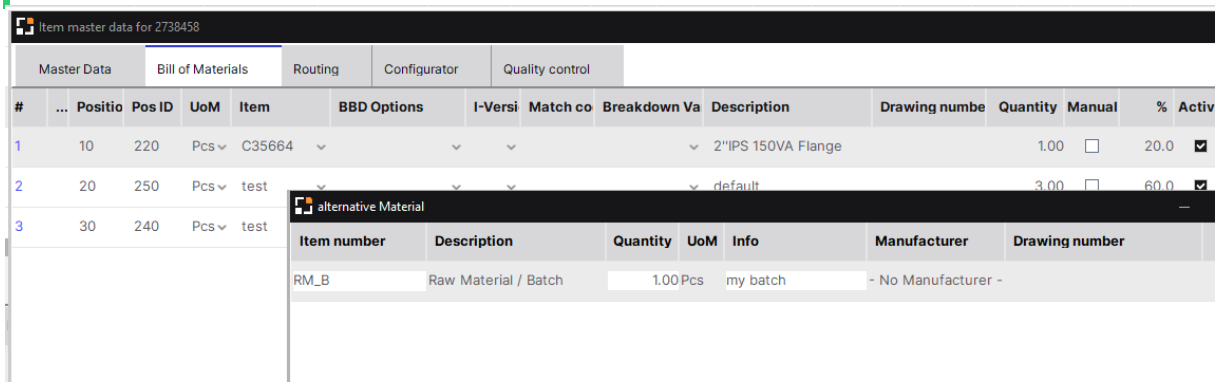
7.5.1.1.2 Alternative material

Bill of materials
Edit BoM
BoM positions
Edit BoM positions
Alternative material
Cross reference
BoM Batch change
Difference BoM
Copy BoM

You can insert alternative materials in the BoM of each item. You can define for example, that instead of 1 item of type A, 2 items of B may be used.
If a BoM position is opened, with right-click on the item number the item can be replaced.

PATH: Inventory > Item master data > Bill of materials tab > right-click a BoM position > select "Alternative material"



WIndow artikel_stlpos_alternativ.psr

Field descriptions

Field	Description
Item number	Item code
Description	Description
Quantity	Add default quantity for this alternative material.
UoM	Unit of measure
Info	Additional information on the alternative material
Manufacturer	Manufacturer code

© 2026 Boyum IT Solutions A/S

Field	Description
Drawing number	Drawing number

If you have deposited alternative items, these are displayed in the tree view with the replacement-icon. Click on this icon to open the selection screen in which alternative items are displayed. If you select a position, the item and the quantity is changed in the BoM.

Alternative material is displayed directly in the work order structure view as well as in the item structure, if the position is not completed and proper editing rights are granted. The item can be changed directly. Here, the quantity and the material is exchanged.
Important:
- If the exchanged material is an order-related assembly, there is no resolution of its material.
- Item Version current not supported

Note on Data configuration

Not saved in a separate data base table, but in BOM data field "BEAS_STL"."ALTERNATIVMATERIAL" with the configuration.

```
Itemcode [tab] Info [tab] Quantity [LineFeed]
```

The alternative material can be synchronized or can be imported vie the Integration Hub.

This window displays in which item or item version the Bill of materials list is used.

This window can be called up via **Bill of materials (header) > right-click:** / **Cross-reference**.

Window settings and Templates are supported. Authorization: Item BoM *(artstl)*

Field	Description
Item	Item which contains the Bill of materials.
I-Version	The item version. If item administration has been set to "separate BoM", only the entry in the item version will be checked, otherwise it is only checked, whether BOM ID and item ID do match. For a cross reference you do not need an item version.
Description	Description of the item or item version.
Version status	Status of the I-Version.
Status Description	Long description of the status.
Release	Is the item version released.
Blocked	Is the item version blocked.
Changeable	Is the item version changeable.

PATH: Bill of Materials > batch-managed item > right-click > "Bill of Materials: Batch changes".

This function allows to change multiple BoMs simultaneously. First, select the change type and the material number to be replaced in the BoMs. This is done under tab "Substitute". Under "Add", new information are displayed.

By clicking "START", all affected BoM positions are displayed. Mark positions to be replaced/removed and click START again to start the process.

NEW: From version 9.3 PL2 this window allows to work with version-controlled items. This means that the values of items with separate Bill of materials can be updated massively. To cover this new functionality a new column is added with version information.

IMPORTANT: if one item has different version and some of its versions are linked to the main definition, these lines will be shown once with the main definition (Without any version number).

The tabs and the switch on the bottom of the window provide the same function.

Function	Meaning
Selection	Filter options by: Item number, item group, match code. Conditions such as "Only material no.", "contains" or "contains not" are available in the selection fields.
Substitute	In the right, you can select window positions for value replacement. On the left side, the new information is entered for the appropriate fields. All BoMs with the specified material number can be changed. In the selected fields (material number, quantity, additional text, etc.) the values stored here are inserted. After finishing all entries, the replacement process is started by clicking "Start".
Add	Select items to be added to the BoM. Upon selection, the item report is displayed. Data to be entered are displayed on the left side. Then new BoM is inserted wherever the previously defined material number exists. Items will be appended or inserted at the specified position. In the latter case the previous item is replaced.
Delete	Display BoM items to be deleted.

Selection tab

Select the filters to narrow down the set of BoM to change.

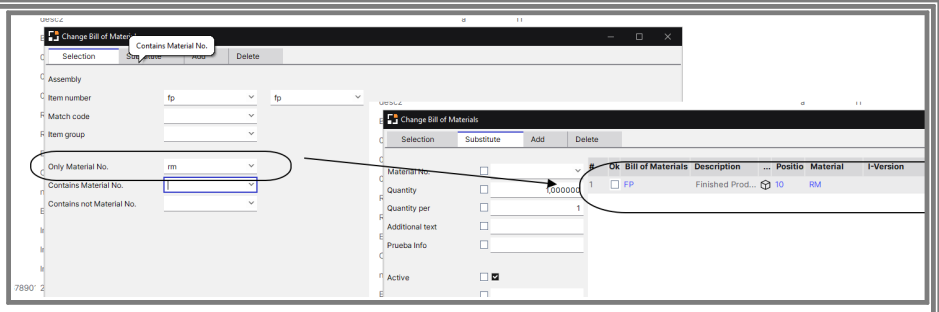
Window artikel_stlpos_batch.psr

Field Descriptions

Function	Description
Assembly	
Item number	Item number from-to: select a range between two item numbers to be filtered
Match code	Select match code
Item group	Select item group
Only Material No.	With this filter defined, the system will display only the selected material in the Substitute tab. ***Example:*** We have item FP that contains 3 materials RM, RM_B, RM_S. if we apply filter by material "RM" system will display 1 only line:

© 2026 Boyum IT Solutions A/S



Contains Material No.	With this filter the system will display all materials related to selected item. ***Example:*** We have item FP that contains 3 materials RM, RM_B, RM_S. if we apply this filter with material "RM", the system will display 3 lines with each material: Contains not Material No.	This filter definition applies the exact opposite behavior to "Contains material no." that is, the system will not display any materials related to the selected item.

Buttons:

Substitute: This button opens the "Substitute" tab to start replacement of the selected BoM.
Add: This button opens the "Add" tab to add materials to the selected BoM.
Delete: This button opens the "Delete" tab to remove materials from the selected BoM.

Substitute tab

Field descriptions

Field	Description
Material number	Select item number to insert.
Quantity	Add quantity to insert. Note: Changing the quantity, conversion factors are not considered. Quantities are specified in Production units, stored conversion factors will be removed to Input Unit and warehouse unit. (The fields beas_stl.input_qty, input_factor, input_unit will be deleted).
Quantity per	Requirement per assembly ***See*** quantity per.
Additional text	Free text.
Active (left and right box)	Left box: Set check marks to select this parameter to be changed. Right check box: Enable to set the BOM item to active. Disable to set the BOM item to inactive.
UDF 1-4	Free user-defined fields can be named in the Configuration wizard.
Ok	Selecting source item, then select "OK" at the items to substitute. Clicking the "Start" button will perform the replacement.
Production/Item structure	When check box is activated, the list shows production information. When unchecked, the list displays the item structure (***see*** above).
Locked - Filter	Visible when "Production/Item structure" field is active.

© 2026 Boyum IT Solutions A/S

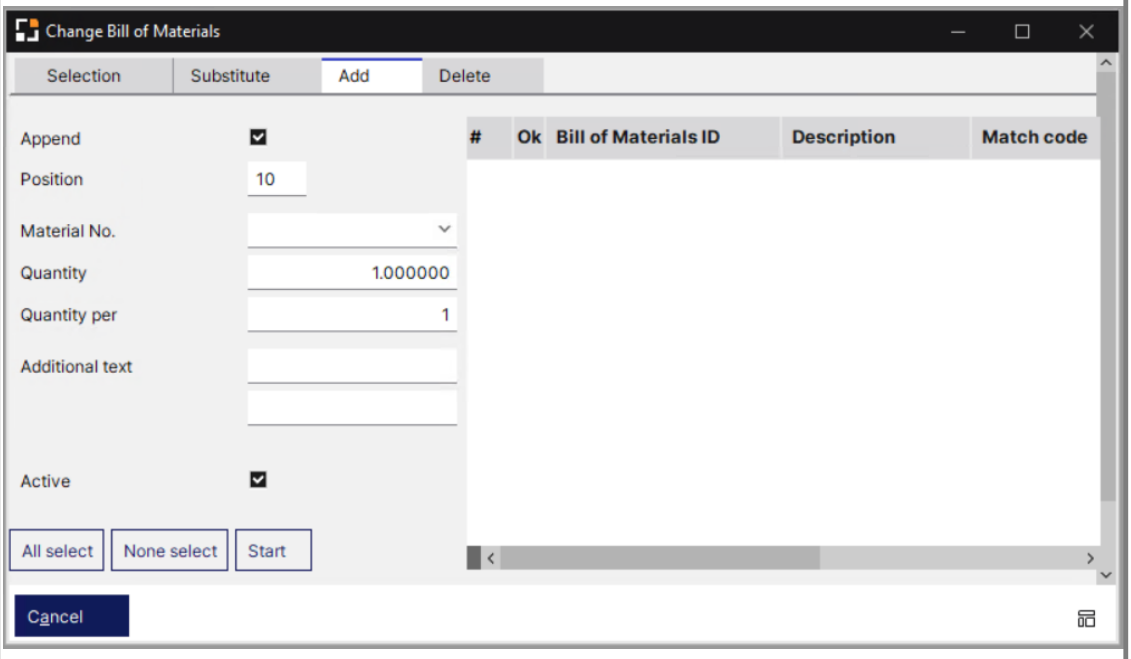
Field	Description
	 Activate check box to hide locked Work orders. When unchecked, the WO list displays locked WOs.

Buttons:

All select: Clicking this button selects all items in the list to substitute (all "OK" fields are selected).
none select: Clicking this button clears all item selections (all "OK" fields are cleared).
Start: Clicking this button starts the mass replacement.
Right-click: **Change Log** - open the Change log for this BoM.

Add tab

In this tab you can add more materials to the selected BoM.



Window artikel_stlpos_batch.psr

Field descriptions

Function	Description
Append	When this check box is active, "position" field is ignored and new position ID will be generated and added at the end of existing BoM.
Position	The new item will inserted at the given position.
Material number	Selected material number for which the change applies.
Quantity	Selected quantity.
Quantity per	Requirement per assembly ***See*** quantity per.
Additional text	Free text.
Active	Check mark indicates whether the BoM items will be active or inactive after the change process. The status is changed in the "replace" tab (***See*** above).
empty fields UDF	Free user-defined fields can be named in the Configuration wizard.

Delete tab

In this tab you can delete BoM items. Select materials from the list, and press **Start**.

back to Bill of Materials tab

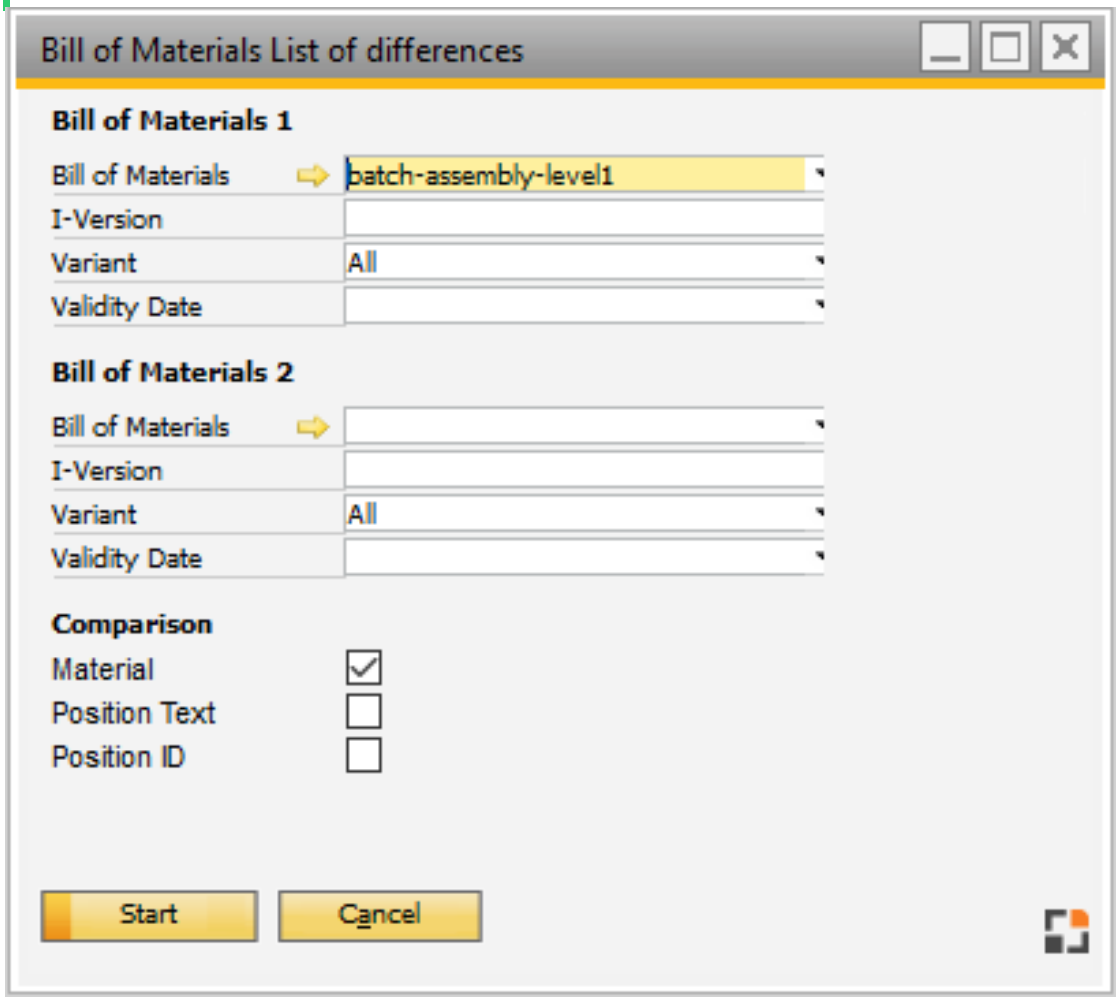
7.5.3 Difference BOM

Bill of materials
Edit BoM
BoM positions
Edit BoM positions
Alternative material
Cross reference
BoM Batch change
Difference BoM
Copy BoM

Comparison between two Bill of materials, or two Bill of materials versions, or two validity periods, or two variants (A-Z). All fields are compared.
After filling the selection fields, click "START" to create the list of differences
Reading rights for Editing Bill of Materials are required.

© 2026 Boyum IT Solutions A/S

PATH: Bill of Materials window > right-click an entry > "Bill of Materials list of differences" function.



Window artikel_stlpos_differenz_start.psr

Field	Description
Bill of Materials 1	
Bill of Materials	BoM to be compared.
I-Version	Select which I-Version of the BoM is to be compared. If an I-Version - period of validity was stored in BoM, you can determine which I-Version of BoM to use for the comparison. Thus, you can compare version within one BoM.
Variant	Select the variant (A-Z) of BoM for comparison.

© 2026 Boyum IT Solutions A/S

Validity Date	Select the period of validity of the BoM item for comparison.
Bill of Materials 2	
Bill of Materials	BoM to be compared with BoM 1. When comparing I-Versions, variants or validity periods, they may be identical.
I-Version	I-Version for comparison.
Variant	Variant for comparison.
Validity Date	Period for comparison.
Comparison	
Material	Compare material positions, that means, even if the position number does not match, but only the material numbers, a comparison is possible. **Important:** if you work with BOMs containing the same material numbers twice, the comparison will return false results.
Positions Text	Use position text field for comparison.
Position ID	Use position Id for comparison.

Resulting list of differences

Results window supports Window settings.

All determined differences in column "Differences" are displayed as comma-separated text.
If an entry was found in one BoM that does not exist in the other BoM, it will be displayed as "not available" at "difference".

Use scripts to fill template fields.

BoM comparison process:
Select an item - right-click: "Bill of Materials: List of differences" - enter a second item number. (***See*** image above.)
After clicking "Start", a table with both items and the differences in BoMs are displayed. Window settings are supported. Columns can be selected and sorted.

back to item structure

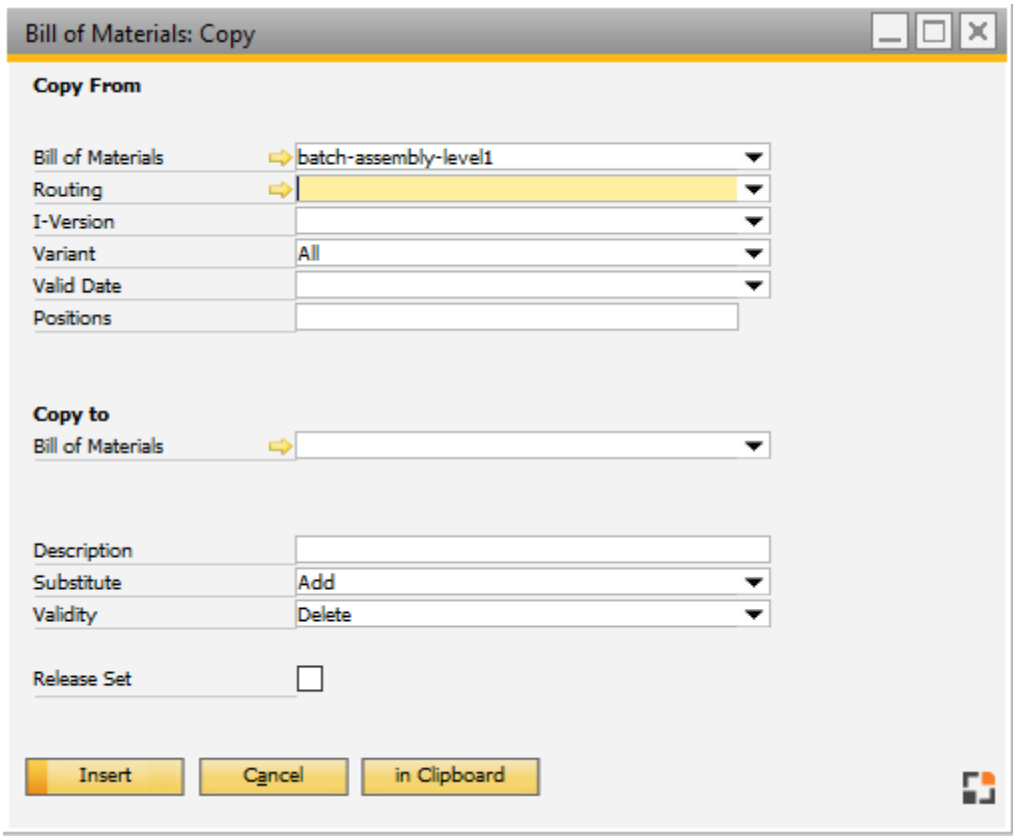
Bill of materials
- Edit BoM
  - BoM positions
    - Edit BoM positions
      - Alternative material
  - Cross reference
- BoM Batch change
- Difference BoM
- **Copy BoM**

Use this function to copy the BoM and /or the routing to another item or to several other items.

PATH: item structure > right-click > Duplicate: XXX item or BoM list view > right-click > **Duplicate to**



Window artikel_stlapl_copy.psr

Function	Description

© 2026 Boyum IT Solutions A/S

Copy from	
BoM	Selection of the BoM. All Bill of materials containing the chosen material are shown in the drop-down.
I-Version	Select I-version to be copied.
Variant	Select variant to be copied.
Valid date	Only positions valid at this date.
Positions	Select BoM positions.
Copy to	
Bill of Materials	Selection of the target BoM.
Description	Description – accepted after selection and can be changed afterwards.
Substitute	**Add**: The copied BoM is appended. **Complete substitute**: Previous BoM is replaced by a new one. **Same position ID Substitute**: Replace all BoM entries with the same internal position number. **Same position Substitute:** Replace all BoM entries with the same position text (visible position number). **Same material number Substitute:** Only same material numbers will be replaced.
Validity	This parameter allows to delete or copy certain fields to a new item. Copy: indicated validity is copied and accepted. Delete: Validity is deleted. The validated fields: - versionfrom - versionto - versionarea - Variants - Valid from - Valid to
Renumber	Select field to renumber a new BoM.
Release set	New BoM is marked as "released".

Note: A change log of the copy is created.

Button

© 2026 Boyum IT Solutions A/S

Button	Description
Insert	Insert a previously defined selection from the clipboard.
Cancel	Close the window without saving.
in Clipboard	Copy the defined selection in the clipboard to insert e.g. in another database.

7.6 Routing

Routings can be managed here. They can be independent from item master if item version control was activated.

Routings or operations are steps or tasks used to manufacture a product, which can be carried out on internal work centers or by contracting external providers. Typically, a routing is made up of a series of operations, also called routing steps or routing positions.

The routing – description for routing catalog, routing master data, production routing and Precalculation are summed up in this documentation, because the field description differ only slightly for all areas.

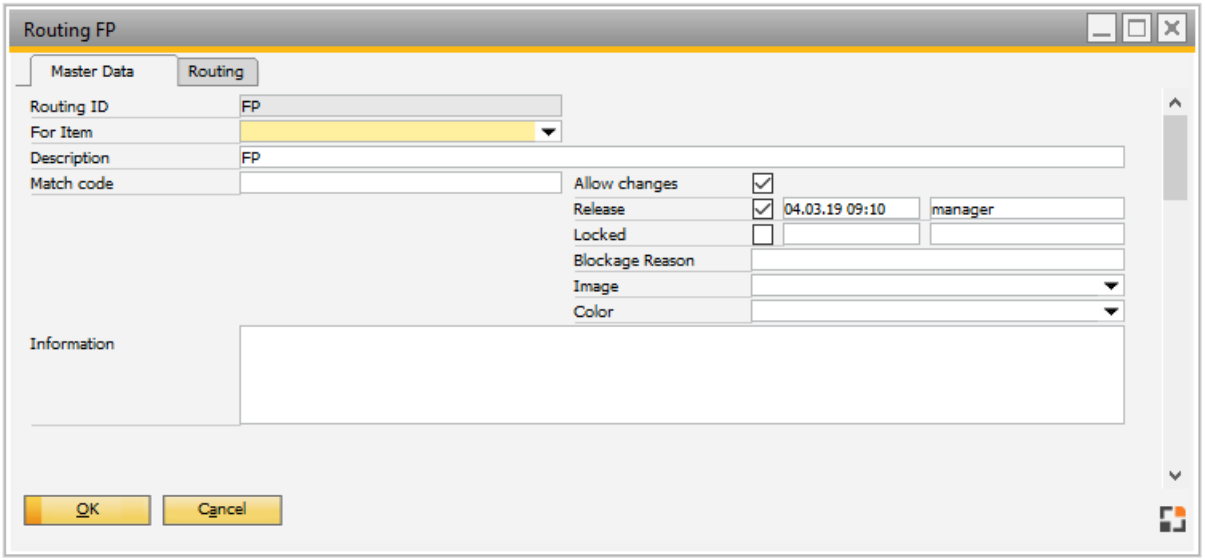
PATH: Inventory > Routing > **Open** a Routing



Window stamm_aplheader_edit.psr

Field	Description
Routing ID	Define an ID for the routing.
For item	Select the item.
Description	Define a description to be displayed for the selected routing in the list.
Match Code	Match code

© 2026 Boyum IT Solutions A/S

Allow changes	Activate check box to allow changes for this routing.
Release	Determines the release of routing. Only for information. The routing can be used in any case The exact time/date of the release and the person validating it is displayed in the field to the right. In the Configuration wizard you can set up whether the BOM is released immediately after new creation or copy. ***See*** Configuration wizard
Locked	Once selecting it, the routing is locked. The exact time/date and the person validating the locking is displayed in the fields to the right.
Blockage Reason	The reason for locking.
Image	Add an icon to be displayed at the routing.
Color	Configure a color for header-specific information of a routing in the Routing list.
Information	Add any additional information.

7.6.1.1 Routing positions

Operation catalog - Routing - Production routing - Calculation

Edit routing

- External operation
- General
- Extended
- Tools
- Utilities
- Parallel
- Alternative
- Documents
- Special functions

Individual operations, values for capacity planning, costs and production are defined in a routing. To allow an operation to be created more quickly, individual processes can be predefined in the master data under Operations.

© 2026 Boyum IT Solutions A/S

The entry can be created and edited either in a list format or in detail format.

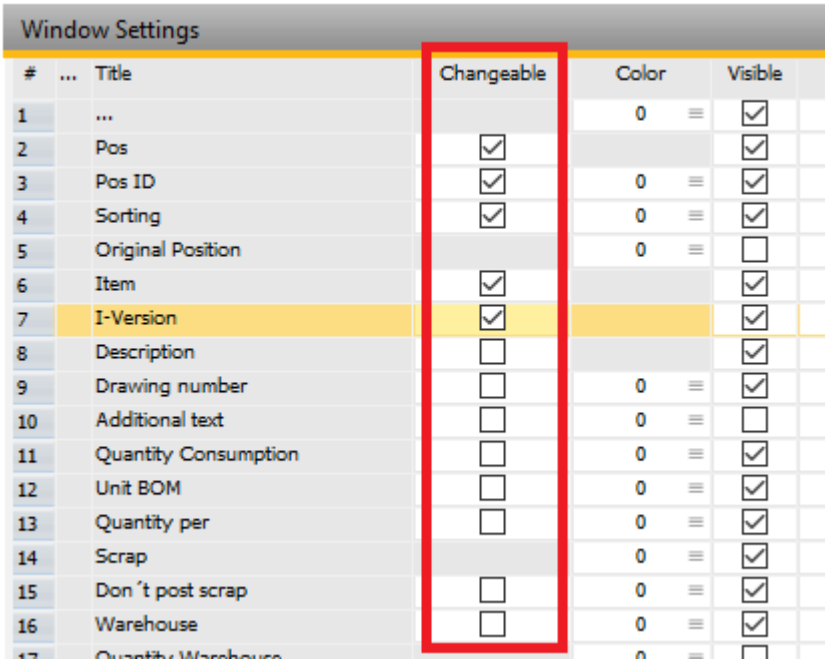
- Enable editing fields in list format

Details can be displayed in detail view or in a list view. In order to edit details in the list view, the fields must be enabled for editing.

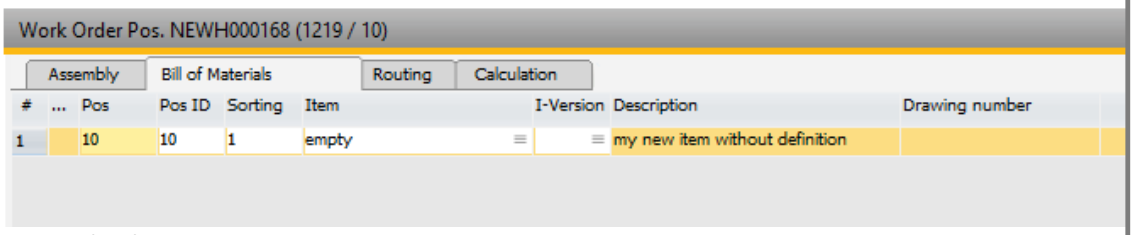
To enable editing:

1. Right-click on a line in the list view and go to **Window Settings**.
2. Set the required fields to Changeable.

This option is not available for all fields



3. Click the **Update** button, then **OK**.
4. Returning to the list view, changes are now visible and fields marked as Changeable are editable.

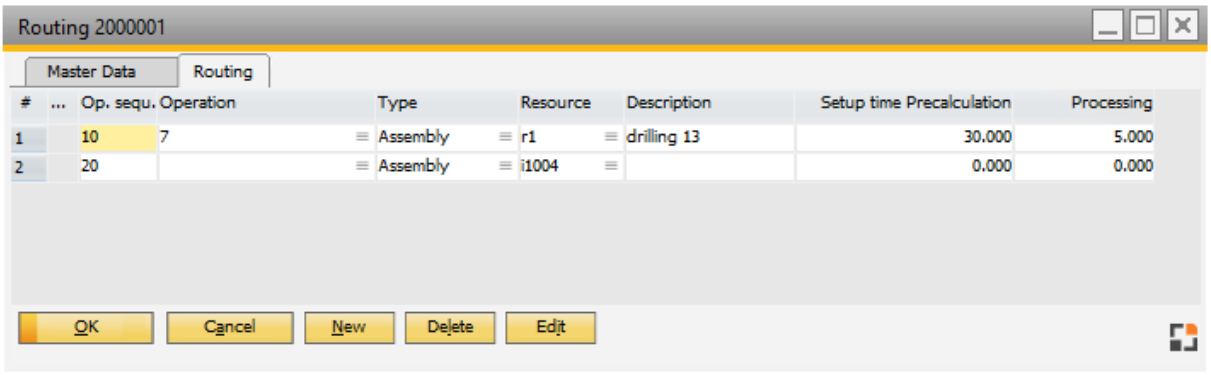


Window fert_ftstlpos_browse.psr

For the description of the fields ***see*** Edit routing.

Window settings and Templates are supported.

© 2026 Boyum IT Solutions A/S



Window artikel_arbplanpos_browse

Sorting

The position number is alphanumeric information and does not determine the sorting.

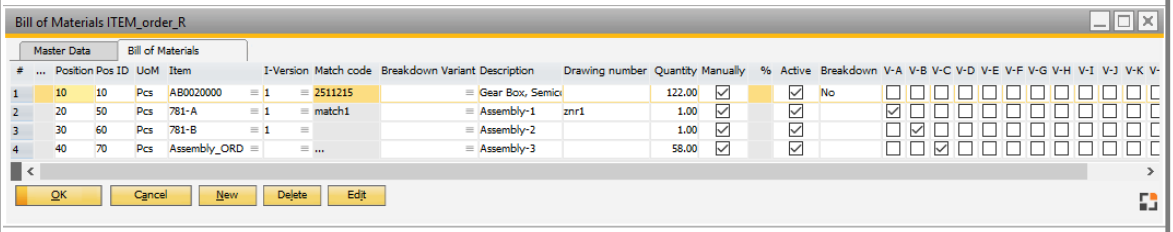
How to change sorting:

1. Click on the field position and hold the click. Note: the selected field is currently not allowed to have the focus.
2. While still holding the mouse, click and move the cursor to the desired row.
3. Release the click.
4. The row is moved to the new row position.

The position numbers are not renumbered automatically. This can be done via right-click > renumber.

Variants A-Z

Variants A-Z can be assigned to the routing positions with check-boxes in a table format.
The variants A-Z have to be made visible via **right-click > window** settings to work with them.



Window artikel_stlpos_browse.psr

If a checkbox is enabled, the routing is only considered if the selected variant is created.
The routing position is ALWAYS considered if no check-box is enabled.

For column structure ***see*** Variants – Notes on database.

© 2026 Boyum IT Solutions A/S

For general information on variants ***see*** Variants.

Note on item version control

This list can be called up via BoM administration.
If working with item version control, the tabs "BoM" / "Routing" are hidden. These can be selected in version control.

Additional functions

More functions are available in the routing browser view.

Function	Meaning
Insert from	Copy routing: Loads the routing from another assembly. If the assembly already has a routing then the loaded plan is added at the end.
Duplicate to	Copies routing into the item to be specified.
Activity Log	If the log is activated, it can be viewed here.
Batch changes	Multiple routings can be changed using this function. ***see*** Batch change routing.

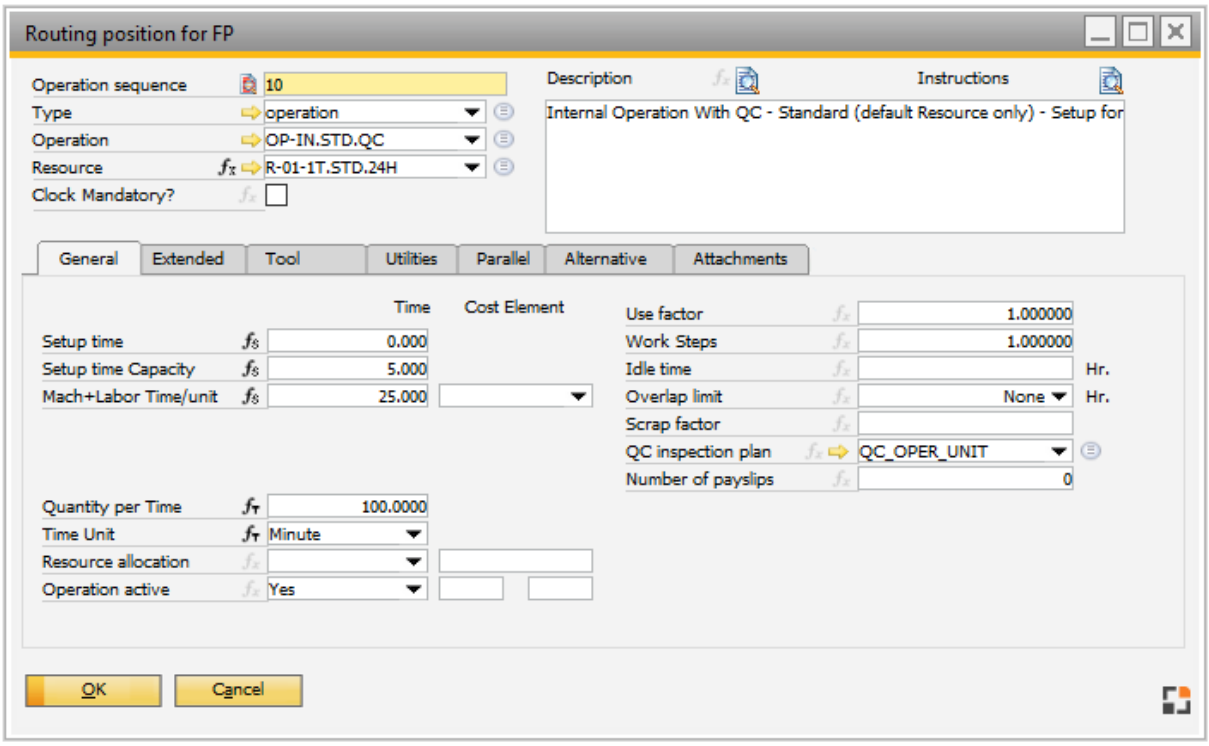
Routing Position editing window:



Window artikel_ arbplanpos_ edit

Header

Field	Description

© 2026 Boyum IT Solutions A/S

Operation sequence	Position number The position number is counted in increments of 10. ***See*** Configuration wizard to set up. The field is alphanumeric with 20 digits. **Note** The order is not related to a position number, but defined in the list of BoMs by Drag&Drop. It reflects the order of entry by default. Position number cannot be unambiguous. The field "internal position number" (BEAS_APL.POS_ID) shows the internal, continuous and unique ID. **Operation catalog:** In the operation catalog there are no operation numbers, only a catalog ID. **Precalculation, routing and work order:** In these functions you can edit the alphanumeric and the numeric position number. *BEAS_APL / BEAS_FTAPL.POS_TEXT* Variants with script Left to the position field you can open the script window by clicking the formula icon f_x. Enable the fields by **right-click >"display formula fields"** **Formula icons** **Icon** / **Boyum Style icon** / **Description** f_x / f_X / Function f_T / f_T / Table f_S / f_S / Script and other Variants

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style icon	Description
		Empty formula
		Text edit disabled. Double-click to open the script editor. Located left of Item number in Item Master data.
		Text edit - script is inside. Double-click to open the script editor. Located left of Item number in Item Master data.

Important: This function is only available if the Variant generator is activated in the Configuration wizard.

See more details in Formulas, Tables, Variables and BeasScript.

The following variables are available

Variable	Description
`e_belnr_id, e_belpos_id`	Work order, Work order position
`e_aktiv`	Routing position active J/N
`e_routingid`	Routing Id
`e_itemcode`	Itemcode
`e_quantity`	Quantity in regional format
`e_source`	"routing"
`e_info1`	Info for current routing position

See Variant generator – Script.

Note: This function is only available if the Variant generator was activated in the Configuration wizard.

Type	Select a type from the drop-down. The icon opens the Operation types editing window.

© 2026 Boyum IT Solutions A/S

Operation	Select an operation from the drop-down.The icon opens the operation catalog definition. This can be used to adopt the information stored in the master data/operation, thus accelerating input.
Resource	The work station, personnel group, machine or machinery group or also external operation supplier or person on or through which the operation is conducted. The icon opens the Resources editing window. In routing and work order routing, it is mandatory to specify a resource. In operation catalog the resource is optional. ***See*** Resources.
Active	Only in Work order routing position > Operation sequence XXX editing window.
Clock Mandatory?	Defines whether clocking (factory data recording) is mandatory. Check box. This is important when calculating the last operation. Definition: The last operation is the position in which "Clocking mandatory" is active for the last time. If, for instance, the finished assembly is entered at the last operation (depending on the setting), it can be determined this way (necessary if the last operation is "Take down", for instance, but it is not clocked). If the last operation is NOT reportable, receipt is performed here for the last reportable routing, and not for the "Receipt for last routing" option. ***Example***: 10 not reportable 20 reportable 30 reportable 40 not reportable First operation is position 20 and position 30 is the last position. To the other position a report is possible, but not mandatory. Therefore these are not taken into account at the checking of rules. For more information ***see*** last Routing Position
Description	Description of the activity. It is possible to add several lines, (max. 16 000 characters).

© 2026 Boyum IT Solutions A/S

An external editor is opened by double-clicking the field or single-clicking the icon next to "Description".

- You can insert formulas which create your description while creating a work order

Customizing the routing description, Item name or additional BoM text

In addition, in the operation description, additional information on the BoM, or item, information from a formula or variant can also be stored in the description of a routing.
Placeholders can be inserted into routing descriptions for this purpose. These placeholders begin with < and end with >. All variables as well as separate formulas, tables, types of origin, etc. can be inserted.

The origin itself is defined in the placeholder using **origin type** and "**:**".
The type "Script" is used if the type of origin is not specified.

TYPE	Description
f:	Origin is a formula, e.g. <f:MyFormula>
t:	Origin is a table, e.g.. <t:tab4711>
i:	From assembly – item master: e.g. <i:itemname> = Item name
v:	Variable which can be defined as necessary: e.g. <v:var0815>
c:	Beas-script. Can be defined as a type of origin definition, e.g.: <c:e_belnr_id> Document number from work order, <c:e_aplatz_id> = resource ID of the routing position
p:	Parameter from a variant. <p:so_sofa_length>

- Example of an operation description.

© 2026 Boyum IT Solutions A/S

	<c:e_quantity> * Cutting to size according to drawing numbe Color: <v:u_color>, length: <v:length>, width: <v:width> with: e_quantity: e.g. from beas Script the value "5" gives u_dnr: Drawing number, e.g. "ZN 078 12345" u_color: e.g. red length: e.g. 20 width: e.g. 10 the following information results in the field "Description": 5 * Cutting to size according to drawing number ZN 078 12345 Color: red, length: 20, width: 10 **External operations** For external operations the entered text is transferred to the service description. For further information ***see*** Collective order – description. Format needs to be considered.
V-A ... V-X	Short variants. Set hooklet to make this row available as variant. Right-click on the title row: - selection: all - selection: delete This is to select/deselect the check boxes for all lines.
Instructions	Additional text field. The instructions field can be edited in Routing position using clicking the icon. The icon is displayed red when any text is stored. You can use different a text format, set up in Configuration wizard. **Note**: Changing the text format in the Configuration Wizard has no effect in existing entries.

Functions

The following functions are available:

Note: In Precalculation these functions are not available.

© 2026 Boyum IT Solutions A/S

Function	Description
Add	Inserts a new routing position.
Duplicate	Duplicates the position. Clicking this function opens a dialog box "Enter new ID" to create a duplicate of the selected entry.
Remove	Deletes routing position. This button is only available if the routing position is connected with no slave-routing or no routing position.
Save sorting	Sorting of position is determined by drag&drop. After moving, you can save the sorting.
Change log	Opens the Change log.
Formula-allocation for active input	Opens the formula field for the current field. ***See*** Variant production – Field assignment.
Display formula fields	Shows a yellow C before each field . If you click on it, you can store formulas directly.
Formula list	Shows all stored formulas.
Reports	Only in Work order routing position > Operation sequence XXX editing window. Right-click function to open the Reports window.
Time receipt	Only in Work order routing position > Operation sequence XXX editing window. Button/right-click function to open the Time receipt window.
Cross reference	Only in operation catalog. Button/right-click function to open the Cross Reference Operation catalog XXX window for related work order.

Script	Here you can store a script for the variant production.
	Only in operation catalog / Routing position:
	
	All values of the operation sequences can be affected via script if a calculation or a work order is created from that.
	
	Example:
	Only insert operation sequence if the work order was created from User "manager"
	`if <currentuser> <> manager then`
	`  setvar=e_aktiv=N`
	`end if`

7.6.1.1.1.1 External operation

Operation catalog - Routing - Production routing - Calculation

Edit routing

External operation

General

Extended

Tools

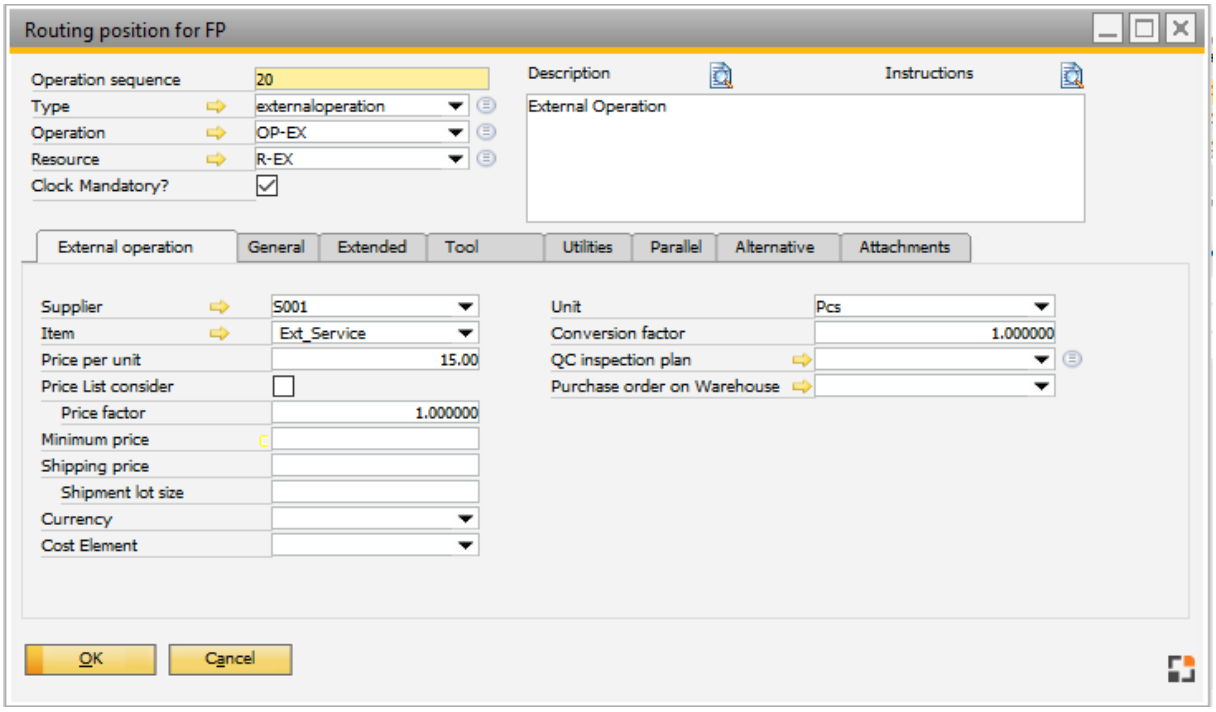
Utilities

Parallel

Alternative

Documents

Special functions



Window artikel_ arbplanpos_ edit

The "External Operation" tab is only visible if an external operation has been selected as a resource.

© 2026 Boyum IT Solutions A/S

An external operation can consist of a pure service (the entry is then on this page only) and / or possess a proprietary throughput time and debit the capacity of a resource, as well as allow costs to arise (entry in General tab)
For further information ***See*** External production.

Field	Description
Supplier	Default supplier Assign the supplier linked to this external operation If specified, it is loaded by default in purchase orders or quotations. Pricing considers the special price list of the supplier if no price was specified for unit price. Suppliers are available depending on settings "select supplier" Clicking on the will open the Business Partner Master Data window. Note: By default, Beas allows to predefine an item for purchase order creation. If the field is filled, it is protected in the purchase order. Pricing depends on **Production > External production > Purchase and provision.** - Pricing for purchase - supplier selection - consider special price list
Item	Assign a non-warehouse item to manage all external operation transactions like purchase orders. If no unit price is specified, pricing is carried out for this item. Clicking on the will open the Item Master data window. Specify service item Only non-inventory-managed items are used for purchasing a service. No material is posted except when provision parts are used. Pricing: ***See*** Pricing for purchase.

© 2026 Boyum IT Solutions A/S

Field	Description
	In purchase, the unit of the item is used. Note: The system ignores UoM Group definition of this item. It is always allowed to choose any UoM for the routing position.
Price per unit	Set the price for purchase orders. Service price per price factor. ***See*** Pricing for purchase.
Price List consider	Check box. Allows Beas to consider pricing, extended price lists, special price lists and blanket orders. ***See*** Pricing for purchase.
Price factor	Include a factor to be used according to the price per unit defined. **Note**: If "Price list consider" is enabled, "Price factor" is hidden, as prices in price list are always stored per Inventory UoM of the service item.
Minimum price	Set a minimum price for the purchase order If the total unit price is below the minimum price, the value specified here is used. ***Example***: €10 € per 1000 units, minimum €30. For 1000 units €30 is calculated (minimum price). For 10000 units €300 is calculated (unit price higher than minimum price).
Shipping price	Transport surcharge Set the transportation price to be included in the total price. Payable per transport lot size. ***Example***: €10 € per 1000 units, minimum price €30, transport price €100, lot size 5000 1000 units are €30 + €100 transport price = 130 € For 10000 units: €300 € €200 €ransport price (2 x lot size) = €500 .€
Shipment lot size	Set the lot size that can be shipped. ***See*** transport price. ***Example:*** 10€ per 1000 units, minimum price 30€, transport price 100€, lot size 5000 1000 units are 30€ + 100€ transport price = 130€ For 10000 units: 300€ + 200€ (transport price x 2 lots) = 500€

© 2026 Boyum IT Solutions A/S

Field	Description
Currency	Specifies the currency in which the amounts are expressed. If no currency is used, the local currency is used.
Cost element	Change the account in which the standard costs from the external operation is booked. If a cost element is stored, and in the cost type an account is stored, costs arising at goods receipt are booked to the WIP account. ***See*** External operation goods receipt, Cost types.
Unit	⊟ Unit in which the purchase is registered Usually you purchase in units of the service item as prices are stored in this unit. ***See*** next Field description in this table titled "Conversion factor".
Conversion factor	⊟ Conversion factor between time receipt unit and assembly unit In the purchase the warehouse unit of the service item is usually indicated. There you can define the conversion factor between consumption unit of the item to be produced and the warehouse unit of the service item. ***Example*:** Production UoM of the assembly: `pieces` Inventory UoM service item: `kg` Conversion factor: `3` For a requirement of `60 pieces, 20kg` of service items `(60 : 3)` needs to be purchased. **Note:** By default, Beas allows to predefine a conversion factor for purchase order creation. If the field is filled, it will be protected in the purchase order. For more Information ***See*** Collective Purchase Order – Quantity.
QC-inspection plan	Define if this external operation has to be inspected by the quality control team when producing the item or performing the task and link to stored QC-inspection plan. Clicking on the opens the the editing screen of the selected plan, and clicking

© 2026 Boyum IT Solutions A/S

Field	Description
	the opens the list of QC inspection plans.
Purchase order on Warehouse	Define the warehouse for purchase order. If you create the purchase order, the system takes this warehouse for the purchase order. This is the own warehouse for the invoice or/and ship back warehouse. For more Information ***see*** Collective Purchase Order.

Additional fields in Precalculation

Warehouse	Determines the warehouse of the service item. This is required for pricing, if you work with "price per warehouse".
from Quantity / Price	Only visible if "consider price list" was activated. Up to 4 quantity-dependent prices can be entered. Quantities are given in units of the service item.

See

Collective Purchase Order

7.6.1.1.1.2 General

There are defined times and costs of the operation, and lead time determines the costs and duration of the work sequence.
Values are specified in "Time Unit" (hour/minute) and refer to "Quantity per Time" in units of usage of the assembly.

Setup time	Setup time for Pre- and post-calculation The setup time in hours or minutes is taken into account in production and costing analysis as well as in Precalculation. Note: Designation can be changed in Configuration wizard – Resource – Definition Time types. **Precalculation and Lot size** Setup time is calculated per calculation lot size. ***Example:*** Lot size 10, setup time=5 minutes, calculated: 19 pieces Result: total setup time 10 minutes or 0,52 per piece

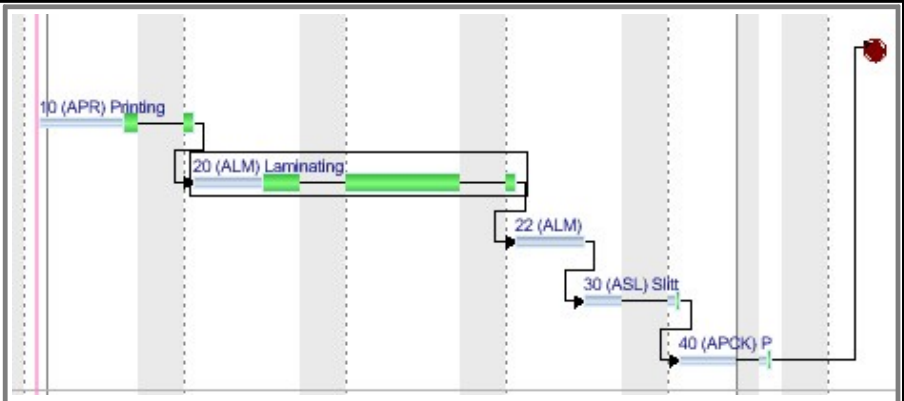
© 2026 Boyum IT Solutions A/S

	If a sub-assembly has its own calculation lot size, it will be taken into account. ***See*** Precalculation – View and lot size. **Production and lot size** If a work order is created automatically (e.g. via order recommendation report or sales order to work order, a separate work order position per item-lot size is created. The setup time indicated here refers to the lot size in item master. **Separate reporting of setup times** If "Extend to cost elements" was set to 2 or more in the Resource, the setup time can be reported separately via FDC and evaluated separately in calculation. Enter the cost element to which the accrued costs are posted.
Setup time Capacity	The set-up for scheduled capacity in hours or minutes is considered in capacity planning and throughput time calculation. This setting has an effect on calculation of target time.
Mach+Labor Time/unit	The actual processing time per work step. The field designation can be changed in **Configuration wizard > Master Data > Resources > Time types** or via Ctrl+ double-click in the text field. Times are specified in units "Times in ..." (hour/minute) and refer to "Times per .. " finished parts taking account of the utility and work steps in units of usage of the assembly. The Cost Element field specifies the cost element for which the planned or accumulated costs should be totaled, facilitating detailed analysis. Tools that determine the throughput time and also alternative operations can only influence the job time (processing time). ***See*** Calculation of planned time.
Secondary, main time	Secondary time and main time. In addition to the job time, two other secondary processing times can be specified if "Extend to cost element" is set to 3 or 4 in the resource. The secondary processing times are designated in Configuration Wizard or

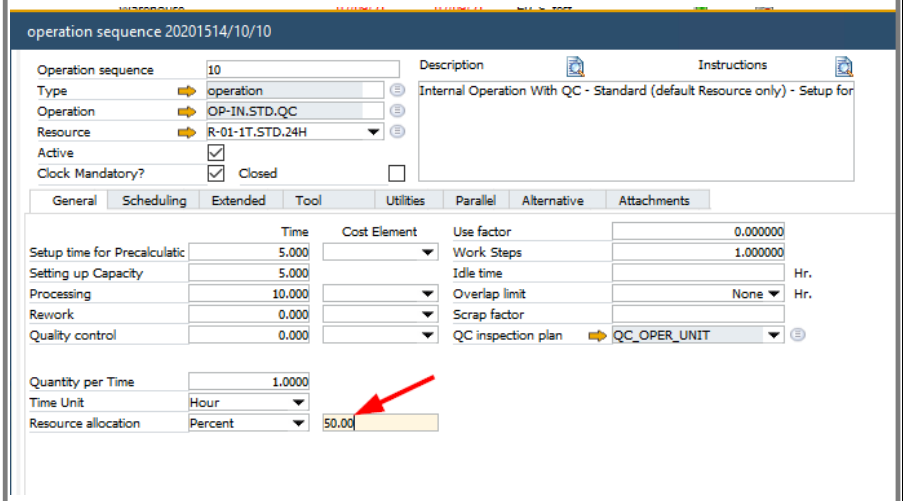
© 2026 Boyum IT Solutions A/S

	via Ctrl+Double click in the text field. ***See*** Concept Time types.
Quantity per Time	Determines the assembly quantity the time refers to. Enter to which assembly quantity (Production UoM) the time refers to. Thus you can indicate even short lead times correctly. ***Example:*** Lead time 0,0001 minutes per piece To make it more readable, you can enter 1 minute per 10000 pieces If it is a fixed time, enter 0 at "quantity per", that means this time is needed only once per lot size. Same effect as for setup time. ***Example:*** Lot size 10 Production 50 pieces Time = 2 Minutes per 0 Total time: 5 lot sizes a` 2 minutes = 10 minutes **Fix Quantity: Quantity per Time = 0** This means you need the time per lotsize ***Example***: 3 Minute per 0, you produce 100 Pcs. The System calculates 3 Minutes for all 100 Pcs. For additional information on lot sizes ***see*** Precalculation – Display and lot sizes.
Time Unit	Unit of time in which times are stored – hours or minutes. The default can be stored in the options.
Resource Allocation	The extent of utilization of a resource. Determines the utilization of the available resource capacity.

© 2026 Boyum IT Solutions A/S



See Default Calculation type: Reallocate forward.



Type	Description
Number	Number of resources used (subject to the prerequisite that the resource exists more than once, e.g. if the resource is a group of persons. Where 2 is input for 5 persons, the resource of 2 persons is scheduled at most. Note: If this is not 1, the system uses the calculation method Exploit Full capacity for this routing position.
Percent	Percentage utilization of the resource. ***Example 1***: Group of 6 persons. At a utilization of 50% the resource of 3 persons is used at most. ***Example 2***: Machine which is only partly utilized. To extend the throughput time, a lower utilization can be specified here.

© 2026 Boyum IT Solutions A/S

Type	Description
	If 20% is specified, throughput time is quadrupled while costs remain the same. Note: If this is not 100%, the system uses the calculation method Exploit Full capacity for this routing position.
Simple	Default setting: For "Simple", only one resource is 100% utilized.

Note:

For Detailed planning (i.e. a resource should be planned to the minute) the option must be set to "Simple".

Operation active

- Determines whether the operation is active and can be used

You can set here whether the operation should be included. Apart from Yes/No, a condition is also possible, such as production quantity greater, in between or smaller than a specification defined here.
Example: The operation in which a small machine has been defined should only be used when the production quantity is smaller than 30. If it is greater, an operation should be used in which a large machine with a respectively higher set-up time but smaller mach+labor time is stored. Quantities refer to "per units of usage" of assembly.

Note: This switch is only visible if in the Configuration wizard – Routing – Operation field show is activated.

- Operation catalog:

In operation catalog this field is not available.

- Routing:

In routing it can be set up depending on the quantity:

Yes: Always active.
No: Not active.
Quantity bigger: Only active if quantity exceeds the given value.
Quantity smaller: Only active quantity falls below the given value.

© 2026 Boyum IT Solutions A/S

Quantity between: Only active if the quantity is between two given values.

Thus you can activate a routing depending on the quantity.

Example:
Depending on the quantity, a certain resource is to be used.

until 10 kg (active quantity < 10 kg): Resource "small bowl", planned duration: 10 minutes
from 10 kg (active quantity > 10 kg): Resource "big bowl", planned duration: 20 minutes

Field description

The value is saved in `aktivformel` with the following configuration `Id=Value1=Value2`
G = "Quantity bigger"
K = "Quantity smaller"
Z = "Quantity between"
N = "Not active"
J = "Active" (Default)

If the field is empty, the entry is treated as active.
Example: Only active for quantity between 10 and 20 "`Z=10=20`"

Note regarding variants / formulas

Only the following values may be returned here if a formula has been stored via the – icon: Y for "Active" or N "Not active". "bigger", "smaller" or "between" are not allowed via the formula system.

Generate Work order

By defining value "N" in the formula, the system does not insert the routing position in the Work order. This is to be activated in **Configuration wizard > Production > Create >** Apply inactive work order sequence.

© 2026 Boyum IT Solutions A/S

Generate Precalculation

In Precalculation the system always transfers inactive routing positions. *(beas 9.3 PL 2)*

Generate new Item (Product Configurator)

By defining the value "N" in the formula, the system does not insert the routing position in the Work order. This is to be activated in **Configuration wizard > Production > Product Configurator >** Apply inactive work order sequence *(beas 9.3 PL 2)*

Active field as Script

If you click in field Pos on – icon, you can define all fields with `setvar=e_[fieldname]=value`

If you want to disable a routing position, use the following script: `setvar=e_aktiv=N`

With *beas 2020.02* the Variable "`e_aktivformel`" is not supported.

Pre-calculation

In Precalculation there is an active-field and an "only if quantity" .... The second field has the same meaning as in routing. The operation is only active if the condition is met.

Work order

Only active routing positions are transferred to the work order. If you make a selection in the Configuration wizard to accept inactive routing positions as well, these will be transferred to the work order, and deactivated.
You cannot log on to these operations and they do not cause time demand.

This switch can be disabled manually.

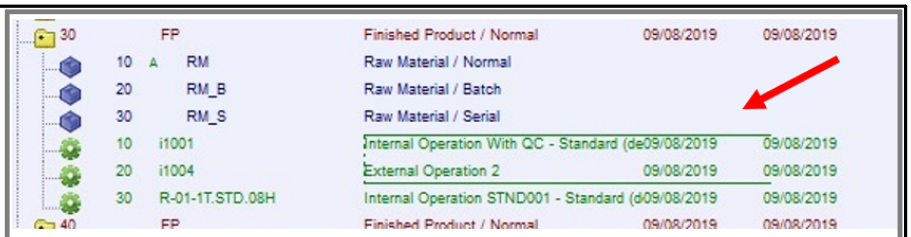
© 2026 Boyum IT Solutions A/S

Valid Period	In Precalculation Operation: Select the From - To dates of a validity period.
Use factor	Determines the use factor of the operation If several parts are produced with only one work step, the use factor is higher than 1. ***Example*** Cut a plate with a saw Duration: 1 minute Result: 2 plates, per 1 plate, only 30 seconds are required. Use factor in this case:2 ***Example 2:*** Injection molding with 12 nozzles. One process creates 12 parts, the use factor is 12 in this case. ***See*** Calculation of planned time.
Work steps	Works opposite to the use factor. Define how many work steps are needed for one part If several steps are needed to finish one part you can enter the number here ***Example:*** Tighten 10 screws. Per screw, 15 seconds are needed. Piece time is `15 seconds` Work steps `10` Total time `15 * 10 seconds = 150 seconds` ***See*** Calculation of planned time
Idle Time	Idle time in hours in which the semi-finished part must not be further processed, e.g. drying time, cooling etc. `|--- Transfer time --| |-- Planned time --| |--- Idle time---|` The resource is available at this time for other orders. There are no arising costs .

© 2026 Boyum IT Solutions A/S

	Forward Scheduling: The next sequence of operations can begin only after the idle period. The idle time should not be used for the extension of lead times. It is recommended to use transit time (***see*** resources). By default, factory calendar and resource calendar are not considered. These can be taken into consideration by changing the settings in the Configuration wizard.
Overlap Limit	The overlap time to the next operation is stored in hours. By using overlap settings, you can define the delay for the subsequent work sequence or define to start it in parallel. Unlike parallel resources, the subsequent work sequence can be moved freely. You can define the overlap limit in **Routing position > Overlap limit**. Choose "Parallel", "No" or insert the number of hours/minutes manually. If this is defined in Position 10, the next position will be parallel. This means: "Clocking mandatory" must be disabled, because you can start with Position 20 before closing Position 10.  *Window fert_arbplanos_edit.psr* In Item Structure view you can see parallel / overlap limit information in this way: In this example in Position 10 the "Overlap limit" is defined:

© 2026 Boyum IT Solutions A/S



Note:

Overlap calculation runs correctly only with forward calculation.

Value	Meaning
0	No overlap.
Parallel	Next Routing position will have same or next possible start date Forward calculation The earliest start date of the following operation can be the same as the first one or the next possible start. The next possible start may also be earlier than the one of the previous operation. ***Example 1 :*** Pos 1 is defined as parallel, so Pos 2 can start parallel to Pos 1  View in Beas

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 Start of 3. routing position is after the end of the latest parallel routing position. ***Example 2***: Pos 2 needs less time than Pos 1.  View in Beas  Start of next routing position is always after the end of the latest parallel routing position. ***Example 3:***

© 2026 Boyum IT Solutions A/S

Value	Meaning
	Scenario: Position 3 is parallel to Position 2, but after Position1 finishes, resource for Pos 2 is not available. For example Resource is reserved by another work order. If the resource is not available immediately, the routing position starts at the next available time. In this example, the position 3 can start **BEFORE** the first position:  ***Example 4:*** Scenario: 2 work order positions. Both WOs have defined the 2. operation as parallel. Start date is same. First operation has different resource, but the second parallel operation has same resource for both WOs. Explanation: The parallel resource uses the start date, on which the resource is free. For the first WO this is the time when operation 1 starts. In the second work order position you see that the start date of second operation does not start together with the first operation. The reason is that WO 1 already occupies the resource. So the second operation of WO can only

© 2026 Boyum IT Solutions A/S

Value	Meaning
	start after the operation 2 of WO 1 stopped. In that case the the second operation does not start parallel but delayed:  You can set parallel-defined operations to always run in parallel in the Configuration wizard. Result with setting "Overlap limit = fix" Start date of Pos 40 on Resource i1001-1 start later, because the next resource i1004 is not available before.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 ***See*** APS fix parallel routing positions Backward Calculation The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration. Parallel resource: The system calculates the following:  If duration of Pos 2 is less than that of Pos 3, then Pos 1 ends with the start of Pos 2.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 In this case, the system is working different from forward calculation. If you work with backward calculation, the first parallel position must have the longest duration. Differences between parallel resource and parallel operation Parallel resource: - is always parallel - 100 % - Parallel resource have always same start / end time - Use Parallel resource, if you don't need this resource 100% (Example: A worker is the "parallel resource", but is working on 4 machines in parallel. In this case he must invest only 25% for his time for this operation) Parallel Operation: - is not always parallel. Only if the resource of parallel operation is available - can have different work time - can work with resource optimization - can have own parallel resource, tools and so on
> 0 Overlapping	Overlap of the following routing position or assembly if it is the last routing position. Forward Calculation

© 2026 Boyum IT Solutions A/S

Value	Meaning
	The Overlap time define, when the next operation can be started. The time, which you define, is the delay in hours/minutes, until the next operation starts. The defined time is the earliest time. **Example:** 2 hours means, the next operation can start - 2 hours after start current operation or after end of this current operation (if the current operation is less than 2 hours) - if resource of next operation is not available after 2 hours, then at the time, when the resource is available. **Example:** In this scenario the start date of the third routing position is the real start date of the second routing position + defined overlapping time in hours, here 1 hour.  An overlap is specified in hours – based on a 24-hour day. The specified overlap always applies to the following routing position. The overlap time is not bound to a resource calendar. This is purely hour-based time excluding time reservations or other factors.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	The overlap time begins AFTER the transit time. The next routing position cannot possess a transfer time, otherwise it will be appended to the transfer time. ***Example:*** Scenario: 2 Work orders, same routing plan. In first operation different resources. Overlap limit = 0.5 hours First work order: Position 20 start 0.5 hours after start of position 10 Second work order: Position 20 start later, because the time is reserved from first work order 
© 2026 Boyum IT Solutions A/S

Value	Meaning
	If you want, that the overlap have always exact the same overlap time, a setting is available. ***See*** Configuration wizard ***Example:*** Scenario: Work time of second work order position is less than the work time of the first operation. In the first operation, overlap time is defined:  In this case you're ready with second routing position before you're ready with first routing position. But you can start with third routing position only, if all parallel / overlapped routing positions are done. In this case after end of Routing position 10. Backward calculation In a simple example the result of backward calculation is same as forward calculation Example: Work time 1 hour, overlap 0.5 hour in first operation  But is the duration of second operation is not same as first operation, then the result is different

© 2026 Boyum IT Solutions A/S

Value	Meaning
	to forward calculation: The system calculate backward: First 30, then 20 - from 20 the overlap is calculated (Start time from Operation 20 + Overlap time from Operation 10 = End time from Operation 10.  Alternative for backward calculation is "forward late as possible" Note: The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration.

Note:

The last operation corresponds to the last "reportable operation".

If an overlap is also configured in the last operation, Beas does not recognize this as the last operation.

However, the automatic assembly receipt or adjustment of the backflushed material depends on this.

Overlapping using assemblies

Assemblies can also overlap in an order-related structure.

Example:

```
        |- Main assembly -|
|--- Subassembly -|
```

© 2026 Boyum IT Solutions A/S

	Start date of the main group is normally the end date of the last routing position of the subassembly. If this last routing position has an overlap, this is also considered. ***Important***: If an overlap is entered in the last routing position, it is no longer recognized as the "last routing position" in the backflushed posting transactions.
Scrap Factor	Scrap factor related to this routing position in % In this field an additional Scrap factor on routing position level can be defined. This is calculated as (Mach+Labor) / 100 * Scap Factor Example: Production 8 Pcs Setup Time = 60 Minute Labor Time = 10 Minute Scrap Factor = 5 % Total Time = 60 + (8 * 10) + (8 * 10 : 100 * 5) = 144 Min.
QC Inspection Plan	Store a QC-inspection plan in operation If a QC-inspection plan is stored, – depending on the settings – a QC order will be created. ***See*** Configuration wizard Measured values can be registered via QC-order, Terminal or WEB-Apps. If respective rules are defined, the release of the next operation may depend on that. ***See*** Configuration wizard – FDC – login rules ***See*** QC-inspection plan Quality control order
Number of payslips	Information field – if applicable, for information on number or pay slip

© 2026 Boyum IT Solutions A/S

	printouts.
Expand to Cost Elements	In Precalculation Operation: Select the number of cost rates. The default is one cost element (processing time), which can represent a mixed calculation of machinery and personnel costs. Select the number of cost elements you are to use in Precalculation, update the window, and the selected cost elements appear in the Costs tab. ***See*** more details in Costs.
Value Labor costs separately	In Precalculation Operation: If this option is activated, a separate cost rate can be stored for personnel costs and the "Labor cost rate" field appears in the Cost tab. ***See*** also Costs.

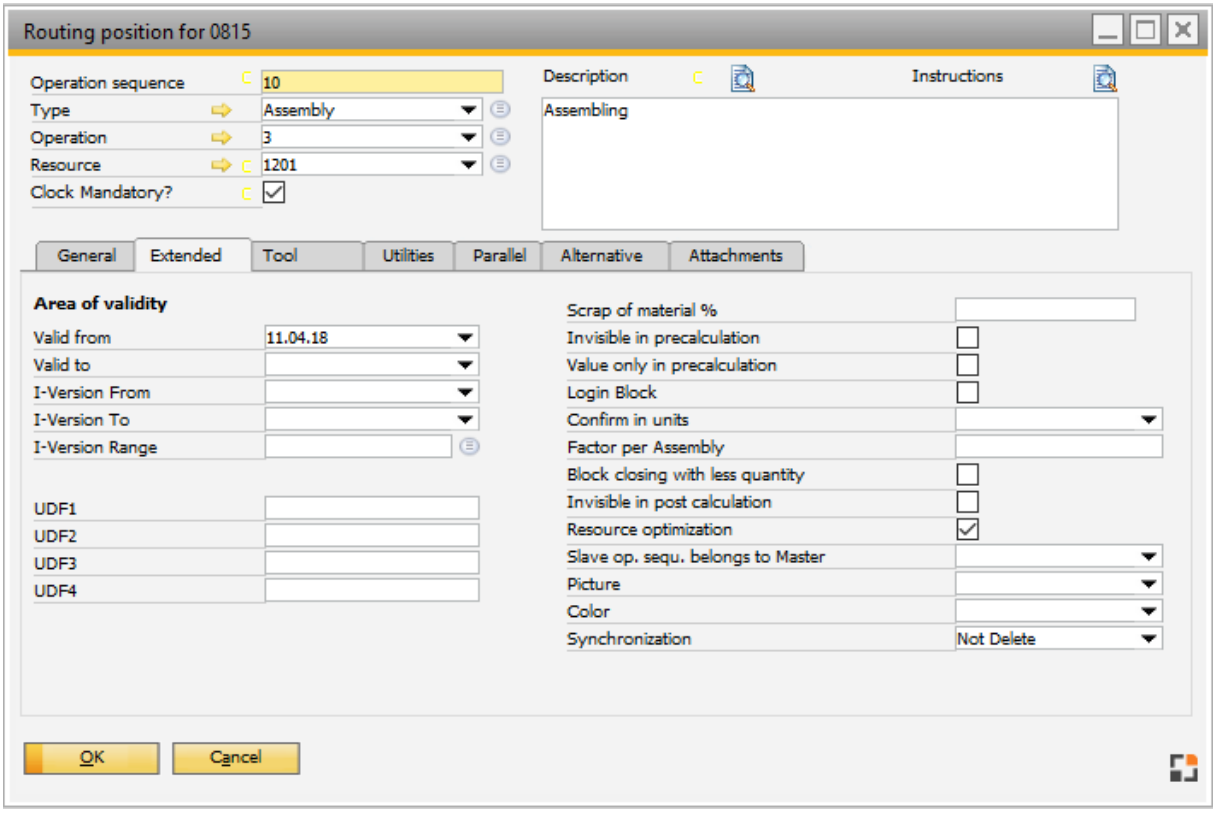
In this tab Beas allows the user to insert additional information used in production processes.



Window artikel_arbplanpos_edit

Field	Description
Valid from / to	Define the Valid Date Area. If no date was entered, it is valid always, otherwise only in the specified period. **Precalculation:** Precalculation date serves as reference. In Precalculation, all BoM positions are displayed but only the valid ones are valued. **Production** Depending on **Configuration wizard > Production > Capacity planning > Default calculation method** Calculation backwards: Delivery date serves as reference. It is checked only at work order creation. If the

© 2026 Boyum IT Solutions A/S

Field	Description

	delivery date is changed subsequently, there is no second check as long as the work order is not updated.
	
	Item-Processing time:
	The Delivery date of the respective assembly serves as reference. The item-processing time of the respective assembly will always be used for the calculation of the completion date of a sub-assembly *(beas 9.1 PL: 08)*.
	
	Creation via ue_api_wo
	The parameter "validdate" can be defined additionally, if the work order will be created via the API. *(beas 9.1 PL: 08)*
	`declare=wo=ue_api_wo`
	`wo=set=validate=<mydate>`
	`// .. normal script to create or refresh a work order`
	
	Sales order in Order recommendation
	At breakdown of the assemblies the delivery date of the sales order is used, minus the average delivery time, stored in the Configuration wizard.
	
	Special case: **Configuration wizard > Production > Capacity planning > Default calculation method = Default calculation method**
	The calculated date of requirement of the respective sub-assemblies is used as reference date for sub-assemblies.
	
	Example 1
	A supplier changes the item number from a given date
	Pos 10: previous item number until date x
	Pos 20: new item number from date x+1
	
	Example 2
	At date x additional material is required.
	If larger changes are needed, we recommend to use item version control.

I-Version From	Field used to select the first I-Version to be taken into account in a range.
I-	Field used to select the last I-Versions to be taken into account in a range.

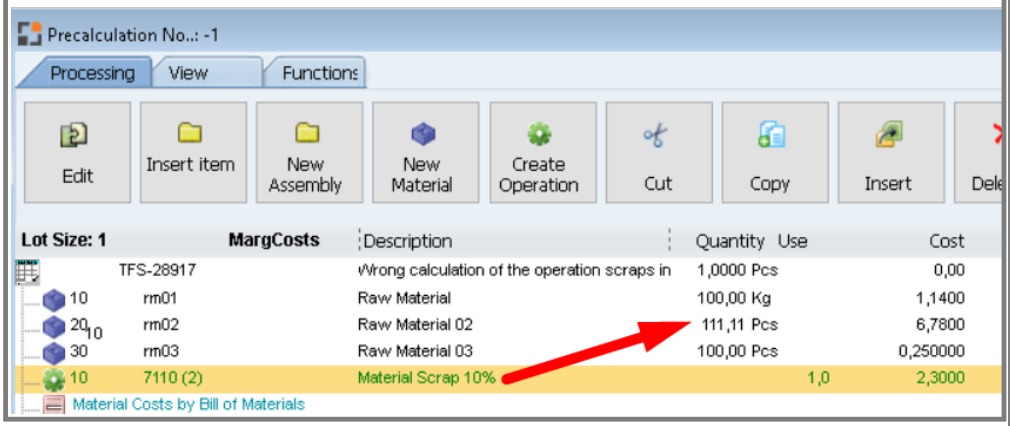
© 2026 Boyum IT Solutions A/S

Field	Description
Version To	
I-Version Range	Field used to select the specific I-Versions to be taken into account. Clicking on the will open the Multiple selection window to choose several versions.
Scrap of Material %	Material scrap % In **Routing position > Extended** you can define the Scrap of Material related to a routing position. ***Example:*** You must produce and fill 6 kg of paste. 15% is lost during filling. Now you must calculate how many liters of paste are needed. **Calculation** Correct formula is: Quantity: (100 – Scrap %) * 100 If you need 6 kg of finished product, you need 6 kg : (100 - (0.15) * 100 = 7.059 kg paste If you see the opposite: I fill 7.059 kg paste and lose 15% = 7.059 - (7.059 / 100 * 15) = **6 kg** In the **Configuration wizard >** "Behavior for Routing Scrap of Material % affects" you can define how the program should work. The "Exceeding planned quantity allowed" affects BoM position - material scrap: The Minimum/Maximum percentage is calculated based on total quantity. ***see*** Configuration setting. The following settings are available: Only the linked material is affected by the Scrap % setting

© 2026 Boyum IT Solutions A/S

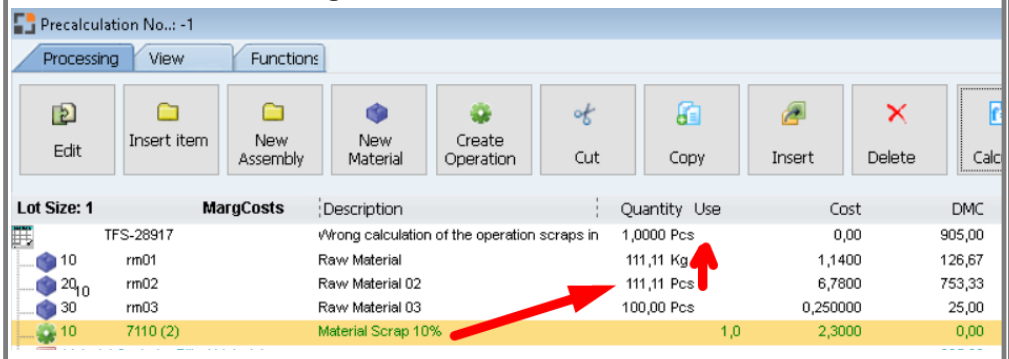
Field	Description

Result see this example:

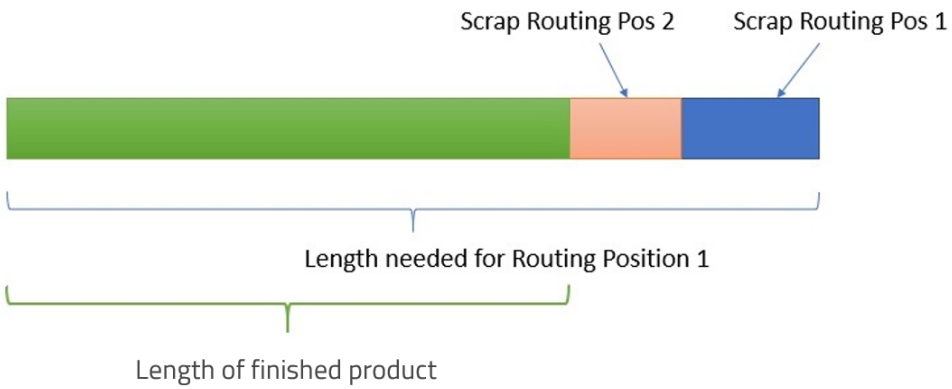


All materials under the last linked materials are affected

This is the Standard setting



Example: When a bar is sawed, a scrap rate of 10% may incur. If the material is ground, the bar becomes even shorter, that is a longer length must be cut beforehand,



© 2026 Boyum IT Solutions A/S

Field	Description

Example:

We need a finished product with a length of 250 mm.

We start with 308.65 mm - sawn : scrap 10% = 277.78.
Continue with 277.78 mm - ground : scrap 10% = 250 mm.

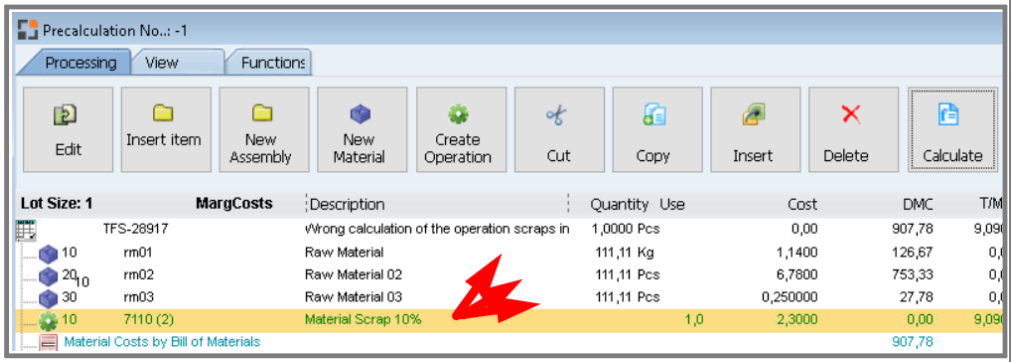
Routing Position	Material	Quantity	Scrap %
10 sawed	bar	308.65 mm	10
20 ground		277.78	10
30 QC		250 mm	

Calculation

Correct formula is: Quantity : (100 – scrap%) * 100

Position 20 we need 250 : (100 – 10) * 100 = 277.78
The value is entered into the production BOM item, column "calculated scrap" as fix value.

