturers so that the requirement can be calculated for the subordinate items during scheduling. In the case of a bill of materials for sales or assembly, no actual production order is output for the higher-level items, only the requirements for the subordinate items.

Buy – Scheduling creates purchase order recommendations for the item.

The Buy method should be selected for the subordinate items of the lowest level of the Bill of materials for items which are not part of the Bill of materials.</td></tr>
<tr><td>Breakdown</td><td>How the Bill of materials/routing is broken down (exploded)

Details

In manufacturing and Beas, breakdown or explosion is the action of breaking apart the Bill of materials for each assembly or sub-assembly into its components. Differentiating between make-to-stock and make-to-order items helps in defining a production strategy. It also defines a combination of scenarios on production planning and execution processes.

The breakdown Variant is defined in Item Master Data > General tab > Manufacturing Data > Breakdown.
Note on APS: If no Breakdown method is defined, the item will not be considered correctly in the APS calculation.

The following Variants are available:
<table><tr><th>Breakdown</th><th>Procurement Method</th><th>Description</th></tr><tr><td>non</td><td>buy</td><td>Ignores Bill of materials</td></tr></table></td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description

Breakdown	Procurement Method	Description
breakdown		Recommended to be used when the item is a general purchase ("buy") item, which normally has no Bill of materials attached to it. Therefore, this item is considered as a purchase item. In work orders it is used for finished goods with mode of procurement set to buy, Beas considers all BoM positions as purchase items and suggests to create a purchase order, in case there is not enough in stock of that item. **Limitation:** When this type of breakdown is used with Produce ("make") items, all information of the Bill of Materials will be ignored.
provision parts	buy	Bill of materials define the provision Items that are included in the purchase item. ***Example***: If you buy an engine from a supplier, and it always comes with a can of motor oil and a gallon of coolant. In this situation, you still need to keep track of how many cans of motor oil and gallons of coolant you have on inventory. The *Provision parts* option is used to define these types of item. This option allows to insert additional items in the bill of materials list so at the moment the goods receipt is issued for the purchase order, Beas suggests and completes the goods receipt for the existing provision parts. For Buy items, MRP generates purchase order recommendations. For Produce items, MRP generates production order recommendations. **Limitation in MRP:** Beas does not calculate MRP Sub-assembly requirements

Field	Description

Breakdown	Procurement Method	Description
		create work order for this Sales order Semi-Finished goods Assemblies can be produced order-related, when the respective option was selected in **BOM item > breakdown.**  The setting has no effect when the work order is created by the calculation functionality. The possible settings are: - No: No work order positions will be created for the semi-finished goods - Always: Works exactly like order-related semi-finished goods - Only shortage: Creates order positions only if there is not enough inventory In order recommendation report these assemblies will still be created as stock-related assemblies. ***See*** BoM position - breakdown
order related	make	**only order-related** This is an assembly that is produced by order, that is: The sub-assemblies are produced together with the main assembly.

© 2026 Boyum IT Solutions A/S

Field	Description

Breakdown	Procurement Method	Description

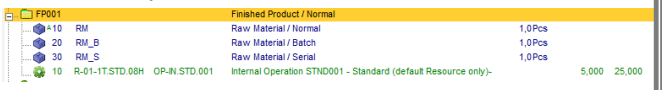
Note: Only order-related!

- You can define a configuration in the Sales order.
- You can define a short variant in the Sales order.
- You can create a precalculation in the Sales order and can change the substructure inside the precalculation. You can use the definition in precalculation for order-related work orders.
- You can create an order-related work order.
- You **cannot** plan stock in MRP.
- You **cannot** use the produced assembly for another order in a simple way.
- Maximum structure level: 20 levels.

Concept for order-related finished good products

An order-related finished product has Bill of Materials and Routing.

Use this only for Sales order



In Sales order you can create Precalculation or/and Configurations or/and Short variants.

You can change the Bill of Materials/Routing in Precalculation.

Notes:

Do not use MRP for planning the request.

© 2026 Boyum IT Solutions A/S

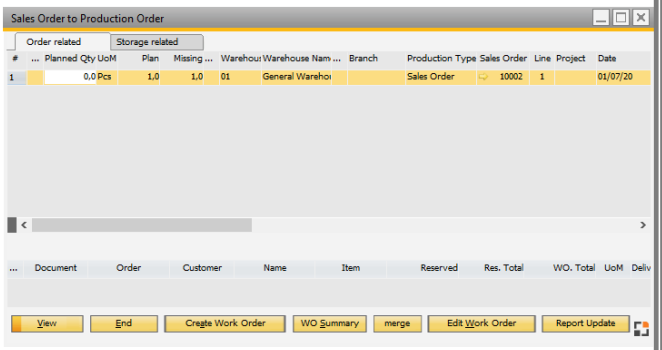
Field	Description
	<table><tr><th>Breakdown</th><th>Procurement Method</th><th>Description</th></tr><tr><td></td><td></td><td>Do not work with lot size. It is always order-related. **Create work order** Work order created via Sales order to Work order.  You can see order-related items in MRP, but the MRP has a "stock view". It is not possible to plan the requirement for order-related items in the MRP. **MRP** In MRP you can see the sales order and it is possible via double-click to produce order-related. But the MRP is item related. Do not use it to manage order-related requirements.  </td></tr></table>

© 2026 Boyum IT Solutions A/S

Field	Description

Breakdown	Procurement Method	Description

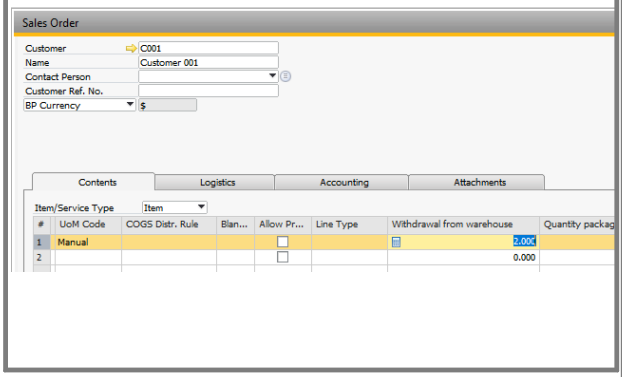
Use the window "Sales Order to production Order" This window has order-related view. You can create work orders directly and only see entries that do not have enough production orders. Here the system ignores the stock because of the order-related view:



Special cases

- Deliver from stock

Example: You produced an order-related finished goods, but the customer canceled the order.
Now the item is on stock.
If you have a new sales order with the same product, you can define the quantity which you want take from stock in **Sales order > column "Withdrawal from Warehouse"** .



© 2026 Boyum IT Solutions A/S

Field	Description
	Breakdown / **Procurement Method** / **Description**

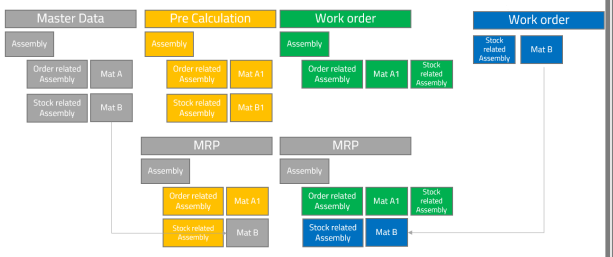
Note:

Use this functionality only for special cases. This is not the original idea of order-related production.

Order related Precalculation

In the MRP, order-related assemblies receive their data from the work order and stock-related assemblies from the item master data.
Therefore, the MRP ignores changes made in the precalculation for stock-related assemblies.

In the following video we describe the complete process:



Concept order related Semi-Finished items

Use order-related semi-finished products if you want to produce this item only for an order or stock-related finished product.
You can produce the order-related semi-finished product as Finished product for a sales order, but not on stock.
In MRP you can see the requirements for semi-

© 2026 Boyum IT Solutions A/S

Field	Description
	Breakdown / **Procurement Method** / **Description**
	finished product, but normally this does not change the balance. In the following example you can see the semi-finished product "SFP_B_O", which is part if Finished Product "FPS_B_O" In the Finished Product the semi-finished product is defined as a Bill of Materials position.  This example produces the following work order:  Inside the semi-finished product you can insert additional semi-finished products. Beas supports max. 20 levels. Recursion: If you insert the same order-related item as Bill of Materials, the system does not break down this order-related semi-finished product. However, it is possible to create a recursive structure. Example: Recursive structure In the following example a recursive item is inside the structure:

© 2026 Boyum IT Solutions A/S

Field	Description

Breakdown	Procurement Method	Description

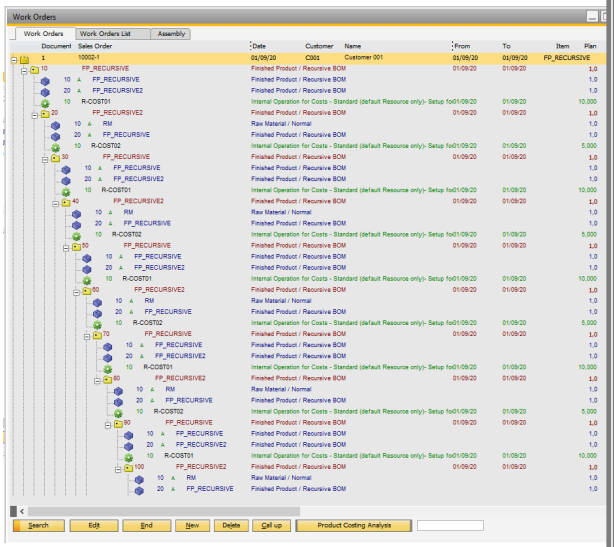
FP_RECURSIVE is inside FP_RECURSIVE. The system display sthis only as material.

Inside FP_RECURSIVE2 you can see FP_REURSIVE. In this case it produces a recursion.

This produces the following recursive production order:

FP_RECURSIVE: no breakdown

But inside "FP_RECURSIVE2" there is "FP_RECURSIVE" again, which produces the recursion, but max. up to 20 levels.



Beas displays the following error message:

© 2026 Boyum IT Solutions A/S

Field	Description

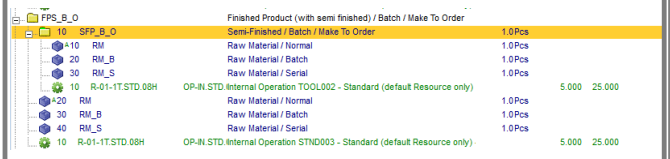
Breakdown	Procurement Method	Description

BoM explosion of more than 10 levels not possible!
Cancel sub-assembly FP_RECURSIVE

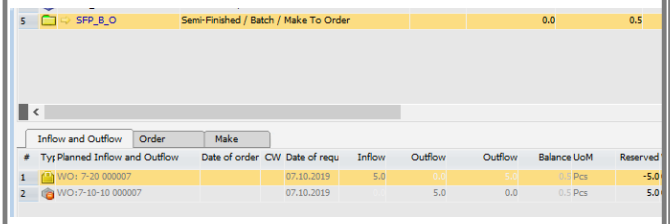
Reservations on storage related orders for order-related assemblies

For the following order-related work order, MRP displays the reservation. As it is an order-related work order, the balance of the reservation is neutral (we porduce 5 which fulfills the sales order -5).

WO:



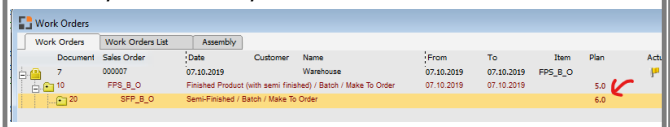
MRP:



The quantity of the work order is manually increased

WO:

Quantity is manually increased from 5-6.



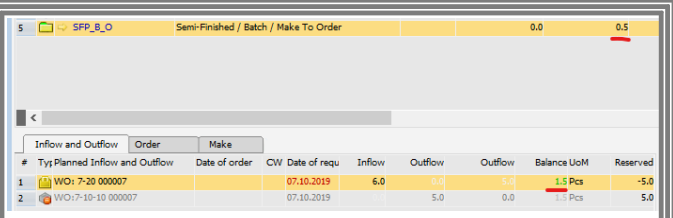
MRP:

In this case stock is produced (there was originally 0.5 in stock).

© 2026 Boyum IT Solutions A/S

Field	Description

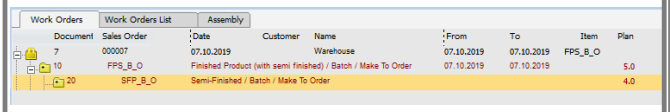
Breakdown	Procurement Method	Description



The quantity of the work order is manually decreased

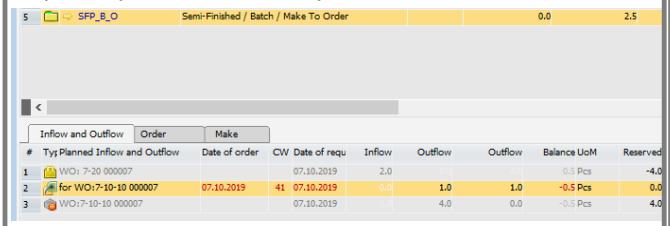
WO:

Quantity is manually decreased from 5-4.



MRP:

An additional line is added to produce the additional required piece and this is produced to stock.



- Special cases
  - Partial postings in order-related sub-assemblies are ignored in the MRP balance calculation

    WO: With partial posting

    MRP:

Field	Description

Breakdown	Procurement Method	Description
		 Closed sub-position in order-related sub-assemblies If the sub-position is closed and the requirements are not fulfilled, a new work order is created to deliver the rest. This is a storage-related work order. WO: With closed position MRP: phantom assembly group	make	Item is a phantom item This is a phantom assembly, i.e. its routing and Bill of materials are part of the used assembly. If the item has the type "Pseudo item", it behaves like an item with scheduling "Phantom assembly".
set	make	Define this item as SAP Business One set item

© 2026 Boyum IT Solutions A/S

Field	Description
	<table><tr><th>Breakdown</th><th>Procurement Method</th><th>Description</th></tr><tr><td>item</td><td></td><td>The Sales BoM represent a finished product assembled at the sales stage, that is, the finished product is composed of its component items only when the parent product is actually sold. The component items are stored and tracked individually in the warehouse. For both the Sales BoM, you do not manage the parent product as an inventory item, but rather as a sales item. The components can also be sales and inventory items in their own right. When you create the delivery to dispatch the customer order, the components are backflush issued from inventory. Note The components for Sales BoMs and Assembly BoMs must be sales items. The BoM will be defined in SAP Business One Bill of Material window Use a Sales BoM where there is a fixed combination of components and the customer needs confirmation of each item. The component items cannot be altered or removed from a sales order. Other items cannot be inserted between the parent and component items in the sales order. However, the quantities of the component items can be modified. Example Sharon's Garden Ltd. sells garden tools and outdoor furniture. One of her best sellers is the Metal Table set. This set is composed of one metal and glass table, six</td></tr></table>

© 2026 Boyum IT Solutions A/S

Field	Description
	Breakdown / **Procurement Method** / **Description**
			metal chairs, and one umbrella. If she chooses the Sales BoM, the table, six chairs and one umbrella, and the Metal Table set all appear in the sales order. She can sell this set with only four chairs, but she cannot introduce a footstool as part of this set in the sales order. If she chooses the Assembly BoM, then only the Metal Table set (the parent product) is listed in the sales order. In both cases, each of the component items is tracked individually in the inventory. When you create the delivery to dispatch the customer order, the components are automatically issued from the warehouse.
	template	make	Define this item as template item The Template BoM is a bundle of items, where the parent product is the first item on the list. It does not act as a BoM once it is added to the sales document, but rather as a list of items brought together at the same time. You can update the quantity of those items, swap items, or delete them in the BOM or the sales order. The components appear below the parent as a list of items in a sales document. Use the Template BOM when you require flexibility in selecting components for a product. ***Example*** Computers can be sold as a standard unit, in which case the Production or Sales BoM is appropriate. However, to customize a sales order, use the Template BoM to allow for DVD burners, speakers, ergonomic keyboards, and so

<tr><td></td><td></td><td>on.

The BoM will be defined in SAP Business One Bill of Material window</td></tr>
</table>
</td></tr>
<tr><td>Administration</td><td>Methods of item administration
<table>
<tr><td>Here you can define how the BoM and routing are linked to the item.

Only editable if an Item, a batch, or serial managed item and a Version is defined.
Default = ID of BoM and routing are the same as the item ID.
Extended view = like default, but in structure view the BoM / routings are displayed per version. This setting affects only the display.
Separate BoM = Item ID, BoM ID and routing ID can be different. In the item version you store which BoM is to use for the item and for the version. In the BoM you define which routing to use.

To activate this field:
1. Click icon right of Item Version – open list of all Item Versions
2. Define a version and go back to the item window
3. Choose the Administration (this field) and update the window. Now full functionality is available for this item.
Note: Item Version only supported by Serial or Batch managed items
If you use this with non Batch/Serial managed items, the MRP will return wrong result. More see datacheck</td></tr>
</table>
</td></tr>
<tr><td>Production UoM</td><td>The unit of measure for consuming this item when it is a component of another items bill of materials during production.
See Edit item's unit of measure
All other units are managed in the Purchase Data, Sales data and Inventory Data</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

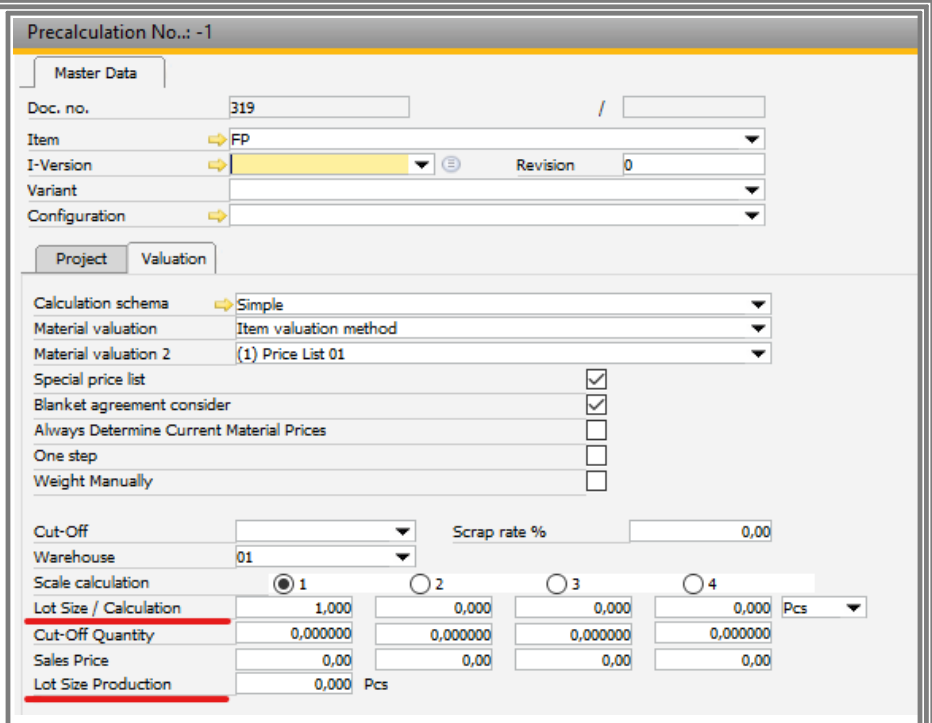
Field	Description
	tab or centrally using the orange arrow in the "Units of Measure" window. Quantity units for production In master data the BOM quantities and the work order quantities are always indicated in production UoM The unit can be used in which material was actually withdrawn: for example storing in liters, but withdrawal in kg. In all functions, where required quantity and stock are indicated, the total stock is always displayed in inventory UoM, as otherwise no comparison of planned quantity, posted quantity and stock would be possible. A special case is single material posting There, the withdrawal quantity can be given in production UoM, which is converted to Inventory UoM immediately. The conversion from inventory UoM to production UoM is defined in Quantity units – Conversion Note: All other units are managed in Purchase/Sales/Inventory tabs or using the orange arrow in window "Quantity units"
Specific weight	Defines specific weight This field can be used as a conversion field between consumption unit and warehouse unit: 1. Activate Specific Weight in **Configuration wizard > Item** 2. The specific weight field in the item master is now used as a conversion factor between the units of store and quantity. 3. Only "density" is specified in the conversion formula between units of store and usage ***see*** Master data - Units of measure If this field is disabled in Configuration wizard, density can be entered in raw material.
Lot size / Production	Production lot size in warehouse unit. Define the max. Lot size for production in Inventory or Production UoM ***See*** concept Lot size

© 2026 Boyum IT Solutions A/S

Field	Description
	Limitations If the lot size produces more than 10 Positions, the system asks if you want to continue. If the lot size produces more than 200 Positions, the system cancels the process with a message: *' Lot size is set to <losgr>. This corresponds to <summ> Positions created. Max. allowed are however <limit> positions. Creation is aborted (LimitLotSize)'* It is possible to increate the limitation. Note on sub-structures: Lot sizes of order related sub-structures are considered only if activated separately. ***See*** Configuration wizard – Production – Create new. If the count of the created positions is larger than the limitation, the system ignores the lot size in the last position and displays an error message (*LimitLotSize)* ***Example***: 1000 Pcs, Lotsize = 1. 200 Positions created. Position 1-199 for 1 Pcs and Position 200 with 801 Pcs MRP Calculation: Ignores Production Lot size while calculating requirement based on sales order, forecast and other documents. Precalculation - Lot Size Precalculation supports Production Lot size **Lot size - Precalculation** - "Calculation lot size" is the default lot size for the calculation. - "Production lot size" is the maximum lot size and is relevant for the calculation of fix costs.