All materials are affected by the Scrap % setting



Notes:

- This field is only visible when the parameter in **Configuration wizard > Master data > routing > "operation related material scrap**" is enabled.
- The Item Report – Item Structure report does not support Material Scrap factor on

© 2026 Boyum IT Solutions A/S

Field	Description
	Routing Level. • Enable this option only if absolutely necessary; the computation will take considerably longer. • In Work orders this field is blocked, because scrap of material is determined only at the moment of creating the work order. • When checking which routing positions are considered, the following criteria apply: - Validity date - Active (no formula, no quantity check) - Variants (A–Z) Not checked: - Variants formulas, Product configurations
Personal allowance %	Define the rate of personal allowance. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Recovery time %	Define the rate of recovery time. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Efficiency Rate %	Define the rate of Efficiency rate. Beas don't use this fields for any calculation. You can use this for own calculation, example for calculate the labor time with formulas ***See*** Variant generator
Invisible in Precalculation	Control the visibility The position is inserted in the calculation but not valued and also not displayed, i.e. these are available here but completely invisible. Creating a work order from calculation, this operation will be inserted. Different behavior applies to "blocked operations". These are not included into the work order. *Field in Document: precalc_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 2* *Example:* *0*00000 = Pos 1 = 0 = Off *1*00000 = Pos 1 = 1 = On
Value	Control the Visibility "only in pre-calculation"

© 2026 Boyum IT Solutions A/S

Field	Description
only in Precalculation	If this option is active, the position is only valued in the Precalculation, but is not transferred to the work order and is also ignored in the scheduling function in the material requirements list. *Field in Document: workorder_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 2* *Example:* *00**0**000 = Pos 2 = 0 = Off* *01**1**0000 = Pos 2 = 1 = On*
Block Login	Block the login or receipt of order times If active, the affected resource is not reserved and a logon/logoff or time-related message of any type is blocked (the "Clocking mandatory" option must be deactivated). *Field in Document: workorder_lock* *Field in Database: BEAS_FTAPL.FLAGS, Pos 3* *Example:* *000**0**00 = Pos 3 = 0 = Off* *001**1**000 = Pos 3 = 1 = On*
Confirm in units	Confirm in Units Determines in which UoM quantities will be reported for this operation sequence via the terminal. ***Example***: Production Unit = kg Confirm unit = Liter, Factor = 1.2 If you create a time receipt with 1 Liter, you confirm 1,2 kg in production unit This is considered in Production Time Receipt External production - Collective Purchase Order.
Factor per Production UoM	Unit conversion factor Determines the conversion factor between time receipt unit and the production unit of the Assembly ***Example:*** Example: Production Unit = kg

© 2026 Boyum IT Solutions A/S

Field	Description
	Confirm unit = Liter, Factor = 1.2 If you create a time receipt with 1 Liter, you confirm 1,2 kg in production unit
Block closing with less quantity	If active, the planned quantity needs to be posted If this option is enabled, the operation can only be completed with a time receipt if: - the full planned quantity was reached - the reported quantity of the previous operation (mandatory to report) was reached, the quantity is larger than 0 and the previous operation is closed. Note: The operation can be closed at any time. *Field in Document: workorder_minqtylock* *Field in Database: BEAS_FTAPL.FLAGS, Pos 4* *Example:* *000**0**00 = Pos 4 = 0 = Off* *000**1**00 = Pos 4 = 1 = On*
Invisible in post-calculation	Define the visibility on post-calculation. If active, the position is hidden in the post-calculation – for planned and actual cost calculation. *Field in Document: postcalc_unvisible* *Field in Database: BEAS_FTAPL.FLAGS, Pos 5* *Example:* *00000**0** = Pos 5 = 0 =*
Resource optimization	Activate resource optimization. If enabled: If the stored resource is part of a resource group, at scheduling, the resource is automatically selected from the group with the shorted lead time. Note: Option can only be changed if the APS has been licensed. ***See*** Resource group Alternative Resources

© 2026 Boyum IT Solutions A/S

Field	Description
	Field in Document: resourcenoptimization *Field in Database: BEAS_FTAPL.FLAGS, Pos 6* *Example:* *000000 = Pos 6 = 0 = Optimization is on* *000001 = Pos 6 = 1 = Optimization is off*
Slave op. sequ. belongs to Master	Define which operation is the master-operation for this operation It is possible to define a master operation. An order time receipt is done automatically on all operations if a quantity or time has been receipted via the master operation. Thus a receipt can be done for multiple operations at once. ***Example:*** Master-operation 10 Slave-operation 20 Slave-operation 30 If an order time receipt is done on master-operation 10, so is an receipt done on position 20 and 30, as well. Important: A concatenation of multiple operations is not possible, which means that a master-operation cannot be a slave-operation at the same time. **Notes:** Master-Slave operations are not connected to or affect parallel resources or parallel working. Not supported in WebApps and by the "Open QC Order after transaction" setting. **Master-Slave operations - time receipt creation** **IMPORTANT NOTE:** When the user defines Master-Slave operations when creating a Time receipt for a "master" operation, Beas first generates all Time receipts for the slave operations, and *then* the time receipt for the master operation. Due to this sequence, if something fails during the time receipt process of the master operation, the previous Time receipts are **not** rolled back.

© 2026 Boyum IT Solutions A/S

Field	Description
	Working with master slave ***See***: Configuration wizard - Master-Slave
Not selectable	Only operation catalog: If active, the entry is hidden and can no more be selected.
Image	Image for this operation, for better recognizability ***See*** Image selection.
Color	With this color the operation is displayed in all screens. ***See*** Color selection.
Synchronization	Determine the behavior at import At import or inserting a routing position, the routing is always deleted completely and re-imported. Use the settings to manipulate the behavior on routing position level. **yes:** Position will be deleted before the import **do not delete:** Position will not be deleted, but can be overwritten **no:** Position will not be deleted and cannot be changed.

7.6.1.1.1.4 Tool

The tools required for an operation can be defined in the Tool tab. It is also possible to assign parallel or alternative resources and utilities under the subsequent tabs. One tool can only be used in one place because of capacity planning. You can set up a new tool under **Inventory > Tool Administration > "New".**

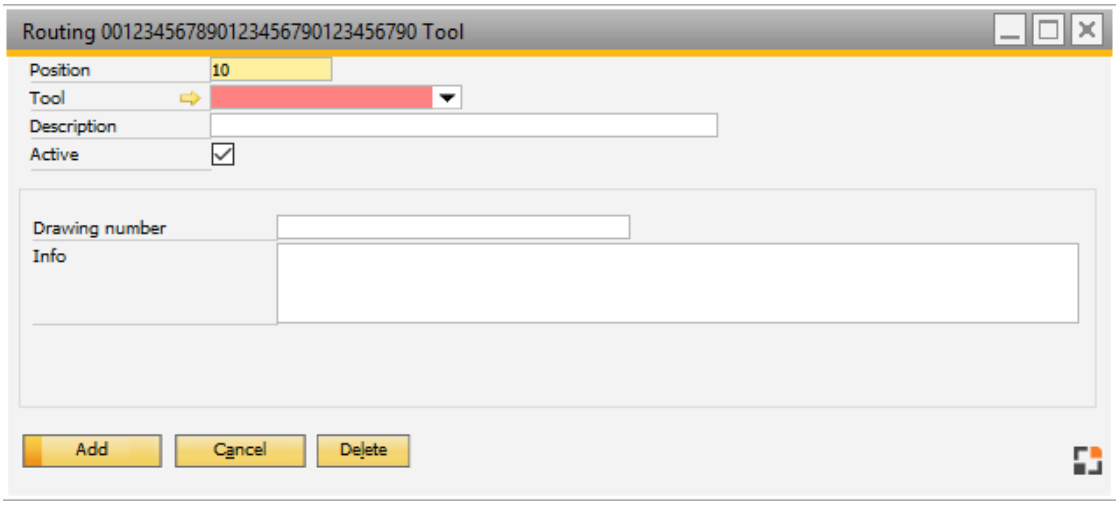
Mach + Labor Time/unit	Job time. Machine + operation time per unit

Adding a new tool

To assign a new tool to the selected operation sequence, click on "**Add line**" under **Routing > Tool tab** and the following window opens:



Window artikel_arbplanpos_Edit_werkzeug_edit.psr

Field	Description
Position	Field used to sort the tool lists from the routing. It is a consecutive number but not a primary key.
Tool	Field used to assign the tool to perform this operation. This field is mandatory.
Description	Field used to display the tool description. This field cannot be changed because it automatically comes from the chosen tool.
Active	Check box field used to set the tool as active in the routing.

Important: Tools that define lead time cannot be simultaneously active for the routing position. Only one of them can be active at the same time, but the active tool can be switched directly in work orders. The time information is copied to the operation. Therefore, the user must check one tool as “Active”; all other tools that define lead time are deactivated automatically.

© 2026 Boyum IT Solutions A/S

(Previously Resources tab, in which tools, alternative work sequences, and parallel work sequences were listed in a table)
A second row of buttons has been inserted here now. The top row of buttons relates to the tool list. Care should be taken here during processing.

General tab

Field	Description
Drawing Number	The technical drawing number. This field cannot be changed because it is read from the chosen tool.
Info	Additional free text information on the tool entry.

Planning tab

This tab is only active if you have selected a tool with capacity planning.

Field	Description
Idle Time	Defines the time in hours after which the tool can no longer be used for other work orders (e.g. cooling, quality control, maintenance, etc.).
Next work sequence begins after idle time	If activated, the next work sequence can only be started after the idle time. Example: If the tool is a bin and this must be cooled before the finished product can be removed from the bin, the next work sequence can only be started after cooling. However, if the idle time is for quality control of a tool, you can begin with the next work sequence immediately (i.e. switch deactivated).

Default Time tab

This tab is only active if the tool defines the throughput time.
If this tool is activated (only one tool can ever be activated which defines the throughput time), its throughput time information is copied to the operation.

Note:
Only fields are considered where entries have been stored in the tool. Consequently, you can remove all entries. Work step and use factor are only used if > 0.

Example:

© 2026 Boyum IT Solutions A/S

Setup time of tool = nothing entered
Processing time in tool = 5 mins
Setup time is not changed in operation, thus it comes from tool.

Please make sure that you work the same way for all tools.

If a tool which determined the time is activated, it is transferred automatically to the operation at saving.

Field	Description
Setup time	Enter the setup time to start using the tool. Time specified per "Time per". **Important**: This replaces the operation setup time when this tool is used.
Processing time	Set the time the tool takes to produce the items. This is the actual processing time per unit produced in the routing position. The processing time for a unit of quantity per "Time per" in consumption unit per "Quantity per" finished parts. **Note**: Secondary processing times cannot be specified here.
Quantity per ..	Defines the number of finished parts in consumption units during the processing time refers to, e.g. 10 minutes per 1000 kg.
Time per	Specify whether the time unit for the setup and production processes is hours or minutes.
Use Factor	Split the production time amongst more finished goods.
Number	Number of required work steps e.g. 10 work steps in "processing time".
Utility	Utility factor, e.g. 10 units are produced at once per step or hub and per processing time.
Cost Element	Set the account in which the standard costs from the usage of this tool is booked. Accumulated costs are written to this cost element.

General settings on tools:
See: Tool administration.

back to Routing

7.6.1.1.1.5 Utility

Utilities are tools or other resources required for this work step / routing. A utility is a simplified form of tool without inventory maintenance, without maintenance, and without other specified costs.

Operation catalog - Routing - Production routing - Calculation

Edit routing

External operation

General

Extended

Tools

Utilities

Parallel

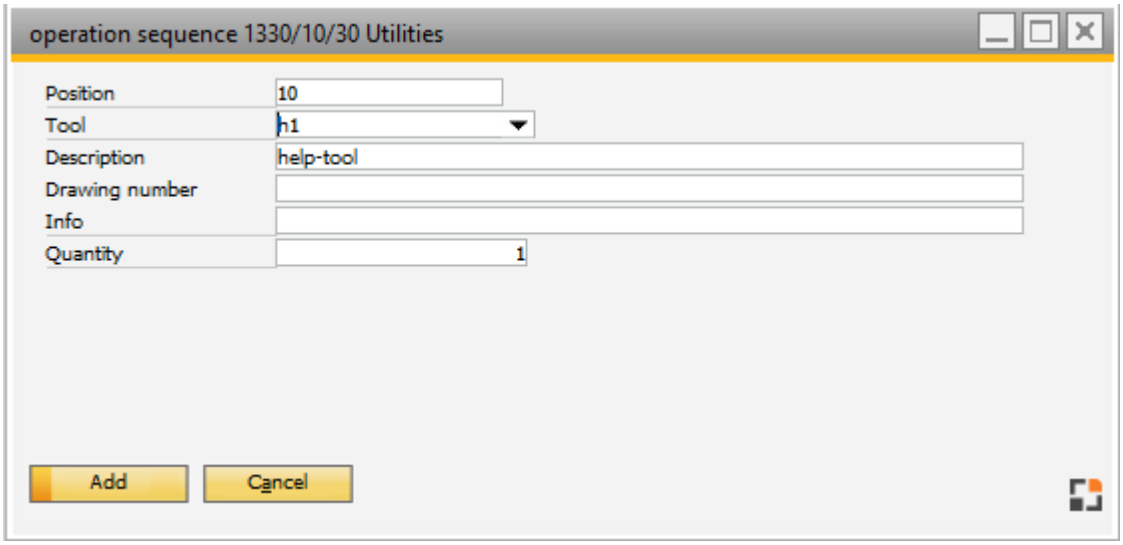
Alternative

Documents

Special functions

Add a new Utility

To assign a utility, click on "**Add line**" under **Routing > Utility tab** and the following window opens:



Window artikel_arbplanpos_edit_hilfswerkzeug_edit.psr

Field descriptions

Field	Description

© 2026 Boyum IT Solutions A/S

Position	Sort the utilities list from the routing. It is a consecutive number, but not a primary key.
Utilities	Utility key (selection from Master Data / Tools / utilities). Assign the utilities to perform this operation. This field is mandatory.
Description	Displaya the utilities description. This field cannot be changed because it is read from the chosen utilities.
Drawing Number	The technical drawing number. This field cannot be changed because it is read from the chosen utilities.
Info	Additional free text information.
Quantity	Specify the number of utilities needed to perform the operation. This field is for information only and has no influence on the routing position.

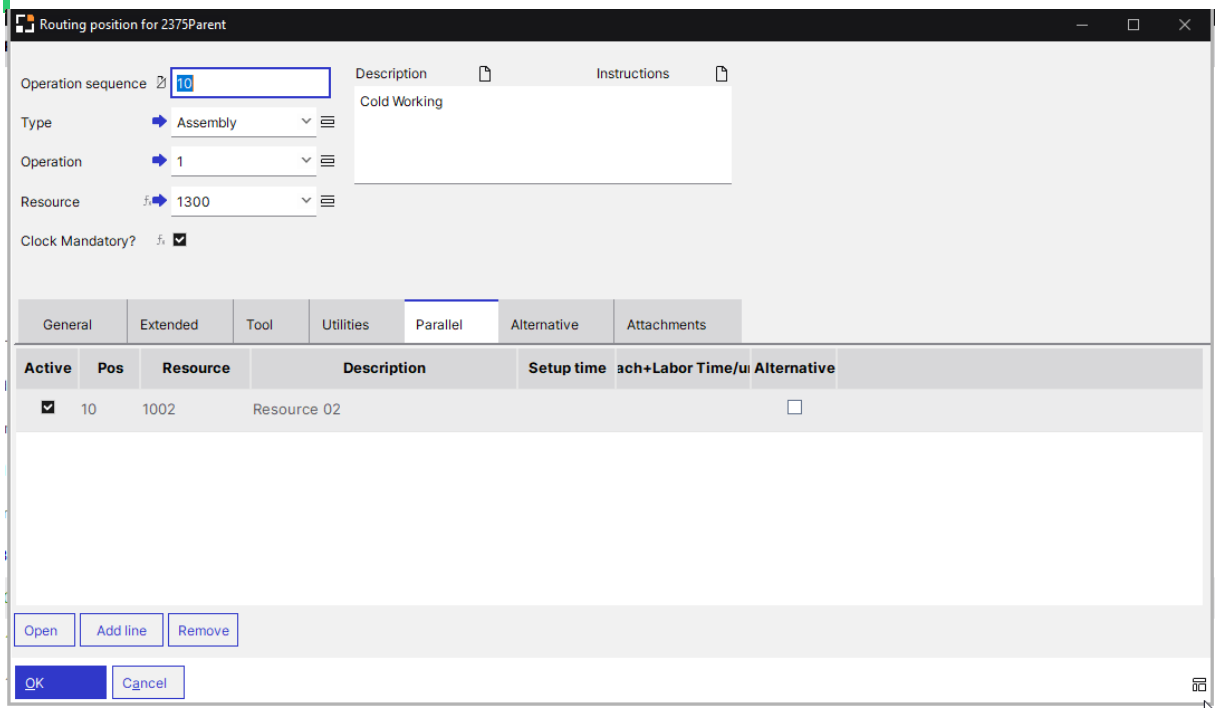
Buttons:

Open: Click button to open the editing window of the selected utility (***see*** image above "Add a new Utility")

Remove: Delete utility for this routing position.

7.6.1.1.1.6 Parallel

Production > Work Order > **Open** WO position > **Open** operation > "Parallel" tab



Window arbplanpos_edit.psr

© 2026 Boyum IT Solutions A/S

In the Parallel tab, Beas displays a list of all resources that will be used in parallel with the main resource assigned in the Header. The user can insert, edit and delete resources.

Important: Only use parallel resources if a separate time planning is required for parallel resources.

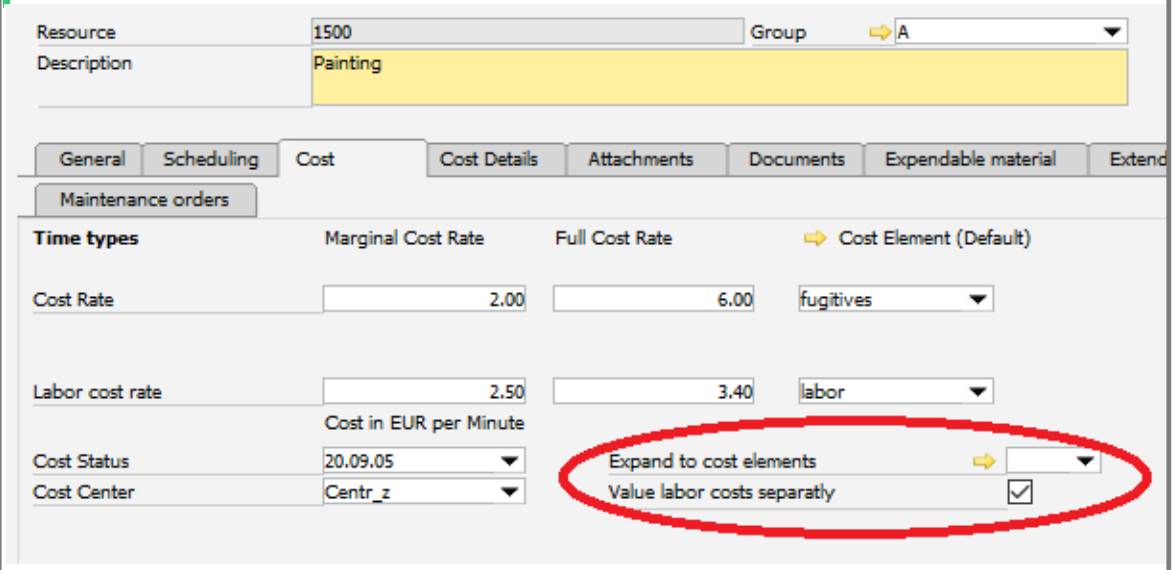
NOTE: Parallel operations do not consider quantities and do not manage Open/Close status!

- Alternative possibilities:

a) Define personnel costs separately. Thus these costs will be calculated separately.

b) Up to 4 separate cost elements can be defined, which can also be receipted separately.

PATH: Resources > Resource Master Data XXX > Cost tab.



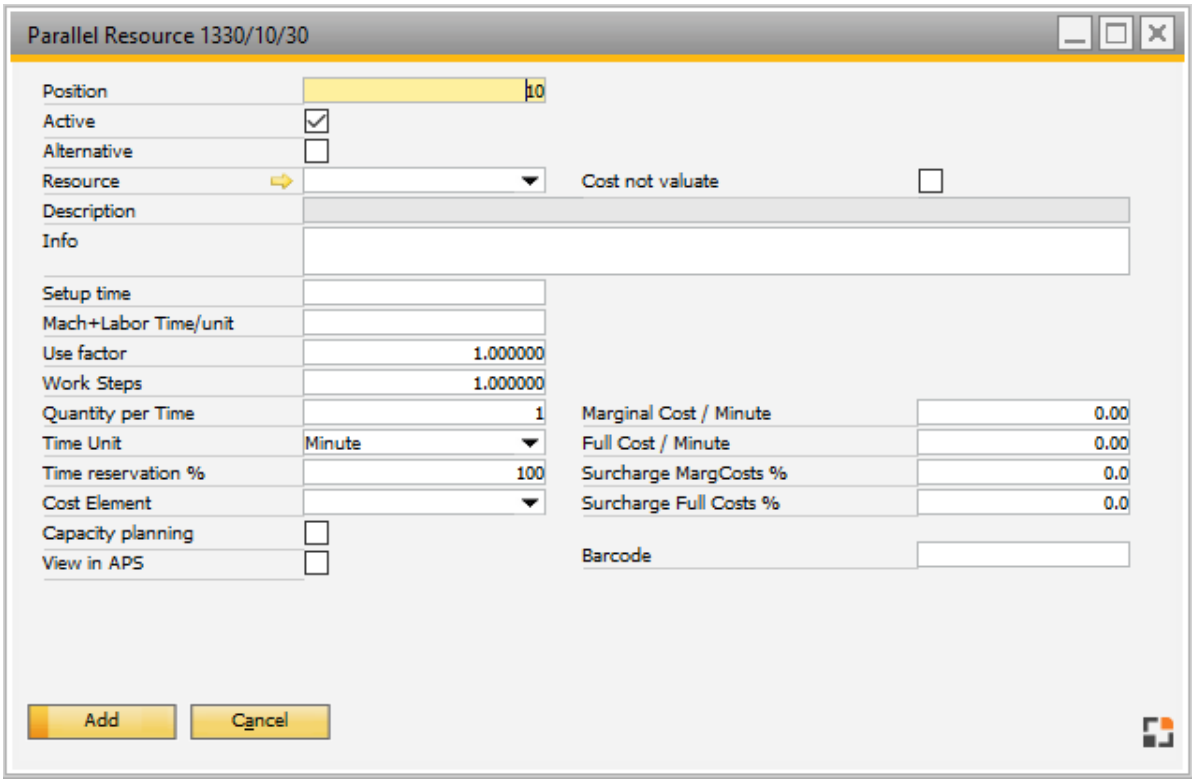
Window stamm_arbplatz_edit.psr

To assign a parallel resource, click on New and a new window opens:

PATH: Inventory > Item report >

1. "Open" an entry >
2. Routing tab >
3. "Open" routing position >
4. "Parallel" tab >
5. "**Open**" / "**Add line**".

© 2026 Boyum IT Solutions A/S



Window artikel_arbplanpos_edit_parallel_edit.psr

Field	Description
Position	Used for sorting the parallel resource list from the routing. It is a consecutive number, but not a primary key.
Active	Set parallel resource active. If enabled, only one position can be active. **Important**: Only one parallel resource can be activated which defines the throughput time per routing. This information is copied to the operation, therefore, the user must check one parallel resource as "Active", and all other resources should have "Active" unchecked.
Alternative	Set if this parallel resource can also be alternative to other parallel resources for the same operation.
Resource	Resource ID of the parallel resource **Note**: No external resources or resources with extended cost rates , for example personnel costs, are allowed.

© 2026 Boyum IT Solutions A/S

Cost not valuate	Determine whether to consider resource costs in calculation If enabled, the resource costs of this parallel resource are ignored. Precalculation and post-calculation are affected. Costs created with time receipts are not taken into account. Use this option if the cost is included with the main resource. Disabled by default. *beas 9.1 PL: 08*
Description	Description of the resource that comes from the resource master data and cannot be changed.
Info	Additional free text information.

Throughput Time area

This information relates only to Business performance, not to the throughput time of the work sequence itself, as this is ALWAYS parallel to the main work sequence and always has the same start and end time.

Field descriptions

Field	Description
Setup time	Setup time of the parallel resource process.
Mach+Labor Time/unit	The Mach+Labor time for a unit of quantity using the *Time unit* in consumption units *Quantity per time* finished parts. **Note**: Secondary mach+labor times cannot be specified here.
Use factor	Split the production time amongst more finished goods ***See*** Calculation of target time.
Work steps	Used as a multiplication factor for the production times ***See*** Calculation of target time.
Quantity per Time	Used as a multiplication factor for the production times
Time Unit	Defines times in hours or minutes. To register a processing time independent from the quantity you can enter 0. ***See*** Calculation of plan time.
Time reservation (%)	If no setup and edit time was entered, the time of the main operation * time reservation is used as reference.

© 2026 Boyum IT Solutions A/S

	At which % should the resource be scheduled? ***Example***: The parallel resource is an employee operating four machines at once. He needs to be available for the machine at the whole time but only at 25%. ***Example***: The parallel resource should work during 30% of the main resource time, the user can enter the value "30" in the Time Reservation field, and Beas calculates the times for the parallel resource automatically. If the setup time or processing time is entered, in Precalculation this value is ignored. ***See*** Calculation of plan time.
Cost element	Accumulated costs are written to this cost element.

Technical information:
Parallel resources share a database table with tools, utilities, and alternative operations.
Structure of bar code on routing card: 6-digit beas_ftapl.number + 3-digit beas_ftapl_wkz.pos_id

back to routing

7.6.1.1.1.7 Alternative

Operation catalog - Routing - Production routing - Calculation
Edit routing
External operation
General
Extended
Tools
Utilities
Parallel
Alternative
Documents
Special functions

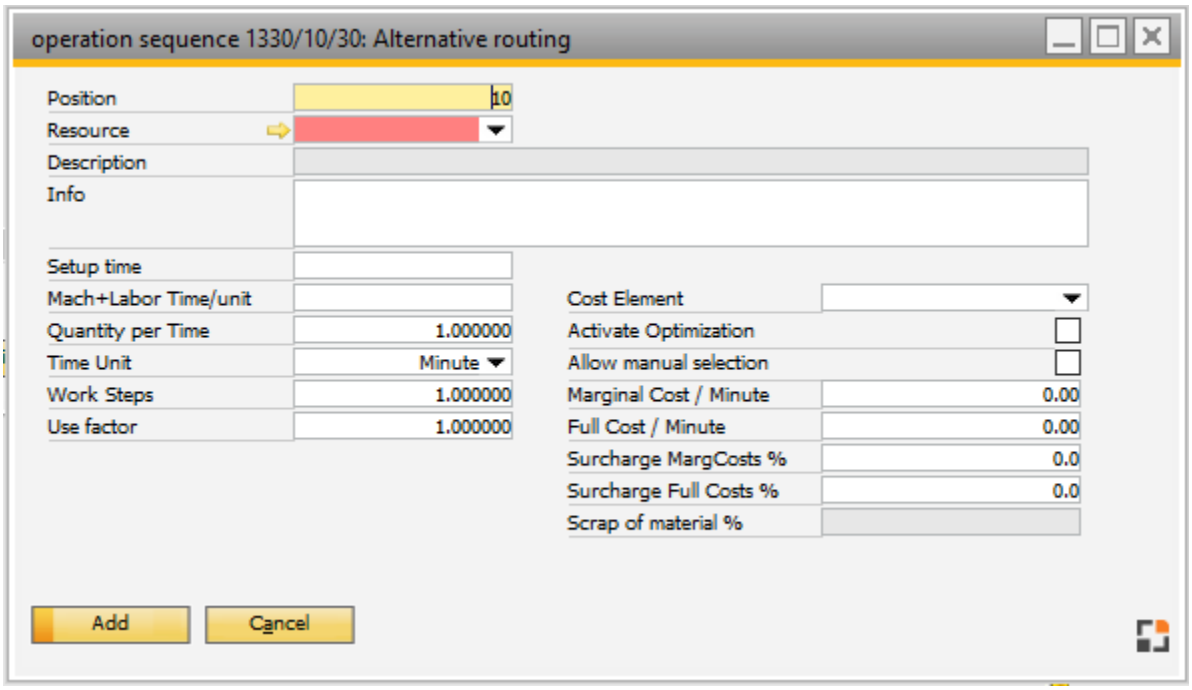
In this tab you can define alternative resources related to a routing position.
In APS and Work order you can change the alternative resource with one mouse-click.

© 2026 Boyum IT Solutions A/S

The alternative resource can have its own parameters as setup time, processing time etc.

The option "Optimization"checks whether a faster production would be possible using this alternative resource.

The user can insert, edit and delete resources. To assign an Alternative resource, click on **Add,** and a new window opens:

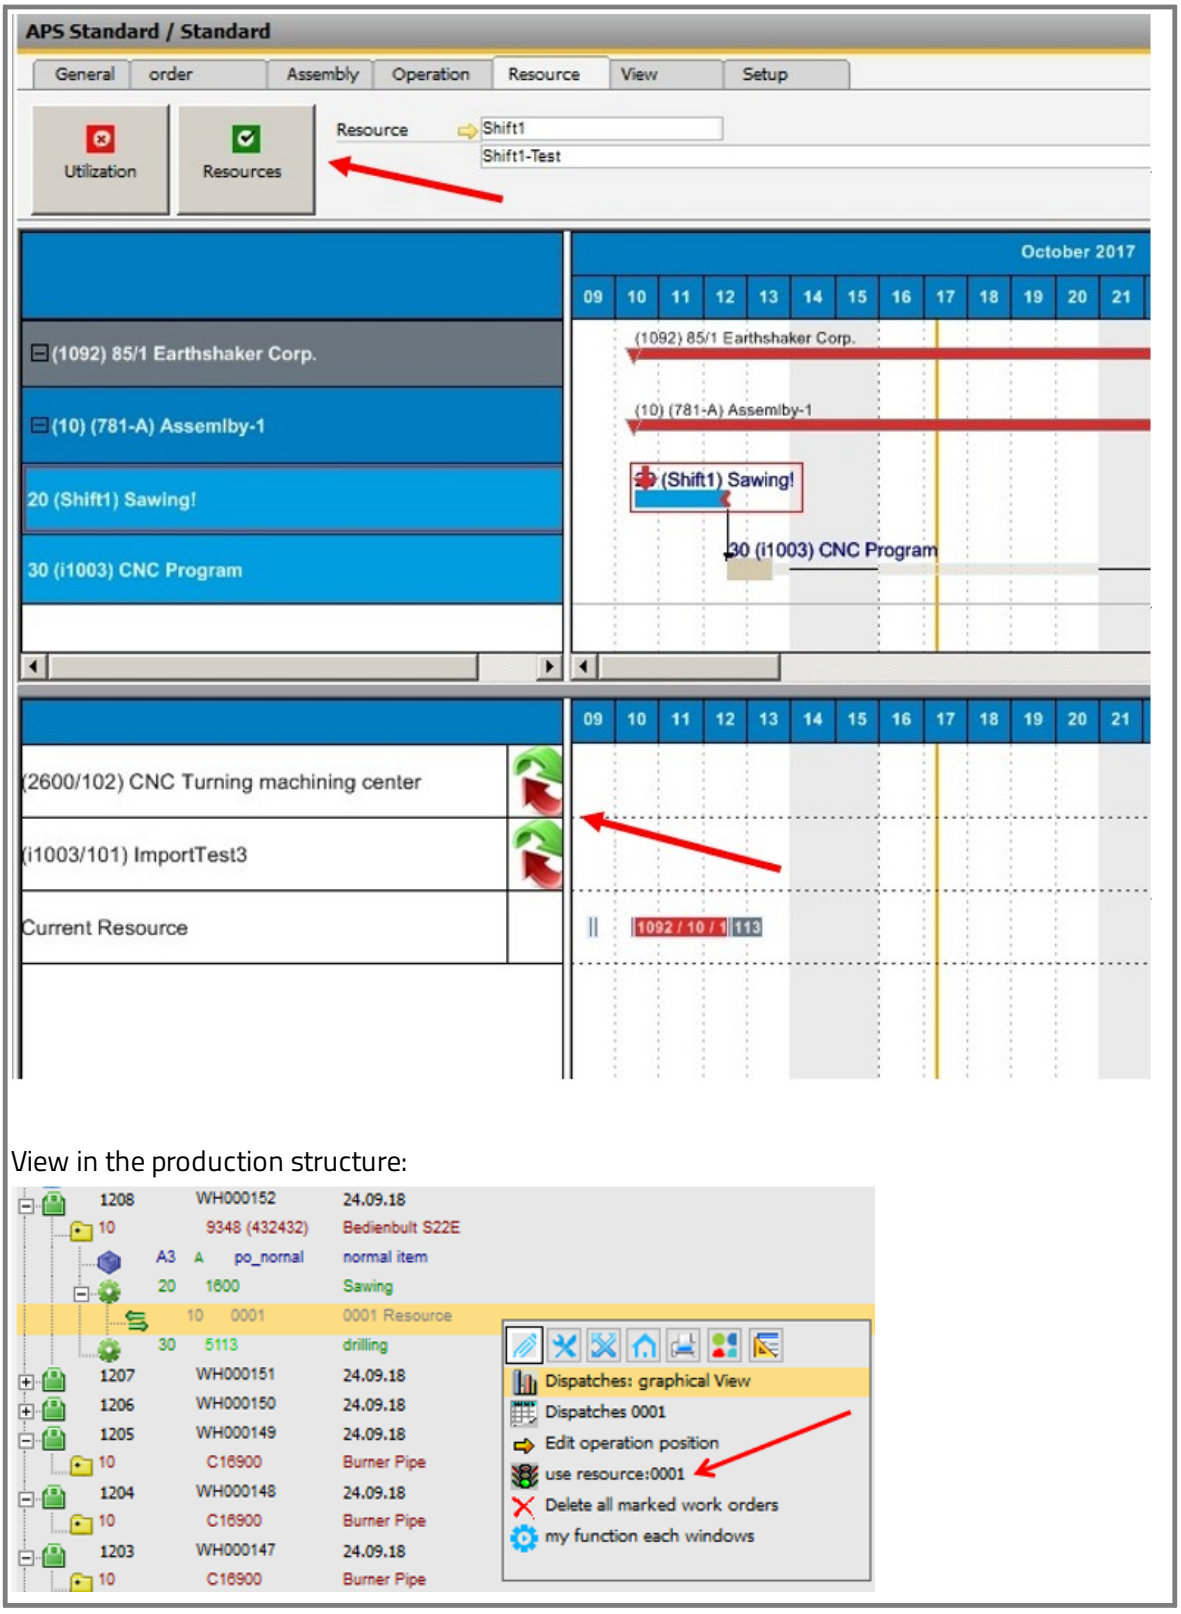


fert_arbplanpos_edit_alternativ_edit, artikel_arbplanpos_edit_alternativ_edit, stamm_ag_alternativ_parallel_edit

- The alternative resource can be selected manually in APS – graphical view and in production structure view.

  Selection in the APS view:

© 2026 Boyum IT Solutions A/S



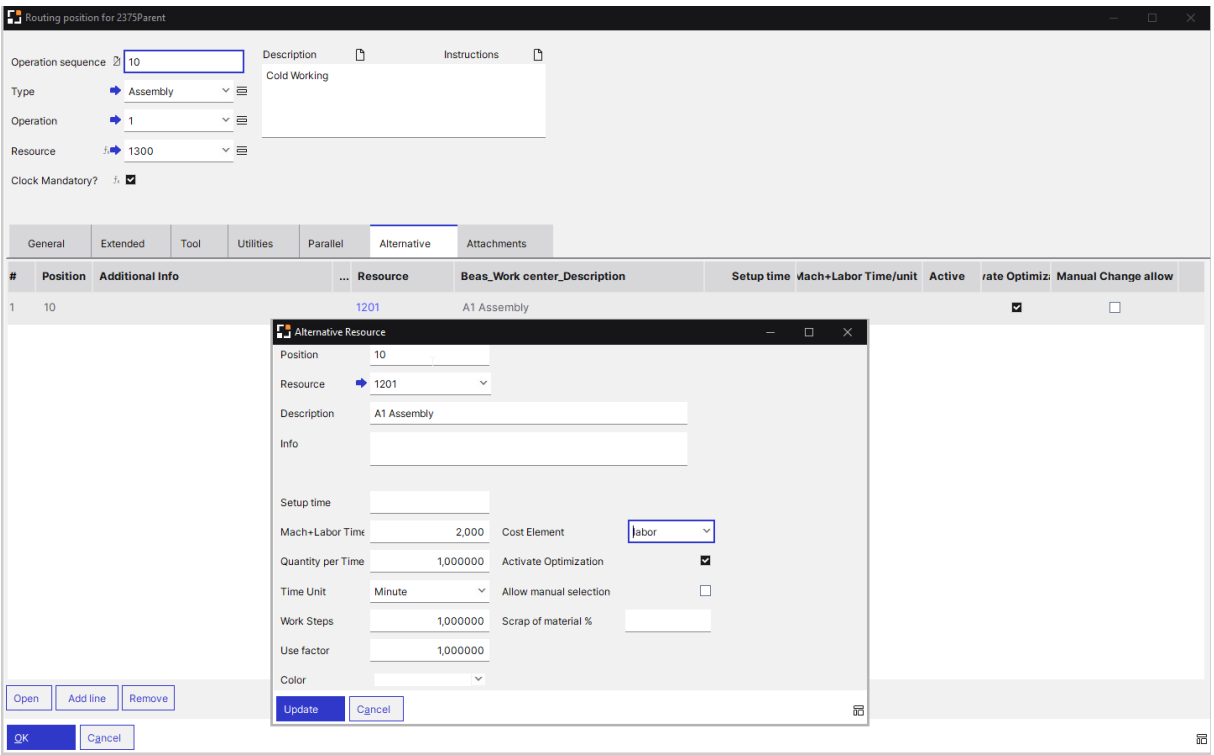
View in the production structure:

See Overview alternative resources

© 2026 Boyum IT Solutions A/S

The alternative resource can be selected manually in the APS – graphic view and Production structure display.

Note: Alternative resources are not supported in the Precalculation.



Field	Description
Position	Used for sorting the parallel resource list from the routing. It is a consecutive number, but not a primary key.
Resource	Select the resource ID of the parallel resource from the existing resources. The alternative resource can be selected manually in the APS - graphic view and production structure display.
Description	Description of the resource that comes from the resource master data and cannot be changed.
Info	Additional free text information.

Throughput Time area

Field	Description
Setup time	Setup time of the alternative resource process. Default time can

© 2026 Boyum IT Solutions A/S

	be specified in the *Quantity per time* parameter.
Mach+Labor Time/unit	The Mach+Labor time for a unit of quantity using the Time unit in Production UoM Quantity per time finished parts. **Note**: Alternative resources do not manage Secondary+Labor times. Therefore, if a main resource manages secondary times when switching to an alternative resource, the information of the secondary values in the operation will be lost, especially if you want to return to the main resource again. In this case you will have to add those data manually or refresh the order if applicable.
Quantity per Time	Defines the number of finished parts in Production UoM to which the processing time refers, e.g. 10 minutes per 1000 kg. ***See*** Routing position.
Time Unit	Defines whether times are specified in hours or minutes. ***See*** Routing position.
Work Steps	Number of required work steps used as a multiplication factor for the production times e.g. 10 work steps in "processing time" are required .
Use factor	Use factor to split the production time amongst more finished goods, e.g. 10 units are produced at once per step or hub and per processing time.
Cost element	Accumulated costs are written to this cost element.
Activate Optimization	If active, define whether Beas should automatically select the most adequate resource, amongst the main and alternative resources in the APS calculation. The resource is replaced automatically.
Allow manual selection	⊟ Allow the manual selection of this alternative resource. This alternative resource can only be selected manually if this option is enabled. The event is canceled and receipted with the error message *'(aktivaplatz440)Resource cannot be selected when flag 'allow manual change' is off'* if this option has been disabled and an attempt has been made to select the resource. **Note**: A change is only possible if change has been allowed according to the production position (**Production position**

© 2026 Boyum IT Solutions A/S

	> **Allow change** has to be activated).
Scrap of material %	Define Scrap of Material. If the user uses this alternative resource, the system replaces the Scrap material % too and recalculates the scraps per Material for all routing positions. ***See*** Concept Scrap of Material Note: If you switch the resource with another Scrap of Material entry in the work order, the system calculates the new quantity of the related BoM Position, but not the quantity of order related sub assemblies. ***See*** this video: *Beas 9.3 PL 1*

7.6.1.1.1.8 Attachments

The Attachments tab is used to attach images and documents to the resources.
Only three documents or images can be stored per operation. The pictures/documents stored here can be viewed in Terminal – Pool list (not in WebApps)

Extended
Tools
Utilities
Parallel
Alternative
Documents
Special functions

Routing load	Loads the routing from another assembly. If the assembly already has a routing then the loaded plan is added at the end.
Save routing in item	Copies routing into the item to be specified
Change Log	If the log is activated, it can be viewed here.
Batch changes	Multiple routings can be changed using this function. ***see*** Batch change routing

7.6.1.1.2 Resource

Resources can be assigned to a routing. Resources include, e.g. another operation (parallel operation), tools and other accessories required for the processing or setup of the machine or an alternative operation.

These are dispatched through Capacity Planning and included.

Field Description

Field	Meaning
Position	Unique position number – normally in increments of 10 to add subsequent positions. This number also serves as sort criterion for the terminal display.
Type	Selecting the resource type with a right-click.
Resource	Designation of the resource – depending on the type selection, the resource can be selected with a right-click.
Description	Designation of the resource – is automatically carried forward after selecting the resource.
Quantity	Overall demand of the resource, e.g. number of tools.
Setup time	The setup time in 'per' according to the field "Time per".

© 2026 Boyum IT Solutions A/S

Mach+Labor Time/unit	The mach+labor time in 'per' according to the fields "Time per" and "Quantity per".
Additional Info	Any additional information displayed at the FDC terminal of a tool.
Utility factor	The utility factor – the inverse of work steps. ***See*** Calculation of target time. ***Example***: By sawing a board apart, the material is provided for two finished goods - the utility factor is thus 2.
Number factor	The opposite to the utility factor. ***Example***: Two steps are necessary to produce a part. The time per 1 cut is stored, the quantity of the required cuts is stored with number.
Quantity per ..	The requirement time is specified for each number indicated here per assembly to be produced. ***Example***: For 1000 the time is per 1000 finished parts.
Time by	Times are specified in hours or minutes.

Types

Type	Meaning
Tool	Tools required for the operation. Any number of tools can be stored. Tools also have a time requirement and can be planned like resources. If "Only 1 tool" is activated in the options, only one tool is ever active and the other tools are the alternatives.
Utility	Required utilities (only information).
Parallel	A parallel resource can be a second person, machine required in parallel etc. Parallel resources require time (capacity planning) and costs (Precalculation). Time receipt can be reported separately for a parallel resource. (Info for bar code: 6-digit beas_ftapl.number + 3-digit beas_ftapl_wkz.pos_id)
Alternative	Any number of alternative resources can be inserted. If the order has been created, you can use the production structure subsequently to specify which alternative should be used. To do this simply click in the structure view: Use this alternative. All data specified here is replaced in the operation at that moment.

7.6.1.1.3 Calculation of target time

The actual plan time in minutes is calculated as follows:

© 2026 Boyum IT Solutions A/S

Special feature: As with Bill of materials, there is also a fixed quantity calculation for routings. If the "quantity per" factor is 0, the assembly quantity is not considered.

Capacity Planning

```
  (
    (
      (Machine time + Labor time + Mach+labor time)
      if "per assembly" > 0 then
        (* (Order Quantity + Scrap) : (per assembly))
    : Utility factor
    * Work steps
      * (1 + scrap factor : 100)
    )
 + Set-up time
  )
 * Time factor (1 for minute, 60 for hours)
 * 100/Efficiency rate in %
```

Precalculation, batch calculation

```
 (
  (
      (Machine time + Labor time + Mach+labor time)
      if "per assembly" > 0 then
        (* Lot size : (per assembly))
    : Utility factor
    * Work steps
      * (1 + scrap factor : 100)
  )
 + Setup for calculation
 )
 * Time factor (1 for minute, 60 for hour)
```

The lot size itself depends on

a) calculated quantity

b) defined reject factor

c) stored calculation lot size.

Final costing

```
  (
    (
      (Machine time + Labor time + Mach+labor time)
      if "per assembly" > 0 then
        (* (Order Quantity + Scrap) : (per assembly))
      : Utility factor
    *
      * (1 + scrap factor : 100)
    )
 + Setup for calculation
  )
 * Time factor (1 for minute, 60 for hours)
```

© 2026 Boyum IT Solutions A/S

7.6.1.1.4 Batch change routing

The batch change routing allows you to change / delete or insert multiple items at once.

The sequence is as follows:
1. Set search criteria according to routing items
2. Select items to be changed / deleted
3. If items are changed / created: define the fields to be changed or
   determine the contents of routing items

Call this function via **Master Data > Item Structure > right-click twice > Routing Batch Change.**

Select the items to be modified using the selection criteria, then display the results list.

Change
The routing items to be changed must be selected in the results list. Then select "Edited".

Then, select the field to be modified in "Column", and select the new field value in "New Value".

"Start Change" immediately performs the changes.

Delete
In the display list, select the routing items to be deleted and then delete them using the "**Delete**" button. Deletion is permanent and cannot be undone.

Merge
Select the items after which a new item should be inserted.
Use "MERGE" to open a new window. Here, you can determine which field should be populated with which content.

Use "Start Merge" to merge the routing items.

Note the following when merging or changing items:
The entries to be changed / merged are processed from top to bottom.
If you change the "Operation" field, all fields are copied from the operation template.
For this reason, the "Operation" field should always be set first if it is to be changed.

© 2026 Boyum IT Solutions A/S

Resources such as tool, parallel resource, alternative resource are not copied and not changed.

7.7 Bin Locations (SAP)

Beas supports SAP Bin Warehouse Management.

Limitations:

- if you want to use the Default Warehouse, do not fill the bin location
- all restrictions are supported, which supported by SAP DI-API
  In dropdown and list views the following restrictions supported:
  "Inactive" and "Transaction Restriction" for
  * All Transactions
  * Inbound Transactions
  * Outbound Transactions
  Transfer is an In- and Outbound transaction.
- No support of "maximum stock" or "minimum stock per Bin location

Sorting in drop-down and list views:
- always by Alternative Sort Code

Backflush, Pre-Assign Functions:
- no support from any Rules

Allocation: Target warehouse: SAP Bin Warehouses are not supported.
Picking apps Terminal 2.1: SAP Bin Locations are not supported.

Drop-down by weight or Volume is not supported.
SAP Bin Barcode is not supported.
Receiving Bin Location is not supported.

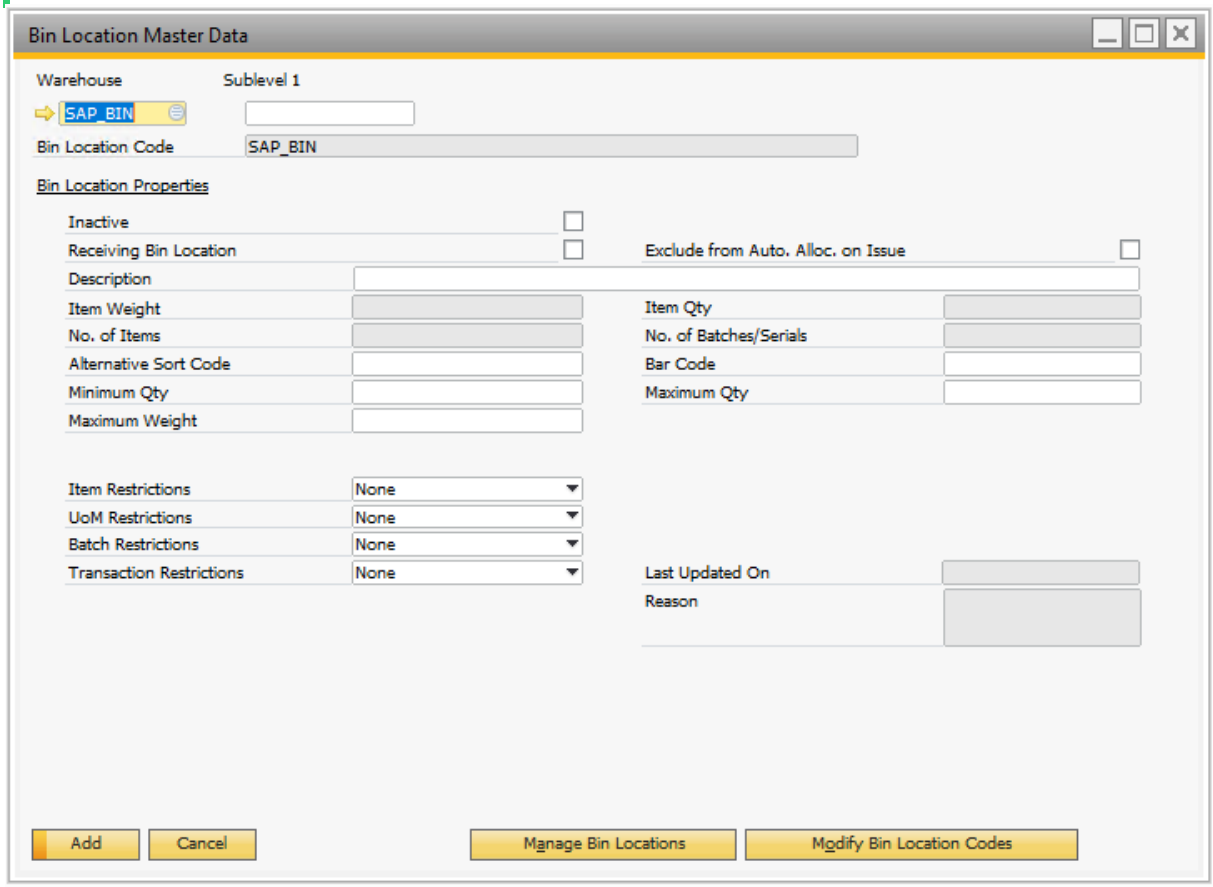
Additional functions do not support SAP bin location:
Beas inventory (all types)
Beas batch split

7.7.1 Bin Location Master Data (SAP)

With Beas Version 9.3 PL 2 SAP Business One is supported.

© 2026 Boyum IT Solutions A/S

PATH: Inventory > Bin Locations > Bin Location Master Data.



Window beasgui.sbo.psr

Note:

Beas does not support SAP Bin Management in all windows. For more information ***see*** Bin Location.

7.8 Warehouse Management

In warehouse management the following functions are available:

- Various warehouse reports
- Administration of bin locations
- Administration of extended warehouse settings.

Warehouse master data

Open documents (Beas)

Inventory list

Bin location system check (Beas)

© 2026 Boyum IT Solutions A/S

Bin location correction (Beas)

Beas supports different Bin Management types:

SAP Bin Warehouse management

Beas Bin Warehouse management

WMS Bin Warehouse management

Beas Bin Warehouse management was created for SAP Version before SAP integrated an own Bin Warehouse solution.

For all new installations: Use SAP Bin Warehouse management

SAP Bin Warehouse management is supported with Beas 9.3 PL 2.

- Currently not all functions are supported. More information:

Beas supports SAP Bin Warehouse Management.

- **Limitations:**

- if you want to use the Default Warehouse, do not fill the bin location
- all restrictions are supported, which supported by SAP DI-API
  In dropdown and list views the following restrictions supported:
  "Inactive" and "Transaction Restriction" for
  * All Transactions
  * Inbound Transactions
  * Outbound Transactions
  Transfer is an In- and Outbound transaction.
- No support of "maximum stock" or "minimum stock per Bin location

Sorting in drop-down and list views:
- always by Alternative Sort Code

Backflush, Pre-Assign Functions:
- no support from any Rules

Allocation: Target warehouse: SAP Bin Warehouses are not supported.
Picking apps Terminal 2.1: SAP Bin Locations are not supported.

Drop-down by weight or Volume is not supported.

© 2026 Boyum IT Solutions A/S

SAP Bin Barcode is not supported.
Receiving Bin Location is not supported.

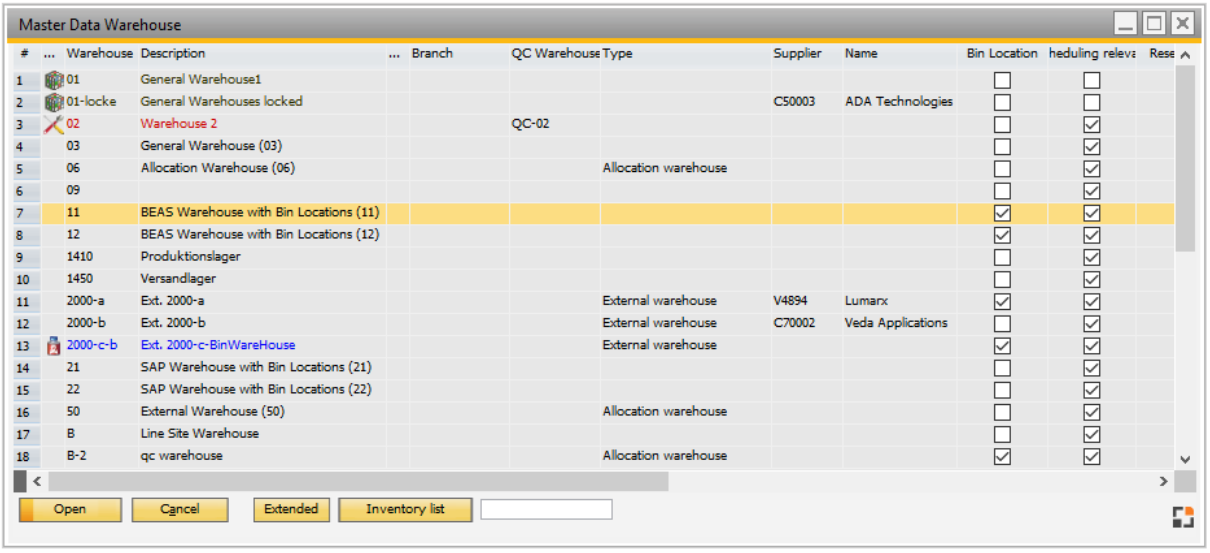
Additional functions do not support SAP bin location:
Beas inventory (all types)
Beas batch split

7.8.1 Warehouse master data

In this window you can administrate:
- SAP Warehouses
- Extended settings for SAP Warehouse, related to Beas functions
- Beas Bin Management

From this browse window you can access general warehouse settings. Via window settings additional columns are available. The list is dynamically adjustable, templates are supported.
The correct setup of the master data is an essential prerequisite for the successful and efficient use of Beas.

PATH: Inventory > Warehouse Management > Master Data.



Window bin_whs_browse.psr

Field descriptions

Field	Meaning

© 2026 Boyum IT Solutions A/S

Warehouse	Warehouse ID.
Description	Warehouse name.
Type	Warehouse type .
Supplier	Supplier ID.
Name	Supplier name.
QC Warehouse	The default QC warehouse.
Bin location management	Checked if warehouse has bin locations. Bin location management can be activated at any time, also subsequently for existing warehouses. If there is existing stock, the fields "warehouse area" and "bin" are displayed. Entry is mandatory. After saving, the warehouse area and the bin are created and the complete stock is posted to this bin. Afterwards, using the inventory function, the allocation of stock to bins can be corrected. In this case, no goods movements occur, therefore no postings and no posting documents are created. **Deactivate bin location management:** Bin location management can be deactivated at any time. (Use right-click) In case of existing stock, it is set to 0. Bin location definitions are preserved.
Relevant for Scheduling	If active, this warehouse is considered in MRP.
Reservation, Allocation	If active, this warehouse is considered for reservation and allocation.
Production outflow	If active, this warehouse is available for issuing functions in production (***see*** Edit warehouse master data).
Production inflow	Default setting **No:** any warehouse can serve as receipt warehouse (settings in item apply). **Yes:** exclusively this warehouse is defined as receipt warehouse.
Third party deal	If active, this warehouse will be used for third party deals.
Address Street	Warehouse address.
Blocked	Checked if blocked.
Address City	Warehouse address.

Select a warehouse click "Edit" to edit warehouse areas.

Right-click menu

© 2026 Boyum IT Solutions A/S

Function	Meaning
Open	Open bin location entry to edit (same with button "Edit").
Window settings	Open window settings.
Correction	Open Bin location management correction window (Beas)
Close all open documents	All open documents are closed WITHOUT assignment to bin locations. After that, it is imperative to correct the bin allocations with the repair program. The start of this operation is logged. Automatic corrections (see features below) can be started only after all open documents have been posted. If this is not possible because of errors, the accumulators must be repaired first.
System check	Restore stock based on goods movements protocol (after crash or when differences in bin location tables arise).
Open documents	Display of open documents.
Accumulators: Repair	This action is performed automatically after a manual correction of the stocks. The accumulators may be flawed due to other influences. For ***example***, the error message "stock is not sufficient"could be issued, even though stock is available. In this case, the repair can be done right here.

Buttons

Function	Meaning
Open	Edit warehouse master data : Settings for bin locations, reservation and production.
Extended	Open SAP Business One warehouse master.

back to bin location management

7.8.1.1 Beas Bin Management

Integrated Beas bin location management can manage different types of warehouses.

> Note: For new installation use SAP Bin management.

Warehouses can be defined in a detailed store structure:

Location
- Warehouse
  - Warehouse Area

© 2026 Boyum IT Solutions A/S

Bin location
Level
Row
Compartment

Each warehouse can be subdivided into free definable areas. Size and configuration, as well as colors, can be selected for visualization.

Training unit Bin location management
Beas warehouses - choose bincode

An inventory location is unique per store, but it is permanently assigned to a storage area. An inventory location can consist of 1–3 dimensions, e.g. Row or level+row or level+row+compartment.
The dimensions can be defined freely. With inventory management the following structure can be displayed:

Item
Warehouse Location
Bin location
Batch/series number
RFID
Stock

or for a simple items

Item
Warehouse Location
Bin location
Stock

RFID is another user-definable ID (e.g. an RFID chip).This is deactivated by default, but can be activated using Options / Material Management.

Inventory movement log:

© 2026 Boyum IT Solutions A/S

In addition to the standard SAP Business One movement log, a movement log is kept in parallel per inventory location for inventory location-managed inventory locations.

Integration in Beas

In Beas, bin location management is fully integrated. The selection of the affected warehouses is made before the posting. Furthermore, in many posting windows bins are presented with graphical visualization if such information was stored before.

Activating bin location management for a warehouse

A subsequent activation of bin location management is possible only when the material is charged off and posted thereafter to bin locations.

Inventory / Initial inventory

The first version of Beas inventory location management does not yet include a separate inventory function.
If the inventory is performed via SAP Business One, the entry document generated by the inventory is available under **Materials Management - Bin Location Management - Open Documents**. This can be used to perform bin location allocations.

When using bin location warehouses, it is imperative that you work with the Beas inventory and not with the SAP Business One - Inventory function. The Beas inventory offers initial stocktaking (Inventory Opening Balance function), annual inventory count and regular inventory (Cycle Count Recommendations function). An integrated correction program simplifies inventory management.
For more information ***see*** Inventory.

> Note:
>
> Negative stock is not managed and can lead to errors ! Although negative stock is allowed in SAP Business One we strongly recommend to deactivate this function in SAP Business One.

Mobile registration

Beas bin location management is fully supported by Beas WebApps.

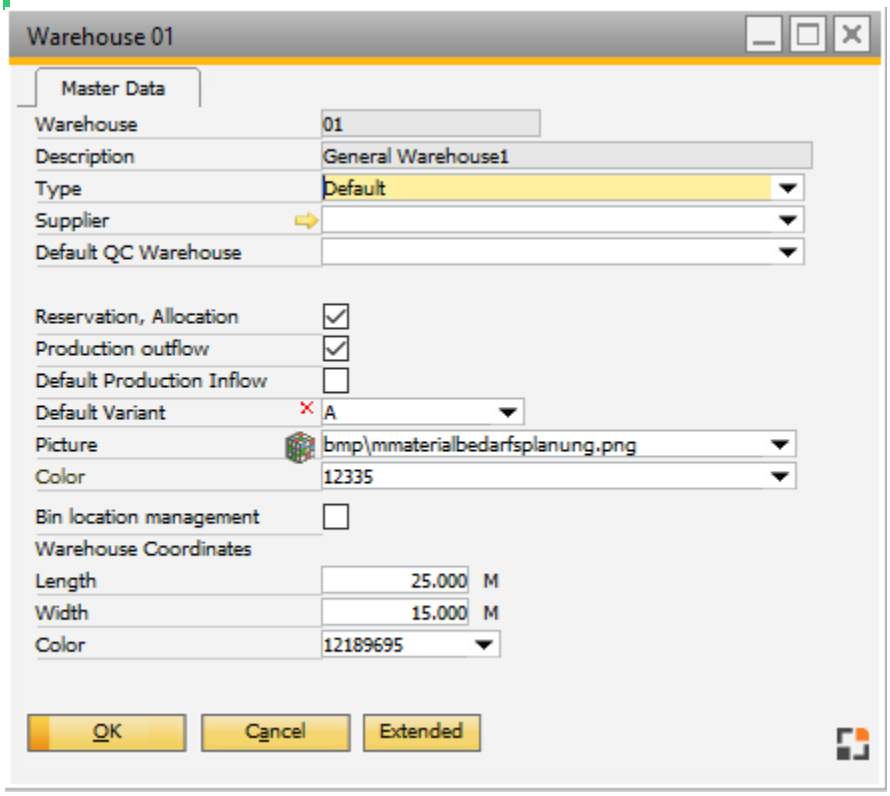
7.8.1.2 Edit warehouse master data

Master data tab

© 2026 Boyum IT Solutions A/S

This window is accessible via Warehouse Management as well as **SAP Business One > Definitions > Warehouse > Button Extended**

PATH: Inventory > Warehouse Management > Master Data > "Edit" an entry.



Window bin_whs_edit.psr

Field	Meaning
Warehouse	Warehouse code For generate new warehouses, please use **Administration > Setup > Inventory > Warehouses**
Description	Name of the warehouse.
(Warehouse) Type	Determine the type of warehouse. Standard warehouse — Available anywhere. Stock is available for all processes. Blocked warehouse — Y — Goods can be posted freely to this warehouse, stock is not available in order recommendation report and production for example allocation warehouse

© 2026 Boyum IT Solutions A/S

Purchase Goods receipt PO and Quality control	W	Goods can be posted freely to this warehouse, stock is available in order recommendation report but not in production. Posting items to this warehouse which have a QC-inspection plan assigned, a QC-order is created automatically. Depending on the settings a QC release can done only via transfer. ***See*** QC-inspection plan - release QC transfer
Allocation warehouse	B	Goods can be posted freely to this warehouse. Used to put goods out for production, in this case, goods are transferred from standard warehouse to allocation warehouse.
External warehouse	E	External warehouse for external operation. Used for external operation - purchase order. If a supplier is stored, a supplier related warehouse will be used. If no supplier is stored, this will be used as general supplier-provision warehouse. If this warehouse has bin locations, one bin location will be creation per supplier. ***See*** Collective purchase order
Purchase commission stock	K	Commission stocks of a supplier ***See*** Work with commission stocks Work with commission stocks Beas supports purchase commission stocks in the following way: - Purchase: post in via purchase - goods receipt to purchase commission stocks(warehouse type purchase commission stock)

© 2026 Boyum IT Solutions A/S

- For this warehouse a supplier is stored and "Production withdrawal" was enabled
- Production - Material issue (backflushing or right-click in work order structure - material issue)
  Goods can also be selected manually from purchase commission stock
  For goods on the commission stock:
  1. issue from commission stock
  2. purchase goods receipt to standard warehouse of the item
  3. issue items from standard warehouse

A goods receipt document is created, which can be used in invoice

Important: the standard warehouse may not have bin locations. For commission stock bin locations are supported.
Goods are posted with default pricing, adaptations are possible.

Adaptations are made by BeasScript in file `workordermanagement.src`

The following function is called once before charging-off from commission stock:
`function commisionpostout`
only the withdrawal price can be set up
Example:
`setvar=e_pricetype=zeroprice`
issue with 0. Important: if continuous stocktaking is active, this can lead to problems.

The following function is called once before processing purchase goods receipt to standard warehouse. It is called per batch, per serial number, per item.

© 2026 Boyum IT Solutions A/S

```
function commisionpoingetprice
```

Variable can be set one (not per row)

```
setvar=e_pricetype=fromplandocument
```

in this case in the variable "e_price" the post in price can be transferred

Example: batches are to be posted in with the price given in the field "notes"

Everything else is posted with 0

```
function commisionpoingetprice
// get price from plan document
setvar=e_pricetype=fromplandocument
select ManBtChNum from OITM where ItemCode=<e_item
// get price and save this in plan document
if <wert1> = Y then
   select OBTN.Notes into e_price from OBTN &
      where OBTN.ItemCode=<e_itemcode,dbstring> an
else
   setvar=e_price=0
end
end function
```

Supplier	Define the supplier ID if this is a warehouse for a special supplier or if you work with Bin location per Supplier **Working with one external bin managed warehouse for all external suppliers** If the external warehouse is a bin managed warehouse, the system can use the supplier ID as Bin Location. This is only working if this field is empty!
Default QC warehouse	For each warehouse a goods receipt warehouse can be defined separately. This setting has a higher priority than the setting in the Configuration wizard. Note: In advance, at least one goods receipt warehouse needs to be defined (type of the warehouse = goods receipt) If no warehouse is selected, setting in **Configuration wizard - quality control** applies. ***See***

© 2026 Boyum IT Solutions A/S

	Configuration wizard - Quality control Goods receipt - Field description
Default WMS Production Line	Define production line that can be linked to work orders. **Automatic assignation:** The WO position is updated automatically if this linked field is changed. ***See*** also Warehouse rules.
Reservation, Allocation	Consideration of warehouses at reservation and allocation At "Production" – "Reservation" and "Production" – "Allocation" only warehouses are available, for which "Reservation" was enabled. Standard setting: Active Pre-allocation function considers only warehouses, for which the switch was activated, even if it is the default warehouse. ***See*** Reservation window
Production outflow	Control of warehouse visibility Affected functions Production material posting Production - backflushing Production - external production For issue only warehouses are displayed, which were activated here. Default setting: active: Exception: for external warehouses it is disabled by default. Automatic pre-allocation does not consider this option, because there, the standard warehouse determination is used. Note: For "manual posting" these rules are not considered. ***See*** Production - Material issue Extended rules

© 2026 Boyum IT Solutions A/S

Default Production inflow	If active, this is the default warehouse for receipt from production. If a warehouse is defined as receipt warehouse, every assembly which is posted in (backflushing, posting with last time receipt, etc.) is posted to this warehouse. Only one production receipt warehouse can be defined. If no warehouse is defined as standard receipt warehouse, the warehouse defined in item or work order is used. Settings accessible also via Configuration wizard
Bin location management	Activate bin location management (or use as status display). This check box is only available if - the Beas bin management is activated or - SAP- and WMS- Bin management **not** activated It is not possible to activate Beas and SAP / WMS bin management at same time. In case of activation, further parameters are entered. Furthermore, warehouse areas and bin locations must be defined. ***See*** Warehouse are, Bin location Note: Please use SAP Bin Management or WMS Bin Management. Beas Bin Management is only available for compatibility reasons. Subsequent activation There are two possibilities 1. First, issue everything, then define bin locations and post-in again by using the function **Inventory > Inventory Opening Balance.** Disadvantage: no batch tracing, Pricing may be incorrect, Differences on various accounts. 2. In case of activation, a bin location is queried. Then, this bin is immediately created and all goods are posted on this bin location. Using the inventory function, a bin location correction can be performed, which does not lead to material issue or transfer.

© 2026 Boyum IT Solutions A/S

	Deactivation Deactivation is using right-click - "disable bin location management" is possible. ***See*** below **right-click menu**.
Default variant	Define default Variant If "Price per warehouse" - "Variants per warehouse" is set up in batch-Precalculation, and it refers to the warehouse to be calculated, the stored variant is used. The option is only displayed if "Price per warehouse" was set up in Basic-Initialization. Additionally, a default variant can be stored which is used at the creation of a work order or in case of changing the receipt warehouse. ***See*** Batch-calculation
Length	Specifies the length (meters) of the storage area (only for visualization if Beas bin management is activated).
Width	Specifies the width (meters) of the storage area (only for visualization if Beas bin management is activated).
Color	Defines the background color for visualizing the storage area.
Picture	Select an image

Button	Meaning
Extended	Open SAP Business One warehouse master where additional Beas features are available via right-click. Additional functions accessible via right-click Extended: Open extended Beas warehouse window List: Open list of all warehouses Inventory list: Open inventory list (only bin location warehouses) Open documents Open window "bin locations" - "open documents" Note: The "Drop-ship" SAP function is not supported in Beas Manufacturing.

© 2026 Boyum IT Solutions A/S

Right-click menu

Button	Meaning
Extended	Same function as the button (***see*** above).
Change log	Open protocol.
Support	Open Beas error messages.
Deactivate bin location management	Only displayed when dealing with a bin location warehouse. After a security query the following happens: When disabling a) an entry to the protocol is created b) all bin location stock is deleted c) all bin transaction protocols are deleted d) all data for wight and volume is reset e) bin location management is disabled **Attention:** Subsequent activation is possible, but the bin locations and stock needs to be restored manually.

If the selected warehouse has bin locations, additional tabs are displayed

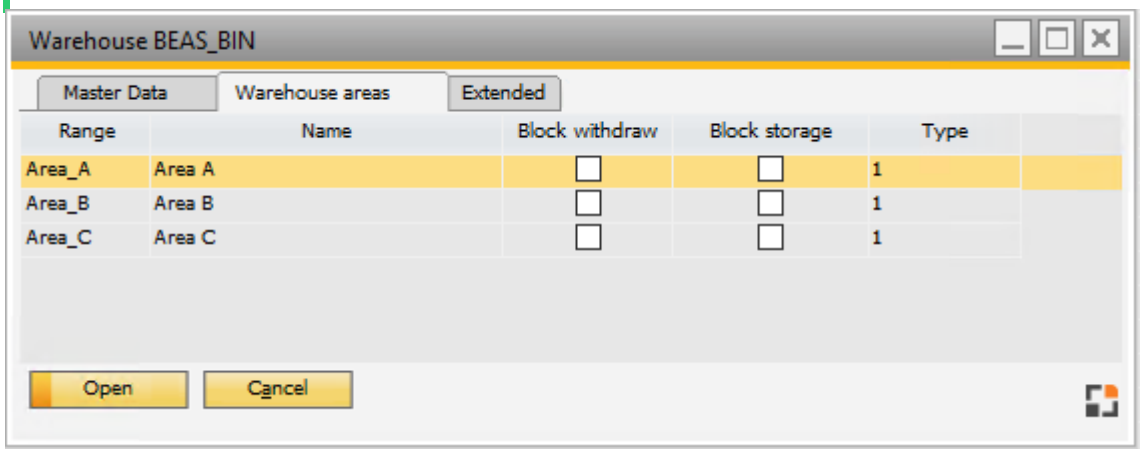
back to Warehouse master data

© 2026 Boyum IT Solutions A/S

7.8.1.3 Warehouse Area (Beas)

Only for Beas managed warehouses:
A rack, a single storage position, or a high-level rack can form a storage area. A storage area can have up to 3 dimensions (e.g. level, row, shelf) and consist of any number of bin locations. Any number of storage areas can be created per store.

PATH: Inventory > Warehouse Management > Master Data > double-click/**Open** a bin warehouse > "Warehouse areas" tab.

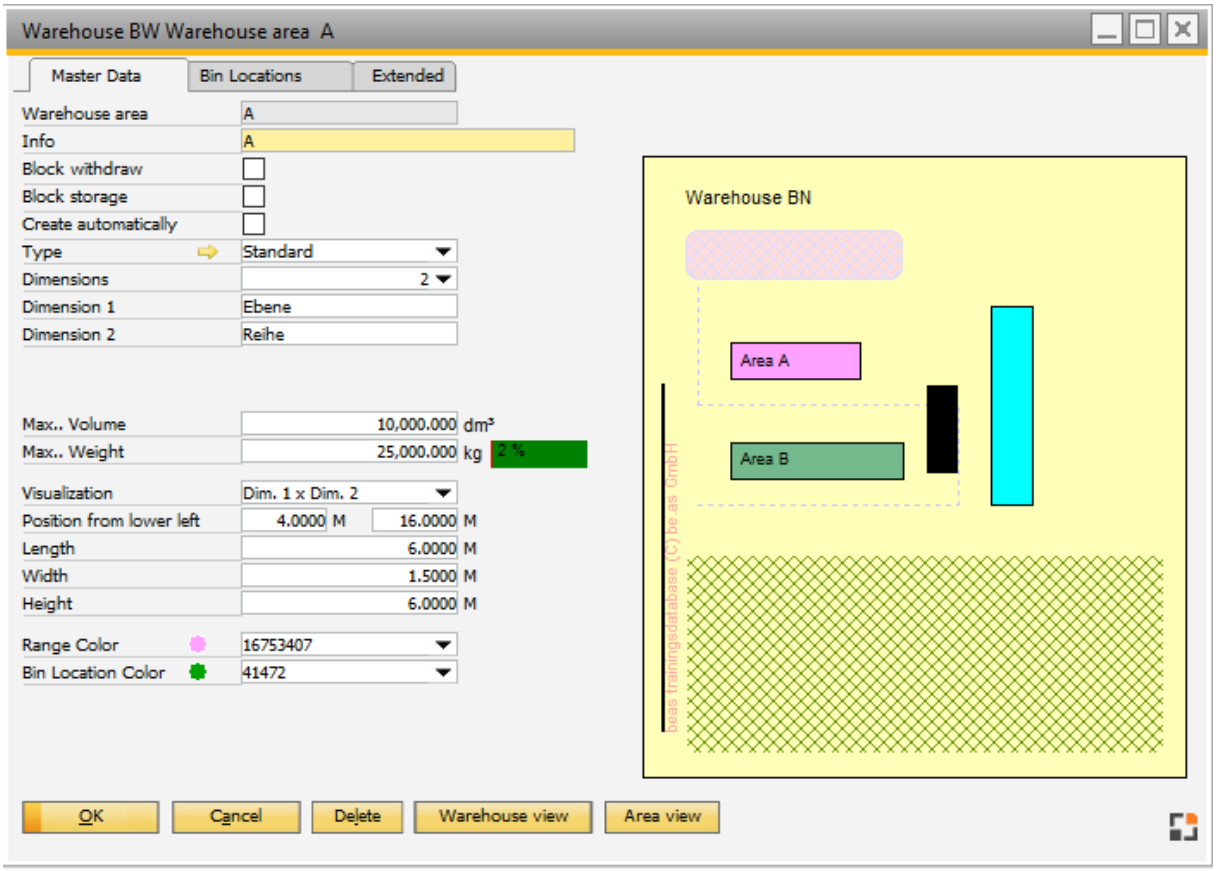


Window bin_whsarea_browse.psr

For visualization, you can specify the coordinates and color for each storage area. There are two views:
1. Warehouse View: Displays the entire store, together with the storage areas in the corresponding color at the corresponding coordinates – viewed from above (i.e., length x width) ***See*** image below.
2. Area view: Displays a storage area from the front, i.e. length x height. For more information ***see*** Inventory location.

PATH: Inventory > Warehouse Management > Master Data > select a bin warehouse > "Warehouse areas" tab > double-click an area.

© 2026 Boyum IT Solutions A/S



Window bin_whsarea_edit.psr

Master data tab

Field	Description
Warehouse Area	ID for the storage area (must be unique throughout a store).
Info	Short description of the storage area.
Block Withdraw	If activated, nothing can be taken from this storage area.
Block Inbound	If activated, nothing can be posted to this storage area.
Create Automatically	No function so far.
Type	Storage areas can be allocated to types.
Dimensions	⊟ Specifies the number of dimensions. Dimension 1 = level Dimension 2 = row Dimension 3 = shelf

© 2026 Boyum IT Solutions A/S

Field	Description
	These can be named as wished, but the names must follow the sequence above. If only a row is defined, and no levels, "1" must be entered for dimension, and "row" must be entered for dimension 1.
Max. volume in dm³	Defines the maximum permitted storage volume. In addition to the inventory, Beas also enters and issues the volume in the storage locations. It is always converted to dm³. However, there is no entry block when the maximum volume is exceeded in the current version.
Max. weight in kg	Enter the maximum permitted total weight The current weight utilization is displayed in addition to this in %. At postings the current weight is determined from Item master - Purchase - Netto weight. The weight is converted to kg at the moment of posting. Note: If the weight is changed in item master subsequently, the display will be incorrect.
Visualization	Type of visualization. So far, only "dimension 1 x dimension 2".
Position from lower left	Specifies the position of the storage area in the store from the bottom left in meters.
Width, length, height	Specifies the dimensions of the storage area. Note: This is visualization information only; it does NOT have to match the actual sizes.
Range color	Defines the color for visualizing the storage area.
Bin location color	Defines the color of the location. However, the color can also be specified separately on creation.
UDF 1...4	Up to 4 UDF can be created if activated in the Configuration wizard.

Bin locations tab

Displays a list of the inventory locations created.

Inventory locations can be created and managed individually or they can be created as a batch.

© 2026 Boyum IT Solutions A/S

For more information ***see*** Inventory location

Extended tab

Use this tab to input a script for extended visualization of the storage area (warehouse area view).

The object for visualization is called "vi"

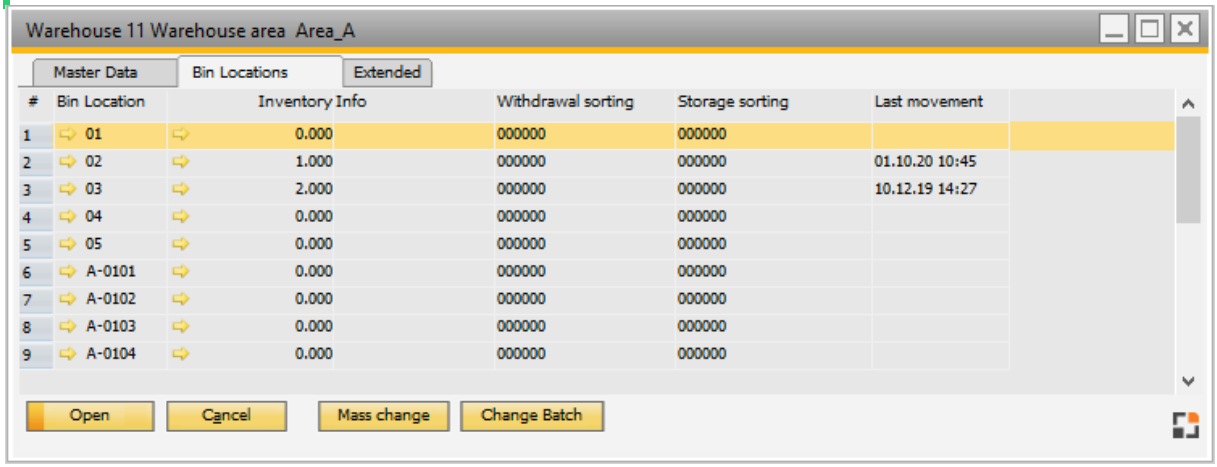
For more information ***see*** Working with the visualization object

back to bin location master data

7.8.1.3.1 Bin location list (Beas)

PATH: Inventory > Warehouse Management > Master Data > double-click/**Open** a bin warehouse >

1. "Warehouse areas" tab >
2. Double-click/**Open** an entry in the list >
3. "Bin Locations" tab.



Window bin_whsbin_browse.psr

Field	Meaning
Bin location	Unique ID related to warehouse.
Inventory	Current stock.
Dimension 1-3	Up to 3 dimensions. e.g. level, row, compartment.
Withdrawal sorting	Sorting for withdrawal.
Storage sorting	Sorting for placing into stock.
Last movement	Date of last posting – can be used for FIFO or LILO rules.

© 2026 Boyum IT Solutions A/S

Functions:

Function	Meaning
Open	Edit selected bin.
Cancel	Opens bin location creation window.
Add	Create a new bin location.
Remove	Only bins without stock can be deleted. Select bins first, then click "delete" button.
Mass change	Change several parameters of bin locations at once. **Approach:** 1. Enter value to be changed in upper area 2. Select bins to be changed from lower list. Use filter (right-click on title) or multiple selection. 3. In upper area: click on replacement icon (red-black arrow) before the entry to be changed. ***Example***: to change length to 5, enter 5 click replacement icon. The change is entered in selected bins. 4. Click on update. Without updating, values are not saved. After re-sorting, values are lost.  *Window bin_whsarea_edit_create.psr*
Change Batch	Opens the Change Batch window.

back to Bin locations

7.8.1.3.1.1 Bin location

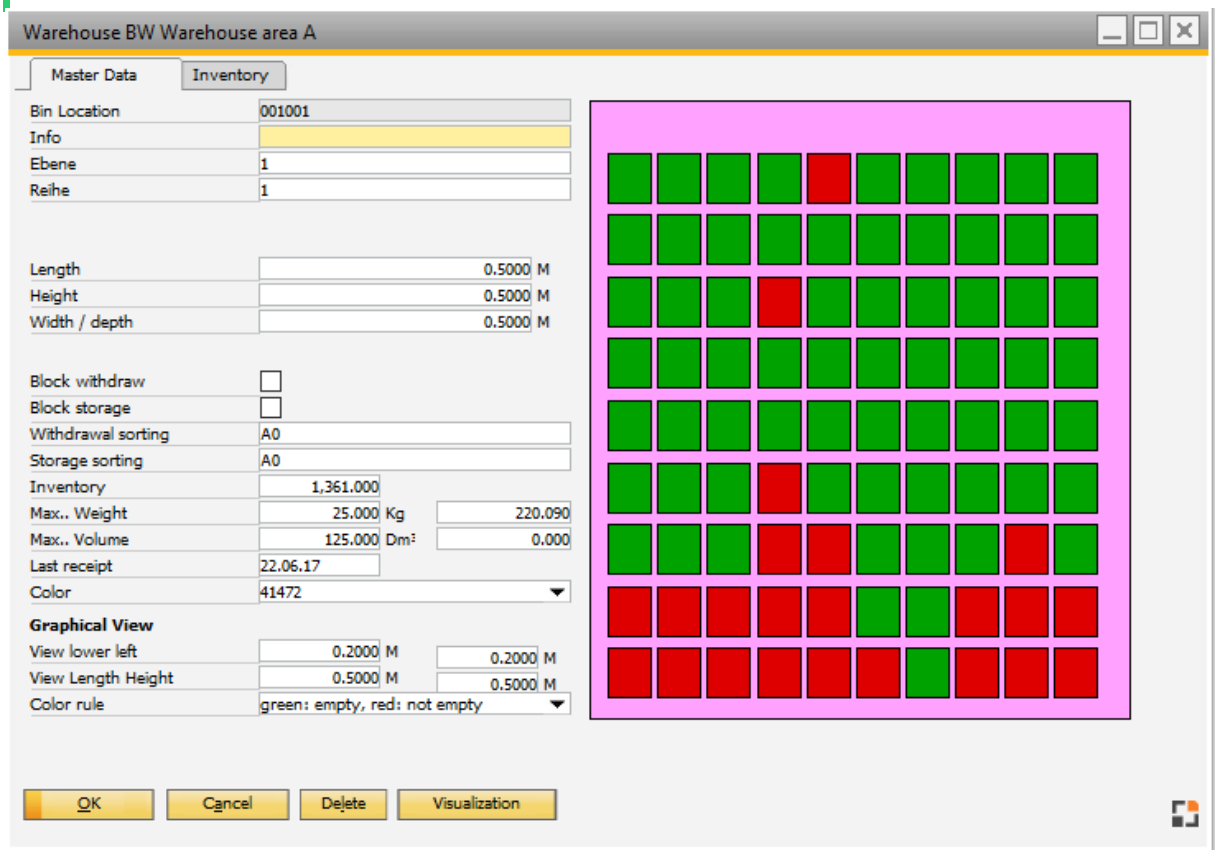
Only for Beas managed warehouses:

© 2026 Boyum IT Solutions A/S

The bin location is the smallest unit of inventory storage. A bin location can be a palette location, a small storing area or even just a compartment of a shelf in a high-level rack at level x of row y.
Beas allows you to store any number of different items, the same items of different batch numbers or identical items with the same identification (the RFID) uniquely in one inventory location.

PATH: Inventory > Warehouse Management > Master Data > double-click/**Open** a bin warehouse >

1. "Warehouse areas" tab >
2. Double-click an entry in the list >
3. "Bin Locations" tab
4. Double-click/**Open** an entry in the list.



bin_whsbin_edit

In a transaction, both the volume and weight of the item are posted in addition to the number of units. A transaction log is also kept for each movement.
Beas always posts in the unit of weight "kg" and volume "cm^3;". Where necessary, the units stored in the item are converted first.

© 2026 Boyum IT Solutions A/S

Note: In the current version of the software, there is no check to determine whether an item may be stored in the compartment of an inventory location based on weight, volume, risk class or dimensions. Corresponding rules are yet to be defined.

You can define whether stock may be stored or removed for each inventory location, similarly to the storage area.

Visualization

The actual dimensions and visualization coordinates can be stored in an inventory location. These do not have to match as an "equalization" or two-dimensional display of a three-dimensional storage area must be possible.

Stock removal and storage sorting

A sort order can be saved for removal and storage.

If you select an inventory location using the selection list, the sort order is taken into account.

Automatic inventory location finding is not available in this beas version, since there are many different rules yet to be defined.

Master data tab

Field	Meaning
Bin location	A unique identification based on the store.
Info	Short text information.
Dimension 1-3	Up to 3 dimensions such as: level, row, shelf, etc.
Length	Actual length.
Width / depth	Actual depth.
Height	Actual height.
Deletion at 0 inventory	No function so far.
Block Withdraw	Goods can not be removed.
Block Inbound	Goods cannot be stored.
Withdrawal sorting	Sorting for removal.
Storage sorting	Sorting for storage.

© 2026 Boyum IT Solutions A/S

Inventory	Current inventory (can be the total of all units).
Maximum weight	Maximum permitted weight (previously only available for information). followed by: currently stored weight in kg.
Maximum volume	Maximum permitted volume (previously only available for information). followed by: currently stored volume in cm^3;
Last receipt	Date of last entry – this information can be used to create a FIFO or LILO rule.
Color rule	Define color for displaying the bin location in List view or drop-downs (not in WEB APPS).

Visualization

Field	Meaning
Color rule	Determine the rules according to which the color should be displayed In the graphical view you can define a color rule. Depending on configurable causes, a bin location can be displayed with different colors. Two rules are currently available, and further ones can be set up if necessary. Generally, where "green" is mentioned, this refers to the basic bin location color ("Color" column).
View lower left	Position of the inventory location based on the storage area.
View length height	Visual length and height. The specifications do not have to correspond to the actual size.

Rule	Meaning
Empty=green, not empty=red	Inventory location is shown as green as long as it is empty, otherwise it is red.
According to weight, up to 50% green, up to 80% orange, 80% or over red	Coloring depends on weight, i.e. on "max. weight" and "current weight". In addition, the filling degree is not only shown through color, but also by means of percentages.

The list is dynamically adjustable, and templates are supported.

Inventories tab

© 2026 Boyum IT Solutions A/S

This window contains the current inventories in this inventory location, including batch/series no., quantity, weight, volume, RFID (if activated) and date / time of last entry.

See

Creating an inventory location

Each inventory location is displayed as a "rectangle".
However, you can use the visualization system to display any other objects such as rectangles, texts, and lines, e.g. via 'Storage area' on the Extended tab.

This tab contains a script window. You can use BeasScript to determine the layout of the visualization.

The object name of the visualization object is vi.

The following graphic objects are available:

rectangle	A rectangle
line	A line
Text	Text
ellipse	A circle or oval
roundrectangle	A rectangle with rounded corners

The parameters for all objects are specified using "/" as a separator.
All dimensions are given in meters.
Decimal specifications are given in the national language, e.g. Germany: 7.6 USA: 7.6

Example:

```
vi=text=text=bin 1/y=0.3/x=4.6/length=0.2/height=1/font.height=-7/color=0
vi=line=y=0.55/x=0/length=4.8/height=0/pen.color=rgb(255,0,0)
```

Text

x,y	Position from bottom left in meters
length/height	Length/height in meters
background.color	Fill color
font.color (or just color)	Font color
Text	Text

© 2026 Boyum IT Solutions A/S

x,y	Position from bottom left in meters
Day	Command to be executed on click
Name	Name of the object
font.face	font type
font.height	Font size. If specification < 0, then in units (normal size = -8, small font: -7, very small: -6. If specification > 0, specification is in system units. Normal size at around 50 - 60.
font.weight	Font weight. 400=normal, 700=bold
escapement	Font rotation in 10ths of a degree, e.g. 450 for 45 degrees
alignment	Font alignment: left, right, center. Default=left.

rectangle, roundrectangle, ellipse

x,y	Position from bottom left in meters
length/height	Length/height in meters
background.color	Fill color
brush.color	Second fill color - depending on brush.hatch
brush.hatch	Hatching 0 = Horizontal 1 = BDiagonal 2 = Vertical 3 = Cross 4 = FDiagonal 5 = Diagonal Cross 6 = Solid 7 = Transparent
background.mode	0 = Opaque, Solid 1 = Transparent
pen.color	Frame color
pen.width	Frame thickness
pen.style	0 = Solid 1 = Dash

© 2026 Boyum IT Solutions A/S

x,y	Position from bottom left in meters
	2 = Dot 3 = DashDot 4 = DashDotDot 5 = Transparent
Day	Function when clicked
Name	Name of the object
ellipseheight, ellipsewidth	Only for roundrectangle: Specifications for the rounded corners.

Line

x,y	Position from bottom left in meters
length/height	End point seen from x,y
pen.color	Color
pen.width	Pen thickness
pen.style	0 = Solid 1 = Dash 2 = Dot 3 = DashDot 4 = DashDotDot 5 = Transparent
Day	Function when clicked
Name	Name of the object

Color

The color can be specified in the following ways.

xxxx	Direct color red + (256*green) + (256*256*blue) 536870912 = Transparent
rgb(r,g,b)	Specification as rgb color r=red, g=green, b=blue e.g. rgb(255,255,255) = white

© 2026 Boyum IT Solutions A/S

xxxx	Direct color red + (256*green) + (256*256*blue) 536870912 = Transparent
green, blue, red	Direct color specifications. Other colors are not supported in this notation. e.g. color=red.
transparent	Transparent color

back to bin location

7.8.1.3.1.2 Creating a bin location

If you have to create inventory locations e.g. for a high-bay warehouse, you can use the new inventory location creation feature to simplify their creation.

You can access this function via the inventory location list, "**New Batch**" button

You can execute a single operation to create all inventory locations and the inventory locations for a storage location, respectively, or the compartments for a shelf all at once. The corresponding visualization coordinates are calculated automatically using the stored information.
Advantage of visualization
You can tell
- which inventory location is blocked
- on removal from storage: where is the selected item located
- on storage: which inventory location is already full

Special feature: Display three-dimensional inventory locations two-dimensionally
For example, a high-level rack with level, row, compartment, where the compartment represents the third dimension that should be displayed in the second dimension.
To do the trick:
The shelf itself is not displayed, instead the external surfaces of the individual compartments represent the shelf.

Shelf1 Shelf 2

Compartment1 Compartment2 Compartment3 Compartment1 Compartment2 Compartment3

© 2026 Boyum IT Solutions A/S

Compartment4 Compartment5 Compartment6 Compartment4 Compartment5 Compartment6

The shelf is discernible from the corresponding arrangement of the compartments, but you see only the individual compartments.

Parameters for creation

Number of dimensions	Stored in storage area – display only.
Inventory location screen	Structure of inventory location identification – ***see*** window definition.
Withdraw Significance	Displays screen for removal sorting.
Inbound Significance	Displays screen for stock storage sorting.
Width, length, height	Actual dimensions of the inventory location in meters.
Max. weight, max. volume	Max. – specifications of weight and volume.
Color	The color used for visualizing.
Dimension 1 from / number	Create the inventory locations for dimension 1 to the specified quantity (dimension 1 is always the Y axis).
Dimension 2 from / number	Create the inventory locations for each dimension 1 from dimension 2 and the specified number. (dimension 2 is always the X axis)
Dimension 3 from / number	Create the inventory locations for each dimension 1 and 2 from dimension 3 and the specified number. Sample high-level rack: Dimension 1 = level = from 1 number 2 Dimension 2 = row = from 1 number 10 Dimension 3 = compartment = from 1 number 6 10 shelves with 6 compartments are now created for level 1 and 2, i.e. a total of 6*10*2 = 120 inventory locations. (Dimension 3 is always the compartment number)

© 2026 Boyum IT Solutions A/S

Number of dimensions	Stored in storage area – display only.
Counter 1, counter 2	There are 2 counters that count up or down. These can be used e.g. for stock storage or removal sorting {COUNTER1} = Counter1, {COUNTER2} = Counter2.

The coordinates are displayed on the right side.

One- and two-dimensional stores

The green lines represent the storage area.
The displayed rectangle in pink represents the inventory location.

Height	Height of the storage area (read-only).
Distance (Y axis)	Distance between the locations vertically.
Height (Y axis)	Visual height of a location.
Pos Y	Y position of the location based on 0 point of the storage area on Y axis.
Pos X	X position of the location based on 0 point of the storage area on X axis.
Length	Visual length.
Distance	Distance between the inventory locations horizontally.

Using "Visualization", the storage area including all already created inventory locations is displayed together with the inventory location to be created (dark-red square) and the entire area for all inventory locations to be created (white area).

Use "START" to start creating and visualizing the inventory locations.
If they are not created as you had planned, undo this process using the "Undo" button.

When created, the first inventory location is created according to the stored coordinates and templates (inventory location identification/sorting). The second inventory location in the row receives the X position (X pos of the first inventory location + length + distance)
If all inventory locations are created in a row, the next row is:
(Y position = Y position of the first compartment + height + distance, X=X position of the first compartment), etc.

Three-dimensional store

© 2026 Boyum IT Solutions A/S

For three-dimensional stores:
Dimension 1 = level
Dimension 2 = row
= the shelf
Dimension 3 = shelf
The coordinates of the third dimension are calculated automatically.
The total area of the compartments provides the coordinate for dimension 1 + 2 (i.e. the actual shelf)
Only the number of compartments per X and Y is specified.

Example:
Shelf: Length 0.8 Height 0.5
Number of compartments: 10
Compartment per X: 5
Compartment per Y 2

The compartments would then be created accordingly.

06 07 08 09 10
01 02 03 04 05

Total length from 01 to 05 here is 0.8 m.
Total height from 01 and 06 here is 0.5 m.

Ensure that the compartments are created in such a way that they are well visible.

Display on the right side of the window:

The green lines represent the storage area.
The displayed rectangle in pink represents the "shelf".
This rectangle contains dark red rectangles. These represent the compartments, i.e. the actual inventory locations.

Height	Height of the storage area (read-only).
Distance (Y axis)	Distance between the "shelves" vertically.
Height (Y axis)	Visual height of the "shelf".
Pos Y	Y position of the "shelf" based on 0 point of the storage area on Y axis.

© 2026 Boyum IT Solutions A/S

Height	Height of the storage area (read-only).
Pos X	X position of the "shelf" based on 0 point of the storage area on X axis.
Length	Visual length of the "shelf".
Distance	Distance between the "shelves" horizontally.
x	(Input field on the right side of the dark orange rectangles). Number of compartments horizontally. If the quantity changes, the number for dimension 3 is adjusted automatically.
y	(Input field above the dark red rectangles). Number of compartments vertically. If the quantity changes, the number for dimension 3 is adjusted automatically.

back to bin location

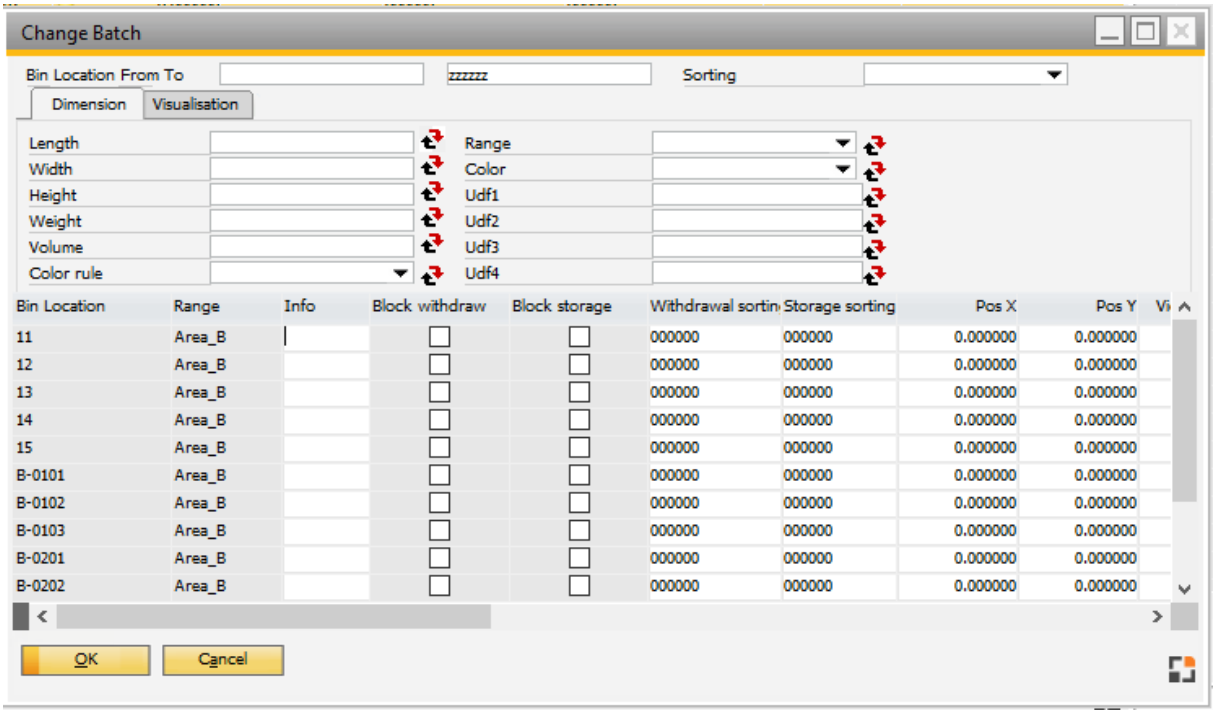
7.8.1.3.1.3 Batch Change

In this window you can change fields from all or parts of bin locations in a simple way.

PATH: Inventory > Warehouse Management > Master Data > double-click/**Open** a bin warehouse >

1. "Warehouse areas" tab >
2. Double-click an entry in the list >
3. "Bin Locations" tab
4. Press **Change Batch** button.

© 2026 Boyum IT Solutions A/S



Window bin_whsbin_change.psr

Define the bin location area and, by option, the sorting for the current list.

- Change field by field

  You can change every value directly in the list.

- Mass Changes

  1. Insert new value in Length, Width, Height etc.
  2. Mark all Bin locations: Click on the first Bin location
  3. Hold Shift Key
  4. Click on the last Bin location

  or

  1. Hold Ctrl Key
  2. Click on all Bin locations you want to change.

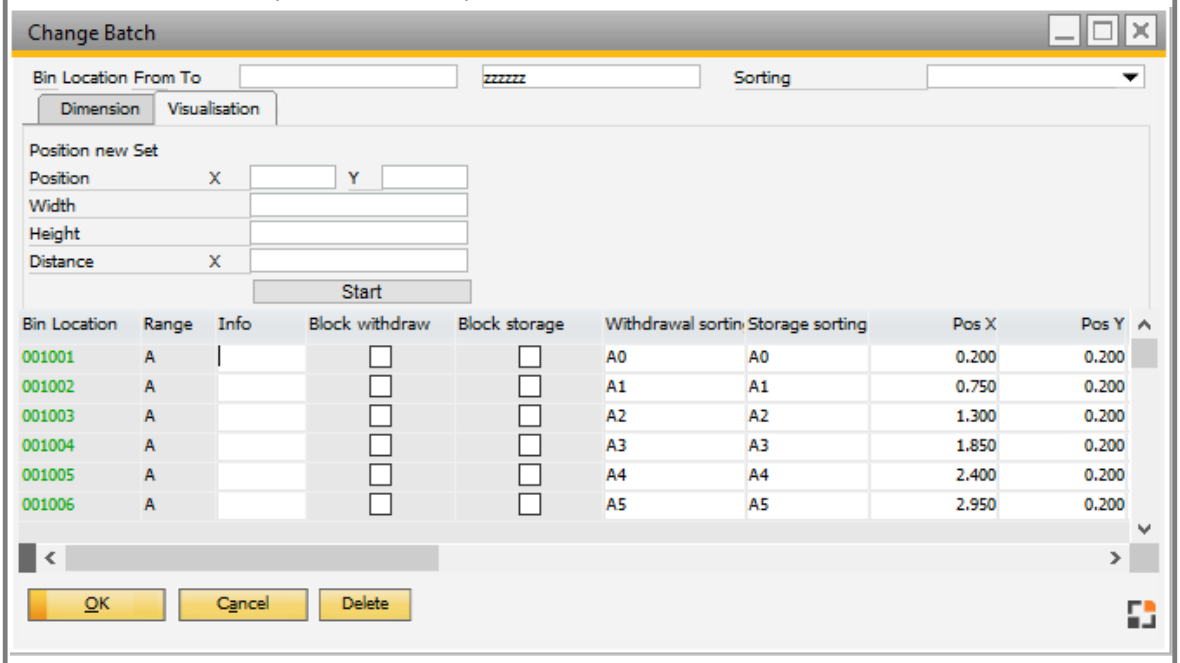
  As a last step, click on the replace icon right of the property field .

  Check changes and click "Update".

- Visualization

© 2026 Boyum IT Solutions A/S

In Tab "Visualization" you can set the position for one row.

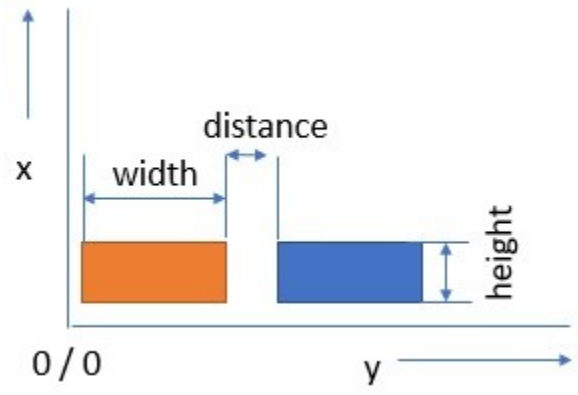


Window bin_whsbin_change.psr

Define position x and y, width and height for the first left bin location (orange).

Define Distance to the next Bin Location .

All values are provided in Meters (m).



1. Sort Bin location.
2. Mark all Bin Locations for this row.
3. At the end, click the "Start" Button.
4. Check the result then click "Update".

© 2026 Boyum IT Solutions A/S

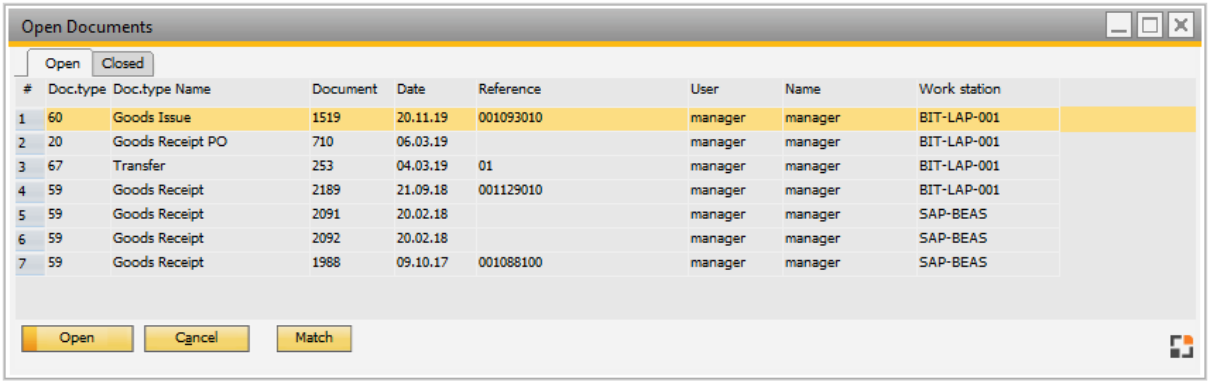
7.8.2 Open documents (Beas)

Only related to Beas Bin Management:

Here journal entries are displayed, created by postings in SAP Business One, for which no bin locations were allocated. Usually, posting to bin locations is performed just after the SAP Business One posting. There are a few exceptions:
- the posting was canceled
- the posting was performed when Beas was inactive
- the posting was performed via another Add-On or other interfaces
- the SAP Business One inventory function was used.

Check for open documents should be performed regularly. For this purpose use the button "match". Closed documents appear in a list in the Closed tab of this window.
The accounting documents presented there should be processed promptly, otherwise the stock will differ from bin location stock.
Before an inventory (stocktaking) is carried out, it is imperative to process open documents. First process post in documents, then issue documents.

PATH: Inventory > Warehouse Management > Open Documents.



Window bin_oinm_openbydocument.psr

Columns

Column	Meaning
Document type ID	Document type ID.
Document type name	Description of document type, kind of transaction.
Document	Document number.

© 2026 Boyum IT Solutions A/S

Date	Date of creation.
Reference	Kind of change.
User	The user who created the transaction. Important: this is the user who created the data in "open documents". Usually this is the same user who created the transaction document. Exception: SAP Business One was used without Beas, the bin location system was inactive and another user clicked the button "match" in SAP Business One in "Open documents" .
Name	User name.
Work Station	Work station on which the transaction was made.

Tabs

Tab	Meaning
Open	Open documents for which a bin location assignment is required.
Archive	All completed documents.

Right-click menu

Function	Meaning
Open	Open the selected document in the editing window.
Match	(right-click function or button) Check for additional open documents – Button below has the same function.
Last Messages	Displays last error messages.

Right-click on a document: selection to change document type.

back to bin location management

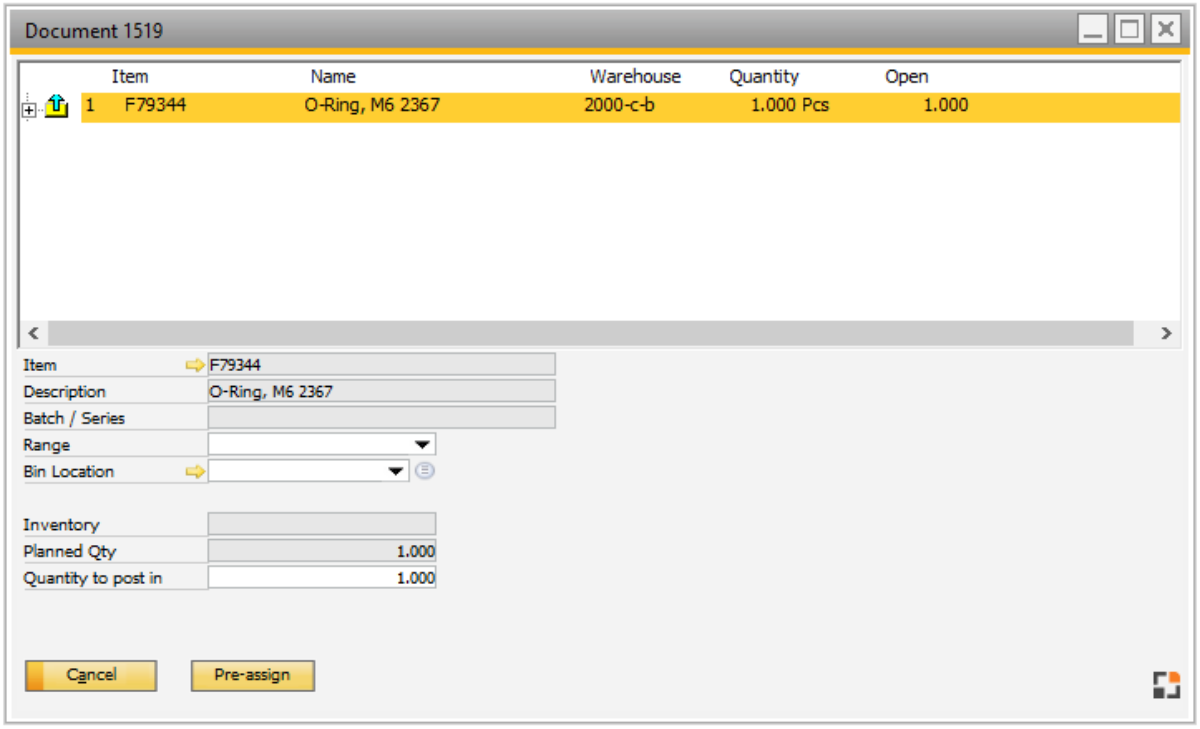
7.8.2.1 Edit open documents

If a transaction is executed on a bin location warehouse via SAP Business One, a bin location assignment is required.
Until completed, the document is presented as "open document" in Beas bin location administration.
If you do the posting in Beas, the bin location is indicated directly in the posting document, and no further assignment is necessary.

© 2026 Boyum IT Solutions A/S

Open documents can be closed by performing postings in this window.

PATH: Inventory > Warehouse Management > **Open** Documents > double-click an entry.



Window bin_ struktur.psr

White window section on top: Selection of items and batches with the orange scroll bar.

Right below: Graphical view of bin locations.

Left: Entry fields.

Field	Meaning
Item	Item.
Description	Description.
Batch	Batch.
Range	Warehouse Bin area: Selection with visualization. After the selection, the warehouse bin area is displayed graphically. By clicking the visualization the bin location can be chosen directly. The selection of the area has no effect on the bin location selection.
Bin location	Bin location: Selection with visualization. Drop-down:

© 2026 Boyum IT Solutions A/S

	At warehouse withdrawal: The bin locations are shown by bin location withdrawal rules. At receipt: The list is adjustable. ***See*** Receipt – Bin location. Click on the icon left of the entry field to open the bin location list. Window settings and templates are supported.
Inventory	Current stock.
Planned qty	Originally planned quantity.
Quantity to post in	Current quantity to be posted.

Right-click menu

Function	Meaning
Inventory history	Open Inventory history.
Journal	Open journal for the selected entry.
Support	Last error messages.

Functions

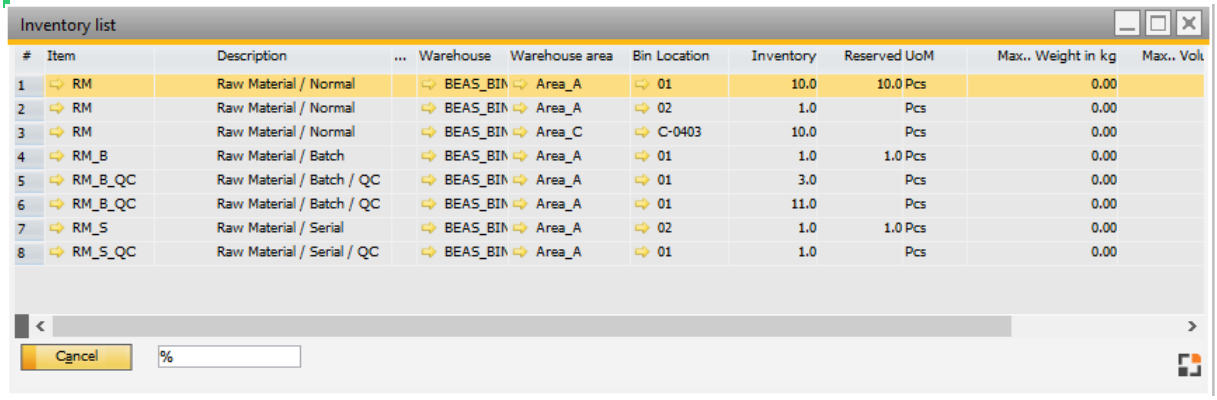
Function	Meaning
Cancel	Cancel the process, close the window after a security query.
Enter	Perform postings and close the window.
All mark	For collective postings. The check box before the entry is marked with an X. In this case, the quantity below cannot be changed anymore.
Selection delete	Only displayed, if entries have been marked before. All marks are deleted, single postings with quantity change are possible again.
Pre-assign	If dealing with a issue document or a delivery slip with serial number related items, the bin locations can be pre-allocated automatically. This is only possible for serial number items as these can be localized always on one bin location only.

back to open documents

© 2026 Boyum IT Solutions A/S

7.8.3 Inventory list

PATH: Inventory > Warehouse Management > Inventory list.



Window bin_binitemlist_browse.psr

This window provides a list of inventory. Previously this was only possible using the report system via **Bin location management > Master data > warehouse areas**.

List features:

- integrated template-system,
- Window is changeable dynamically, all fields of a bin location can be displayed,
- Full text search for item, batch, bin,
- Direct links.

back to bin location management

7.8.4 Bin location system check (Beas)

After a crash of the system, or in case of differences in bin location tables, bin location stock can be restored based on the goods movement protocol via the "System Check".
The system checks program analyses and repairs inventory based on bin transactions (beas_whsbinjournal). First, the Inventory Movement list is checked for negative entries and if necessary, counter entries are created, setting the balance to 0.

The following is checked:
- Status and quantities in "open documents"
- Stock in bins
- All empty entries are deleted
- General clean up of bin location tables

© 2026 Boyum IT Solutions A/S

All corrections are logged in the Beas protocol. After running the system check, it is recommended to:

- view the protocol
- bin location: process open documents
- **bin location master data > right-click > correction**: check the differences and correct them if necessary.

A system check is only required if, after the processing of open documents, there are still differences between SBO stock and Beas bin stock. Before starting the check, keep only those documents open that cannot be processed due to stock differences.

back to master data

back to bin location management

7.8.5 Bin location correction (Beas)

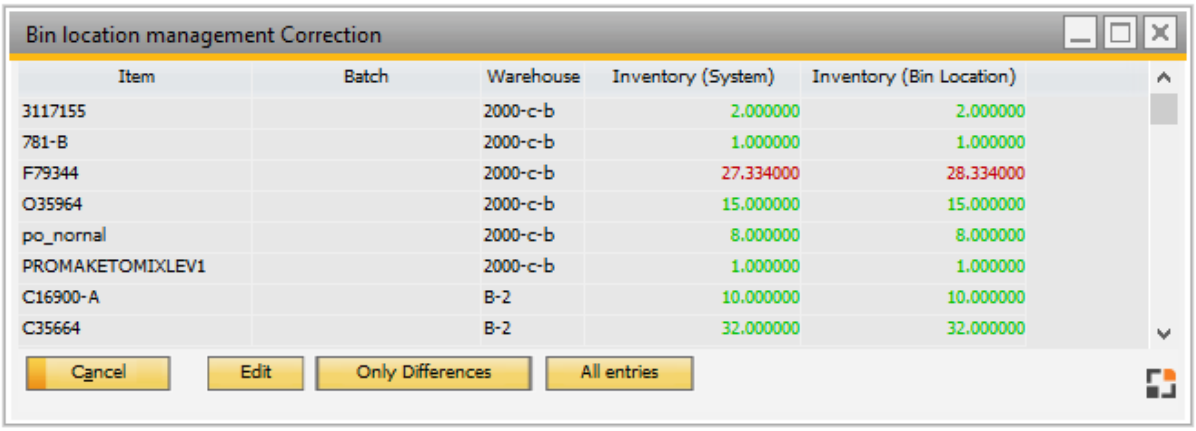
The correction program serves as a support for correct inventory of bin location, if it deviated from system inventory. The correction program can be started only if there are no open documents. To run the correction program system authorizations are required. After the call, a list is displayed for the following entries:

- Items, batches and serial numbers with system inventory
- Existing bins with inventory but without system inventory
- Bin locations with negative inventory

Incorrect entries are displayed in red.

PATH: Inventory > Warehouse management > Master data > right-click > "**Correction**"

© 2026 Boyum IT Solutions A/S



Window bin_whs_support.psr

Field descriptions

Field	Meaning
Item	Item
Batch	Batch ID
Warehouse	Warehouse name
Inventory (System)	Currently posted inventory in the system
Inventory (Bin location)	Actual bin location inventory

Button / right-click menu

Field	Meaning
Cancel	Close window.
Edit	Open manual bin location correction for the selected entry.
Only differences	Filter: display only entries with inventory differences between system and bin location. All green entries are hidden.
All entries	Filter off. All entries are displayed.

Notes on inventory

Even if an entry is green, there could be problems: For example, due to negative stock on bin locations inventory the sum can be correct.

Example:

System inventory 5, Bin location inventory 1x 6 and 1x -1 = 5 For this reason, bin locations with negative stock are presented separately.

© 2026 Boyum IT Solutions A/S

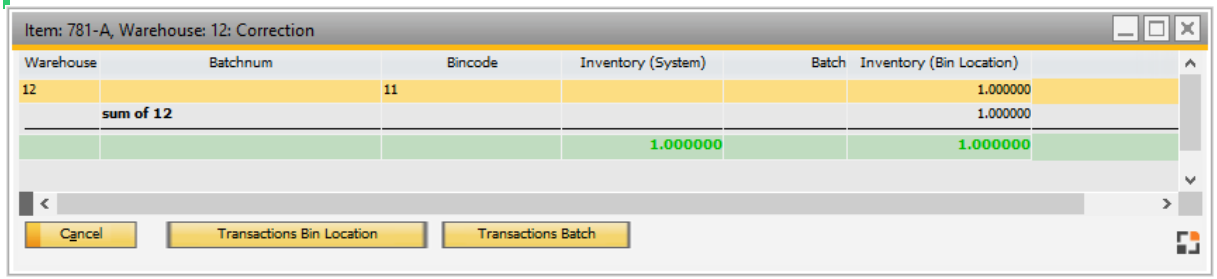
To correct an entry, click on "Edit".

back to warehouse master data

7.8.5.1 Correct bins manually (Beas)

Here, inventory can be corrected manually. All bin locations of an item, batch and serial numbers are displayed. Below bin location in the green line, the system inventory is shown, next to it the bin location inventory. The aim of the repair is to match system inventory and bin location inventory. In this window, you can only manipulate bin location inventory.

PATH: Inventory > Warehouse management > Master data > right-click > "Correction" > **Edit** button



Window bin_whs_support_detail1.psr

New bin locations can be created, existing ones can be changed, and numbers can be adjusted. All changes are logged in bin location history. Once the sum lines are green, the window can be closed. There is no check on accuracy of data.

If the RFID system is activated, RFIDs can be freely changed or corrected.

Important: This program is intended to serve only as a repair program and not to be used for bin location management.

Field	Meaning
Warehouse	Warehouse
Sum per batch	Dispalyed in the line below bin location inventory.
Batch	Batch ID
Bincode	Bin location code. Can be changed via right-click.
Inventory (System)	Currently posted inventory in the system.
Inventory (Bin location)	Bin location inventory.

© 2026 Boyum IT Solutions A/S

Buttons/Functions

Button/right-click function	Meaning
Cancel	Close window.
Add	Enter new bin location.
Remove	Delete bin location and its inventory.
Transactions bin location	Open a list of all transactions of this bin location.
Transactions batch	Open a list of all transactions of this batch.

back to Bin location correction

7.9 Inventory transactions

Inventory transaction types:

Manual postings

Batch transfer

Batch Split

Inventory (Stocktaking)

Batch calculation (precalculation)

Reservation list

Warehouse choose bincode

7.9.1 Manual postings

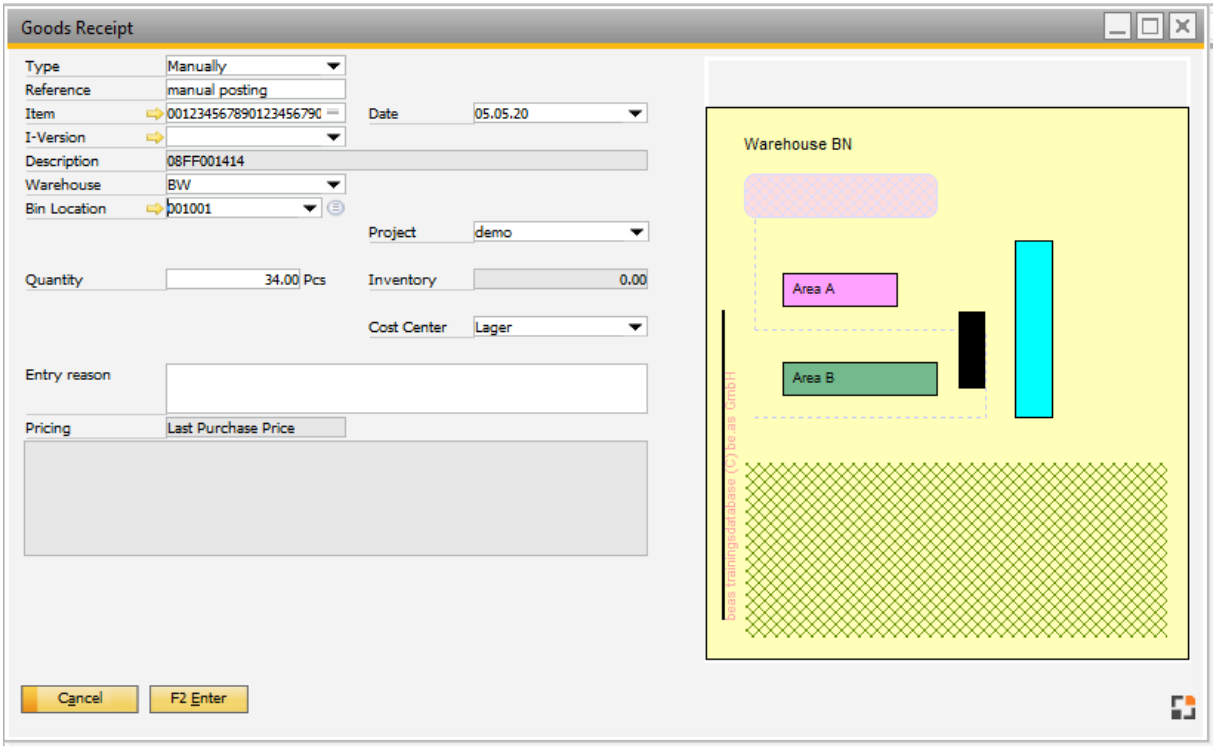
With manual postings the inventory can be adjusted without a document.
For example, after the stocktaking, part of the stock was not counted, the missed amount can then be manually posted.

The following manual posting options are available:

- Receipt
- Issue
- Transfer

Only one item can be added per manual posting procedure.
The posting is a simplified operation to be used in production and some information is omitted.

© 2026 Boyum IT Solutions A/S



Window mw_manuell_buchen.psr

Posting types

There are different types of postings

Type	Description
Manual	Used to report a manual posting. This option uses the accounts set in Beas general parameters. These accounts can be different from the correction option.
Production	Assigned to a production order. Entry of the production document and the position or BoM position is necessary. The process: After choosing the position, the item is inserted automatically. The posted quantity is displayed and evaluated in the production structure views. In the Production order field the following can be entered: • work order number • work order position bar code • BoM bar code The entry is processed according to its type.

© 2026 Boyum IT Solutions A/S

	Production posting type special case **Receipt - Pricing** With the Type "Production" selected, the Pricing field becomes invisible as then the pricing Production valuation assembly is used. Postcalculation may be running in the background. **Receipt - order time receipt** is created automatically if enabled in Configuration wizard – Production – Work order backflushing – Book times automatically and "...to employee" is defined Correction	Used to report adjustment of remaining inventory (evaporation, scrap, and so on). This option uses the accounts set in Beas general parameters.
Inventory	Uses the same accounts as the Manually option, but the inventory adjustment posting type is entered in the comment field in the goods issues document.

Window structure, field description

The input window structure changes, depending on the entered information. Related fields become available depending on whether receiving, issuing or transferring takes place, whether a batch or a serial number is entered or whether there are different inventories or Production UoMs. The same applies to bin locations. If the bin location has been created, they are displayed for selection.

Field	Meaning
Work order	Displayed only if Production type was selected.

© 2026 Boyum IT Solutions A/S

The Work order area has three fields:

Document number, line and position. If new is selected from the position drop-down, "-1" is displayed in the field. A new work order position can be entered instead of the -1, the item and quantity can be selected.

1. Field - work order number

The work order can be selected from the drop-down list or scan:

a) The work order document number (Data field: beas_fthaupt.belnr_id).

b) The work order bar code (9 digits). It is used for posting in the assembly. The second and third field is filled automatically. (Data field: beas_ftpos.barcode)

c) The material bar code. Used to post material. (Data field: beas_ftstl.nummer)

(BoM - Extended - Bar code)

2. Field - work order line number

Select work order item to be issued or posted (Data field: beas_ftpos.belpos_id). Only items allowed to post are available (items not closed or blocked)

3. Field - work order position number

Select the BoM item to be posted (Data field: beas_ftstl.pos_id).

Only BoM positions that are not closed been closed, with warehouse oriented items are allowed.

Special case:

0 or empty = the assembly is posted.

-1 = a new BoM item is generated.

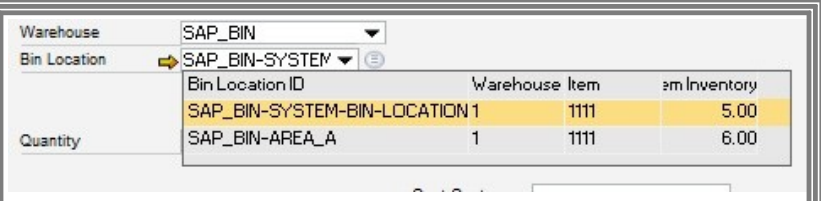
Blocked BoM positions

Blocked BoM positions cannot be selected, but the position number can be manually entered or scanned via

© 2026 Boyum IT Solutions A/S

	barcode. For postings, the respective authorizations are required. Post and create new BoM position It is possible, to issue material and to create a BoM position at the same time, if the position does not exist. Select the work order document and the assembly, and then select "new" in the third field.
Item	Item number. NOTE on WMS-related receipt: **WMS Integration:** If the receipt is made from BEAS in a WMS warehouse, it applies the Quality status defined in **Produmex WMS > Organizational Structure > Production tab**.
I-Version	Item version to be posted. *(beas 9.1 PL: 08)* Note: It is only possible to create a manual receipt of an item version with "Released" status.
Warehouse	Warehouse that item is posted to. ***See*** Warehouse rules. Note: As of Beas Manufacturing 9.3 PL03, Produmex WMS warehouses are supported for Beas transactions.
Bin location	Bin location to be posted to Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3) The field has the following components: **Arrow icon** / List of all bins where the item is located. **Selection (Drop-down)** A list opens to select the desired bin location.

© 2026 Boyum IT Solutions A/S



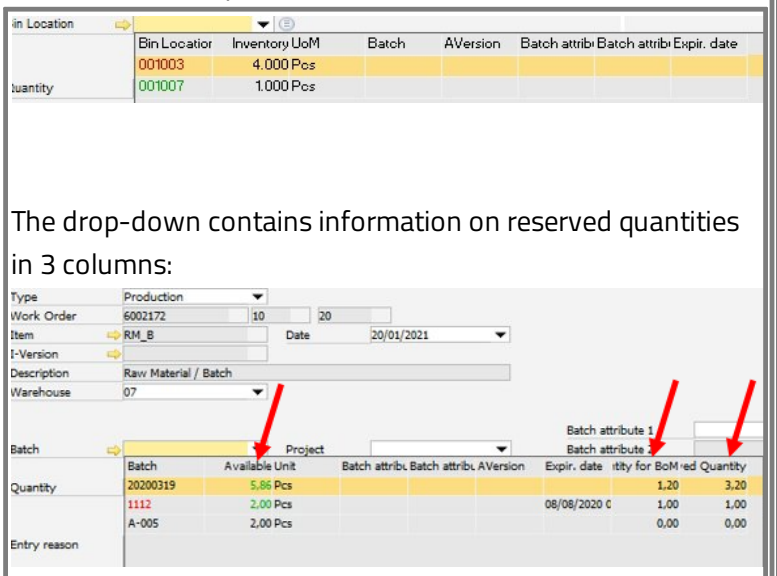
The selected drop-down option displays the following information in receipt documents:

- Bin Location
- Warehouse Area
- First item in this bin location
- Stock of the first item in this bin location

The list can be modified in the Configuration wizard.

The selected drop-down option displays the following information in issue documents:

- All stock information of all bin locations with batch- and serial number information.
- Reserved Batch quantities information



The drop-down contains information on reserved quantities in 3 columns:

The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

© 2026 Boyum IT Solutions A/S

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

Select or List - Icon

By using the selection icon, an adjustable selection list opens. Window settings and templates are supported.

- Notes: Beas Bin Warehouse

  The Definition of the bin location is mandatory.

- Notes: SBO Bin Warehouse

  If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type.
  This is entirely managed by SAP Business One.

  Drop-down for volume or weight is not supported. Columns are always 0.
  beas 9.3 PL 2

- Notes: WMS Bin Warehouse

  Bin location is mandatory.

© 2026 Boyum IT Solutions A/S

Drop-down for volume and weight not supported.

Customizing of the drop-down list in Beas 9.3 PL 2 or newer release

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent setbindropown`)
2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

In the `e_bindropdownbsl` variable, the ODATA command can be defined.
It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.

The standard functions for receipt and issue are as folows:

```
file stockmanagement.src

function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$mask=1
end function

function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,
BatchAttribute2,ExpirationDate&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

© 2026 Boyum IT Solutions A/S

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered by
OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$select=BinLocation/BinCode,BinLocation/BinColor
,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where OnHand >
0 of the selected ItemCode, ordered by OnHand
descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand
desc, BinLocation/BinCode asc
end function
```

- Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent`)
2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

Window-specific adjustments:

Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.

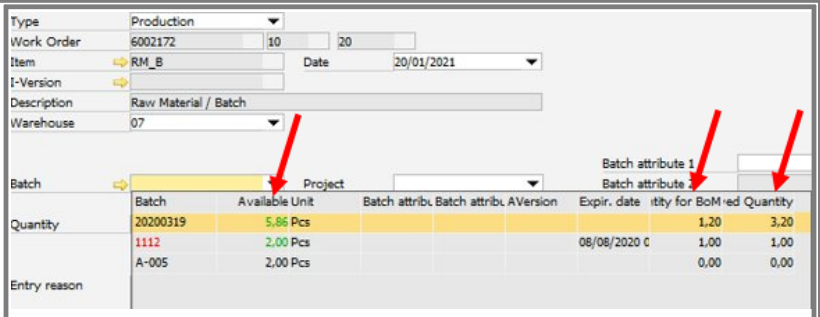
Example:

```
windowevent setbindropdown
setvar=e_bindropdown=ddsql=select "BINCODE" from
"BEAS_WHSBIN" where
```

© 2026 Boyum IT Solutions A/S

	"WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT" end event Note: This window event is supported in every window where the selection field is available. **General adjustment** Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration. file stockmanagement.src function binreceiptdropdown setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT" end function ***See*** Warehouse rules.
LUID	Define LUID number ***See*** LUID behavior settings. WMS Production receipt
Project	Link to an SAP Project code. The default value comes from the project linked to the work order. If continued stock is active in the database, the project code is included in the journal entry.
Batch/Serial	Click the orange arrow to generate a new batch or serial number. After this batch or serial number is firmly assigned and the arrow is hidden. Information on Reserved Batches: The drop-down contains information on reserved quantities in 3 columns:

© 2026 Boyum IT Solutions A/S



The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

See:

Production – Batch administration

Materials management – Batch administration

Date	Posting date of the document. The default value is the today variable.
Quantity	The quantity to be issued. **Serial numbers:** For serial numbers only a quantity of 1 can be entered.

© 2026 Boyum IT Solutions A/S

	Serial number reservation Posting in a production assembly any quantity can be entered if the serial number determination is set to "automatic" for the respective item and the serial numbers have been reserved. In this case, a window opens where the serial numbers can be selected. ***See:*** Configuration wizard – Production – Serial numbers Concept Serial number reservation Item master – Series tab
Conv-Quantity	⊟ Enter posting quantity in consumption units Only displayed, if the consumption unit does not match the warehouse unit of the item. ***See*** consumption unit The entered quantity is converted to warehouse unit. Length, width and height are indicated. These parameters are considered, using the conversion formula. ***See*** Conversion
Close	⊟ Close WO position Only visible, if a production assembly is posted. Set automatically, as soon as the planned quantity is reached. Manual change is possible. The behavior can be defined in Configuration wizard - Close assembly automatically. If the option is active, the production position is closed after receipt.
Cost center	⊟ Select cost center If no cost center is selected, the default settings apply. **Adaptation** Use the script in workordermanagement.src and materialmanagement.src to extend determining the cost center.

© 2026 Boyum IT Solutions A/S

	See Configuration wizard - Production - Material - Account determination Configuration wizard - Production - Assembly - Account determination Item - General - Cost center
Entry reason	Free text to add information.
Pricing	Shows the method determining the price. Automatically filled.

Production Assembly	Settings apply from **Production > Valuation and booking of the assembly > Valuation**
Post in positive BoM item	Settings apply from **Materials management > post in manually > Purchased items pricing booking**
Post in negative BoM item	Settings apply from **Calculation > Precalculation > Pricing negative BoM**
Other posting	Settings apply from **Materials management > Post in manually > Purchased items/In-house production pricing booking**

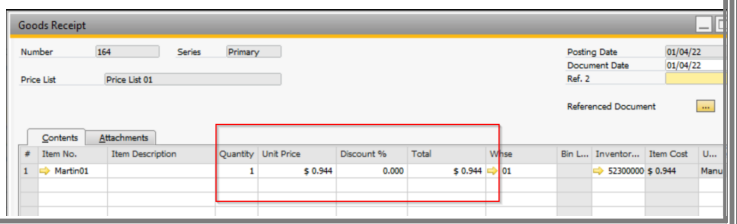
SAP Limitation:

SAP Manual receipts: When Beas creates a receipt document, the system calculates the Unit price based on calculating the Total price of the booking.

The difference between the decimals of SAP and Beas can cause mismatch between the values: The "Total" price field may be rounded as the Unit price is defined with a different

© 2026 Boyum IT Solutions A/S

number of decimals.



Additional fields are available at transfer:

Field	Description
To	Define the warehouse to transfer to. The To warehouse can only have the same entry as Warehouse if it is a bin location inventoried warehouse. A pure bin location transfer is then possible. Note: A bin location move instead of a SAP Business One - Transaction runs at a bin location transfer. There is no account movement, no calculation of FIFO prices or average prices. The bin location entry is changed. An entry is created in the bin location-movement protocol.
Bin Location	Define the bin location to transfer to. For further information, ***see*** from bin location.

Functions and Buttons

Button	Description
Cancel	Cancel the process.
Batch list (F3)	Inventory list by batches This button is only visible if a batch related item is selected.
Book (F2)	Start the booking process.

Events

© 2026 Boyum IT Solutions A/S

Every posting process creates several events, which can be set as default or customized (***see*** customizing).
Posting finished products (assigned to a work order), calls the assignment program which controls closing, pricing, and batch administration. An external materials management system can also be connected and used in parallel.

- Account settings

Accounts that are used, depend on the posting type. If a posting is performed with reference to a work order, generally the WIP account of the work order is used. In other cases the default account of SAP Business One is used. Account settings can be changed in the Configuration Wizard.

See:
Materials management - manual postings
Production – posting
Production – Account determination

- Pricing

Pricing depends on the posting type. If an assembly is posted in for a work order, pricing is performed as set up in the work order, if there was nothing set up, the settings in **Configuration wizard > Materials management** apply.

See:
Materials management - Pricing
Production Valuation of assembly

- Batches and Serial numbers

See
Configuration wizard – Batch administration
Configuration wizard – Serial numbers

7.9.1.1 manual issue

An item can be issued with this function.

See: Manual postings

- Automatic quantity pre-allocation

If the "work order" type is selected, and document number, assembly and material position are entered, the remaining demand quantity is proposed, regardless of the stock.

© 2026 Boyum IT Solutions A/S

This quantity recommendation is also made if the barcode is used for registration or if the posting screen was accessed through the work order structure view.

- Cancellation mode

When calling up the window via **Production > Work order document (posting-in assembly) > Cancellation** all information from the posting document are used including accounts to which the booking was made, post-calculation information, batches/serial numbers and prices.

Note:
Correct booking of costs and valuation work only if the cancellation function is used.
An issue is always performed at the valuation price. Only using standard costs method, the price for posting in and issue is the same. For all other valuation methods (average, FiFo) the current valuation price is used. As a result, differences on the WIP account may arise.

If continuous stocktaking is disabled, the correct price can be used. That means, for issue the same price is used as for posting in.

If a valuation method is used which depends on the calculation, the cancellation mode corrects the valuation tables. The subsequent assembly postings are made correctly. This works only for postings made with beas9.0 or later. Otherwise after cancellation a message is issued, "bm9494" tells that bookings cannot be valued correctly.

See WO structure material postings – Cancellation

See

Link to serial numbers/batches

Cancellation window

back to manual postings

7.9.1.2 manual receipt

The Goods receipt allows to post or to store an item. The options on the manual receipt screen are the same as for the manual issue window. ***See*** Manual postings description for the field descriptions.

See

Special case posting type "production"

Link serial numbers / batches

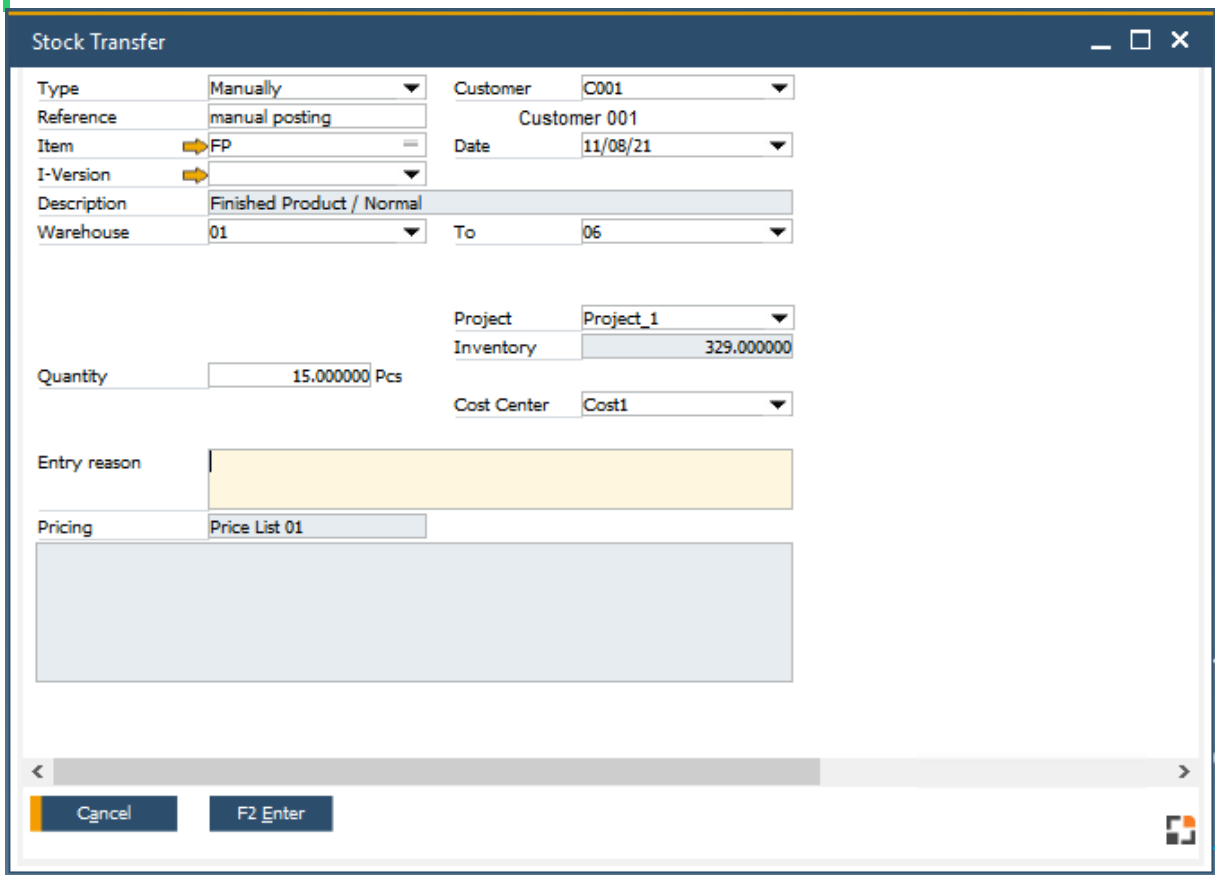
manual postings

© 2026 Boyum IT Solutions A/S

7.9.1.3 transfer manually

Stock transfer can be used for transferring one item from one warehouse to another. A bin to bin transfer in one warehouse is also possible.

PATH: Inventory > Inventory transactions > Stock transfer (single event)



Window mw_manuell_buchen.psr

Transfer and Reservation

You can transfer reserved material only if you define the linked document.

Example: You reserve material for work order 1000, Pos 10/20.

In Stock transfer you must define Type = Production and Position 10/20 and then it is possible to transfer the material.

The System deletes the reservation from the old warehouse/bin location, but it does not create a new reservation on the new place. You lose the reservation information.

© 2026 Boyum IT Solutions A/S

Note:

POI (Folio Numbering) is not supported.

It is not possible to transfer material reserved for a Sales order or Pre-invoice.

SAP Transfer (Standard):

From transfer request, created by Beas (linked to work order): Reservation supported.

For all other: You can't transfer reserved material.

For detailed field descriptions and function buttons ***see***: manual postings.

7.9.1.4 Batch list

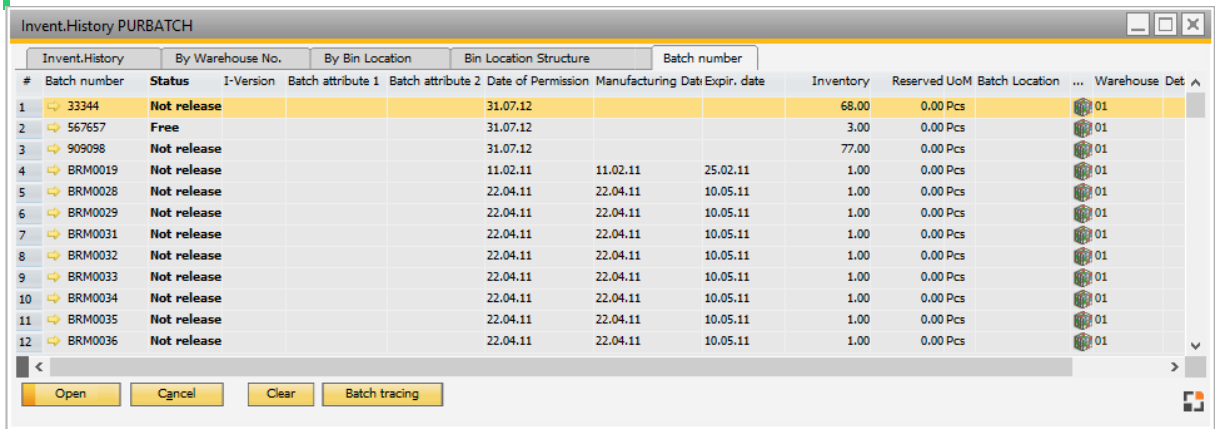
Batch list can be called up from Manual postings (receipt, issue, transfer).

In case a batch item was selected, the "**F3 Batch report**" button is available.

Window settings and Templates are available.

All batches with current stock are displayed for the selected item.

PATH: ***see*** above.



Window: artikel_bestand_nach_charge.psr

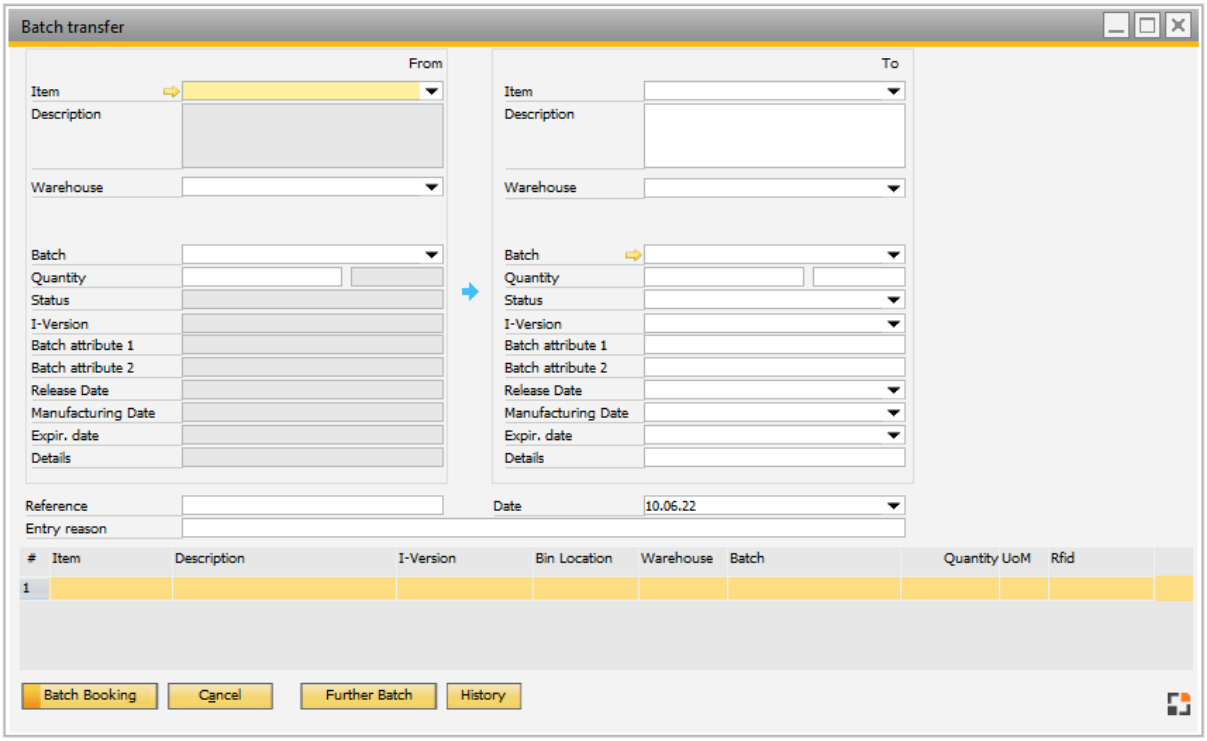
7.9.2 Batch transfer

This module offers the following possibilities:

- Transfer batches or a part of a batch to an existing or a new batch.
- Mix several batches into one.
- Combine several batches of different items with another item or batch.

PATH: Inventory > Inventory transactions > Batch transfer.

© 2026 Boyum IT Solutions A/S



Window mw_batchnum_transfer.psr

Items with different batches and different quantities from same warehouse can be summarized to new batches. The total quantity is proposed by the program and can be changed later. The active batch, marked for editing, is highlighted.

A table with two columns is displayed, the batch is transferred from left to right. See image above and field descriptions below.

Behavior is defined in the Configuration wizard – Batch transfer.

	from	**to**
Field	**Description**	**Description**
Item From/To	Select item from whose batch to transfer to an existing or new batch.	Choose item to which the batch selected in the "From" field should be transferred.
Description	Description of the item.	Description of the item.
Warehouse	Select source warehouse of the batch to transfer.	Add target warehouse of the batch to transfer.
Bin Location	Select source bin location of the batch to transfer.	Add target bin location of the batch to transfer.

© 2026 Boyum IT Solutions A/S

Field	Description	Description
	SAP, Beas and WMS Bin Manage supported *(beas 2020.02)* Here you choose the Bin location and Batch number. In Bin managed warehouses you can't choose Batch number in Batch number field	SAP, Beas and WMS Bin Manage supported *(beas 2020.02)*
Batch	Number of original batch Only selectable, if not Bin managed warehouse	Number of new batch A new batch will be created by single-clicking the yellow arrow. Up until *beas 9.2*: The batch according to the goods receipt definition is used in all cases. From *beas 9.2*: The behavior can be defined in the Configuration wizard.
Quantity	Quantity of current Batch, which you want to transfer to new batch number on right side	Quantity of new Batch
Status	Status of Batch	New Batch status. Define the Status of this Batch after the transaction. Only editable if you create a new Batch. For existing Batches it is not possible to define new status in this window. **Attention:** The system does not check any rules. You can release the Batch without any quality control, and you can transfer a locked batch to a released batch.
Batch attribute 1+2 I-Version Release date Details	Batch number information. Only for information. Not changeable	Various, Batch number-related pieces of information. Only editable if you create a new batch number

© 2026 Boyum IT Solutions A/S

Field	Description	Description
Manufacturing Date Expir. date		
Reference Date Entry reason	Reference information, Post date and Notes for transfer (issue/receipt) document	

Functions

Function	Description
Batch booking	Click Batch booking to issue the total amount of the batches to be split and to post in the batches to be created (in the background an issue and a receipt document are generated.
Further batch	Insert the next batch into the line.
History	Open the History log window.

- Pricing

The batch on the right side receives the total price of all batches selected on the left side.
Use Perpetual Inventory active: The price which is stored in the journal of the charge-off document is used here.
Use Perpetual Inventory disabled: The total price which is stored in the charge-off document is used here.

Example:
left side (Issue document): Batch 1: `1x3€ + Batch 2: 2*4€ = total 11€`
right side (Receipt document): The new Batch is posted in with `11€`

Additionally, a booking reason and reference to this process can be entered.
Batch control: original and target batch may not be equal.
A pure bin to bin transfer is not possible if there is an assignment to a sales order or if the batch is reserved. After editing by pressing "post batches" the batch is transferred. The button "History" shows all previously performed transfers, and a separate document is created for each batch.

Note:

© 2026 Boyum IT Solutions A/S

Batch transfer creates 2 documents: Issue and Receipt.
In the issue document created by the Batch transfer you can see the *Info price.*, which is not the same as *Stock price*.
You can see the correct price in the column "item cost"
Example:
Info price is 1715€ and Item Cost is 863,41€
For the Receipt document Beas is using the Item cost price, because this is the price, which you can see in the journal entry.

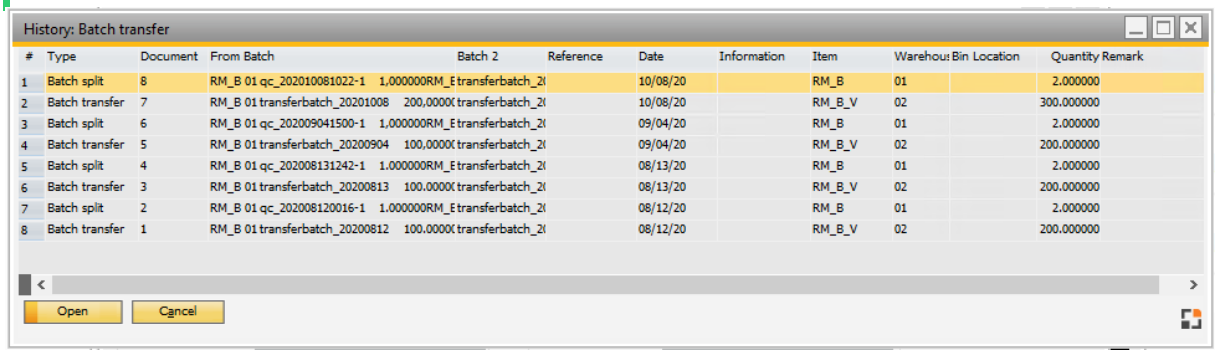
Batch Transfer Pricing

Rounding problem:
If the price only saved with 2 decimal places (SAP Definition - count of decimal places for prices) and you work with high quantity, then this can produce a rounding problem and different prices between Issue and Receipt
Workaround: increase count of decimal places for prices.

7.9.2.1 History

In Batch Transfer / Split Batches you can open the history log via right mouse click.
In this window you see all created split/transfer documents with all details.

PATH: Inventory > Inventory transactions > Batch transfer > **History** button.



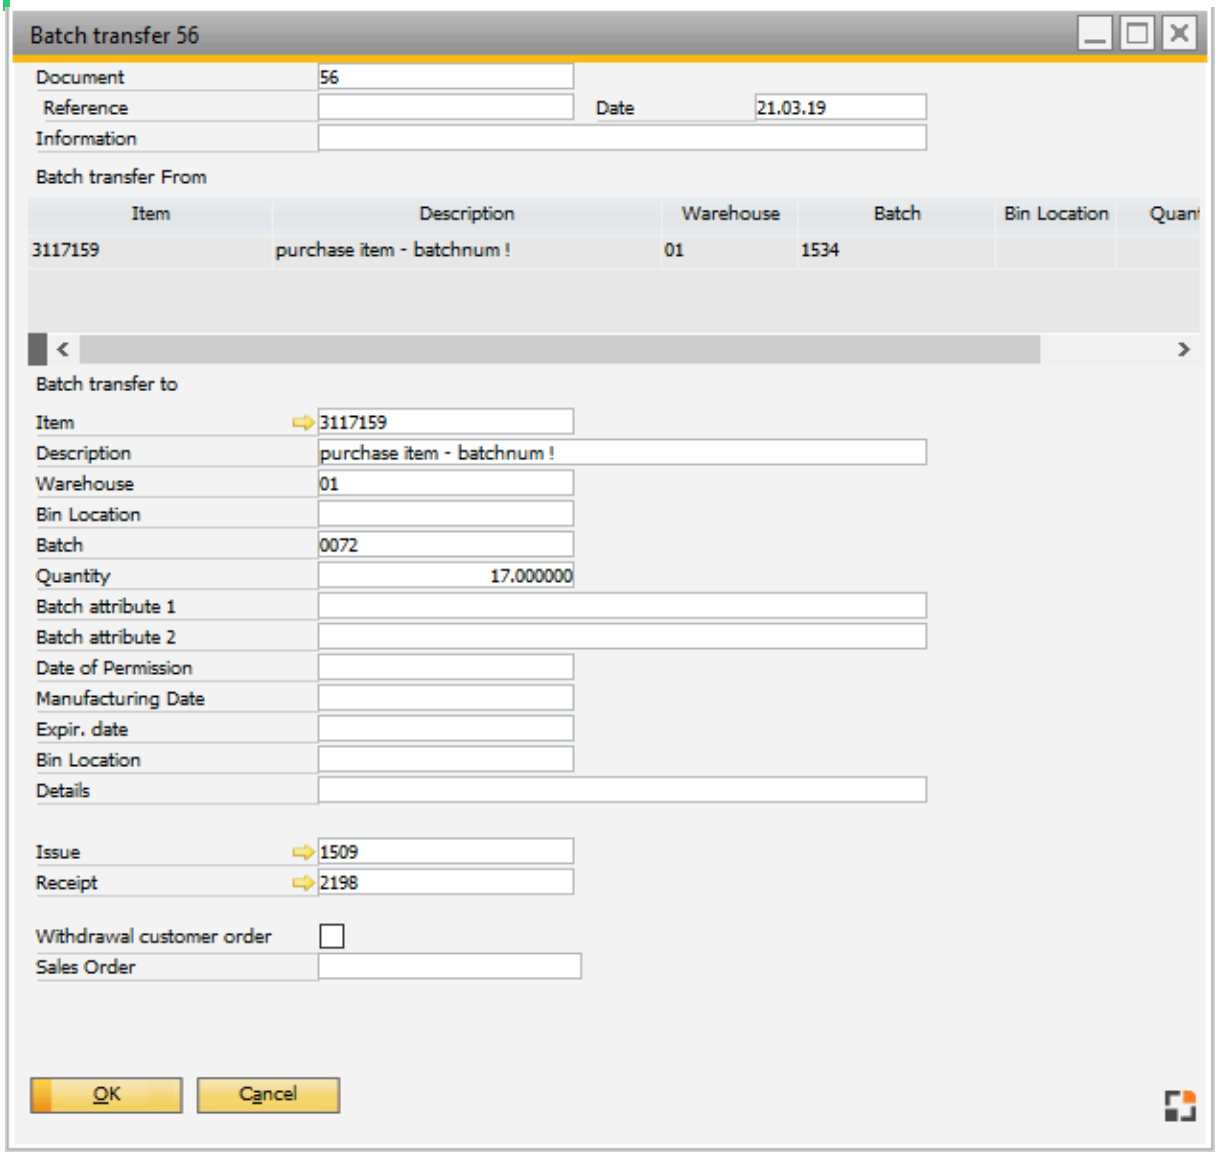
Window mw_batchnum_transfer_historie.psr

Double-click or use the "Edit" button to open the created document.
Beas creates an issue and receipt document in the background.

In this document you see an overview of the complete transaction process and you can open the created issue and receipt document.

© 2026 Boyum IT Solutions A/S

PATH: Inventory > Inventory transactions > Batch transfer > "History" button > double-click/**Open** an entry in the list.



Window mw_batchnum_transfer_historie_detail.psr

7.9.3 Batch Split

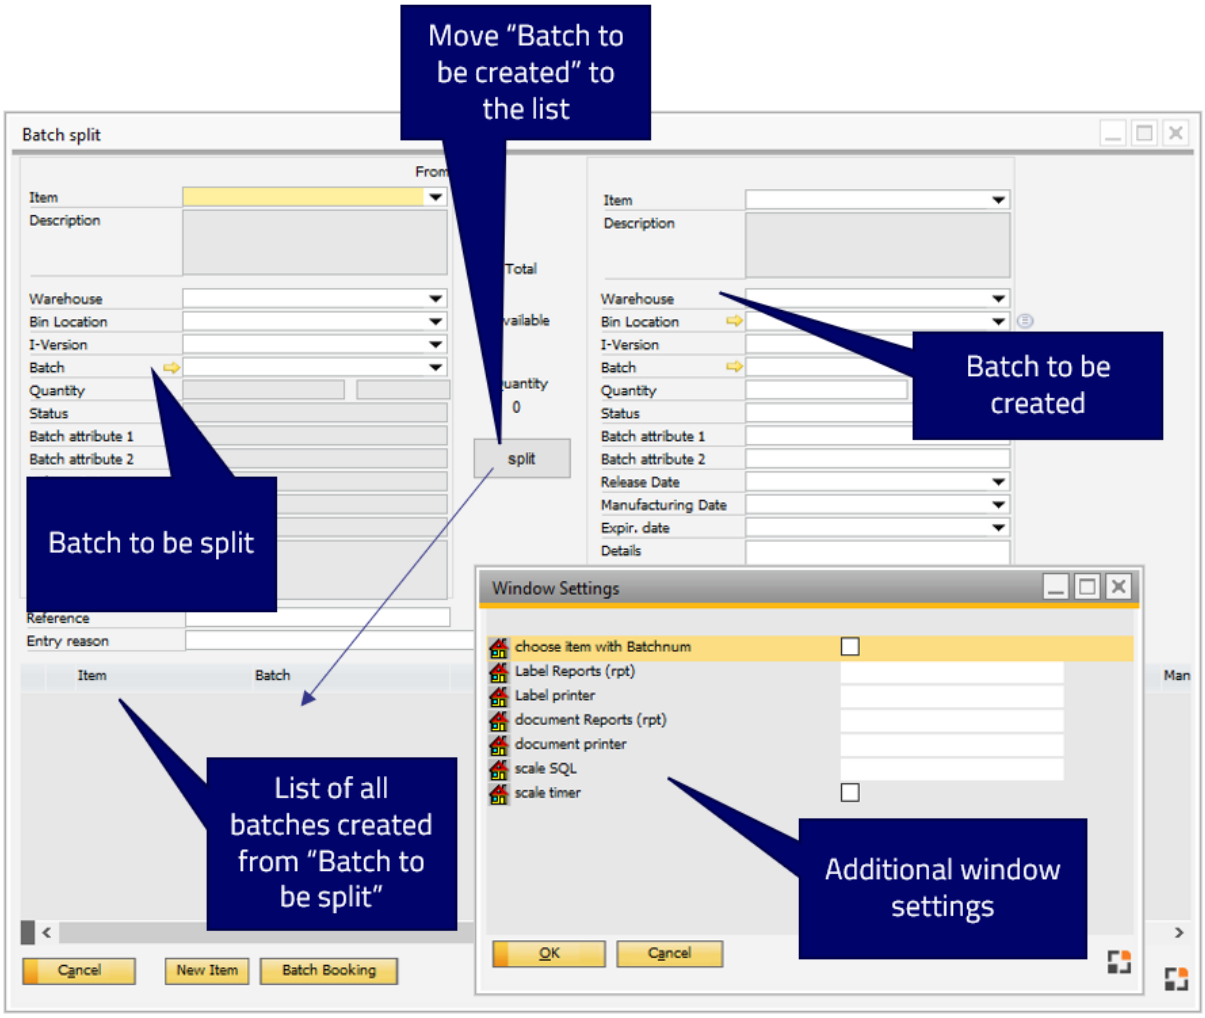
In this window an item batch can be divided into several item batches. In this case, neither the item number nor the batch lot number needs to match. The quantities of source and target batch may differ, only the current stock is considered as limit.

PATH: Inventory > Inventory transactions > Batch split.

The window is divided into three areas:

© 2026 Boyum IT Solutions A/S

Area	Description
Top left	Batch to be split.
Top	Batch to be created.
Below	Already selected batch to be created.



Window mw_batchnum_splitt.psr

Process description:

Indicate the batch to split (left) and the batch to be created (right). The amount of the batches to be created may not exceed the amount of batches to be divided. Different units of measurement are not considered.

Clicking on **Split** the batch on the list below is accepted and the "available" value is reduced accordingly.

© 2026 Boyum IT Solutions A/S

Click **Batch booking** to issue the total amount of the batches to be split and to post in the batches to be created (in the background an issue and a receipt document are generated)

In parallel, a transfer document is created with its own document number. There the numbers of the related documents for receipt and issue are stored. Documents are accessible via **right-click - archive.**

- Window settings

The behavior of the batch split function can be adapted using **right-click – window settings**. These are saved as workstation-specific.

Window setting	Description
Choose item with batchnum	If enabled, batch numbers and bin locations are displayed in item selection list. Thus all information is displayed in a list. Note: This list can get very long. If disabled: Only batch-related items with stock are displayed.
Label Reports	A report can be stored which is generated when clicking "divide". Parameters for the report: `itemcode, distnumber, quantity, unit, whscode, bincode, mnfserial, lotnumber`
Label Printer	If another printer than the default printer shall be used for printing the label report, enter the printer name here.
Document Report	A Crystal-Report can be stored. It is printed when clicking on "post batch" . Parameters for the report: `docentry` This refers to the table `beas_batchnumtrans.docentry` where all additional information is stored.
Scale SQL	A SQL-statement can be stored returning the quantity. ***Example***: `select top 1 weight from my_scale_table order by nr desc` ***Example*** of use: scales are entering the weight to an SQL table. The entered value is transferred clicking the button "scale".

© 2026 Boyum IT Solutions A/S

Window setting	Description
Scale timer	If enabled, scale SQL is executed every 2 seconds and the last weight is used.

Note:

SAP and WMS Bin Management are not supported in this window.

Pricing

The system creates 2 documents
- Issue document for the item which you want to split
- receipt document for all entries

The system uses standard pricing for issue / receipt

Issue document

Basic Initialization - Use Perpetual Inventory is disabled:

Beas uses price from the Configuration wizard - Purchased Items Pricing Booking or In-house Production Pricing Booking

The system converts the price to home currency, saves this in field "Price per Unit" and does not use any rounding.

Basic Initialization - Use Perpetual Inventory is enabled.

The system uses SAP Standard; the item valuation method.

Receipt document

Beas uses price from the Configuration wizard - Purchased Items Pricing Booking or In-house Production Pricing Booking

The system converts the price to home currency, save this in field "Price per Unit" and does not use any rounding.

Note:

The system writes the Price and Unit price, not the total price.

The total price of the Issue document is not the price of receipt document.

Beas does not manage the rounding as it is completely managed by SAP.

© 2026 Boyum IT Solutions A/S

When applying Batch split with serial/batch valuation method, consider that Goods issues will be created according to the SAP serial/batch valuation method. However, Goods receipts are generated according to average price valuation.

Example:

An Item has 2 batches

BN001 - 10 units x 10€ = 100€
BN002 - 10 units x 5€ = 50€

Using the Batch split function:
Split 5 units of BN001 to BN002 (the system issues 5 units of BN001, then receipts 5 units of BN002)

Cost of the goods issues of BN001 is calculated by SAP (using batch/serial valuation) as 5 units x 10€ = 50€

Cost of the goods receipt of BN002 is calculated as average price of all batches in stock at the moment the goods receipt is going to be created.

BN001 5 units x 10€ = 50€
BN002 10 units x 5€ = 50€

Cost average at the goods receipt is = (50 + 50) / 15 = 6.66666666€

7.9.4 Inventory (Stocktaking)

Beas extends the standard stocktaking of SAP Business One with the following features:

Extended functions:

- Part inventory across multiple warehouses and storage areas
- Stocktaking templates, administration of counting lists, inventory valuation
- Full support for batch and serial numbers and bin locations
- Easy import of counted stock, freely adjustable counting and recording list
- Cycle Count Recommendations – with stocktaking, correction of stock and bins

© 2026 Boyum IT Solutions A/S

- Log and archive for all inventory transactions

INTRODUCTION TO INVENTORY COUNTING:

Introduction to Inventory Counting – PDF presentation

INVENTORY COUNTING - WEBINAR 2017

Note:

SAP Bin Management and WMS Bin Management are not supported.

The following types of stocktaking are available:

- Annual inventory count

Use annual inventory count to register all stock on a given date. System stock is compared to counted stock, differences are corrected automatically. Only differences are registered.

Process

Define annual inventory count

Start stocktaking, save system stock

Optional: create counting lists

Register counting lists, ***see*** counting list, single registration, WEB-Application. NOTE: only registered entries are corrected and posted.

Check counting lists

Post differences

Close stocktaking

Note:

Only the difference is posted between stock and counting list to the moment of stocktaking. In this period there may be no goods movements.

Example:

Stocktaking started 20.12. for warehouses 01 and 02

Counting lists are printed. Goods are counted in warehouse 01. Counting completed. From now it is allowed to post goods to warehouse 01.