© 2026 Boyum IT Solutions A/S

Field	Description



Window pk_haupt_edit.psr

The production lot size affects:

- Setup times in a Bill of materials position.
- Fixed times (Quantity per = 0) in routing positions.
- Fixed surcharges.
- Purchase prices (special price list).
- Price per lot size

In sub-components the calculation uses the production lot size. If you activate Configuration wizard > Production > Create > Sub-assemblies: Consider production lot size, the system uses the production lot size defined in the sub-component, otherwise the lot size of the main item.

Example:

Routing position 10 Min setup time, 5 Min Mach+Labor time

Lot size calculation: 100, Production: 0 (ignore it)

```
Cost  = 10 Min + 100* 5 Min = 510 Minutes * cost rate
```

© 2026 Boyum IT Solutions A/S

Field	Description

Lot size calculation: 100, Production: 30

In this case we must calculate the production `30 + 30 + 30 + 10 = 4 times`.

```
Cost = 4*10 Min + 100*5 Min = 540 Minutes * cost rate
```

Working with sub-assemblies

If consider Sub Assemblies is activated, the system split the sub-assemblies too

Example:

Production 40 Pcs, Lot size 30 Pcs

Sub assembly is order related, Production lot size = 0 Pcs (no lot size)

This case is a WO position-related process.

If an order-related sub-assembly has its own lot size, the system checks this, as well - but always per production level from the parent item.

Example : Lot size 20 Pcs

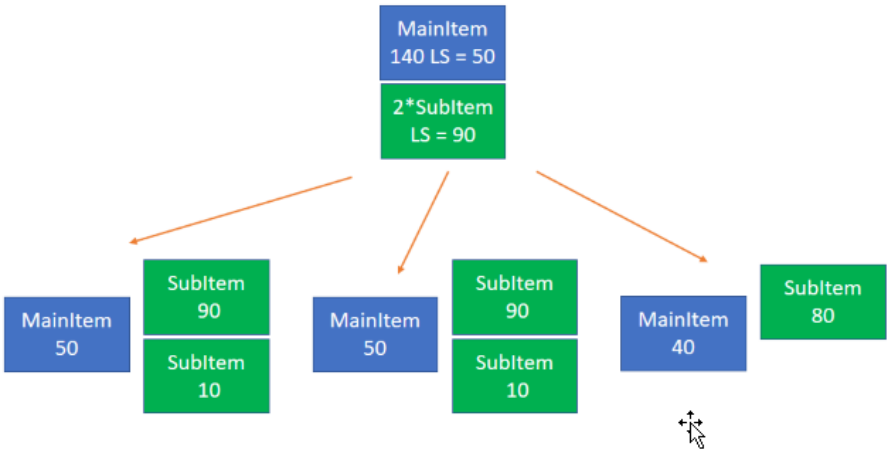
© 2026 Boyum IT Solutions A/S

Field	Description

In this case the setup time will be multiplicated with 4 in the sub assembly

2. Example for order-related sub-assembly:

- Main and sub-item are order related, the lot size of the main item is 50
- We need the sub-assembly 2 times per main item, the lot size of the sub-item is 90
- We want to produce 140 Units of the main item



Result:

- We need to produce 3 lots for Main item (50 + 50 + 40)
- For the first and second lot of the main item we need 2 lots of the sub-item (90 + 10)
- For the last lot of the main item we need 1 lot of the sub item (80)

Stock-related

if the sub-assembly is stock-related, the sub-assembly ignores the lot size from the parent assembly:

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>

if the stock related sub-assembly has its own lot size, the system uses it without relation to the lot size of the parent item.

Note:
This is working differently than in Beas 2020.11 or older. If you need the old functionality, you can change this in a user event. See Script documentation.
</td></tr>
<tr><td>Issue method</td><td>Defines the issue method.
Defines the way the item is issued in production: backflushing (automatically) or manually.

<table>
<tr><th>Setting</th><th>Description</th></tr>
<tr><td>Manually</td><td>The components are manually output to the production order without considering the output of the product.</td></tr>
<tr><td>Backflushing</td><td>The components are automatically issued to the production order once completion of the higher-level item is reported. (e.g. reporting the last operation, Goods receipt of the assembly or via Materials Management – Backflush).</td></tr>
</table>

Serial number- or batch number-managed items cannot be set to "Backflushing".
However, if this type of item should generally be removed with backflushing, it can be activated in the Configuration Wizard.
see Backflushing - Also post batches
Webinar 8/2017, Part Configuration</td></tr>
<tr><td>Cut-Off (%)</td><td>Portion of cut-off</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
	Only available when Mode of Procurement is defined as “Buy”. This field is used to define a percentage of the material that is wasted when it is used as raw material for production. For example: if Cut-Off (%) is set to “10” and the item is linked to a Bill of Material with the quantity of “50”, Beas will change the quantity to “55” in the position when a Work Order is created (“50” from Bill of Materials plus “5” from 10% cut-off rate). Cut-Off (%) will also be considered while calculating cost in the pre-calculation functionality. Video: Scrap on Item Level ***see*** Scrap, Calculated scrap, Option consider cut-off, Production item – cut-off
Scrap Rate %	Portion of scrap This value is used for Precalculation. Only available when Mode of Procurement is defined as “Produce”. Scrap factor for assemblies relates to the material requirement for an assembly rather than the assembly. **Assemblies:** Scrap factor for assemblies is not related to the assembly requirement, but only to the material requirements of this subassembly. In Precalculation, there are only an information on quantity for BoM item and assembly. This creates an additional requirement for the assembly. If then a work order is created, the behavior may vary. **Phantom assembly** Scrap factor is calculated and entered as "calculated scrap" into the BoM item and taken into account. **Order-related Item** BoM Order related items do not apply the scrap factor. The system generates a work order position for the order related item and the scrap factor is applied to the sub work order BOMs only. **Purchase part:**

© 2026 Boyum IT Solutions A/S

Field	Description
	The scrap factor is calculated in the work order as total value, added to the cut-off value and other scrap factors and entered to the BoM column calculated scrap. Precalculation: entered in **Master Data > scrap** and also taken into account. Note: For using order time receipt function and reporting scrap ***See*** Configuration wizard – Backflushing Video: Scrap on Item Level ***see*** Concept Scrap, Calculated scrap, Option consider cut-off, Production item – cut-off
Scrap Table Cut-Off Table	Cut-off factor and cut-off surcharge of the item. Define item based scrap on table level. The Scrap defined in Scrap/Cut-Off Table The scrap factor affects: purchase parts: "calculated scrap" assemblies: material requirement of the subassembly sub-assemblies: surcharge for scrap in sub-components Note • using order time receipt function and reporting scrap ***See*** Configuration wizard – Backflushing • no consideration in Precalculation Video: Scrap on Item Level ***see*** Concept Scrap, Calculated scrap, Option consider cut-off, Production item - cut-off
Phantom Item	Is it a phantom item? Phantom items only define the Bill of materials and routing, have no inventory maintenance and can be neither purchased nor sold. An assembly can have any number of phantom items, finally used to combine the Bill of materials and routing according to the assembly principle. **Note**: A phantom item is an item type in Bill of materials which only has a

© 2026 Boyum IT Solutions A/S

Field	Description
	technical or structural function. Phantom items are not actual components or intermediate assemblies, so they are defined as non-warehouse items. For example, a company produces different laptops as finished good, and all different laptop models use the same set of cables: monitor connector, power connector, HDMI cable. It is easier to group the set of cables as a phantom item in Beas, so you do not have to assign the cables to each Bill of materials separately. To do so, we have to create the Bill of materials with all required cables, and link the phantom item as a component of all laptop models. After creating a Work Order, Beas only includes the phantom item structure (Bill of Materials and Routing) and not the item as an assembly.
Withdrawal Document	For information only.
Made-To-Order	For information only.
Allocate	If active, this item must be made available in the allocation warehouse. The item has to be allocated to a specific warehouse in order to be available for consumption in a Work Order. ***See*** Allocation – Button Filter.
Release production	Release for production? If disabled, no work order may be created for this item. ***See*** WO Document position.
Gross Weight	For information only.

7.4.1.1.1 UoM of item

Item: Unit of measure

PATH: Inventory > Item structure/Item report > Double-click an item > Item master data for XXX > Master Data tab > General tab > double-click "Unit BoM" .

In this window you can define all UoM and factors for this item.

Note: If UoM Group is defined, you can only choose the UoM which was defined in the UoM Group.

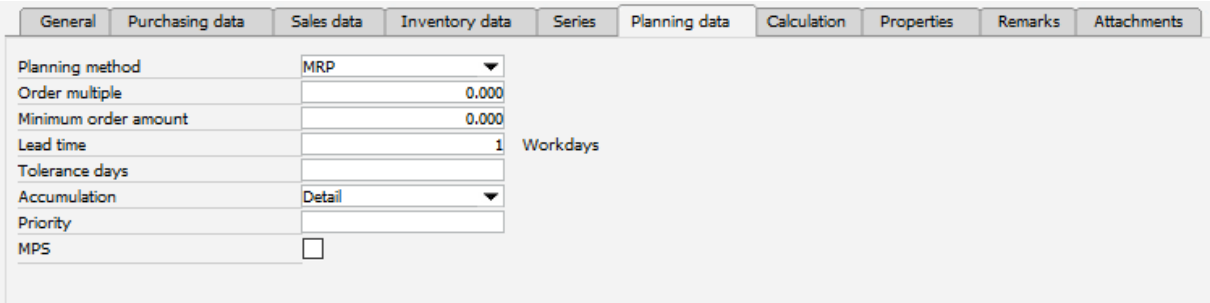
7.4.1.2 Planning data

Scheduling- and production-related information is input in this tab.



Window artikel_edit.psr

Field	Description
Planning method	Determines the planning method of the item This switch must be activated if item procurement is to be verified through the MRP run (Beas). Selection of one of the following options: • Scheduling (MRP): Planning item procurement with the scheduling system • None: Item procurement is not planned via scheduling, and no production order or order recommendation is created for the item. If dealing with an assembly, it is broken down independent of planning method. Its subordinated items can create a demand in order recommendation report. In BoM you can override the planning method. For more notes ***see*** BoM - Planning.
Multiple order	Determine the multiple order for purchases and MRP requirement coverage calculation Enter a numeric value specifying the lot size for scheduling. Relates to inventory unit. This affects work order and purchase order generation via the MRP run. ***Example***: Multiple order = 10 Purchase order quantity 8 is input or transferred. It is not proposed to increase the quantity to 10. ***Example***: Multiple order = 10, production lot size = 5

© 2026 Boyum IT Solutions A/S

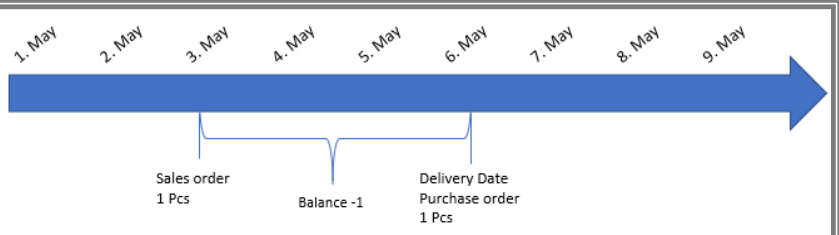
Field	Description
	Production quantity 8 is input or transferred. It is not proposed to increase the quantity to 10. 2 work orders are created for every 5. Multiple orders are considered in MRP - requirement coverage calculation. ***See*** MRP wizard – Breakdown replenishment – Consider multiple orders.
Minimum order amount	Enter a value, specifying the minimum lot size Generally, at least the specified amount is purchased. This is a default, no fixed value. Quantity is in Inventory unit Affected - Scheduling: Create purchase orders - Breakdown sub-assemblies. ***See*** MRP wizard – Breakdown replenishment – Consider multiple orders.
Lead time	Input of the number of work days from the date of the order to the date of goods receipt. This value can be calculated automatically for in-house production. ***see*** calculate resources Resource and lead time calculation video The lead time for in-house parts is calculated according to quantity in the MRP run (this can be optionally deactivated in the MRP run). You can set up lead time to be used instead of operation times in general. ***See*** Configuration wizard – Capacity planning Lead time is always specified in work days. A lead time of 0 days is marked as an "error" by the data check. For assemblies the lead is the production time of the assembly without consideration of sub-structures. ***Example:***

© 2026 Boyum IT Solutions A/S

Field	Description
	Given structure: - X011 with 3 days --- contains order related X012 with 2 days ------- contains storage related X013 with 4 days Lead time for X011 in sum 5 days (order related) Total lead time 9 days, if X013 is not covered from stock
Tolerance days	Number of work days for allowed shortage In **Item Master Data > Planning Data tab** you can define Tolerance days.  Related to order scheduling: If there is negative stock in the time line, the item will be shown as shortage in MRP. Here you can enter the number of days. Negative balance is tolerated. ***Example:*** Stock = 0 Sales order = 3rd May Purchase order delivery date = 6th May Material comes 3 days late

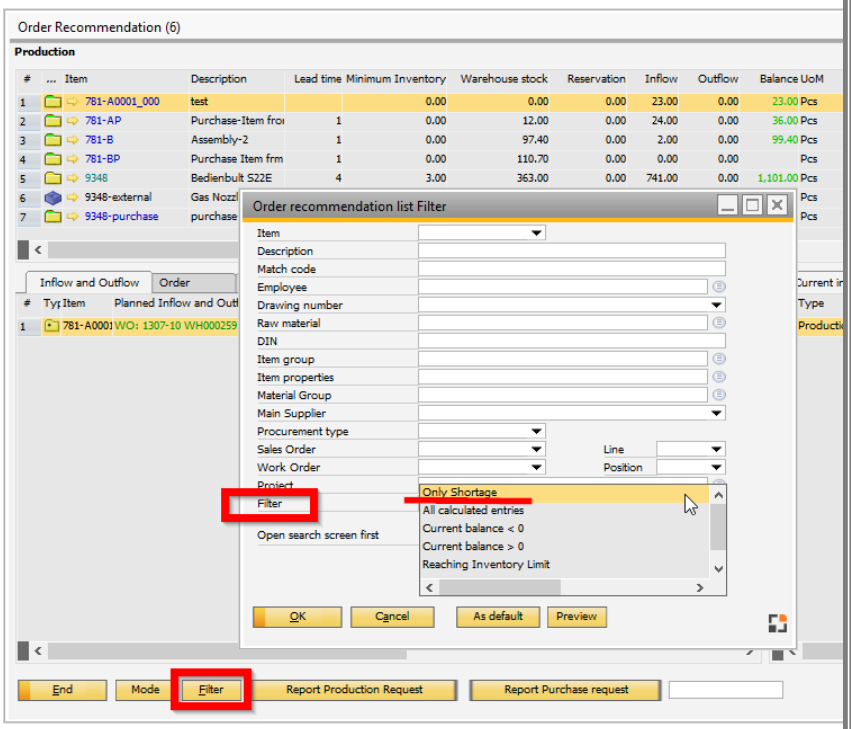
© 2026 Boyum IT Solutions A/S

Field	Description



If the tolerance date for this item is defined with 3 days or more, the result is: OK
If the tolerance date is < 2, MRP must display this piece of information.

In MRP the filter "Only shortage" means:
Display all entries which have a negative balance in the timeline.



(MRP Filter - Predefined Filter)

In this example the item has a balance of 0, but a negative balance between 3rd and 6th May
MRP displays this item if the item has "tolerance days" < 3 days.
MRP does not display this item if the item has a "tolerance days" > 3 days.

© 2026 Boyum IT Solutions A/S

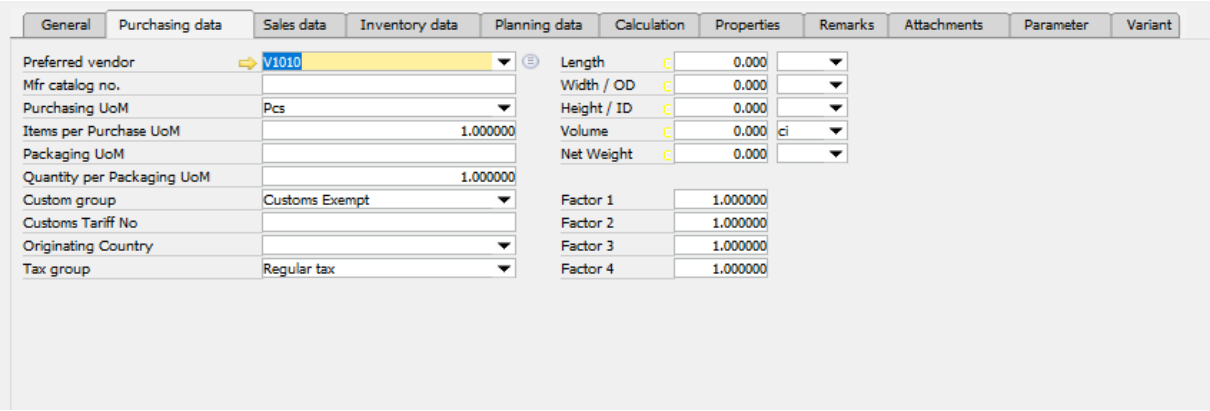
Field	Description
	Negative Balance in past Negative Balance in the past is ignored entirely. The calculation for the time area starts from the current Date. ***Example:*** Today is 5th May Sales Order is 3rd May Delivery = 6th May The system calculates: Balance is negative from 5th – 6th May = 1 day.
MPS	Activate MPS.

Note for Beas Item Master Data:
For additional fields ***see*** Advance Scheduling

back to item master

7.4.1.3 Purchasing data

Purchase-related information on the items can be entered in this tab.



Window artikel_edit.psr

Field Description

© 2026 Boyum IT Solutions A/S

Field	Description
Preferred vendor	Input of preferred supplier for the item or selection of a supplier from the list. For every recommendation, the system proposes this value automatically. Here you can define additional vendors. Enter the preferred vendor for the item, or select a vendor from the list. Each time SAP Business One creates a recommendation, it enters the value automatically. "Preferred Vendor" is used in MRP as the default supplier. Beas displays Preferred vendors always on top of lists.
Mfr catalog no.	Input of catalog number of the item from the default supplier catalog. This number is displayed in the purchase and sales documents.
Purchasing UoM Name	Input of unit of measurement for Purchase documents SAP Business One standard does not support defined UoM Definition in item master Data. The UoM is only a name. With Beas integration, the name is the UoM ID. It must be defined in Unit of Measure Setup. Beas can work correctly only if UoM Code and UoM Name are exactly the same:  Units of Measure - Setup | # | UoM Code | UoM Name | Lengt | | 13 | Pk | Pk | | | 14 | Rollen | Rollen | | | 15 | Spool | Spool | | | 16 | to | to | | | 17 | TPcs | TPcs | | | 18 | TStk | TStk | | | 19 | PK2 | PK2 | | | 20 | DblSpool | DblSpool | | The system checks the existence of UoM Code in all UoM name fields. It inserts the correct Code or make the field empty if the UoM Code does not exist.