© 2026 Boyum IT Solutions A/S

The differences are posted once counting in warehouse 02 has finished and all values have been registered.

- Cycle Count Recommendations

Use this feature to get recommendations for stocktaking and start a counting for the selected items.
Prerequisites:
- Define inventory cycles. ***See*** **SAP Business One > Inventory cycle > Definition.**
- Store inventory cycle in the item. ***See*** **SAP Business One > Regular inventory > Definition.**

The process of the Cycle Count Recommendations function is the same as for annual inventory count.
See Annual inventory count.
Cycle Count Recommendations.

- Inventory Opening Balance

Use Inventory Opening Balance function to import or register stock for the first time.

Process
Start initial stocktaking with the Inventory Opening Balance function,
Import stock or use counting lists, single registration
Check counting lists
Post in stock

- Work with SAP Standard Inventory

Beas-stocktaking function replaces the original SAP Business One function. We recommend to use the Beas function because all rules of the Beas-logic (e.g. reservation feature) are taken into account. Nevertheless, it is possible to use the original SAP Business One function. To do so go to **Configuration wizard > Materials management > Warehouse management > Use original SBO inventory**

However, this is not recommended as several problems could occur when using the SAP Business One inventory:

- no support of bin location management

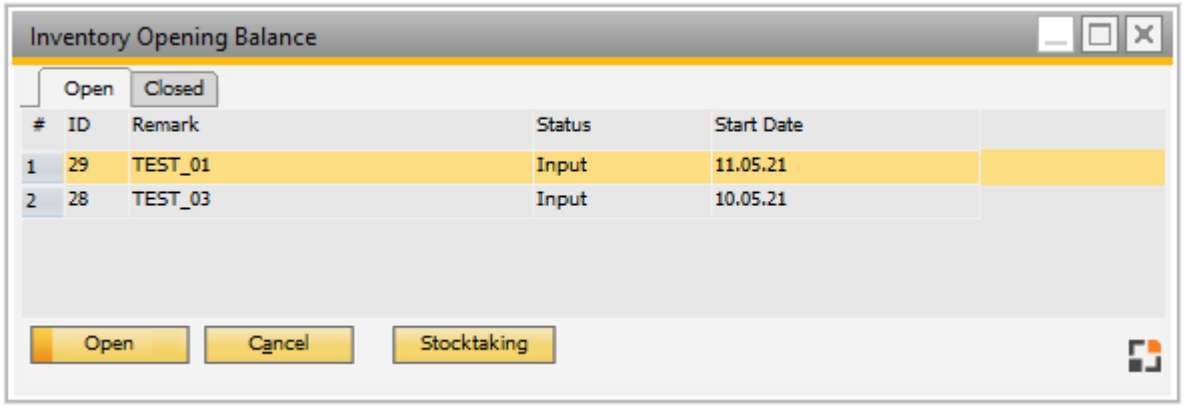
© 2026 Boyum IT Solutions A/S

- posting problems with reserved goods

7.9.4.1 Inventory Opening Balance

Window for new or initial stocktaking. Here you can insert items that are going to be received in the system for initial inventory.

PATH: Inventory > Inventory transactions > Inventory Opening Balance.



Window mw_inventory_header_browse.psr

Open tab

List of all open entries.

Closed tab

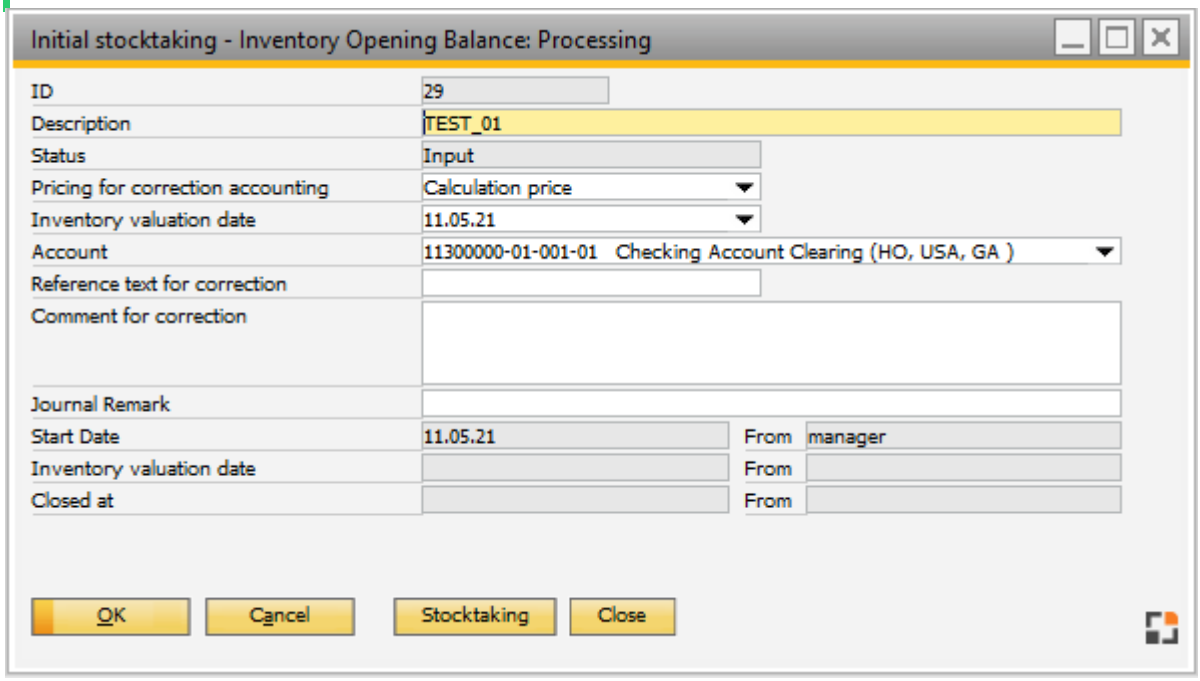
7.9.4.1.1 Edit stocktaking

PATH: Inventory > Inventory transactions > Inventory Opening Balance > **Open / Inventory Administrate** button.



Window mw_inventory_header_stocktaking.psr

Field	Meaning
ID	ID of this process
Description	Description
Item From / To	Filter.
Item property	Filter.
Item group	Filter: can be used to narrow down the number of items to be counted. Only creation of stocktaking / counting list is affected. The "register new" feature is not affected.

© 2026 Boyum IT Solutions A/S

Status	Status of inventory: Input, registration, booked, closed.
Warehouse	Warehouse for which a stocktaking is to be performed. Use the drop down-arrow to select warehouse areas. Note: Beas inventory is not compatible with SAP Bin Managed or WMS-managed warehouses. You cannot select only not bin-managed warehouses or Beas bin-managed warehouses.
Warehouse areas	Selected warehouse areas.
Pricing for correction accounting	Pricing, used for difference posting. Note: Only prices > 0 are taken into account. Pricing type cannot be changed subsequently. If prices are changed, you cannot correct them as long as stocktaking was not completed. ***See*** Inventory list – new valuation. The "last purchase price" is used if no price was stored in the indicated price list. Note: on continuous pricing The price determined here cannot be considered at issue, if continuous pricing is active and the material had to be issued because of a negative difference. For issues, generally the pricing stored in the item is used.
Inventory valuation date	Valuation date for stocktaking. If corrections are required, these will be posted with this date. Note: At the moment of posting, the date may be in future only if this was allowed in **SAP Business One > Administration > System initialization > Document settings > Allow future posting date**

© 2026 Boyum IT Solutions A/S

	See Difference posting.
Account	Select an account to book the values.
Stock increase / reduction	If to use another than the standard account, enter the account here.
Reference text for correction	The entered reference text will appear in correction bookings.
Comment for correction	The entered notes will be added to correction bookings. Beas place holders are supported eg. <today> for the date, at which the posting was performed
Journal Remark	Content of this field will be copied to SAP Business One document "goods receipt" into field "Journal remark", this information is saved in the journal entry. If this field is empty, then default value will be assigned by SAP Business One automatically.
Start date	Time and date, user who started the stocktaking.
Posting date	Time and date, user who started the last difference posting.
Closed at	Date and user who closed the inventory.
As template Save	This stocktaking will be saved as "Inventory Template".

Button	Meaning
OK	Saves stocktaking and closes window.
Cancel	Cancellation without saving.
Stocktaking	Stock is posted into the system.
Close	Completes the inventory, and displays it in Inventory Opening Balance > Closed tab.

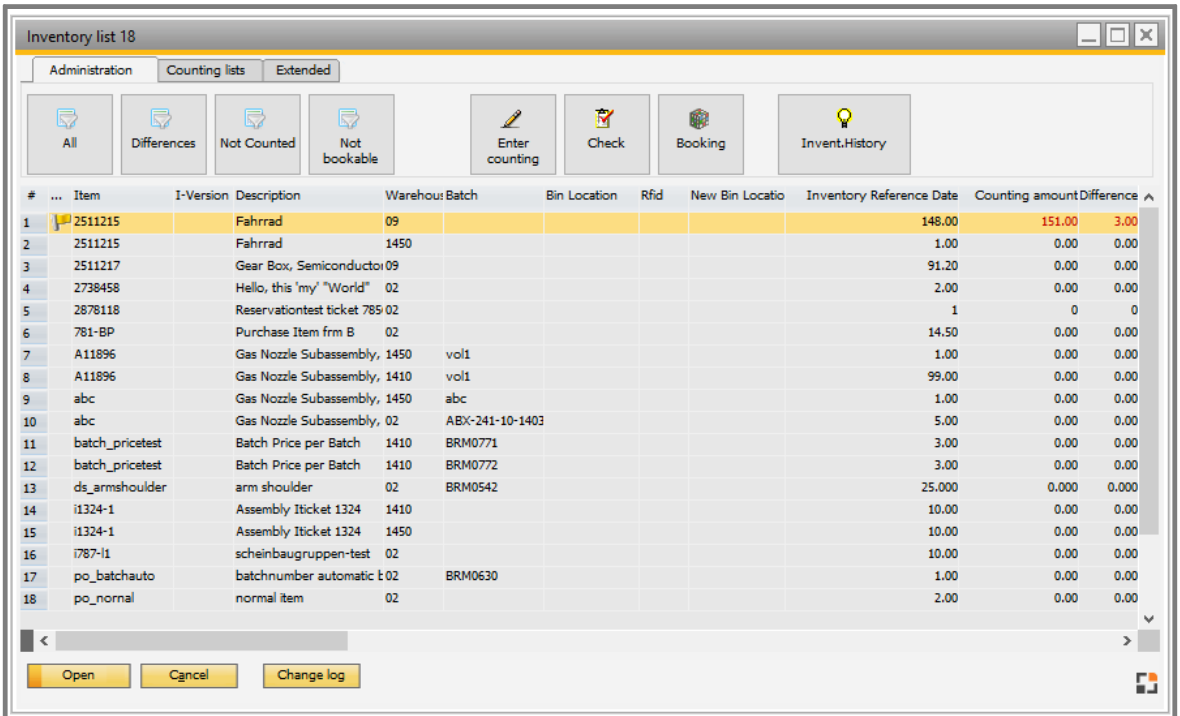
7.9.4.3.2 Inventory list

The inventory list displays all entries to be counted and provides the current counter reading. It is also the management page for stocktaking.

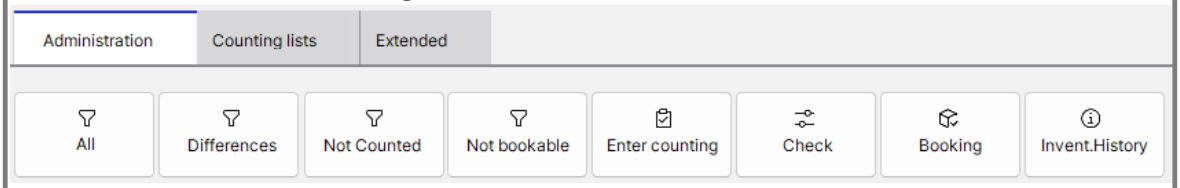
PATH: Inventory > Inventory transactions > Annual inventory count > "Inventory list" button / right-click entry.

Administration tab



Window mw_inventory_items_difference_browse.psr

Button bar in Boyum Style design:



Buttons

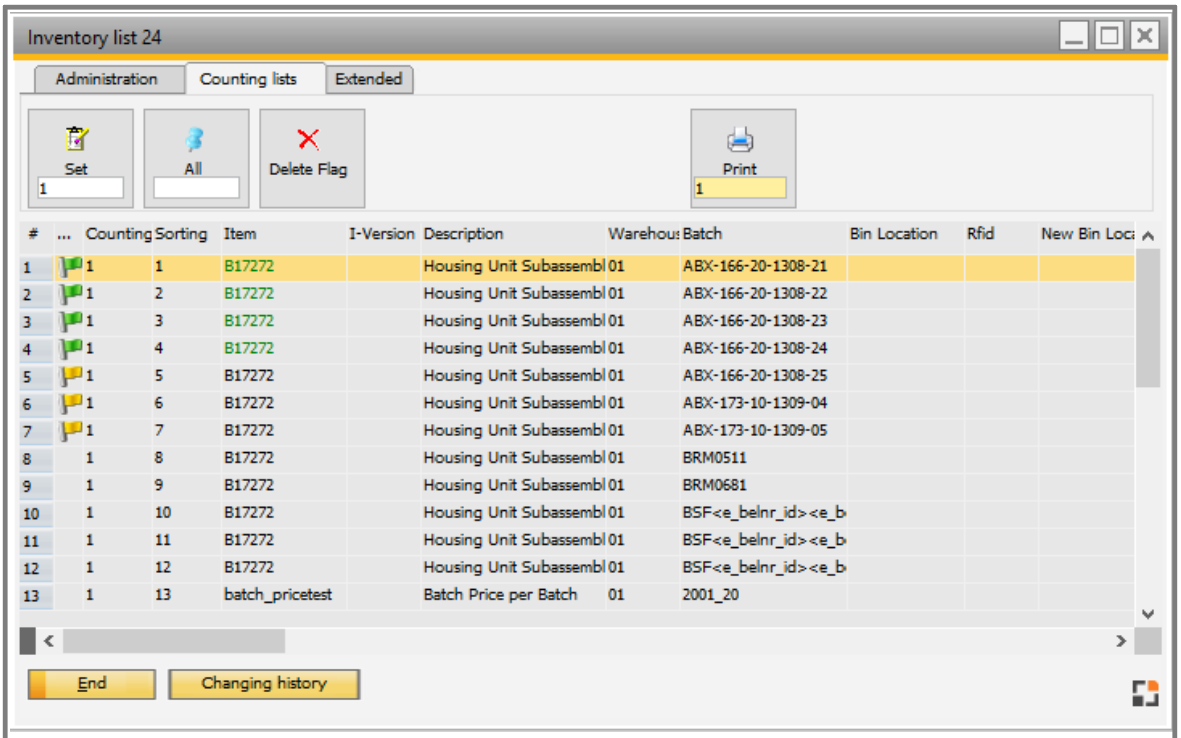
Button	Meaning
All	Filter off, all entries are displayed.
Differences	Filter "only differences" which have been marked as "counted".
Not counted	Filter all entries which are not counted .

© 2026 Boyum IT Solutions A/S

Not bookable	All entries are filtered, which are not bookable according to last check.
Enter counting	Opens list for enter counting to enter counting results.
Check	Check entries (pre-check).
Booking	Book differences.
Inventory history	Call up Inventory history for the selected entry.

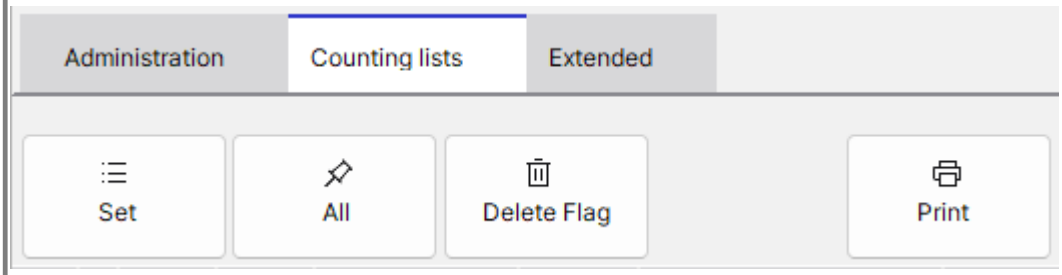
Window settings are available.

Counting lists tab



Window mw_inventory_items_difference_browse.psr

Button bar in Boyum Style design:

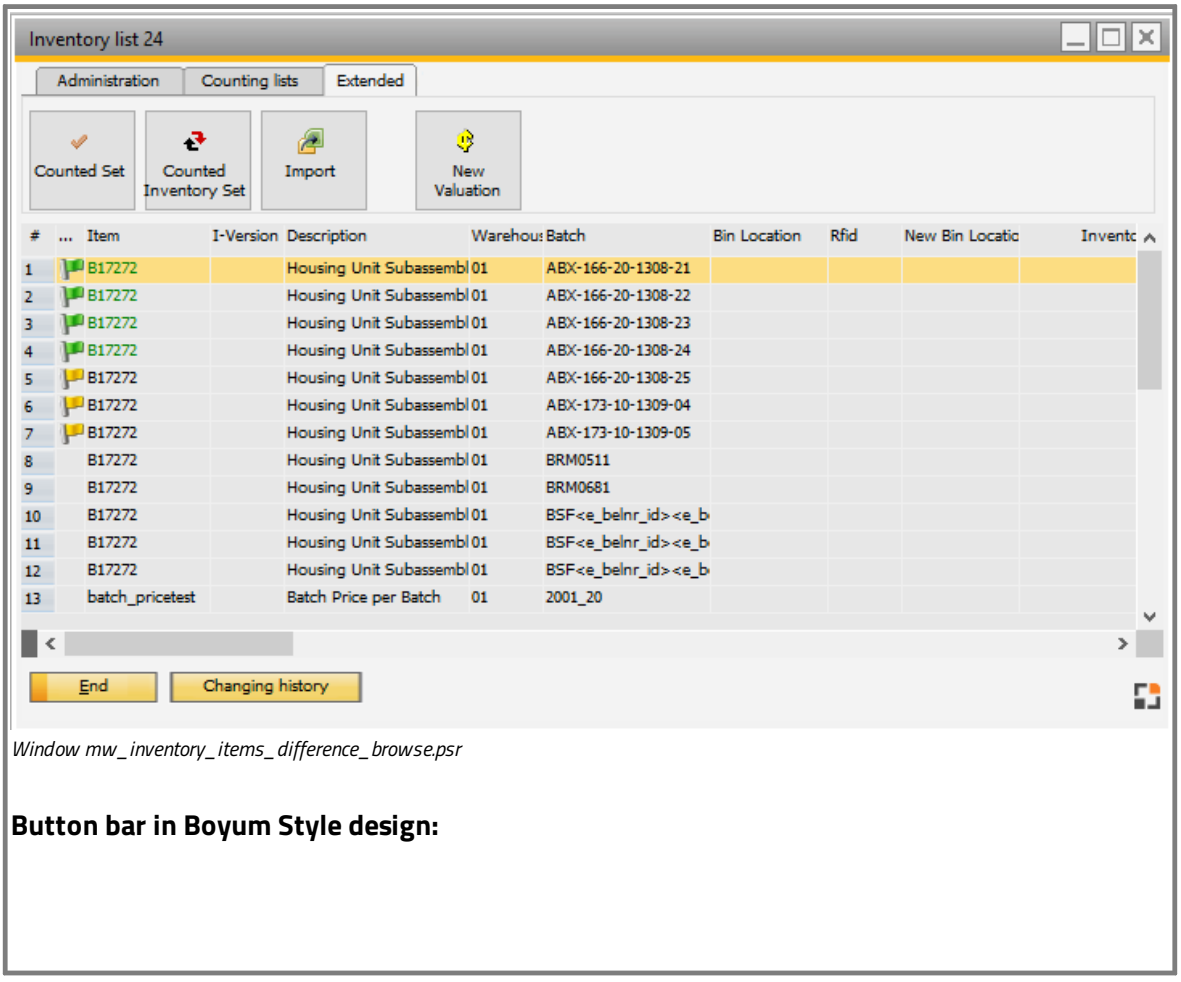


Buttons

© 2026 Boyum IT Solutions A/S

Button	Meaning
Set ...	Several entries can be marked. These are linked to the counting list, which was defined with the button "**Set**" . Entries are sorted by the current order. It is not possible to insert any letters in the button field, only numbers.
All ...	This function distributes visible entries on counting lists. The given number of entries is set to a counting list. Specify the number of entries you want on a count list. ***Example***: 5 entries per count list. Entry 1-5 on count list 1, entry 6-10 on count list 2. Within the counting list, the specified sorting is applied.
Delete flag	All selected entries are deleted. Already booked entries cannot be deleted.
Print	Selected counting list is displayed and can be printed.

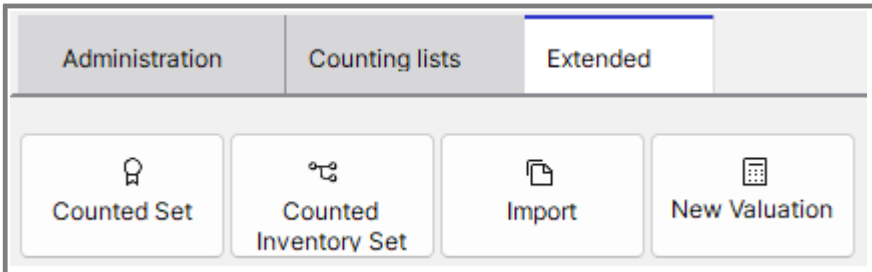
Extended tab



Window mw_inventory_items_difference_browse.psr

Button bar in Boyum Style design:

© 2026 Boyum IT Solutions A/S



Buttons

Button	Meaning
Counted Set	All entries are set to "counted". Differences are posted only if a value was entered or if the switch "Change" was enabled. Selecting "set to counted" the check mark "status changed" is activated for all rows. Use this for example to issue the complete stock. 1. Start stocktaking 2. Set everything to "counted" 3. Book stocktaking
Counted Inventory Set	All counted quantities are set to warehouse stock. With this function, the warehouse stock is used for the column "counted quantity". The columns "warehouse stock" and "counted quantity" are then equal. ***Example***: Only stock deviations are registered. In column "counted" the system stock is entered, the counter corrects then the counted quantity.
Import	Counted values can be imported using a simple text file. New entries are added. ***See*** Import stock.
New valuation	Valuation price is read in new. Read in new valuation prices according to selected pricing. This may be required, if prices are determined and stored only at counting and if they are to be transferred to the counting list.

© 2026 Boyum IT Solutions A/S

Columns

Below the buttons of numerous columns are displayed (configurable via window settings). The columns "count list" and "sorting" must not be moved or set to hidden!
All available fields are now described (view all: Window Settings – Enable all fields).

Columns	Meaning
#	Line number.
...	Line status. Empty = not registered yellow = registered, difference determined and not yet posted green = everything fine: registered and posted, or registered without differences red = Error at posting
Counting list	Number of counting list **Do not hide!** Visible only when switching to Counting list tab.
Sorting	Current sorting **Do not hide!** Visible only when switching to Counting list tab.
Item	Item, If a difference was posted, or if there are no differences displayed in green.
Warehouse	Warehouse code.
Batch	Batch.
Bin location	Bin .
RFID	RFID.
New bin location	New bin after bin correction.
Warehouse stock	Inventory of the selected item at the reference date(start of stocktaking).
Counting amount	Counted quantity.
Difference	Difference.
UoM	Unit of measure.
Status change	Check mark, if status changed, or if bin or counted quantity was changed.
Reserved	Reserved quantity.
Error	Check mark if booking is not possible.
Booked	Check mark if booked.

© 2026 Boyum IT Solutions A/S

Posting error	Description of booking error.
Counter	Name of counter.
Recorder	Name of recorder.
Entry date	Date of entry.
Info	Free text.
Price from entry	Booking price. Note: Only prices > 0 are considered.
Valuation price	Valuation price.
Printing date	Printing date.
Warehouse area	Warehouse area.
Serial ID	ID Number of serial.
Batch attribute	Batch attribute.
Ser. batch number	From SAP Business One-batch number.
Expiration date	Expiration date.
Manufacturing date	Manufacturing date.
Release Date	Date of release.
Bin location	Bin location of first posting of this batch (not the current one).
Details	Details from batch/serial number.
Begin / End of Warranty	Details on warranty from batch/serial number.
Serial	Check mark in case of batch-related item.
Batch	Check mark in case of batch-related item .
Bin location booked	Check mark if bin location has been booked.

back to Annual inventory count

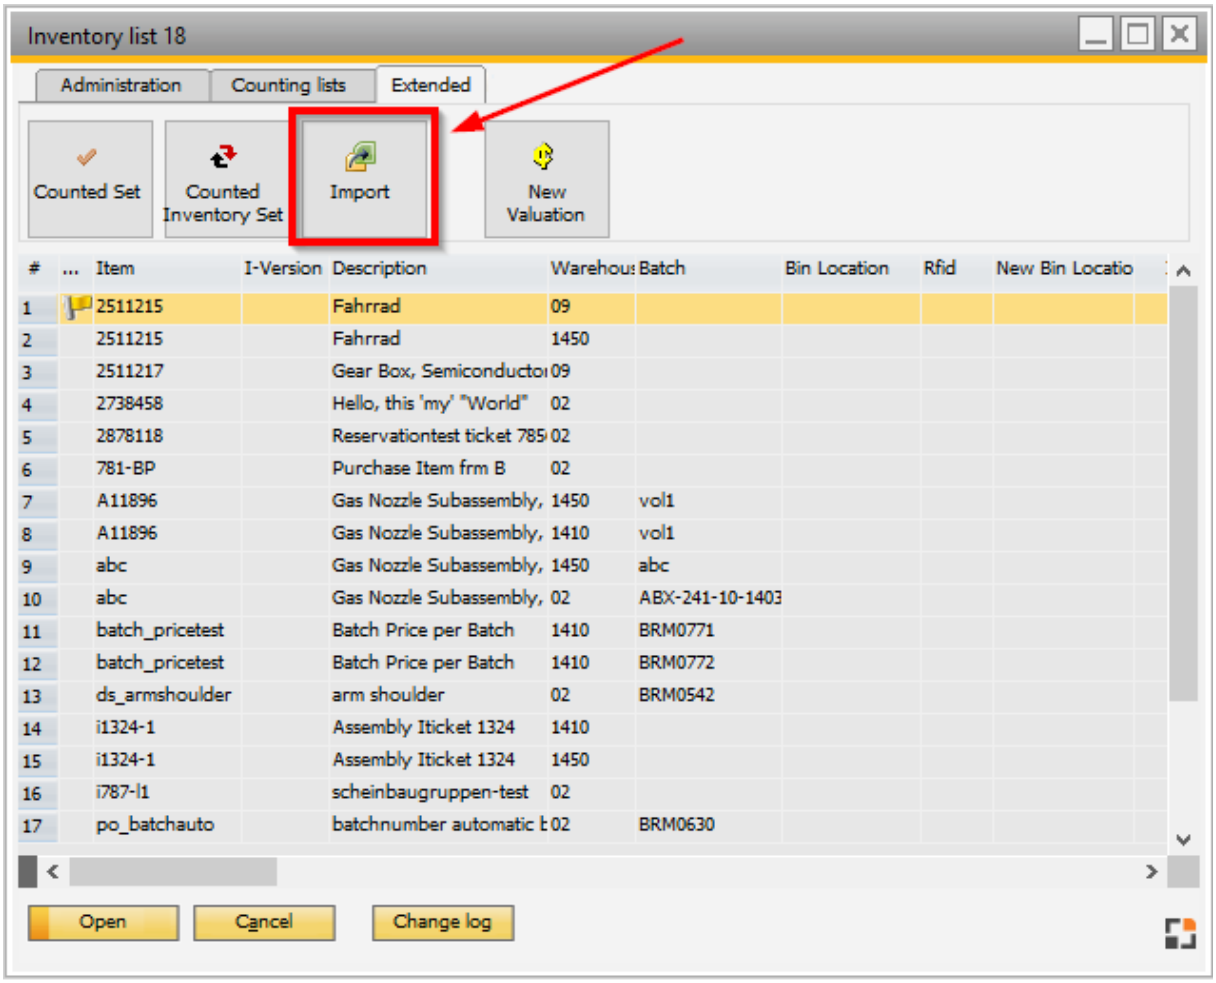
7.9.4.3.2.1 Import inventory

Inventory can be imported with the help of a text file.

After clicking on the **Import** button under **Inventory list > Extended tab**, a warning message pops up where you can confirm the Start of the import.

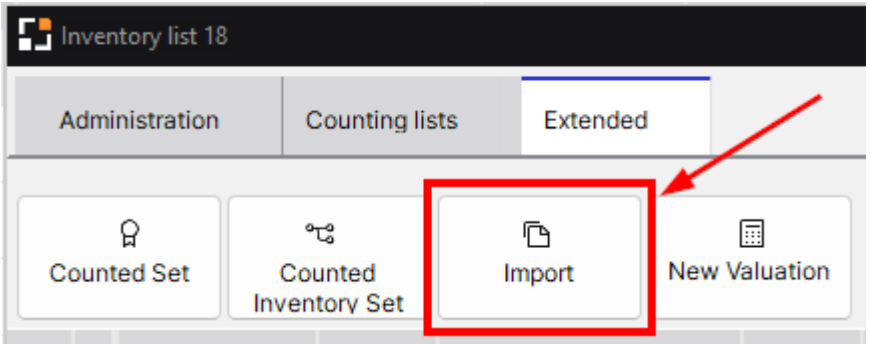
Upon clicking "yes", a browser window opens to select the path for the new import file.

© 2026 Boyum IT Solutions A/S



Window mw_inventory_items_difference_browse.psr

Button bar in Boyum Style design:



A text file in CSV format (tab-separated) needs to be created with the following structure:

```
Item code, quantity, warehouse, bincode, batch or serial number, shelf life (for batch/serial numbers only), Price, Currency, Version (For items version controlled)
```

Example:

© 2026 Boyum IT Solutions A/S

Enter the information in an Excel sheet and save it as a text file:

	A	B	C	D	E	F	G	H	I	J	K
1	itemcode	quantity	warehouse	bincode	batchnum	shelflife	price	currency	version		
2	FP11	230	01		RM210		8	EUR			
3	FP12	870	01		RM220		1,6	EUR			
4	FP13	1400	01		EM1535		8,34	EUR			
5	FP14	567	01		EM1536		7,54	EUR			
6	FP15	123	01		EM1537		5,23	EUR			
7	FP16	4500	01		EM1538		2,33	EUR			
8											

Separator: Tab (Char 9)

Date format in yyyy / mm / dd , e.g. 2008/12/31 or in the format of the Windows regional settings.
Numbers in the format of the Windows regional settings.

All values need to be entered. If a value does not exist, leave the field empty. Enter no title.

- Example with (item number, quantity and storage location only):

```
100004[TAB]1,4[TAB]001[TAB][TAB][TAB]
100005[TAB]1,5[TAB]002[TAB][TAB][TAB]
```

Field	Meaning
Item number	Item number to register. Item must exist in the system.
Quantity	Counting amount in Inventory UoM without thousands marker. As decimal separator the character according to windows-system setting is required. ***Example***: German regional settings: 25,5 ***Example***: American regional settings: 25.5 For serial number related items: only the amount of 1 is allowed.
Warehouse	Target warehouse; needs to be deposited in the item.
Bin location	For warehouse with bin locations, enter bin code.
Batch	For batch-related items: batch number. For serial number related items: serial number Use DistNumber (visible batch number), not internal system number.

© 2026 Boyum IT Solutions A/S

Shelf Life	Optional entry of expiration date. Use format of windows regional settings or in format yyyy/mm/dd ***Example:*** 2018/04/03
Price	Optional. Format see quantity. **NOTE:** Only prices > 0 are taken into account.
Currency	Currency for price.
Version	Item Version of the Item. (System does not validate if the assigned version exists for selected item)

Import entries are then checked immediately by the pre-check and incorrect entries are marked as not bookable.

back to Inventory Opening Balance

7.9.4.3.2.2 Difference posting and pre-check

After recording counted stock or initial stock (initial stocktaking) a Pre-check is performed followed by the Posting of differences.

Pre-check

Before differences (or initial stock values) are posted data is checked for accuracy. A check is also performed after an import or if clicking in "check" in annual inventory count. Entries which did not pass the check are marked, the error description is displayed under "error info".

- The following is checked

Item deleted	Item was marked in SAP Business One as deleted.
Item blocked	Item is blocked. Posting not possible.
Warehouse (Item) not found	Warehouse is not existing or is not deposited in the item.
Warehouse blocked	Warehouse is blocked. Posting not possible.
Bin location not found	The given bin location does not exist.
Entry: not unique	Entry is not unique.
Batch: not unique	Batch is not unique.
Negative quantity	Negative quantities are not supported by Beas
Price missing	If a posting is necessary because the counted stock is larger than the system stock, and no price could be determined, an

© 2026 Boyum IT Solutions A/S

	error message is issued and Beas prompts a price to be entered. If no posting is necessary because the counted stock is less than / equal to the system stock, a missing price does not trigger an error message.

Posting differences

The difference between system stock and counted stock is posted. For regular inventory (Cycle Count Recommendations) or annual inventory count the system stock represents the stock at the moment the inventory was started. After manual (handwritten) registration of counted stock, normal work can continue, even if the accounting of differences was not performed (for example early release of storage areas is possible)

Only the following entries are posted

- If not marked as incorrect by Pre-check
- Status "Modified" activated
- If not marked as "posted"

Note:

- As valuation date, the date set up in Inventory is applied. At the moment of posting, the date may be in future only if this was allowed in **SAP Business One > Administration > System initialization > Document settings > Allow future posting date.**

- SAP or WMS Bin managed warehouses are not supported.

SAP stock posting disabled

Beas uses for posting the SAP B1 function
- "Goods receipt"
- "Goods issue"

The system cannot use the SAP Inventory counting function.

First, difference receipt, then difference issues are posted. If continuous stocktaking is enabled, the stored price cannot be used when reducing stock, because issues are always performed using the standard valuation method of the item.

Grouping in posting document: counted numbers are grouped in the posting document by

© 2026 Boyum IT Solutions A/S

- Item
- Warehouse
- Price

If several batches of an item can be found in a warehouse, only one document line is created, and the batch stock correction is deposited behind the document line. If one of the batch entries has a different price, a new document line is created. The same applies for bin locations and serial numbers. Thus, the number of transactions is reduced significantly, and the creation of documents is optimized.

The system creates receipt/issue documents with max. 500 document lines.
In case of an item in the same warehouse with same price and same batch number, the system creates only one line. The system creates a new line only if one of the parameters is different.
Why: The increased number of lines can cause instability in the SAP DI-API.
If the system cannot create the receipt with 500 lines, it tries with 50, then 2 and then 1. In this case you can find out, which item produces a problem.

Note:
With an increased number of entries, the process may take long.

In SAP Business One there is a limitation of 10000 Lines.

Note on mass postings

When posting large amounts of data it can be expected that the posting may take a long time. The PC must have enough memory. With more than 15,000 stock registrations, a 64-bit operating system with at least 4 GB of main memory is recommended.
If the posting process takes too long due to many posting errors or large amounts of data, it may happen that the SAP Business One interface cancels the connection to Beas (timeout). In this case, the application must be re-started. The posting can be started again at any time. Already posted entries are not posted again.

back to Inventory Opening Balance

7.9.4.3.3 Inventory template

For recurring stocktaking templates can be saved. (edit inventory – save as template). Templates are managed here.

Field	Meaning

© 2026 Boyum IT Solutions A/S

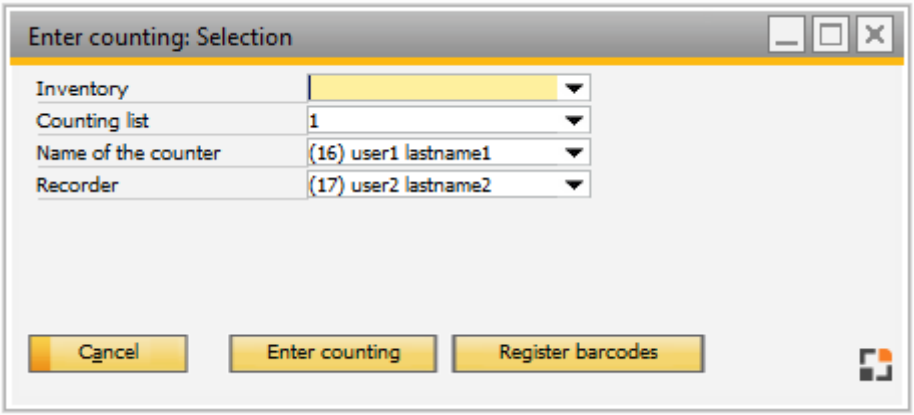
End	Window is closed.
Use	The selected template is used for new inventory. The inventory editing window opens. ***See*** Edit inventory.
New	Opens a new inventory without a template.

back to Annual inventory count

7.9.4.4 Enter counting: selection

Selection window for counting lists entry. Via "Enter counting" inventory can be registered in a list. The entries are saved immediately, making possible a simultaneous registration by several employees. Next to stock other values as batch information or bin corrections can be registered. The count list is dynamically adjustable and supports templates. Depending on the kind of inventory, counting entry can be adjusted, for example "only counted" what means that the switch "counted"is activated, but no stock is entered.

PATH: Inventory > Inventory transactions > Enter counting: selection.



Window mw_inventory_counting_choose.psr

Call up via Annual inventory, via Cycle Count Recommendations or via menu item "enter counting", it can also be included in the terminal screen. A reading access on inventory is required. When called up via the menu item "enter counting", the active inventory, the counter, typist and the count list need to be specified. If no count lists are defined, leave the "1".

If called directly from inventory, as user the person currently logged in will be used. All counting lists are displayed.

Button

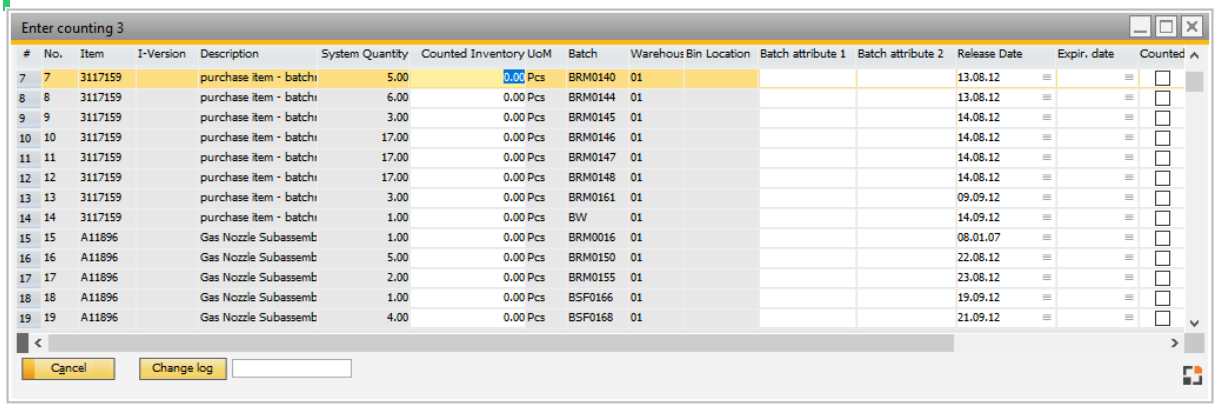
Register barcodes	Open Bar code registration.

back to inventory.

7.9.4.4.1 List for enter counting

In this window you can enter counting and related information for inventory.

PATH: Inventory > Inventory transactions > Enter counting: selection > **Enter counting** button.



Window mw_inventory_counting_browse.psr

Field	Meaning
Counting list	Counting list number.
Sorting	Continuous number within the counting list.
Item	Item number.
Batch	Batch number
Description	Item description.
Warehouse inventory	Inventory deposited in system.
Counted inventory	Enter the currently counted stock.
UoM	Inventory unit of measure.
Batch	Batch number.
Warehouse	Warehouse of the item.
Bin location	Bin location of the item.
New bin	New bin location: entry for Bin location correction.

© 2026 Boyum IT Solutions A/S

Batch Attribute 1-2	Batch attributes
Counted	Set check mark, to mark as counted. If Inventory quantity is entered, this check mark is automatically set as active.

Window settings and templates are supported.

Button

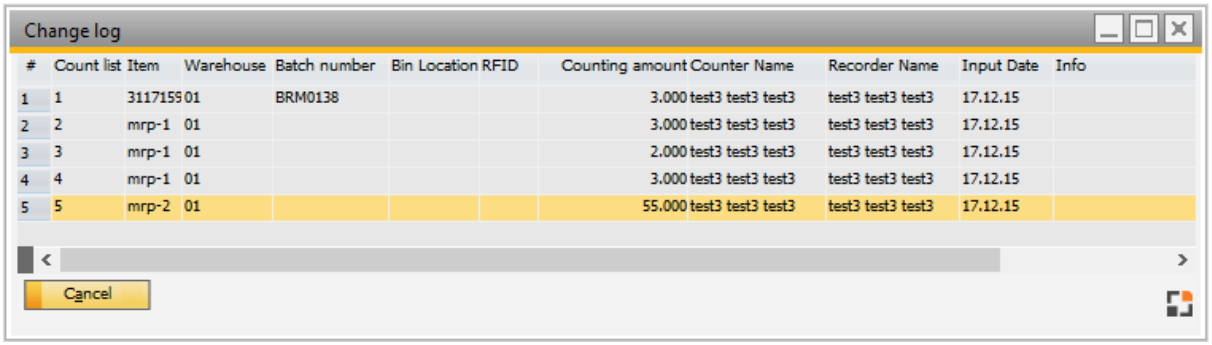
Change log.

back to Enter counting.

7.9.4.4.1.1 Inventory Change log

All changes made during the inventory are logged here. All standard filter functions are supported.

PATH: Inventory > Inventory transactions > Annual inventory count > **Inventory list** button > **Change Log** button.



Window mw_inventory_history_browse.psr

Column	Meaning
Item	Item.
Warehouse	Warehouse.
Batch number	Batch number.
Serial number	Serial number.
Bin location	Bin location.
RFID	RFID.
Counting amount	Counted quantity.
Counter Name	Name of counter.

© 2026 Boyum IT Solutions A/S

Recorder Name	Name of recorder.
Input Date	Registered (date).
Info	Free text.
Inventory price	Inventory price.

back to enter counting

7.9.4.4.1.2 Bin location correction

If the stock of an item is correct, but the item is on the wrong bin location, this can be corrected here. To enable this feature, in list for counting entry the column "new bin" needs to be activated (***see*** window settings). Now the correct bin location can be entered or selected using the right mouse button. The entry is then marked as "counted". If previously no count had been entered, it is set to the system stock.

Posting process: if a difference exists between system stock and counted stock on the given bin location, it is booked. If the difference is correct, or if there have been no differences, the transfer to the specified bin location is performed. This bin location transfer is displayed in the item movement protocol and has the inventory number as document number and the reference text of the inventory. During this transfer process, no SAP document is created.
If the transfer was carried out correctly, the current bin location is displayed in green. This is considered as a mark that a bin correction has taken place.

Valuation
Posting-in, material is valued according to inventory settings. Only prices >0 are considered.
See

Edit inventory

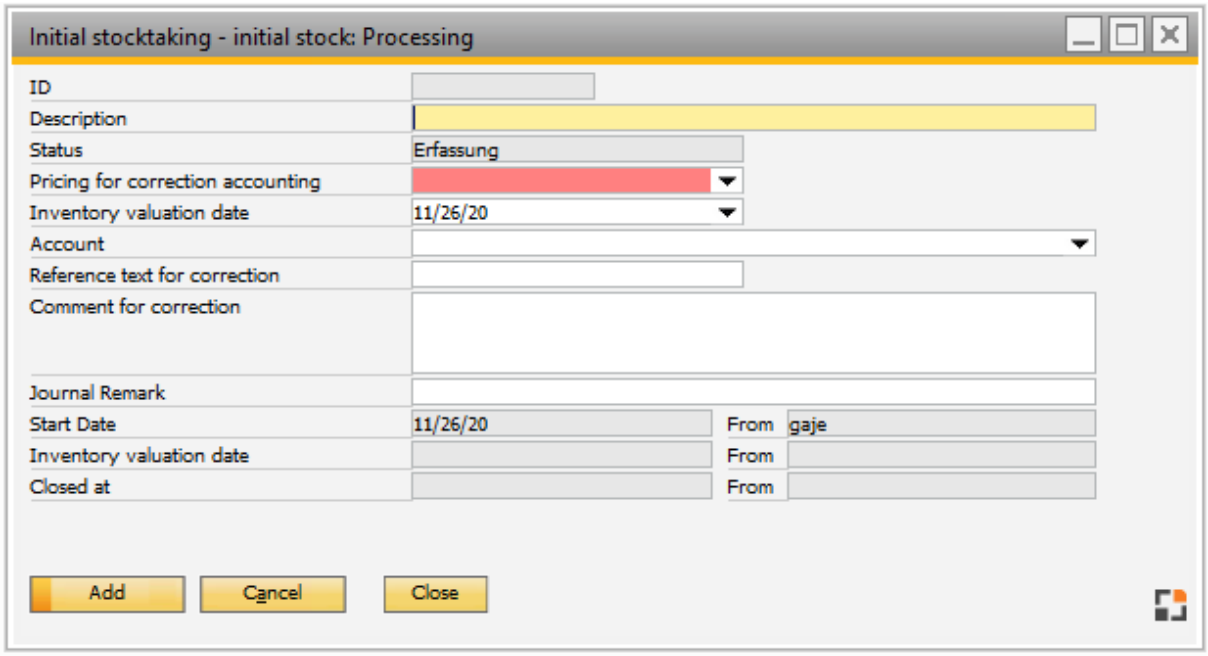
7.9.4.4.1.3 Initial stock taking

Window for manual stock entry. Specific entry fields are made available depending on item and warehouse type. Mandatory fields are displayed in red.

PATH: Inventory > Inventory transactions > Inventory Opening Balance > **Open** an entry

© 2026 Boyum IT Solutions A/S



Window mw_inventory_header_stocktaking.psr

Field	Meaning
ID	Stocktaking ID. (continuous number through all kinds of stocktaking).
Description	Description.
Status	Status of inventory: registration, booked, closed.
Pricing for correction posting	Pricing, which is used for difference posting.
Inventory valuation date	Valuation date for this stocktaking. If correction postings are necessary, they will be done by this date.
Account for posting in and issue	If to use another than the standard account, enter the account here.
Correction reference	The entered reference text will appear in correction bookings.
Comment on correction	The entered notes will be added to correction bookings. Beas-place holders are supported e.g. <today> for the date, at which the posting was performed.
Remark	Free text
Start date	Time and date, user who started the stocktaking.

© 2026 Boyum IT Solutions A/S

Inventory valuation date	Time and date, user who started the last difference posting.
Closed at	Date and user who closed the inventory.

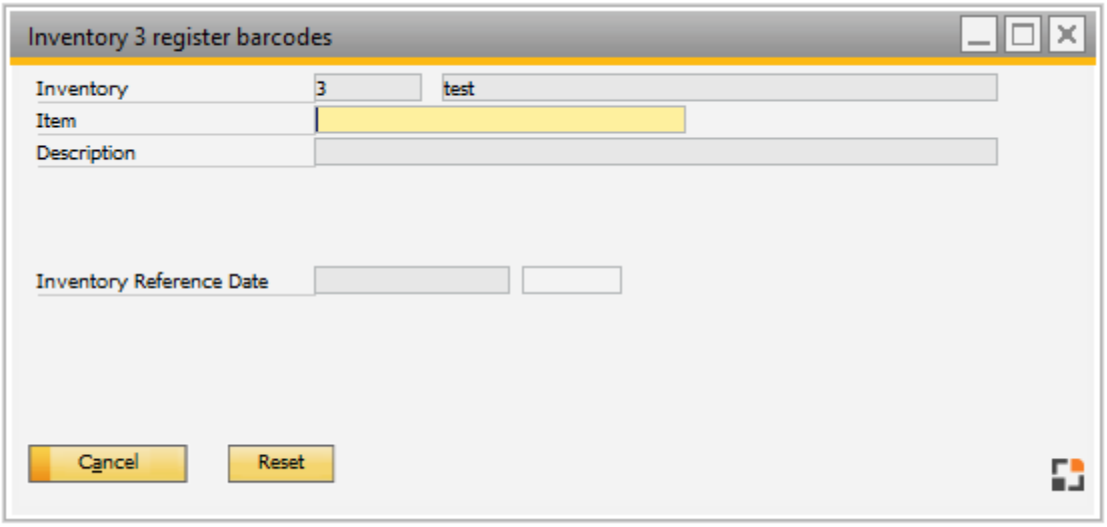
back to Initial stock

7.9.4.4.2 Enter barcodes

Quick entry screen optimized for bar code readers.

PATH: Inventory > Inventory transactions > Enter counting: selection > **Register bar codes** button.

Data is registered directly, fields released successively. First the item, then batch/serial number, followed by warehouse, bin and quantity. After the quantity has been registered, it is transferred to the counting list, and the screen is closed again.
If the item is not part of the counting list, it will be added. Counting lists are not considered, and the complete inventory is checked.



Window mw_inventory_counting_scan.psr

Field	Meaning
Inventory	Inventory ID.
Item	Enter the Item Code.
Description	Item description.
Batch / Serial Number	Insert the Serial or Batch Number. Only visible if the item is a serial- or batch-managed item.

© 2026 Boyum IT Solutions A/S

	If you insert a non-existing Batch number, the system generate one automatically.
Warehouse	Insert Warehouse information. All warehouses are allowed. Warehouse selection from inventory start is not considered. **Attention:** SAP Bin Management and WMS Bin Management are not supported.
Bin Location	Insert the Bin Location Only visible if the selected Warehouse is a Beas bin managed warehouse.
Inventory reference date	Stock of the last reference date is displayed.
Counting amount	Enter the total amount. If you inserted the amount before, you can see the old number. You can replace this with the total number. ***Example***: There is a batch in two different locations in the same warehouse (no bin management). Location 1: 10 Pcs, Location 2: 15 Pcs --> Insert 25 Pcs.

back to enter counting

7.9.5 Batch calculation (precalculation)

Batch calculation (precalculation)

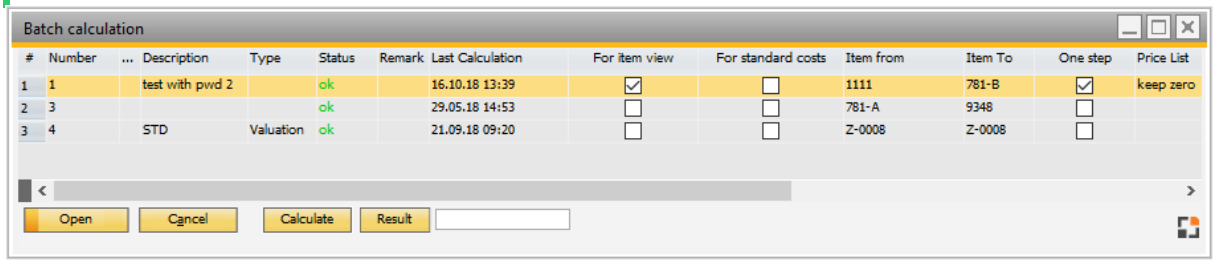
- Batch calculation overview
  - Edit Batch calculation
    - Selection tab
    - In-house production
    - Purchased items
    - Extended tab

With batch calculation, price lists can be calculated and used as a basis for standard cost method or price valuation. The detailed results are stored and archived. Several calculation scenarios can be created, whereas only one scenario is used for price valuation or standard cost method. In the **item**

© 2026 Boyum IT Solutions A/S

master > Calculation tab the result of a batch calculation for specific item can be displayed in details or as a histogram or list.

PATH: Inventory > Inventory transactions > Batch calculation.

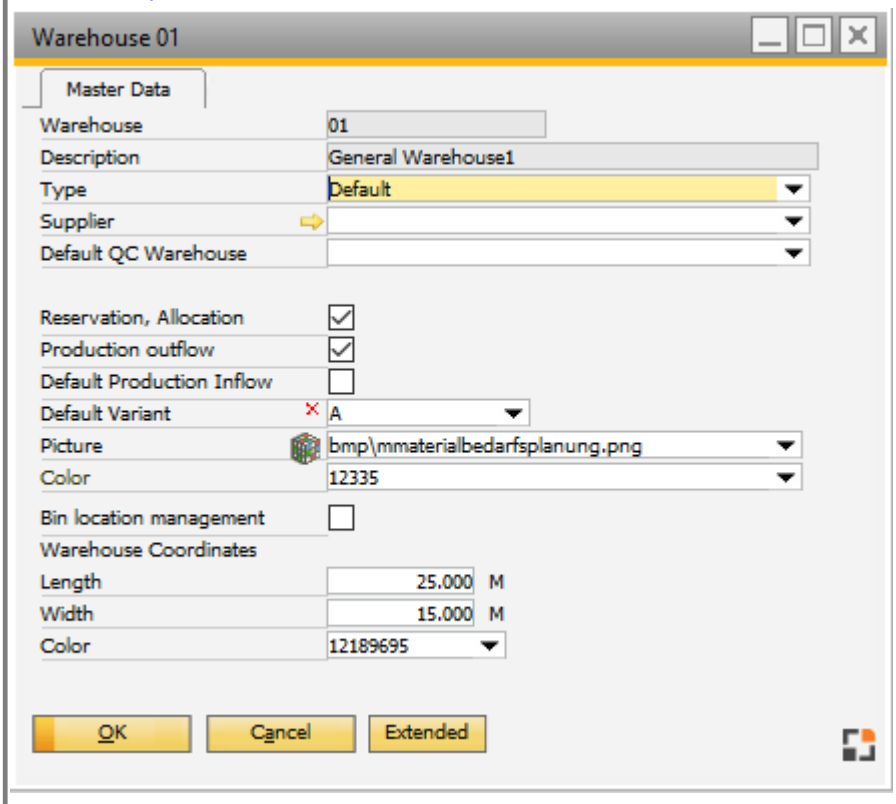


Window pk_batchkalk_browse.psr

Important Notes

Short Variants

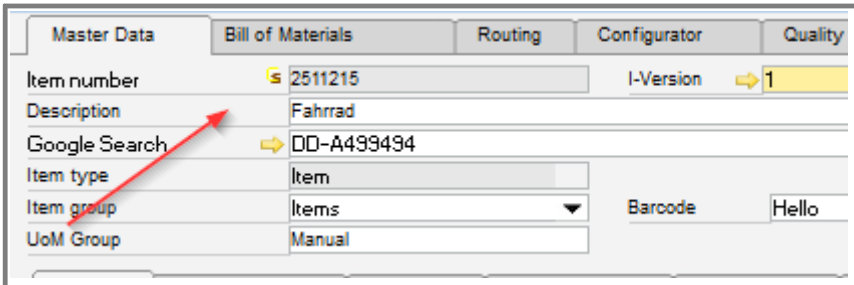
For item variants, items with value "A" are used. If Default Variant defined in Warehouse and calculation per warehouse is used, it uses the Variant defined in the warehouse.



Formulas, Formula, Variant Script

In item Master Data you can define additional script, in Bill of Materials and Routing position you can link formulas and tables via click on yellow "C".

© 2026 Boyum IT Solutions A/S



The Batch calculation does not support this and ignores all related settings and definitions.

Item Version

Batch calculation supports Item Version and always uses the Version, which is defined in the Item Master Data - I-Version field.

Schema script

In the calculation schema you can define your own scripts.
Only fields relevant for the calculation are filled:
That means drawing number, designation additional identifier and other fields are not filled.
All fields will only be visible if you activate "Precalculation save" in **Batch calculation > Master Data > Extended**, but the calculation time takes time and produces a lot of data.

Exchange rates

The system checks if exchange rates are defined. If calculation is running over midnight and the exchange rate is not defined for the next day, the system takes the last defined exchange rate.

The batch calculation can be performed automatically e.g. weekly, overnight by using the Beasserver. ***see*** Beas Manage Server.

The calculation settings stored in **Configuration Wizard > Calculation > Precalculation** are used for the calculation.
The batch calculation uses the calculation lot sizes in Inventory UoM.

Selection tab

© 2026 Boyum IT Solutions A/S

Window: pk_batchkalk_edit

Field	Description
Item Range	Item range to be calculated (item numbers from–to).
Item Group	Item groups to be calculated.
Material group	Material groups to be calculated.
Item properties	☐ Only the items with the selected item properties are calculated. If these are not selected, this setting is ignored. You can use an OR or AND connector to specify which items should be considered with which item properties.
Employee	Consideration item only from the employee chosen here.

Filter SQL	☐ Own conditions; define via SQL.
	An own SQL statement can be stored here, with which the containment can be executed.
	
	Click on the SQL Icon left of field to define the SQL Filter.
	 	Window sys_sqleditor_inserted
	
	Here you can define the SQL statement after "WHERE"
	
	`select "OITM"."ItemCode" from "OITM"`
	`where /* all other filter */ /* your filter */`
	
	Available tables: BEAS_PK_BATCHCALC and Item Table "OITM"

© 2026 Boyum IT Solutions A/S

	Example: Only all items which begin with "A". `and substring("ItemCode",1,1)='A'` If a faulty SQL statement is entered, a red flag is displayed. If it is correct, a green flag is displayed.
Last goods receipt	All items delivered in the last x days If a value is entered here, only the items posted in the previous days (not working days) will be considered via purchase – goods receipt. Use this for revaluation of purchase parts. Note: If this restriction is not to be considered, the value of this field has to be deleted completely.
Blocked items	If enabled, blocked items are included to the calculation. Default: inactive. All items that are marked as "inactive" in the Item master data and belong to the Item range are considered by this setting. **IMPORTANT:** The blocked sub-assembly of an item is **not** included in the calculation!

Note: Deleted items `(OITM.Deleted='N')` and items of other type than "item" `(OITM.ItemType='I')` are generally not included into the calculation.

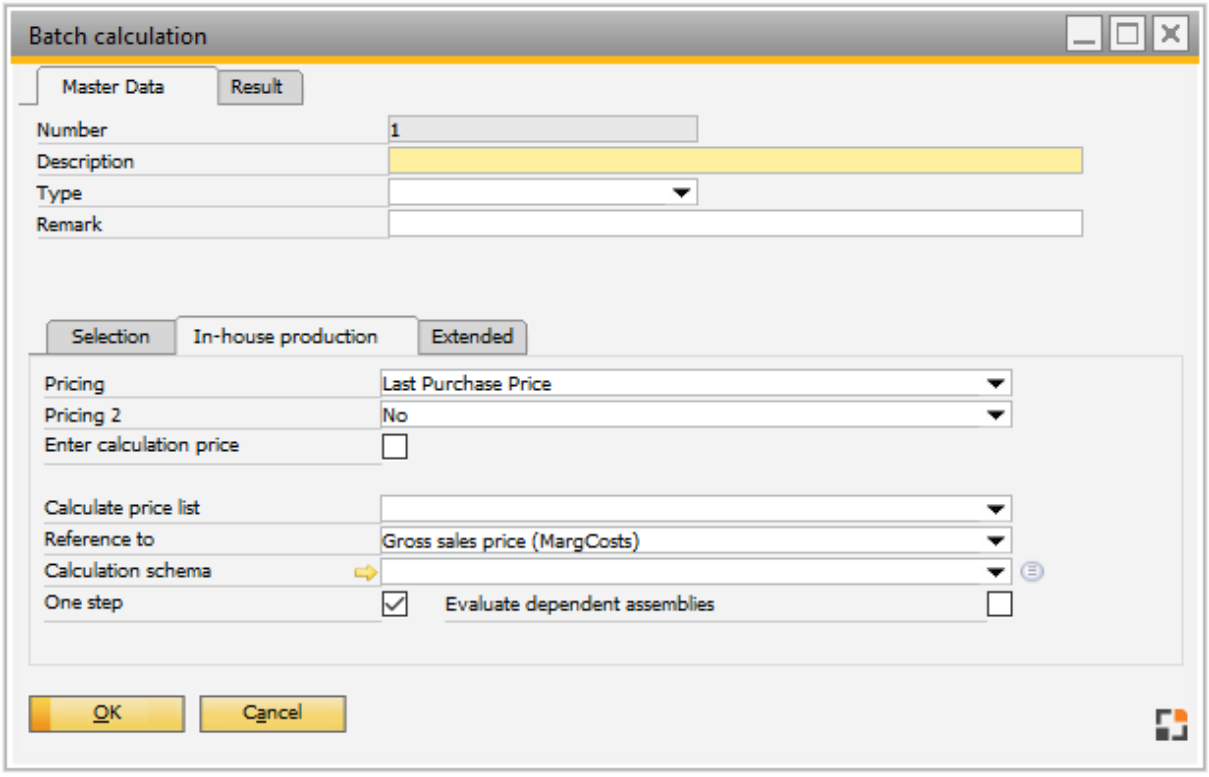
7.9.5.1.1.2 In-house production

Batch calculation (precalculation)
Batch calculation overview
Edit Batch calculation
Selection tab
In-house production
Purchased items
Extended tab

In-house production tab

© 2026 Boyum IT Solutions A/S



Window: pk_batchkalk_edit

Field	Description
Calculate In-house Production	Should parts produced in-house be calculated? Activated by default. *Field: eigenteil (J =on - standard, N=off)*
Pricing	Pricing for calculation If this field is not filled, standard settings will be used. ***See*** Precalculation - Material - Purchase price. Configuration wizard - Calculation - Precalculation - Pricing.
Pricing 2	Second pricing if no price could be determined with the first one
Enter calculation price	Should the calculation price stored in the item master data be entered? If so, you can specify the price in the following field. This field is visible only if "per warehouse" was not enabled. ***See*** Item - Calculation - Calculation price.
Includes price for	Specifies the value of the calculation price to be entered. This field is visible only if "fill calculated price" was enabled. ***See*** Item - Calculation - Calculation price.

© 2026 Boyum IT Solutions A/S

Calculate price list	Specify whether a price list should be filled. If a price list was selected, you can specify the price that should be entered in the following field. This field is visible only if "per warehouse" was not enabled. Note: Saving the price list is very time-consuming. If Beas finds a Beas-Common-Service running, the price list update is moved to that service. Therefore, the Precalculation can be completed faster.
Reference to	Specifies the price that should be entered in the price list. At single level calculation this price is used for "material price determination" for the upper assembly. ***See*** single step.
Calculation schema	You can select a calculation schema to be used to perform the calculation. ***See*** Calculation schema.
One step	When enabled, only the first level of the calculation is calculated. Sub-assemblies are not broken down but calculated as purchase parts; phantom assemblies are broken down. Depending on the switch "**value depending assemblies**" (see below) sub-assemblies are always valued first. Example Calculation item area A-C. Assembly A contains a sub-assembly B which again includes a sub-assembly C. First the assembly C is calculated, then B and A as last. The sub-assembly is valued with the value indicated in "**Price list" - "with reference to**". If the sub-assembly was not valued before, the price according to "pricing" is used. Example

© 2026 Boyum IT Solutions A/S

	Calculation item area A-B "**value depending assemblies**" disabled. Assembly A contains a sub-assembly B which again includes a sub-assembly C. First, assembly B is calculated, C is valued according to "pricing" like material. Assembly A is calculated as last, for valuation of B the calculation result is used - according to the setting "with reference to". Note: If you use "One Step", the result can be different than when the option is disabled. Reason: if you work with one step, the system calculates the sub-assembly with all costs from the calculation schema. The main item uses this result in its Bill of materials and adds the costs of calculation schema at the end again. If disabled, the system calculates the complete structure and adds costs from the calculation schema once. Note: If purchase parts are included in the batch run, the calculated price of the purchase parts is used as reference for material valuation when calculating the assemblies. *Field: onelevel (1=on, 0=off - Standard)*
Evaluate dependent assembly	Button is visible only if "One step" was activated. If active, sub-assemblies of the assemblies to be valued are also valued even if they do not fit the selected filter. Example Filter: All items from A-B Item A is calculated, which includes items B and C If the switch is active, items B and C are valued before. If the switch is not active, only item B is valued. For item C the price according to pricing is used. Note: Variants are not checked! ***Example:***

© 2026 Boyum IT Solutions A/S

	sub-assembly B1 variant "A", B2 for variant "B" Both sub-assemblies are calculated, even if only one of the sub-assemblies is included in the calculation of the superordinate assembly. *Field: onelevellinked,(1=on, 0=off - Standard) Version: beas9.9-000-000-006*

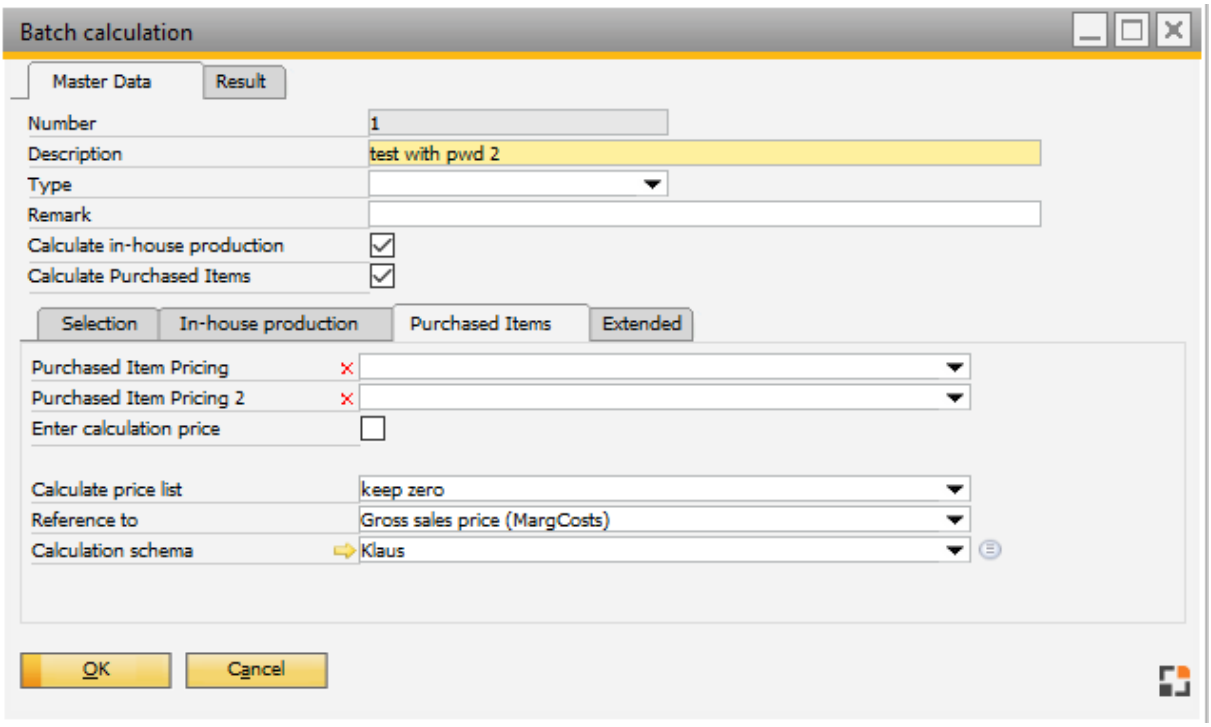
back to overview batch calculations

7.9.5.1.1.3 Purchased items

Batch calculation (precalculation)
Batch calculation overview
Edit Batch calculation
Selection tab
In-house production
Purchased items
Extended tab

Purchased items tab

A calculation of purchased items is only possible if activated in **Configuration wizard > Calculation > Precalculation.**



Window: pk_batchkalk_edit

© 2026 Boyum IT Solutions A/S

Field	Description

Calculate Purchase Items	You can use a purchased item evaluation, for example, to add administration costs and any other costs at a default price defined by pricing, and to fill a price list.
	Calculation for this area is deactivated by default.
	
	Purchase part calculation may be used for generating a sales price list, after adding storage costs, transport costs, revenue etc.
	
	Notes
	Purchase parts are calculated the same way as assemblies. Stored routings and materials are taken into account. If no BOM was stored, the material itself is taken as reference, all surcharges from the selected calculation schema are added, and the price is saved.
	
	Example 1
	
	`Material A`
	`  |_ Material B`
	
	Result = `Costs from Material B + Calculation Schema`
	
	Example 2
	
	`Material A (without Bill of Material)`
	
	Result = `Costs from Material A + Calculation Schema`
	
	Order of calculation
	
	When calculating assemblies and purchase parts, first the purchase parts are calculated and the resulting value is incorporated into the assembly.
	
	Field: kaufteil (J=on, N=off - Standard)

Purchased Item pricing	Pricing for calculation. If this field is not filled, standard settings are used.

© 2026 Boyum IT Solutions A/S

	See Precalculation - Material - Purchase price Configuration wizard - Calculation - Precalculation - Pricing
Purchased Item pricing 2	Second pricing if no price could be determined with the first one.
Enter calculation price	Should the calculation price stored in the item master data be entered? If so, you can specify the price in the following field. This field is visible only if "per warehouse" was not enabled. ***See*** Item - Calculation - Calculation price
Calculate price list	Specify whether a price list should be filled If a price list was selected, you can specify the price that should be entered in the following field. This field is visible only if "per warehouse" was not enabled. Saving the price list is very time-consuming; it can double computation time. If the Beas common interface is active, the process is executed asynchronously using this interface. Thus, price lists are updated using fewer resources. **Note:** The price list is filled using DI-API. The user starting the calculation requires rights to change prices via DI-API. ***See*** Server management
Reference to	Specifies the price that should be entered in the price list. This field is visible only if at "fill price list" a price list was selected.
Calculation schema	You can select a calculation schema to be used to perform the calculation. ***See*** Calculation schema.

Field descriptions

Field	Description
Consider special price list	Independent of the Configuration wizard, you can set up whether to consider special price lists and blanket agreements.
Per Warehouse	If enabled, calculation is performed per warehouse. In the next field, the warehouses to be included can be limited. Note The field is only visible if "Price per warehouse" was set up in SAP Business Onebasic initialization. If enabled, no prices can be saved to the price list or to the calculation price, because there a price per warehouse is not allowed.

© 2026 Boyum IT Solutions A/S

	This calculation is computationally extensive.  ***See*** Precalculation - Material - Purchase price
For item view	If active, the result of this calculation is displayed in item master; under "calculation" detailed information of the last calculation and various diagrams can be displayed. Only the result of one batch calculation is displayed. This can be used to define which of the batch calculations shall be used for the view.
For standard costs	Result is used as default for standard costs calculation and one stage post-calculation. **Standard costs** If active, this batch calculation is used for valuation of standard costs. In this case, the button "stock revaluation" is displayed in the results list. You can revalue the calculated items with this option. Furthermore, this switch affects the standard valuation method, and the **Detail** function in Batch calculation results. **Post calculation – Single stage valuation** In one stage post calculation "last Precalculation" can be used as a valuation form. The Precalculation in which this switch was activated is considered in this case. ***See*** Configuration wizard - Post calculation - Singe stage valuation

© 2026 Boyum IT Solutions A/S

	Note: If enabled, the type of batch calculation is set automatically to "valuation". For "Pricing per warehouse" you need to set up "per warehouse" here - Do not select the option "save Precalculation". ***See***: Batch calculation – stock revaluation Valuation of assembly – Standard costs method Concept: valuation of assemblies WO items Edit Batch-calculation – Standard costs
Variant	⊟ Determine the default variant to be used If any other than variant "A" shall be used as default, enter the variant here. You can also store a variant in warehouse definition; the variant stored there has a higher priority.
Warehouse	⊟ For which warehouse price calculation must be created This field is only visible if "per Warehouse" is activated. Define, for which warehouse the price must be calculated. For more information ***see*** per Warehouse.
Calculate autom.	⊟ If active, this calculation is executed automatically The batch-calculation can be started automatically via an activity. Use this switch to control whether this batch-calculation is to be included. ***See*** Activities.
Last calculation	Date of last calculation
As service	Determines the mode of calculation. ⊟ Enabled If the batch-calculation is started, it is carried out in the background. You can continue working. This is also possible for big amounts of data. This service uses the same, currently logged-on user – please make sure that all necessary rights have been granted. ⊟ Disabled

© 2026 Boyum IT Solutions A/S

	The calculation is started immediately. You need to wait until it is finished. Use this option for debugging. Do not use this mode for of huge amounts of data.
Precalculation Save	Save results as pre-calculation If active, the calculation is saved as Precalculation. **Performance note:** This type takes much more time. Select this option only if you need an image of this calculation to view it under Precalculation. Do not use this function to calculate more than 100 Items! Limitation: max. 1000 Items. As "Customer name" the designation of Batch-calculation is saved, under "Info" the continuous calculation number. Disabled option (Default): Calculation is faster. Precalculation is not saved and results are only displayed in Precalculation View Schema. Note: For standard pricing this option cannot be activated. If a Precalculation document is created from the Batch calculation process: - The Schema "Save Value As" function is not working. - Beas does not save the calculation schema result behind the result list.

back to overview batch calculations

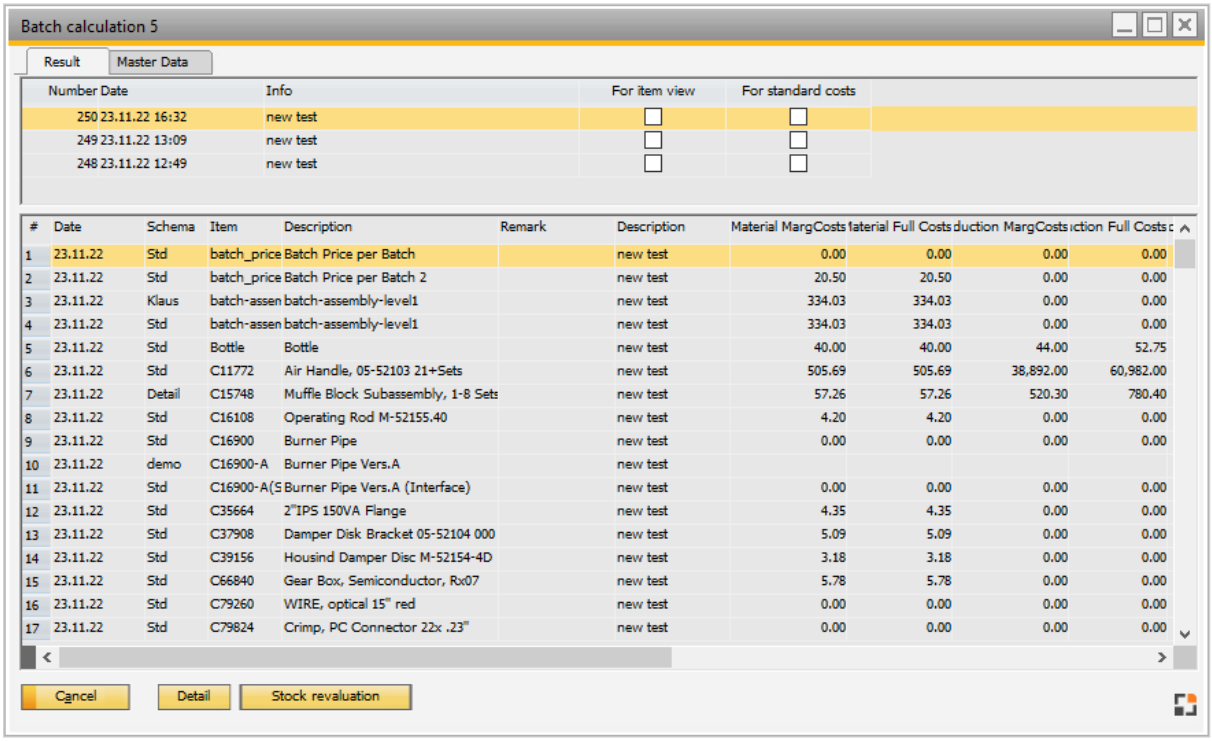
7.9.5.1.2 Batch calculation results

View results of batch calculation.

In the upper area, existing batch calculations are listed. Clicking on a calculation in the upper window section will display the information in the lower section with the results.

PATH: Inventory > Inventory transactions > Batch calculation > **Results** button.

© 2026 Boyum IT Solutions A/S



Window pk_batchkalk_browse.psr

IMPORTANT: When Production UoM and Inventory UoM are different, Batch calculation result is based on Production UoM and lot size. However, the result is converted to Inventory UoM and displayed in it.

Use Window setting to display additional result fields our own result fields.

Function

Button	Description
Detail	Open batch calculation details If the "Precalculation save" flag is active in the Batch calculation Extended settings, this button opens the Precalculation results window. The result is displayed in Production UoM. **View results in Inventory UoM:** 1. Double-click the golden arrow left of the Lot size field 2. The Calculation master data window opens 3. Change the value of **Calculation master data > Valuation > "Lot size/Production"** field from Production UoM to Inventory UoM.

© 2026 Boyum IT Solutions A/S

	 If the "Precalculation save" flag is inactive, this button opens the schema view of the Precalculation for the selected entry. Results are displayed in Inventory UoM. Button alternative: Double-click the selected entry.
Stock revaluation	Open stock revaluation window. Note: This button is only available if "for Standard costs" is activated in this Batch calculation.

back to batch calculation overview

7.9.5.1.2.1 Batch calculation stock revaluation

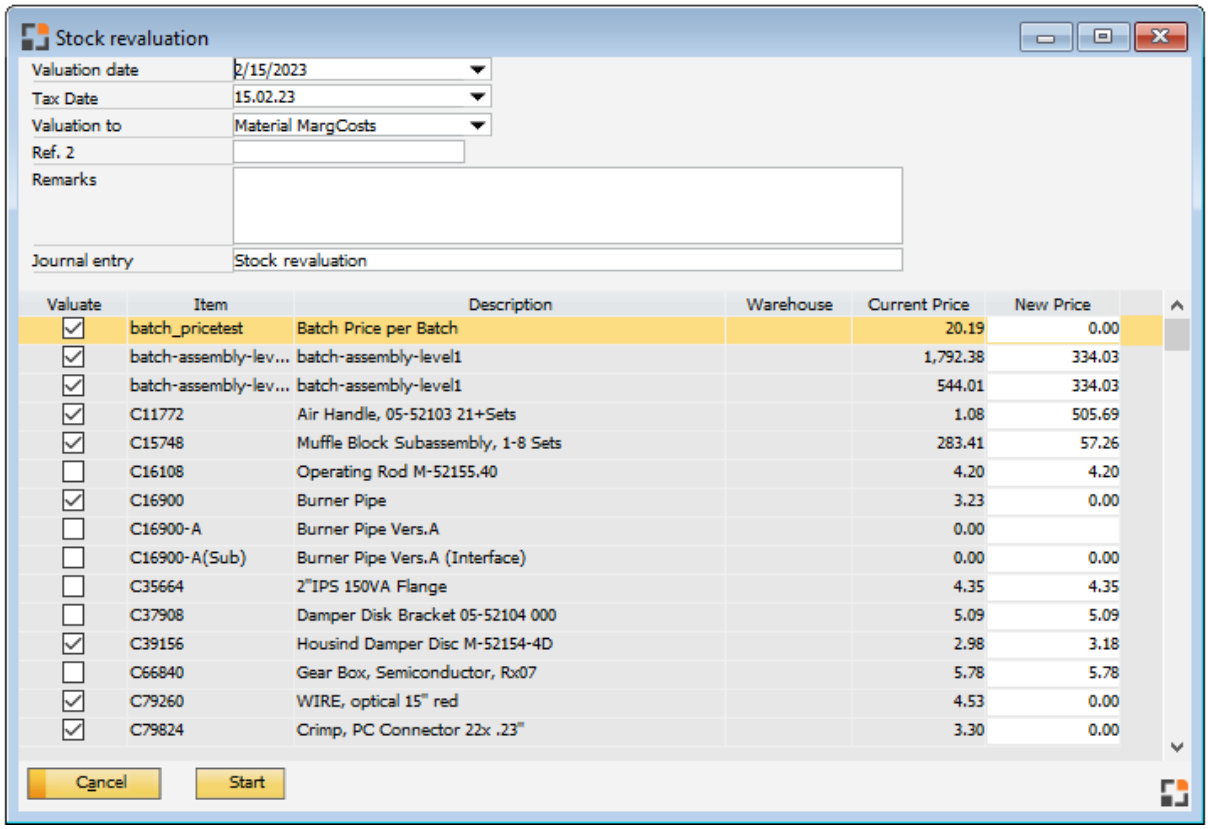
Works only if perpetual inventory system is activated in SAP Business One.
If the option "For standard costs" is enabled in a batch calculation, and the user has permission for inventory revaluation, based on the calculated results, an inventory revaluation can be conducted.

Open the results window (**Batch calculation > Result button**). If all requirements are met, the button "**Stock revaluation**" appears. If you click on this, it opens the Stock revaluation window. All items are shown with previous price and calculated price. If there are differences, in the field "review", the switch is active. The new price can be changed. Only the checked items entries are revalued. Only products with the valuation method "average price" and "Standard price" are displayed.

© 2026 Boyum IT Solutions A/S

Note: FIFO is not supported.

PATH: Inventory > Inventory transactions > Batch calculation > **Results** button > Batch calculation XX > **Stock revaluation** button



Window pk_batchkalk_revaluation_header.psr

Description	Item description.
Warehouse	Current warehouse.
Batch	Batch.
Bin location	Bin location.
Requirement	Remaining requirement of pegging.
Res. Entry	Quantity reserved in total for that pegging. If this entry is large than the requirement it is displayed in red and marked as wrong.
Reservation	Quantity of the current reservation for that entry (item/batch/bin) depending on pegging. If this entry is larger than the current stock, it is displayed in red and marked as wrong. For reservation type "receipt" this column is hidden.
Reservation Total	All reserved batch quantity. **WMS Integration:** The quantity considers all WMS locks of supported types "Batch", "LUID" and "Detail".
Locking level	⊟ The WMS locking type that reserved this material. **WMS integration:**

© 2026 Boyum IT Solutions A/S

	Beas displays the WMS locking type with which the material was reserved. The supported WMS locking types: - Batch - LUID - Detail For more information, ***see*** our Beas-WMS integration documentation. ***See*** also: WMS documentation of the locking function (PATH: **Produmex WMS Fields and Settings > 6.1.1. Locking > 1. Inventory lock**)
OK	Allows direct issue If this check box was ticked, the marked line can be issued directly, by clicking the button "issue". The button is displayed, when at least one line was marked. You can mark only reservations, which are - Of type "warehouse" - Linked to a work order *(beas 9.0 PL: 07)*
Res. Entry	Reservation for that (item/batch/bin) independent from pegging. If this entry is large than the current stock it is displayed in red and marked as wrong. For reservation type "receipt" this column is hidden.
Inventory	Stock of this item/batch/bin. For reservation type "receipt" this column is hidden.
UoM	Unit of measurement.

Functions

Function	Meaning
(Reservation) Open	The button opens the "Reservation" window for the selected item.
Remove	Delete the reservation. **WMS integration:** The button is only available for WMS locks by "Detail". The deletion of other supported locking types (Batch and LUID) is not supported.

© 2026 Boyum IT Solutions A/S

Cross reference	Opens Item cross reference.
Invent. history	Opens Inventory history.
Filter: Error	Only entries marked as wrong are displayed. Filter applies only for displayed entries. Reservation type "receipt" is not displayed. Click the binoculars right below to display all entries (Filter: All).
Change log	Open the Change log.
Search (input field)	Enter a term to search for the following • Item Number ("BEAS_RESERVATION_LINE"."ItemCode") • Match Code ("OITM"."U_match") • Item description ("OITM"."ItemName") • Base Doc Entry ("BEAS_RESERVATION_LINE"."BASE_DOCENTRY") • Batch ("BEAS_RESERVATION_LINE"."BatchNum") • Bin Code ("BEAS_RESERVATION_LINE"."BINCODE") *(beas9.0-000-002-003)*
Issue	Issue marked reservations directly Button (located top left) is displayed only if at least one reservation row was marked using the check box. It is possible to issue the reserved entry directly. ***See*** Column "OK". *(beas 9.0 PL: 07)*
Reservation Conflicts	Opens a screen to resolve conflicts of reservation/locking between Beas and WMS systems. The Configuration wizard setting to Integrate WMS reservation system is linked for activation. *Window wms_reservationconflic.psr*

Window settings are available.

7.10 Tool Administration

Beas is equipped with complete tool administration which is supported in Precalculation and in manufacturing.

Tools can be maintained, variation costs recorded and drawings and documents can be stored.

© 2026 Boyum IT Solutions A/S

Tools can be entered and requirements can be administered via the routing.

Note: Tools are currently not supported in post-calculation.

LIMITATION ON TOOLS:

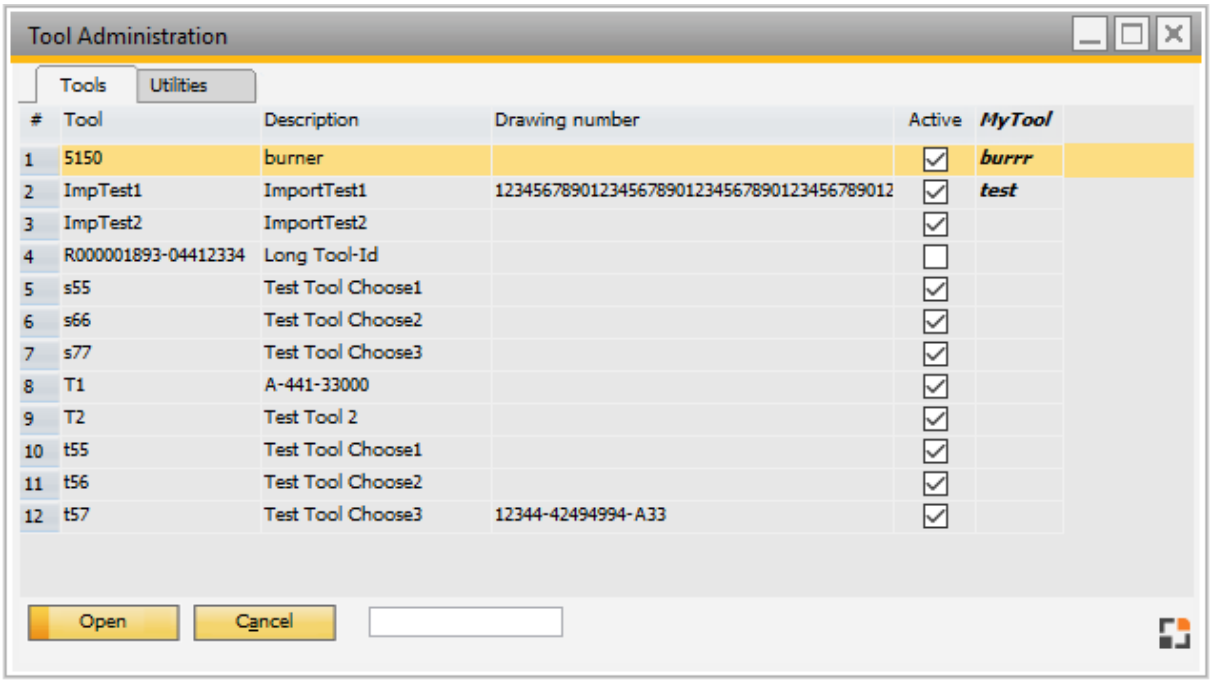
Important: In APS, the system calculates interruption time ONLY for resources. Tools do not have a precalculated calendar, and Beas does not check interruption on Tool level.

Beas supports the following types of tools:

Field	Meaning
Utility	The simplest type of tools are utilities. These have no imputed costs, do not influence capacity planning, and have no maintenance process. Utilities can be used for example in quality control orders. ***See*** QC–inspection plan.
Tool without resource planning	Tools with purchase and maintenance costs but which have no effect on resource planning.
Tools with resource planning	Tools with purchase and maintenance costs, which only exist once, are uniquely defined in tool management, and so are also reserved.
Tools that influence the throughput time	Tools with purchase and maintenance costs, which only exist once, are uniquely defined in tool management, and influence the throughput time of the main work sequence. Any number of tools of this type can be stored per work sequence, but only one such tool can be active at a time. The throughput time (defined in Operation – Tools tab) is transferred to the work sequence once the tool entry is activated.

PATH: Inventory > Tool Administration.

© 2026 Boyum IT Solutions A/S



Window stamm_wkz_browse.psr

Tool Management tabs

Tab	Meaning
Tools	Definition of tools.
Utilities	Definition of utilities.

Important: Data on tools and utilities is stored in the same table. For this reason, utilities and tools must not be given the same ID.

Field descriptions

Field	Description
Tool	Tool name
Description	Description of tool
Drawing number	Drawing number
Active	If tool is active, check box is flagged.
My Tool	Unique tool name
Type	Type of tool
Warehouse location	Warehouse location for the tool.
Capacity planning	If the tool is considered in capacity planning, the check box is active.

© 2026 Boyum IT Solutions A/S

Field	Description
Maintenance Info	Information of maintenance work done on the tool.
Locked reason	Reason for tool block.

Window settings are available.

Functions

Function	Description
Open	Open selected tool entry.
Add	Create new tool.
Remove	Remove selected tool entry.
Duplicate	Create a new tool entry by duplicating the values of the selected tool. A "Copy" pop up window appears to Enter new ID.
Search	Open dialog box to search by Description, Drawing no., Type and ID.

7.10.1 Edit tools

In this window it is possible to edit tools.

General tab
Scheduling tab
Graphic tab
Costs tab
Bill of Materials tab

Maintenance orders tab
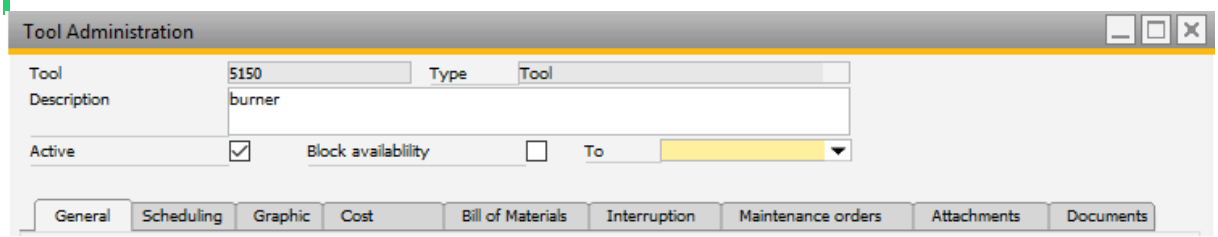
Attachments tab
Documents tab

PATH: Inventory > Tool Administration > **Open** an entry.



© 2026 Boyum IT Solutions A/S

Window stamm_wkz_edit.psr

Field description of the tool position

Field	Meaning
Tool	Unique 20-digit tool ID.
Type	Type of tool. Selected automatically based on which tab the in Inventory > Tool Administration the tool was created, Tools or Utilities.
Description	Description of the tool.
Active	Enabling the active flag makes the tool available for selection at productions operation. If it is deactivated, selection is not possible. If it is still in use, it is blocked in planning together with its use.
Block availability...To	A time-based block e.g. due to maintenance or repair can be set here. You must also specify the time until which the block is planned with the field "To" on the right. This blocks the tool for selection at productions operations on a specific date.

Description of tabs

Tab	Meaning
General	General definition of the tool.
Scheduling	Capacity planning information. Only visible if "Capacity planning" is activated.
Graphic	Shows a graphic image of tool usage per days/percentage. ***See*** Graphic tab.
Cost	Purchase or production costs and definition of maintenance costs.
Bill of Materials	Further tools or tool parts belonging to this tool can be defined here. Various BoM information with Position number, Tool ID, quantity etc. Window settings are available.
Interruption	Set up or edit new interruption time, start / stop interruption.
Maintenance orders	Display all maintenance orders linked with this tool. ⊟ Display old tab before beas9.1-008-040-003. Maintenance information, counter readings CTRL+N+U > and insert the next line setvar=as_oldMaintenance=1
Attachments	Up to 3 further images or documents can be attached.
Documents	Documents can be stored per tool.

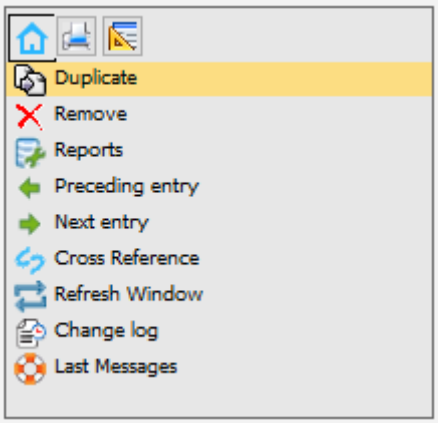
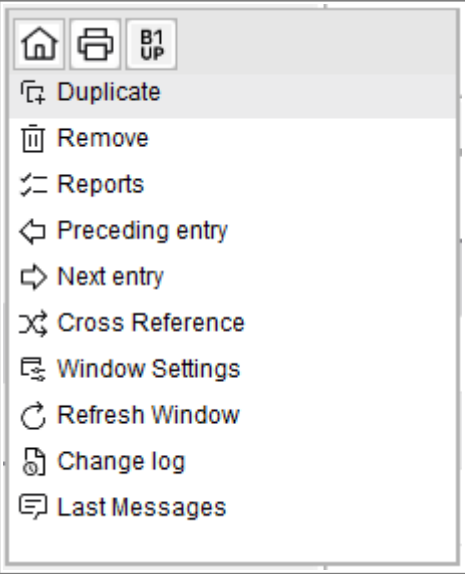
Right-click menu:

Traditional style	Boyum Style
	




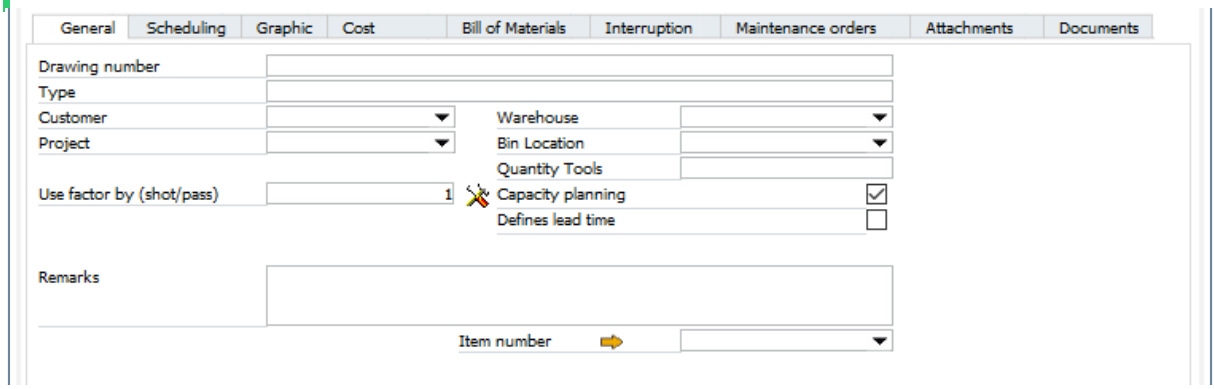
Change log: you can Call up Change log.

Note: Changes in "BoM" tab and "Documents", as well as "Costs"/"Change log" are not included in the change log.

(beas9.1-004-068-000)

7.10.1.1 General tab

PATH: Inventory > Tool Administration > **Open** an entry > "General" tab.



Window stamm_wkz_edit.psr

Field	Meaning

© 2026 Boyum IT Solutions A/S

Drawing Number	Drawing number of the tool.
Type	Tool type. Only used for as additional information for reporting and organizing them
Customer	Select a business partner if the tool belongs to a customer, was sent to a provider, or is used to manufacture parts that will be sold to a specific customer.
Project	Select a project in case the tool belongs to a specific project.
Use factor (per shot / pass)	Use factor of the tool. A tool can produce several parts per shot. If the use factor changes, use this field to apply the change to all routing positions. ***Example***: a stamping tool can produce 20 parts per shot. Utility factor = 20. After certain time, the tool is partly defective and can only produce 18 parts. Using this utility factor, this information can be written directly to all active routings and work orders. Enter 18 to this field and click the tool icon next to it to apply changes to all routing positions. ***Example***: The production of plastic injected parts, where the mold used to produce the parts (which is the tool) can have multiple cavities to create several parts at the same time. If the mold has 5 cavities, this means it can generate 5 items at each use, the number 5 should be filled at the Use factor by (shot/pass) field. If the tool is used to determine the production times, you can click on the button right next to Use factor by (shot/pass) field to update the changes in this field into all existing routings and work orders. **Important**: This field is only available for tools, not for utilities.
Remarks	Include additional information, if applicable
Warehouse	Specify a warehouse for the tool. The information at this field does not change any of the transactions created by the tool. This can be set to be used by default in the Configuration wizard.
Bin location	Used only if no item number has been stored. A bin location can also be stored here without accessing inventory management.
Quantity tools	Number of available tools. For information only.

© 2026 Boyum IT Solutions A/S

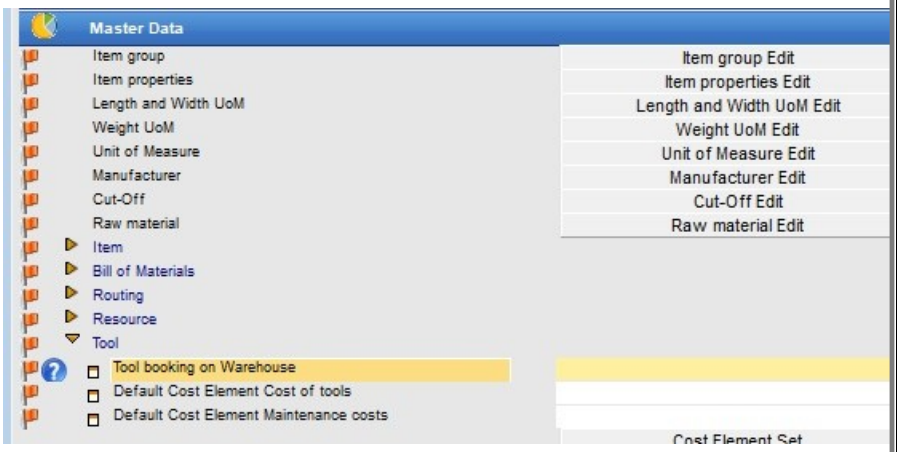
	Note: For the tool to be used in capacity planning, the value in Quantity Tool cannot be greater than “1”, and each tool should be registered separately. **Important:** The value entered in this field is ignored if "Number of machine/person" in the resource is higher than 1.
Capacity planning	Calculating lead time - is the tool taken into account? By enabling this option, you need to enter times. Planned use of tools is taken into consideration - depending on the calculation type. Tool availability is checked. **Important**: This field is only available for tools, not for utilities.
Defines lead time	Does the tool determine the lead time? If enabled, the default times of the tool are transferred to the operation. In this case, the tool influences lead time. Only values are used, which had been entered in "planning". Empty fields are ignored. If more than one tool was stored in an operation and for both "determine lead time" was enabled, only one tool can be activated. Activating or exchanging the tool is possible in Work order structure or in APS – graphic view.
Selectable at time receipt	If enabled, it allows the tools to be selectable when creating a time receipt. This influences the maintenance counters. This field is only visible if "determines lead time" was activated. **Important**: This field is only available for tools, not for utilities.
Item Number	When tools should be entered or should generate a demand through production, an item entry must be made in parallel to the tool. **Attention:** Only limited support. This entry defines the item entry through which the tool is entered. At the same time, it is necessary to define a tool store in the options into which the tool can be entered for the interim period if the tool is used. The intermediate inventory should be of the type "Locked inventory".

© 2026 Boyum IT Solutions A/S

An automatic transfer of the tool is performed for the setup login of an order.

Workflow:

1. Create item for this tool.
   Preconditions:
   - No batch- and serial management support.
   - Item must be stock on default warehouse.
   - Item must have a stock default warehouse.
2. The system transfers the tool from default warehouse to "tool in production" warehouse.
   Create this warehouse and define this in the Configuration wizard:



3. Insert this tool in routing position.
4. Create a work order.
5. Log in to this routing position. **ATTENTION:** Only type (R), that is "Setup Time" is available for login. The process is not triggered for any other types.
6. The system automatically creates an issue document from Default warehouse.
7. If no stock is available, the system does not create the issue document. No warning or error message appears.
8. Then, the system creates a receipt document to the warehouse defined in the Configuration wizard.
9. Log out from the routing position.
10. You must transfer the tool manually to the default warehouse.

© 2026 Boyum IT Solutions A/S

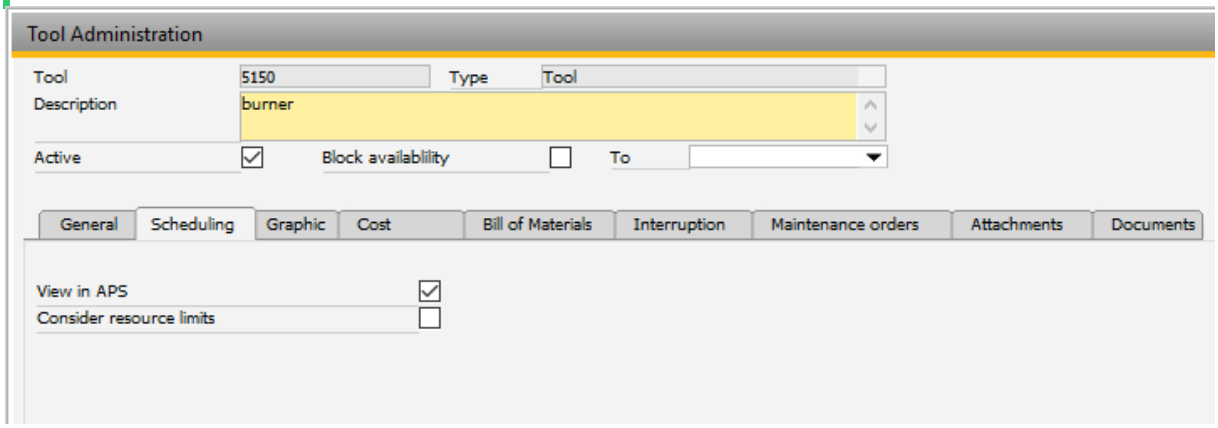
	The system does not check if the tool is on stock. Availability is only visible in the Pool List -> "F2 Open" window. **Limitation:** - Beas uses standard accounts for manual transactions. - Beas uses the price defined in SAP B1. - Bin Management is not supported. - Beas does not check minimum stock or other stock rules. - No support of work order numbers > 1000000.

back to tool tab

7.10.1.2 Scheduling tab

The **Planning** tab is only visible if the **Capacity planning** option has been activated in the **General** tab.

PATH: Inventory > Tool Administration > Open an entry > "Scheduling" tab.



Window stamm_wkz_edit.psr

Field	Meaning
View in APS	Determines whether the tool should be displayed in the APS Gantt view. If this is not relevant for planning in the graphical view, it is advisable to deactivate this option.
Consider resource limits	If enabled, resource limits are taken into consideration.

© 2026 Boyum IT Solutions A/S

Buttons:

Reference: Opens the Reference window for Production.

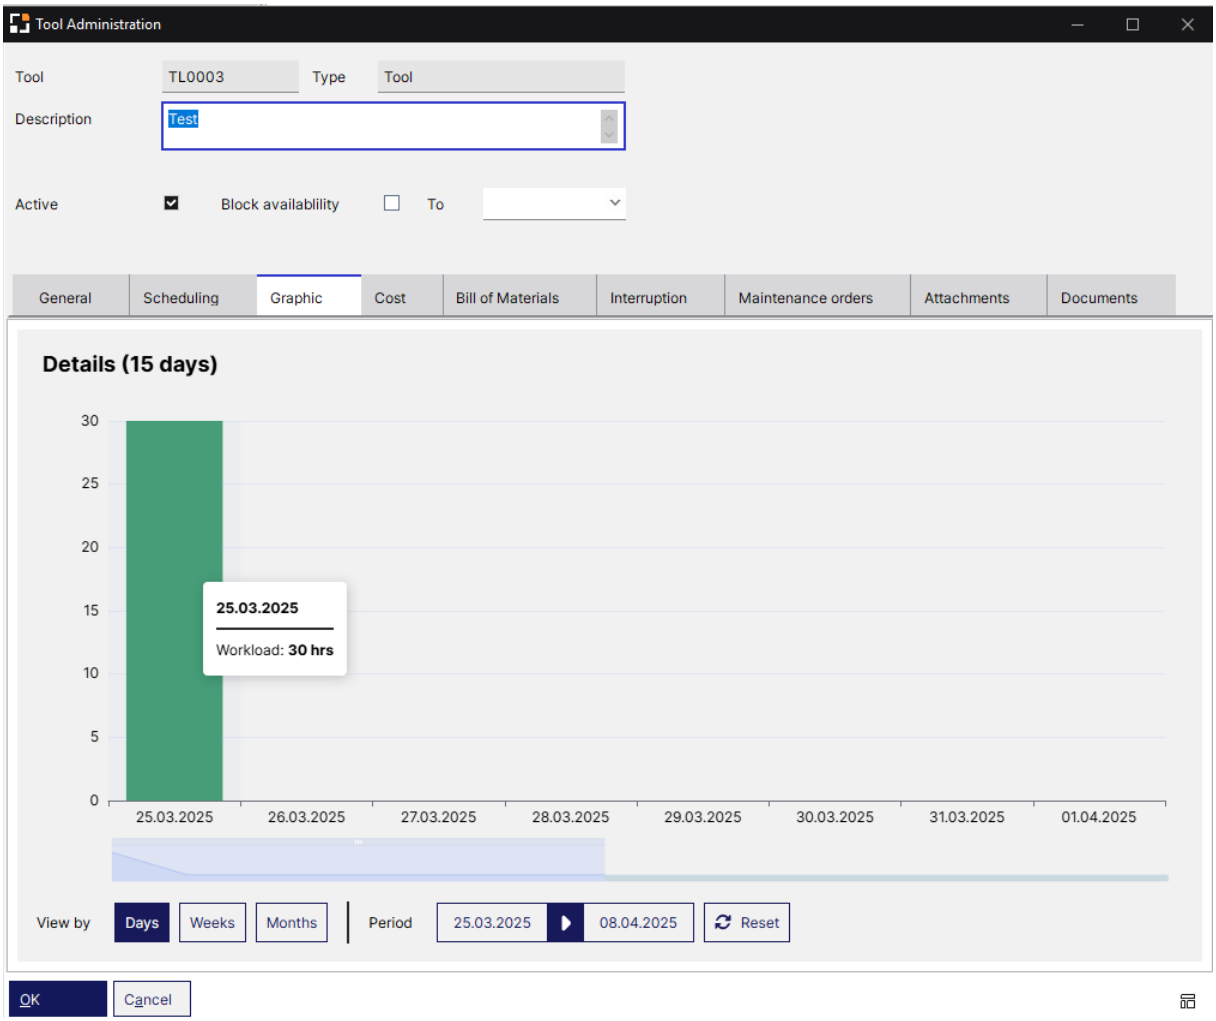
Counter Status: opens the Tool Interval window.

back to maintenance tab

7.10.1.3 Graphic tab

This tab provides a graphic demonstration of tool usage per days/weeks/months and percentage. It shows the workload of the selected tool detailed in a specific period of time.

> Note: Only available for tools with Capacity planning.



Window stamm_wkz_edit.psr

© 2026 Boyum IT Solutions A/S

7.10.1.4 Costs tab

The costs for a tool are calculated from 2 areas: Purchase/production and maintenance costs. Both values are written to separate cost elements which can be configured in advance in the Setup Wizard and overwritten in the tool, as well as later in the routing, Precalculation, and production. In post-calculation tool costs are not taken into account.

Purchase or production costs

For single use

Example: the tool is only used for this one order. In this case, the lifespan does not apply.
Purchased Price = the production price
Lifespan in units of quantity or hours = is set to 0.
Following is calculated: Purchase price: quantity to be produced = tool purchase price costs per unit to be produced

For multiple use

If the tool is used for other orders, the lifespan plays a part in cost calculation.
This is calculated in time (*cost recording* in time) or quantity (*cost recording* in quantity).

For *cost recording* in *Time:*
Tool purchase price costs per unit to be produced = purchase price: Lifespan (time) * Time required per unit

For *cost recording* in quantity*:*
Tool purchase price costs per unit to be produced = purchase price: Lifespan (quantity)

Maintenance costs
The maintenance costs are specified as a second factor. These can be written to another cost element if purchase price costs and maintenance costs should be separately analyzed or posted.

For *cost recording* in *Time:*
The costs are specified at marginal and full costs per time unit to be stored (hour/minute).
Costs per unit to be produced - corresponds to time required per unit * cost record per time unit
e.g. Marginal costs = €2 per minute, production time for 1 unit = 10 minutes: Maintenance costs of €20 per unit to be produced are generated.

For *cost recording* in *Quantity*:

© 2026 Boyum IT Solutions A/S

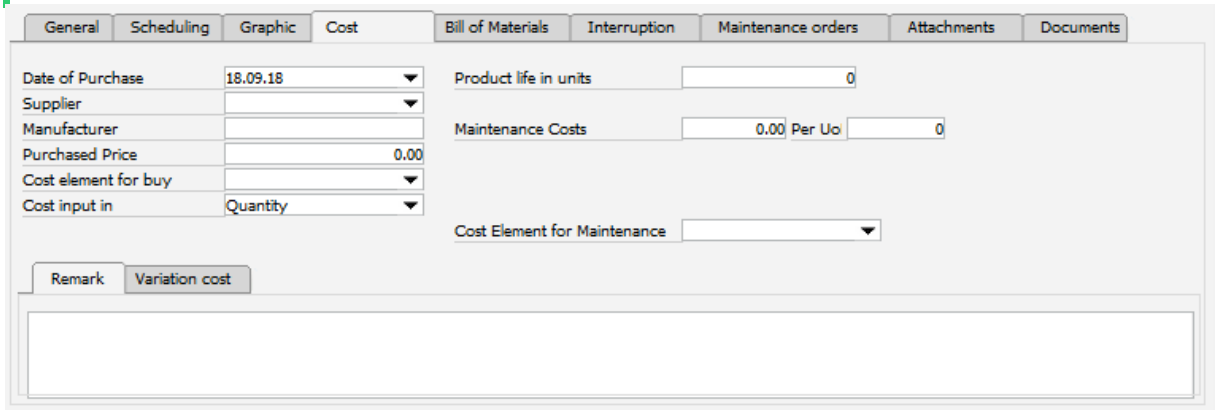
The costs (*Maintenance Costs*) per quantity to be specified (*per QU*) are specified, e.g. €500 per 10,000 units.
In this case, maintenance costs of €0.05 per unit to be produced are generated.

Tool costs in Precalculation

Tool costs can only be considered in Precalculation by creating a costing object. Although tools are stored behind routing positions, the costs are not summed there. Tool costs may be issued separately only in the sum objects.

1. Create two types of costs.
2. Store these types of costs in the tool.
3. Insert two surcharge objects in calculation referring to the respective cost type. Then, the tool costs can be included in the sum.

PATH: Inventory > Tool Administration > Open an entry > "Cost" tab.



Window stamm_wkz_edit.psr

Field Descriptions

Type	Meaning
Date of Purchase	Date of purchase or manufacture of the tool.
Supplier	Supplier of the tool.
Manufacturer	Name and other data of the manufacturer.
Purchased Price	Purchase or production costs in home currency.
Cost element for buy	Cost element to which the purchase or manufacturing costs should be written in the precalculation and costing analysis (can be changed in

© 2026 Boyum IT Solutions A/S

	the precalculation and in the work order).
Cost input in	Defines whether the maintenance interval specifications refer to time or quantities.
Cost element for maintenance	Cost element to which the maintenance costs should be written in the precalculation and costing analysis (can be changed in the precalculation and in the work order).

Settings for *Cost input in* in "quantity"

Type	Meaning
Product life in units	Defines the lifespan per Production UoM of the assembly to be produced.
Maintenance Costs	Defines the costs per "*per QU*" - use in Production UoMs of the assembly to be produced.
per QU	Refers to "*Maintenance Costs*". Defines the factor that the maintenance costs refer to.

Settings for *Cost input in* in "time"

Type	Meaning
Time to Live in Hrs	Defines the lifespan in hours.
Cost per	Defines whether the specified costs per hour or minute correspond.
Marginal Cost	Determines the marginal cost rate per "*Cost per*". Can be overwritten in the precalculation and work order.
Full Cost	Determines the full cost rate per "*Cost per*". Can be overwritten in the precalculation and work order.

An additional tab is displayed under the inputs with the following functions:

Tab	Meaning
Remark	Comments on purchase or production costs.
Variation Cost	Definition of further costs due to changes. **Note**: For information only. Does not affect Beas functionality.

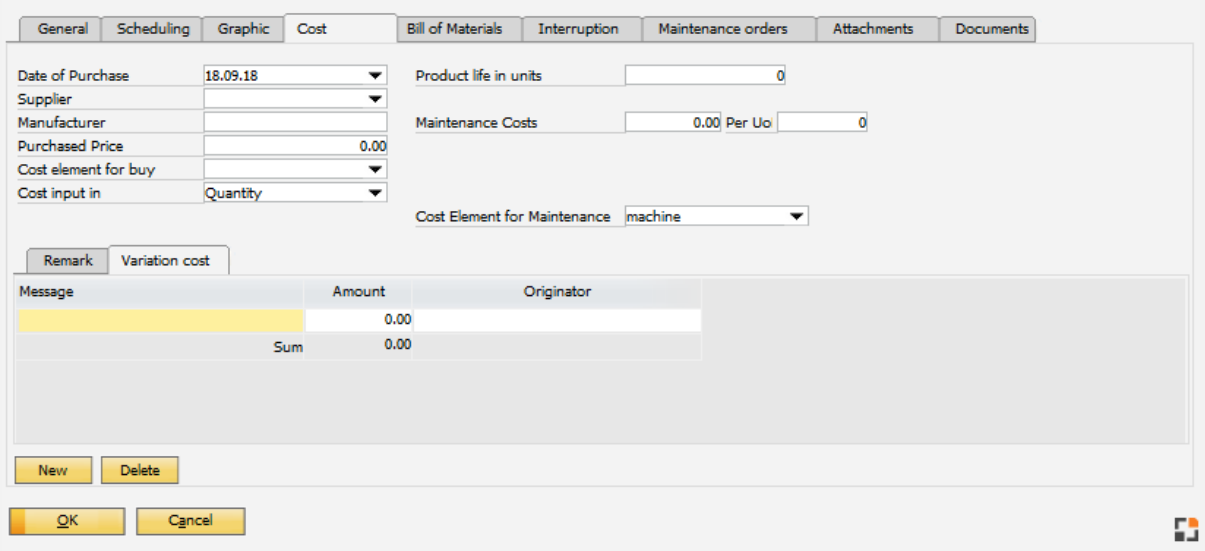
© 2026 Boyum IT Solutions A/S

back to tool tab

7.10.1.4.1 Variation Costs tab

High quality tools are often modified, serviced or repaired for customers. The corresponding costs can be captured in this tab.

PATH: Inventory > Tool Administration > Open an entry > "Cost" tab > "Variation cost" subtab.



Window stamm_wkz_edit.psr

Field Description

Message	Information field on the change. You can add a new message by clicking the New button.
Amount	Costs
Originator	The originator person (repair or customer request)?

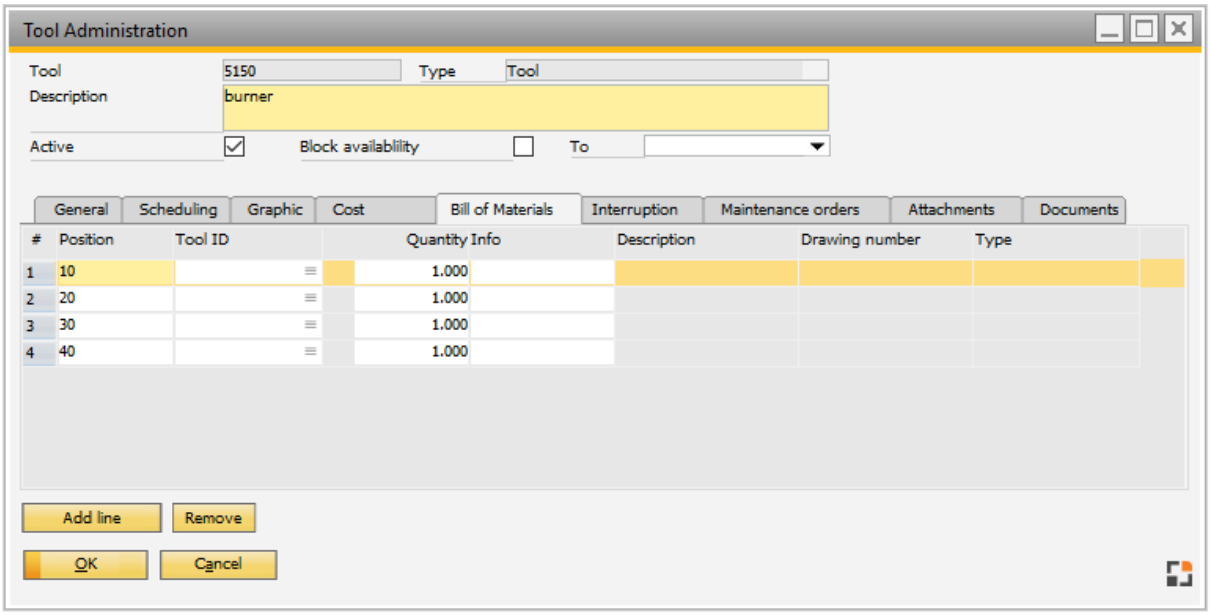
New: Use this button to add further variation costs to the current tool by filling the above detailed fields.
Delete: Use this button to remove a variation cost from the list.

7.10.1.5 Bill of Materials tab

A tool can also represent a blanket term for multiple tools.
Auxiliary tools and normal tools can be grouped into one main tool.

PATH: Inventory > Tool Administration > Open an entry > "Bill of Materials" tab.

© 2026 Boyum IT Solutions A/S



Window stamm_wkz_edit.psr

Note:

The tools specified here are not considered in Business performance or capacity planning.

Field Description

Type	Description
Pos ID	Unique position number.
Tool	Unique 20-digit tool ID.
Quantity	Required tool quantity.
Information	Any information.
Description	Tool description.
Tool drw. no.	Drawing number of the tool.
Tool type	Tool type.

Window settings are available.

Add line: Use button to add further bill of materials to the list.

Remove: Use button to delete any bill of materials from the list.

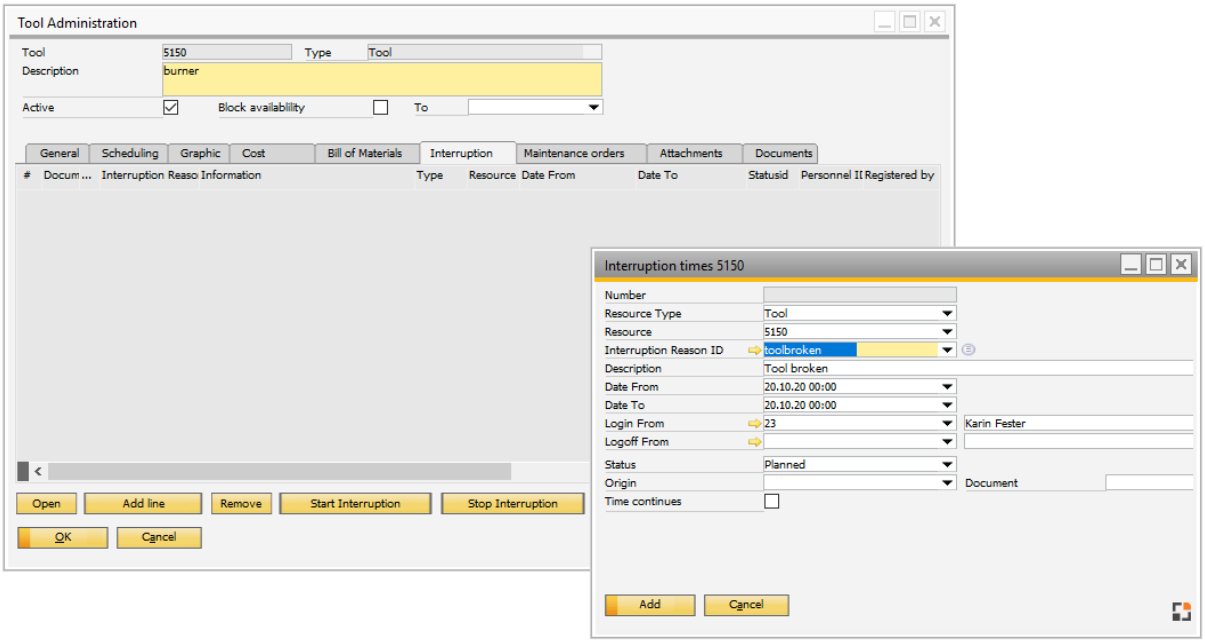
7.10.1.6 Interruption tab

In this tab you can set up or edit new interruption time, start / stop interruption times.

PATH: Inventory >Tool Administration > Interruption tab > **Open /Add line**.



Window stamm_arbplatz_stillstandgrund_edit.psr

Field Descriptions

Field	Description
Number	Field used to identify the interruption. This is a counter created automatically by Beas.
Resource type	Field used to specify whether the interruption will be created for a resource or tool.
Resource	Field used to define the resource or tool where the interruption should be created.
Interruption Reason ID	Field used to define the interruption reason. This can be created directly in this tab by clicking on the list button right next to the ID field, or from the setup menu in SAP.
Description	Free text description of the interruption reason. By default this is the description from the selected interruption reason.

© 2026 Boyum IT Solutions A/S

Field	Description
Date From	Start of interruption. A day and time can be defined. By default, the current date is selected. **Important**: This field changes depending on the status. For example, if the status is set to active, the date changes from the current date to 01/01/50 00:00. This is in order for the system to understand that this resource cannot be used before the interruption ends.
Date To	End of interruption. A day and time can be defined. By default, the current date is selected. **Important**: This field changes depending on the status. For example, if the status is set to active, the date changes from the current date to 01/01/50 00:00. This is in order for the system to understand that this resource cannot be used before the interruption ends.
Login From	Specify the person responsible for starting the interruption.
Logoff from	Specify the person responsible for stopping the interruption.
Status	• Planned • Active • Complete
Origin	Include the maintenance order linked to the interruption.
Document	
Time continues	Determines if the production time continues, as long as interruption is active. This can be activated e.g. if also costs of the interruption times should run on the current running work order. Youtube *(beas 9.2 PL:00)*

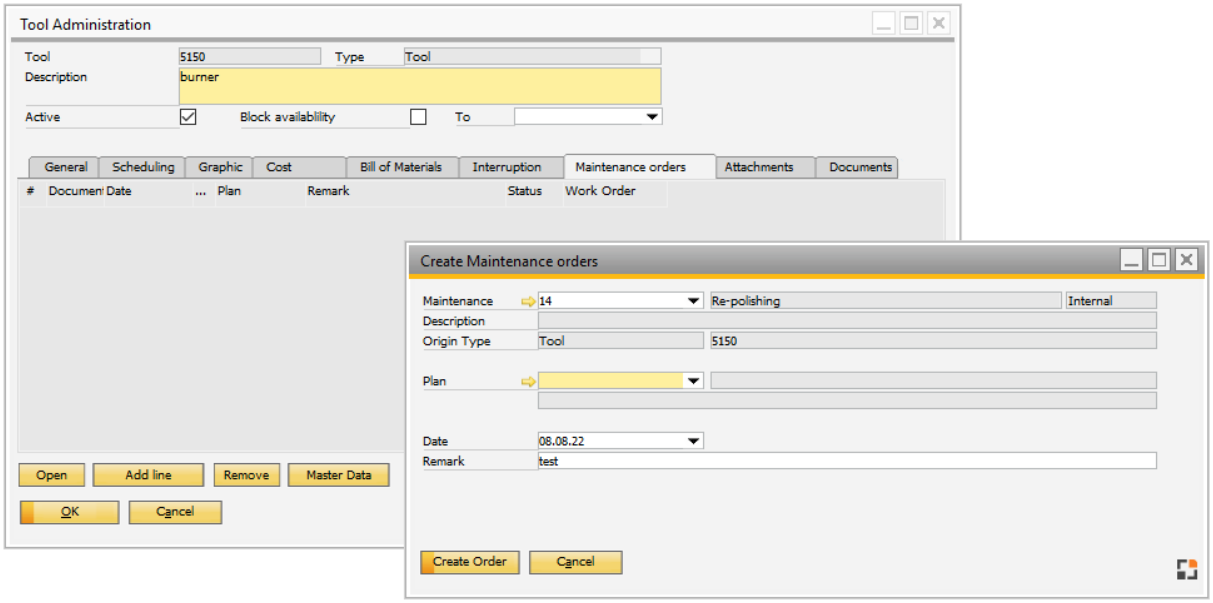
Window settings are available.

© 2026 Boyum IT Solutions A/S

7.10.1.7 Maintenance orders tab

Maintenance information can be stored here if you do not use the maintenance module.

If this must be activated, the following customer specific script must be stored:
`setvar=as_oldMaintenance=1`



Window: stamm_wkz_edit.psr, maintenance_order_new_psr

Field	Meaning
Last Maintenance	Date of last maintenance. Required for analysis.
maintenance (per uom)	Maintenance interval according to corresponding units of quantity or time, which are defined in the Costs tab. Required for maintenance analysis.
Maintenance counter status	The maintenance analysis relates to reported quantities (yield and scrap). If the quantity has not been reported or the counter was not set to 0 at begin of the registration, the counter can be increased manually. The current counter status is displayed by pressing the button "**Counter status**".
Current counter status	Put in the current counter status for a defined date. Manual input field, only for information purpose.
Last determined at	Date of determination of current counter status.
Status	Text information on tool status.
Remarks	Maintenance information (text field).

Window settings are available.

© 2026 Boyum IT Solutions A/S

Button **counter status:** Displays counter status and maintenance information.

Column	Meaning
Tool	Name of tool.
Description	Description of tool.
Maintenance max	Information from tool: maintenance interval (per x uom).
Last maintenance	Information from tool: last maintenance.
Reported quantity	quantity reported via time receipt since the last maintenance.
Manually	Information from "maintenance counter status".

If "reported quantity" + "manually" is greater than "maintenance max" the line is presented in red.
With "Search / New Search", the filter set for tools can be removed, an overview on all tools is presented.

Buttons:

Only requirement: Show only tools with overdue maintenance.
With message: Show only tools with a time receipt.

back to tool tab

7.10.1.7.1 Periodic tool maintenance

This list helps to observe the maintenance intervals.

7.11 Item management

Item management provides options to administer batches and serial numbers during the production life cycle.

Serial Numbers
Batches
Batch tracing

7.11.1 Serial Numbers

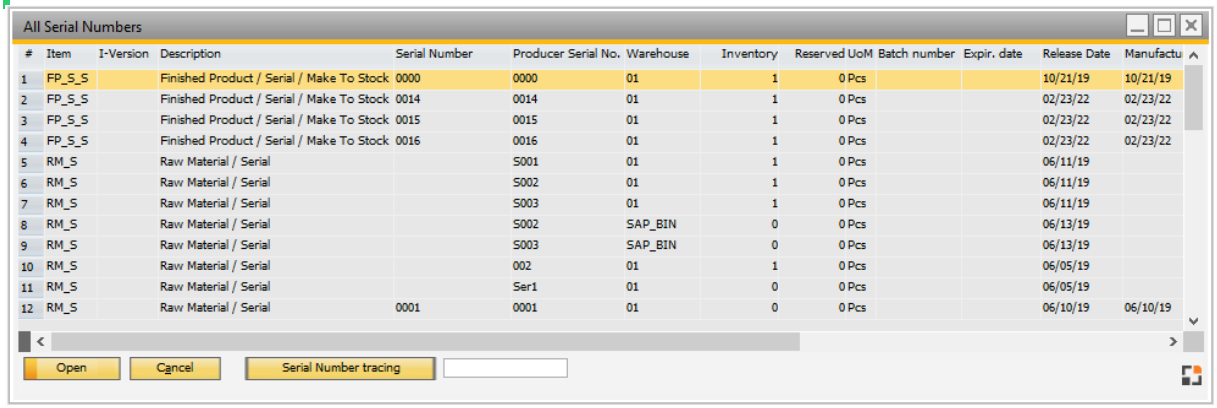
Beas provides extended serial number administration functionality.
Beas enables the user to trace batch and serial number managed items throughout the whole production life cycle. The function also makes it possible to track all transactions related to a batch or serial number.
A list of all generated serial numbers as well as a serial and batch tracing functionality is described in this section.

The following functions are available in the serial number area:
All serial numbers
Serial number tracing

7.11.1.1 All serial numbers

This window lists all serial numbers, and therefore provides quick and easy access to all generated serial numbers.
To see the details of an entry, select the entry and click the Open button. For a description of columns and buttons, ***see*** All Batches and Batch details.

PATH: Inventory > Item management > Item Serial Numbers > All serial numbers



Window mw_osri_browse.psr

© 2026 Boyum IT Solutions A/S

Column descriptions

Column	Description
Item number	Item number
I-Version	Item version
System number	System number
Serial number	Serial number
Description	Item description
Producer Serial No.	Serial number used at production.
Warehouse	Current warehouse
Inventory	Current stock of the bin location
Reserved	Reserved quantity of the bin location (if there are no bin locations, quantity of the warehouse)
Self produced	Check mark shows if the item batch was produced
UoM	Unit of measurement
Batch attribute 1	Free text
Batch attribute 2	Free text
Expir. date	Expiration date
Manufacturing date	Manufacturing date
Release Date	Date of release
Serial Location	Batch/Serial-specific information. Can be used for location description, if bin location management is not used.
Details	Free text
UDF	user-defined fields

Window settings and templates are available.

Function	Description
Open	Open serial details.
Cancel	Close window without saving changes.
Inventory history	Open Inventory history.
Serial number tracing	Open Serial number tracing.

Expir. date	Expiry date
Warranty starts	Starting day of warranty period

© 2026 Boyum IT Solutions A/S

Field	Descriptions
End of warranty	Warranty period ending day
Serial Location	
Details	Free text

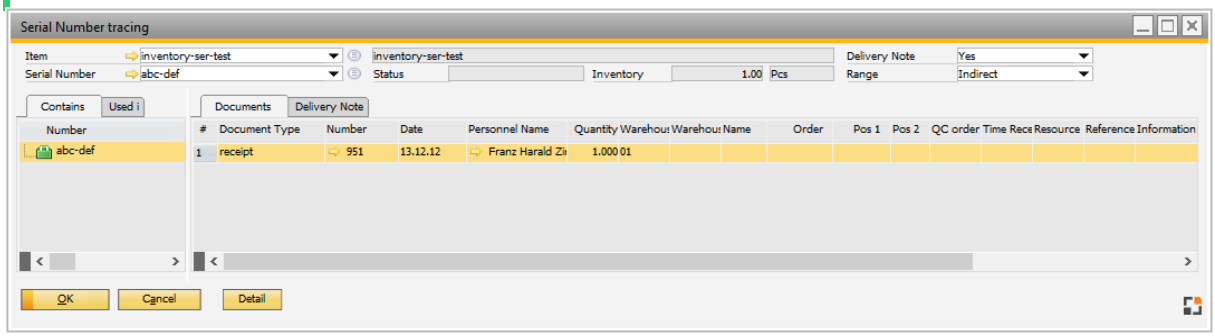
7.11.1.2 Serial number tracing

Serial number tracing and batch tracing are the same functions. Using the serial number tracing function, you can track:

- Which raw material item was used to create a specific semi-finished product, and which finished product includes this semi-finished item
- Whether a batch or serial number was checked against a QC-order
- Whether a production time receipt was reported for an operation linked to a batch or serial number
- Any resource related to an operation which is linked to a batch or serial number.

The tracing functionality is described in detail in Batch Tracing.

PATH: Inventory > Item management > Item Serial Numbers > All serial numbers > **Serial Number tracing** button



Window mw_tracing_master.psr

For more information, also ***see*** WO structure – serial number reservation.

© 2026 Boyum IT Solutions A/S

7.11.2 Batches

Beas provides extended batch management functionality.
Beas enables the user to trace batch and serial number managed items throughout the whole production life cycle. The function also makes it possible to track all transactions related to a batch or serial number.

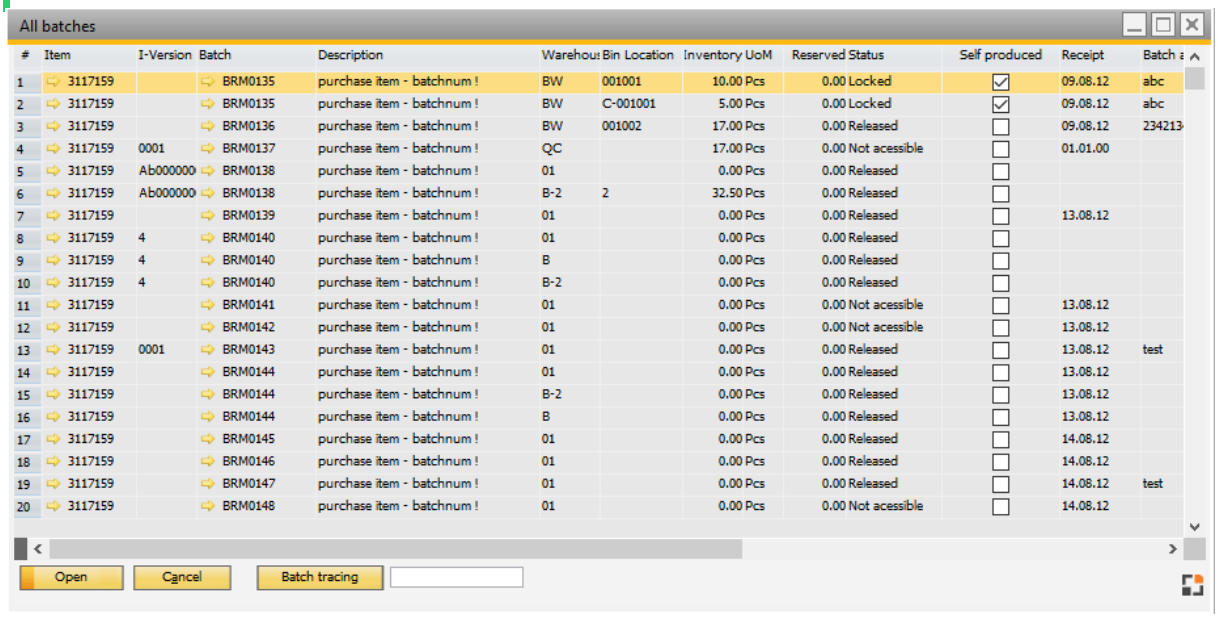
The following functions are available in the batch area:
All Batches
Batch Tracing
Batch generation

Work order batch assignment

7.11.2.1 All Batches

This window lists all batch numbers, and therefore provides quick and easy access to all generated batch numbers.
To see the details of an entry select the entry and click the Open button.

PATH: Inventory > Item management > Batches > All batches



Window mw_oibt_browse.psr

Window settings and Templates are supported.
Use the search field to search for Item number, Description.

Field descriptions

Column	Description
Item number	Item number
I-Version	Item version
Batch	Batch number
Description	Item description
Warehouse	Current warehouse
Bin location	Bin location code
Status	Not released / Free / Locked / access denied
Inventory	Current stock of the bin location
Reserved	Reserved quantity of the bin location (if there are no bin locations, quantity of the warehouse)
Self produced	Check mark shows if the item batch was produced
UoM	Unit of measurement
Batch attribute 1	Free text
Batch attribute 2	Free text
Expiration date	Expiration date
Manufacturing date	Manufacturing date
Date of permission	Date of permission
Location	Batch specific information. Can be used for location description, if bin location management is not used.
Details	Free text
Customer name	Customer name from first order (filled in from SAP)

Function descriptions

Function	Description
Open	Open batch details.
Cancel	Close window without saving changes.
Inventory history	Open Inventory history.
Batch tracing	Open batch tracing.

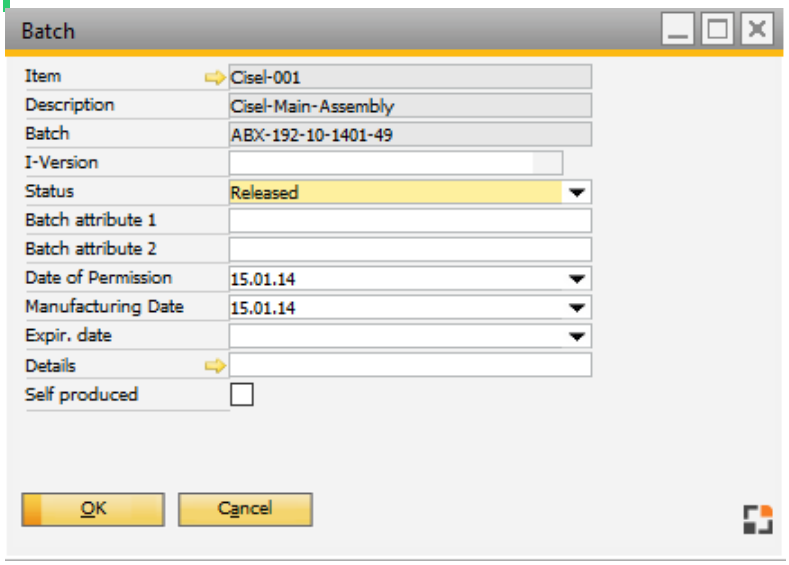
7.11.2.1.1 Batch details

This window displays the details of a selected batch.

PATH: Inventory > Item Management > Batches > Batch details



Window: mw_oibt_edit

Field descriptions

Field	Meaning
Item number	Item number
I-Version	Item version
Batch	Batch number
Status	Released / blocked / access denied
UoM	Unit of measurement
Batch attribute 1	Free text
Batch attribute 2	Free text
Expiration date	Expiration date
Manufacturing date	Manufacturing date
Date of permission	Date of permission
Details	Free text
Self produced	Set check mark if the item batch has been produced. If the batch is bought or posted in manually, do not activate the check box.

© 2026 Boyum IT Solutions A/S

Quantities...	The button opens the Batch Quantities window with with quantity information on batches and Warehouse Code. 
UDFs can be set up in the Configuration wizard to display additional information. To edit, Batch-editing rights are required.

7.11.3 Batch Tracing

For certain manufacturers, tracing each material serial or batch number from the moment it is received in the warehouse is an essential requirement for offering a full service to customers. Beas covers this requirement with the batch number tracing and serial numbers tracing functionality that can track each single transaction on a serial or batch number.

The default name of this field is Batch number. However, if a serial number is entered in the field, the name of the field will be displayed as Serial number.

Using batch and serial tracing you can determine the following:

- Which batch or serial number was built in to which batch or serial number
- Which batch or serial number a batch was built into or transformed to
- Whether a batch or serial number was checked against a QC-order
- Whether a production time receipt was reported for an operation linked to a batch or serial number
- Any resource(s) related to an operation which is linked to a batch or serial number
- The delivery note that was created for the delivery of a finished batch or serial number item

The following transactions are considered for batch and serial number tracing:

- Production receipts and issues
- Production backflushing booking processes

© 2026 Boyum IT Solutions A/S

- Batch transfer
- Batch split

A direct batch tracing can only be completed, if the receipt and issue are in a process. This is done for example, at backflushing WO or at a order time receipt - last operation sequence.
Only an indirect assignment is possible if the issue process is separated (Area=indirect). In this case it can only be determined which batches have been used or created for the work order position.

No batch and serial number tracing is available for other types of transactions, for example SAP Business One - Production. The connected transaction is only displayed in the Documents area.

Example:

Assembly A, batch A1 contains assembly B

Assembly B has been created with batch B1 and receives material C

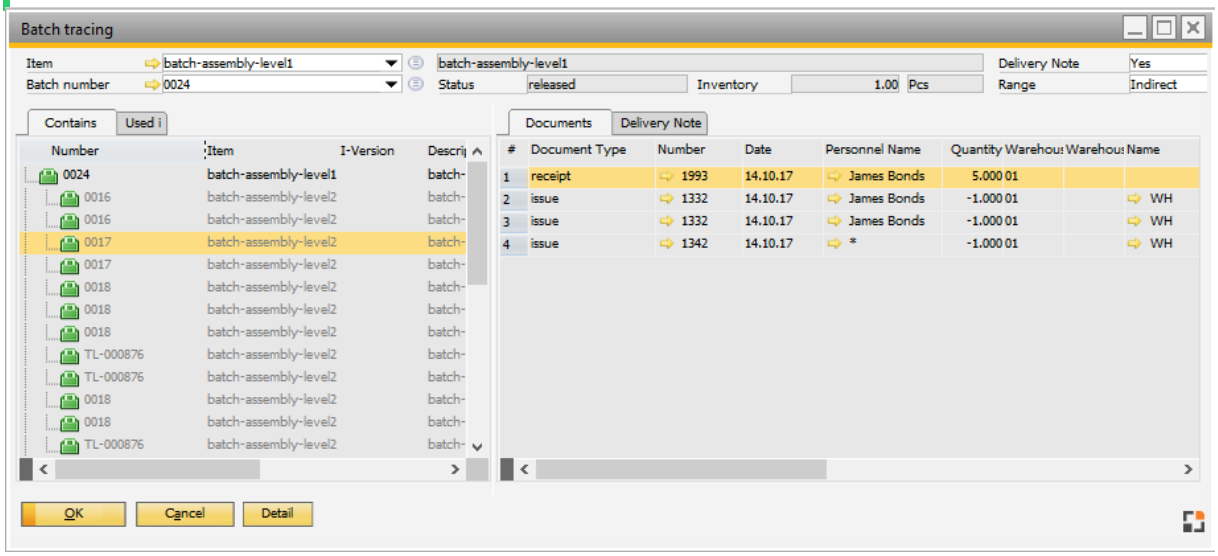
Material C has been booked with batch C1

The following can be seen in the structure display:

```
A1 (A)
|- B1 (B)
|  |- C1 (C)
```

The batch window

PATH: Inventory > Item management > All batches > **Batch tracing** button.



Window mw_tracing_master.psr

Area	Description

© 2026 Boyum IT Solutions A/S

<table>
<tr><td>Header: Item / Batch</td><td>Enter the item batch or item serial number.

Other Fields:

Delivery Notes: Specifies whether delivery note information is displayed related to the selected batch or serial number.

Range: Specifies the range of items and transactions that are be displayed for the specified item.

<table>
<tr><td>Direct</td><td>The system displays all items that are directly linked to the selected batch or serial number.

Following types of transactions are considered:
• Order time receipt - last operation sequence with backflushing material postings and posting-in assembly
• Production backflushing receipt
• Batch transfer
• Split batch</td></tr>
<tr><td>Indirect</td><td>The system displays all items that are indirectly linked to the selected batch or serial number.
This setting can be used, if there are no direct assignments. This checks all bookings, which are assigned to an assembly. This calculation method is very time consuming and should only be used if there is no direct assignment.</td></tr>
<tr><td>All</td><td>The system displays all items that are directly or indirectly linked to the selected batch or serial number.
Use only, if the indirect option does not display all transactions (for example, batch split) and the direct calculation method is not enough.</td></tr>
</table>
</td></tr>
<tr><td>Contains tab</td><td>Structure display for batch and serial number assignments</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

	The selected item is displayed on the Contains tab with an overview of all the batch and serial number items that are linked to this item in the system. If there is a direct assignment (that is, via production - order time receipt, backflushing, batch transfer, and so on) between the batches and serial numbers, then the associated batch or serial number is displayed in black. If there is an indirect connection, the entry is grayed out. Double-clicking on an entry, opens the tracing for the selected batch or serial number. The items are displayed in structure view. The maximum structure depth as well as the quantity of the maximum allowed rows, can be set in the Configuration wizard > Materials management. Each batch and serial number is displayed only once, even if they are used multiple times. This can be configured in the Configuration wizard. Setting every batch number only one time Issues may occur at partial postings where one batch is displayed multiple times, because this option is enabled. In this case "batch-assembly-level2" has been issued twice for the item "batch-assembly-level1". The batch is broken down twice accordingly. **View settings** The structure display area, as well as, the distance between the structure display and the item number can be customized. The color of icons represents the batch status: Green folder = released Blue folder = no access Red folder = blocked
Used in tab	Displays all batches or serial numbers that the searched batch or serial number was used in.

© 2026 Boyum IT Solutions A/S

Documents tab	All transactions and QC-orders are displayed here for the batch or serial number selected in the structure area. Beas document types like batch transfer or batch split are taken into account. The screen can be configured with Window settings.
Delivery Note tab	Delivery notes that the batch or serial number was delivered are displayed in this area. This area shows delivery notes related to all displayed batches.

Field descriptions

Field	Description
Document	Document number.
Type	Document type.
Date	Document date.
Personnel	Personnel who created the document. Important: The employee name is displayed, not the user name. No name is displayed, if working without a terminal, if there is no connection between user name and employee name, or the document was not created in Beas.
Quantity	Posted quantity.
Warehouse	Affected warehouse. In case of transfer, the withdrawal warehouse is displayed.
Warehouse 2	In case of a transfer, the target warehouse is displayed.
Name	Customer name.
Order, Pos 1, Pos 2	Linked work order document: order number, assembly position, BoM position
QC-order	Linked QC-order.
Time receipt	Linked time receipt. Important: This is only displayed for posting documents, created from beas9.0-000 Patch3 and only, if the posting is made together with a time receipt.
Resource	Reported resource in the linked order time receipt.
Reference	Reference number of posting document.
Information	Information, Memo from linked document.

© 2026 Boyum IT Solutions A/S

Work station	The work station, where the document was created. Only displayed, if the document was created by Beas.
Quality Status	Produmex WMS Quality status
LUID	Produmex WMS Logistics Unit ID
SSCC	Produmex WMS Serialized Shipping Container Code
UDF 1–6	Up to 6 user-defined fields to add any customer information
Beas version	The version of Beas that the document was created with.

- In case of low performance

If response times are long, adjust the following settings:

1. Switch the Delivery notes Option to No.
2. Set the Range Option Direct.

- Batch tracer - Report, Export structure information

(beas 9.1 PL: 08)

Beas offers an object, that processes the structure report in the BEAS_REPORTAUSWERTUNG table. A structure report and batch tracing report cannot be created with SQL statements.

Execute the following script commands before the output of the report:

```
object=ue_chargenbuchung=tracerreport=<itemcode>=<distnumber> [=<sysnumber> [=Bereich]]
```

or for the opposite - used in

```
object=ue_chargenbuchung=tracerreport_buildin=<itemcode>=<distnumber> [=<sysnumber> [=Bereich]]
```

Return = Variable `id`

If you do not indicate the sysnumber, it is determined automatically, as long as it is a batch. Serial numbers must be entered.

Area:

all = all connections

bf = only direct connections (Standard)

bfa = directe and indirect connections (very slow)

via

```
select * from "BEAS_REPORTAUSWERTUNG" where "ID"=<id> order by "NR"
```

© 2026 Boyum IT Solutions A/S

The report is generated. After this, the content should be deleted again.

```
delete from "BEAS_REPORTAUSWERTUNG" where "ID"=<id>
```

The following fields are available in the BEAS_REPORTAUSWERTUNG table:

Field	Description
ItemCode	Item number
ItemName	Item designation
distnumber	Batch- or Serial number
pos	System number of the batch- or serial number (SysNumber)
version	A-Version of batch
ag_id	Is is a batch? Y=yes, N=no
aplatz_id	Is is a serial number? Y=yes, N=no
level	Level
bitmapname	Depending on the status, a bitmap is created
pos_text	Status - Text in current user language
colorid	Status of the row black(0/0/0) = direct connection grey(128/128/128) = indirect connection
Nr	Sorting
id	Everything linked to this ID, belongs to this report

8.1.1 Resource Groups

For different applications Beas offers several types of resource groups:

- Simple resource group: consists of multiple machines/persons. Only the group as a whole is scheduled, not their parts.
- Resource domain: different resources not summarized to a group for computing capacities.
- Machine group: capacity is summarized, but their parts are scheduled separately. For this group, a resource is defined to represent this group.

Training unit resource group

See Alternative Resources

8.1.1.1 Resources group administration

All existing resources groups are displayed with their current utilization.

Select a group and right-click the **Open** button to open, or the **Add** button to create a resource group.

Red: Overloaded capacity - number of hours over the planned capacity

Select a day in the calendar view and it visualizes the details of resource utilization (hours/period) in the "Details" graph.

Month - Year (Calendar view)	Details: Resource XXX
The calendar visualization provides a monthly overview at resource utilization. The number of resource capacity hours are indicated under the date numbers. Color codes and tool tips assist usability. **Color codes of calendar days:** • Grey: Non-labor day (no capacity or holiday) • Red: Day with overloaded capacity • White: Any day with capacity planning • Blue: the currently selected day Hovering over a calendar day shows a tool tip on the relevant details of resource utilization: 	Shows the utilization information of a resource on a specific day / period. **Tool Tip Description** **Tool tip entry** / **Description** Date / Week 01-52 / Month 01-12 — The date / Time range being viewed. Overloaded — When the "Workload" exceeds 90% of the dispatching index of a resource, the system indicates this with a red "Overloaded" note (***see*** image above). Workload — Scheduled hours for the selected resource. Capacity — The available capacity of the selected resource in hours. **Controls** **Control** / **Description** **View by** Days / Weeks / Months — Select the unit of time range to view utilization details of the resource. Period — Select a start- and end date

Month - Year (Calendar view)

Tool tips

Tool tip entry	Description
Date — shift type	Displays the date of the day over which the mouse is hovered. Right of it, the shift of this day is displayed (***see*** image above).
Overloaded	When the "Workload" exceeds the dispatching index of a resource, the system indicates this with a red "Overloaded" note (***see*** image above).
Workload	Scheduled hours for the displayed resource.
Capacity	The available capacity of the resource in hours.

Controls:
Left-right arrows to navigate between calendar months.

Details: Resource XXX

Control	Description
	for the period that you wish to view.
Reset	Click this button to set the viewing period to the default starting date: today
Slider bar	The slider bar below the X axis shows the total time of the selected period to refine/re-adjust time selection or easily jump to any part of a longer period.

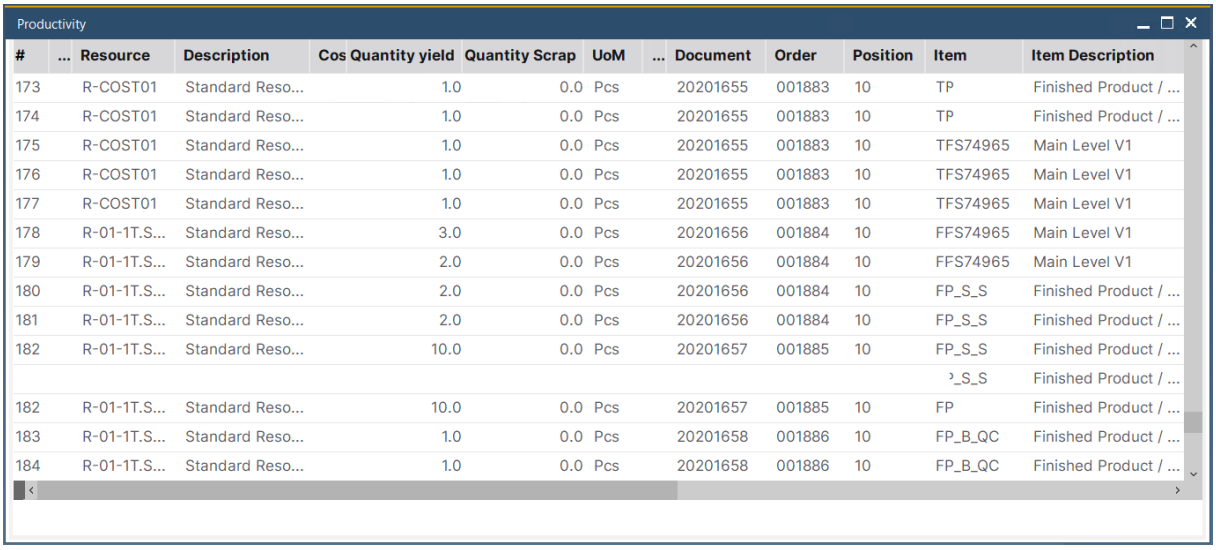
back to Dispatches

8.1.2.2 Productivity

This window displays the read-only list of key productivity figures for each resource stored in the system.

PATH: Resources > All resources tab > right-click > Productivity evaluation.

© 2026 Boyum IT Solutions A/S



Window stamm_arbplatz_worktimes.psr

Field descriptions

Field	Description
...	Bitmap image of resource
Resource	Resource name
Description	Description of resource
Cost Center	Cost center linked to resource.
Quantity yield	Delivered quantity
Quantity Scrap	Scrap amount / the delivered quantity
UoM	Unit of measure
...	Bitmap for order document
Document	Document number
Order	Work order number
Position	WO position number
Item	Item
Item Description	Item description
...	Bitmap image of WO position
Op. sequ.	Operation sequence number
Activity	Name of activity
Employee	User who performed the activity
Personnel No.	Personnel number of employee

© 2026 Boyum IT Solutions A/S

Field	Description
Start	Starting date and time
End	Ending date and time
Duration	Duration time
Op. sequ.	Operation sequence
Type	Operation type

8.1.3 Edit resource

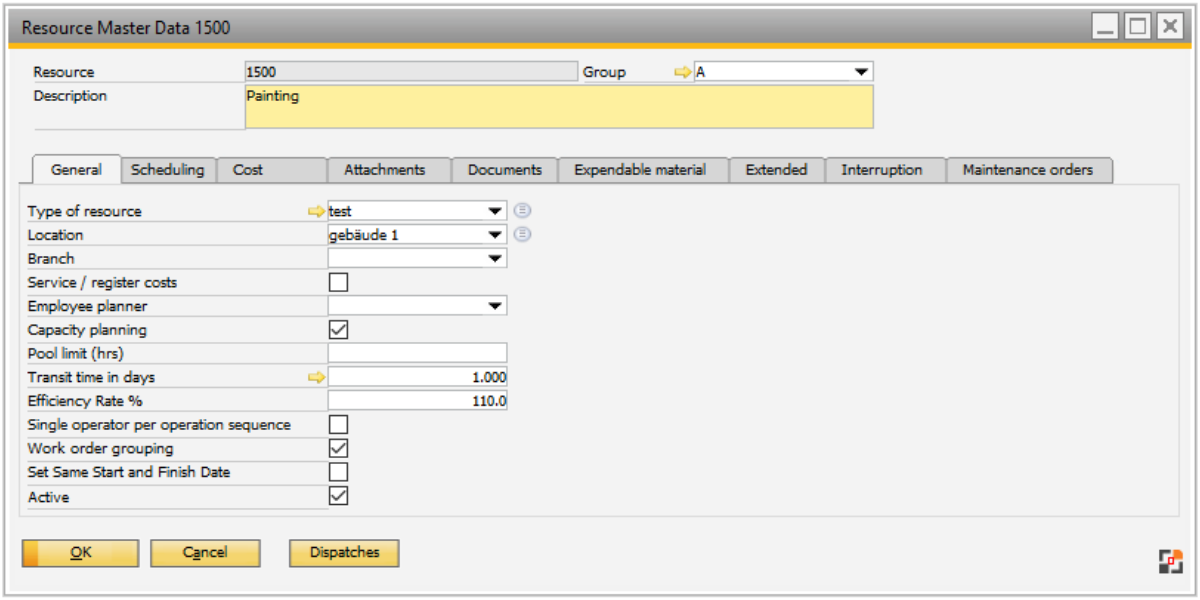
Resource master data

The term “resources” refers to productive resources that are planned as the smallest capacity unit. Only through the correct entry of resources is it possible to receive information on the capacity situation, determine lead times for work orders, or estimate manufacturing costs for the calculation.

PATH: Resources > Resource Master Data.

or

PATH: Resources > Resources.



Window stamm_arbplatz_edit.psr

Header

Field	Meaning
Resource	Unique identification, max. 20 characters. The following characters are not permitted:

© 2026 Boyum IT Solutions A/S

	Space, equals sign, comma, <, >, quotation marks, apostrophe, &, %, ö, ü, ä, ß
Description	Long description of the resource.
Group	ID of the group to which this resource belongs. The yellow arrow opens the Resource group editing window.

Description of tabs

Tab	Meaning
General	General definition of the resource.
Scheduling	Plan utilization or availability of a resource.
Costs	Specification of the costs at marginal and full costs and allocation of cost elements .
Cost details	The marginal and full cost rate can be specified here in further details.
Attachments	3 images or documents can be stored per resource.
Documents	Documents can be stored per resource.
Expendable material	The continual expendable material can be stored for a machine here.
Extended	Further Setup.
Interruption	The reported interruptions can be displayed and revised here.
Maintenance Orders	Displays all maintenance orders linked to this tool. *(beas9.1-008-040-003)*

Buttons

Button	Meaning
Cross reference	- Right-click entry. Opens the Item cross reference. All routings, operations and work orders are displayed containing this resource.
Cancel	Close window without saving changes.
Duplicate	Create a duplicate of this entry.
Remove	Delete this entry.
Reports	Opens the Reports window with a list of reports to start.
Change Log	Opens the Change Log for this resource entry.

© 2026 Boyum IT Solutions A/S

Cost Rates	Opens the Cost rates window for this resource.
Dispatches	Displays current dispatches.

Training unit master data resources

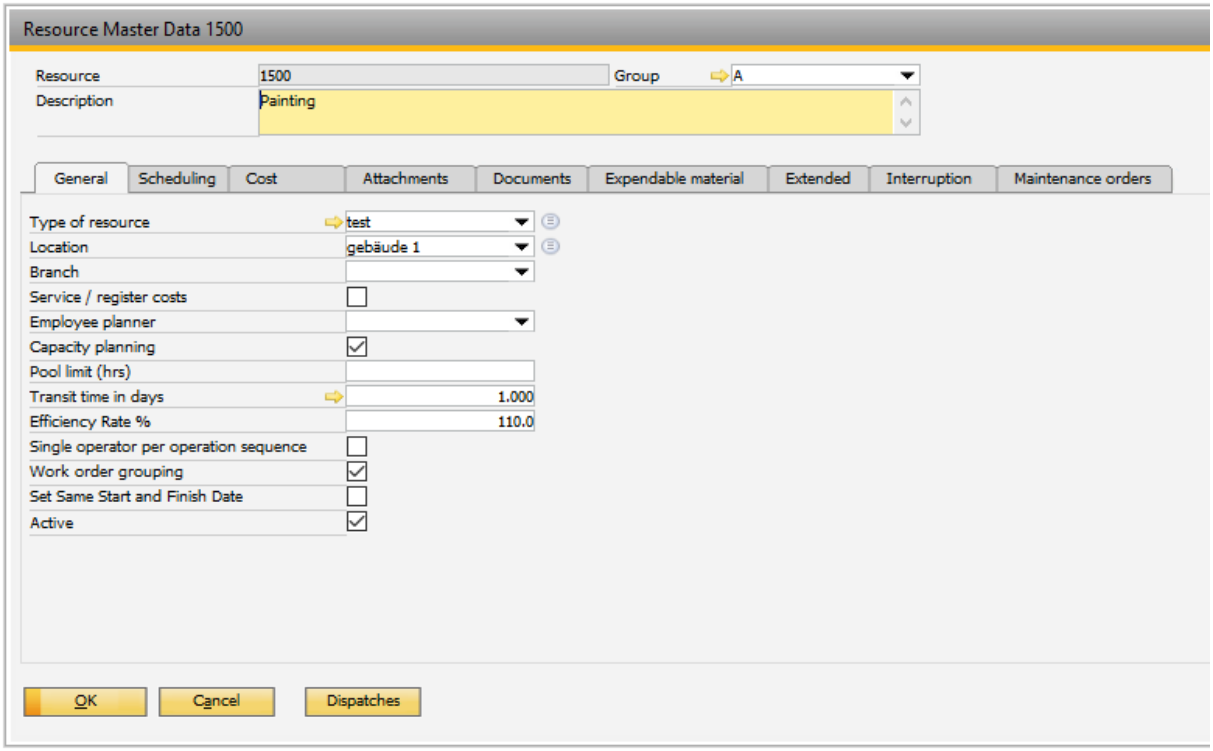
8.1.3.1 General tab

The fields of the General tab are described below.

PATH: Resources > Resource Master Data.

or

PATH: Resources > Resources.



Window stamm_arbplatz_edit.psr

Field	Meaning
Type of resource	Select from deposited resource types. This is only for information and has no additional functionality.

© 2026 Boyum IT Solutions A/S

Field	Meaning
Location	Where is the resource located? Locations according to **Administration > Warehouse administration > Locations.**
Branch	Branch where the resource is located.
Service / register costs	If this option is activated and the resource is selected in a routing position, it is an external operation. An external operation can be reported differently: - Time receipt: In addition to time, a pure cost field is available which can be used to input external production costs directly. - Purchase Order: A purchase order can be generated for the routing position. Further fields such as Supplier, Individual Price, Item, etc. are available in the routing position. Resources of the "External processing" type are not normally subject to capacity planning (deactivate capacity planning), but planning as for normal resources is possible, i.e. a resource such as this can be used, planned and reported like a "normal" resource. For other handling of external operations or external processing, ***see*** External Operations.
Employee planner	Defines the person responsible for planning capacities (APS).
Capacity planning	Determines whether the resource should be scheduled. If this option is activated, the "Planning" tab is displayed and further values can be stored in the area of scheduling. If the option is deactivated, there is no schedule planning, the routing position with this resource is not considered in APS.
Pool limit (hrs.)	If working with pool management, the maximum number of hours is entered per pool. If there is no hour limit, a 0 is entered. ***See*** Pool
Transit time in days	Time required for transfer from one resource to another. Entered transit time is always the transit time to the next operation. Transit time can be - Transportation time from one to another place - Drying time - Expand lead times. In this way, urgent work orders can be squeezed in by reducing transit times in APS-calculation types or Priorities. ***Example:*** Step 1 is machine a, Step 2 is machine B

© 2026 Boyum IT Solutions A/S

Field	Meaning

	When the employee is finished with Step 1, he returns the goods to a collection point.
	Later, the next employee collects the goods from the collection point and starts with step 2.
	This time in between is an average transit time.
	
	The transit time is always the time from the preview operation to the next operation and is defined in the resource from preview operation.
	Transit time is entered in days.
	Resource calendar is not taken into account. The factory calendar is considered only if this was enabled in the Configuration wizard.
	Minimum transit time is entered: Configuration wizard – Master data – Resources.
	