© 2026 Boyum IT Solutions A/S

Field	Description
	 Example: If you insert "sp" + TAB, the System inserts "Spool" Use the golden button with three points to choose the UoM from the list. Note: Many Beas functions, especially MRP and Work order can only work properly if the correct UoM is defined. **Working with UoM Group** If a UoM Group is activated, the system displays two UoM fields. Beas always uses Purchasing UoM name and does not support the code.  This only works if UoM Code and UoM Name are the same. **UoM Code general** ***See*** Concept of UoM
Items per Purchasing UoM	Input of item quantity per purchasing unit.
Packaging UoM	Input of packaging UoM for purchasing, which is a multiple of the unit of measure.
Qty. per Packaging UoM	Definition of quantity per packaging UoM.
Custom group	If the purchased part is imported, the custom group is entered. The customs duties can be calculated with this. Select custom group from the list, re-define one to create a new custom group.
Customs Tariff No	The customs tariff number of the item.
Originating Country	Country of origin of the item.
Tax group	Selection of a tax group which is used to specify the tax to be used for country-specific tax calculation: • No tax • Regular tax (default)

© 2026 Boyum IT Solutions A/S

Field	Description
	• Use Tax
Length, width A/D, height I/D, volume	Define Length / Width / Height and Volume for this item related to the Purchase Area (not the Inventory UoM). Enter the dimensions of the purchase item. If you defined the units of measure when you configured the system, enter the measurements and press TAB and the system automatically enters the measurements of the purchase item. In addition, enter the values for the length, width, and height to calculate the volume of the item. Alternatively, you can enter the volume value without entering the length, width, or height. The System automatically calculates the "Volume" if you change one of the other fields-  Beas uses this information for Warehouse – Bin Management – Calculate Volume. Click on "**>>**", if you want to copy this information to the Sales Area. **Attention:** If you try to modify "purchase" or "sales" dimensions by setting any of them to "0", some SAP versions return the following error: `256000267 di-api the unit of length, width, height or weight cannot be set if length, width, height or weight is 0` In this case, you can only modify these values in the standard SAP Item Master Data window.
Net Weight	⊟ Input of the net weight Weight. Enter the weight of the item, followed by the weight measure. Note: This is used as reference weight in Beas bin location management for transactions. If used with weight calculation in bin location management, it should not be changed here.
Factor 1–4	⊟ Input of the quantity, which is a multiple of various factors. If e.g. a fence is

© 2026 Boyum IT Solutions A/S

Field	Description
	purchased, the corresponding default dimensions must be considered. Factors 1–4 Enter the quantity which is a multiple of several factors. For example, if you buy a fence, you have to consider its measurement standards. The Factor fields are used as variables, so you can enter the proper values to calculate the appropriate quantity. The default value is one (1). The values that you enter in the item master data appear on marketing documents. The factor fields are used as variables so that the corresponding values can be entered into these fields for calculation of the relevant quantity. (1) is displayed as a suggested value. The values entered in the item master data are displayed in the documents.

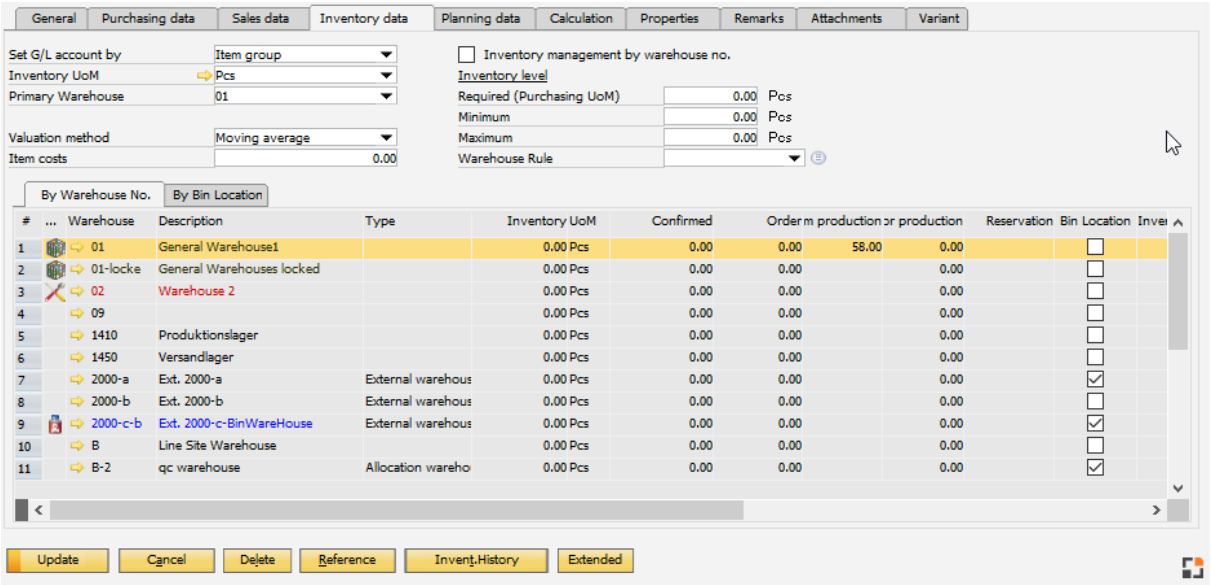
7.4.1.5 Inventory data

The warehouse data of the item are entered and displayed on this tab.



Window artikel_ edit.psr

Header details

Field	Description
Set G/L accounts by	Selection of default G/L account method from the available options for the item: • Warehouse - All G/L accounts defined on warehouse level.

© 2026 Boyum IT Solutions A/S

Field	Description
	• Item group - All G/L accounts defined on item group level. • Item level - All G/L accounts defined on item level.
Inventory UoM	Defines the unit of measure of the item when it is stored and inventory is managed, e.g. crate, carton, box. Only visible when "UoM Group" is not set to Manual. If this field is left empty, the field Production UoM will also be empty, and Beas shows no decimals in the Item Structure Report and does not display the Unit of Measure field when this material is included into another item's Bill of Materials. SAP Business One standard does not support defined UoM Definition in item master Data. The UoM is only a name. With Beas integration, the name is the UoM ID. It must be defined in Unit of Measure Setup. Beas can work correctly only if UoM Code and UoM Name are exactly the same:  Units of Measure - Setup | # | UoM Code | UoM Name | Lengt | | 13 | Pk | Pk | | | 14 | Rollen | Rollen | | | 15 | Spool | Spool | | | 16 | to | to | | | 17 | TPcs | TPcs | | | 18 | TStk | TStk | | | 19 | PK2 | PK2 | | | 20 | DblSpool | DblSpool | | The system checks the existence of UoM Code in all UoM name fields. It inserts the correct Code or make the field empty if the UoM Code does not exist.  Purchasing UoM Name Manual ... ***Example:*** If you insert "sp" + TAB, the System inserts "Spool" Use the golden button with three points to choose the UoM from the list.

© 2026 Boyum IT Solutions A/S

Field	Description
	Note: Many Beas functions, especially MRP and Work order can only work properly if the correct UoM is defined. **Working with UoM Group** If a UoM Group is activated, the system displays two UoM fields. Beas always uses Purchasing UoM name and does not support the code.  This only works if UoM Code and UoM Name are the same. **UoM Code general** ***See*** Concept of UoM
Primary warehouse	Warehouse from which postings are done by default. If in **SAP B1 Administration > System initialization > General settings > Inventory: "Auto. add all warehouses to new items**", was disabled, each warehouse will still be selectable from the drop-down, even those that are not defined in the Item Master. They will be added automatically for selection. **Note**: If no standard warehouse is defined, various functions as allocation, backflushing, pre-assignment, reservation, MRP do not work correctly.
Inventory level	Set of fields used to define the inventory level required to be ordered and stored. SAP Business One has three fields for determining the optimal inventory levels, Required (reorder point), Minimum, and Maximum. Fields Required and Minimum are considered by MRP for calculating the purchases recommendation. If you need to define these values by Warehouse you have to do it in the Standard SAP Business One Item Master Data window, inventory tab.
Warehouse rule	A group of warehouse rules can be stored. ***See*** Warehouse rules.
Valuation method	This option is only relevant for continual inventory management.

© 2026 Boyum IT Solutions A/S

Field	Description
	Selection of one of the following options: Moving average Moving average - This method is based on the calculation of the average costs for the item in each purchasing and sales transaction.SAP Business One calculates it automatically in the background. Beas returns this price at pricing, it is always calculated in home currency. Standard Standard pricing allows to select a fixed price which will be used for all transactions. The standard price is stored in Item master / inventory data / item costs. The price can be changed only as long as no journal entries exist. The price is always stored in home currency. As soon a journal entry exists, the standard price can be changed only via **Inventory > Inventory transactions > Inventory revaluation**. FIFO Another continual inventory management system in which the first goods purchased are the first sold or issued without consideration of the current goods movements.The valuation method can only be changed as long as no material has been posted. **Pricing Precalculation:** For Fifo the following formula is used: Total value of all items currently in stock - valued by Fifo : total stock = average value This value is used as default for all calculations and for posting in material and assemblies. For issue Fifo principle applies. If there is no stock, the last purchase price is used as reference. Series / Batches From SAP Business One 9.1 the valuation method "Series / Batches is available. This is a moving average method per series/batch.

© 2026 Boyum IT Solutions A/S

Field	Description
	Pricing Precalculation: The average price of all batches in stock is determined. This value serves as default for all calculations and for posting in material or assemblies. For issue, the average pricing per batch applies. If there is currently no stock, the last purchase price is used as reference.
Item costs	Input of the costs of the item for the default calculation method. The value is updated and calculated for all inventory entries in the Moving Average and FIFO fields.
Inventory Management by Warehouse no.	This option is used to specify the calculation method for minimum and maximum inventory quantities. If the flag is set, the total quantity of the fields Minimum warehouse stock, Req. warehouse stock and Max. warehouse stock is displayed in the warehouse table.
Required (Purchasing UoM)	Input of the required inventory levels for this warehouse. Value deposited in purchasing unit, it is supported in order recommendation report, if no minimal stock was entered. The quantity required to reach to the minimum warehouse stock is displayed in the Required (purchasing UoM) field. If the release of warehouse stock under the minimum limit is selected in the document settings, the system issues warnings if the minimum warehouse stock is not reached. The system does not permit further input of inventory documents if the warehouse stock has reached the maximum quantity.
Minimum	Input of the minimum warehouse stock quantity for this warehouse.
Maximum	Input of the maximum warehouse stock quantity for this warehouse.

Lower tabs - Stock information

Field	Description
By Warehouse No.	Warehouse stock – per warehouse.

© 2026 Boyum IT Solutions A/S

Field	Description
	Display all warehouses for the current item.

Field	Description
Warehouse	Warehouse
Inventory	Total stock of the item including blocked batches.
Unit	Unit of measure
Confirmed	Planned issue for customer orders. No breakdown of sub-components. Calculation according to SAP rules.
Ordered	Planned receipt from purchase orders. Summation according to SAP rules.
Goods receipt from production	All planned receipts are displayed without consideration of any settings (blocked work orders etc).
Goods issue for production	All planned issues are displayed without consideration of any settings (blocked work orders etc). **Important:** all previous postings for this item are considered regardless of which warehouse they were posted from. This works only if the work order was created by Beas without any changes by external programs.
Reserved	For the future reservation system: all reservations are displayed, stock related and planned receipts.
Inventory locked	The warehouse is blocked on item level. It is related to SAP Business One **> Item Master Data > Inventory Data > field Locked.** Locks the warehouse for the item and prevents you from adding the item from this warehouse to any A/R or A/P document. Warehouse Type	Type of warehouse. ***See*** Warehouse administration.

back to item master

7.4.1.6 Batch

Only visible for batch-managed items.

Field	Description
Only at Issue	Determines the moment to request a batch number. If this field is checked, Beas only requires a batch number in output documents. Batch number is only output for a posting transaction.

© 2026 Boyum IT Solutions A/S

	Important: If this field is checked, it is not possible to manage BIN Locations for the item. For managing BIN Locations, it is mandatory to provide the batch number in the receipt documents.
Batch determination	Define the batch number Set up batch determination Beas can generate the batch automatically for a receipt transaction. Here you can set up whether the batch is entered manually or generated automatically when posing in material. **Batch according to material**

© 2026 Boyum IT Solutions A/S

If this option is selected, Beas creates the batch of the finished product with the same number as the batch of the last consumed material.

Example:

Example 1

Assembly: "Paste y in container x"

Bill of Materials: Paste y line 10

1. issue: batch aaa
2. issue: batch bbb

If "Paste y in container x" is now produced and posted in, the batch number of "Paste y" of the last posting, that is batch "bbb" is assigned.

Example 2

Assembly: "Paste y in container x"

Bill of Materials:

Line 10, Material A001 (Batch-related)

Line 20, Material A002 (Batch-related)

Last Issue Line 20, A002, Batch aaa

The System uses "aaa" as Batchnumber

Example 3

Last Issue Line 10 - A001, Batch aa1 and Line 20 – A002, Batch aa2

The System uses "aa1", because it is the first position

Temporary sorting issue:

At present the system is using the "BEAS_FTSTL"."POS_ID" as sorting, not the correct Sorting field "SortId".

If you change the order inside the BoM, the program may not work properly. We are planning to fix this in Beas 9.3 PL 2 HF 1

Example: Booking according to material

© 2026 Boyum IT Solutions A/S

	Automatic batch determination Batches are generated automatically. Beas creates a batch number for the item based on the parameter in the Configuration wizard. **Enter batch manually** If activated, manual batch input is always performed for this item. **Attention**: Manual input is not supported at receipt creation by WEB Service. **Selection:** Manually – (*oitm.u_batchroh=M or NULL*) = Default Automatic – (*oitm.u_batchroh=N*) Batch according to material (only batches) – (*oitm.u_batchroh=J*) ***see*** Batch generation Configuration wizard – Materials management – Batch administration Configuration wizard – Goods receipt – Batches Production – Valuation and posting of the assembly – Batch administration Materials management – Manual postings – Batches
Shelf Life in Days	Defines the number of calendar days that are added to the items production date for calculating its expiration date. If a receipt is performed via Production or a Quality Control, release is performed, the shelf life date is reset from release. If the Manufacturing date is blank, the current date is used for calculation. If a manufacturing date is entered in the any receipt window, the date of expiry is calculated automatically (calendar days of shelf life are added to manufacturing date). ***see*** Batches to be verified

© 2026 Boyum IT Solutions A/S

7.4.1.7 Serials

Only visible for serial number related items.

Field	Description
Serial number	Set up determination of serial number. Automatic determination of serial number. Serial number is generated automatically at **Goods receipt** and **Production > Post in assembly** and in other functions. This is necessary, if working with automatic serial number reservation. ***See*** Serial number reservation For automatic generation the generation template needs to be defined in Configuration wizard. ***See*** Configuration wizard - Serial numbers Configuration wizard - goods receipt (*oitm.u_batchroh='N'*) Manual entry of serial number Serial numbers are defined manually. Automatic serial number reservation is not possible. (*oitm.u_batchroh='N'*) Default: manually (*oitm.u_batchroh='M' or NULL*) ***See*** Goods Receipt – Quantity Configuration wizard – Serial number reservation Batch generation
Shelf Life in Days	Defines the amount of days that are added to the items production date for calculating its expiration date.

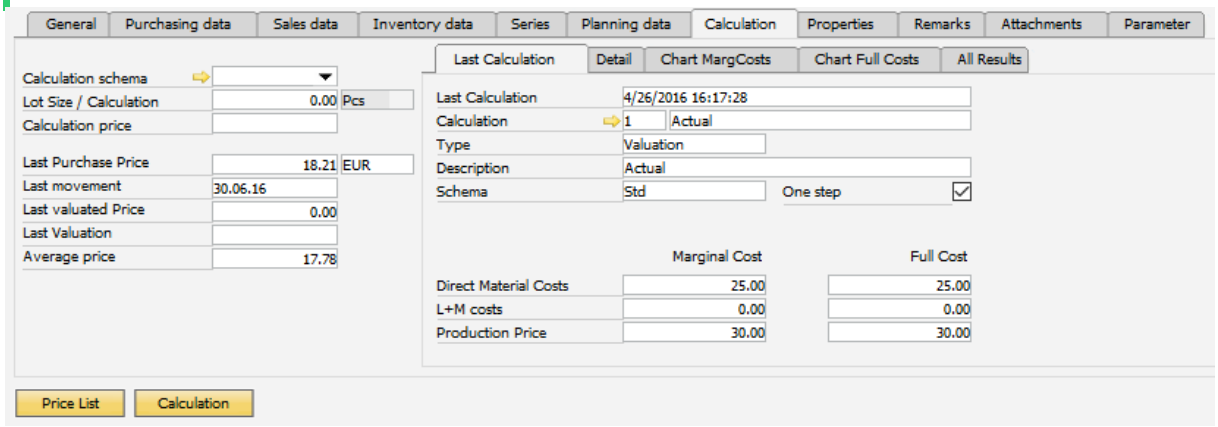
© 2026 Boyum IT Solutions A/S

	If a receipt is performed via Production or a quality control release is performed, the shelf life date is reset from release. Counted from production date - if empty, it is counted from today. If a manufacturing date is entered in the Goods receipt window, the date of expiry is calculated automatically. (calendar days of shelf life are added to manufacturing date).

7.4.1.8 Calculation

Data for Precalculation can be stored in this tab.

PATH: Inventory > Item structure/Item report > Double-click an item > Item master data for XXX > Master Data tab > "Calculation" tab.



Window artikel_edit.psr

Field Description

Field	Description
Calculation Schema	Default – Calculation schema. Defines which calculation schema to be used for Precalculation and work order valuation. Work order creation: If Calculation schema is defined in the Configuration wizard the Beas ignores the setting in Item Master data. If no Calculation schema is defined in the Item Master Data and Configuration Wizard, Beas uses Schema "Std". ***See*** Configuration wizard

© 2026 Boyum IT Solutions A/S

Field	Description
	Calculation schema.
Lot Size/Calculation	Predefined calculation lot size in warehouse units. Define a batch size for calculations. Pre-calculations can be executed using predefined batch sizes. Batch Calculation always uses the Lot size defined in this field. The Unit of measure is displayed. This can be defined per Inventory or Production UoM ***See*** Concept Lot size
Calculation price	Manually include a price to be used as reference for postings and calculations. However, after running a Batch Calculation process, Beas updates this field with the actual calculation value. The Unit of measure is displayed right of the field. ***See*** Edit batch-calculation – fill calculation price
Last purchase price	Last purchase price on the last receipt price incl. currency (determined from SAP Business One).
Last movement	The date of the last stock transaction for the item. This field cannot be changed.
Last valuated price	Last Determined Price using the function **SAP Business One > Warehouse Management > Inventory Reports > Inventory Valuation Report**. This has nothing to do with **Item valuation via Calculation > Batch Calculation** .
Last valuation	The date of the last execution of the **SAP Business One > Warehouse Management > Inventory Reports > Inventory Valuation Report**. This field cannot be changed.
Average Price	The current average valuation price determined by SAP Business One. This field cannot be changed. Only if price valuation is not by warehouse.

More functions

Button	Description
Price List	Editing the price list directly – item-related. ***see*** Price list button.
Calculation	Running the calculation view directly for this item. ***see*** Calculation button.

© 2026 Boyum IT Solutions A/S

If a batch Precalculation was performed, further tabs are displayed:

Tab	Description
Last calculation	Result of last batch calculation.
Detail	This tab displays detailed results of the last Batch Calculation, showing the Calculation Schema lines. Only available after executing a Batch Calculation process.
Chart of MargCosts	This tab displays a graph with the history of Batch Calculations, showing the representativeness of direct material and marginal production costs over the calculation prices. Only available after executing a Batch Calculation process. ***See*** image in toggle below: Chart MargCosts Chart Full costs	This tab displays a graph with the history of Batch Calculations, showing the representation of direct material and full production costs over the calculation prices. Only available after executing a Batch Calculation process.
All Results	List of all Batch Calculations executed for the item. Only available after executing a Batch Calculation.

In case of a purchased item, this tab is only displayed if Calculation of Purchased Items is activated in **Configuration wizard > Calculation > Precalculation**.