	Configuration of operation sequence:
	`|--- Transit time --| |-- Planned time --| |--- Idle time--|`
	
	First operation has no transit time.
	Example with 2 operations:
	
	`Plan time operation 1`
	`Idle time operation 1`
	`Transit time of resource of operation 1`
	`Plan time operation 2`
	`Idle time operation 2`
	
	Resource-related transit time
	It is possible to define different transit times to the next resource.
	Example : 1 day to Resource A and 2 days to Resource B.
	Click on the yellow arrow left of the entry field "Transit time". In this window it is possible to insert the target resources with the resource related transfer time.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	 *stamm_arbplatz_uebgzeit.psr* Transit time can be used to expand lead times. In this way, urgent work orders can be squeezed in by reducing transit times in APS-calculation types or Priorities Example You have transit time 0.5 days With forward calculation you see: It is not possible to deliver it to the planned delivery date Now it's possible to decrease the Transit time in APS-calculation types or Priorities 
© 2026 Boyum IT Solutions A/S

Field	Meaning

	Overlapping
	In case of overlapping, always the largest transit time is used. The factory calendar is considered only if this was enabled in Configuration wizard.
	See Parallel Operation and Overlapping
	Example
	Operation sequences 1,2 and 3 are parallel: 2 hours each, A2 has a transit time of 2 hours.
	Operation 4 is normal with 2 hours duration
	`A1 Start 8:00 - 12:00`
	`A2 Start 8:00 - 12:00`
	`A3 Start 8:00 - 12:00`
	`Idle time A2: 12:00 - 14:00`
	`A4 Start 14:00 - 16:00`
	Note:
	The system works with internal cache. If you change the transit time per target resource, you must reopen the APS Graphical view.
	See
	Factory calendar

Efficiency Rate %	Specifies the % by which the planning time needs to be multiplied. In this way, the planning time can be influenced by the resource. Ratio between planned time and actual time: by entering an efficiency rate you can manipulate the planned time via the resource. ***Example:*** You have 2 milling cutters. A modern, powerful machine + an old, slow machine. ***Example:*** With the Efficiency rate you can define the duration. Defined duration is for powerful machine, example 50 Minutes. Efficiency Rate = 100%. Total = 50min.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	If you must use the old machine, then you can define another Efficiency Rate, for example 80%. Total = 62.50min Calculation Planned duration *100 : Efficiency Rate 50 Minutes *100 : 80% = 62.50 Minutes Work with Efficiency Rate ***see*** Concept Scrap
Single operator per operation sequence	If enabled, only one employee may log in to the operation sequence to which the resource has been assigned. That means several orders may be registered to that resource, but only one employee can work per operation sequence.
Work order grouping	Determines whether several operations may be processed at once on that resource. Several orders can be processed at once on that resource. Enabled Multiple orders can be processed in parallel on this resource. The option is activated by default. This is only considered in the new **FDC > Open Work Order** or in Pool list with multiple selection. Disabled If an order was already registered on a machine (Resource), a second one cannot be registered. In the login window a sign "no entry" is displayed on the resource selection page. Upgrade Information: If work order grouping is to be disabled in general, enter the following statement: `update "BEAS_APLATZ" set "MEHRMASCHINENBEDIENUGN"=0`
Set Same Start and Finish Date	Activate the collective login / logout Only visible if work order grouping has been activated.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	If several work orders are registered in the resource by one person, the same start and end date is set for all work orders at logout, and all are displayed in a list. Standard parallel time calculation is disabled. The entire lead time is distributed to the time receipts. ***See*** Order logout Start/End date
Active	Set resource to be selectable / not selectable. If active, (default) the resource can be selected. If disabled, the resource is no more available for selection. Note: In this case, you can still use the resource. In existing master data and work orders the resource needs to be replaced manually, if necessary. APS-Optimization continues to use this resource, as long as it is stored in resource groups. This switch is no blocking flag. *(beas9.0-0004-021-000)*
Time receipt not split	Determine whether to distribute times for parallel time receipts. Option is visible only if you set up parallel times in the Configuration wizard . Only to be calculated proportionately. ***Example:*** A user logs in to two resources in parallel and logs out after one hour. In this case each operation receives 30 minutes. You can now set up to ignore one resource from the parallel calculation. ***Example:*** Resource A+B consider parallel calculation, for resource C the option "Time receipt not split" has been activated. Operations are registered for all 3 resources in parallel for one hour. As a result, resources A+B receive 30 minutes each, resource C receives 60 minutes. *(beas9.2)*

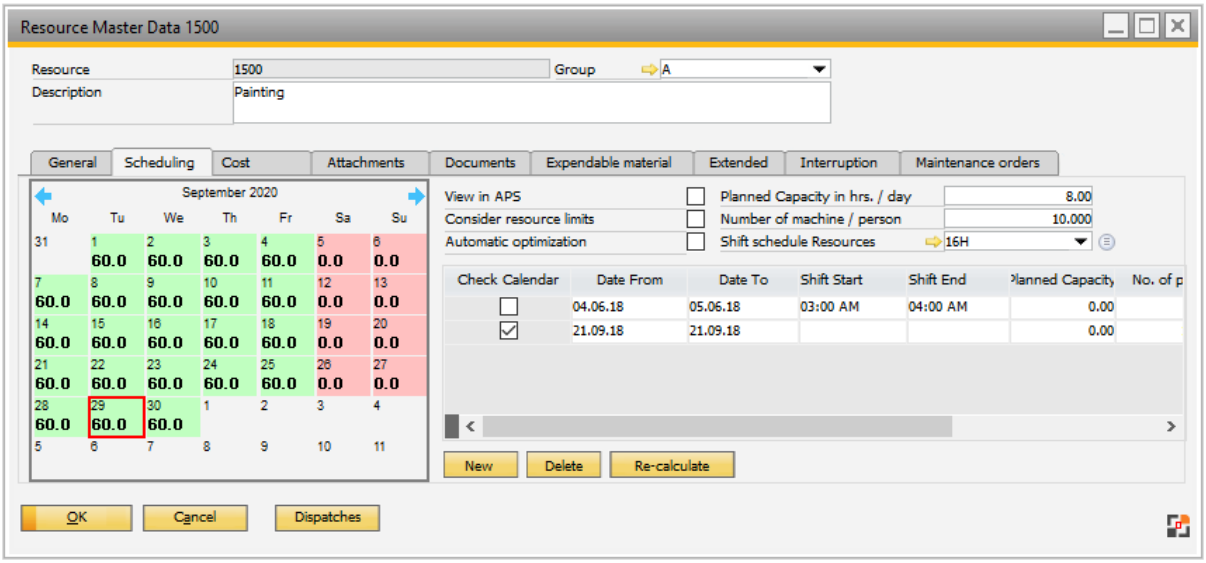
back to edit resource

© 2026 Boyum IT Solutions A/S

8.1.3.2 Scheduling tab

The utilization or availability of a resource can be set per day. Since a resource can also constitute a personnel group, this function can also be considered as the vacation schedule of a personnel group.

PATH: ***see*** "Edit resources".



Window stamm_arbplatz_edit.psr

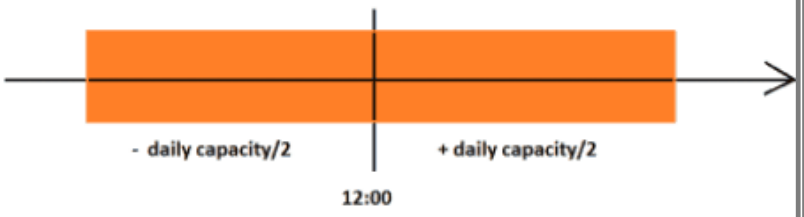
Field	Meaning
View in APS	Display in APS. If active, the work sequence using this resource is displayed in the APS. When deactivated, this is hidden. Note: This option can only be changed with an APS license.
Consider resource limits	Consideration of the resource capacity limits Determines whether the resource has capacity limits or whether this must be considered during the calculation. This must generally be deactivated for external resources, except for ones with planned capability. The resource limit is determined from planned capacity / day x number of machines/persons, the daily plan, and the factory calendar.

© 2026 Boyum IT Solutions A/S

	Note: This option can only be changed with an APS license, because the APS only accepts calculation types considered by the capacity limits.
Automatic optimization	Resource is considered in automatic optimization If active, this resource is considered in automatic optimization. If this resource is to be considered, this option must be enabled additionally in the Resource group – Resource optimization and at alternative resources, as well. Note: The option can only be changed with an APS license. ***See***: Res resource group Alternative Resources
Planned Capacity in hrs. / day	Net capacity per resource. without cleaning, maintenance and other planned downtime. Total net capacity is (planned capacity in hours/day) * (number machines / persons) * (%-value as per factory calendar) Planned capacity can be influenced by - Priorities - Shift schedule of the resource - Shift schedule of the resource group - Shift calendar Planned capacity cannot exceed 24 hrs/day. If in shift schedule for resources or resource calendar a start / end time is defined, the planned capacity is at most the period between start and end time. ***Example***: Start 8:00, End 14:00 Maximum time for scheduling: 6 hours. Start time and end time. The calculated Start is at 12 o'clock - (planned capacity in hours : 2)

© 2026 Boyum IT Solutions A/S

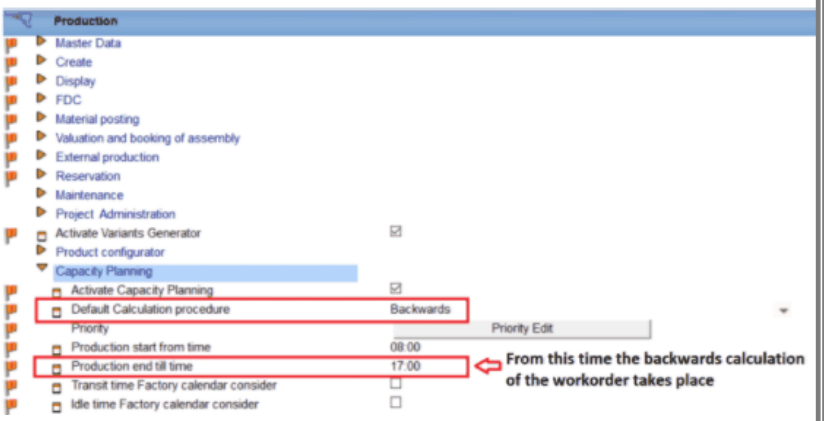
The calculated End is 12 o'clock + (planned capacity in hours : 2)



Backward scheduling considers only the end date

Forward scheduling considers only the start date

Example:



A Resource has a daily capacity of 8 hours.

Shift Start = 12 - 4 = 8 o'clock

Shift End = 12 + 4 = 16 o'clock

So the calculated end is the shift end of the resource at backwards scheduling, which is 16 o'clock in this example instead of 17 o'clock.

Note:

If a start / end date is defined in the Shift definition, these have a higher priority, but do not affect planned capacity.

Note for available planned capacity for an operation:

The max. number of hours between start- and calculated end are available for an operation.

© 2026 Boyum IT Solutions A/S

	e.g. 15 hours day, shift start = 8 o'clock, shift end = 16 o'clock Means, max. 8 hours are available Exception: number of the machines / persons is higher than 0 and defined in the operation, so that all resources can be accessed. Note: View Production structure – Time unit automatically. The setting affects the definition of the unit value "Days" Special case external operation. External operation times are often entered per day. To do so, the planned capacity and the number machines / persons should receive the value 1. 1 equals 24hours in this case. For more information: ***See*** External operation – lead time ***See*** Resource shift plan Priorities Expand and compress Configuration wizard - Production - Capacity planning - End date Capacity planning
Number of machines / persons	Number or single resources for this resource Use this option, to define a kind of resource group without a detailed planning of the elements. A resource can represent a group of machines (e.g. 5 milling machines) or a group of workers (e.g. 5 technicians). To do so, enter a number greater than 1. **Example**: 5 employees are working on one machine. They are not planned separately -> enter 5 The resource represents a person who can work in parallel on 5 turning machines -> enter 0,2 IMPACT ON CAPACITY PLANNING: The field "planned capacity" and "Number of machines / persons" are multiplied, resulting in the total capacity of the resource. (s. resource scheduling calendar)

© 2026 Boyum IT Solutions A/S

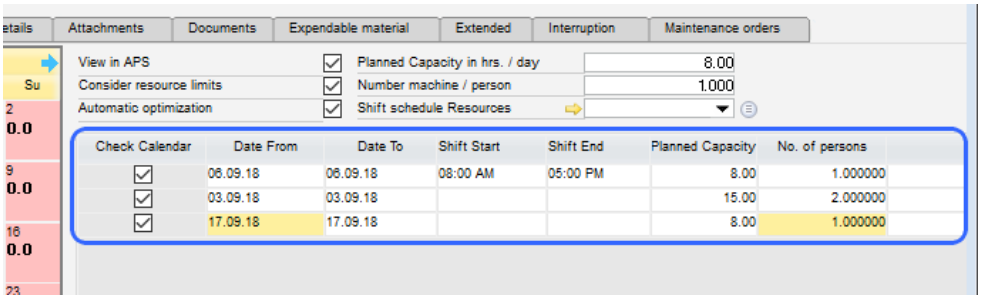
	In capacity planning, only one machine from the group is dispatched to minimize set-up times. If you want to prevent this, enter the group with only one machine but with the corresponding multiplied planned capacity. **Attention:** If the APS calculation is planned as "backward", no resource limits should be checked, and the setting of this field > 1 results in the system not doing a detailed capacity planning. Beas only calculates with the total available capacity for a day. In this example the resource has 3 * 8hr. = 24 hrs. per day. As Beas only plans with the capacity, the “start time” is the same for all resources and. The given start time can be ignored, also the given end time, only the day is relevant. ***Example:*** All WO’s need the resource for 5 hrs. We assume the calculation starts the next day at 8:00 and the day “ends” at 16:00 (this is 8 hrs. working time for one machine) Based on this, the calculation works as follows:. 1. WO: Starts 8:00, End:13:00, takes 5 hours from the 24 --> now for next WO 19 hours remain 2. WO Starts 8:00, End:13:00, takes 5 hours from the19 --> for next WO 14 hours. remain 3. WO Starts 8:00, End:13:00, takes 5 hours from the14 --> for next WO 9 hours remain 4. WO Starts 8:00, End:13:00, takes 5 hours from the 9 --> for next WO 4 hours remain 5. WO --> Starts 8:00, takes the remaining 4 hours --> there is 1 hour less to finish at this day. This 1 hour is taken to the next day and the WO ends the next day at e.g. 9:00.

© 2026 Boyum IT Solutions A/S

	REMEMBER: The start and end times are theoretical and are set normally by the defined starting time of a machine, and the duration of the operation. **Important:** If this value is higher than 1, the Quantity tool field value is ignored by the system.
Shift schedule Resources	Select a resource shift. ***See*** shift schedule for resource If a resource does not have a shift plan assigned to it, the system checks if this resource is associated to a group of resources and reads the shift plan from the resource group.  *Window basis_resource_layerplan_edit.psr*

Resource calendar

Right to the resource calendar exceptions for certain periods can be entered. These are displayed in a table.



Window stamm_arbplatz_edit.psr

Field descriptions

© 2026 Boyum IT Solutions A/S

Field	Meaning
Date from/to	Period in which the exception applies.
Check calendar	Set the check mark to active if the factory calendar has to be taken into account at capacity calculation. If the factory calendar is NOT taken into account, the following formula applies: Total net capacity is (planned capacity in hours/day) * (number of machines or persons) * If the factory calendar is taken into account, the following formula applies: Total net capacity is (planned capacity in hours/day) * (number of machines or persons) * (%-value as defined per factory calendar).
Shift Start/End	Shift start/end. If set, the shift stored in shift schedule for resources is overwritten. For further information ***See*** Shift schedule for resources. By leaving the field empty, the default shift applies. **Attention:** Shift over midnight is not possible.
Planned capacity	Overwrites the planned capacity for this shift in the given period.
Number of persons	Overwrites the number of single resources (***see*** above) in the given period.
Reason	Reason for the exception.

See

Capacity Planning

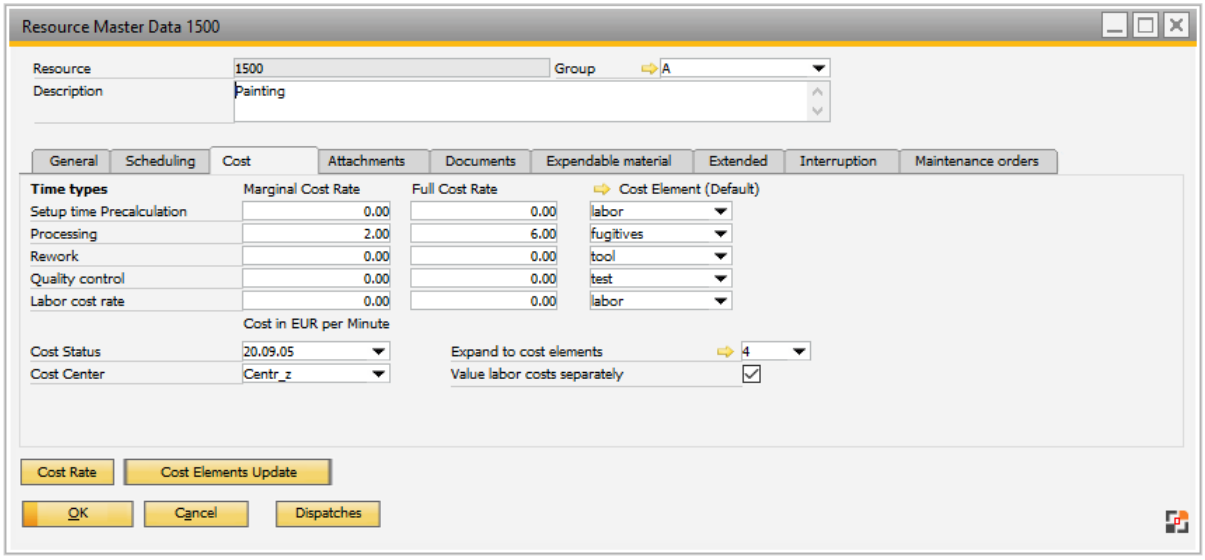
back to edit resource

8.1.3.3 Cost tab

In this tab you can specify the costs as marginal and full costs and assign them to cost elements.

PATH: ***see*** "Edit resources".

© 2026 Boyum IT Solutions A/S



Window stamm_arbplatz_edit.psr

The cost elements are designated in **Configuration Wizard > Master Data > Resources >** Time types

.

For general information on resource costs and some examples, ***see*** Resource costs.

All costs are specified in minutes or in hours. This is configured in the Configuration Wizard.

Field Description

Field	Description
Time types	The time types with their cost rates are displayed. Click the yellow arrow to set up the time types.
Setup time pre-calculation (Setup time type)	Cost rate "setting up". Only visible if the "Expand to cost element" is greater than 1. You can specify a separate cost rate for the setup process. The setup process can be reported separately in the FDC. Input marginal and full costs. A Cost element can also be stored and it can be inserted into the work sequence by selecting it in the operation. ***See*** Time types
Processing (cost rate)	Cost rate "processing"

© 2026 Boyum IT Solutions A/S

	This field is always visible. This is the main cost rate and can represent either a mixed calculation of all costs ("Extension to cost element" = 1), machinery costs only ("Evaluate personnel costs separately" active) or the main processing time ("Extension to cost element" > 1). If you change Marginal Cost Rate and in Cost Details Fixed Costs defined, the System automatically calculates the Full Cost Rate, which is Marginal Cost Rate + Fixed Costs. Input at marginal and full costs. A Cost element can also be stored and it can be inserted into the work sequence by selecting it in the operation. Please consider general information on Resource costs.
Rework Quality control	Cost rate secondary time, extended cost rate In these fields additional cost rates such as rework, quality control, pure machinery costs, and so on, can be set up as a separate cost rate as required. These can also be reported separately in the FDC without having to insert another resource or operation. Only visible if the "Expand to cost element" is set to 3 or 4. Input the marginal and full costs. A Cost element can also be stored and it can be inserted into the work sequence by selecting it in the operation. ***See*** Concept Time types Configuration wizard - Resources
Labor cost rate	The Labor cost rate can be set in these fields. Only visible if "Value labor costs separately" is active. Input marginal or full costs. A Cost element can also be stored and it can be inserted into the work sequence by selecting it in the operation.

© 2026 Boyum IT Solutions A/S

Cost Status	Date of the cost definition.
Cost Center	Specification of a cost center for further analysis (not the same as the cost element).
Expand cost elements	Define number of cost rates. The number of cost rates available. The default is one cost element (processing time), which can represent a mixed calculation of machinery and personnel costs. Up to 4 cost rates can be defined, if for example a separate report should be made for machinery, personnel, or other cost originators via FDC. If setup time is to be valued separately, select "2" cost elements. Then for setup and for processing time rates of marginal and full costs and a Cost element are available. At order time receipt you select if the registered time is setup or processing time. Two additional time types can be set up to perform separate cost calculation and time registration. ***See*** Concept Time types Time types Configuration wizard – Resources
Value labor costs separately	Separate personnel costs. If this option is activated, a separate cost rate can be stored for personnel costs. Special feature: If a cost rate is stored in the personnel master, the costing calculation is performed using the personnel cost rate of the employee who reported the time. For this type of cost recording, separate personnel clocking in/out is not necessary, although this means that this type of cost recording can only be used if the person operates only one machine at a time.

© 2026 Boyum IT Solutions A/S

	Example: Personnel costs with 2 cost elements ("Extend to cost elements" = 2): 1. Setup cost element €0 2. Processing cost element €2 / minute (= machinery costs) 3. Personnel costs €1.5 / minute When logging in to FDC, the employee can now decide whether he reports the "setup" or the "processing". In the first case, a calculation of €1.5/minute (= 0 + €1.5) is performed, and for a processing report €3.5 (= €2 + €1.5). Only one time report is generated in which all direct costs are included. As a separate cost element can be stored for personnel costs, separate analysis of the planned or accumulated personnel costs are possible in the pre-calculation and cost analysis. If the person operates several machines and clocks his own costs, this can be performed using an extended cost element.

Buttons / Functions

Button	Meaning
Cost Rate	Define additional cost rates.
Cost Elements Update	The selected resource costs elements can be updated in all routings containing this resource as a routing position. In the prompt the following options are available: All: all cost elements are replaced. Only empty: only empty cost elements are updated.

Back to edit resource

© 2026 Boyum IT Solutions A/S

8.1.3.3.1 Resource costs

The costs that a resource generates costs are related to a minute or hourly rate of the usage time stored in the routing. These costs can be sorted into different types.

Type	Description
Only one cost rate	There is only one cost rate into which the personnel and machinery costs have been factored. Advantage: Handling is very simple.
Machinery + personnel costs	There are two cost rates in the resource: • One for the machine • One for the use of personnel It is assumed that the resource is a machine operated by one person and the person operates only one machine and works on only one order. The actual personnel costs according to the personnel master can also be considered in the costing analysis. Advantage: Handling is very simple. Disadvantage: Does not support work order or machine grouping.
Machine setup time, machine processing time	There are two cost rates: • One cost rate for the setup process • One cost rate for the processing time The personnel costs is factored into both In this case, the setup process and the processing time are logged in and out separately in factory data collection. Advantage: Separation of corresponding costs. Disadvantage: Handling is somewhat more complex.
Machine setup time, machine processing time + personnel costs	There are three cost rates: • One cost rate for the setup process • One cost rate for the processing time • One cost rate for the use of personnel In this case, the setup process and processing time are logged in and out separately in factory data collection. In the setup process: setup costs + wage costs are calculated.

© 2026 Boyum IT Solutions A/S

	Processing time: processing costs + wage costs are calculated. It is assumed that the resource is a machine operated by one person and the person operates only one machine and works on only one order. The actual personnel costs according to the personnel master can also be considered in the costing analysis. Advantage: Handling is relatively simple. Disadvantage: Does not support work order or machine grouping.
User-definable cost rates	⊟ Up to 4 cost rates can be defined which can all be logged in and out separately. This setting makes it possible for a machine processing an order at machinery cost rate and the employee at the employee cost rate to log in for different durations. Therefore the setup process, employee assignment and machine assignment can be planned and evaluated separately. Up to four time types (employee assignment, setup process, quality assurance, and so on) can be defined, and any cost element can be stored for each type. Advantage: Exact separation of costs. Disadvantage: Costly factory data collection.
Parallel resources	Another option for separating machine and personnel costs is using parallel resources. ⊟ Details: One resource is created for the machine and one for the personnel. A parallel resource for the personnel time is added to the main operation for the machine. This approach can be used to calculate and evaluate machine time and personnel time separately. Advantage: Exact separation of costs. Disadvantage: Costly master data and factory data collection.

© 2026 Boyum IT Solutions A/S

Note on changed resource costs:

The resource costs specified in the work order are planned costs from the moment of creating the work order or when transferred from pre-calculation from the moment the pre-calculation was created. It is exclusively planned costs (calculation costs).
For a time receipt the resource costs are used, that are currently stored in the resource.
The moment of reporting order time is applied, not the valuation time.

Example:
1st May: resource costs 5 €, when the work order is created
2nd May: resource costs increased to € 5.50 in the resource
3rd May: order time receipt is created and € 5.50 is used for the valuation
4th May: resource costs are increased to 6.00 €
5th May: order time receipt is created retroactively for 3rd May. Because no price history is available, the reference price is the current resource price of € 6.00.

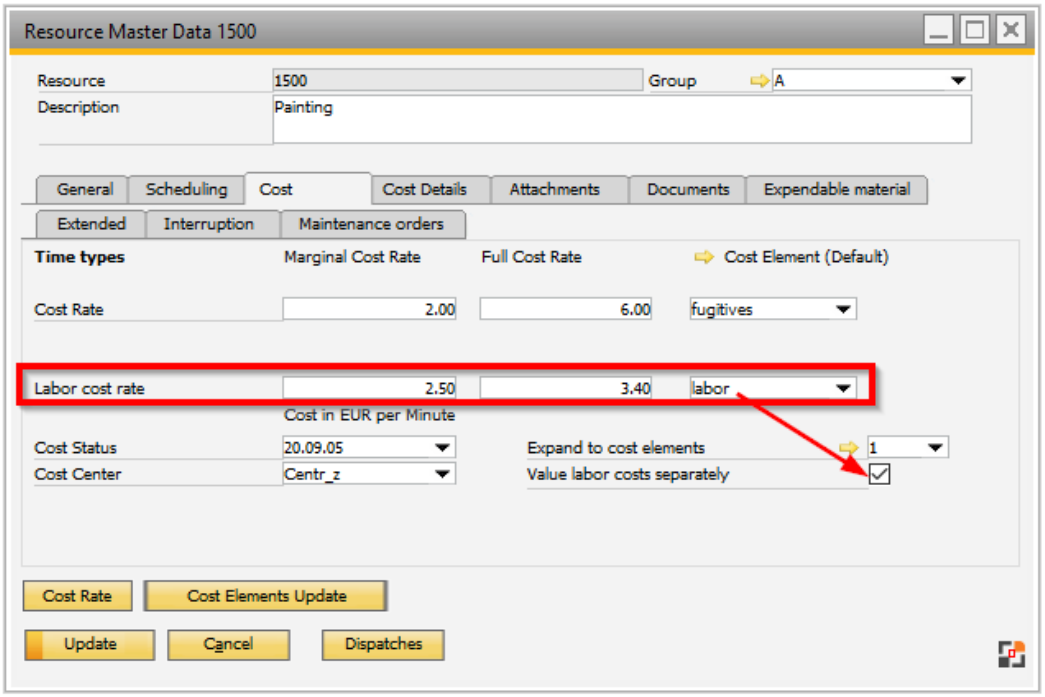
Changes to costs in the resource master or the production order have no effect retroactively on journal entries. Resource costs in the work order are the result of calculations, they have no effect on the cost of time receipts.

8.1.3.3.1.1 Separate wage costs

Labor cost collection is only possible if the employee works with only one machine or resource, so the machine and personnel times run in parallel.

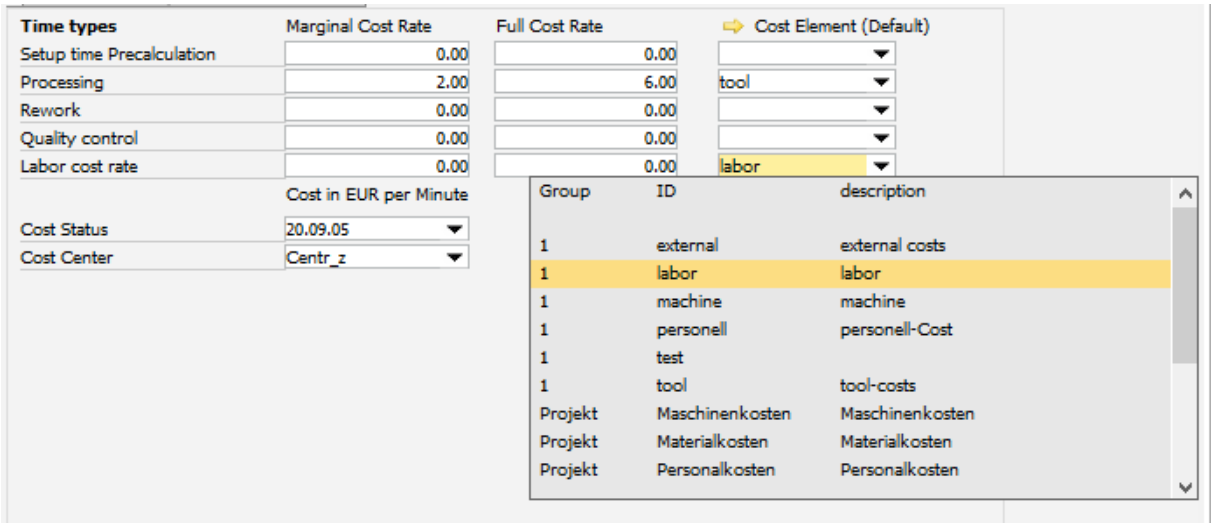
These settings can be configured independently for each resource in the Costs tab, using the *Value labor costs separately* field. If this option is active, the personnel cost fields (marginal costs and full costs) are displayed.

© 2026 Boyum IT Solutions A/S



Window stamm_arbplatz_edit.psr

Different cost elements also visible. By selecting maximum 4 cost elements in the *Expand to cost elements* drop-down field, 3 additional time types appear with relevant fields for marginal cost rate, full cost rate and drop-downs fields for cost elements for each line:

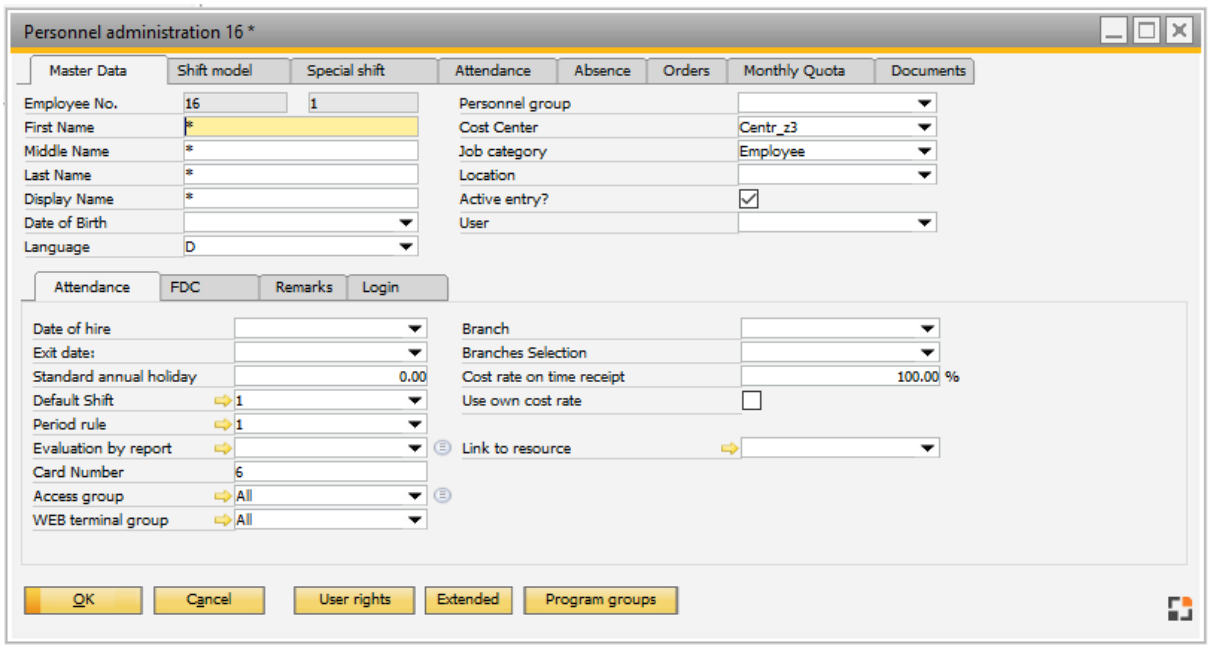


Window stamm_arbplatz_edit.psr

The individual costs (machine or personnel) are not visible in the costing analysis or the time entry. The sum of machine and personnel costs are always displayed in the costing analysis. However these cost data are stored separately.

© 2026 Boyum IT Solutions A/S

If the employees have custom hour or minute rates, depending on configuration, you can configure Beas so that the personnel rate stored in the personnel master data is used for the costing analysis rather than the planned personnel rate.



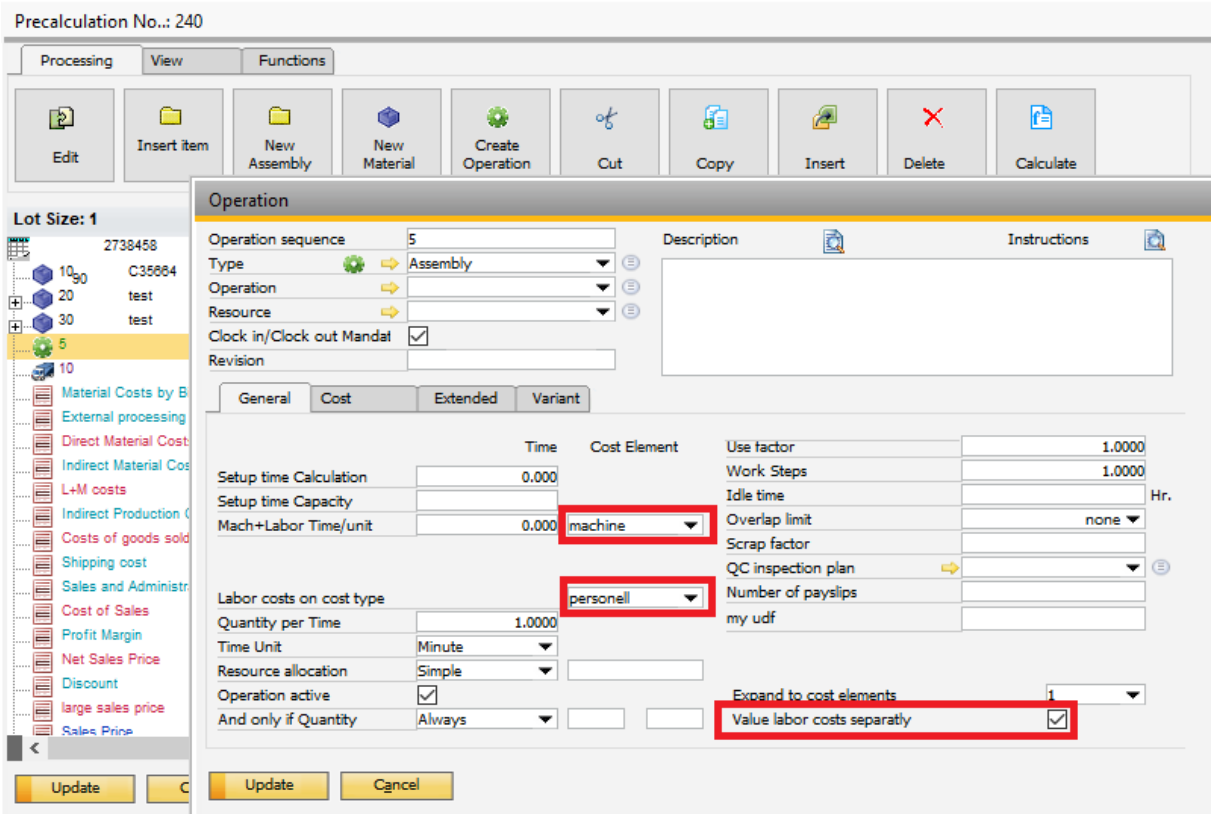
Window bde_personnel_edit.psr

Separate display of machine and personnel costs

The time types can be used to evaluate the machine and personnel costs separately.
Following is an example with a new calculation:

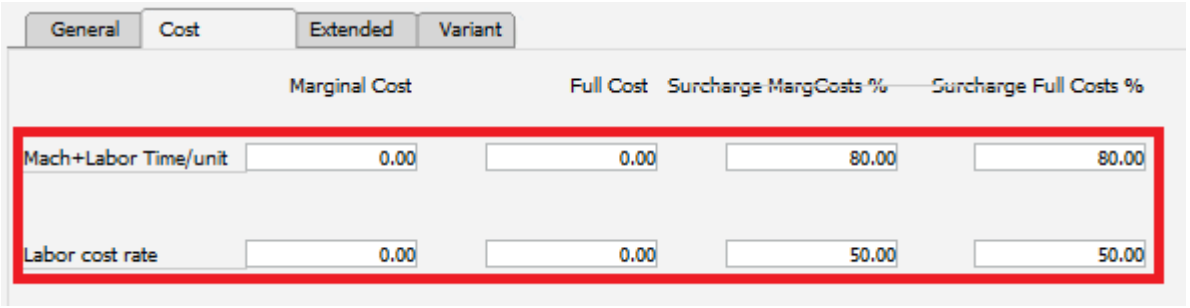
On the operation General tab activate *Value labor costs separately*. During processing, enter the previously created time type *Machine* and *Personnel* for personnel costs.

© 2026 Boyum IT Solutions A/S



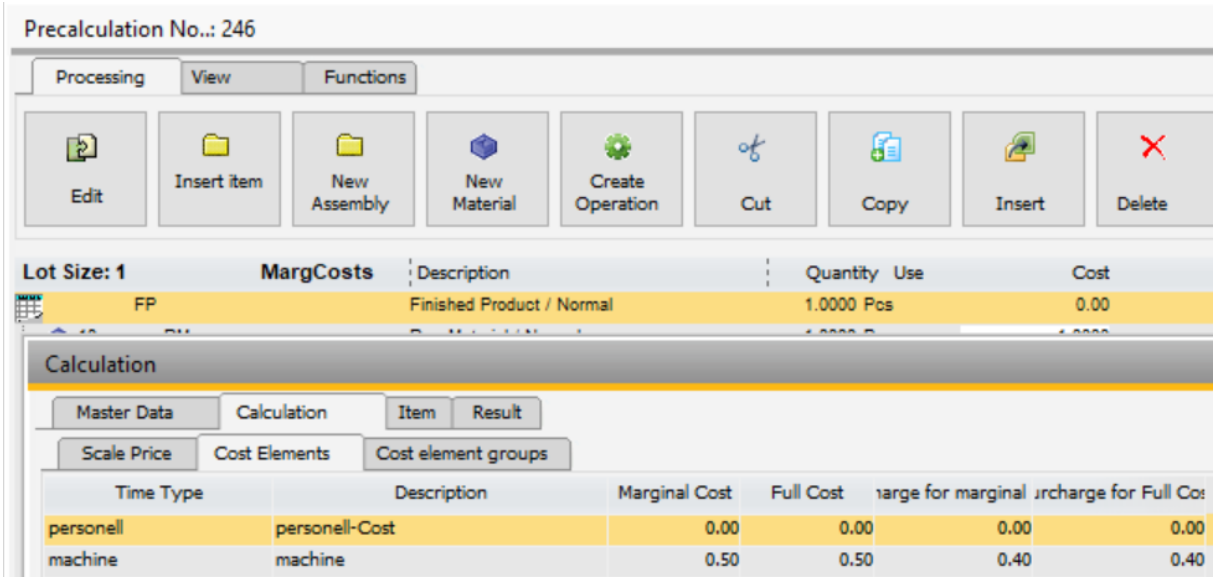
Window pk_arbplanos.psr

The machine and personnel costs are entered in the Costs tab:



If you process the first entry of the calculation and go to **Calculation > Cost Elements**, the costs per cost element are displayed:

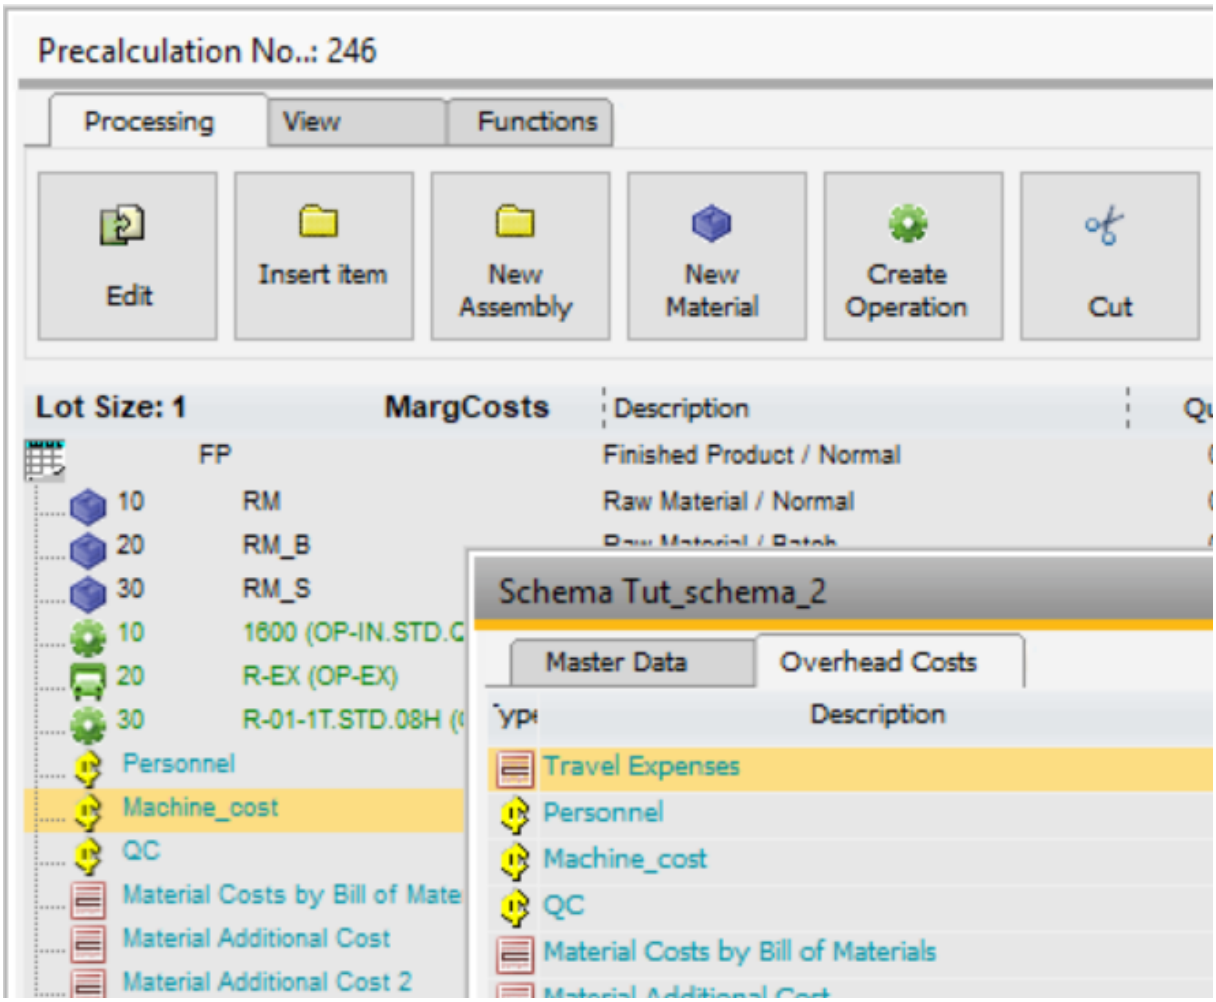
© 2026 Boyum IT Solutions A/S



- There are two approaches for using cost elements:
- Instead of the production costs, the costs of the individual cost elements are displayed.
- The individual cost elements are displayed in addition, without them being added to the final sum (deactivate *Evaluate in precalculation* option).

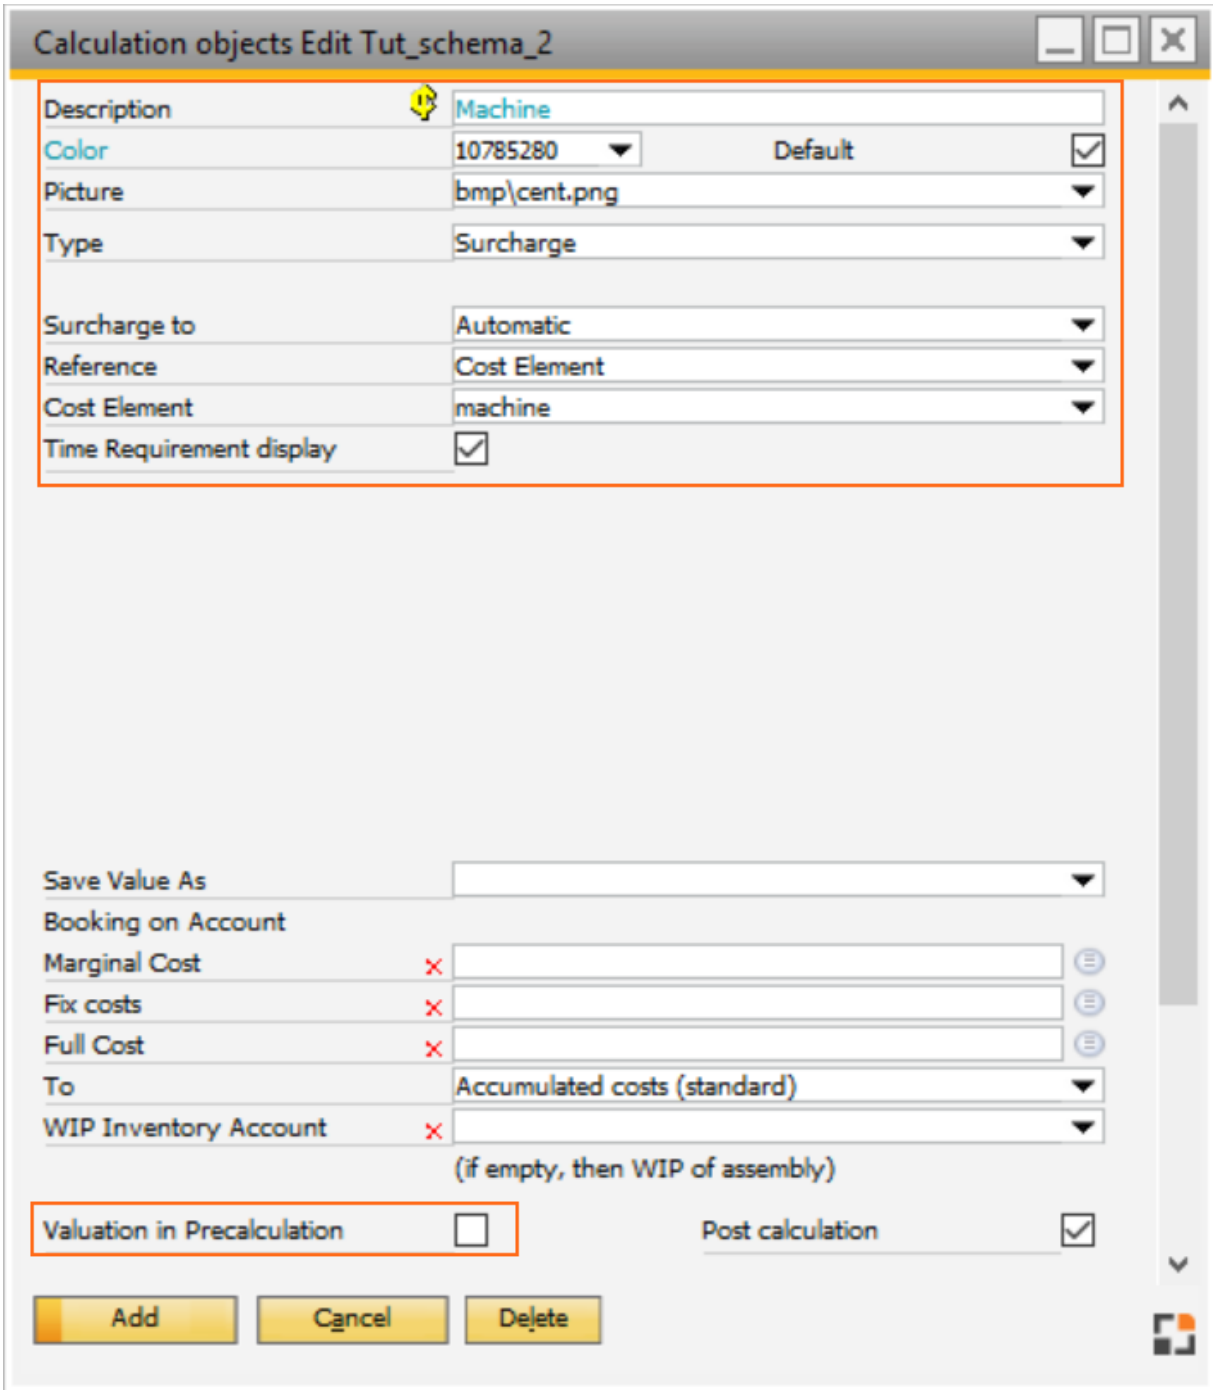
Example for the second option:
This is done using the calculation objects. You can insert any calculation object after the production costs.

© 2026 Boyum IT Solutions A/S



This is processed immediately.

© 2026 Boyum IT Solutions A/S



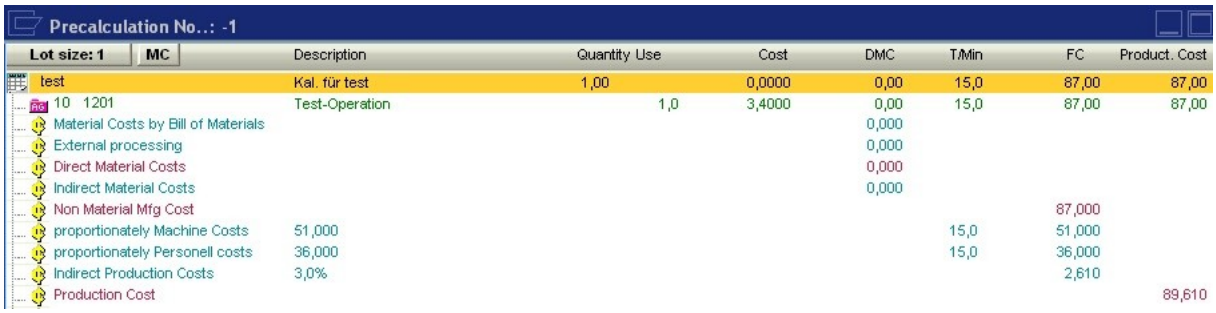
Add a description and cost type. Use the cost element type in the reference field, then select the required cost element.

Do not select the *Valuation for Precalculation* as this is already part of production costs.

The same setup is used for the *Personnel* cost element.

The individual cost elements are now listed in the calculation and not added.

© 2026 Boyum IT Solutions A/S



If only the costs of the cost elements should be listed, do the following:

1. Remove the *Production costs* object.
2. Activate the *Evaluate in Precalculation* in the inserted objects.
3. In the first object, set *Belongs to* to Production so that the program recognizes that these costs belong to the production costs from this line.

In order to avoid having to re-define the surcharges every time, you can adapt the calculation template directly under **Calculation > Template**.

1. Copy the default template
2. Adapt the newly created template to the requirements
3. In the **Configuration Wizard > Calculation** set default template to the user-created template.

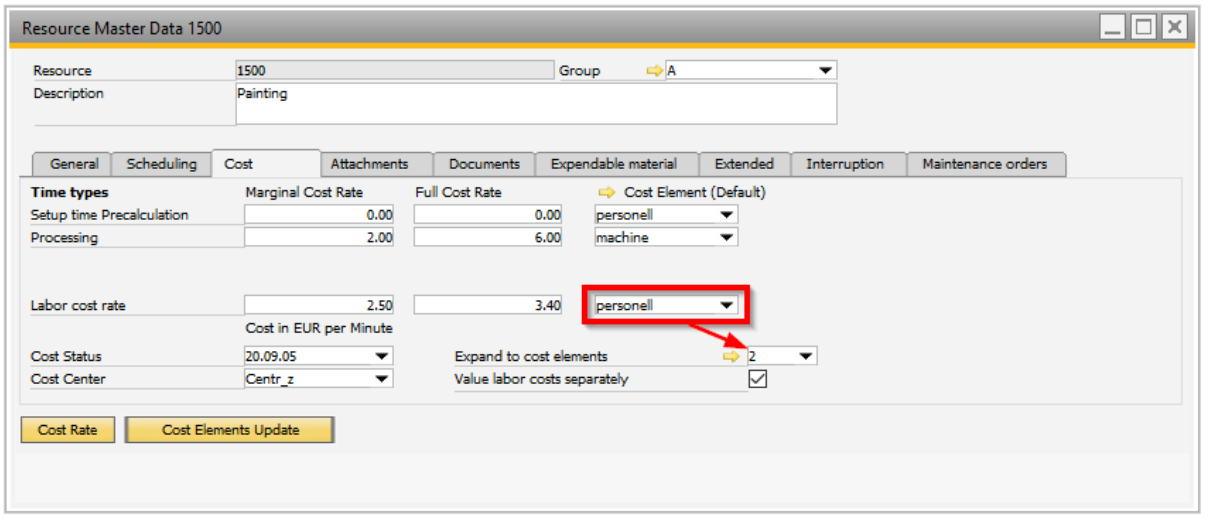
8.1.3.3.1.2 Separate setup costs

The processing and setup costs can be assigned different cost rates and can be reported separately. Also ***see*** Separate wage costs.

This is activated in the **Resource Master Data > Cost tab**.

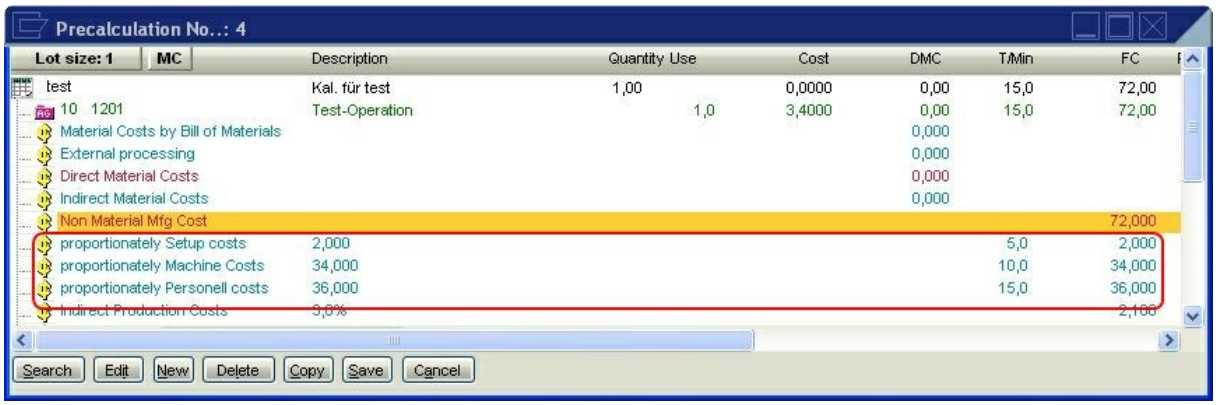
Set the Expand to cost elements parameter to 2. This makes the processing and setup time available as different time types and you can store the cost rate per minute at marginal and full costs.

© 2026 Boyum IT Solutions A/S



In this example, the labor costs are also activated, but this is only possible if machine grouping is not used. Alternatively, the personnel costs can be factored into the setup and processing time.

The setup costs can now be displayed separately in the calculation. ***See*** setup of calculation objects in Separate wage costs.

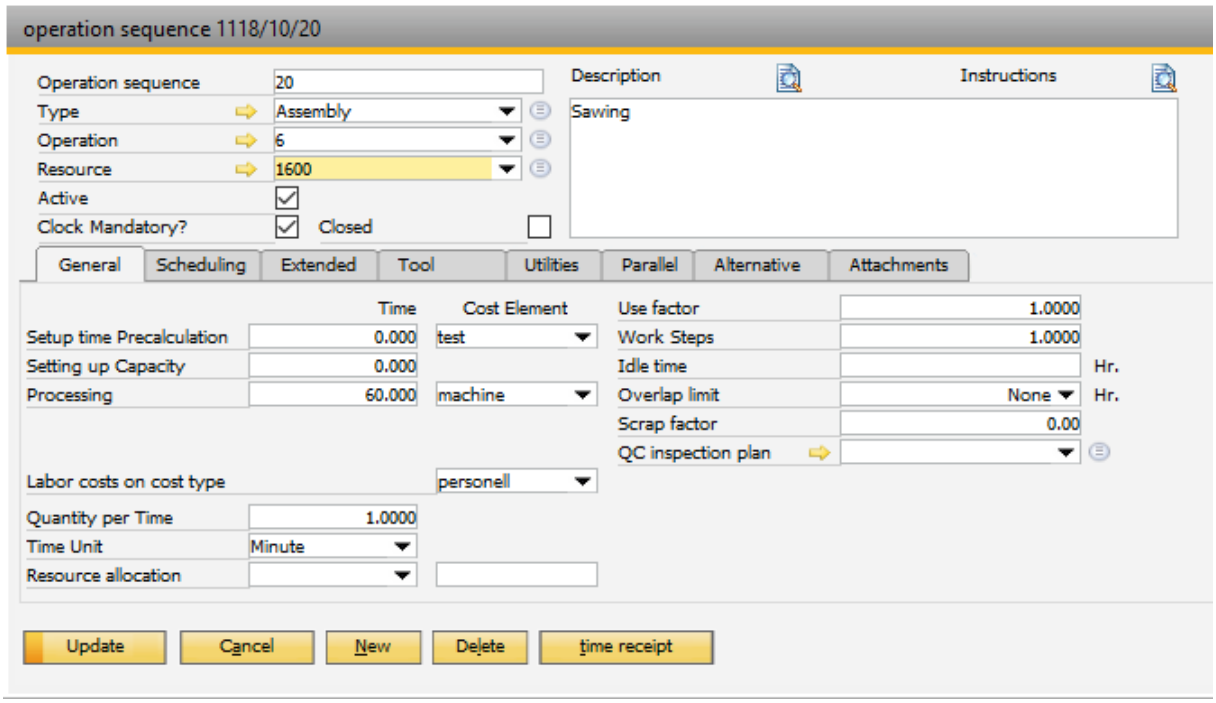


Window pk_struktur.psr

This example illustrates that 5 minutes of setup time and 10 minutes of processing time was used and the person, who may only operate one machine, generated both values (setup + processing time), that is, 15 minutes of cost for this work sequence.

This has the following effect in the area of production:
A resource is stored in a work sequence with the corresponding setting.

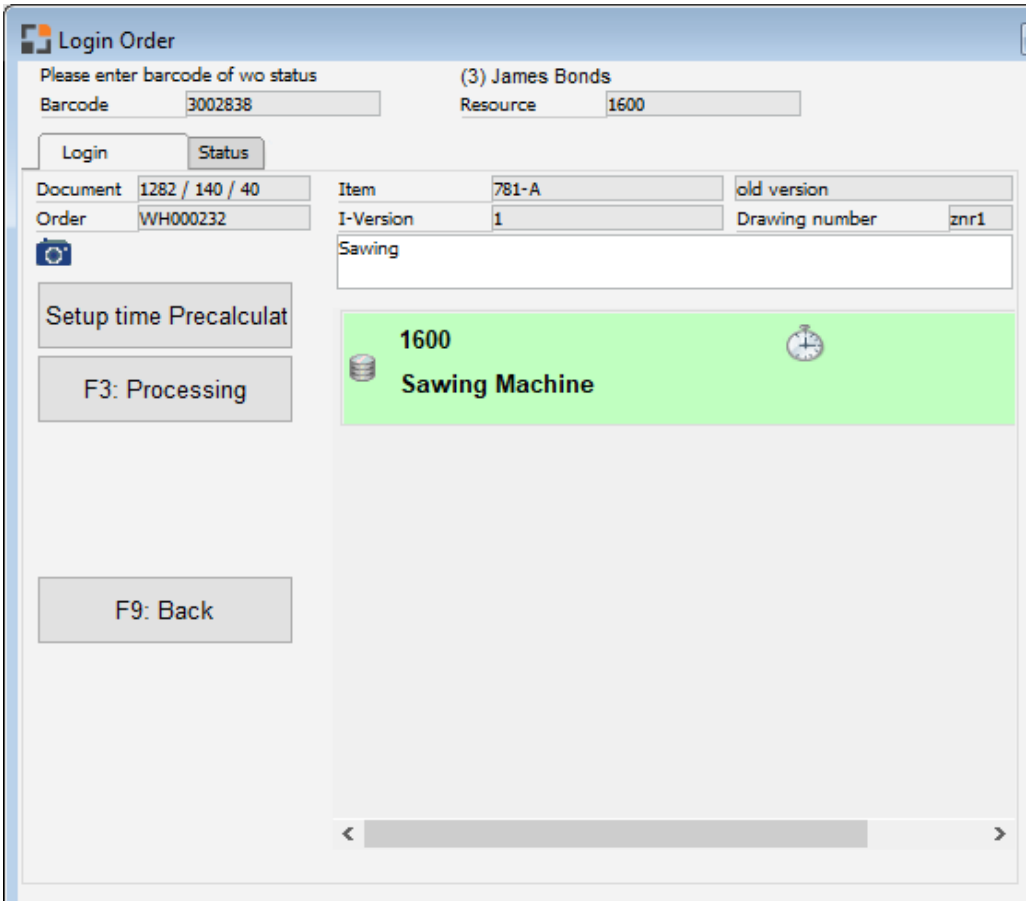
© 2026 Boyum IT Solutions A/S



Window fert_arbplanos_edit.psr

If the work sequence is now logged in, the employee can choose whether to log in the setup time or machine time.

© 2026 Boyum IT Solutions A/S



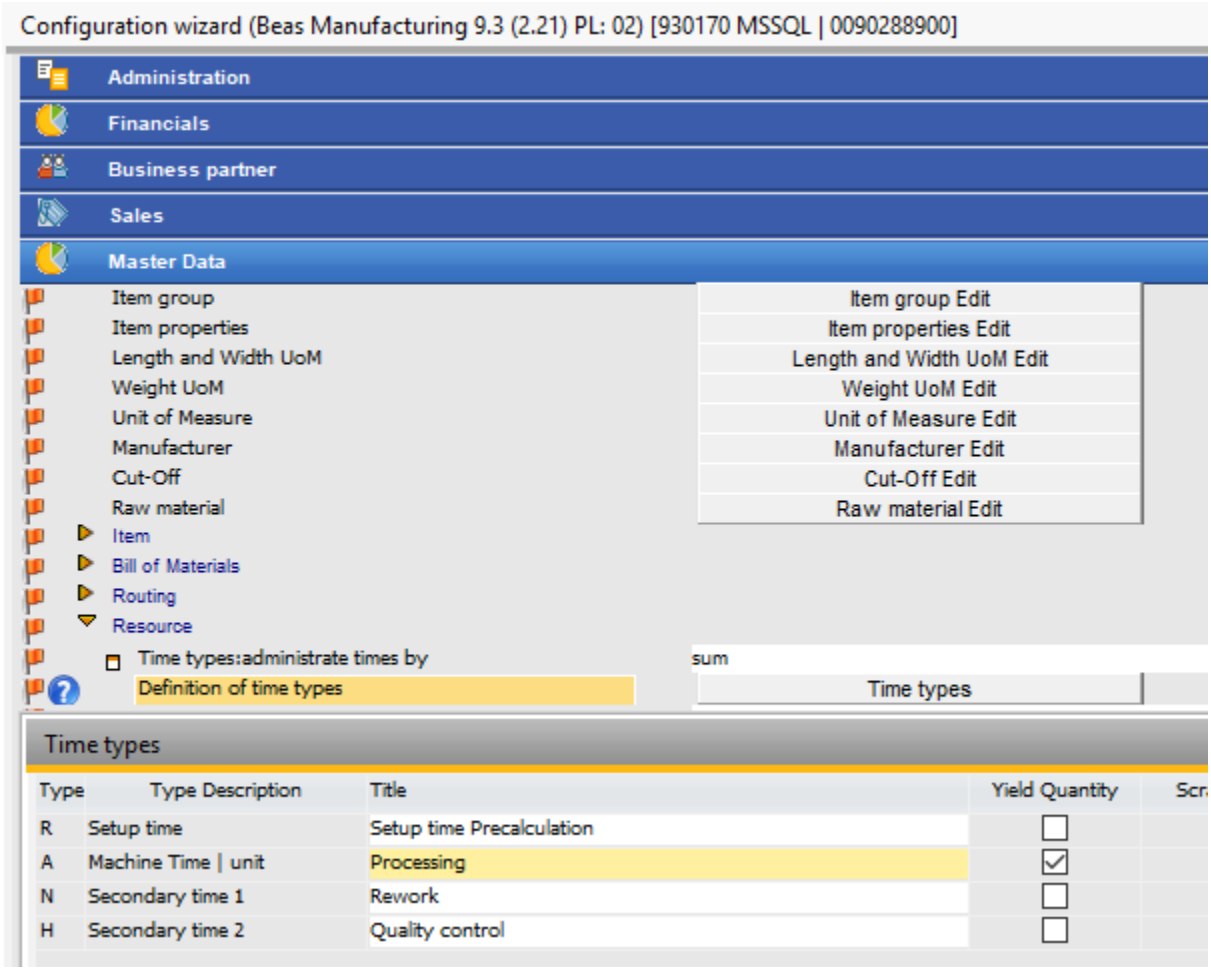
Beas determines which functions are available directly from the master data and resources rather than the work sequence as the information in the work orders represents the plan data.

8.1.3.3.1.3 Concept time types

Up to 4 time types can be set up in the Configuration Wizard. In the flowing example, the following time types are set up:

- Setup time
- Processing
- Rework
- Quality control

© 2026 Boyum IT Solutions A/S

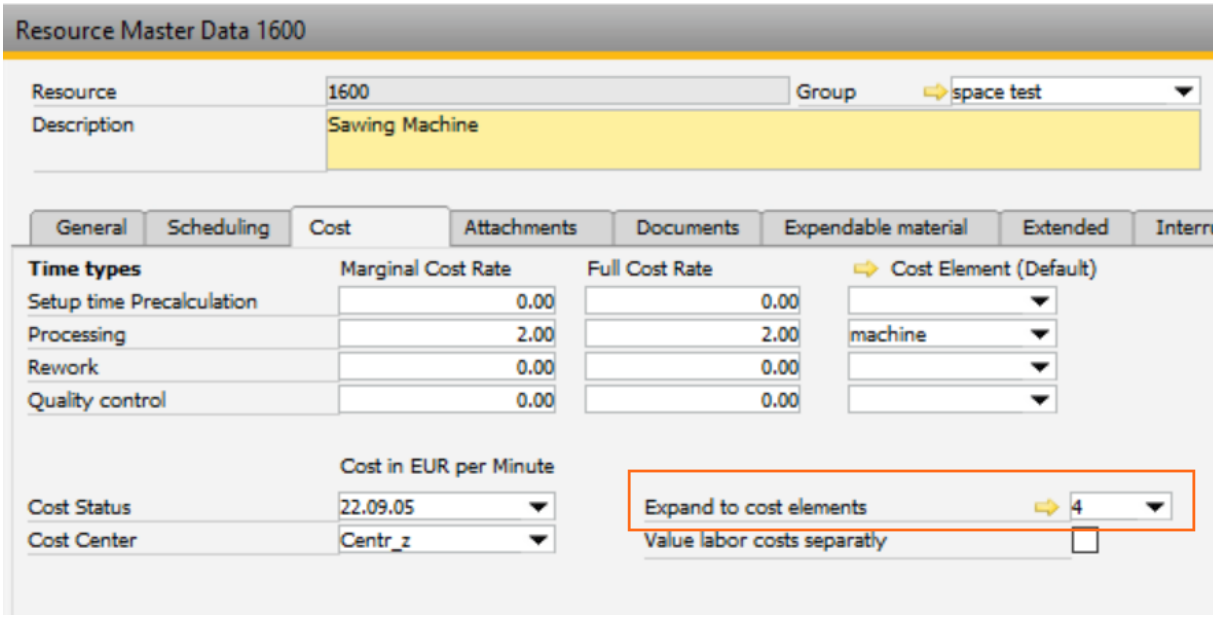


Type R: setup time

Type A: main order time for which the number of pieces is reported

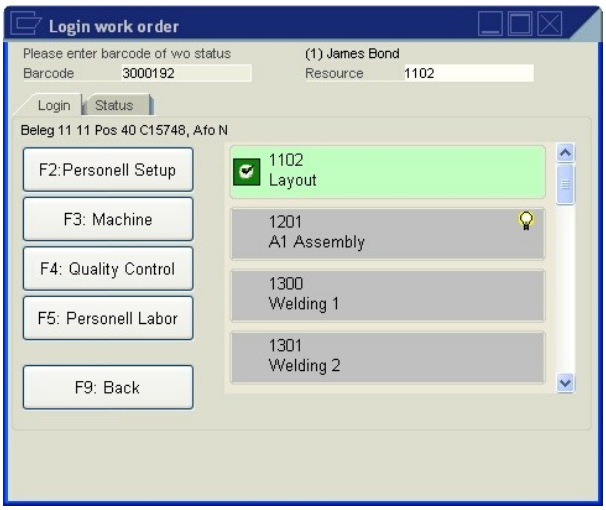
All time types can be activated in the resource by extending cost elements to 4:

© 2026 Boyum IT Solutions A/S



It is possible to store a separate cost rate and cost element for each time type.

If this type of work sequence is logged in, the following login functions are available to the user:

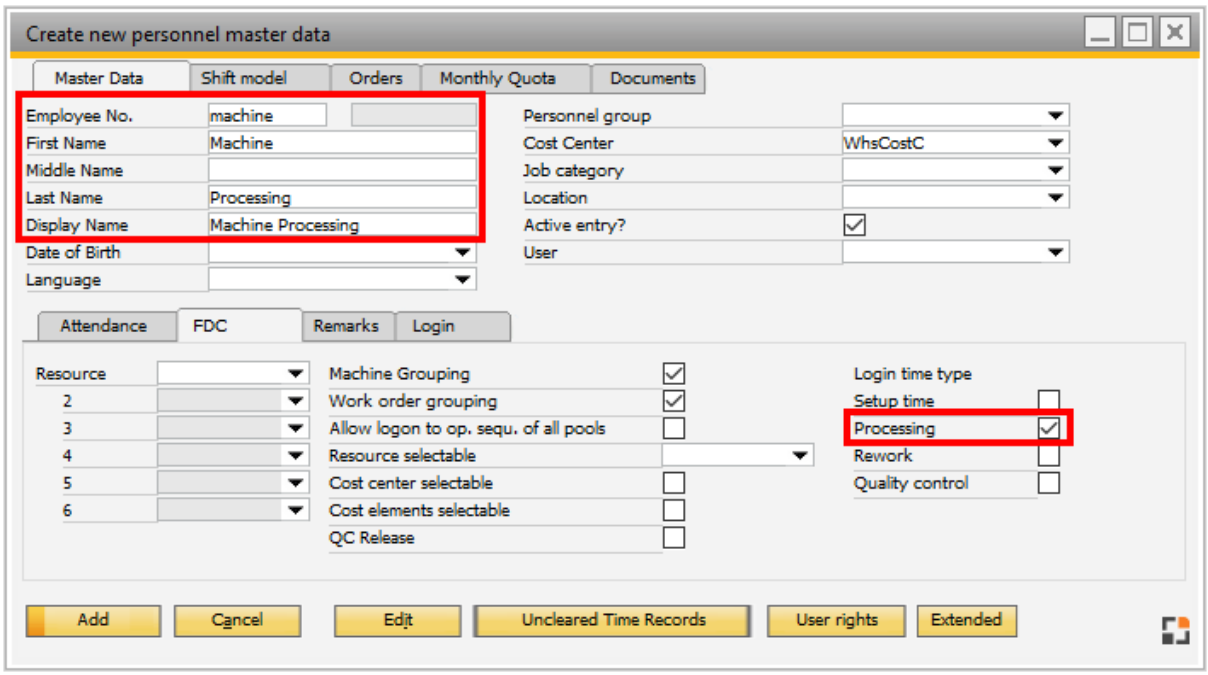


A person cannot report the personnel time and machine time for a work sequence simultaneously. Machines must therefore be reported using a different personnel number.

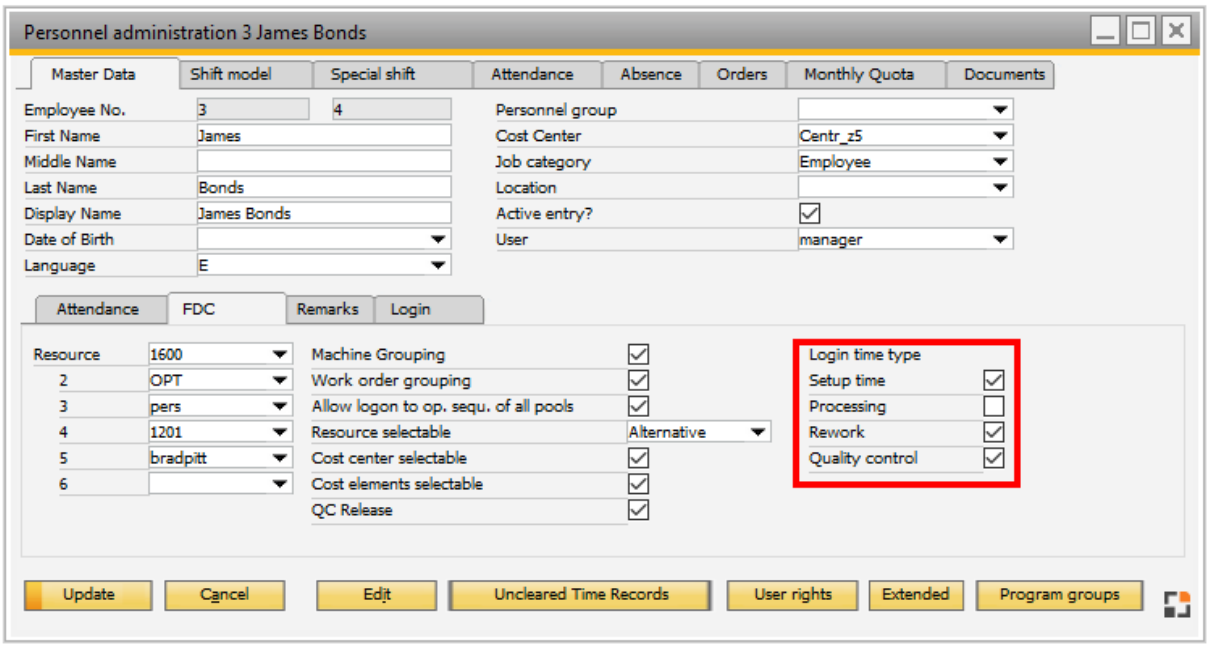
Approach:

The Processing time type is registered as a personnel; a single personnel entry can also represent all machines.

© 2026 Boyum IT Solutions A/S

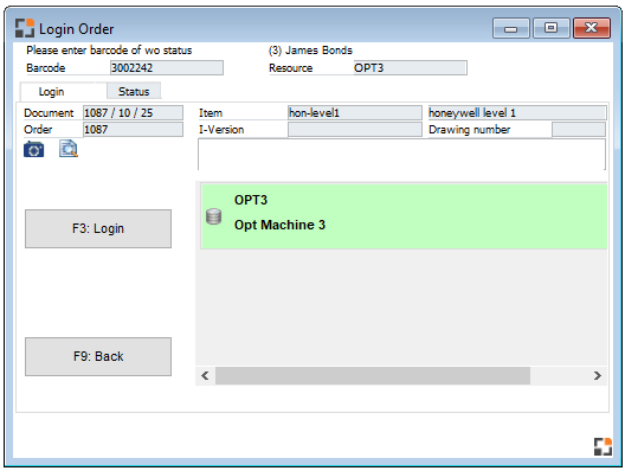


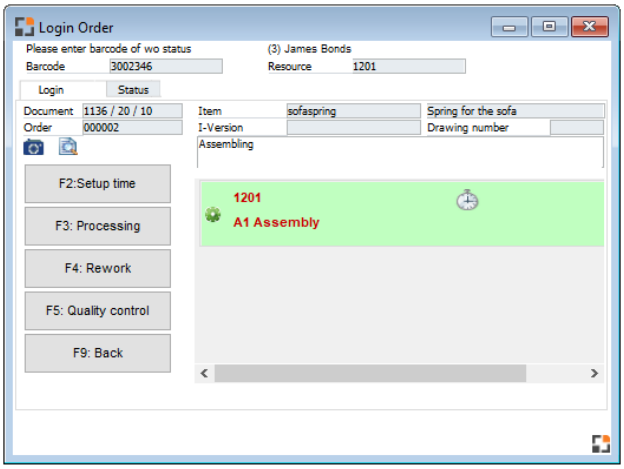
In the Personnel master of the employees, everything is then activated except the time type "Processing".



If a login is now performed using the card number of the machine, the following selection is available, in addition to selection using the card number of a person.

© 2026 Boyum IT Solutions A/S





This method permits very accurate recording of all time types, including in work order and machine grouping - from Precalculation to FDC through to costing analysis. However, as the machine must be logged in and out separately, the cost incurred for process time collection is high.

See

Resource costs

Time types

Configuration wizard – time types

Configuration wizard – Resources

Back to Resource costs

8.1.3.3.2 Cost rates

For Default cost rate different cost rates for marginal and full cost can be created. Instead of the planned values from work order one of these cost rates can be used as reference in the costing.
See Batch-post-calculation.

© 2026 Boyum IT Solutions A/S

Full and marginal costs can be entered here for different cost rates. Define additional cost rates using the button "**Definition**"
In post-calculation via "**Resources > cost rate**" you can define, which cost rate to use. If no cost is specified, planned values are used.
For editing, the authorization "resources" is necessary. ***See*** Authorizations

Restrictions
These cost rates can only be used in post-calculation, not used in Precalculation. Only the processing cost rates can be defined, but not advanced cost rates as set-up costs, rework, staff cost rates, etc.

PATH: Resources > Resource Master Data > **Open** resource > Resource Master Data XXX > Cost tab > "**Cost Rate**" button.

or

PATH: Resources > Resources > **Open** resource > Resource Master Data XXX > Cost tab > "**Cost Rate**" button.

8.2 Work order general

In the production (or work) order all the instructions for the planning and production of an item are summarized. In the work order, you can track all bookings and material costs associated with the production process and additional costs, such as staff overheads.

The main window for managing work order is the WO structure view

Work orders
- WO structure view
  - Work order document
- Work orders list
- Assemblies
- WO-lists

8.2.1 WO structure

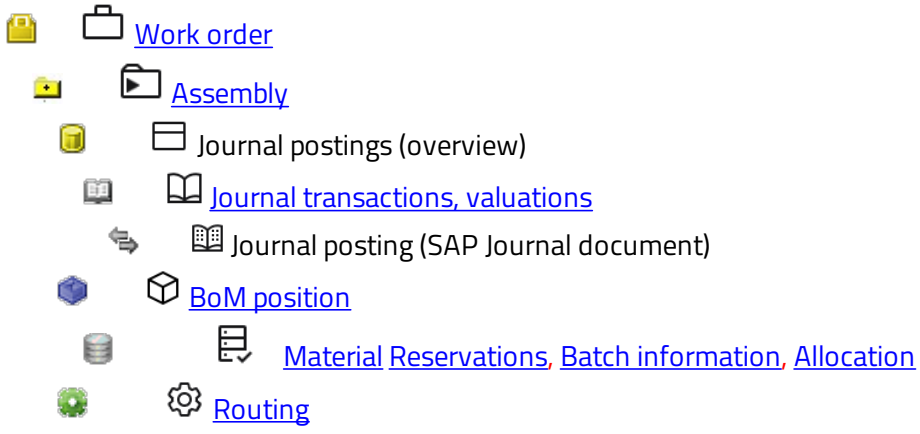
The Work Orders window is the central window for managing all production functions.

PATH: Production > Work Orders.

Work orders
- **WO structure view**
  - Work order document
- Work orders list
- Assemblies

The work orders are shown as a structure.

The second icons in the structure below are displayed in Boyum Style (Beta):



© 2026 Boyum IT Solutions A/S

Time receipt

In this list routings, BoMs, Assemblies, Time receipts can be administrated, added and deleted. Double-click the upper level (black font or marked with an orange bar) and press the **Open** button to open the work order document.

If the work order is not expanded, icons are displayed on the right in column "actual", indicating the current status of the work order.
Right of it, (column drawing number) the utilization of the affected resource is displayed for a selected period in a graphical view.

Window fert_struktur_browse.psr

Notes

Slow buildup
Extensive information is displayed in the WO window. For large databases this may take some time.
Ways to optimize the buildup of the structure view:
1. Reduce the number of rows to be displayed (Template or general setting in Configuration wizard – System)
2. Disable the Extended status display.

© 2026 Boyum IT Solutions A/S

Export to Excel

It is not possible to export the complete, comprehensive information of the structure views.

- Adapt structure view

Structure views are adjustable only to a limited extent. Templates are supported, but not Window settings.

In every row a different data type can be displayed: Work order, Assembly etc. These have different data sources and different columns. Accordingly, separate adjustment is required for every row.

- Work orders:

On the upper level you can work with templates. Define filter and sorting and up to 6 template fields. These fields are not displayed directly, as it is not a dynamically adjustable list.

You can change the visible formula fields instead.

Example:

Show the designation of the assembly in WO level in field "drawing number". Display the drawing number in the assembly.

Template Field 1: `"BEAS_FTPOS"."ItemName"`

Customer-specific script in this window:

```
windowevent open
dw=cfield1.expression="if(zeilentyp=0,templatefield1,znr)"
end event
```

This means:

`cfield1` = object, which shows the drawing number

`zeilentyp` = 0 = work order line

Expression

if `<zeilentyp>` = 0 then show the result of templatefield1, otherwise the drawing number

© 2026 Boyum IT Solutions A/S

- Assembly, BoM and routing

  These areas can be adjusted via **Right-click > third tab > Window settings.**

Meaning of the icons

Work order

Icon	Boyum Style icon	Description
		Work order (different icons for different types, default: orange)
		Second icon – violet dot: the first assembly in this work order is a phantom item – ***see*** Item master > Phantom Item
		Errors in the work order This icon is only displayed if an error occurred during the editing of the work order, for example a DI API error at order time receipt. As long as this icon is visible, the work order is not hidden, even if it has already been completed. The errors must be checked and confirmed. ***See*** WO Structure Work order
		Work order status: printed
		Work order status: logged on
		Blocked
		Not scheduled
		Released and scheduled

There are many context-dependent functions (right-click menu) depending on the line – the type of entry – specific features are available.

Right-clicking above in the window (below the title line) opens the window settings for the structure view. ***See*** Configuration of WO structure view.

Lower buttons

© 2026 Boyum IT Solutions A/S

Button	Description
New	Opens a new record of the selected line. For example, if a work order is selected, a screen opens to create a new work order; if a Bill of materials position is selected, a screen opens to create a new Bill of materials position.
Product Costing Analysis	Creates a temporary post-calculation for the current work order.

Last messages	Information on when the last FDC report was carried out.