Last calculation tab

Information on the last batch calculation is displayed in this tab>

Field	Description
Last calculation	Date and time of the last calculation.
Calculation	Number and name of the batch calculation incl. call-up option.
Type	Type of calculation (simulation, valuation, etc.).
Description	Description of the calculation.
Schema	Schema used in the batch calculation.

© 2026 Boyum IT Solutions A/S

Field	Description
One step:	If activated, a single-level calculation was performed.
Direct Material Costs	Material costs at marginal and full costs without surcharges.
L + M costs	Manufacturing costs at marginal and full costs without surcharges.
Production Price	Total of material and production costs without surcharges.

Using **Beas > Calculation > Batch Calculation** a calculation can be defined the result of which is displayed here in the item calculation view.
Follow this procedure:
1. Set up batch calculation.
2. Activate "Item view" setting.
3. Run the calculation.
From the first time the calculation is run the result is available in this view.

back to item master

7.4.1.8.1 Price List button

Beas has an item-related price list view but conforms to the price lists and special price of SAP.
Beas does not support price lists dependent on other price lists.
The Beas Price list is a parallel function to SAP Business One-price lists. Extended price lists **cannot** be edited here.

NOTE: Due to conversion, rounding differences may arise.
Window settings and templates are supported.To edit, item editing rights are required.

The price list displayed is not based on Unit Groups or other definitions.

Field Description

Field	Description
Price List	Name of price list.
Origin price list	Reference or basic price list. Not supported by Beas. **Warning:** Not every scenario is permitted in SAP either.
Price	Price as per price list.
Currency	Currency.

© 2026 Boyum IT Solutions A/S

Manual	Price is maintained manually (no dependency on other price lists).

Price input is deactivated by default and can be activated using window settings.

Price Time Discounts button

Extended provides access to the extended price list, which is structured on two levels:

1. Time discounts – Price
2. Within the valuation period of the time discount, the quantity discounts

see: **SAP > Manage Time and Quantity Discounts**

The extension can only be called if the price was specified in the price list.

Time discounts

The time range, discount and price in Inventory UoM are displayed here by default.

Input / change options can be activated using the window settings. Templates are supported.

The price can also be input in purchasing and sales UoM.

As SAP does not support these units, Beas uses the units of conversion here, i.e. if the price is changed in sales UoM, the price is actually converted into Inventory UoM.

Field	Description
Item	Time discount for items.
Customer	Special price list for customer (here, always * followed by the price list number. This cannot be changed here.
Price list no.	Number of the price list.
Line no.	Line number time discount.
From date	Validity period.
To Date	Validity period.
Discount	Discount in % in relation to the price as per price list (automatically calculated if the price is entered.
Price	Price for this time range in Inventory UoM.
Currency	Currency of the price.
Sales Price	Price in sales UoM. If changed, the price per Inventory UoM and price per purchasing UoM is calculated automatically.

© 2026 Boyum IT Solutions A/S

Sales UoM	Display of sales UoM incl. conversion factor and currency (e.g.: EUR per 5000 Pcs.)
Unit	Sales UoM.
Factor	Sales UoM – Inventory UoM conversion factor.
Purchase Price	Price in purchase UoM. If changed, the price per Inventory UoM and price per purchasing UoM is calculated automatically.
Unit	Purchasing UoM.
Factor	Purchasing UoM – Inventory UoM conversion factor.
Default price	Price in price list.

Quantity discounts

Quantity discounts can be stored for a time discount range.

Field	Description
Item	Time discount for items.
Customer	Special price list for customer (here, always * followed by the price list number. This cannot be changed here.
Price list no.	Number of the price list.
Line no.	Line number time discount.
From date	Validity period.
To Date	Validity period.
Scale	Price valid from quantity (in Inventory UoM).
Discount	Discount in % in relation to the price as per price list (automatically calculated if the price is entered).
Price	Price for this time range in Inventory UoM.
Currency	Currency of the price.
Scale - sales	Price for this time range in sales UoM.
Sales Price	Price in sales UoM. If changed, the price per Inventory UoM and price per purchasing UoM is calculated automatically.
Sales UoM	Display of sales UoM incl. conversion factor and currency (e.g.: EUR per 5000 Pcs.)
Unit	Sales UoM.
Factor	Sales UoM – Inventory UoM conversion factor.

© 2026 Boyum IT Solutions A/S

Scale - purchase	Price for this time range in purchasing UoM.
Purchase Price	Price in purchasing UoM. If changed, the price per Inventory UoM and price per purchasing UoM is calculated automatically.
Unit	Purchasing UoM.
Factor	Purchasing UoM – Inventory UoM conversion factor.
Default price	Price in price list.

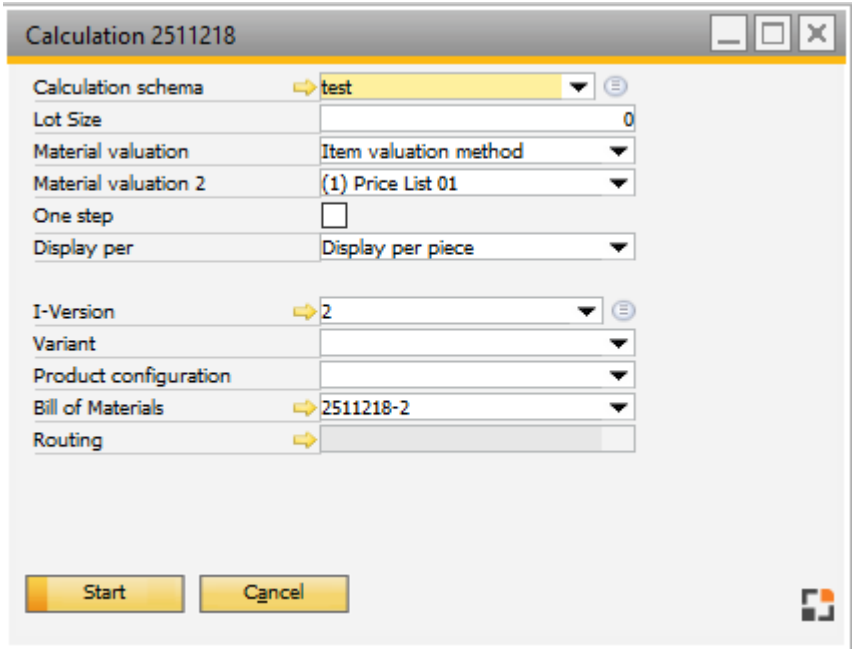
back to calculation tab

7.4.1.8.2 Calculation button

The button calls the Precalculation for the item. This calculation is only for display and cannot be saved.
In the first window you can define all parameters for the precalculation.
With the button "**Start**" Beas opens the precalculation window.

PATH: Inventory > Item structure/Item report > Double-click an item > Item master data for XXX > "Calculation" tab > "**Calculation**" button.

An intermediate window opens where you can configure further parameters. Use the icon to open the Schema Detail window.



Window pk_new.psr

© 2026 Boyum IT Solutions A/S

Field Description

Field	Description
Calculation schema	Defines which Calculation schema to use to calculate this item. ***See*** Calculation Schema.
Lot Size	You can define the Lot size in Production or Inventory UoM. Default is Production UoM.
Material Valuation Material Valuation 2	Determine the source for the direct material costs. Material Valuation 2 determines the source for the direct material costs in case any of the direct material costs is not found in the source set in Material Valuation. This setting has no effect on **External operation > Valuation of services.** The default schema is defined in the Configuration Wizard. ***See*** Setup wizard – Calculation – Costing analysis and Pricing types.
One step	If activated, only a single-level of Precalculation is performed, that is, sub-assemblies are not further broken down. If not selected, the complete BoM structure is broken down. Sub-assemblies are valued according to the selected method.
Display per	Determines how to display the results: • Display per piece (or unit) shows the calculated values for one piece. • Display per lot size (corresponds to calculation lot size) shows the calculated values for the amount of pieces set in the Lot size field. • Display per .. (factor can be entered manually) shows a new field to set the quantity of pieces for which to display the calculated values. You can define "Lot size" and "Display per" with decimal places.
I-Version	Select a specific item version for running the calculation process. This field is used to determine the BoM and routing to be used. ***See*** Item master – I-Version Item version control
Variant	Select a specific variant for running the calculation process. Up to 26 variants can be stored per item.
Product configuration	Select a specific product configuration for running the calculation process.

© 2026 Boyum IT Solutions A/S

Field	Description
Bill of Materials	The BoM to be used for the breakdown. The BoM to be used for the breakdown of the assembly can be selected in this field. It is stored in the item or item version. This fields is only visible if Item version control was activated.
Routing	Routing to be used for the breakdown. The Routing to be used for breakdown of the assembly can be selected in this field. It is stored in the item or item version. This fields is only visible if Item version control was activated. This field can be edited only when creating a new calculation and and the Routing directly selectable option is enabled.

See

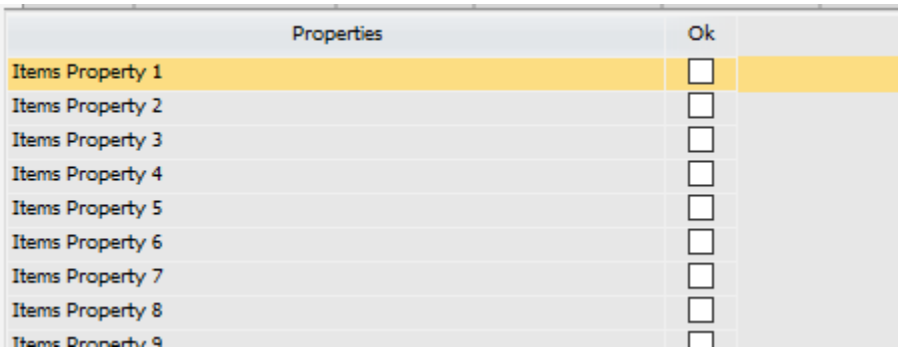
Precalculation

Item Master – calculation tab

7.4.1.9 Properties

Use the Properties tab to assign individual features to the displayed item.

Up to 60 characteristics can be activated in SAP Business One for items.
The individual characteristics can be activated or disabled in this tab.



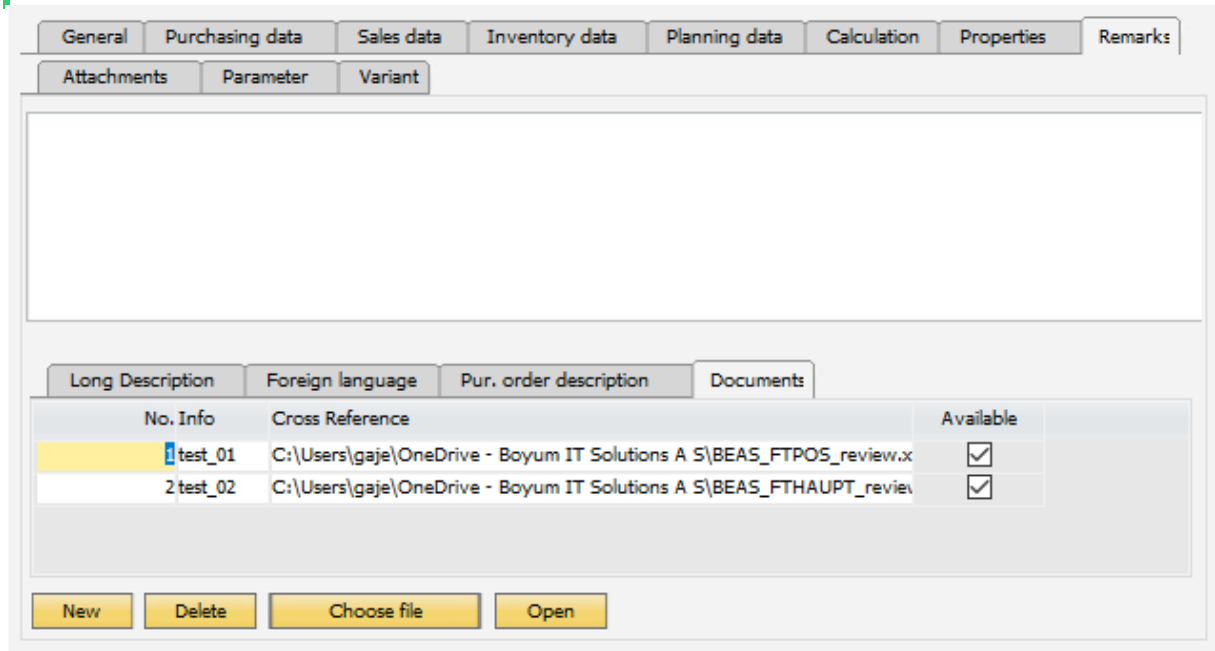
back to item master

7.4.1.10 Remarks

In this tab you can add further, descriptive information to an item. Enter long description, information in a foreign language also in RTF format, or attach documents.

© 2026 Boyum IT Solutions A/S

PATH: Inventory > Item structure/Item report > Double-click an item > Item master data for XXX > Master Data tab > "Remarks" tab.



Window artikel_edit.psr

Tab descriptions

Tab	Description
Long Description	A long description of the item, which can also be entered in RTF format (**Configuration Wizard > Master Data > Item > Use of RTF input fields**). This text can also be printed on sales documents. Extended information relating only to the rich text entry objects is only active as long the text is edited; it is not saved. **Important**: SAP Business One cannot read RTF format. If long description is entered in RTF format, it can only be displayed in Beas layouts and documents.
Foreign language	Long description for foreign languages. Can also be printed on sales documents in the case of a foreign language. Input in RTF format is also possible here.
Pur. order description	Long description for output on order forms, which can also be entered in RTF format (**Configuration Wizard > Master Data > Item > Use of RTF input fields**).
Attachments tab	⊟ Three documents or images can be stored. The pictures/documents stored here are available in the FDC terminal.

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Tab</th><th>Description</th></tr>
<tr><td></td><td>The last used folder is opened. This is saved per window and workstation.
Use the Pre-view window to view the first attachment.
Important: In order for every SAP user to have access to the attachments, it is necessary to place the attachments in a shared folder and give the users rights to access the folder. Beas only creates a link to the attached file.</td></tr>
<tr><td>Documents</td><td>Any number of documents can be stored. The reference to the document (directory, document name) is stored, not the document.

If a document was added here, it can be called from from different windows e.g. logon order (after WO selection), Pool list – logon work order or via app "Display documents".
Details
Beas supports two kinds of documents:
- Documents stored in SAP Business One (only view)
- Documents stored in Beas You can add new documents, add remarks – these documents are not visible in SAP Business One
Important: the documents must be in a released network directory.

Note: Attachments saved in the SAP Business One screen are displayed in the Beas window (extended master data). They can be opened, but not renamed or deleted. Files attached in the Beas window are not displayed in the SAP Business One window.

Sorting and filtering by cross reference is available.

back to item master

7.4.1.11 Parameter

The Parameter tab is only available if enabled in the **Configuration wizard > Master data > Item > Display > Item master > Manage parameters**.

Parameters are used to include additional information for the items. The product can be described in further detail using user-definable parameters. The information can be used in reports or in customizations for variant production. For example, parameters can include nutrition information for food items, or alloy percentage composition for metals. When creating a Work Order document for an item that contains parameters, all parameters are copied into the work order.

Variant production can access these parameters directly and use them as a reference for breaking down formulas and tables.

Field	Description
SortID	Used to sort the parameters
Parameter	Name of the parameter
Contents	Value of the parameter
UDF 1...4	Up to 4 UDF can be set up Note: UDF's set here are not copied into the UDF fields of the **Work Order Position > Parameter** tab.

Button	Description
New	Create a new parameter

© 2026 Boyum IT Solutions A/S

Button	Description
Delete	Delete the selected parameter
Delete: All	Delete all parameters for this item
Copy: from	Copy all parameters from a selected item to the current one
Window settings	Open window settings for the parameter list

back to item master

7.4.1.12 Variant

This tab is used to create a simple and limited version control for the items. Up to 26 variants can be defined for the item. This type of variant is easy to define and can be implemented simply and quickly.

- Only available if enabled in the **Configuration wizard > Master data > Item > Variant > Variants per Item**.

The variant system is fully supported by MRP, calculation and production, and can also be combined with variant production and the product configurator.

see Variants

back to item master

7.4.1.13 Report "used in"

PATH: Item master > right-click menu > list "Used in".

In two, respective tabs, this window gives an overview of which Bill of Materials and Documents the item is used in.

Field	Description
Item	Name of the Item made up of the selected Item/assembly.
I-Version	Version number.
Description	Item description.
Drawing number	Drawing number
Cross Reference	The current item used in the item/assembly mentioned in the first row.
Item group	The item group where the item is classified.
Active	Item active.
Release	Select check mark for Release production.

© 2026 Boyum IT Solutions A/S

Window artikel_revisionnumbercontrol.psr

7.4.1.14 Item version

Item version controls different versions of finished goods or sub-assemblies and helps in the phase-in or out phase-out of components.
Version control in Beas is visible in the item structure on all levels. Grayed-out materials are phase-in materials that are used for production from a specific date. Phase-out and phase-in materials are taken into account in the specific version controlled BoM (based on validity dates) and MRP is calculated accordingly.
Dedicated alert procedures can be set up in SAP Business One in order to warn procurement personnel of issued purchase orders with phase-out materials.

Example of the item version structure

Window artikel_struktur_browse.psr

Item versions (I-Version) can be stored in an item. All entries for an item are displayed in the item version list. Item versions can be edited, and documents can be stored for them.
Window settings and templates are supported.

As soon as a version entry is stored, the item administration and the release management is activated for the item. Only those version numbers are allowed to be used for the item that have been stored in the item.
For more information on management methods of item version control, ***see*** Item master, Configuration wizard.

- Notes on item version control

© 2026 Boyum IT Solutions A/S

- Inventory management by item version is only possible for batch or serial number-related items.
- The order recommendation list cannot create a balance per item version, because order recommendations are calculated per item.
- The active version in indicated in the I-Version field of the item master data, which is used as default for the work order and order recommendation, if no other version was indicated elsewhere (e.g. in sales order).
- Item version control is not supported in all areas, for example it is not available in Web Apps or Alternative Item.

Realese management

Functions

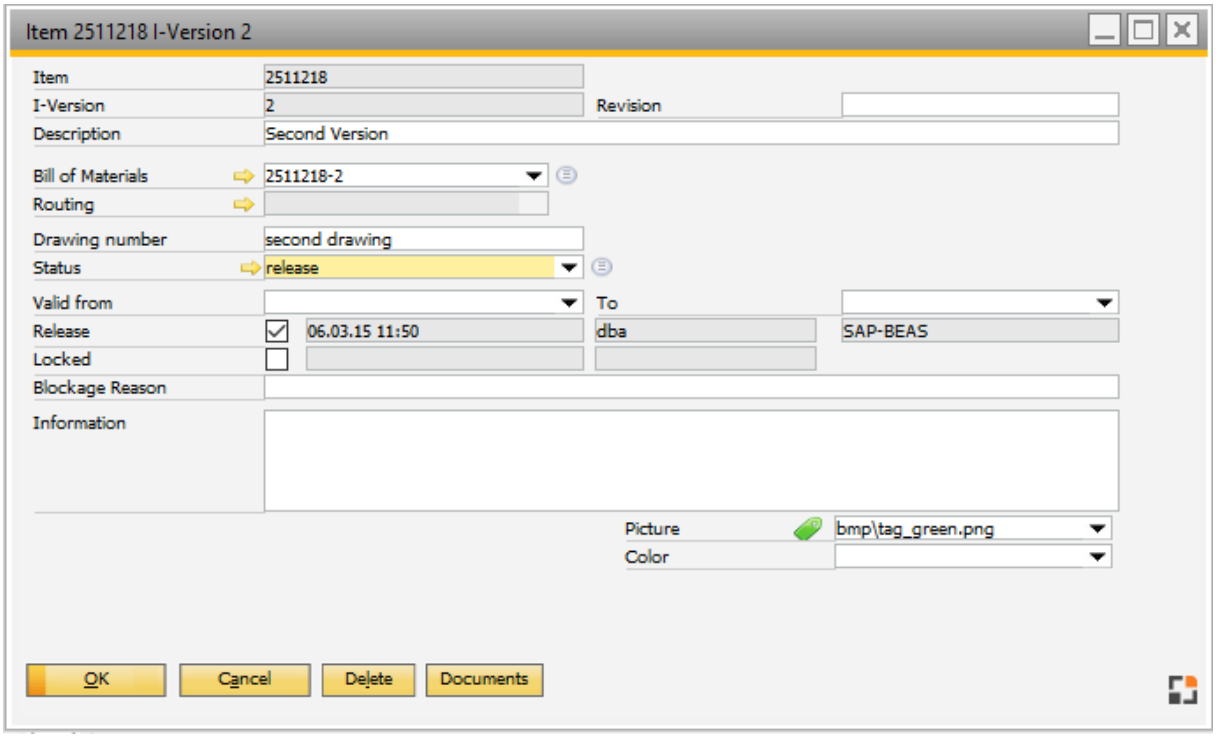
Function	Description
Open	Open the details window for an item version.
Add	Create a new item version.
Remove	Delete entry.
Duplicate	Duplicate the entry and create a new one with the following number. Function available only if you work with continuous numbering. (right-click and button) When using this function, the new duplicate appears in the top of the list in this window.
Documents	Open the documents window to store documents per item version.