See Configuration of WO structure view

© 2026 Boyum IT Solutions A/S

8.2.1.2 WO structure Assembly

Entries in brown – second level in work order structure.

Icon	Boyum Style	Meaning
		Assembly. Click on the small + to expand Bill of Materials and routing. Click on the sign left to the + to display the associated sub-assemblies.
		One of the following settings is disabled in the item master: capacity/material planning, login to work order, material posting.

Right-click opens the following menu:

Right-click on Assembly 1. Basic functions

Function	Meaning
Assembly edit	Edit the assembly.
Alternative Item	Opens selection of alternative items for this position (if deposited).
Print	Opens the print menu (macro).
New Assembly	Add an assembly to this work order. Upon saving, all order-related sub-assemblies (marked with a green clip) are also included. Stock-related sub-assemblies are only inserted as BoM items.
Copy Assembly	The assembly is marked as "to be copied" and can then be inserted below another assembly or into another work order.
Insert Assembly xx	Insert copied assembly. The assembly previously selected for copying is inserted below the marked assembly. A BoM position is created inside this assembly and the copied assembly is inserted to this position. The new BoM position receives the quantity of the original assembly. The inserted assembly receives the BoM quantity multiplied with the quantity of the superordinate assembly. Note: The entire assembly structure is copied including BoM, Routings and tools.

© 2026 Boyum IT Solutions A/S

	Alternatively, the assembly can also be inserted directly in the work order. ***See*** WO Structure Work order
New Bill of Materials Position	Create new Bill of materials position for the selected production position.
New Operation	Create new position for the production position.
[Assembly] receipt	Assembly is posted in Manual entries.
[Assembly] issue	Open the Material issue window to issue the required material for this assembly.
Collective post-in	Working with negative BoM positions (dis-assembly, by-products) you can post in via Collective posting.
Allocation structure for pos	Opens the list of allocations for this position.
Material requirement for assembly	Open the Material requirement list.
Invent. History	Open the Inventory history.
Expand assembly, BoM and routings	Expand all BoMs, routings and assemblies below this assembly.
Search for structure	***See*** above.

Right-click on Assembly 2. Extended functions

Function	Meaning
Update Assembly Quantity	Recalculate planned quantities of sub-assemblies If the work order is revised manually and the quantities are changed for BoM entries for example, then the quantity specifications of the sub-assemblies that depend on the BoM positions are not automatically updated, since an automatic update is not required in this case. This function is used to adjust the quantities of the sub-assemblies to the BoM quantities. **NOTE:** Use this function only if there is but one assembly assigned to a BoM position.

© 2026 Boyum IT Solutions A/S

	Example: If a lot size was stored in a sub-assembly and you set up the lot sizes to be considered in sub-assemblies in the options, it is likely that more than one sub-position is created for one BoM position. In this case, only the first position is determined at calculation.
Split assembly	The assembly is split into two work order positions
Clear WIP account	The account for Work in Progress is cleared.

A click on an assembly line in the structure view opens the window work order item.
A right-click above in the window (below the title line) opens the window settings for the structure view. ***See*** Configuration of WO structure view.

back to work order general

8.2.1.3 WO structure BOM

In work order structure the lowest level – material entries – are in blue color.

Note: If the work order position has been closed, or "Allow changes" was disabled, or authorizations are missing, all editing functions are disabled.

Bill of materials and operation sequences

Icon	Boyum Style	Meaning
		BoM position ***See*** Production – BoM item. Note: Another icon can also be stored in the BoM which, then, is displayed here.
		BoM position confirmed manually or by confirmation with full actual quantity.
		BoM position with posting ID "automatic" - a capital "*A*" letter in italics right top of the position number - is posted automatically (backflushed).
		BoM position is assigned to an operation sequence. The number refers to the operation sequence. In combination with the posting ID A: the material is posted automatically, at the moment a time receipt is created for this operation. **Note on phantom items**: When a phantom parent item has a routing link, all sub-assemblies apply the same definition of the parent.

© 2026 Boyum IT Solutions A/S

		A violet dot indicates, that this BoM position was created from a phantom assembly. (in master data – tree view the dot means, the BoM position is a phantom item (of type phantom assembly).
		Status marker appearing right of the planned quantity: Charge-off batch inventory from the remaining amount. ***See*** "Issue batch remains..."
		Negative BoM position.
		Link: production receipt is linked to a customer (Sales) order or to a work order position. **Note:** This information is only displayed when the actual item is "stock-related", as this piece of information is related to reservations. Sales order links are not displayed for non-stock items.
		Tool.
		Tool with activated switch "determines lead time".
		Parallel operation (in structure view marked with parallel lines additionally) ***See*** Production routing**:** Parallel Resource.
		Alternative resource ***See*** Production routing > Alternative Resource.
		Exchange material with alternative material. A list is created which displays alternative materials after clicking on it. The item in this BoM position is exchanged when selecting a material. Alternative item can be defined in Item related: SAP B1 > Item > right-click > Alternative item. BoM related: Beas BoM > Edit > right-click > Alternative Material NOTE: The action of exchanging a material with an SAP Alternative item cannot be rolled back.
		Allocation in right-click menu. Allocated goods are displayed in the structure with the icon.
 	 	Reservation: **Traditional style**: Gray: goods reserved, but planned quantity not reached. **Boyum Style**: Empty barrel: goods reserved, but planned quantity not reached.

© 2026 Boyum IT Solutions A/S

Traditional style	Boyum Style
Green: required planned quantity reserved.	Barrel with a check mark on the bottom right: required planned quantity reserved.
Red overflown: too much reserved.	Barrel with an exclamation mark on the bottom right: too much reserved.

Pending quantity to be picked by WMS

When creating WMS pick lists for reserved batches in Beas, the icon represents the quantity pending to be picked by WMS.

Beas can display Pick lists with Status "Ready", and "Not Ready". In this latter case, the WMS reservation is displayed without bin location information. ***See*** image and tables:

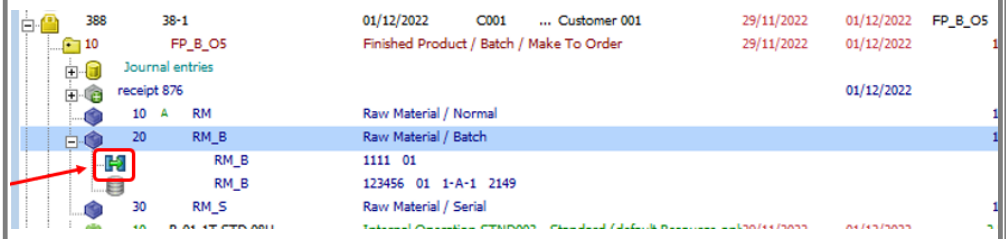
Example:

WMS "Not Ready" status

RM_B	Item code
1111	Batch number
n.a.	Warehouse number
n.a.	Bin location number
n.a.	RFID (Beas) or LUID (WMS)

WMS "Ready" status:

RM_B	Item code
123456	Batch number
01	Warehouse number
1-A-1	Bin location number
2149	RFID (Beas) or LUID (WMS)



See Work flow video:

See Work flow written in bullet points in integration documentation.

See Reservation system.

Right-mouse menu over Bill of materials position

- Note on editing BoM

  All change options are hidden if the work order position has been confirmed or "allow changes" was disabled in the work order position or if you have no authorizations.

Function	Meaning
BoM Item edit	The selected position is edited ***See*** Production – BoM item.
New BoM item	Inserts a new Bill of materials position.
BoM Item delete	Deletes the selected Bill of materials position. If it is impossible due to existing time receipts or postings, the program offers to close the position. Items for which this is possible are deleted, and the others are closed. Open (only logged on but not finished) time receipts are deleted, as well.
New Operation	Inserts a new operation.
Item edit	Edit the selected item (master data).
Material issue	Charges off the material of the current BoM position, ***see*** manual entries.
Material receipt	Creates a Goods receipt for the material of the current Bill of materials position.
Reservation	Opens the Reservation window for this position.
Material requirement	Opens the Material requirement list.
Allocation	Opens the Allocation window for this item.
Invent. history	Opens Inventory history.
Search for structure	***See*** above.

Double-click a line to open the window to edit the BoM item. Changes in BoM for this work order do not affect the master data.

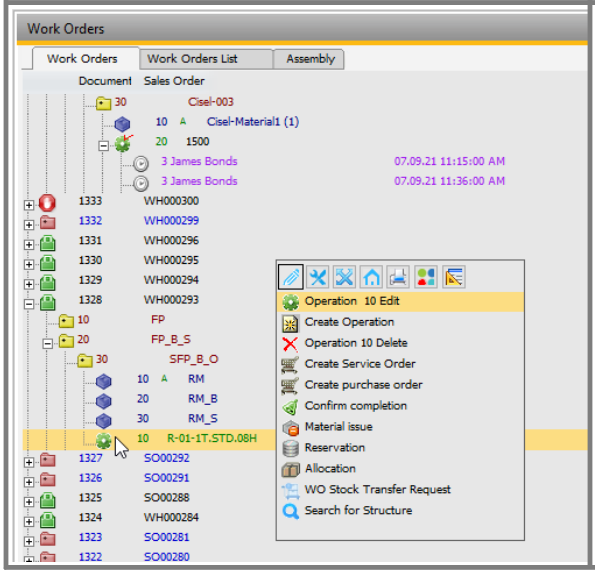
© 2026 Boyum IT Solutions A/S

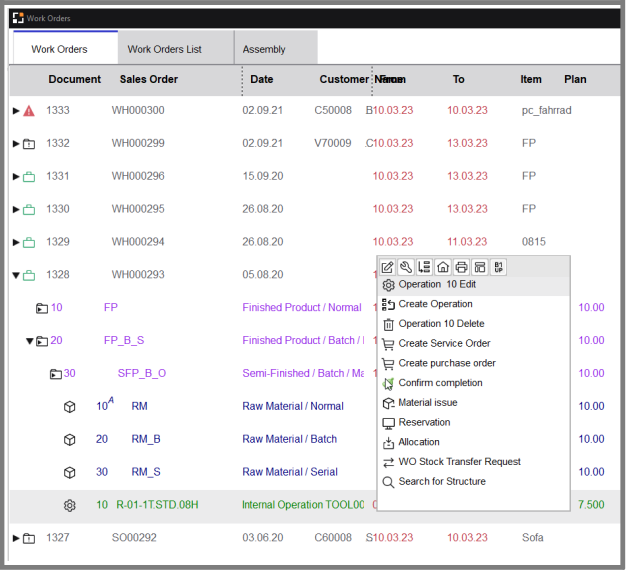
Right-click above in the window (below the title line) opens the Window settings for the structure view. ***See*** Configuration of WO structure view.

back to work order item

8.2.1.4 WO structure operation

Lower level in work order, entries in green.

Traditional style	Boyum Style
	




Note: If the work order position has been closed, or "Allow changes" was disabled, or authorizations are missing, all editing functions are disabled.

Right-click on operation

Function	Meaning
(External) Operation xx Edit	Click to edit the currently selected operation or external operation.
Create Operation	Insert new operation.
Operation xx delete	Deletes the operation.
Insert xxxx/xx/xx from 01.01.21 11:05	Insert the time receipt that was cut from under another operation.
Confirm completion	Available if Operation types > "Only confirm OK" setting is enabled.

© 2026 Boyum IT Solutions A/S

Function	Meaning
Consider number of days: X	Defines the number of calendar days that are used when displaying resource utilization for the current view without changing the standard setting. After reopening the window, the system returns to the standard setting.
Dispatches graphical view	Displays the graphical overview on utilization.
Dispatches	Shows all planned time reservations for this resource. The reservations are deposited behind the operation.
Search for structure	***See*** above.
WO Stock transfer request	Opens the Work Order Stock Transfer Request window. only if activated in WO structure view - Window settings - Inventory transfer request Open the transfer request window.
Create Service Order	Create Service Order for this operation.

Click an entry to edit.

Routing link for phantom items:

When a phantom parent item has a routing link, all sub-assemblies apply the same definition of the parent.

If a tool is assigned to the operation, it is displayed below.

Icon	Boyum Style	Meaning
		Tool.
		Reference: receipt from production is linked to a sales order or to a WO item.
		Tool with enabled switch determines lead time.
		Parallel operation.
		Alternative resource.

© 2026 Boyum IT Solutions A/S

	Alternative operation sequence with alternative resource.

Right-click on tool

Function	Meaning
Edit operation position	Edit currently selected operation.
Modify tool	Open tool master data.

Activate tool	The tool is activated for this operation.
	Activate or de-activate the tool. All rules are considered as:
	- determines lead time
	- only one tool active
	See Tool management.
	
	Note: If there are several tool entries which affect lead time, only one tool can be activated. In case of activation, all time values stored in the tool are transferred to the routing position. Empty values in the operation are not changed.
	
	Tool entries without the "determine lead time" feature enabled can be activated in parallel.
	
	User events
	With the following User events you can manipulate the behavior:
	`windowevent pretoolactivate` before activation/De-activation. The process is canceled with "return failure". In variable "`e_activ`" you can store whether the toll should be activated (=1) or de-activated (=0).
	
	Example:
	Only user "manager" is allowed to change:
	`windowevent pretoolactivate`
	`if <currentuser> <> manager then`
	`  return failure`
	`end if`
	`end event`

© 2026 Boyum IT Solutions A/S

	`windowevent posttoolactivate` is called after the process.

The structure view is dynamic, depending on the function (BoM, material postings, QC-order) different information is displayed. But the column header remains the same.
Operations are displayed in green. ***See*** overview on operation types.

The following information is displayed in the line of an operation:

Column	Description
Sales order	Icon Operation type right to it position number, resource ID.
Name	Activity description.
From	Start of processing time (without idle time, transfer).
To	End of processing time. Colors: Date gray: operation is already closed or outside the period Date red: operation in the past (too late). The WO will not be finished in time
Plan	Planned time: Calculate from the planned quantity * process time / Efficiency rate % + setup time. Already reported amounts or times are not pulled off. Note: The unit of time to be displayed is adjustable in the Configuration wizard.
Current	Already reported times.
Drawing number	Shows dispatches of the related resource.
Type/Scrap	Reported yield and scrap quantity for this position. For external operations the sum of all goods receipts is displayed.
Match code	Pool info: active or inactive. "Optional" for operations which do not need to be reported.

Below the operation several changes can be displayed.

Right-click above in the window (below the title line) opens the window settings for the structure view. ***See*** Configuration of WO structure view.

Right-click entry	Description
	material linked to the operation. Opens the External Production - Goods Receipt XXX window.
Goods Receipt PO XXX	Open the created External Production - Goods Receipt XXX window.
Edit: Goods Receipt PO	Open the External production > collective purchase order. Only available if purchase order was created for the parent, external routing position. For more details ***see*** External production – Goods Receipt.
Returns: Goods Receipt PO	Cancel the Goods Receipt Purchase order Only available if purchase order was created for the parent, external routing position. When selecting this option to cancel the Goods Receipt PO, a query window pops up to confirm quantity, then the following system message appears: *'Should goods receipt PO XXX be canceled?'* **Attention:** When canceling a Goods Receipt purchase order, the materials are **NOT** returned to the warehouse. Therefore, the material issue is not canceled with it, as the material has already been consumed.
Issue provision parts	Open the External Production – Issue provision window. This option only appears when material is linked to the operation.

See External production

8.2.1.6 WO structure QC orders

In WO structure quality control orders are displayed below the respective operations. The following icons are used:

Quality control

Icon	Boyum Style	Meaning
		QC-Order (Head).

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Meaning
		QC-Order measurement position.
		QC-Order open.
		Single QC-Measurement position.
		Batch (receipt or issue).
		Serial number.

Conditions for QC order creation can be set up in the Configuration wizard.

Administrate Quality control order.

back to WO Structure

8.2.1.7 WO Structure Material postings

On material level information on batches and serial numbers, the material requirement, postings and reservations are displayed.
Double-clicking on the posting line opens the posting document (user needs authorization "MW Journal").

Status icons for material

Icon	Boyum Style	Meaning
		Batch (incoming, or outgoing).
		Serial number.
		Reservation:

Traditional style	Boyum Style
Gray: goods reserved, but planned quantity not reached.	Empty barrel: goods reserved, but planned quantity not reached.

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Meaning
		Traditional style / **Boyum Style** Green: required planned quantity reserved. / Barrel with a check mark on the bottom right: required planned quantity reserved. Red overflown: too much reserved. / Barrel with an exclamation mark on the bottom right: too much reserved.

Below the material posting the journal entry is displayed.

Postings

Icon	Boyum Style	Meaning
		An assembly has been posted already. If this is a batch or serial number related assembly, a batch or serial number-related material can be linked to it. ***See*** Batch tracing, Serial number tracing, Linking batches / serial numbers.
		Material has been charged off already.
		All journal entries for this work order. (user needs authorization (Journal entries). ***See*** Journal.
		%PROGRAMNAME%> Journal. Entry displayed below the / . ***See*** Journal.
		SAP-account movement (Journal) displayed below the → / →
		Right of planned quantity: a value was entered in "Issue batch remains..."

Right-click on posting entry

Function	Meaning
Cancel: xxx	Opens the Cancellation window.

© 2026 Boyum IT Solutions A/S

This function is displayed at material issue or at posting in assemblies. A posting document, a serial number or a batch posting can be canceled.

Note: Correct WIP accounting works only using the cancellation feature, as well as a correct valuation of later postings.

- Post in assemblies

  Only possible with single postings. The cancellation feature is only available by clicking on the batch or serial number. Upon clicking, the material issue window is opened in a special cancellation mode.

  Note: A cancellation is always performed at the valuation method selected for the item if continuous stocktaking is active.

  Example:
  Item valuation method "Average price", continuous stocktaking enabled.
  Item was received with a price of 2000€, an average price of 1500€ has been determined. If canceled now, the price will be 1500€.

  Reason: Beas uses the issue object of SAP Business One. SAP Business One would post the amount of difference between valuation price and issue price to a difference account which is unwanted in this case.

  The problem occurs not if
  - working with valuation method "Standard price"
  - continuous stocktaking is disabled.

- Issue material

  For material postings, the complete document can be issued at once. A special Cancellation window is opened.

© 2026 Boyum IT Solutions A/S

Batch tracing	For batch items: Open batch tracing. Depending on window settings in structure view, a simple variant of that feature is available. In this respect, posting entries are displayed right below the batch. For restrictions ***see***: integrated batch tracing.
Provision	For provision parts: open linked provisions.
External production goods receipt	Open Goods receipt for external production items.

Right-clicking above in the window (below the title line) opens the window settings for the structure view. ***See*** Configuration of WO structure view.

8.2.1.7.1 WO structure allocations

In WO structure, the allocations are displayed below the respective material. The following icons are used:

Right-click button on allocation

Function	Boyum Style	Meaning
Material issue		***see*** Material issue.
Material receipt		Material receipt.
Transfer back to warehouse		Collective cancellation on multi-select allocations. + All linked reservations are deleted too.
Cancellation: Allocation		Manual cancellation.
Batch tracing		***see*** Batch tracing.

The System supports WMS, SAP and Beas Bin Managed warehouses *beas 9.3 PL 2 HF 2*

© 2026 Boyum IT Solutions A/S

back to WO structure BoM

8.2.1.7.2 Serial Number Reservation

You can reserve serial numbers immediately while creating work orders. To do this, activate serial number reservation under **Administration > Configuration wizard > Production > Valuation and Posting of assembly > serial numbers.**

With the automatic serial number generation in Beas, the corresponding serial numbers are generated and stored for the work order if the finished part is a serial number-managed item. Manual reservation of serials is not possible, but the system makes it possible to create a new Serial reservation in the material issue window.

The assigned serial numbers are visible in the production structure view under the position, regardless of how the work order was created (manually, from a customer order, or from a calculation).
If a position is deleted, the assigned serial numbers are also deleted and are no longer available. If the number is changed, the number of assigned serial numbers is adjusted. If the number is increased, the new serial numbers are added; if reduced, the last serial numbers are removed.

Goods receipt of finished goods

If a production position is received by manual entry, selection of the serial numbers opens automatically after entering the number of units. The corresponding quantity of serial numbers is pre-selected. The actual number of entries corresponds with the quantity of selected serial numbers.
It is not possible to receive more goods than the available quantity of serial numbers. Based on the reserved serial numbers, the confirmation is blocked when trying to report a higher quantity. In the event of overproduction, therefore, the number in the work order must be increased in advance.
Received serial numbers are marked as received in the structure view.

Reserved serial numbers can be changed retroactively, as long as they have not been posted. The editing window is opened in **Work order structure view > expand and double-click on "reserved serial numbers“ > double-click.** Click on edit to edit the numbers.

Cancellation entry

If a serial number is re-issued on a work order basis, the serial number in question is reset to "unreceived".

Backflushing

© 2026 Boyum IT Solutions A/S

If you enter the finished goods by backflushing or reporting the last operation, the serial numbers are determined automatically. The smallest serial numbers are posted first. If the quantity of reserved serial numbers is insufficient, new serial numbers are determined for the excess quantities.

Note to Issuing serial numbers:
If the option "also post serial numbers" was enabled, you only need to define the serial number to which the material will be posted.

NOTE: It is recommended to switch this option to "manually" to prevent automatic pre-assignment.

See

Material issue – Serial numbers
Configuration wizard – Material – Backflushing – Serial numbers
Serial number tracing
WO structure – Serial number reservation

8.2.1.7.2.1 WO reservation of serial numbers

If serial number reservation is enabled, or a reservation was entered manually, reserved serial numbers are displayed below the assembly.

On first level only the number of reserved serial numbers is displayed.

Icon	Boyum Style	Meaning
		xx Serial numbers reserved.

Expanding the first level, the single numbers are displayed:

Icon	Boyum Style	Meaning
		(without red check marks): serial numbers reserved, but not yet posted in and linked.
		(with red check marks): serial numbers already posted in.

The material that was linked to the serial number is displayed below.

Serial number administration

© 2026 Boyum IT Solutions A/S

By double-clicking, an administration screen opens providing the following options:
- Change serial numbers manually (only if not booked)
- Delete serial numbers (only if not booked)
- Insert new reserved Serial number

Already posted entries are displayed in gray. They cannot be changed or deleted.

Note: The system does not check if the entry is correct. If you insert an existing serial number, which is on stock, it will produce an error message in the receipt document.

Access: You need rights for Managing time receipts

See

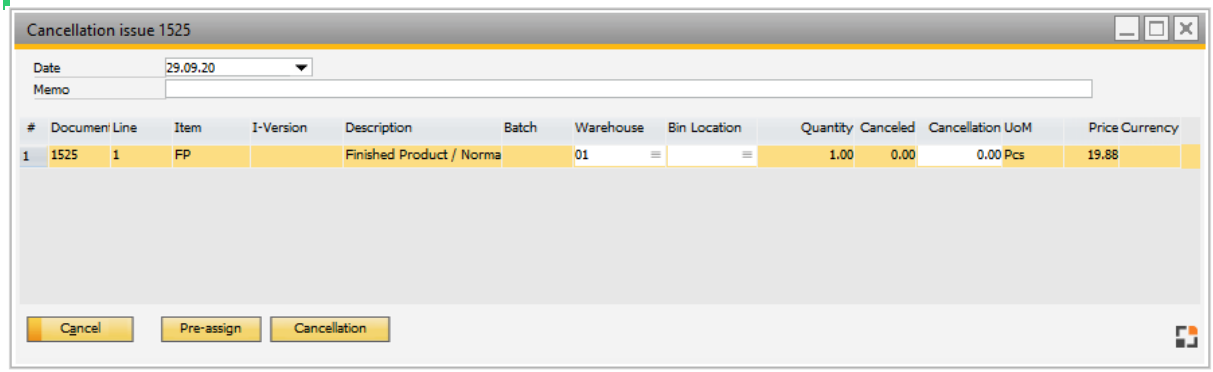
Serial number reservation.

Configuration wizard – Material – Backflushing – Serial numbers,

Serial number tracing

8.2.1.7.3 WO cancellation screen

PATH: Work order structure > raw material issue / right-click > **Cancellation** / .



Window mw_storno_browse.psr

Here the entire WO issue document can be canceled at once. The document is presented in its entirety – per batch, per serial number and per bin location on separate lines. The amounts can be pre-allocated or entered manually. Double cancellation is not possible.

Approach: The program performs a posting for the same price as the issue to the same account. A normal receipt document is generated.

Note: When using average price or FIFO valuation deviations can occur. With FIFO, no cancellation with the correct prices is impossible in general.

© 2026 Boyum IT Solutions A/S

Note: This window is also opened when scrap is posted back for reuse after an issue. Therefore, setup in **Configuration wizard** under **Production > FDC > View time receipts**: Post back scrap material.

With serial numbers, the posting is done to the same internal number. There is no new serial creation. Prerequisite: The serial number was not manually posted.

Field	Meaning
Date	Cancellation date. Default: today; it is changeable.
Memo	Additional information, transferred to SAP Business One - document.

Column	Meaning
Document	Document number.
Line	Row number.
Item	Item.
Description	Description from Item
Batch	Batch ID. or Serial number from Issue document. It's not possible to change this
Warehouse	The system inserts the warehouse from which the issue document was created. It is possible to change this to every warehouse with the following rule: - The warehouse is available for the item - The warehouse is not locked - The warehouse is free for production receipt (***see*** warehouse setting) - Not an external warehouse The System supports WMS, SAP and Beas Bin Managed warehouses *beas 9.3 PL 2 HF 2*
Bin location	If this is a WMS-, SAP- or Beas bin managed warehouse, you can define the Bin location. This field is only editable if this is a bin/managed warehouse. The system does not insert the bin location from an issue document automatically if it is in an SAP or WMS managed

© 2026 Boyum IT Solutions A/S

warehouse.

Customizing, WMS and SAP Support from beas 9.3 PL 2 HF 2

More about Bin Location field

Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3)

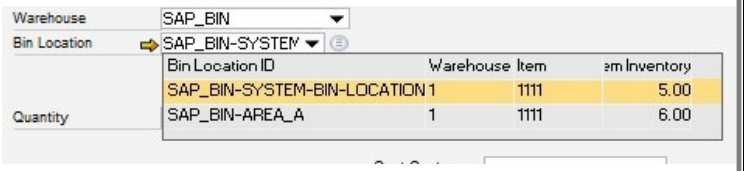
The field has the following components:

Arrow icon /

List of all bins where the item is located.

Selection (Drop-down)

A list opens to select the desired bin location.



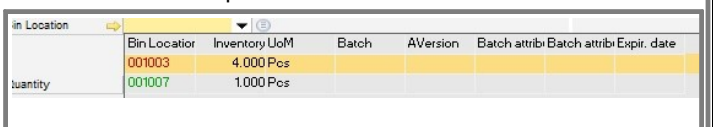
The selected drop-down option displays the following information in receipt documents:

- Bin Location
- Warehouse Area
- First item in this bin location
- Stock of the first item in this bin location

The list can be modified in the Configuration wizard.

The selected drop-down option displays the following information in issue documents:

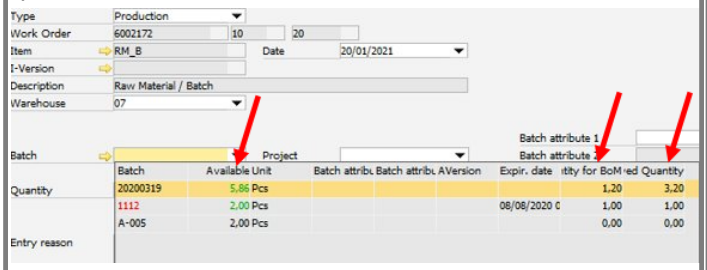
- All stock information of all bin locations with batch- and serial number information.
- Reserved Batch quantities information



The drop-down contains information on reserved

© 2026 Boyum IT Solutions A/S

quantities in 3 columns:



The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

Select or List - Icon

By using the selection icon, an adjustable selection list opens. Window settings and templates are supported.

- Notes: Beas Bin Warehouse

© 2026 Boyum IT Solutions A/S

The Definition of the bin location is mandatory.

Notes: SBO Bin Warehouse

If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type.
This is entirely managed by SAP Business One.

Drop-down for volume or weight is not supported.
Columns are always 0.
beas 9.3 PL 2

Notes: WMS Bin Warehouse

Bin location is mandatory.
Drop-down for volume and weight not supported.

Customizing of the drop-down list in Beas 9.3 PL 2 or newer release

This list can be modified in the Configuration Wizard.
General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent setbindropown`)
2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

In the `e_bindropdownbsl` variable, the ODATA command can be defined.
It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.

The standard functions for receipt and issue are as folows:

```
file stockmanagement.src

function binreceiptdropdown
```

© 2026 Boyum IT Solutions A/S

```
setvar=e_bindropdownbsl=BinLocation(<e_binwhsco
de,bsl>)?$mask=1
end function

function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwh
scode,bsl>)?$select=BinLocation/BinCode,BinLoca
tion/BinColor,OnHand,UoMCode,Batch,IVersionId,B
atchAttribute1,BatchAttribute2,ExpirationDate&$
filter=ItemCode eq <e_itemcode,bsl> and OnHand
gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered
by OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhsco
de,bsl>)?$select=BinLocation/BinCode,BinLocatio
n/BinColor,OnHand&$orderby=OnHand
desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where
OnHand > 0 of the selected ItemCode, ordered by
OnHand descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwh
scode,bsl>)?$select=BinLocation/BinCode,BinLoca
tion/BinColor,OnHand,UoMCode,Batch&$filter=Item
Code eq <e_itemcode,bsl> and OnHand gt
0&$orderby=OnHand desc, BinLocation/BinCode asc
end function
```

- Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes

© 2026 Boyum IT Solutions A/S

	using Windowevent `setbindropdown`.
	
	The following priorities are considered:
	1. Window-related customization (`windowevent`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	Window-specific adjustments:
	Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.
	
	Example:
	`windowevent setbindropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE"`
	`from "BEAS_WHSBIN" where`
	`"WhsCode"=<e_binwhscode,dbstring> order by`
	`"STORAGESORT"`
	`end event`
	
	Note: This window event is supported in every window where the selection field is available.
	
	General adjustment
	Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.
	
	`file stockmanagement.src`
	`function binreceiptdropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE"`
	`from "BEAS_WHSBIN" where`
	`"WhsCode"=<e_binwhscode,dbstring> order by`
	`"STORAGESORT"`
	`end function`

Quantity	Quantity from issue document.
Canceled	Previously canceled quantity.
Cancellation	How much to be canceled now.
UoM	Unit of measurement.
Price	Price from issue document.

© 2026 Boyum IT Solutions A/S

Currency	Currency.

Function

Pre-assign: Pre-assign the same values as present in the issue document: quantity, batch, warehouse and bin information.

back to Work order structure
back to WO Structure material postings

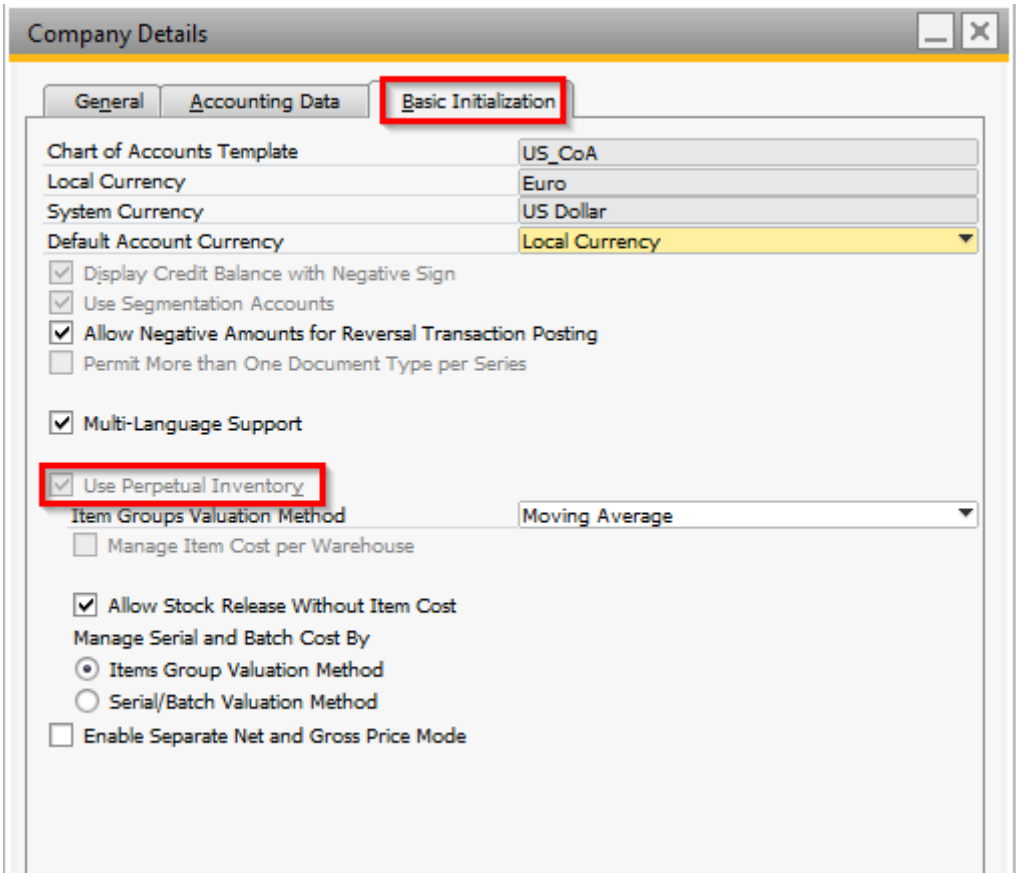
8.2.1.7.4 Journal

For each booking created by SAP Business One for posting documents or for each Beas journal entry, another journal information header is created (table beas_journal). This superordinate document is normally linked firmly to a SAP Business One journal document.

In this document the origin is described. For assembly postings the price calculation is documented and the results are presented in post-calculation for this posting.

Only visible if "Use Perpetual Inventory" is activated:

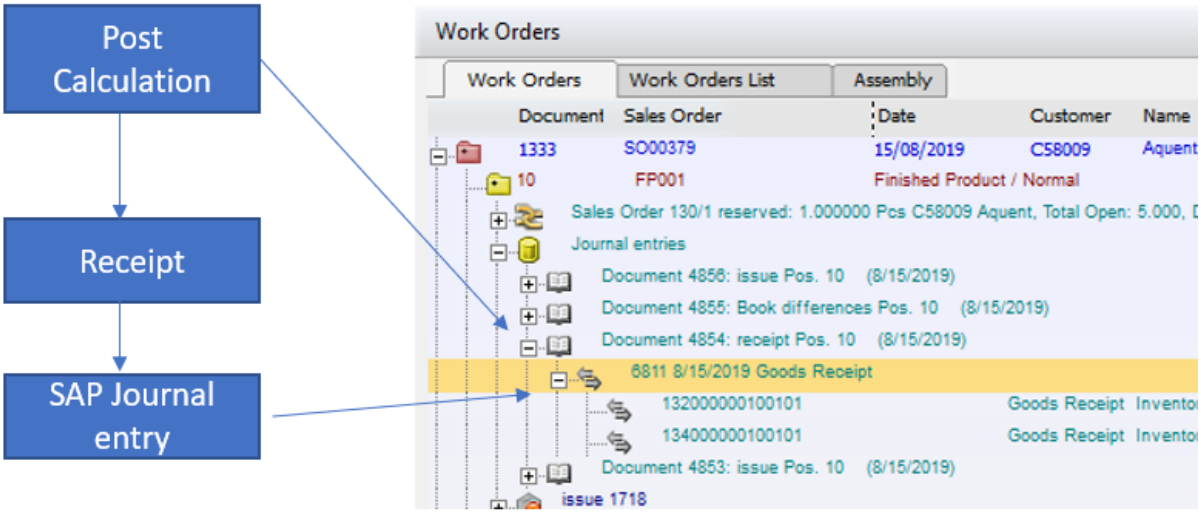
© 2026 Boyum IT Solutions A/S



Window beasgui_sbo.psr

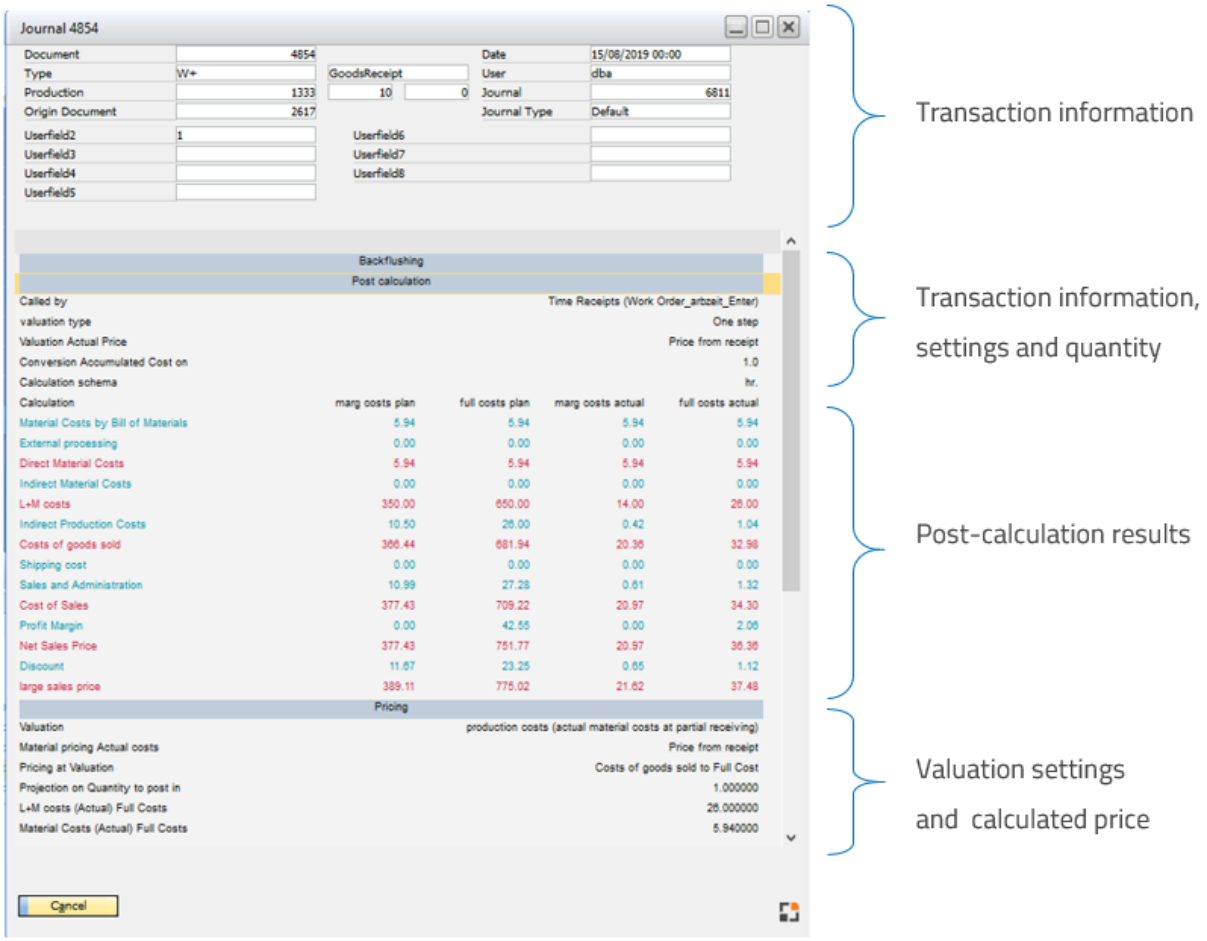
In the Journal line you can see more details of the transaction.

In the receipt documents the complete price valuation is described with the result of post calculation.



© 2026 Boyum IT Solutions A/S

By double-clicking a Journal line, the program displays the details:



Window fert_journal_edit

Area pricing

Overview of all displayed information. The visibility of the rows depends on the selected valuation.

Title	Description
Valuation	The valuation in use. Independent from valuation settings, regardless of partial posting or final posting.
Valuation Actual Price	The valuation used for actual material costs. Default setting is posting price, but it may also be a Precalculation price or a price from price list. ***See*** Configuration wizard – Post-calculation .
Conversion Accumulated Cost on	Visible only if "Conversion to posting quantity" was stored in the Configuration wizard . From the already posted quantity the quantity still to be posted is projected.
Calculation Area	⊟ Result of Calculation:

© 2026 Boyum IT Solutions A/S

	Only the calculation schema is displayed without details. Valuation to Plan Cost: Only the plan area (first 2 columns) is displayed. Valuation to Real Cost: All 4 columns (Plan/Actual to Full/Marginal cost) are displayed.  Material Costs by Bill of Materials 240,00 240,00 37,28 37,28 External processing 60,00 60,00 0,00 0,00 Direct Material Costs 300,00 300,00 37,28 37,28 L+M costs 800,00 1200,00 600,00 800,00 Unit 4,00 8,00 4,00 8,00 LotPrice 1,00 2,00 1,00 2,00 Cost of Sales 1105,00 1510,00 642,28 847,28 Add Percent value 55,25 151,00 32,11 84,73 Net Sales Cost 1160,25 1661,00 674,39 932,01 large sales costs 1160,25 1661,00 674,39 932,01
Valuation	The setting defined in the Configuration wizard, for example: Production planned cost, Actual material costs
Pricing at valuation	Determines from which area of the calculation schema the valuation price shall be used, and whether to value at marginal or at full costs, or whether to take prices from the price list. ***See*** Valuation of assembly.
Precalculation Material pricing	Only active if valued at planned costs. There you can decide how the material is valued at planned quantities. Set up in Configuration wizard – Precalculation – Material pricing.
Value planned costs at	Only active if valuing at planned costs or if the option Configuration wizard – Post-calculation – Material costs always at planned costs was activated. This setting overrides the pricing "Precalculation Material pricing" if not "Precalculation" was stored. There, you can store the planned pricing for post-calculation, which can affect valuation. ***See*** Configuration wizard – Post-calculation.
Material (calculation type)	Display used Material result from the calculation schema. Related to the valuation of planned/real cost to full/marginal cost. This calculation object considers direct costs + material surcharges.
L+M costs (calculation type)	Display used L+M (Production) result from the calculation schema. Related of valuation the plan/real cost to full/marginal cost
Surcharge Cost of (defined area) to (calculation type)	Display used Surcharge result from the calculation schema related of valuation the plan/real cost to full/marginal. ⊟ Calculation of surcharge cost:

© 2026 Boyum IT Solutions A/S

	The system uses 1 defined column of the calculation schema, for example real cost to Marginal cost Result is the entry of "Cost of Sales" or "Net Sales Cost" - L+M-Cost from same column - Direct Material Cost from same column = Surcharge price
as yet booked	Count of currently booked assemblies (without current booking) Only visible if entry > 0
- Material already booked	Sum of booked Material
- Production already booked	Sum of booked L+M (Production)
- surcharge booked	Sum of booked Surcharge
calculated Material Costs	Result Material costs (Material pricing - Material already booked)
calculated L+M costs	Result L&M Costs - already booked
calculated surcharge	Result Surcharge costs - already booked
Total price	calculated total price
Price	Price per warehouse unit

8.2.1.8 WO structure time receipts

Below the operation the respective time receipts are displayed.

Time receipts

Icon	Boyum Style	Description
		Work Order time receipt has been created.
		Someone is currently working on this work order.
		Main time receipt.
		Setup time reported.
		Time receipt currently being registered.

© 2026 Boyum IT Solutions A/S

If material was backflushed after the order time receipt, the link to the created document is displayed below the time receipt message.

Right-click on time receipts

Function	Meaning
Edit time receipt	Opens the Time receipts editing window.
Delete time receipt	Deletes the time receipt.
Time receipt cut	Time receipt is moved to the clipboard and can be pasted somewhere else. It is only cut once it has been pasted at the new location. This function is only available if the order-related time receipt has not caused a journal entry and the deletion option was not deactivated using the Configuration wizard.
Insert <document> <date>	Only visible if a time report was cut previously. The cut time report is moved to this place. This function is only available if the order-related time receipt has not caused a journal entry and the deletion option was not deactivated using the Configuration wizard.

Time receipts are administrated under administrate work order times.

Also ***see*** Registration window for time receipts.

Upon creating a time receipt, the material is posted. ***See*** time receipt – material posting.

Note: The designations: main, setup and secondary time can be set up in **Configuration wizard >** time types.
You can report to these time types only if the cost type was deposited in the respective resource under "costs“ "extend to cost types“.

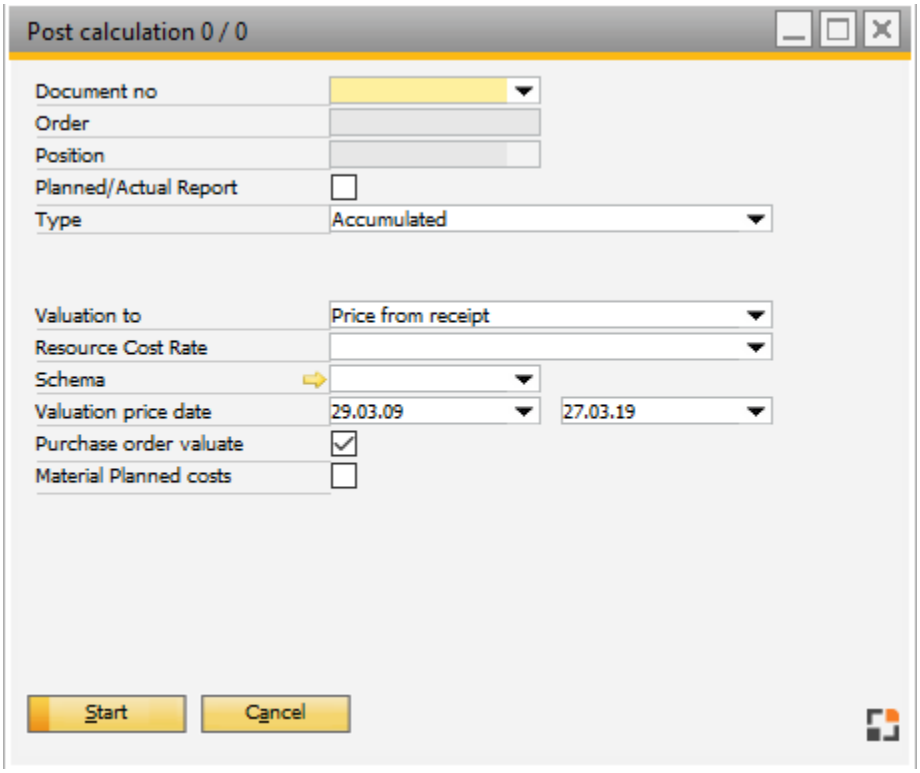
8.2.1.9 WO post-calculation

In this window you can set up parameters for a single post-calculation.

PATH: Production > Work Orders > Work orders list tab > right-click menu > Button **post calculation**.

© 2026 Boyum IT Solutions A/S

See WO structure.



Window fert_naka_auswahl.psr

Field	Meaning
Document number	Document number of the selected work order.
Work order	Work order number.
Position	Position number.
Actual / Plan	Check mark: activates Actual/Plan – comparison.
Type	Type of calculation. **Accumulated**: All incurred costs are valued. Assembly posting is only valued if it was enabled in the settings. By default, assembly postings do not affect the price. Special case: warehouse withdrawal. (***see*** Valuation of assemblies) ***Example:*** Order-related assembly structure (10) Assembly A |_ (20) Assembly B

© 2026 Boyum IT Solutions A/S

	|_ (20)/(10) Material C In WO post-calculation costs are passed on from lower level to top levels. Assembly "A" thus contains the costs of Assembly "B" and Material "C" and of the calculation schema. In Batch-Post-calculation only one result row is displayed (***see*** option "accumulated, all assemblies separately calculated)
Default	The actual post-calculation value of an assembly is valued. The additional postings of the sub-assemblies are considered. ***Example:*** If costs arose for sub-assembly B , but assembly B was not yet reported as completed, these costs are not passed on to the superordinate assembly A.
One step	Only the current level is valued. Sub-assemblies are valued as material (default) or according to the setting "value assembly". Projection function is available. This is the default valuation method which is used to value assemblies for postings.
Accumulated, all assemblies separately calculated	Each position is calculated in several steps separately. The results of the sub-assemblies are not saved. This option is available only in the batch-post-calculation ***Example*** order related assembly structure (10) Assembly A |_ (20) Assembly B |_ (20)/(10)Material C Calculation:

© 2026 Boyum IT Solutions A/S

	- "accumulated" for Assembly "A", which contains all costs of Assembly "B" with Material "C" and all surcharges of the calculation schema - separately "accumulated" for Assembly "B", contains the costs of Material "C") and all surcharges of the calculation schema Result: two rows Result of total structure Assembly "A" Result total structure Assembly "B" Note: The option is available only on Batch-Post-calculation. ***See*** Valuation
Valuation to	Selection from valuation methods (according to configuration wizard).
Resource cost rate	Determines which cost rate to use to value resources. Default: no entry=planned and actual values are used. If a cost rate is selected, planned and actual values valued at the selected cost rate. ***See*** Cost rates *beas9.0-000-003-000*
Schema	Used calculation schema. When this window is opened from a WO, Beas loads the schema defined in the Work order.
Valuation price date (period)	Only costs from the selected valuation dates (period) are calculated.
Purchase order valuate	If this switch is enabled, purchase orders are considered as actual costs. (No need to wait for Purchase invoice).
Material Planned costs	Activate radio box consider material as planned costs.

Functions

Button / Menu	Meaning

© 2026 Boyum IT Solutions A/S

Start	By clicking start, the work order is re-calculated and displayed. ***See***: WO post-calculation – Results.
Save settings	The current settings are saved for the current user and can be re-used. Function is only accessible via right-click.
Window settings	Access on relevant settings of the configuration wizard (except from post- calculation area). There are settings that cannot be set up per calculation. These settings apply for all users and can be accessed also via **Configuration wizard > calculation > post calculation**.

Click on Start to perform a final costing for the work order. The result can be viewed.

Note: Tool costs are not taken into account in post-calculation.

WO-post-calculation

8.2.1.9.2 Export to Crystal

No Crystal report is supplied as standard for the structure view of the product costing analysis, as Beas offers the standard export functions using Excel.

Note: "Treeview" export to Excel is not supported.

The structure view of the product costing analysis is not saved, so direct output via Crystal is not possible. However, it is possible to cache the contents of a table and print them with Crystal.

With the command
`object=ue_fert_naka=export_naka_soll_ist`
you can export the current structure view. This is then available in the table `beas_reportauswertung` . As a parameter, the following variable can used :"`id`". The export function can also be abused in order to use the result in other ways.

Important: The table `beas_reportauswertung` is only temporary. The entries are promptly removed automatically. Only a limited selection of fields are exported.

Available columns:

Column	Description
`id`	ID
`No.`	Serial number, sort order
`Item`	type of entry 2 = Overhead (lower total) 50 = Item line 52 = Routing position, parallel routing position 100 = Time report 101 = Material posting
`Doc. no. id`	Document No

© 2026 Boyum IT Solutions A/S

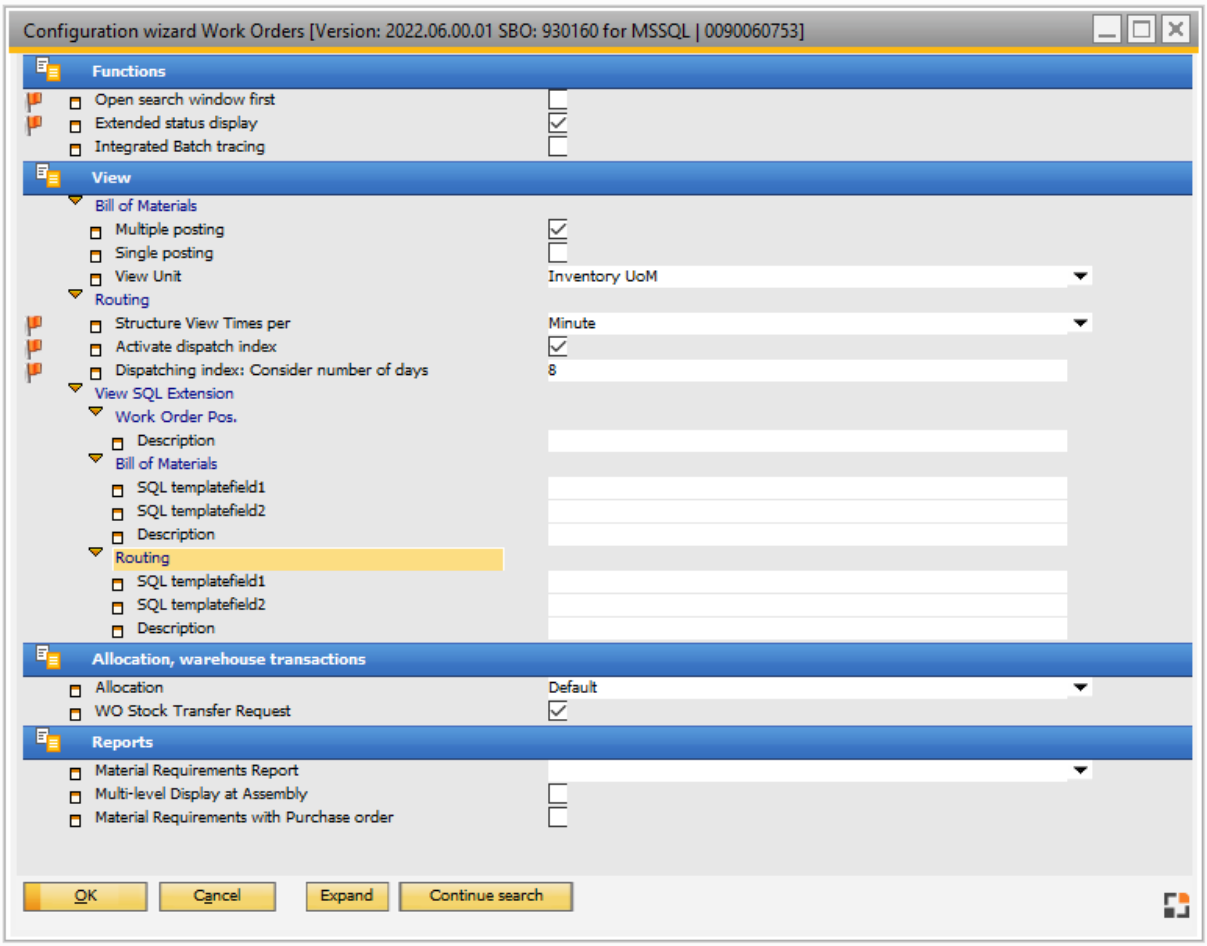
Doc pos	Assembly position
pos_id	Bill of materials / routing position
itemcode	Item
itemname	Item Description
Drw.No.	Drawing Number
quantity_consumption_is	Reported quantity
quantity_consumption_planned	planned quantity
costs_actual_oh	Individual costs at marginal costs
costs_actual_sp	Individual costs at full costs
costs_planned_oh	Planned individual costs at marginal costs
costs_planned_sp	Planned individual costs at full costs
materialcosts_actual_oh	Material costs at marginal costs
materialcosts_actual_fc	Material costs at full costs
materialcost_planned_oh	Planned material costs at marginal costs
materialcosts_planned_fc	Planned material costs at full costs
productioncosts_actual_mc	Production costs at marginal costs
productioncosts_actual_fc	Production at full costs
productioncosts_planned_mc	Planned production costs at marginal costs
productioncosts_planned_fc	Planned production at full costs
productioncosts_actual_mc	Production costs at marginal costs
productioncosts_actual_fc	Production costs at full costs
productionscosts_planned_tc	Planned production costs at marginal costs
productioncosts_planned_fc	Planned production costs at full costs
op_id	Operation ID
aplatz_id	Resource ID
Description	Description of routing position
Number	Work steps
Use	Utility factor
time_actual	Previously required time in minutes
time planned	planned time

© 2026 Boyum IT Solutions A/S

Empl ID	Personnel number for reported time
pers_name	Name of personnel
overheadtext	Text for overhead
overheadinfo_tc	Overhead - surcharge information at marginal costs
overheadinfor_fc	Overhead - surcharge information at full costs

8.2.1.10 WO General Parameters

Can only be accessed via right-click menu in Work order structure view – 4th tab



Window system_option_struktur.psr

Right-click functions

The "**History**" and "**History Current Entry**" functions open the Change log all settings, or the selected one.

Functions

© 2026 Boyum IT Solutions A/S

Field	Meaning
Open search window first	Query before opening the list. If this option is enabled, a selection window opens first. Then, the work order can be selected. Advantage: faster selection with many work orders in the database. *Variable auftr_str_suchmaske, Standard N*
Extended status display	Visibility of icons indicating work order status. In the work order structure icons are displayed right to the work order, indicating whether postings or time receipts have been created. For large databases this can lead to low performance. Use this switch to disable the display. Note: If this switch is disabled, the system does not display these icons in the structure view. *Variable fertstructur_estatus, Standard J*
Integrated batch tracing	Activate integrated batch tracing. If this option is enabled, click on a batch in the work order structure to view all related transaction documents displayed right below the batch (posting in the batch or from which other batch this batch derived) Note: Max. 50 transactions are displayed per batch. If a single batch is moved very often, the overview can be lost. For this reason, this option should not be activated in such cases. The function "batch tracing" can be used instead.

© 2026 Boyum IT Solutions A/S

	Serial number related items are also affected. *beas9.0-000-003-051, Variable ftstr_tracer Standard: N*

View

Bill of Materials

Field	Description
BoM multiple postings	After clicking on a BoM item, generally the function "material issue" instead of "Item x issue" is displayed. For collective posting action (e.g. click on assembly, work order or at multiple selection) „material issue" is displayed, by which several BoM items can be charged off at once.
BoM single posting	After clicking on a BoM item, the feature "issue item x" is displayed (downward compatibility).
View Unit	Select from unit of measures to view BoM: - Inventory UoM - Production UoM

Routing

Field	Description
Routing structure view times per	Enables dispatch display in work order structure view.
Activate dispatch index	Activates the utilization display of resources in the structure view.
Dispatching index: Quantity days consider	Defines the number of calendar days, that is used when displaying resource utilization. If you change it, you must reopen the window.

SQL-extensions for the structure view - BoM / Routing

In structure view only a few customizations are possible. With these settings the designation for Work order position, BoM and routing can be changed. ***see*** customization of WO structure view.

Field	Description
SQL templatefield1	SQL-fragment to fill templatefield1
SQL templatefield2	SQL-fragment to fill templatefield2

© 2026 Boyum IT Solutions A/S

Description	Data window command line to display the "description" field of a work order position, routing or BoM item.

Allocation

Field	Description
Allocation	Defines which allocation function will be made available. **Standard**: Allocation function introduced in Beas8.8. Only available with activated reservation system. **beas2009**: This parameter is not closeable any more. If it must be set, use the following script: `setsetup=ftstr_matlisttyp=2` **no**: No allocation.
WO Stock transfer request	Check box option to activate WO Stock transfer request for work orders.

Reports

Field	Description
Reservation	Enable reservation function?
Material Requirements Report	Defines which material requirement list is available **Standard**: Material requirement list introduced in Beas 8.8 **beas2009**: "old" material requirement list **no**: No reservation
Multi level display for assemblies	Allows a multi level display for material requirement lists Affects Reservation function, the default Material requirement list, Material issue and Allocation. If this option is enabled, and you right-click on a BoM item, selecting one of the above mentioned features, not only the material requirement of the current BoM item is considered, but also the material requirement of its sub-structure.
Material Requirements with Purchase order	Available only for compatibility reasons. Material requirement list from which a purchase order can be created. The created purchase order is not work order-related. If activated, the Material Requirements for Assembly option is available in the WO structure contextual menu.

© 2026 Boyum IT Solutions A/S

back to work order structure

8.2.1.11 WO Print

A standard document is stored for the WO document.
If necessary, this can be copied into the project directory and edited there.

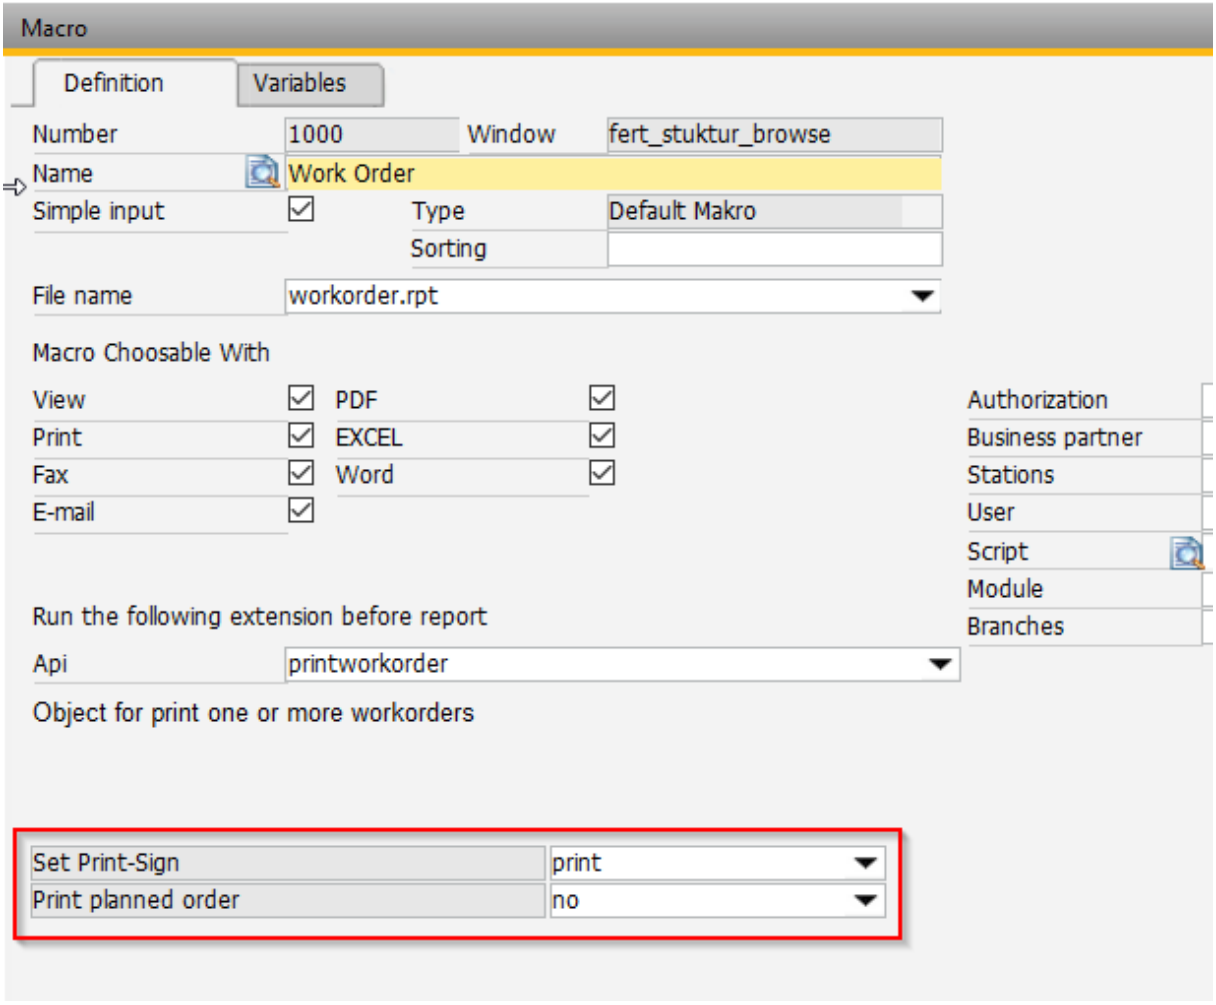
The WO document is printed in WO Structure View. The currently selected WO is printed. Individual WO position can also be printed. To do this, the WO is expanded and the required WO positions are selected. In this case, the WO itself should not be selected.

Limitation on printing Work Order Report:
Work order structure view reports are designed to display 6 sub levels, therefore the system does not print information over 6 sub levels.

There are two settings in the macro definition

Setting	Meaning
Set printing ID	Defines whether the print ID is to be set in the WO document or WO position. Settings: Always or at print.
Print planned WO	Determines whether planned WO can be printed. Settings: Yes/No. Default: No. ***See*** Production types.

© 2026 Boyum IT Solutions A/S



Window program\report_makro_edit_page1.psr

Note: If the WO is a planned order (Production Types – Planned Order), it is not printed. However, it is possible to print the individual positions.

8.2.1.11.1 Customization WO structure view

The work order structure view cannot be changed with the normal settings and customizations which Beas offers, because different forms are nested.
Each row type (work order, assembly, routing etc.) has its own SQL-statement and output form.

To make possible a limited customization nevertheless, to window settings some options have been added. For BoM and routing additional information can be called from database. The description can be changed for this line type.
see Window settings - WO structure view

Note: Extended knowledge is required for customization.

© 2026 Boyum IT Solutions A/S

SQL-Template fields must be written in valid SQL syntax, for HANA environments we have to apply HANA sql rules.

Example: Display quality control plans in routing. Approach:

Window settings > Routing > SQL-Template field1: `beas_ftapl.qs_id`

Window settings -> Routing -> Description: `bez+ '(' + templatefield1 + ')'`

Result: the activity is displayed in the view. Right of it, in brackets, you can see the quality control plan

Example: display current stock in material. Approach: (Query is HANA compatible)

Window settings -> Bill of materials -> SQL-Template field1: `cast("OITM"."OnHand" as nvarchar(50))`
Window settings -> Bill of materials -> Description: `bez + ' (' + templatefield1 + ')'`

Result: in the view the activity is displayed and next to it in brackets, the stock of current item

SQL-statement

Direct access on the following tables

BoM: `beas_ftstl, beas_ftpos, oitm, beas_me`

Routing: `beas_ftapl, beas_aplatz, beas_ftpos, beas_agtyp, beas_me`

Statement needs to return a value of type "char" or "varchar". Other data types need to be converted using `convert(varchar(50),[fieldname]).`

Sub-Select-statements need to be put n brackets:

```
(select myfield from [@myTable] where "ItemCode"=beas_ftpos."ItemCode")
```

Description

There you can determine, what to display as description. Enter in Datawindow-Syntax.

see DataWindow-Syntax

All fields in the window can be accessed. ***see*** **Debug-Window - "Variable" tab > Button "Local"**

© 2026 Boyum IT Solutions A/S

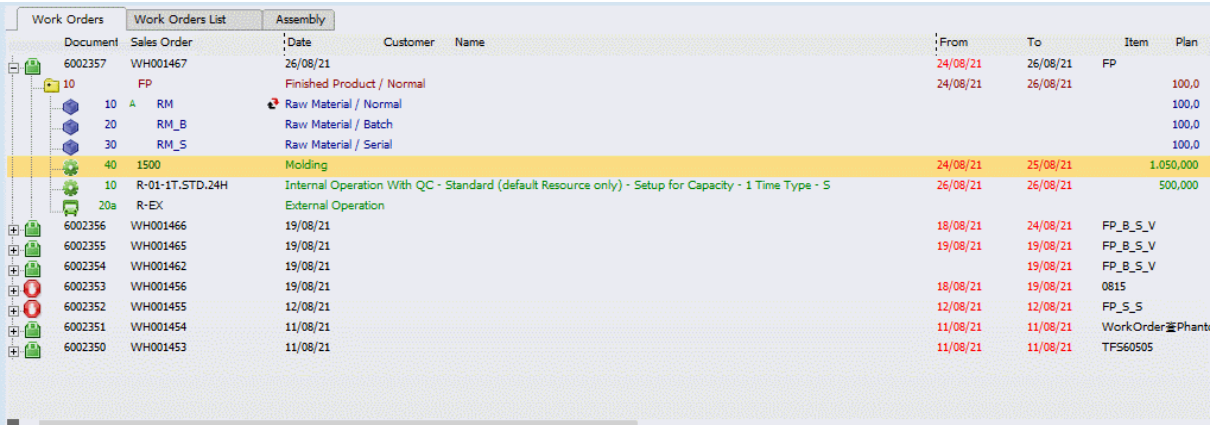
8.2.1.12 Split assembly

WO structure > right mouse click on assembly > second tab > Split

With this function it is possible to split a work order position in two positions.

Examples:

- Due to partial manufacturing scrap, the remaining parts have to be manufactured separately.
- split production order to produce on 2 different machines in parallel
- decide to deliver first part earlier and split 1 lot size in two lot sizes.



A new assembly is created for these.
The quantity of the new assembly is entered into the consumption unit.
The entered quantity remains in the assembly that is to be split.

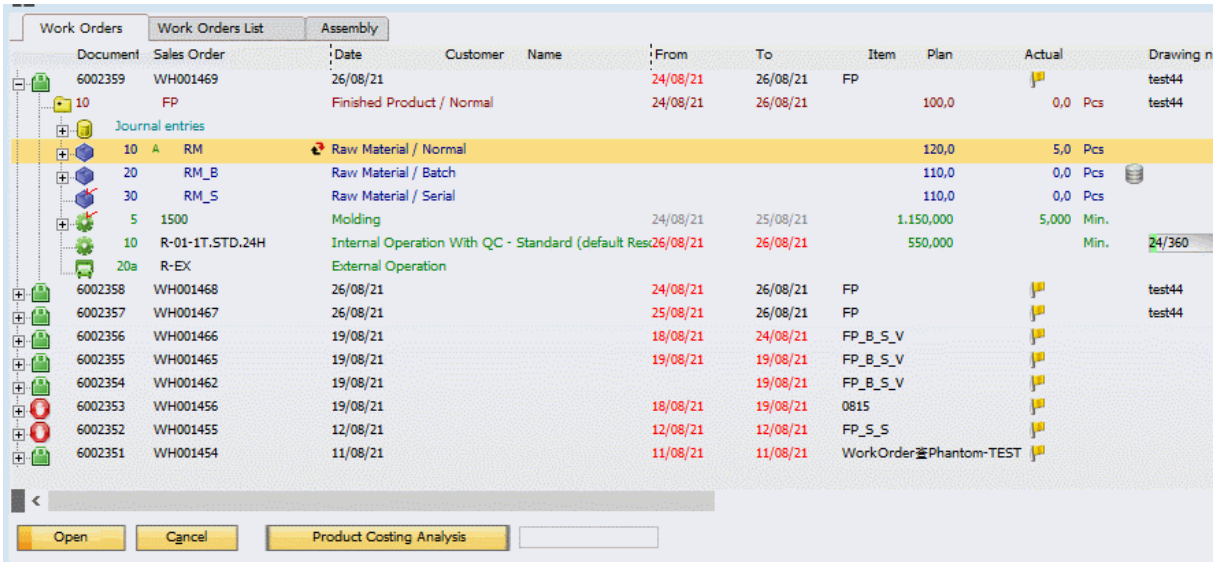
This must be smaller than the quantity of assemblies to be split.
The entered quantity is subtracted from the assembly that is to be split.

The Closed Routing position is closed in the new Position, and the Time receipt mandatory setting is disabled in the Configuration Wizard.

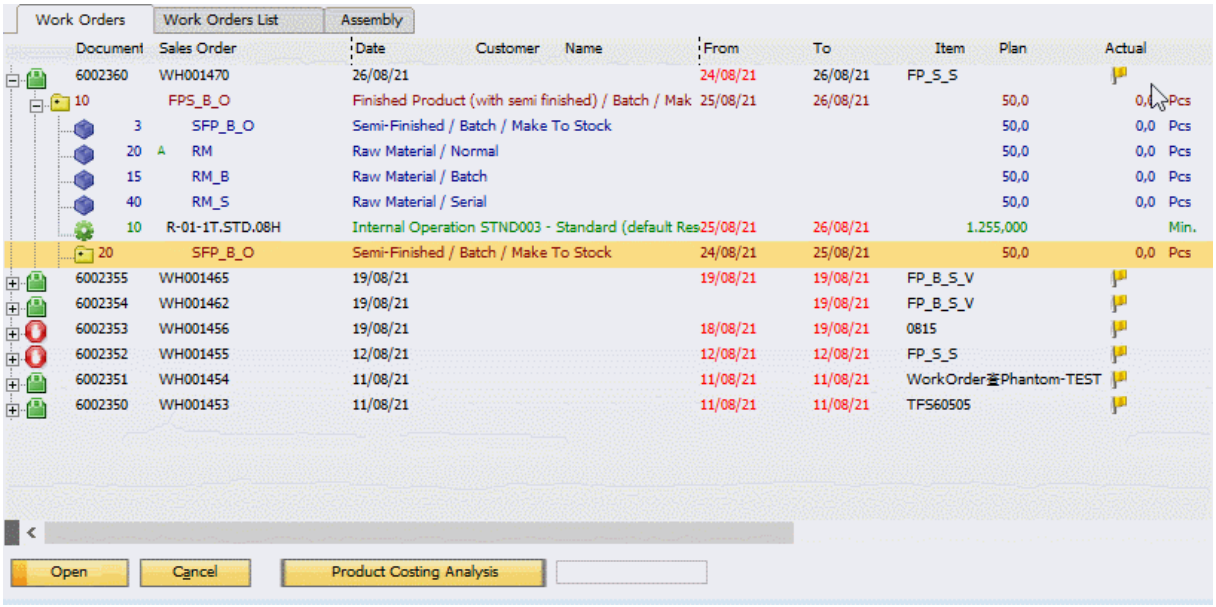
Bill of Materials - scrap quantity is not counted against this.
Work order position - scrap quantity in new assemblies is always set to 0 and remains unchanged in the assembly that is to be split.

Production lots are not observed.
Existing material reservations are deleted.

© 2026 Boyum IT Solutions A/S

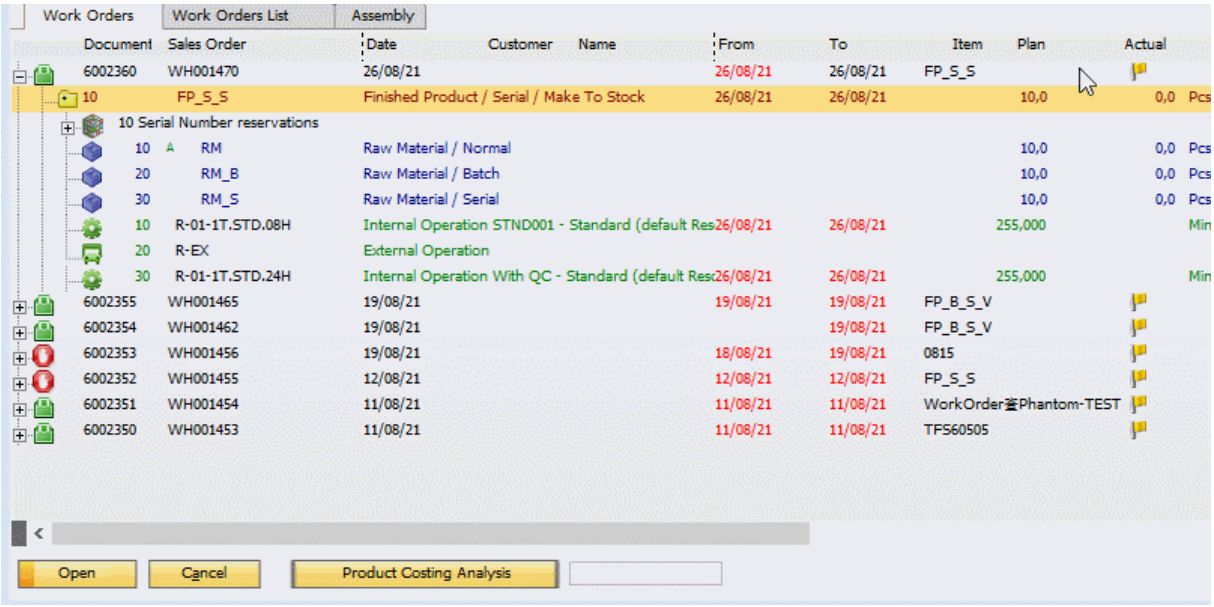


The system splits only current positions, not sub-structures.



Existing **serial number reservations** are split. A selection window opens and the last entries are pre-selected.

© 2026 Boyum IT Solutions A/S



8.2.1.13 Material requirement report

The Material requirement report shows the requirement of selected work orders, BoM items or assemblies.
In this manner, the order-related requirement can be checked, and purchase orders can be created.
For a storage-related view you can use MRP.

The material requirement report is provided in two different versions.

PATH: Production > Work orders > right-click an entry > select "Material Requirements".

Window reservation_set_source.psr

The list offers the following functions:

- Overview on material requirements and current warehouse status

© 2026 Boyum IT Solutions A/S

- Manual issue
- order related purchase orders and purchase requests

The list can be called up from work order structure, work order list, work order, work order item and others.
Additional definitions ***See*** Configuration wizard > Production.

- Columns, Rules

The list is created using the same object as the Material issue window.

Columns and rules ***See*** Reservation window > Requirement list and Configuration wizard > Production > Material requirement

Window settings and Templates are supported.

- Multilevel display

If the list is opened from work order structure and only one assembly was selected, its sub-assemblies are displayed as well.
See
Work orders > Window settings > Lists > Multi-level display for assemblies.

- Notes on templates:

Up to 6 additional fields can be defined for this list. This works only for work orders. Material requirement calculation for sales orders does not consider templates.
Sorting and filtering is not possible on SQL-level.

The content of this window is loaded after opening and using an object. It behaves differently than most other windows and has various limitations: sorting and filtering by these fields on SQL level is not possible.

linked tables:
BEAS_FTHAUPT, BEAS_FTPOS, BEAS_FTSTL, OITM (Assembly), OITM2 (Material), OITW (Warehouse Material)

- Notes on window settings:

Functions of this list depend on the activated fields.
Pricing is executed only if the price is not hidden.

© 2026 Boyum IT Solutions A/S

Functions

Function	Description
Reload	Build up the list new (for example after goods have been issues).
Invent.History	Open Inventory history.
Issue	Open manual issue window. Fields are pre-allocated for the selected item.
Purchase request	Create a purchase request. A Purchase request is created for all rows for which a quantity and a supplier were stored. After this, quantity fields are cleared and the value in "purchases" rises. It is only visible if you activate this functionality. ***See*** function Order. Note: SAP Purchase request is not supported.
Order	Create a purchase order. Create a purchase order It is possible to create an order only for the selected line after you have inserted an order quantity. After this, the quantity field is cleared and the value in "purchases" rises. The function is available only if the field "purchase quantity", "delivery date", "Supplier" and "Price" is displayed. Activation steps: 1. Open Window settings 2. Activate the fields 3. Close Window settings and material requirements 4. Reopen this window. The functionality is now available. 
© 2026 Boyum IT Solutions A/S

List Purchase requests	List of purchase requests is opened. Only available if you activate this function. ***See*** function Order. ***See*** Purchase request
External operation	Call up External operation – collective purchase This switch is visible only if, at least, one external operation was stored in the selected work order or WO position. The window External operation – collective purchase is opened. This provided central access on material and services.
Filter: Requirement	Display only lines with requirement Requirement for Filter means: `Planned Quantity - Booked Quantiity > 0` For negative BoM Positions: `(-1) * Planned Quantity - Receipt Quantity > 0` If Required Quantity 0 displayed is activated in **Configuration wizard > Production > Material Posting > Backflushing**, the formula is the following: Requirement for Filter: `Planned Quantity - Booked Quantiity >= 0` For negative BoM Positions: `(-1) * Planned Quantity - Receipt Quantity >= 0` Note: This Requirement is not the Quantity which you see in column "Requirement", because in the column "Requirement" the system is checking the reserved Quantity (`Planned Quantity - Booked Quantity - Reserved Quantity`)

See

Video: how to open the material requirement lists

Video: Activate purchase function

See Material requirements in the Beas Production Cockpit (2025.06)

© 2026 Boyum IT Solutions A/S

8.2.1.14 Link serial numbers / batches

This window displays which parts (serial numbers, batches) have been used for in the manufacturing process to construct a manufactured item.
The function allows to link serial number or batch related material positions which are issued to serial number or batch related assemblies. Accessible: **Work order view > Right-click > Link serial numbers / batches.**

The window appears only if
a) a posting exists
b) the assembly is batch or serial number related
c) you click on the assembly

The window consists of three parts:

Above: Displays all serial numbers or batches of manufactured items (assemblies) which have been posted in
Bottom left: Displays all BoM items which include a batch or serial number related material
Bottom right: Displays all the serial numbers and lot numbers which have been issued for the selected BoM item.

Upper window section

Column	Meaning
Item	Manufactured item (assembly) .
Description	Description.
Batch	Batch or Serial number of the manufactured item, created or assigned by Beas. ***see*** batch generation .
Warehouse	Current warehouse of the manufactured item.
Quantity	Work order quantity.
Unit	Unit of measurement.
Document	Document number.
Date	Date of work order creation.

Left below

© 2026 Boyum IT Solutions A/S

Column	Meaning
Pos.	BoM item number from work order.
Item	Material (BoM item).
Description	Description.
Quantity	BoM quantity.
Linked	Quantity already assigned to each BoM.
Unit	Unit of measurement.

Right below

Column	Meaning
Selected	Check the box to reserve this material for the BoM and to create link.
Description	Material description.
Batch	Manufacturer batch number (external) .
Warehouse	Current warehouse of the material.
Quantity reserved	Quantity reserved for the BoM on the left.
Quantity	Quantity to be assigned.
Unit	Unit of measurement.

Click the boxes in the "Selection" column to reserve material from the right screen for the BoM on the left and to create link.

Later, this link is entered and saved with all information by the user, and can be viewed in the batch number tracing window.