7.4.1.14.1 Edit I-version

PATH: Item master data for XXX > Master data tab > header: double-click "I-Version" .

Enter or edit the details of an item version (I-version):

© 2026 Boyum IT Solutions A/S



Window artikel_ version_ edit.psr

Field	Description
Item	Item ID.
I-Version	Item version (I-Version, alphanumeric, 20 characters). This is assigned automatically. The configuration of the number template can be edited in the Configuration wizard.
Description	Version description . Displayed in most lists instead of the item description.
Drawing number	Drawing number of the item version. If this field is filled, in most lists, in work order and calculation the drawing number of the version is displayed instead of the item drawing number.
Status	Select a status for this entry. See the details of statuses and create new statuses by clicking on the selection icon on the right of the field. All release properties of the item version can be defined in the status. Default settings for creating and copying a status can be defined in the Configuration wizard. **Note**: In case a status is defined, the item version is no longer changeable. The same applies for the stored BoM and routing.

© 2026 Boyum IT Solutions A/S

BoM	Assigned BoM. This field is only visible if the *Separate Bill of Materials* option is selected in item master data. Administration field. If no BoM is stored, the BoM with the same ID as the item number is used.
Routing	The routing used for this version. This field is only visible if the *Separate Bill of Materials* option is selected in item master data Administration field. This field is not editable. You can define the routing plan in the Bill of Materials Header.
Valid from/to	Validity period of the item version. This is information only and doe not provide functionality.
Release	Release I-Version If this flag is set, the name, time and work station name are saved. The default release ID in can be set in the Configuration wizard. The release behavior can be defined in Status. This release ID can also be set in the status. **Note**: If at least one status setting exists, that controls the release ID or blocking ID, it can no longer be changed manually.
Locked	Block I-Version If this flag is set, the name, time and work station name are saved. Blocked I-versions are not displayed in selection lists and in the item structure. Manual entry of this item is still possible. Further behavior can be defined in the Status. The ID can also be set in the status. **Note**: If at least one status setting exists, that controls the release ID or blocking ID, it can no longer be changed manually.
Blockage reason	Enter a blockage reason manually.
Information	Free text field.
Picture	Icon to mark this I-version.
Color	Display color of the I-version.

Documents: The button opens the list of linked documents.

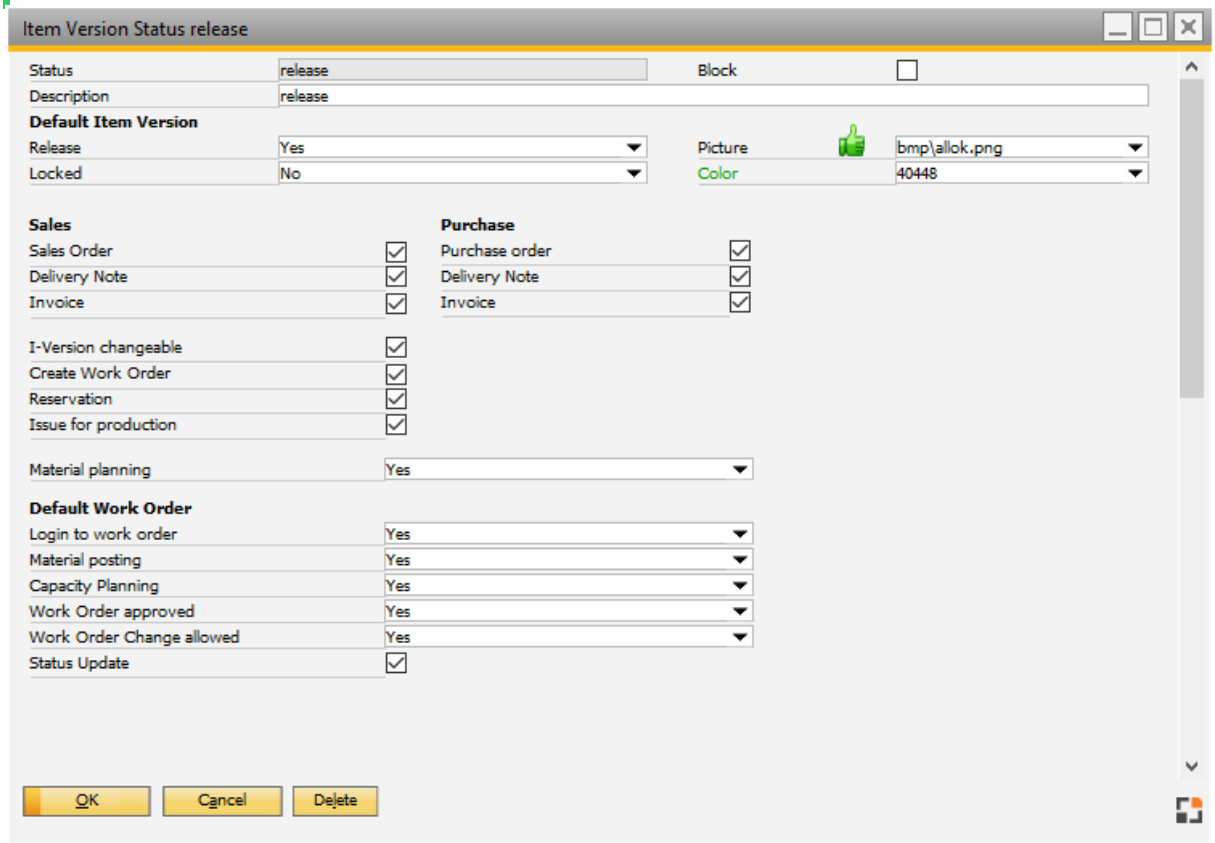
© 2026 Boyum IT Solutions A/S

7.4.1.14.1.1 Item version - Status

Item version – Status - Release management

The release administration on item version level occurs in the status administration.
Use the status administration to manage releases on item level. It can be defined whether the Bill of materials, routings and work orders can be changed.

PATH: Item master data for XXX > Master data tab > header: double-click "I-Version" > double-click "Status" .



Window artikel_version_status_edit.psr

The list can be customized using window settings and templates. The authorization to Item version – Status is necessary in order to edit the settings.

Field	Description
Status	Unique identifier. This should be a descriptive name.
Description	Long description of the status.
Block	Blocks the selection of this entry.

© 2026 Boyum IT Solutions A/S

	If the status is in use, this can no longer be changed.
Release	Defines whether the item version should be released when this status is used. **Yes / No / None change** are selectable.
Locked	Defines whether the item version should be blocked when this status is used. **Yes / No / None change** are selectable.
Sales, sales order, delivery note, invoice	Defines if a sales order, a delivery note or an invoice may be created for this item version.
Purchase order, delivery note, invoice	Defines if a purchase order, a delivery note or an invoice may be created for this item version.
I-Version changeable	Definition of the item version may be changed If this option is deactivated, the stored routing cannot be changed. But the fields in the item version are still changeable.
Create work order	Defines if a work order may be created for this item version If this option is enabled, a work order can be created for this item version, depending on "Release not check" and "Release I-Version" parameters. If this option is disabled, then the work order cannot be created manually. When creating the work order through an automated process (MRP, Data Integration Hub, BeasScript) the work order is created, but in a blocked status. The blocking can be avoided by using Production types e.g. for a sample production.
Reservation	Defines whether the item version may be reserved for a sales order or work order.
Issue work order	Defines whether if the item version may be issued for a work order.
Material planning	Defines whether the item version is to be considered in material planning. If a work order has already been created, this option affects the same option in the work order position. ***See*** Update Status. **Yes/No/None change** are selectable.

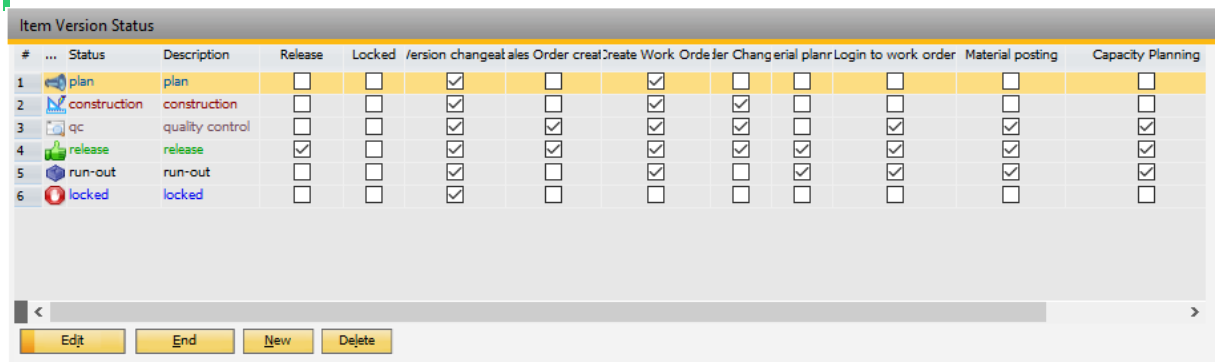
Default work order

Define which options are transferred to the work order position, after a work order was created.

© 2026 Boyum IT Solutions A/S

Login to work order	Defines whether order time receipts may be created for this item version. This option affects the same option in the work order position. ***See*** Update Status. **Yes/No/None change** are selectable.
Material posting	Defines whether material postings may be created for this item version. This option affects the same option in the work order position. ***See*** Update Status. **Yes/No/None change** are selectable.
Capacity planning	Defines whether the item version is to be considered in capacity planning (APS). This option affects the same option in the work order position. ***See*** Update Status. **Yes/No/None change** are selectable.
Work order approved	Defines whether for this item version the work order position may be approved. This option affects the same option in the work order position. ***See*** Update Status. **Yes/No/None change** are selectable.
Work order Change allowed	Defines whether for this item version, changes may be executed in the work order. This option affects the same option in the work order position. ***See*** Update Status. **Yes/No/None change** are selectable.
Status Update	If this is active, the above mentioned options are updated immediately in all work order positions where this item version is stored, as soon as this status is selected.

PATH: Item master data for XXX > Master data tab > header: double-click "I-Version" > double-click "Status".



Window: artikel_version_status_edit, artikel_version_status_browse

beas 9.1 PL: 08

Note: An automated change of item version status can be controlled by BeasScript. For example, if after creating a new version, the old one is set to inactive automatically.

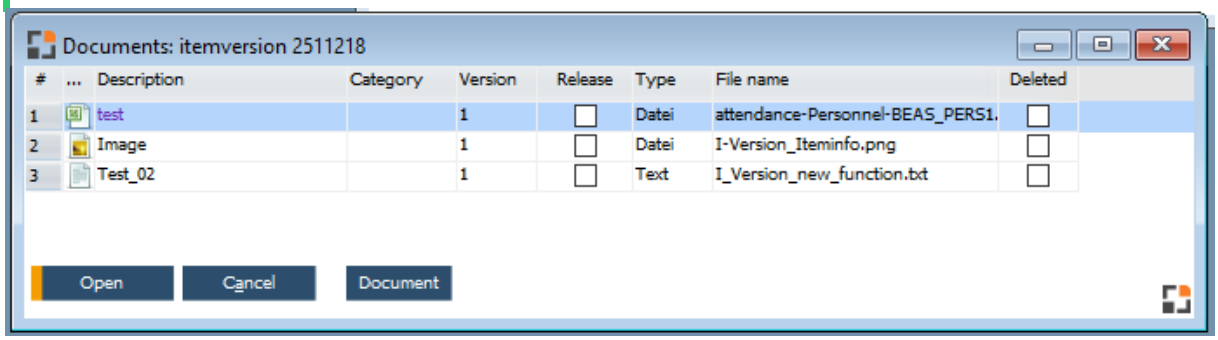
See BeasScript documentation.

© 2026 Boyum IT Solutions A/S

7.4.1.14.2 Documents

This window provides a list of documents linked to an Item Version.

PATH: Item master data for XXX > Master data tab > header: double-click "I-Version" > Documents button.



Window documents_browse.psr

Field descriptions

Field	Description
...	Icon of the document
Description	Free short text to describe the document
Category	
Version	Version number
Release	Check box indicating released version
Type	Data or text
File name	File name of the document
Deleted	Check box indicating if the file has been removed/deleted from the accessed folder.

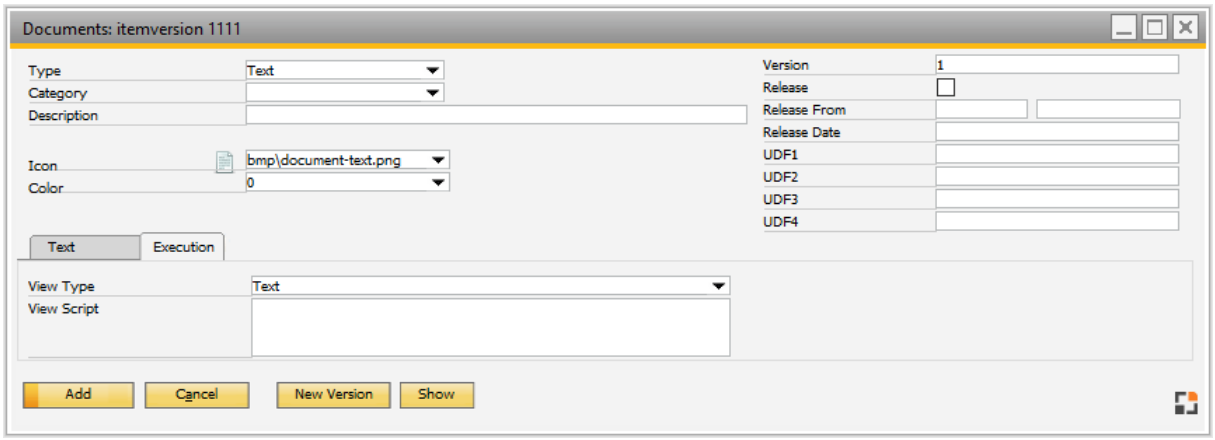
Open: Open the editing window of the linked document.
Add: Attach a document in the opening window. Available from the right-click menu.
Document: Open the system_textedit window to store a text.

7.4.1.14.2.1 Edit documents

In this window you can describe/edit and attach a document to an Item Version.

PATH: Item master data for XXX > Master data tab > header: double-click "I-Version" > **Documents** button > **Open/Add**.

© 2026 Boyum IT Solutions A/S



Window documents_ browse.psr

Field descriptions

Field	Description
Type	Text or file.
Description	Free short text to describe the document
Category	Add a category to the document and click OK - it can be selected from the dropdown at later use.
Version	Version number
Release	Activate check box to release version
Released by	
Release Date	The date when the release was done.
File	Browse the file to attach
UDF1–4	User-defined fields
Execution tab	
View Type	- Shell: The file can be viewed using the program associated with it as default in the system (similar to double-clicking in a file browser). - Text: The system opens an internal window to show the text file. - Bitmap Viewer: The system opens the image with a bitmap viewer. - Script: execute this as a BeasScript file.
View Script	When Script view type is selected, this field displays the actual script.
File name	File name
Text tab	You add further text in this tab.

© 2026 Boyum IT Solutions A/S

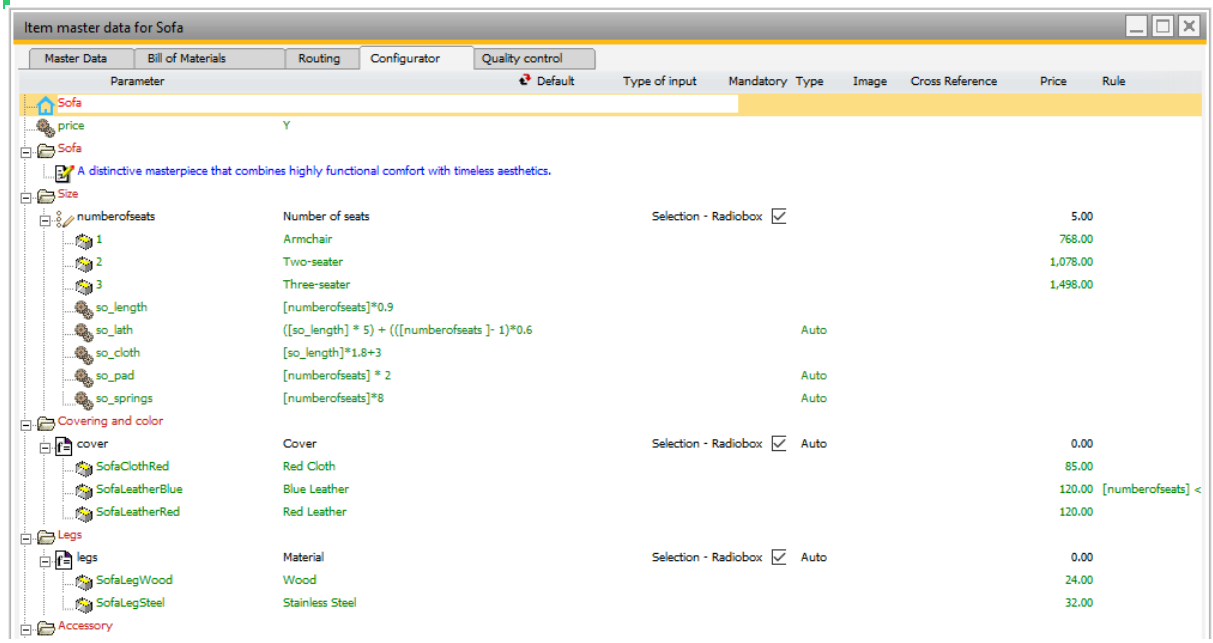
New Version: A pop-up window is displayed prompting: *'Do you want to create a new version?'*. If you click yes, another version of the document is stored for this version.
Show: Open the system_textedit window to store a text or open the file based on the "View Type" setting (***see*** field description above).

7.4.2 Configurator tab

The configuration of an item can be defined here.

Note: The tab is only visible if the module "Product configurator" was activated in the license window and the user has a valid license.

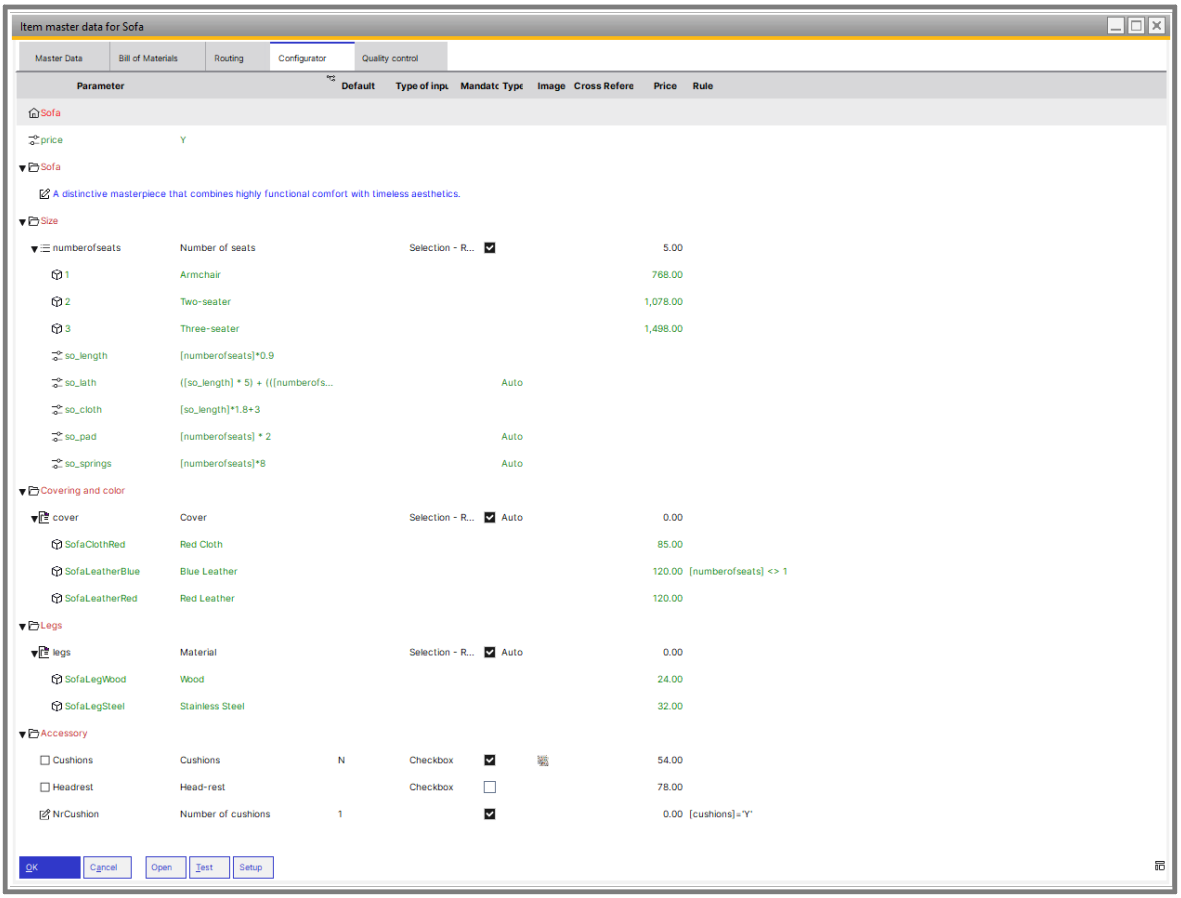
PATH: Inventory > Item structure/Item report > double-click an item > Item Master data for XXX > Configurator tab



Window artikel_edit.psr

Boyum Style configurator design

© 2026 Boyum IT Solutions A/S



Field Description

Field	Description
Parameter	Name of the object (e.g. the formula or selection).
Default	Definition of default value.
Type of Input	Definition of input as: normal, check box or selection.
Mandatory	Set field input as "Required".
Image	Image file name.
Cross Reference	Reference (referencing) via e.g. a database query.
Price	Value of fixed price. ***See*** Price - parameter
Rule	Visibility rule for the object.

Buttons:

Field	Description

© 2026 Boyum IT Solutions A/S

Open	Click to edit the configurator for the item. ***See*** Edit configurator.
Test	Opens the Configurator window.
Setup	Opens the Configurator Setup window where you can select Customer, Date, add Quantity and choose the target Variant.

see:

Configuration wizard – Production – Product configurator

back to item master

7.4.2.1 Edit configurator

The fields can vary according to object (e.g. formula, set object).

Field description of the configurator position

Field	Meaning
Name	Name of the object (e.g. the formula or selection).
Description	Description of the object.
Image	Image file name (can also be selected via the drop down list).
Size	Size setting for the selected image.

The tabs can vary according to object.

Description of tab

Tab	Meaning
Output	Specification of the output form.
Input	Specification of the input form.
Price	Price specification or price determination at run time.
Visibility rule	Definition of visibility of the object.

back to Configurator tab

© 2026 Boyum IT Solutions A/S

7.4.2.2 Output

Field Description

Field	Meaning
Form of Output	Output definition of image and title.
Long Text	Input of any required additional text.
Text1-3	Option of inputting 3 additional texts.

back to configurator tab

7.4.2.3 Input

Field Description

Field	Meaning
Required	Set field input as "Required".
Type of Input	Which input is possible in configurator. **Normal:** one line for entries. **Normal – large:** a large text field is available for input. Reaching the border, it is scrolled automatically. **Check box:** a check box to select the options is displayed. **Selection – Radio:** a radio button list displayed. **Selection – Drop down**: a reference is displayed in a drop down-list.
Default	Definition of default value.
Cross Reference	Input of a reference (referencing) via e.g. a database query.

back to configurator tab

7.4.2.4 Price

Field Description

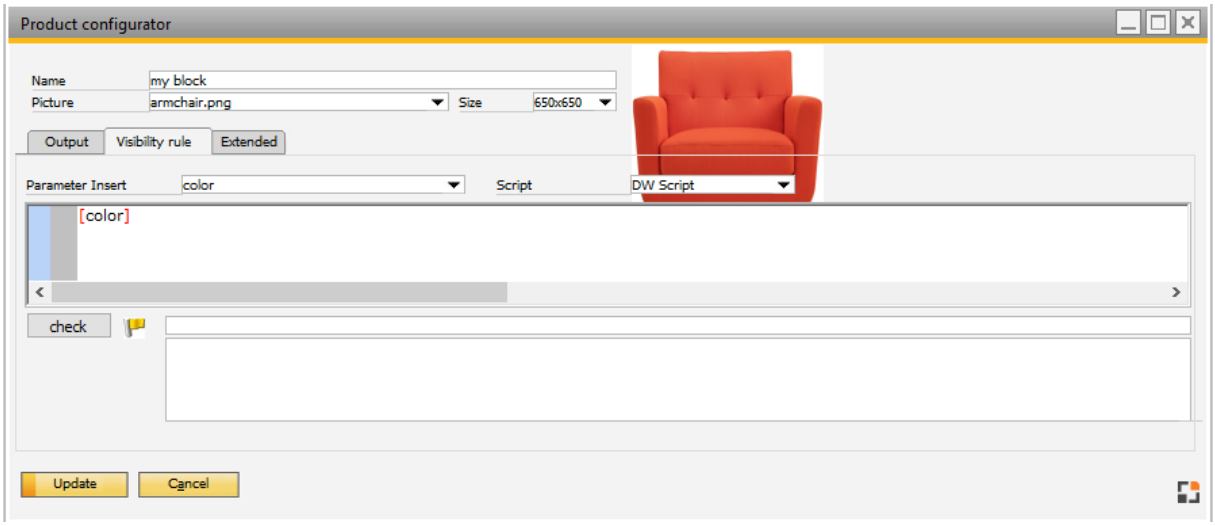
Field	Meaning
Price	Input of a fixed price. Right of the field you can find the used currency symbol, for example "$". ***See*** Price - parameter
Determine price using formula	Specifies whether price should be determined using a formula (at run time).

© 2026 Boyum IT Solutions A/S

Formula	Definition of a formula for price determination.

back to configurator tab

7.4.2.5 Visibility rule



Window artikel_produktkonfigurator_detail.psr

Field Description

Field	Meaning
Parameter insert	Selection of a previously defined parameter / input of the visibility rule. Syntax highlighting is supported in both 32/64Bit versions.
Script	Select from a pool of scripts: DW Script JavaScript Formula JavaScript VBScript Formula VBScript
Check function (button)	Possibility of syntax review of the visibility rule.

back to configurator tab

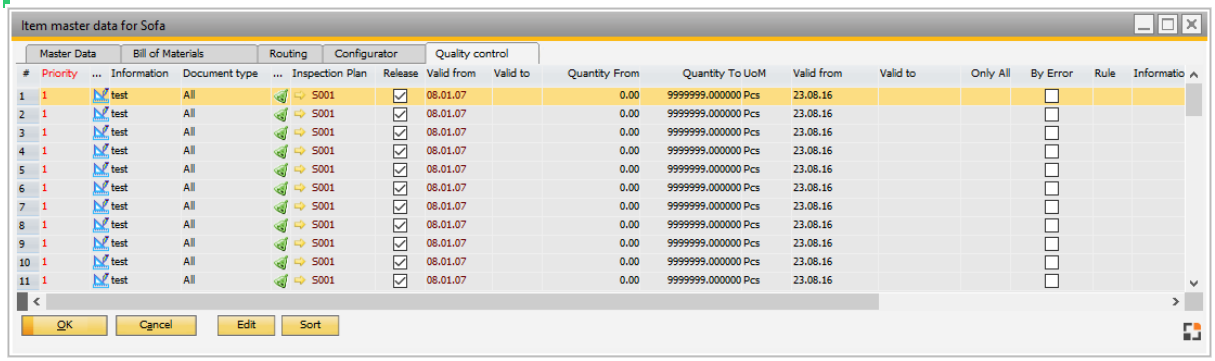
© 2026 Boyum IT Solutions A/S

7.4.3 Quality control

Inspection plans can be defined for an item. The inspection plan on top position in the list is used, matching the stored conditions.

The list is freely adjustable. ***See*** Window settings, Templates.
For Field descriptions ***see*** Item – QC-inspection plan – linkage
For editing, the authorization "Item Quality control" is required.

PATH: Inventory > Item structure/Item report > double-click an item > Item Master data for XXX > Quality Control tab



Window artikel_edit.psr

- List is sorted automatically by priority:

  Priority:

  Sorting by points
  Customer: 100 points
  Warehouse: 100 points
  I-Version: 100 points
  Document type: 50 points

  The list is sorted by the sum of points, quantity and date of validity.
  The more conditions have been defined for one entry, the higher the priority gets.

  If extended rules are active, sorting is done first after clicking the button "**Sort**". Otherwise, after every new entry.

  If updating from older Beas versions to *beas9.0-000-003-xxx:*

© 2026 Boyum IT Solutions A/S

Previous priority is similar to the new points system. After the update, sorting by points apply.

After the first call of this window it is queried whether to activate extended rule determination.

Note: If no Quality control plan is assigned to one specific item, the system checks if there is a quality control plan created with the same name as the item. In this case, the system assigns the QC plan to the Item.

See Item – QC extended rules

If Item – QC extended rules is disabled, the list can be re-sorted by click on "Information" and using Drag&Drop.

Fields

See QC Item – inspection plan – Linkage

Functions

Functions	Description
Update	Save the current sorting.
New	New entry.
Delete	Delete entry.
Edit	Open entry. ***See*** QC Item – inspection plan – Linkage.
Sort	Sort the list by Priority.

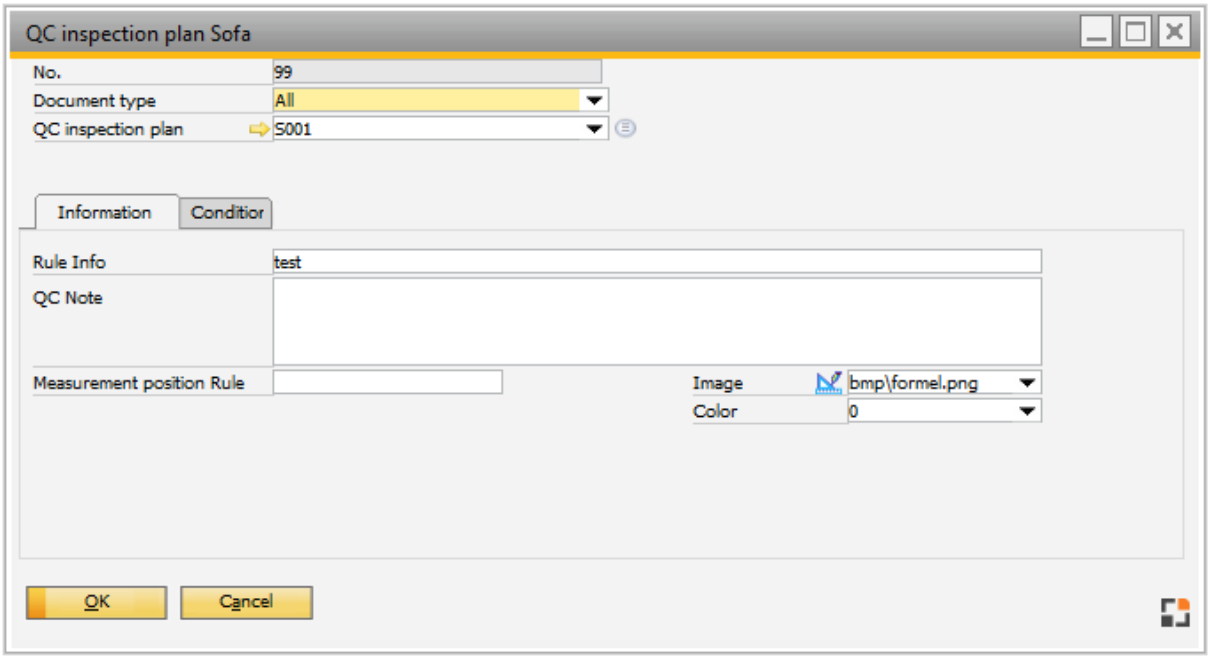
See: Quality control

7.4.3.1 QC Item-Inspection plan linkage

In this link you can store the rule and the inspection plan to be used for this item.
Creating a document, the stored inspection plan is used for the QC order to be created. If no matching entry is found, no QC order is created. If more than one entry fits, according to Priority the first one is used.

PATH: Inventory > Item structure/Item report > double-click an item > Item Master data for XXX > Quality Control tab > double-click an entry

© 2026 Boyum IT Solutions A/S



Window qs_qsverweis_edit.psr

At entry, 3 areas are to be filled:

- Information
- Condition: Creation of a QC-order can be controlled
- Rules: Determine, whether the entry is selectable

For editing, the authorization "Item Quality control" is required

Field	Description
No.	Continuous number assigned automatically.
Item	Item number, inserted automatically.
Document type	Rule applies for which document type. All = applies for all document types. **Document types** Goods receipt PO (I) – Purchase goods receipt Production (E) – Assembly posting in production Sales-Return (R) – Sales credit or offset Reaching Date of Expiry (C) – Set at "batches to be verified"

© 2026 Boyum IT Solutions A/S

	<table><tr><td>Stock transfer (T)</td><td>Stock transfer</td></tr><tr><td>Goods Receipt (M)</td><td>All manual postings</td></tr><tr><td>AP Invoice (X)</td><td>Purchase invoices</td></tr><tr><td>Goods return (Y)</td><td>Returns from purchase with negative amounts</td></tr><tr><td>Credit note (Z,O)</td><td>Credit memos</td></tr><tr><td>AR Invoice</td><td>Invoice with negative amounts</td></tr><tr><td>Delivery (P)</td><td>Deliveries with negative amounts</td></tr><tr><td>Invoices (Q)</td><td>Invoices with negative amounts</td></tr><tr><td>Batch Split (A)</td><td>Batch split</td></tr><tr><td>Batch transfer (B)</td><td>Batch transfer</td></tr><tr><td>Manual</td><td>Manual creation</td></tr><tr><td>Cancellation</td><td>Cancellation</td></tr></table>
QC-inspection plan	Stored the inspection plan to be used ***See*** QC-inspection plan.

Information

Field	Description
Rule Info	Only information.
QC note	Note is transferred to QC-order, it is specific to Item-QC-inspection plan .*(beas9.0-000-003-xxx)*
Measurement position Rule	Value is transferred to QC-order. The rule determines, which measurement positions are inserted or hidden. ***See*** QC-inspection plan – Edit measurement position
UDF1-UDF4	Free definable fields, e.g. Image and color. ***See*** Configuration Wizard.

Condition

If a matching entry was found, with this setting the creation of a QC-order can be prevented.

Only All documents	⊟ Enter interval - for every x goods receipt a QC-order will be created. Every rule has its own counter. ***Example***: 1. Rule: only every 5 goods receipts for supplier A

© 2026 Boyum IT Solutions A/S

	2. Rule: only every 2 goods receipts for supplier B For supplier A a QC-order is created for the 1., 6. and 11. goods receipt. Independent of that, for supplier B for the same item for the 1. and 3. goods receipt a QC-order will be created. *(beas9.0-000-003-xxx)*
Always by Error	⊟ Always create a QC-order after errors Only together with "Only All documents". If a QC-order is marked as faulty, independent of the above option at the next goods receipt a new QC-order is created. The counter is not reset. ***Example***: supplier A: only every 4 goods receipt a QC-order is created "always after error" is active. 1. Goods receipt O, 5. goods receipt not OK. Now for the 6. goods receipt a QC-order is created and then for the 9. goods receipt. *(beas9.0-000-003-xxx)*
Condition ÍScript	⊟ Use BeasScript to determine whether a QC-order is created return failure = do not create QC order return success = do create QC order **Available variables:**

e_qcorder	Origin document (DocNum/Linenum, Belnr_id/Belpos_id ...)
e_qcbasetype	Origin document type
e_qcbaseorder	Origin document number
e_qcbasebasetype	Origin of origin document eg. which WO in case of GR from external operation
e_qsitemcode	Item
e_qscardcode	Business partner

© 2026 Boyum IT Solutions A/S

Rules

Entry can only be selected, if the conditions are met. Tab is only visible if extended rules have been activated.

See Configuration wizard – Quality control

Field	Description
Business partners	Empty: Independent of the business partner. Otherwise only if in the respective document (Goods receipt PO, work order) the business partner is stored.
Valid from ... to	Only applies in the corresponding period.
Quantity from ... to	Only applies from the specified quantity (warehouse units).
Warehouse	Only when posted to this warehouse *(beas9.0-000-003-xxx).*
Item version	Only for this version of item. This function will be available with item versions *(beas9.0-000-005-xxx).*

See: Quality control

7.4.4 Characteristics

Up to 60 characteristics can be activated in SAP Business One for items.

The individual characteristics can be activated or disabled in this tab.

Field descriptions - Master Data tab

© 2026 Boyum IT Solutions A/S

Field	Description
Bill of Materials ID	BoM ID. The BoM can be assigned as the related item number, or free assignment is also possible. If a separate BoM is selected in the item master – administration, any BoM can be assigned. Note: One BoM can be assigned to multiple items. ***Example of use:*** The version number can also be assigned in the BoM ID: Item: 300.3042 BoM Version 1 = 300.3042-001 BoM Version 2 = 300.3042-002
For item	For which item the BoM was defined. It is a information field. Definition is not necessary, because the BoM can also be assigned to multiple items. ***See*** button "Example of use"
Description	Description.
Routing	Define the Routing Plan. In Item Master Data – Administration you can define the Version Control Administration. If you define "Separate Bill of Materials", you must link in this field the Routing position to the Bill of Material. In this field you can choose the Routing plan. If you don't define this, the system copies the BoM ID in the Routing ID field. *Beas 2020.02*
Match code	Further ID for the BoM for simplified search.
Drawing number	Drawing number.
Release	Determine the release of BoM . Only for information. BoM can be used in any case.

© 2026 Boyum IT Solutions A/S

	In the Configuration wizard you can set up, whether the BoM is released immediately after new creation / copy. ***See*** Configuration wizard. At a release, the name of the user, date and station name, will be entered, on which the release executed. The release affects on the create work order: If the BoM is not released, a related work order cannot be created, or locked. The error message *'(checkrelease5) The BoM <...> for item version <...> / <...> is not released or locked'* will be issued.
Authorization group	By clicking the icon, the Authorization group window opens.
Change possible	If active, editing for the entry is locked.
Locked	If active, locking information is displayed indicating the date and time and the personnel.
Blockage reason	The reason for locking.
Picture	Select an image to appear for this BoM in the browse window.
Color (...)	Select a color of display for the detailed information of this BoM in the browse window.
UDF 1–4	Free definable fields. (***See*** Property A-D in the image above)
Remark	Add remarks to this BoM.

Special right-click functions:

Refresh window: Refresh changes

Change log: Open the Change log for this BoM.

Field descriptions

Field	Description
...	Bitmap image associated with the position.
Position	BoM position number. ***See*** more details in Edit Bill of Materials.
Pos ID	BoM position ID
UoM	Inventory unit of measure
Item	Item number of material, sub-assembly or phantom item ***See*** more details in Edit Bill of Materials.
I-Version	If item version control is active, the default version number or variant is entered here. An alternative variant or version can be selected. Based on this the BoM or routing is determined (if the item is an assembly).
Description	Short name of BoM position **Master data** If "manually" is disabled, the designation of the selected item is displayed. If an I-Version was selected, the designation of the item version is

© 2026 Boyum IT Solutions A/S

Field	Description
	displayed. It is not copied to the BoM; the original designation is used at all times. If you enable "manually" you can change the designation. It will be saved, then, in the BoM position. **Note:** In BoM – list the designation cannot be changed. **Production / Precalculation** Designation of used material / Assembly, changeable.
Quantity	Number of units available.
Manual	Allows a manual entry of drawing number **Only visible in master data** If active, the drawing number and designation can be entered manually. If not, it is taken from master data of the selected I-version. You can define a default item in Configuration wizard to be used for BoM positions without existing items. If the default item is inserted into a BoM position, the switch "manually" is disabled automatically.
Routing pos	The ID of the linked routing position.
Warehouse	Code of the Warehouse where the item is stored.
Bin Location	Bin location number - available for bin-managed warehouses. Only valid "Bin Locations" for the selected warehouse are allowed. After changing the warehouse, the bin location content is set to empty in this field. **Work Order BoM and Precalculation:** A work order created from an Item, or Precalculation copies this field automatically for the BoM. If there is not enough stock to pre-assign quantities from this, pre-

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>defined bin location, Beas continues to pre-assign them from further bin locations based on the sorting rules.</td></tr>
<tr><td>BBD Options</td><td>Define Best Before Date (WMS) values

WMS Integration:

Define a "Best Before Date" (WMS) value for the Bill of materials position.
IMPORTANT: The selected value can only be applied during the Picking for Production process in WMS.

For more information on each WMS Best before date value, see Produmex WMS documentation > Produmex WMS Fields and Settings > 3.1 Bill of Materials.
<table><tr><th>Value</th><th>Description</th></tr><tr><td>D</td><td>"Due date and shelf life" (This is the old DEFAULT value in versions prior to Beas 2023.02)</td></tr><tr><td>P</td><td>"Pick date" (Default when no value is defined)</td></tr><tr><td>B</td><td>"Best before date of finished product and shelf life"</td></tr></table>
The field is hidden by default and can only be made visible after manual selection in the Window settings of the function.
Only available in the following BoM browse forms:
artikel_stlpos_browse.psr
fert_ftstlpos_browse.psr

When a Work order is created, the default values defined in the BoM master Data are copied to the Work Order BoM definition. Those values, then, can be modified for any specific WO to have different values than the standard.

Limitations: Precalculation does not support this field.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

- Sorting

The position is alphanumeric information and does not define the sorting.

Steps to change sorting:

1. Click on the field position and hold the mouse button. A right hand shaped cursor appears.
Note: the selected field may not have the focus.
2. Move the cursor with pressed mouse button to the desired row.
3. Release the mouse button.
4. The row will be moved to the new row position accordingly.

Note: The position number is not renumbered automatically. This can be executed via **right-click > renumber**.

For more information on Position number, Sorting and Field descriptions ***see*** Field description "Position"

- Example: Gas Nozzle Sub-assembly

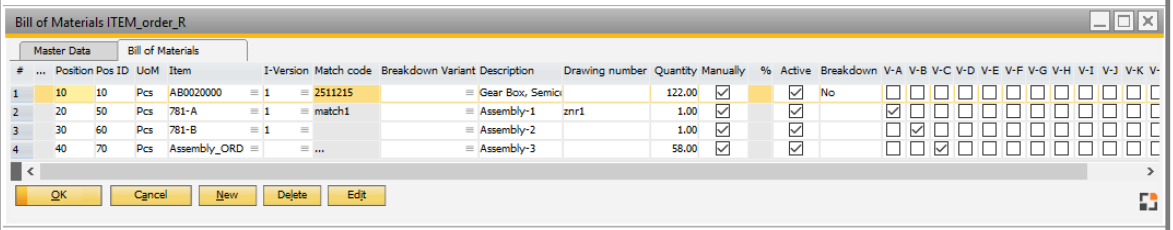
BoM contains:

12 Damper Disk Bracket
12 Crimp PC connector 22x 23"
4 Wire 15" green
1 Plate 1"x12,5" Control Mount

If several operations are needed to manufacture an item, the material can be assigned in the BoM of each operation.
Double-clicking on an item opens the editing window. ***See:*** Edit BoM item

- Variants A-Z

In this list you can define which variant (A-Z) of the BoM should be used.
To work with variants A-Z, you must make them visible via right-click > window settings.



Window artikel_stlpos_browse.psr

© 2026 Boyum IT Solutions A/S

If a check box is enabled, the BoM is considered if the selected variant is produced.
The BoM is ALWAYS considered if no check box is enabled.

Column setup: ***See*** Variants – notes on database

Working with Variants

Beas includes proprietary variant management. It is possible to store up to 26 variants for an item. The descriptions of the variants are stored directly with the item.
A variant is a fixed occurrence of the parameters defined in the item.

Define which BoM positions and routing position must be used for this variant (A-Z).
The variants (Variantenmatrix) can be inserted in the BoM or in the routing via window settings.

The following rule applies:
This position will be inserted if no variant – check box is enabled.
If at least one variant is active – check box, the position will only be inserted if the resulting check box has been selected.

Master Data | Bill of Materials

#	...	Position	UoM	Item	I-Version	Description	Quantity	Manually	Active	V-A	V-B	V-C	V-D	V-E	V-F	V-G	V-H	V-I	V-J	V-K	V-L	V-M	V-N

Windows artikel_stlpos_browse.psr

Define variant description

Variants A-Z can be named in the item or in the configuration wizard. ***See*** Configuration wizard, Item master data

> Note: At a variant definition Variants are always sorted by A-Z in lists instead by the names which are stored in the article master.

Field definition in database and data import

The variant definition is stored in the tables `BEAS_STL.SHORTVARIANTDEF` (for BOM) and `BEAS_APL.SHORTVARIANTDEF` (for routing) as a "character string".
It consists of 26 characters with J (Active) and N (Not active)
Example: `JJNNNNNNNNNNNNNNNNNNNNNNNN` = Active for variant A and B

© 2026 Boyum IT Solutions A/S

Please note:
If there is something else in this database field or the "string" is not exactly 26 characters long, the variant will not be checked!

- Variants in sales order

To create a customer order using a specific variant, create the customer order, then select the item, and select it via the right-click-menu "variant". In the new window all variants are displayed. Select the variant which you will have for the item in the actual line of the customer order. You can select from existing variants, copy a variant, or generate a new variant by entering parameter values for this item.
Calculation: You can perform a calculation for a line, according to its variant, from a quote or order in SAP Business One. The Precalculation can be called up via right-click-menu "calculation". Parameters not defined in the variant are queried explicitly during the BoM breakdown. A calculation structure modified according to the parameters is created. The result is usually displayed in the calculation window. You can also convert it into a work order.
The resulting variant is transferred automatically to the customer order or quote line. You can then generate a work order from the customer order. The BoM and routing from the work order are then customized accordingly.

- Variants in Order recommendation list

If a work order is to be created for a sales order, the variant stored in the sales order is displayed when you switch to the "Production" tab in the bottom left window. If no variant is stored, this can be selected here if variants are stored in the item.

Requirement calculation: If no work order exists for a sales order yet, and it is an order-based item, the variant stored in the sales order is considered for the requirement calculation. In case of an assembly (warehouse-managed item), the BoM and routing positions active by default are used, i.e. you must define which default scenario should be used for requirement calculation. It is generally unreasonable to produce variant items in the warehouse.

- Variants in pre-calculation

All variants are loaded in a Precalculation at all times. In the header of the calculation, the variant to be calculated currently can be selected. All BoM positions and routing positions not belonging to the currently selected variant are grayed out and not

© 2026 Boyum IT Solutions A/S

evaluated.
It is not possible to change Variant settings in the Precalculation.

- Variants in work order

When manually creating work orders, the variant can also be selected for the assembly position if variants are stored in the item.
This only works when creating a new work order. This cannot be changed subsequently.

- Variants per warehouse

In extended warehouse master data a default variant can be created. Different variants of a product can be produced depending on the production warehouse. If a work order is created (manually or via MRP) the respective variant is inserted. *(beas9.0-000-000-006)*.
See Edit extended warehouse data

- Variants with version control

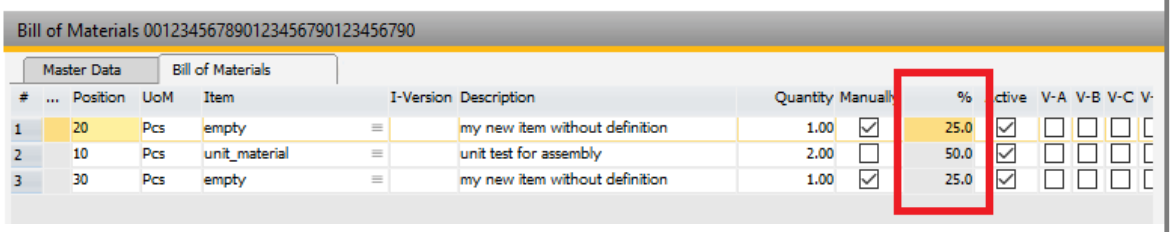
If Version control is set to "Variants", an item version corresponds to a variant. Use this if a BOM and routing needs to be defined separately for each variant. This can be performed without formulas and scripts.

- Item with BoM per item version

This list can be called up via BoM administration. If working with a separate BoM per version for this item, the tabs "BoM" / "Routing" are hidden. These can be selected via item version.

- Percentage display

It is possible to display quantities of BoM positions in %: Window settings > activate column %
The requirement of single BoM positions is displayed in %. The sum of all quantities equals 100%.



Window artikel_stlpos_browse.psr

© 2026 Boyum IT Solutions A/S

Example:
Pos 10 = 3 ml = 60%
Pos 20 = 2 ml = 40%

Calculated as follows:

```
Single quantity : Sum of all quantities * 100
```

Important:
Scrap % and fixed surcharges are not considered. If you use one of these factors, the display will not be correct.

For the calculation the consumption unit will be used. All BoM positions must have the same consumption unit, but different the warehouse unit and input unit.

Right-click menu

Function	Meaning
Open	Edit BoM item (like double-click).
Search	Open search menu.
Add	Create new BoM item.
Remove	Delete BoM item. Multiple selection and deletion is supported.
Report	Open list of stored reports.
Next entry	Jump to next entry.
Window settings	Open window settings.
Renumber BOM	⊟ BoM is renumbered The currently visible BoM is renumbered after new sorting. Increments can be set up in the Configuration wizard. Only the visible column will be numbered *(Feld "BEAS_STL.POS_TEXT")*. Internal numbering will not be changed *(Feld "BEAS_STL.POS_ID")*.
Duplicate to	Open the window "Duplicate BoM".
Insert from	Insert a copied BoM position from clipboard.
Save sorting	Sorting of position is determined by drag&drop. After moving, you can save the sorting.
Protocol	Change log.

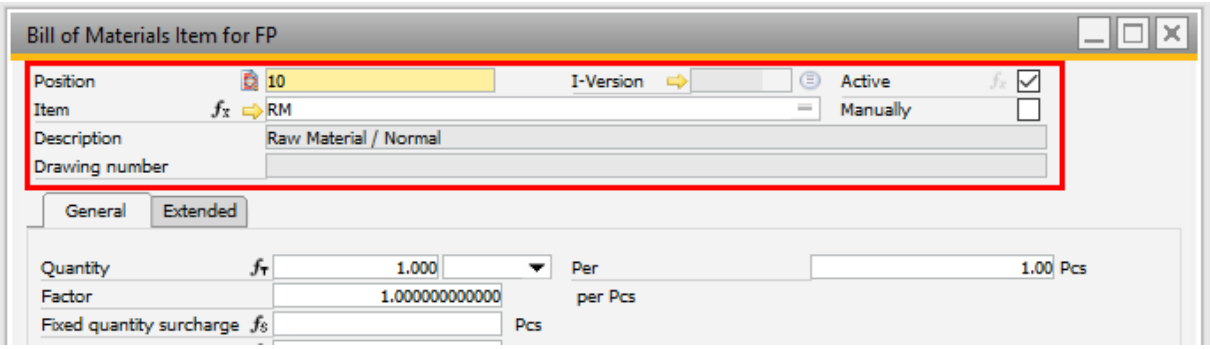
- Edit BoM
  - BoM positions
    - **Edit BoM positions**
      - Alternative material
  - Cross reference
- BoM Batch change
- Difference BoM
- Copy BoM

In **Bill of Materials > Edit (item)** you can add detailed BoM-specific information by filling various fields in three tabs: General, Extended and Costs. Item master data are not affected.

Header:

© 2026 Boyum IT Solutions A/S



Window artikel_stlpos_edit.psr

Header Field descriptions:

Field	Description
Position	Position number The position number is counted in increments of 10. ***See*** Configuration wizard to set up. The field is alphanumeric with 20 digits. Note: The order is not related to position number. It is defined in the list of BoMs by Drag&Drop, it reflects the order of entry by default. Position number must be unambiguous. The following fields are available: BEAS_STL.POS_TEXT = visible, alphanumeric ID BEAS_STL.POS_ID = continuous unique ID BEAS_STL.SORTID = determines sorting **Note on Update:** If you updated from an older version (Beas 9.1 PL: 07 and older) , the position text and sorting will be pre-assigned with the previous internal ID (POS_ID). **Advantages** ✓ Double Numbering possible (e.g. at maximal BoM) ✓ Simpler sorting (Drag&Drop) ✓ Changes of links to routings ✓ Alphanumeric number assignment (Project manufacturer / Connection to PLM systems)

© 2026 Boyum IT Solutions A/S

Field	Description

Example: Multiple assignment of same position number

BoM with conditions

Position text	Pos ID	Sort ID	Variant	Description
10	10	1	A	rod red color
10	20	2	B	rod bue color
10	30	3	C	rod yellow color
20	40	4		screw 6 x 40
30	50	5		screw 3 x 50

The position 10 was assigned 3 times, respectively for a variant in this example.

Only one of the 3 positions is used in dependence of the variant, so that always the correct BoM could be created with the position numbers 10-20-30 without re-numbering.

Example: Alphanumeric Position number

Alphanumeric position numbers are often assigned at complex drawings.

Important: A sorting by the alphanumeric number position is not wanted here generally, because the alphanumeric positions are also used as position ID on a technical drawing.

Position text	SortId	Description
Z1	1	Module 400o-200
A-5020	2	Module 300a-400
A-5020/1	3	Screw 3x20
A-5020/2	4	Screw 4x25

AS_APL / BEAS_FTAPL.POS_TEXT

Renumber at creating work order

The BoM can be renumbered automatically if a work order is created, but the parameter for this can be deactivated in the Configuration wizard.

© 2026 Boyum IT Solutions A/S

Field	Description

Note: For phantom items, BoM positions are always renumbered – even when the parameter is off.

Variants with script

Left to the position field you can open the script window by clicking the formula icon f_x.
Enable the fields by **right-click >"display formula fields"**

Formula icons

Icon	Boyum Style icon	Description
f_x	f_x	Function
f_T	f_T	Table
f_S	f_S	Script and other Variants
f_x	f_x	Empty formula
		Text edit disabled. Double-click to open the script editor. Located left of Item number in Item Master data.
		Text edit - script is inside. Double-click to open the script editor. Located left of Item number in Item Master data.

Important: This function is only available if the Variant generator is activated in the Configuration wizard.

See more details in Formulas, Tables, Variables and BeasScript.

The following variables are available:

Variable	Description
`e_belnr_id, e_belpos_id`	Work order, Work order position

© 2026 Boyum IT Solutions A/S

Field	Description
	<table><tr><th>Variable</th><th>Description</th></tr><tr><td>e_itemcode</td><td>The Assembly from work order position</td></tr><tr><td>e_quantity</td><td>Quantity in regional format</td></tr><tr><td>e_source</td><td>"Routing"</td></tr><tr><td>e_info1</td><td>Info for current routing position</td></tr><tr><td>e_rohitemcode</td><td>The Material from BoM</td></tr></table> ***See*** Variant generator – Script Sorting function
Item	Item number of material, assembly or phantom assembly The item number of the material, assembly or phantom assemblies needed for the assembly are stored here. Note on entry in Production - Edit BoM If an order-related assembly is added when saving the BoM position, the assembly is added to the work order. If a sub position is linked to this Bill of Materials position or a receipt or issue document for this position exists, this field is protected. Assembly and BoM - Item same (recursive) In the following example a recursive item is inside the structure: FP_RECURSIVE is inside FP_RECURSIVE. The system display sthis only as material. Inside FP_RECURSIVE2 you can see FP_REURSIVE. In this case it produces a recursion.

© 2026 Boyum IT Solutions A/S

Field	Description
	This produces the following recursive production order: FP_RECURSIVE: no breakdown But inside "FP_RECURSIVE2" there is "FP_RECURSIVE" again, which produces the recursion, but max. up to 20 levels.  Beas displays the following error message: *BoM explosion of more than 10 levels not possible! Cancel sub-assembly FP_RECURSIVE* ***See***: Item breakdown *BEAS_STL.ART1_ID*
I-Version	Version number or Item variant If item version control is active, the default version number or variant is entered here. An alternative variant or version can be selected. Based on this the BoM or routing is determined (if the item is an assembly).

© 2026 Boyum IT Solutions A/S

Field	Description
	This field is visible only if item version control was enabled. The "Active" check box to the right has to be selected. ***See*** tem version control Note on entry in Production – Edit BoM If a sub-position is linked to this Bill of Materials position, or a receipt or issue document for this position exists, then this field is protected.
Description	Short name of BoM position **Master data** If "manually" is disabled, the designation of the selected item is displayed. If an I-Version was selected, the designation of the item version is displayed. It is not copied to the BoM; the original designation is used at all times. If you enable "manually" you can change the designation. This is, then, saved in the BoM position. **Note:** In BoM – list the designation cannot be changed. **Production / Precalculation** Designation of used material / Assembly, changeable.
Drawing Number	Drawing number of BoM position **Master data** If "manually" is disabled, the designation of the selected item is displayed. If an I-Version was selected, the designation of the item version is displayed. It is not copied to the BoM, the original designation is used at all times. If you enable "manually" you can change the designation. This is, then, saved in the BoM position. **Note:** In BoM - list the designation cannot be changed. *Designation changeable from beas 9.1 PL: 08*

© 2026 Boyum IT Solutions A/S

Field	Description
	Production / Precalculation Designation of used material / Assembly, changeable.
Active	Mark check box to make the BoM active.
Manual	Allows a manual entry of drawing number **Only visible in master data** If active, the drawing number and designation can be entered manually. If not, it is taken from master data of the selected I-version. Use this option if no item is available for the position. You can define a default item in Configuration wizard to be used for BoM positions without existing items. If the default item is inserted into a BoM position, the switch "manually" is disabled automatically.

Right-click function

Function	Meaning
Add	Create new BoM position.
Duplicate	Create a duplicate of the current BoM position. Selecting this menu entry opens a dialog to "Enter new ID" for the duplication.
Remove	Delete BoM position.
Inventory Movements	Open the Inventory Movements.
Invent.History	Display inventory history for this item.
Change log	Change log for this work order.
Formula-allocation for active input	A formula or a table (only master data) can be stored directly about this in the active field.
Formula list	List of all formulas stored in this routing. Its execution sequence can also be changed (only master data).

© 2026 Boyum IT Solutions A/S

Display formula fields	Work with Variant System. The stored formulas created with the Variant generator can be displayed for the BoM.
Alternative material	Defines alternative materials.
Position re-activate	Reactivate a closed position. Only available if - Production – Bill of Materials window - Position is closed with this function you can reactivate this Bill of Material position but only if the work order position is not closed.
Last messages	Displays a log with version code and exact time of system messages with the latest on top.

Window artikel_stlpos_edit.psr

Field descriptions

Field	Description

Quantity	Requirement in Input units
	Determines the requirement in input UoM per assembly in input unit (***See*** Input UoM , Units of measure)
	
	Calculation of total quantity
	The total quantity is always in inventory UoM
	Calculation is
	
	`total quantity = input UoM`
	`* Conversion factor to production UoM`
	`* Scrap % (formula: see scrap%)`
	`* Conversion factor to inventory UoM`
	`* (Quantity from work order position * Conversion factor to inventory UoM)`
	`: Quanity per (see per)`
	`+ fixed quantity surchase`
	
	IMPORTANT: When an UoM Group is defined for an item, the UoM Conversion is applied based on SAP definitions and NOT the conversions defined in Beas.
	
	Not planned Material position (Quantity = 0)
	You can define Material position with Quantity = 0

© 2026 Boyum IT Solutions A/S

Field	Description

Example: For Material positions which you need only in processes related to the business work flow or production processes of a company.

Valuation

In precalculation / post calculation you can define if Beas should valuate this Plan/Real cost. ***See*** Configuration Wizard Value negative quantity.

By-products, coproducts, disassembly (negative quantity)

Sometimes the user needs to indicate that several products are a result of a work order. These products can be:

- Co-product: Usable product, automatically generated during the production of the main product.
- By-product: A product that occurs incidentally or undesirably during the manufacturing of the main product.
- Dismantling: Disassembling of assemblies and returning components to the inventory.

In these cases, the BoM quantity is entered as a negative entry.

Negative BoM quantity behavior

Procedure or module	Negative Bom quantity is treated as
Order recommendations	Planned receipts.
Backflushing	Posted automatically or manually.
Work order structure	Displayed in the same color as assemblies but with another icon. Displayed positive (as receipt).
Posting	Manually, backflushed or posted in via collective receipt. ***See*** Collective receipt.
Merging work orders	Individual receipts are inserted as negative BoM items and posted correctly to the WIA account.
Sales order	Negative items can be reserved for sales orders.
Pre-calculation	Valued according to Configuration wizard > Precalculation > Value negative quantity.
Post-calculation	Valuation based on post-calculation is not possible.

© 2026 Boyum IT Solutions A/S

Field	Description

Order related sub assemblies

A Bill of materials position can be a sub-assembly with own Bill of materials list and Routing position.

How to manage this in the areas:

Procedure or module	Result
Pre-calculation	Bill of materials defined as receipt (negative costs) Valued according to Configuration wizard > Precalculation > Value negative quantity. Routing positions cannot produce negative costs. These are always zero.
Post-calculation	**Planned cost:** Bill of Materials: negative costs Routing position: zero **Real costs:** Bill of Materials: Sum of all transactions Routing position: Sum of all time receipts. It can only be positive value.

Configuration example for disassembling:

For disassembling, there is no main product. Use a service item (not storage-related) and define the resulting products in the BoM. Expected quantities are entered as negative.

```
Service item
|_ Product 1
|_ Product 2
```

Configuration example for a by-product:

For by-products indicate a main product on top level. This way you can work with off-cut and reuse waste material.

```
Main item
|_ Material
|_ By-product
```

INPUT_QTY, QUANTITY_USE

Note:

If an issue or receipt document is created for this position or the position has order-related sub-assemblies, it is not possible to change the quantity.

INPUT_QTY, QUANTITY_USE
</td></tr>
<tr><td>Quantity per ..</td><td>
Defines in which unit the quantity specification takes.

The quantity specification relates to the assembly quantity x the factor specified here. At quantity 2 and "Quantity per 10 pieces", 2 pieces are needed per 10 assemblies. The default for "Quantity per" can be stored in the options.
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description

	Requirement (quantity per) means: how much material is needed per assembly (quantity given in "quantity per")
	Assembly quantity "1" relates to the consumption unit of the assembly
	BoM quantity relates to the consumption unit of the BoM item
	
	Quantity per = 0
	`Entered quantity = Total quantity`
	Note: It is recommended to use "fixed quantity surcharge" instead of 0.
	
	Quantity per = 1
	`Entered quantity * Assemblies to be produced in Production UoM`
	
	Quantity per > 1
	`Entered quantity * Assemblies to be produced in Production UoM : Quantity per`
	MENGE_JE

Unit	Determines the unit of the quantity to be entered This is the field right of Quantity without title. Here you can choose the Unit of Measurement, in which you want to define the needed Quantity (***See*** field Quantity) Standard is Production UoM ***See***: Units of measure  Inventory / Bill of Materials

© 2026 Boyum IT Solutions A/S

Field	Description
	It is possible to change this field every time and to every UoM which is defined in the Unit of measurement. **UoM Group is defined in defined item** If a Unit of Measurement Group is defined in the Master Data of this Material, you can choose only an UoM defined in the UoM Group. It is not possible to change the Factor in this window. Related to the conversion formula and current values of this BoM Position, the system calculates the Quantity in Production UoM and then the Inventory UoM. **UoM Group is not defined in the item** If the item does not have a UoM Group, you can choose every UoM. You can define a factor between this input unit and production unit only if the defined UoM is not the Production UoM of this item. Note: Beas ignores length/width/height change as these are part of the Conversion factor - formula. If you change the UoM factor in the item master data, or if you change the formula in the UoM, it does not affect the existing Bill of materials positions. The system takes the conversion factor defined in this window. If you create a work order and the UoM Group is not defined, the system ignores the UoM and UoM Factor definition, and always works with production UoM. Related to the conversion factor, the system calculates the Quantity in Production UoM and then the Inventory UoM. Precalculation It is possible to change this field every time and to every UoM, which is defined in the Unit of measurement. if a Unit of Measurement Group is defined in the Master Data from this Material, you can choose only an UoM defined in the UoM Group. Note: It is important that a UoM Conversion factor is defined in UoM Conversion. Related to the conversion formula and current values of this BoM Position, the system calculates the Quantity in Production UoM and then the Inventory UoM. Work order

© 2026 Boyum IT Solutions A/S

Field	Description

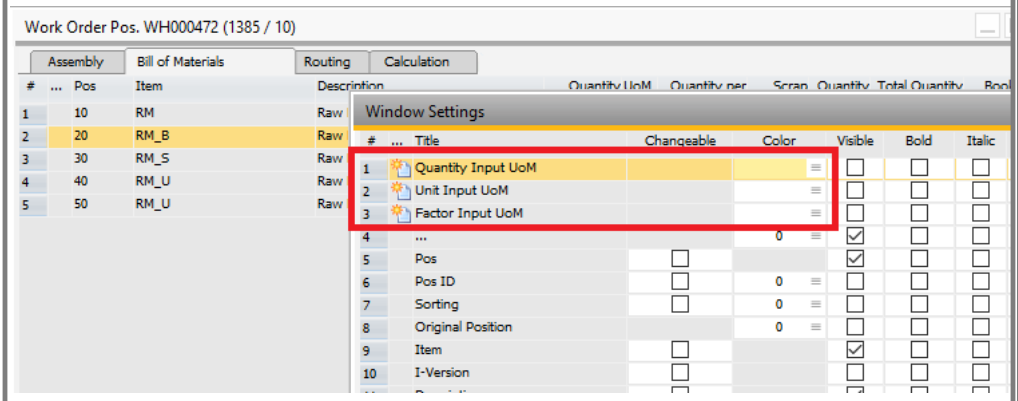
In **Work order > Bill of Materials** the input unit is only changeable:
- if no transaction exists
- a Unit of Measurement Group is defined in the Master Data from this Material

You can choose only UoM if
- Defined in the Unit of Measurement Group
- UoM Conversion exists for this UoM and Inventory UoM

If you change the Input unit, the Quantity will be calculated based on quantity in production UoM and on the Conversion formula defined in the UoM Conversion.
If you change the Quantity in input UoM, the system calculates the quantity in production UoM and in inventory UoM based on UoM Conversion.

If you change the quantity with BeasScript or import hub, the system overwrites the Input Unit with Production UoM.
If you refresh the work order, the system overwrites the Input Unit with Production UoM.

In Work order Bill of Materials you can activate the Input Unit via window settings. But this fields is not changeable.



If you change the quantity in Production UoM, the system overwrites the Input unit with Production UoM.

UoM Conversion

If Unit of Measurement Group is defined in the Master Data of this Material, the system tries to use the conversion factor defined in the UoM Group.

© 2026 Boyum IT Solutions A/S

Field	Description
	If it is not stored there, the system searches the UoM Conversion table. If it does not exist, the system searches the opposite in the same table and creates the formula "1 : [the defined formula] If the opposite does not exist, the system returns an error and continues with Conversion factor 1. **Note on UoM Groups** In Bill of Materials you can define the Quantity in Input Unit. This will be converted in Production UoM and this in Inventory UoM. Problem: If the Production UoM is not the same as the Inventory UoM and the Input UoM is not Production UoM, the system cannot find an entry in the UoM Group. In this case, the system searches for the conversion in the UoM Conversion table to convert the quantity from Input Unit to production Unit. **Unit factor and UoM Tool tip** In the work order position, the system displays the unit in green which means that the unit factor is inside (***see*** image below). Moving the mouse over this field, the system displays a tool tip with information on the factor and the UoM (***see*** image below). The system can calculate with 20 decimals rounded up to 6 decimals for display.  When you change the UoM, the system calculates the Quantity and the factor automatically (***see*** image below). The new Quantity is based on the current production unit.

© 2026 Boyum IT Solutions A/S

Field	Description
	NOTE: This is only possible if a Conversion factor was defined previously). ***Example:*** Conversion: 1 TPcs =1000 Pcs Old Qty = 2000 Pcs Change UoM to TPcs. The System display Quantity = 2 TPcs If the Quantity in TPcs is changed, the system calculate the Production UoM and from this the Inventory UoM If length/width/height, density or item code self is changed, the base quantity is always the quantity in Production UoM and the system always calculates the quantity in the Production UoM and Inventory UoM.
Factor	Conversion factor between entry unit and consumption unit Only in Master Data and Precalculation: Displayed only if consumption unit and entry unit are different. Enter the conversion factor between the quantity indicated here and the consumption unit. Quantity is divided by the indicated factor. 12 decimal places are supported. ***Example*** Quantity 10, Factor 5 Results in a Requirement of 2 in consumption units of the material position per consumption unit if the assembly. Note: The "Exceeding planned quantity allowed" production configuration setting affects the Conversion factor: The Minimum/Maximum percentage is calculated based on total quantity. ***see*** Configuration setting. *BEAS_STL.INPUT_FACTOR*
Fixed Quantity surcharge	Defines a fixed and unique quantity surcharge Share of the surcharge – used for the Precalculation and production. The scrap factor at assemblies relates not the assembly, but only to its material requirement.

© 2026 Boyum IT Solutions A/S

Field	Description
	The scrap is calculated per lot size: ***Example:*** Assembly lot size 500, required 1000, scrap 1 in assembly equals to 1 per 500 = 2 There is a total requirement of 1002 if a material 1x per assembly is required This value will be calculated in production and cannot be changed.
Scrap %	Determines Percentage of scrap Indicate material scrap which is added to the calculated requirement.  Note: This field is visible in Master Data and Precalculation. In Work orders you can see the calculated scrap. Set the formula to be used in the Configuration Wizard. Available formula definitions: `Scrap = Quantity * ( Scrap % )` (= default setting) `Scrap = Quantity / ( 1 - Scrap%/100 )`

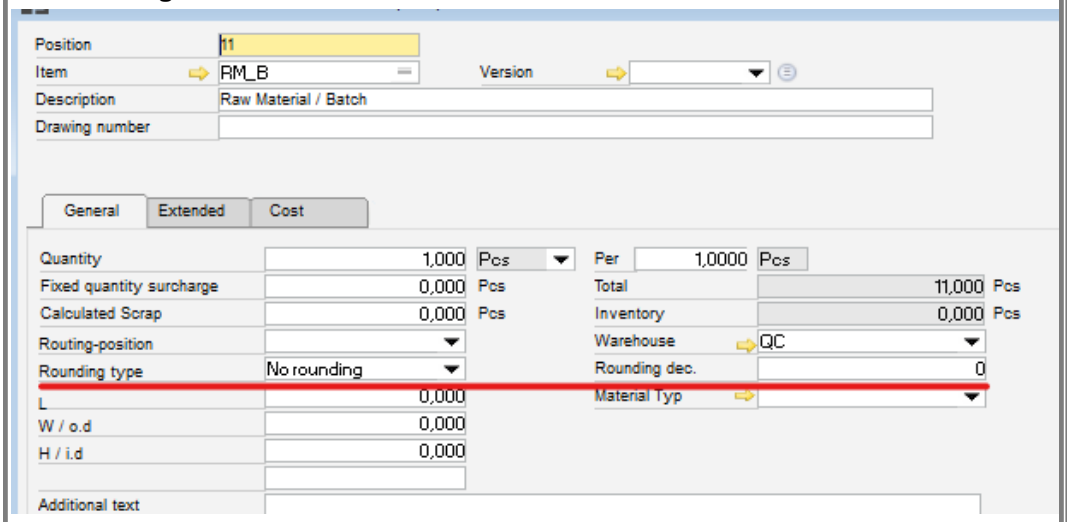
© 2026 Boyum IT Solutions A/S

Field	Description
	Example: Definition with `Scrap = Quantity * ( Scrap % )` Requirement: 10 Pcs Scrap: 10% Total requirement: 11 Pcs Definition with `Scrap = Quantity / ( 1 - Scrap% / 100 )` Requirement: 10 Pcs Scrap 10% Total requirement:
Scrap %	Calculated from scrap values This value is calculated when the work order is created. It cannot be changed; it is a one-time surcharge. (Assembly quantity * BoM quantity) + "calculated scrap" If the assembly quantity is changed, the "calculated scrap" does not change. To re-calculate, a Work order update is required. ***See*** - scrap factors in routing, ***see*** Routing - material scrap - scrap of superordinate assembly or phantom assembly, ***see*** Scrap - offcut factor of superordinate assembly or phantom assembly, ***see*** Offcut factor For purchase parts additionally - scrap as per master data, ***see*** Scrap - off-cut factor as per item master, ***see*** Offcut factor Note: If in BoM position "Do not post scrap" is activated, scrap will not be determined. ***See***: Master data – edit BoM

© 2026 Boyum IT Solutions A/S

Field	Description
	Offcut Option consider offcut
Rounding type Rounding dec.	Determines the rounding rule

The rounding rule can be defined here:



Available settings:

No rounding	There is no rounding defined.
Round up	The number is rounded up. The exact decimal place can be defined in "Rounding Dec." ***Example:*** You have defined 1 piece per 18: the factor is then = 0.055556 If you multiply 0.555556 x (17+1) = 1.000008 After this you apply a round up --> The final result is 2.
Round off	
Rounding at 5	From 0,5 (1 Decimal place) or 0,5 (2 Decimal places) will be rounded up. Lower will be rounded off ***Examples:***

© 2026 Boyum IT Solutions A/S

Field	Description

Requirement	Decimal place	Rounded
1,45	2	1,45
1,45	1	1,50
1,45	0	1,00 Note: Only the last decimal place is considered. Thus, there is no rounding up of the second decimal place.
1,49	0	1
-1,5	0	-2
-1,45	0	-1
-1,45	1	-1,5

multiple of	Always the multiple will be formed, which will be indicated in "Rounding Dec." ***Example:*** Multiple order of 4 4, 8, 12, 16 is counted At quantity 3 is rounded to 4 At quantity 4 the quantity 4 remains unchanged At quantity 5 is rounded to 8 ***Example:*** Multiple order of 10 10,20,30,40 is counted At quantity 1 is rounded to 10 At quantity 10 the quantity 10 remains unchanged At quantity 11 is rounded to 20

Example 1:

A palette per 100 pieces is required

Quantity of requirement corresponds 0.01 palette per piece. But at least one palette

© 2026 Boyum IT Solutions A/S

Field	Description
	has always to be required and from 101 pieces even 2 palettes. The BOM position will be adjusted as following for this: Quantity: 0,01 Rounding type: multiple of Rounding Dec. 100 ***Example 2:*** A half piece is required. because there is no half piece. It must always be rounded up to 0 decimal place because there is no half piece. Thus a requirement of 0,8 will actually be rounded up to 1 piece. The following setting occurs: Rounding type: round up Rounding Dec: 0 Note: Negative statement of decimal places are not supported. Rounding results are always in Inventory UoM.
Routing-position	Determines the routing position for which the material is required For backflushed material, the material is issued on receipt of this routing position. The MRP run and APS consider the start date of this operation when calculating the material requirement. **Phantom assembly group:** Routing-assignments work with restrictions for nested phantom assemblies: The routing assignment of the above located main assembly group always applies instead of the phantom assembly group assignment within a sub-phantom assembly group. **Master data:** Which routing is to be used can be defined in the BOM. The routing with the same ID will be used if none have been defined. A checking of the assignment is not possible because a routing can be assigned to multiple Bill of materials. The assignment will not

© 2026 Boyum IT Solutions A/S

Field	Description
	be checked even at a change of a routing. **Production:** Assignment is always done at the routing of the current production position.
Total	Calculated total quantity in Inventory UoM Only in Work order Bill of Material window More information see concept "Total Quantity"
Inventory	Current Inventory in Inventory UoM on Warehouse, which defined in field "Warehouse". Only in Work order Bill of Material window

Warehouse	Default warehouse for planning and backflushing
	If a warehouse is specified, the material is issued from this warehouse by default when backflushing. Warehouse information is mandatory.
	You can choose any warehouse defined for this item, and active on item-warehouse side and active on warehouse side.
	It is allowed to select a warehouse, which is locked for issue transactions.
	
	MRP checks the warehouse defined in the BoM Position.
	Precalculation: It is possible to select locked warehouses.
	
	If the material position is an order-related sub-assembly, the system creates a new work order position for this sub-assembly but does not take the warehouse from the Bill of materials position.
	For the new work order position, the system uses the standard rules for warehouse definition. ***See*** warehouse rules.
	Example:
	Assembly A, default Warehouse 01
	BoM Order-related Assembly B, default Warehouse = 01, Bill of Materials Warehouse 07
	
	If you create a work order:
	`Work order Position 10: Assembly A = Warehouse 01`
	`Bill of Material Position 10: Warehouse 07`
	`Work order Position 20: Warehouse 01`
	
	Note: At "Production backflushing" you can specify an issue warehouse which has a

© 2026 Boyum IT Solutions A/S

Field	Description
	higher priority. ***See*** Production backflushing
Bin Location	Bin location number - available for bin-managed warehouses. Only valid "Bin Locations" for the selected warehouse are allowed. After changing the warehouse, the bin location content is set to empty in this field. **Work Order BoM and Precalculation:** A work order created from an Item, or Precalculation copies this field automatically for the BoM. If there is not enough stock to pre-assign quantities from this, pre-defined bin location, Beas continues to pre-assign them from further bin locations based on the sorting rules.
Length Width / OD Height / ID	Length, width, height or outer/inner diameter Determines the measurements of the materials. The requirement of the consumption unit can be indicated. The required quantity in warehouse unit can be defined in Quantity unit - Conversion The measurement can be indicated in the conversion. e.g. Requirement: 100mm (Consumption unit) Conversion to piece: 1 piece = 1000mm A requirement of 0.1 piece is then determined.
Completed	Production: defines the position as "completed" It is set automatically according to the settings if the default quantity has been reached. The completed BOM positions are no longer considered in the material requirement list and MRP.
Info	Any information This field is unnamed in the basic installation. The name of the field can be configured in **Configuration Wizard > Master Data > Bill of Materials > View > Info Field**.
Closed	Close this Bill of Materials position

© 2026 Boyum IT Solutions A/S

Field	Description
	Only available in Work order Bill of Material position Displays if the Position is closed or not if this position not closed, you can close this position If you want to reactivate this Bill of Material position, you must choose "right mouse click" – "Position re-activate"

Breakdown

Here it is decided whether sub-assemblies should be included in production or not.

With this option you can change a stock-related item to order-related item for this Bill of materials position.
Only in Bill of Materials (Master Data); it is not available in Precaclulation or Work order.
Only displayed if the material is a stock-related item.

Work order creation

Setting	Description
no	The Sub-assembly is not produced (stock-related production).
always	The Sub-assembly is inserted into the work order with the specified requirement quantity. Inflow is treated as order-related inflow. Manufacturing lot size is not considered (order-related).
Only shortage	Sub-assembly is created only in case the requirement for the work order cannot be covered from stock. For this purpose, stock will be reserved for the work order. Note: It only functions if reservation system is active. Receipt reservation only at = always Sub-assemblies reserve = always  ***Example***: in stock 10, requirement 50. For the work order, 10 are reserved firmly, the sub-assembly is created for 40. Other work orders cannot access this reserved stock. These 10 pieces can also not be issued or used