Create Shortcut

If a serial number or a batch is selected in the bottom right window, it is immediately connected to the serial number or batch number which is currently selected in the list above.

back to work order (general)

8.2.1.15 Cross Reference

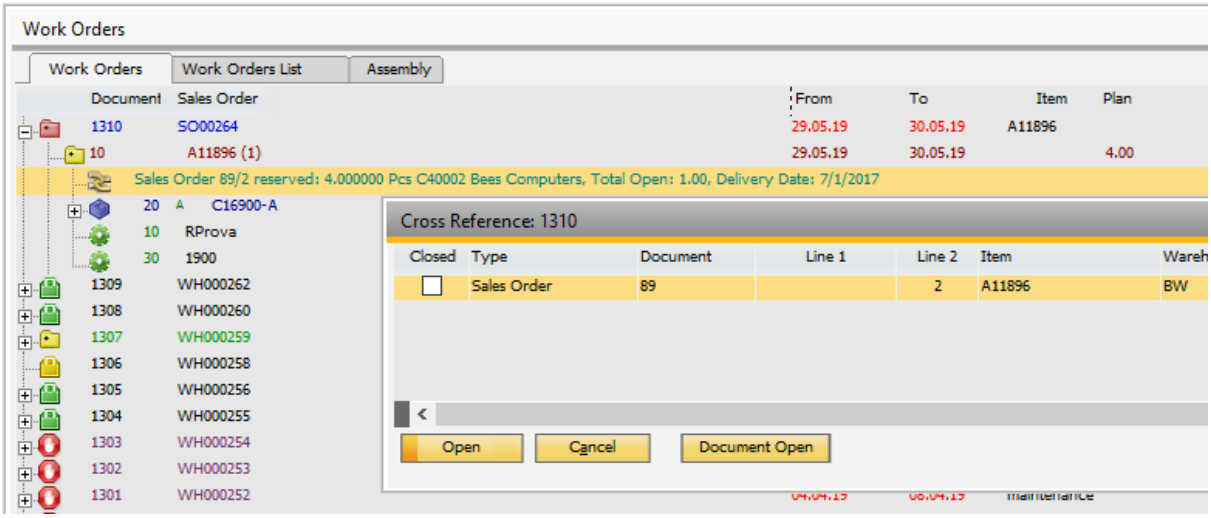
Links between a work order item and an origin document (sales order, advance invoice, production BoM item) can be established and edited here.

Note: The function is only available if the Beas Reservation system is activate.

A receipt reservation is created. The receipt for a work order is firmly linked to the origin document. If, then, the assembly is posted in, goods are reserved automatically for the linked document (the reservation is turned into a warehouse reservation.
Several origin documents can be stored. The delivery date of the linked document is decisive for priority.

Limitation: The MRP calculation system only applies coverage for the first line in the Cross reference list. ***See*** MRP Coverage Calculation
Attention: This list only displays information for "stock related" items because the information displayed in this screen is related to reservations. In case of non-stock items, no cross-reference is displayed in the WO structure.

PATH: Production > Work orders structure > right-click a link / .



Window reservation_link_browse.psr

Field	Description

© 2026 Boyum IT Solutions A/S

Closed	Reservation completed (fully delivered) A receipt reservation will not be deleted, but archived when closed. It can be reviewed at any time.
Type	Origin document (Sales order, work order BoM item or advance invoice).
Line 1	If linked to a work order document: document position, for other documents always 0.
Line 2	If linked to a work order document: BoM position, for other documents the document line.
Warehouse	Warehouse, to which the receipt is planned.
Balance	How much is actually still reserved ? If for ***example***, 10 pieces were reserved and 6 have been posted in already, a warehouse reservation for 6 pieces is created, the receipt reservation (column "remain" is reduced to "4".
Reserved	Total quantity of receipt reservation. Only the remain is taken into account. Total quantity is only displayed for information.
Document open	Open quantity in origin document, not yet delivered. Note: This is not related to the current work order position.
Warehouse reserved	Reserved quantity in warehouse for the origin document. As soon as the work order item is posted in, the value from "remain" is reduced and the warehouse reservation is increased. Note: This is not related to the current work order position. It is the sum of stock reservation from the Origin document (example: sales order)
Customer	Customer number from origin document.
Name	Customer name from origin document.

Note:
All quantities are given in warehouse units.

Button

Open document: the origin document is opened.

Open: The Cross Reference - Edit window opens.

- Performance

  This window is designed for optimal usability.
  If you are working with mass data, it is important to disable the extended view.
  See
  Configuration wizard > Production > Material posting > Backflush > Reservation, material issue: extended Display

- Keyboard functionality

  The window includes sections with lists to navigate in with cursor movement controlled by arrow keys.

© 2026 Boyum IT Solutions A/S

UP/DOWN: Moving the cursor with the up/down arrow keys always operates in the list which currently has the focus.

If the focus is on the search field, the cursor is placed on the top (Requirements) list.
If scanner optimization is disabled, the system does not set the focus automatically to the input field.

SHIFT + UP/DOWN: Set the focus to the top (Requirements) list.
CTRL + UP/DOWN: Sets the focus on the bottom list.

See: Configuration wizard – Reservation settings
Charge off reserved material

8.2.1.16.1 Reservation screen

Standard-selection window for reservations. For process description ***see***: Reservation system

Upper area: Requirement list. Only items with current requirement (not yet posted) are displayed. Which items are included, is also depending on extended warehouse settings

Left: stock down to batch, serial number and bin level. This list is sorted by priority:

- 1. Reserved goods for this order line
- 2. Supply warehouse
- 3. Standard warehouse
- 4. Other warehouses. Within this, batches are sorted by withdrawal rule according to configuration wizard.

Right: Selected inventory for reservation.

Window structure

Header Functions in header	
Requirement list	
Inventory list	selected material

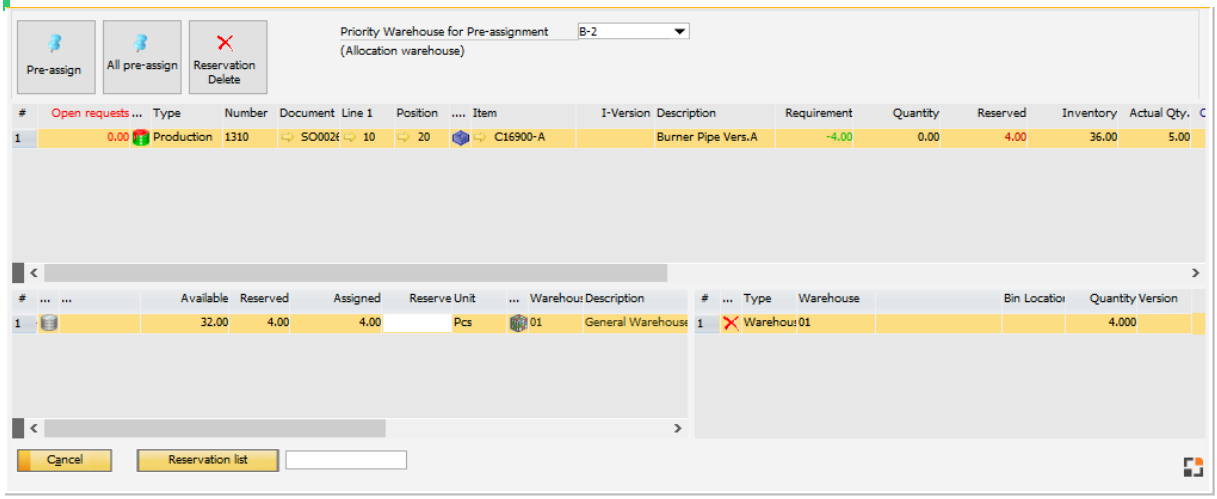
PATH: Production > Work orders structure > right-click an entry > "Reservation".



Window: reservation_set_master

Scanner support

The active field is always the entry field in the lowest line. This can be used for registration via scanner. There are two settings:

Production > Material posting > Backflushing > Material posting with scanner.

Active:

A matching batch or serial number is searched. If an entry is found, it is used and the required quantity is accepted. If no entry is found, an error message is issued: no entry found.

If the entry is blocked, (batch status, blocked bin location) the entry is not accepted, a message is issued.

Inactive:

Beas searches for the following entries: Batch number: field is selected, the cursor is set to quantity field.

Serial number: quantity is accepted immediately.

Item: entry selected, cursor is set to quantity field.

If no matching entry was found and the entry is numeric, the current entry is accepted including the quantity.

Error messages are issued in no case.

See

Configuration wizard – Material posting with scanner

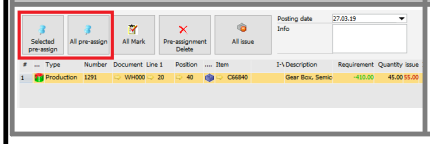
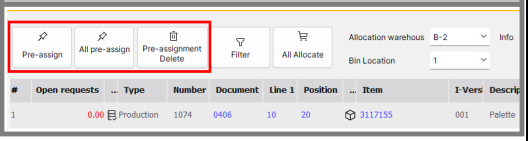
Functions in the upper ribbon:

Button	Meaning
Pre-assign	With the pre-assign buttons you can assign inventory automatically.

Traditional style	Boyum Style
	




Pre-assign: Action is performed for all marked entries.
All pre-assign: Action is performed for all entries.

The warehouse inventory is pre-assigned to the requirement automatically with the following sorting rules and filter rules:

- Sorting

1. Reserved goods (not in reservation process)
2. Allocation warehouse (***see*** Allocation window)
3. Warehouse and Bin location defined in BoM position
4. Standard warehouse of the item

Within this,
a) batches and serial numbers are sorted by the withdrawal rule according to the Configuration wizard. ***See***: Configuration wizard
b) if Bin managed: Issue Sorting defined in Bin definition

Normal items (not batch- or serial number related) will be pre-allocated only if the issue method was set to "automatic" in the Item master. ***See***

© 2026 Boyum IT Solutions A/S

Item master – Issue method

Note: Allocation warehouse is set up per work station. ***See*** Allocation window.

Allocation rules

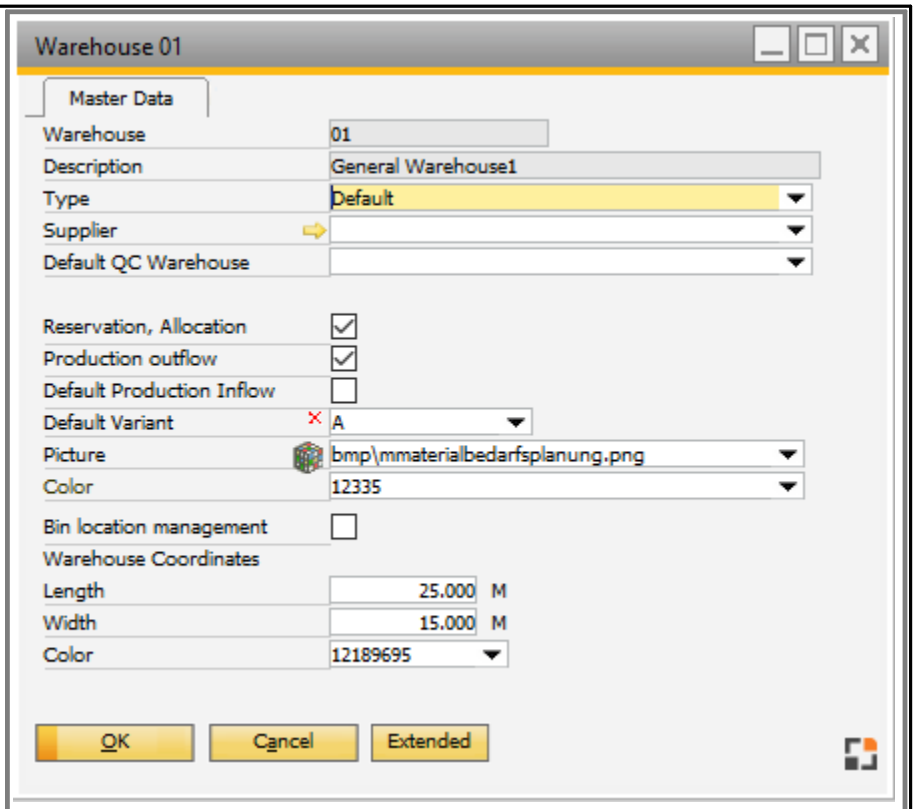
Batch and serial numbers

Within this, batches and serial numbers are sorted by withdrawal rules according to the Configuration wizard.
See Configuration wizard – Backflushing

Warehouse

Only warehouses allowed to be used for the relevant process are considered (Reservation, issue etc.)
See extended warehouse settings
Available at **General settings > Warehouse > Warehouse master data > Extended**

© 2026 Boyum IT Solutions A/S



Window bin_whs_edit.psr

Attention

SAP Bin Management not supported.

Rounding / Multiple of

In this column you can see the requirement.

For Planned Quantity the system calculates with the Rounding system.

Requirement = the calculated Quantity - Booked Quantity

The Requirement is not rounded again.

But if you **Pre-assign** the quantities, the system rounds the result again.

Example:

Plan Quantity = 4.5, Round = multiple of 2. Requirement = 6

Issue document for 5 Pcs, Requirement is 1

Click on **Pre-assign**: The system defines 2 Pcs, because it works with rounding "multiply of".

Why:

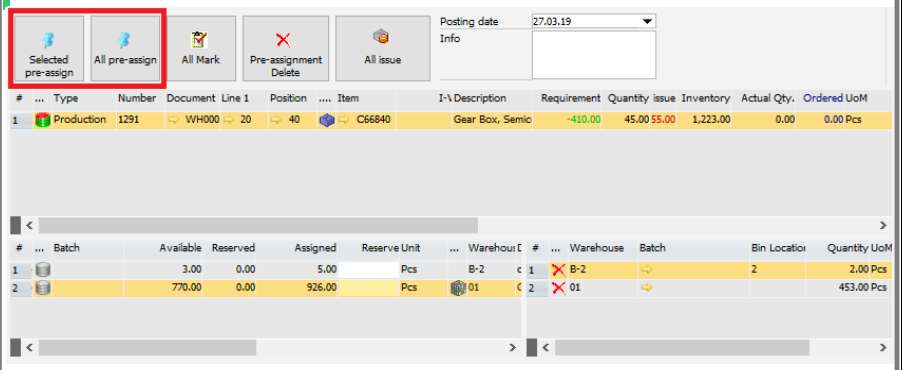
© 2026 Boyum IT Solutions A/S

Example: You are working with pallets. Multiple is 1
You need 0.2 Pallets per Pcs.
But for every receipt + backflushing process you need a pallet and not part of a pallet.
This is the reason that the system MUST use the rounding concept for every partial receipt and related issue document.

Extended rules / Customization / Script

In the reservation window, material issue window and in provision window you can apply customer-specific rules for automatic pre-assignment.
See Material booking > Automatic pre-assignment setting.

PATH: Production > Work orders structure > right-click an entry > "Reservation".



Window resevation_set_master.psr

Boyum Style button design:

These extended rules can be stored in the function "`workordermanagement.src`". (In project folder)
Depending on the window a specific function is called, for example for reservations `setres_reservation()`

See Pre-Assign buttons description
For more information ***see***

The requirement is for the complete planned quantity, which is the total requirement - booked quantity.
Planned assembly quantity * BoM requirement
- already posted material
+ canceled material</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

- currently reserved goods (at reservation) or selected material (at allocation or transfer)

Backflushing for example via time receipt

The requirement is for the quantity that is defined. In this case the already issued quantity is ignored.

(reported yield quantity + reported scrap) * BoM requirement

- already allocated quantity (pre-allocation) or manually selected quantity

A 0 is displayed if enough goods have been selected.

Colors:

Column is displayed with colors

red: not enough goods available

blue: enough available

green: no requirement or enough goods selected (value = 0)

negative BoM quantity

Negative requirement (planned inflow) is displayed here as positive. The allocated receipt quantity is subtracted. In this case, not the requirement, but the planned quantity – received quantity is displayed. Such a position is marked with the icon / .

Rounding rule

The rounding rule according to BoM position is applied to the current remaining requirement. The rounded remaining requirement minus the reserved quantity will be displayed.

Number of digits as per UoM is not considered. It is rounded according to **General settings > Display > Decimals > Quantity**.

Note: If scrap quantity is used, planned scrap and off-cut may not be considered. ***See*** Configuration wizard – backflushing.

© 2026 Boyum IT Solutions A/S

Quantity	Required total quantity without consideration of the reserved quantity.
Reserved	Reserved, issued or selected quantity Displays the currently reserved or selected quantity. Depending on the window, the column has different designation and meaning. Reservation list: "Reserved": the total reserved quantity **WMS Integration:** From Beas Manufacturing 2024.04 on, this field considers WMS Batch/LUID and Detail level locks. Issue material: "Issue": the quantity to be issued Allocation "Reserved" - the allocation quantity Color: gray: nothing selected blue: not enough selected green: correct quantity selected red: too much selected **Note**: After changing columns in Window settings the column is displayed as "reserved". Only after reopening the title is changed window specifically.
Order related purchased	Purchased quantity for the current row Total quantity of open purchase orders and purchase requests for this row, quantity in Inventory UoM.
Allocation warehouse	Stock on allocation warehouse
External warehouse	Stock on external warehouse
Planned quantity	Total requirement without consideration of the reserved quantity
Actual quantity	Displays posted material. If the list is called from a from the time receipt window, then 0 value is displayed in this column.

© 2026 Boyum IT Solutions A/S

Open Quantity	- visible in WO Stock Transfer Request window. Displays the quantity of existing requests (not closed or transferred).
Request	- visible in WO Stock Transfer Request window. Editing field to indicate the manually or automatically preassigned Quantity to request for the selected Material. Entering the value is mandatory.
Transferred	- visible in WO Stock Transfer Request window. Displays the number of items transferred from the transfer request.
Stock	⊟ Stock of pre-allocated warehouse In sales order or Production – BOM position a warehouse is stored. The stock of this warehouse is displayed. *(beas9.0-004-048-000)* Current free stock
Total stock	⊟ Available total quantity Display depends on setting Extended display: Option activated The stock of all non-blocked warehouses is displayed. For batch related items only released batches are considered. Option disabled The stock of all non-blocked warehouses is displayed.
Goods receipt from PO	Total quantity of open purchase orders in Inventory UoM.
Release	check mark selected if the check mark "approved" was set in sales order – logistics tab.
Warehouse, primary warehouse	Warehouse which is stored in the pegging Production BoM position: always the warehouse which is entered in the BoM Sales order: The warehouse which is stored in the sales order row
Picklist Release	check mark, if the check mark "print picking sheet" was set in sales order – logistics tab.
Blocked stock	Stock in blocked warehouse
Res. Total	Total reservation (all orders, customer and work orders), meaning all reserved quantities for the selected item

© 2026 Boyum IT Solutions A/S

	WMS integration: This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Delivery date	Delivery date Selection type can be set up in Configuration wizard – Material requirement planning.
Requirement date	Delivery date less lead time
Assembly	Assembly ID
Assembly quantity	Quantity of the assembly to be produced
Purchase inflow	Planned inflow from purchase
Sales order	Requirement of sales orders
Res. sales order	Reserved quantity of all sales orders
Lead time	Item lead time (replenishment time) from item master

NOTE: The following fields are visible only in
- material requirement list
- in other windows if "Reservation, issue: Extended views" was enabled.

Content of these fields is taken from Inventory history

See Configuration wizard – Production – View
Configuration wizard > Material posting > Backflushing – extended display
Inventory history

Field	Description
Balance	From inventory history: total balance for all orders
Production outflow	From inventory history: sum of planned requirement from all work orders
Production inflow	From inventory history: sum of planned receipts from all work orders
Minimum stock	Minimum stock of this item for all warehouses
Maximum stock	Maximum stock of this item for all warehouses
Res.customer order	Reserved quantity for all customer orders
Total available	Total available quantity

© 2026 Boyum IT Solutions A/S

	Total stock - production outflow - sales order quantity + purchased quantity + production inflow

Material requirement – Purchase area

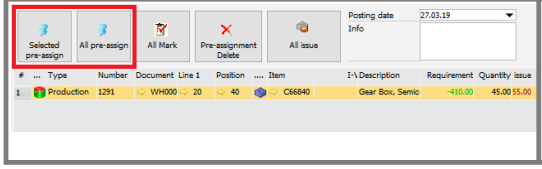
Purchase function is available only in material requirement list and only active if the field **Purchase quantity in warehouse units** or **Purchase units** was set to visible.

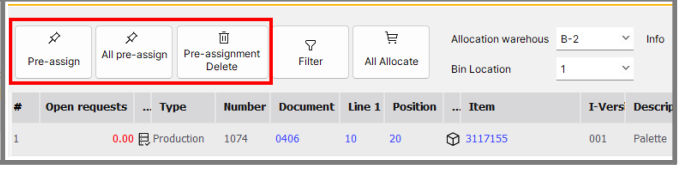
Field	Description
Purchase quantity warehouse units	Purchase quantity can be entered in warehouse units (blue)
Purchase quantity purchase units	Purchase quantity can be entered in purchase units (green)
Unit purchase	Purchasing UoM
Purchase factor	Conversion factor between Purchasing and Inventory UoMs
Supplier	Default supplier Can be selected by right-click Selection type can be set up in Configuration wizard – Material requirement planning.
Delivery date	Desired delivery date
Price	Price in Purchasing UoM. All pricing rules are considered. Gross price lists are not considered.
Currency	Currency for the purchase order. Determined automatically with pricing.
Info	Free entry field. Transferred to purchase order.

back to Issue and reservation window.

8.2.1.16.1.2 Pre-Assign buttons

With the pre-assign buttons you can assign inventory automatically.

Traditional style	Boyum Style
	




© 2026 Boyum IT Solutions A/S

Pre-assign: Action is performed for all marked entries.
All pre-assign: Action is performed for all entries.

The warehouse inventory is pre-assigned to the requirement automatically with the following sorting rules and filter rules:

- Sorting

1. Reserved goods (not in reservation process)
2. Allocation warehouse (***see*** Allocation window)
3. Warehouse and Bin location defined in BoM position
4. Standard warehouse of the item

Within this,
a) batches and serial numbers are sorted by the withdrawal rule according to the Configuration wizard. ***See***: Configuration wizard
b) if Bin managed: Issue Sorting defined in Bin definition

Normal items (not batch- or serial number related) will be pre-allocated only if the issue method was set to "automatic" in the Item master. ***See*** Item master – Issue method

Note: Allocation warehouse is set up per work station. ***See*** Allocation window.

- Allocation rules

Batch and serial numbers

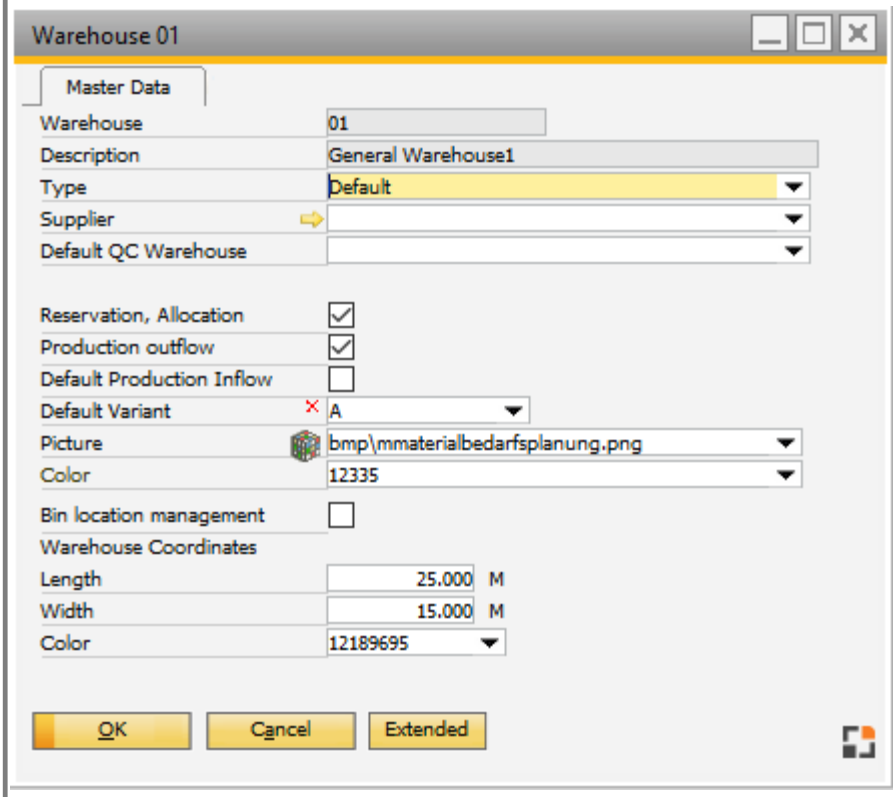
Within this, batches and serial numbers are sorted by withdrawal rules according to the Configuration wizard.
See Configuration wizard – Backflushing

Warehouse

Only warehouses allowed to be used for the relevant process are considered (Reservation, issue etc.)
See extended warehouse settings

© 2026 Boyum IT Solutions A/S

Available at **General settings > Warehouse > Warehouse master data > Extended**



Window bin_whs_edit.psr

Attention

SAP Bin Management not supported.

- Rounding / Multiple of

In this column you can see the requirement.

For Planned Quantity the system calculates with the Rounding system.

Requirement = the calculated Quantity - Booked Quantity

The Requirement is not rounded again.

But if you **Pre-assign** the quantities, the system rounds the result again.

Example:

Plan Quantity = 4.5, Round = multiple of 2. Requirement = 6

Issue document for 5 Pcs, Requirement is 1

Click on **Pre-assign**: The system defines 2 Pcs, because it works with rounding "multiply of".

Why:

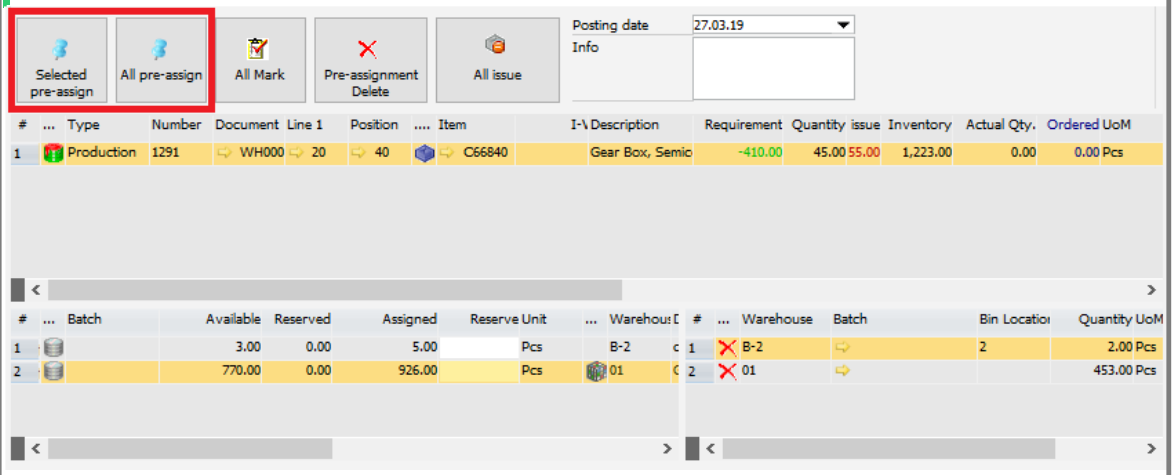
© 2026 Boyum IT Solutions A/S

Example: You are working with pallets. Multiple is 1
You need 0.2 Pallets per Pcs.
But for every receipt + backflushing process you need a pallet and not part of a pallet.
This is the reason that the system MUST use the rounding concept for every partial receipt and related issue document.

Extended rules / Customization / Script

In the reservation window, material issue window and in provision window you can apply customer-specific rules for automatic pre-assignment.
See Material booking > Automatic pre-assignment setting.

PATH: Production > Work orders structure > right-click an entry > "Reservation".



Window resevation_set_master.psr

Boyum Style button design:

These extended rules can be stored in the function "`workordermanagement.src`". (In project folder)
Depending on the window a specific function is called, for example for reservations `setres_reservation()`

See Pre-Assign buttons description
For more information ***see***
UserEvents

8.2.1.16.1.4 Icons

The meaning of the icons in reservation window, allocation window, provision window and material issue window:

<table>
<tr><th>Icons</th><th>Boyum Style</th><th>Description</th></tr>
<tr><td> </td><td> </td><td>Reservation:<table><tr><th>Traditional style</th><th>Boyum Style</th></tr><tr><td>Gray: goods reserved, but planned quantity not reached.</td><td>Empty barrel: goods reserved, but planned quantity not reached.</td></tr><tr><td>Green: required planned quantity reserved.</td><td>Barrel with a check mark on the bottom right: required planned quantity reserved.</td></tr><tr><td>Red overflown: too much reserved.</td><td>Barrel with an exclamation mark on the bottom right: too much reserved.</td></tr></table></td></tr>
<tr><td> </td><td> </td><td>Selected quantity is moved back to the left window. The pre-allocation is deleted. The barrel icons disappear.</td></tr>
<tr><td> </td><td> </td><td>This is Receipt reservation, which cannot be deleted here. By clicking the icon, the screen customer order to work order opens.</td></tr>
</table>

8.2.1.16.1.5 Inventory list

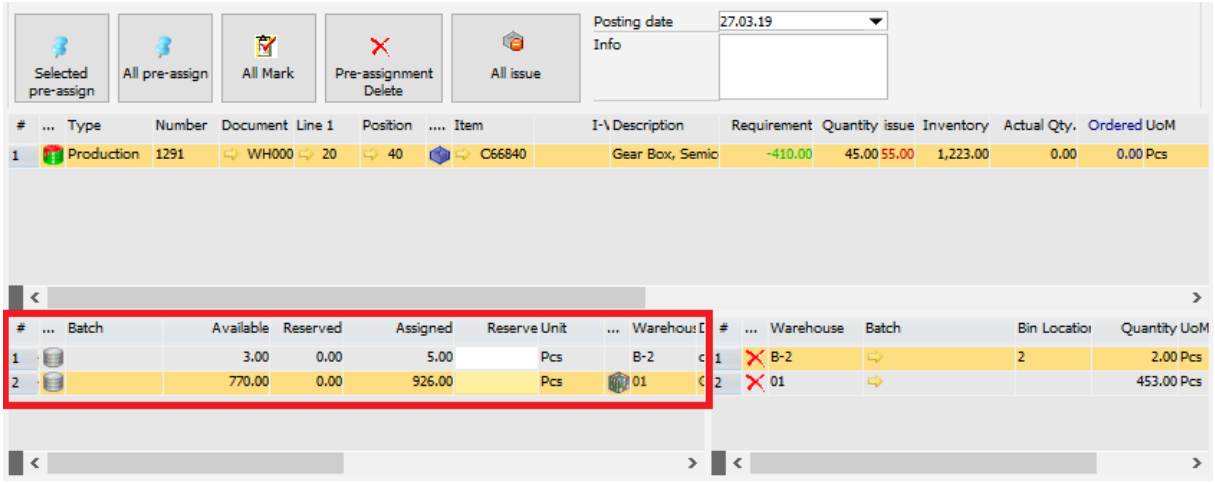
In the Reservation, issue, and WO Stock Transfer Request windows – the warehouse inventory is displayed on the area bottom left.
The display is adjusted automatically for the serial number items, batch items and normal items.

In case of a negative BoM, the relevant receipt form is displayed in the issue window.

A quantity can be selected from a warehouse inventory via double-click or input of the quantity. This will then be displayed as reserved on the right side.

PATH: Production > Work orders structure > right-click an entry > "Reservation".

© 2026 Boyum IT Solutions A/S



Window reservation_set_master.psr

Sorting

Inventory with batch/serial number/bin location, sorted by priority

- 1. Reserved goods for this order line
- 2. Allocation warehouse
- 3. Standard warehouse
- 4. Other warehouses. Within that sorting:

Batches: Withdrawal rule according to Configuration wizard

Serial number: By serial number.

Note: The pre-assign function uses a different sorting and filter than this view.

This list

- ignores the pre-defined bin location

- ignores sort definition in bin location

Filtering

The following information is displayed only:

- Only warehouses relevant to the field are displayed
- Multiple branch solution: Only warehouses of the same branches are displayed
- Only warehouses released for the withdraw or reservation (Reservation, Allocation, Production outflow etc.) are displayed
- If Parameter "Issue only for default warehouse" is active then only warehouse defined in WO BoM is displayed. All other warehouses will be ignored.
- **WMS Integration**: When working with a WMS database, and connected Produmex Add-On, the list is filtered based on the **Produmex WMS Add-On > Organizational structure > Quality**

© 2026 Boyum IT Solutions A/S

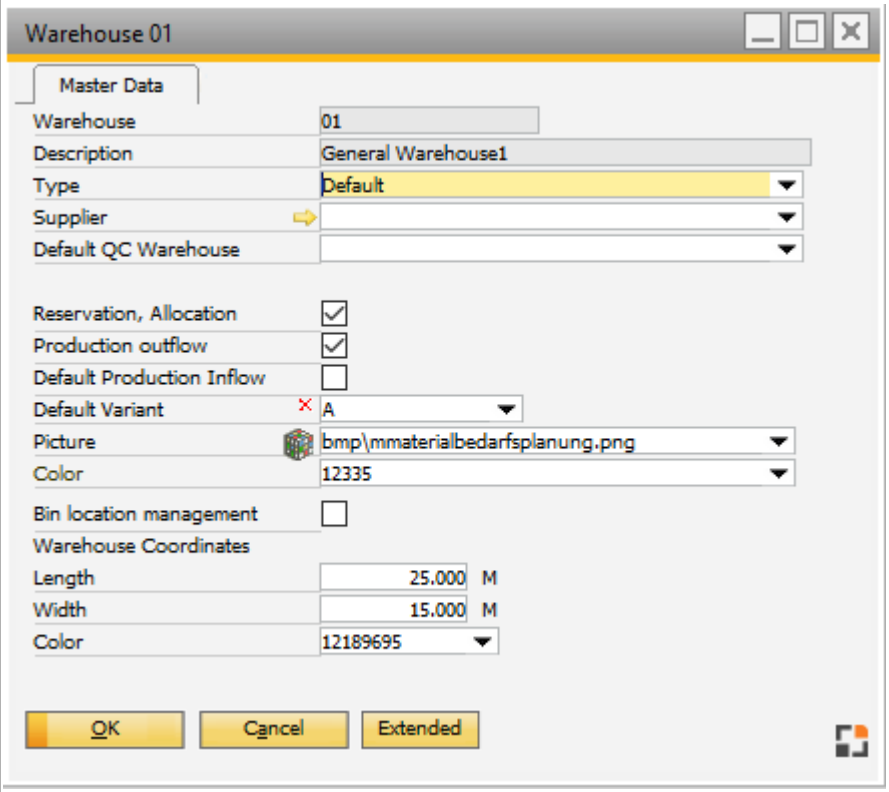
Status >"Can be used for production". If the "Can be used for production" field is active, this BEAS screen section only displays WMS items with this quality status with this flag

•

WMS Integration: In the Configuration Wizard > WMS settings you can configure the system to filter stock according to WMS Zones and Bin locations for the WO Material Issue function.

Inventory > Warehouse management > Master data

See Edit warehouse master data



Window bin_whs_edit.psr

Alternatively, the warehouse filter can be changed by script.

Customized warehouse filter

windowevent loadstock next to UDFs warehouse filter can be defined. Use variable "`e_stock_(area)_where`" or subordinated: `e_stock_where` for definition.

Area: destinguish between normal, batch or serial number items.

Batch: `e_stock_batch_where`

Series: `e_stock_serial_where`

Normal: `e_stock_std_where`

© 2026 Boyum IT Solutions A/S

A general filter in variable "e_stock_where" can be defined or a separate filter for batch or serial number items. The standard behavior can be changed completely.

Priority:

Filter as per area filter `e_stock_(area)_where`

If not set: filter as in variable `e_stock_where`

If not set: standard filter (see Standard behavior)

Enter a SQL-fragment for the WHERE-clause

The following tables are available:

Serial number: `OSRN, OSRQ, OWHS, OITW, BEAS_WHSBINITEM, BEAS_WHS, BEAS_WHSBIN, BEAS_WHSAREA`

Batch: `OBTN, OBTQ, OWHS, OITW, BEAS_WHSBINITEM, BEAS_WHS, BEAS_WHSBIN, BEAS_WHSAREA`

Normal: `OWHS, OITW, BEAS_WHSBINITEM, BEAS_WHS, BEAS_WHSBIN, BEAS_WHSAREA`

For batches you can change the sorting using the variable *(beas 9.1 PL:08)*
`e_stock_batch_order`

Example:

User "harald" may only withdraw from warehouse "02" and "03"

```
windowevent loadstock
if <currentuser> = harald then
  setvar=e_stock_where= and`OWHS`.`WhsCode` in ('01','02')
end if

// Default sort for batchnumber: only by batchnumber
setvar=e_stock_batch_order="OBTN"."DistNumber"
end event
```

This window can be called up as reservation or issue window. If, depending on the area, different filters are needed, use the variable as_menu.

Area	Content Variable as_menu
Reservation	reservation
Allocation	supply
issue provision parts	externalissue
issue	issuewo

© 2026 Boyum IT Solutions A/S

Example: Extended rule only for issue

```
windowevent loadstock
if <as_menu> = issuewo then
  setvar=e_stock_where= and`OWHS`.`WhsCode` in ('01','02')
end if
end event
```

Note:

The rule defined here has no effect on allocation. This is set up separately. ***See*** Extended rules.

See Customization

Field	Meaning
...	Reservation status Show if reservation exists = Reservation exists for the current Bill of material position.
Batch number / Serial number	The Batch / Serial number Serial managed item: Display the serial number Batch managed item: Display the batch number Black: Batch Status is released Red: Batch status is not released
Available	Currently available total quantity. Material for this Batch Number / Serial Number on this Warehouse and on this Bin Warehouse. **WMS integration:** This field also considers all units available for WMS lock types Batch, LUID and Detail. ***See*** "B / L / D Available" field description below.
B Available L Available D Available	Quantity available by PMX WMS lock types: - The three fields are hidden by default - Activate in Window settings.

© 2026 Boyum IT Solutions A/S

	<table><tr><th>Field</th><th>Locking Type (WMS)</th><th>Description</th></tr><tr><td>B Available</td><td>Batch</td><td>Quantity of batches available for reservation without considering any location, palette or other details. To keep the integrity of the system, Beas does not allow to consume more material than the available quantity. ***Example:*** You want to reserve 6 units from two locations that contain 5-5 batches each. Beas will only allow max. 4 batches to reserve from one location, and 2 from the other.</td></tr><tr><td>L Available</td><td>LUID</td><td>Quantity of batches available for the reservation of one specific palette (LUID) that can be moved in the warehouse. ***Example:*** Reserve 2 batch units on a palette, and the system moves the palette to the new location.</td></tr><tr><td>D Available</td><td>Detail</td><td>Quantity of batches available for reservation on a specific palette and location. **IMPORTANT:** Moving is not possible.</td></tr></table> **WMS integration:** The system supports Produmex WMS locking types "Batch, "LUID" and "Detail". ***See*** documentation of the WMS Inventory locking system.
Reserved	⊟ Reserved quantity Display reserved Quantity. Only stock reservations are displayed. Pre-reserved sub-assemblies that are yet not in stock are not displayed. **WMS integration:** This field also considers all WMS reservations for locking types Batch, LUID and Detail. ***See*** "B / L / D Reservation" field description below.

© 2026 Boyum IT Solutions A/S

Example in Issue function.

There are 2 lines with the same material
Stock = 100

in the first line you choose the item 50 Pcs
if you go on to the second line, you will see "available stock" = 50

Reason:
in an issue window you work with "soft reservation"
in the second line you cannot see the "soft reservation" from another line, another station or another process.

With this concept we can reduce the number of problems that may emerge when working with hard reservation

In "Reservation Window" Beas use a hard reservation and this type of reservation will be checked in every window and every line.

B Reserved
L Reserved
D Reserved

Quantity reserved by PMX WMS lock types:

- The three fields are hidden by default - Activate in Window settings.

Field	Locking Type (WMS)	Description
B Reserved	Batch	Quantity of batches reserved without considering any location, palette or other details. To keep the integrity of the system, Beas does not allow to consume more than the available quantity. ***Example:*** You want to reserve 6 units from two locations that contain 5-5 batches each. Beas will only allow max. 4 batches to reserve from one location, and 2 from the other.
L Reserved	LUID	Quantity of batches reserved for one specific palette (LUID) that can be moved in the warehouse. ***Example:*** Reserve 2 batch units on a palette, and the

	Serial number: `OSRN, OSRQ, OWHS, OITW, BEAS_WHSBINITEM, BEAS_WHS, BEAS_WHSBIN, BEAS_WHSAREA`
	Chargen: `OBTN, OBTQ, OWHS, OITW, BEAS_WHSBINITEM, BEAS_WHS, BEAS_WHSBIN, BEAS_WHSAREA`
	Normal: `OWHS, OITW, BEAS_WHSBINITEM, BEAS_WHS, BEAS_WHSBIN, BEAS_WHSAREA`
	
	To check which window is currently open, check the content of the variable "as_menu". In the reservation window "reservation" is stored.
	
	Example:
	in case of serial numbers and reservations in UDF1 the field U_myfield shall be displayed and labeled with "my field"
	`windowevent loadstock`
	`setvar=e_stock_serial_udf1=`OSRN`.`U_myfield``
	`setvar=e_stock_serial_udfname1=my field`
	`end event`
	
	Note:

© 2026 Boyum IT Solutions A/S

	Set variables are not reset as long as the window is not reopened. UDF's are only visible if activated in they are windows settings. ***See*** Customization.

back to issue and reservation window

Quantity available by PMX WMS lock types:

- The three fields are hidden by default - Activate in Window settings.

Field	Locking Type (WMS)	Description
B Available	Batch	Quantity of batches available for reservation without considering any location, palette or other details. To keep the integrity of the system, Beas does not allow to consume more material than the available quantity. ***Example:*** You want to reserve 6 units from two locations that contain 5-5 batches each. Beas will only allow max. 4 batches to reserve from one location, and 2 from the other.
L Available	LUID	Quantity of batches available for the reservation of one specific palette (LUID) that can be moved in the warehouse. ***Example:*** Reserve 2 batch units on a palette, and the system moves the palette to the new location.
D Available	Detail	Quantity of batches available for reservation on a specific palette and location. **IMPORTANT:** Moving is not possible.

WMS integration:

The system supports Produmex WMS locking types "Batch, "LUID" and "Detail".

See documentation of the WMS Inventory locking system.

© 2026 Boyum IT Solutions A/S

Quantity reserved by PMX WMS lock types:

- The three fields are hidden by default - Activate in Window settings.

Field	Locking Type (WMS)	Description
B Reserved	Batch	Quantity of batches reserved without considering any location, palette or other details. To keep the integrity of the system, Beas does not allow to consume more than the available quantity. ***Example:*** You want to reserve 6 units from two locations that contain 5-5 batches each. Beas will only allow max. 4 batches to reserve from one location, and 2 from the other.
L Reserved	LUID	Quantity of batches reserved for one specific palette (LUID) that can be moved in the warehouse. ***Example:*** Reserve 2 batch units on a palette, and the system moves the palette to the new location.
D Reserved	Detail	Quantity of batches reserved on a specific palette and location.

WMS integration:

The system supports Produmex WMS locking types "Batch, "LUID" and "Detail".

See documentation of the WMS Inventory locking system.

8.2.1.16.1.6 Selected material

Field	Meaning
...	Current status of the row: Deletion-icon: click to delete the reservation
Type	Type of reservation
Warehouse	Current warehouse
Batch	Batch number
Bin location	Current bin location

© 2026 Boyum IT Solutions A/S

RFID	RFID
SSCC	Support to Produmex WMS – SSCC code to identify a logistic unit.
Quantity	Reserved quantity
UoM	Unit of measure
Assignment	If the material is a Batch/Serial item, and it is consumed by another Batch/Serial-managed parent item, the distnumber information of that parent item is displayed here.

In WO Stock Transfer Request when total quantity is > the Top List request, the Top list request has to be updated to the new quantity.

Note: Selected batches or serial numbers serve only as reference in the stock transfer request for the user that creates the stock transfer request, but the stock transfer document could be created with a different selection.
See WO Stock Transfer Request creation process.

back to issue and reservation window

8.2.1.16.1.7 Scanner support

The active field is always the entry field in the lowest line. This can be used for registration via scanner. There are two settings:
Production > Material posting > Backflushing > Material posting with scanner.

Active:
A matching batch or serial number is searched. If an entry is found, it is used and the required quantity is accepted. If no entry is found, an error message is issued: no entry found.
If the entry is blocked, (batch status, blocked bin location) the entry is not accepted, a message is issued.

Inactive:
Beas searches for the following entries: Batch number: field is selected, the cursor is set to quantity field.
Serial number: quantity is accepted immediately.
Item: entry selected, cursor is set to quantity field.

© 2026 Boyum IT Solutions A/S

If no matching entry was found and the entry is numeric, the current entry is accepted including the quantity.
Error messages are issued in no case.

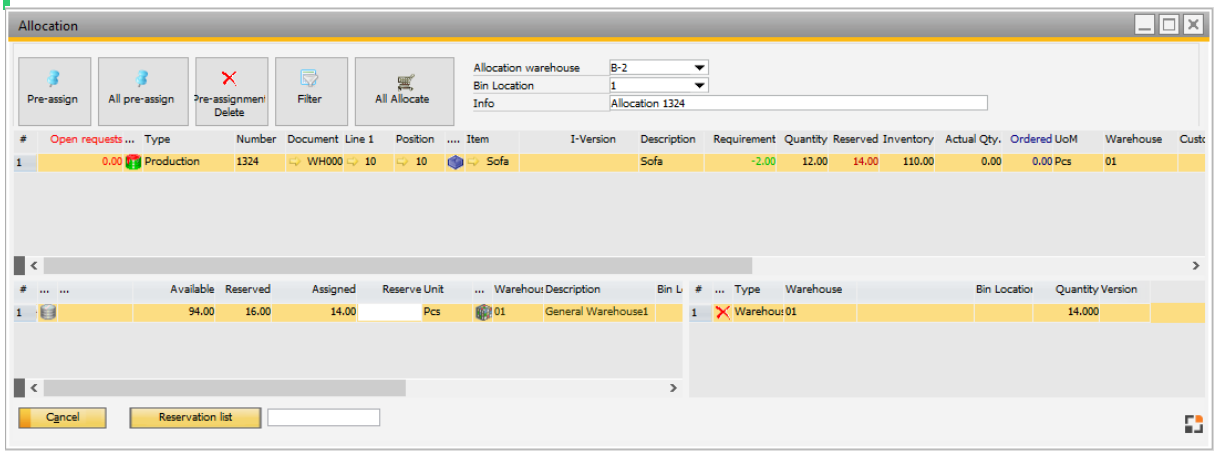
8.2.1.16.2 Allocation screen

The allocation/deliver function is used to transfer material needed for a work order from a default warehouse to an allocation warehouse. The material is also reserved for that work order. When doing an allocation, Beas creates a transfer document. Usually this is cost-neutral and not assigned to the work order.

PATH: Production > Work Orders > right-click an allocation in the WO structure / right-click an item > "Allocation".



Window reservation_set_master.psr

Boyum Style top bar buttons design:

Fields right of the ribbon

Only some fields explained in the table below are displayed, depending on the work flow.

Field	Meaning
Posting date	**Postings**: select the posting date.
Allocation warehouse	**Allocation**: allocation warehouse. Setting is saved per work station. Note: this has no effect on the reservation and issue screen. ***See*** Reservation window, Material posting.
Bin location	Bin location of the external warehouse to which material is transferred (field is only displayed if the warehouse has bins). For reservation the definition of Bin Location is mandatory
Address	Address of the external warehouse.

Functions in upper ribbon:

Button	Meaning
Pre-assign Quantity (manually)	Visible in WO Stock Transfer Request window. With this option the user can manually pre-assign quantities for each

© 2026 Boyum IT Solutions A/S

material line based on the equivalent amount of the parent product. In the quantity field you can specify the quantity of the parent product. Apply changes for the selected lines.

Example:

To manufacture 1 product A, you need:

- 2 MA
- 3 MB
  - 20 MA
  - 30 MB
    - 2 * 2 = 4 MA
    - 2 * 3 = 6 MB
      - If Quantity is <= 0, the status bar message appears: "a quantity is required for pre-assigning"
      - if Quantity is > 0, calculation is made for each Material in the list, considering part of the quantity of this BoM according to the Parent Quantity Field on the pre-assign button. Consider proportion of calculated scrap quantity. The result will be in the Column "Request" of the Material List.
      - If you have reservations, the system will assign the reserved quantity to the right matrix.
      - Beas create a transfer request document in background. This don't support any Bin management system. It is possible to choose item from bin managed warehouse, but the bin location information is not saved in the transfer request document

Pre-assign Batches and Serials:

Attention: In WO Stock Transfer Request, the pre-assign process does not select any batch/serial numbers, unless there is an existing reservation.

See WO Stock Transfer Request creation process.

© 2026 Boyum IT Solutions A/S

Pre-assign	All entries selected in the upper list will be pre-allocated automatically Sorting 1. Reserved goods for this order line 2. Allocation warehouse 3. Default warehouse as per BoM or standard warehouse of the item Within this, batches and serial numbers are sorted by withdrawal rules according to the configuration wizard. ***See***: Configuration wizard. Normal items (not batch- or serial number related) will be pre-allocated only if the issue method was set to "automatic" in the Item master. ***See*** Item master – Issue method. Allocation rules **Batch and serial numbers** Within this, batches and serial numbers are sorted by withdrawal rules according to the Configuration wizard. ***See*** Configuration wizard – Backflushing **Warehouse** Only warehouses allowed to be used for the relevant process are considered (Reservation, issue etc.) ***See*** extended warehouse settings Available at **General settings > Warehouse > Warehouse master data > Extended**

© 2026 Boyum IT Solutions A/S

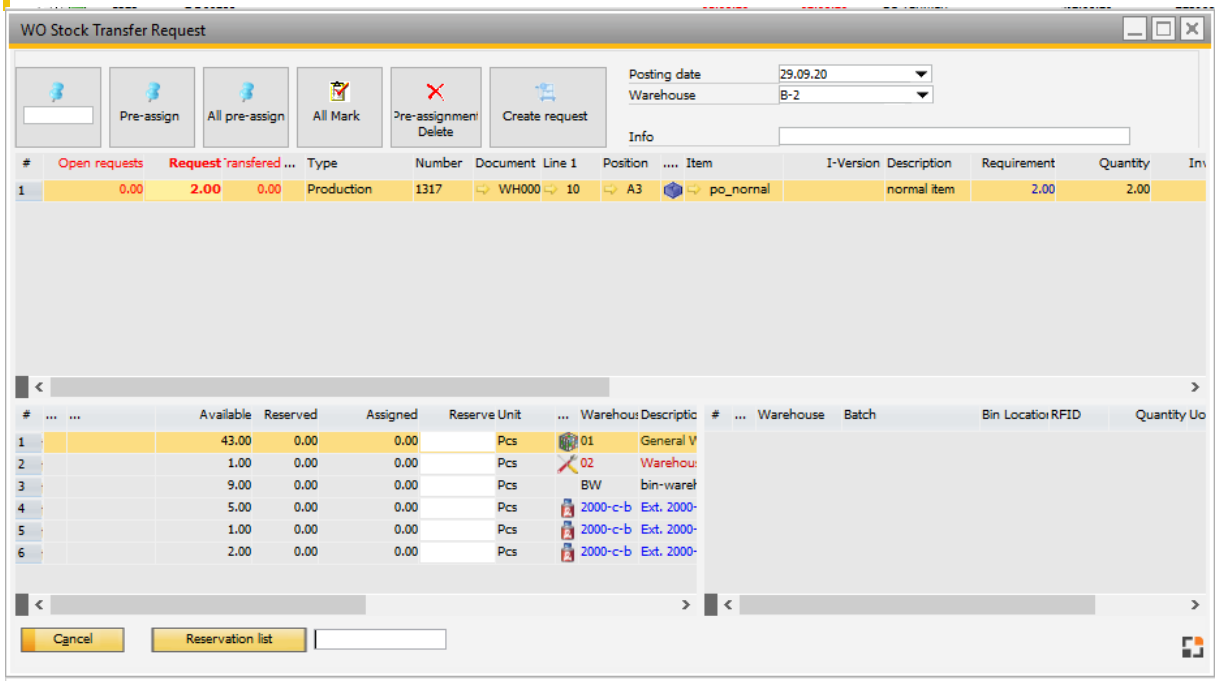
8.2.1.16.3 WO Stock transfer request

In this window you can create a stock transfer request based on Work order Bill of Materials, and so request partial or total quantities for a production location for one or multiple WO positions. Activation of the Reservation system is recommended but not mandatory.

The processing of these requests is equivalent to the current Allocation procedure in Beas, but create a SAP Business One transfer request.

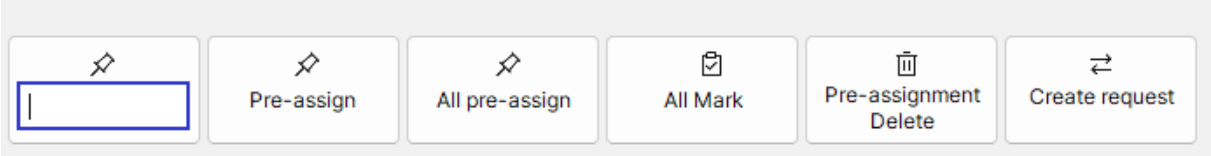
PATH: Production > Work Orders > right-click an entry > "WO Stock Transfer Request" option.

Note: To open this window/see this option in the right-click menu of work orders, activate "WO Stock transfer request" setting in WO structure view – Window settings.



Window reservation_set_master.psr

Button bar in Boyum Style design:



From Beas **work order BoM to** SAP Business One **Inventory Transfer:**

1. Create the request in this window.
2. Close the window and go back to the WO structure view.
3. Double-click on the newly created / Inventory transfer request line.

© 2026 Boyum IT Solutions A/S

4. The standard SAP Business One Inventory Transfer window opens where you can create a stock transfer document.

Closing the WO position also closes the remaining entries in the Stock Transfer Request and the system creates an Allocation.

WMS Integration:

As of Beas Manufacturing 2024.06 and later, the logic of creating reservations for a Beas WO Stock Transfer Request is also applied when WMS creates the document.

See VIDEO of a sample, WMS-integrated workflow: WO Stock Transfer Request with PMX WMS.

- Workflow

1. Create a "WO Stock Transfer Request" in Beas by reserving a Batch.
2. Go to WMS and click the "Generate picklist proposal" function in the newly created SAP Inventory Transfer Request document.
3. Select "Generate Pick list" in the Pick List Proposal document.
4. Once the Pick list is generated, start the WMS Mobile App, and complete the "picking process".
5. When the pick list process is completed, generate the Stock Transfer Request document based on this picked QTY. For this functionality we use the option "SHIPPING".
6. Now the new functionality starts and creates a reservation in the Beas reservation table and also in the WMS reservation table.

For detailed information with screenshots, ***see*** Beas-WMS documentation "Work Order Transfer Request" sub-chapter.

For functions and field descriptions click links in the window structure:

Filter: all	Lines which have been posted are also displayed.
Filter: only requirement	Standard view. Only lines which have not been posted are displayed.
New series	This button is active only if assembly and material position are serial number related. With "New series" a new serial number to be posted in later can be added and assigned to the serial number to be issued. ***See*** Serial number. *beas9.0-000-001-000*

Notes

- WMS, SAP and Beas Min management system supported.
- Beas RFID and WMS LUID supported.
- Not possible to create issue from same batch from different Bin locations or same Bin location but different RFID/LUID.

back to Work order general

8.2.1.16.6 Serial Number linking

If the assembly and the material are serial number related, a linking of serial numbers is possible.

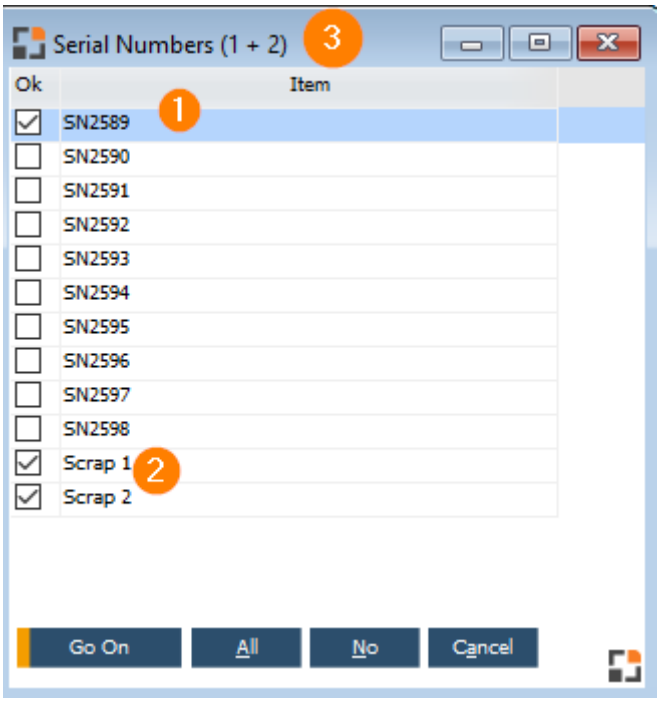
If the option "also post serial numbers" in the Configuration wizard is set, a window pops up where you have to select the serials for the finished product - for which the material will be booked.

© 2026 Boyum IT Solutions A/S

If the scrap is also to be reported during the reporting process, the '"serial list" contains entries for the scrap, as well.

Example:

Here, the quantity of one good and two scraps is reported in a time receipt:



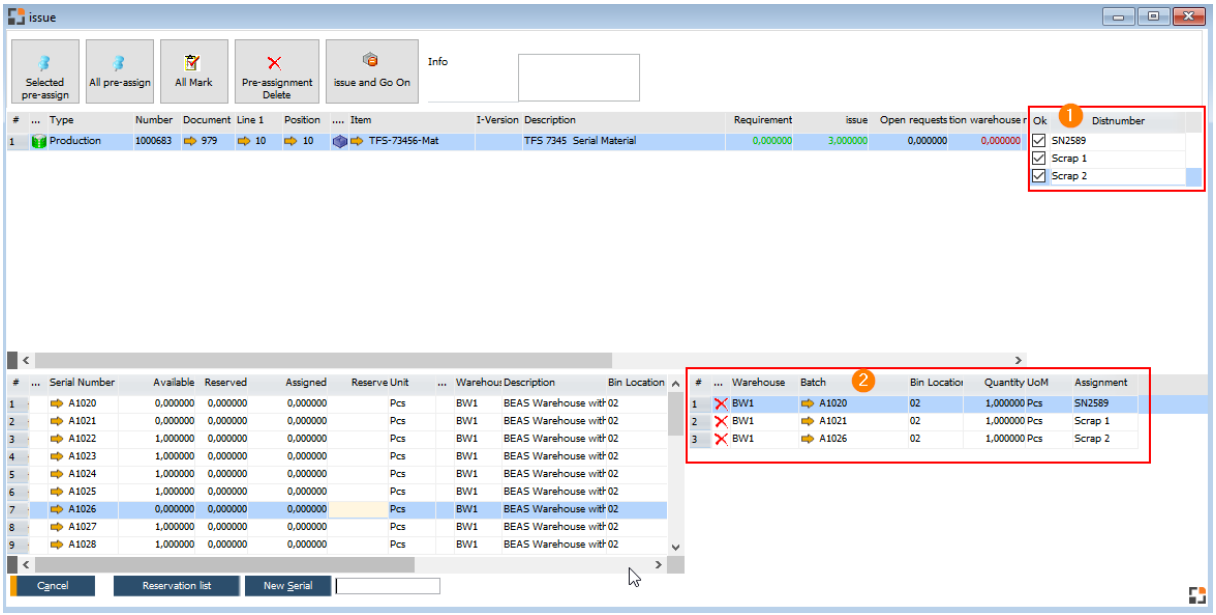
1) The first available serial number is checked. It is possible to change the selection by clicking another row.

2) For the scrap, 2 lines are added and checked. It is not possible to deselect them.

3) In the title you can see the number of serials to select (1 good and 2 scrap)

4) After this selection, the issue window shows all the previously selected serials (1), and you have to link the material serials to the serials for the finished product (2):

© 2026 Boyum IT Solutions A/S



See also Serial numbers, Serial number reservation, Serial number tracing

8.2.1.16.7 WMS Picklist for Production

Pick list for production

In this window you can create a request for picking to production.

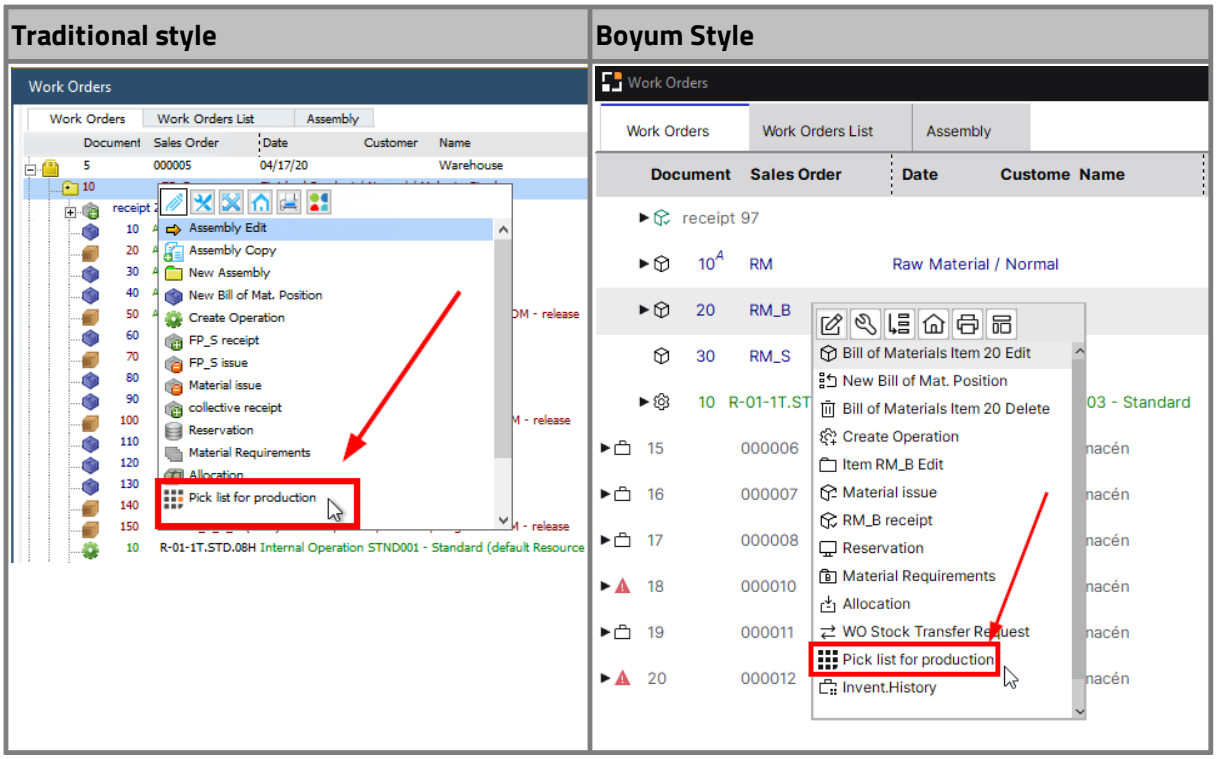
See WMS settings

See WMS Pick list for production work flow.

PATH: Production > Work orders > right-click a WO or BoM position

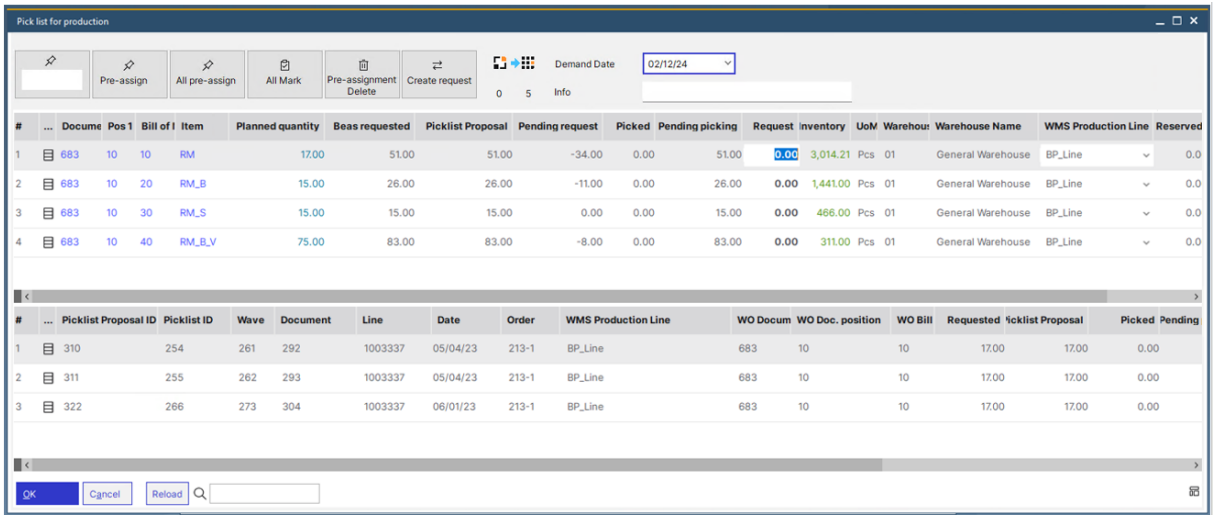
Note: You can also access the function by multiple selection of WO Headers/positions and BoM positions.

© 2026 Boyum IT Solutions A/S



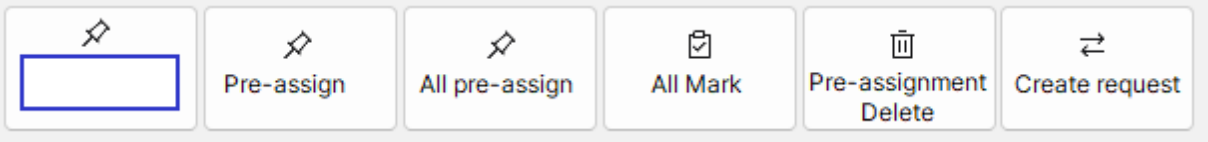
The window is based on the Beas Reservation/Allocation window structure with only one bottom screen section.

Window settings are available.



© 2026 Boyum IT Solutions A/S

Boyum Style functions bar:



Window wmspickproduction.psr

Limitation:

WMS picking process does not support Beas I-Version control.

IMPORTANT: Synchronization between WMS Locking and Beas is *only* for WMS locking types "Batch", "LUID" and "Detail"! Item level locking is not considered by Beas.

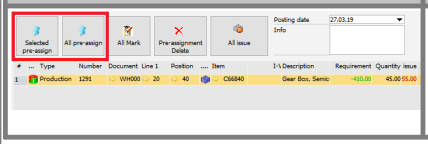
Header (Functions)

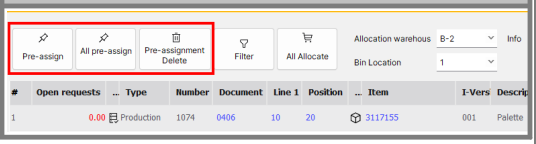
Function/Field	Description

Assign quantity	With this option the user can manually pre-assign quantities for each material line based on the equivalent amount of the parent product. In the quantity field you can specify the quantity of the parent product. Apply changes for the selected lines.
	
	Example:
	To manufacture 1 product A, you need:
	• 2 MA
	• 3 MB
	  • 20 MA
	  • 30 MB
	  • 2 * 2 = 4 MA
	  • 2 * 3 = 6 MB
	  • If Quantity is <= 0, the status bar message appears: "a quantity is required for pre-assigning"
	  • if Quantity is > 0, calculation is made for each Material in the list, considering part of the quantity of this BoM according to the Parent Quantity Field on the pre-assign button. Consider proportion of calculated scrap quantity. The result will be in the Column "Request" of the Material List.
	  • If you have reservations, the system will assign the reserved quantity to the right matrix.

© 2026 Boyum IT Solutions A/S

Function/Field	Description
	• Beas create a transfer request document in background. This don't support any Bin management system. It is possible to choose item from bin managed warehouse, but the bin location information is not saved in the transfer request document
Pre-assign / All pre-assign	With the pre-assign buttons you can assign inventory automatically.

Traditional style	Boyum Style
	




Pre-assign: Action is performed for all marked entries.
All pre-assign: Action is performed for all entries.

The warehouse inventory is pre-assigned to the requirement automatically with the following sorting rules and filter rules:

Sorting

1. Reserved goods (not in reservation process)
2. Allocation warehouse (***see*** Allocation window)
3. Warehouse and Bin location defined in BoM position
4. Standard warehouse of the item

Within this,
a) batches and serial numbers are sorted by the withdrawal rule according to the Configuration wizard. ***See***: Configuration wizard
b) if Bin managed: Issue Sorting defined in Bin definition

Normal items (not batch- or serial number related) will be pre-allocated only if the issue method was set to "automatic" in the Item master. ***See*** Item master – Issue method

© 2026 Boyum IT Solutions A/S

Function/Field	Description
	Note: Allocation warehouse is set up per work station. ***See*** Allocation window. Allocation rules **Batch and serial numbers** Within this, batches and serial numbers are sorted by withdrawal rules according to the Configuration wizard. ***See*** Configuration wizard – Backflushing **Warehouse** Only warehouses allowed to be used for the relevant process are considered (Reservation, issue etc.) ***See*** extended warehouse settings Available at **General settings > Warehouse > Warehouse master data > Extended**

© 2026 Boyum IT Solutions A/S

Function/Field	Description
	 *Window bin_whs_edit.psr* **Attention** SAP Bin Management not supported.
	Rounding / Multiple of In this column you can see the requirement. For Planned Quantity the system calculates with the Rounding system. Requirement = the calculated Quantity - Booked Quantity The Requirement is not rounded again. But if you **Pre-assign** the quantities, the system rounds the result again. ***Example:*** Plan Quantity = 4.5, Round = multiple of 2. Requirement = 6 Issue document for 5 Pcs, Requirement is 1 Click on **Pre-assign**: The system defines 2 Pcs, because it works with rounding "multiply of".

© 2026 Boyum IT Solutions A/S

Function/Field	Description
	Why: ***Example:*** You are working with pallets. Multiple is 1 You need 0.2 Pallets per Pcs. But for every receipt + backflushing process you need a pallet and not part of a pallet. This is the reason that the system MUST use the rounding concept for every partial receipt and related issue document.
	Extended rules / Customization / Script
	In the reservation window, material issue window and in provision window you can apply customer-specific rules for automatic pre-assignment. ***See*** Material booking > Automatic pre-assignment setting. PATH: Production > Work orders structure > right-click an entry > "Reservation".  *Window resevation_set_master.psr* **Boyum Style button design:** These extended rules can be stored in the function "`workordermanagement.src`". (In project folder)

© 2026 Boyum IT Solutions A/S

Function/Field	Description
	Depending on the window a specific function is called, for example for reservations `setres_reservation()` ***See*** Pre-Assign buttons description For more information ***see*** UserEvents UserEvents for PreAssign
All Mark	Mark all entries in the requirement window section.
Pre-assignment delete	Delete pre-assignment of quantities for the selected lines.
Create request	Create a pick list proposal or pick list proposal + picking list. Request is created based on the Configuration wizard WMS settings. **Attention:** If you click on the "reload" button while the "Create request" function is being processed by WMS, Beas shows an icon for error ( ). If you click the "reload" button again, the Beas retrieves the current information. Once the WMS document is generated, the system shows the final message.
	The icons represent the two responding, running services of the two products. ***See*** WMS Pick list for production work flow. Below the icons, the system displays the number of pending messages to be processed.
Demand Date	The date for the picking to be processed.
Info	Free text.

(Right-click) Functions

Function	Description
Cancel	Close window without saving changes.
Reload	Reload window.
Search	Search requirement
Filter: All	Lines which have been posted are also displayed.
Filter: Required	Standard view. Only lines which have not been posted are displayed.
Inventory history	Open Inventory history for the item.

8.2.1.16.8 backflushing screen (beas 2009 version)

Note: This window will be deleted soon! All 2009 Variants are to be disabled as of early 2020.

© 2026 Boyum IT Solutions A/S

This old window opens for backflushing material if in Configuration wizard **> Production > Material posting > Backflushing > issue quantity changeable: YES (beas2009 version)** was selected.
This window has fewer features than the default backflushing window, but negative BoM quantities are supported.

The quantity, the warehouse, batches and serial numbers can be selected. Negative BoM quantities are supported. Pre-allocation according to Automatic pre-allocation of batches.
Reservation: The pre-allocation functions considers the reservation, but is not designed for it. When working with serial number access reservation, this option (YES for 2009 version) must currently be selected, because only this window is allowing that assignment.
This option should not be selected when working with reservation or with bin locations.

8.2.1.17 Collective receipt

The function collective post-in is available for merged work orders. All assembly items and **negative** BoM items can be posted at once. There is no material backflushing.

The function is accessible via:

PATH: Production > Work order structure > right-click on production order > Collective receipt.

or

PATH: Terminal > app "production collective receipt".

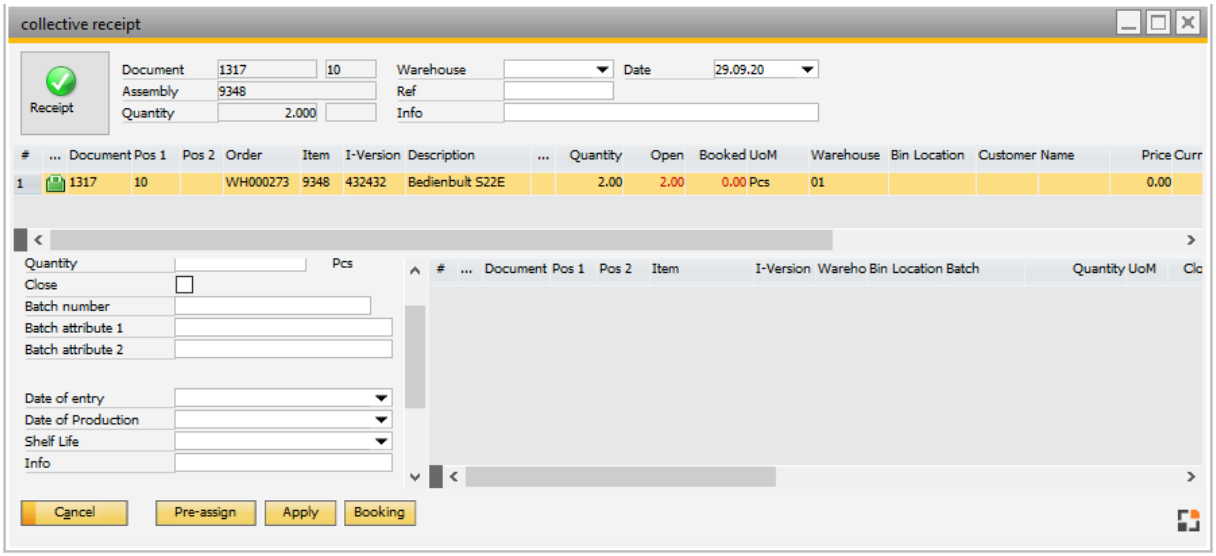
If called from work order structure, several work orders can be selected at once.

Batches, automatic batch determination, serial numbers, automatic serial number determination bin location management are supported.
WMS Integration: Produmex WMS Batch attributes are supported.
Serial number reservation is not supported.

The window consists of three sections:

Upper section	Planned receipt List is adjustable via **Right-click > Window settings.**
left below	Enter the quantity to post in for the currently selected (above) line Enter quantity, batch number, batch attributes, and price
right below	Displays already selected items

© 2026 Boyum IT Solutions A/S



Window fert_postin_summary_header.psr

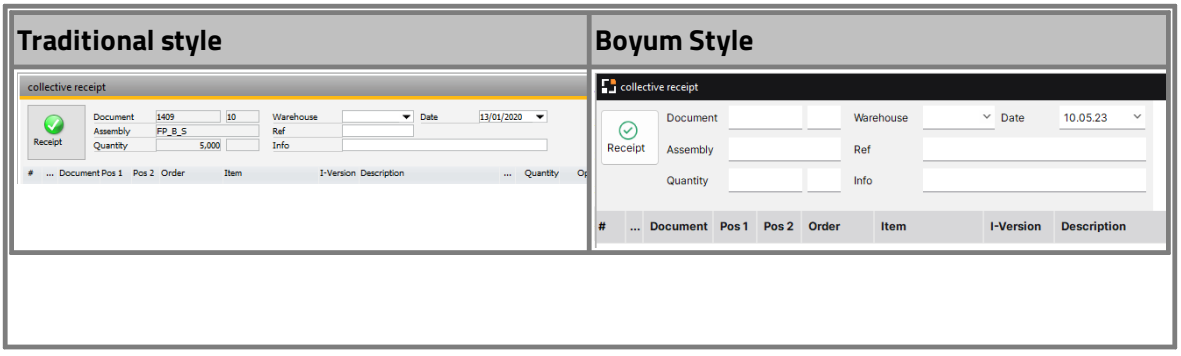
Workflow

1. With cursor up/down the next position from the upper list can be selected.
2. In the left window you can insert additional information such as Quantity, Batch number etc.
3. With the "**Apply**" button you can choose the position with the defined quantity,
4. With "**Booking**" you can create the receipt document.

For batches and serial numbers with automatic number generation, only the quantity can be entered, because the numbers are automatically generated when creating the accounting document.
The expiration date is pre-assigned automatically. ***See*** Item - batch - shelf life
In production type you can set up whether batches or serial numbers are generally entered manually (enable manual batches). In this case batch numbers always need to be entered (e.g. for disassembly). ***see*** Production type - manual batches

Field descriptions

- Header



© 2026 Boyum IT Solutions A/S

Display the current work order. If more than one work order is chosen, the system displays the first work order

The following additional fields define properties for the receipt document.

Field	Description
Warehouse	If empty, the system uses the warehouse defined in the work order. If you change the Warehouse, all positions are receipted on this warehouse. Note: If you change the Warehouse and work with different WIP Accounts, this can produce problems in accounting! If you choose a warehouse from another branch, the receipt returns an error. ***See*** Warehouse rules.
Ref	Reference displayed on the Receipt document. If empty, the Bar code of the Work order is displayed.
Info	Additional reference. If empty, the note on the current work order is shown.
Date	The posting date. You can define a posting date for the past.

Upper list

Planned receipt is displayed in the upper list. Use window settings to adjust.

Note on WMS Integration

If the receipt is made from Beas in a WMS warehouse, it applies the Quality status defined in **Produmex WMS > Organizational Structure > Production tab**.

It is not recommended to have more than 1 serial number per LUID, because the WMS Quality Status cannot be defined per serial number.

Field	Description
Document	Work order document

© 2026 Boyum IT Solutions A/S

Pos 1	Document position (Assembly)
Pos 2	BoM item (for assembly always 0) otherwise the Pos-ID of the BoM with negative amount
Order	Order number of work order document
Item	Item number of the assembly
Designation	Designation of the assembly
Quantity icon	Visual display of registered quantity (empty) – no registration some quantity has been registered the correct quantity has been registered too much registered
Quantity	Planned total quantity as per work order (without scrap) in warehouse units
Open	Quantity still to post in: Planned quantity - posted qty + canceled qty - selected qty = open (in warehouse units) Column is display in colors: Red = open > 0 (still something to post) Green = open = 0 (everything completed correctly) Blue = open < 0 (too much was posted)
Posted	Already posted quantity: posted qty - cancelled qty + selected qty = posted (in warehouse units) Column is display in colors:

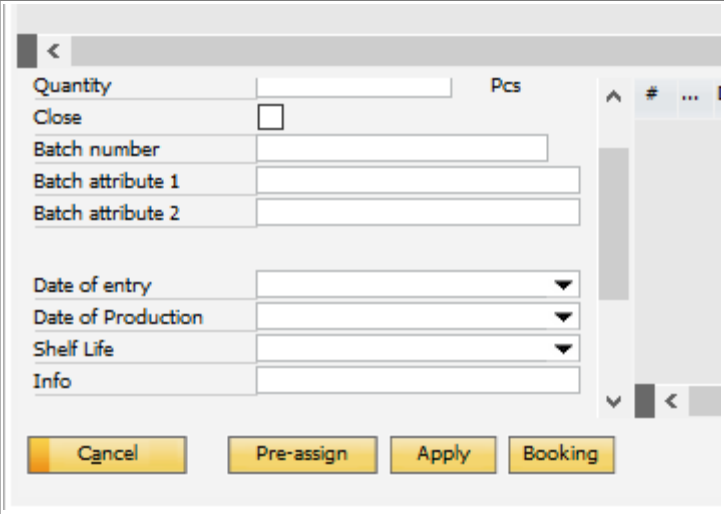
	Red = open > 0 (still something to post) Green = open = 0 (everything completed correctly) Blue = open < 0 (too much was posted)
Unit	Unit (warehouse unit)
Warehouse	Warehouse to post to. Note: The warehouse stored in thew work order item is displayed. If no warehouse was entered, the default warehouse of the assembly is used.
Customer	Customer number from the work order
Name	Customer number from the work order
Quantity CU	Planned quantity without cut-off in consumption units
Unit CU	Unit in consumption units
Factor	Conversion factor between warehouse and consumption unit
Price	Manually entered price 0 = Price is determined automatically Price valuation ***see*** Configuration wizard – Calculation Entry of price only possible if enabled in production type. ***see*** Production type – manual price

Left window



© 2026 Boyum IT Solutions A/S

In this area you can insert details for the Assembly or Bill of materials for post in.

Field	Description
Bin Location	Define the Bin Location. Only visible in case of bin-managed warehouses. ***See*** Warehouse rules. Note / Limitation: If you book one work order position on a different bin location, the system creates one document line per Bin location.
LUID	Define LUID number. ***See*** LUID behavior settings.
Quantity	Define the post-in Quantity
Close	Define if the work order position or Bill of material position should be closed: If "close assembly automatically" in Configuration wizard is activated and the total receipt quantity is equal to or bigger than the planned quantity, the system activates this flag automatically. *Beas 2020.02* Note: The system cannot close the complete work order.
Batch / Serial Number	Define the Batch or serial number: **Items with automatic batch Generation:** If you insert a batch/serial number, the manual input has higher priority. Otherwise, it generates the batch/serial number automatically. **Working with Serial number reservation** If Serial Number reservation is active, the system uses the next reserved serial numbers automatically.

© 2026 Boyum IT Solutions A/S

Field	Description

	Alternatively you can choose one of the reserved serial numbers *beas 2020.08*
	 	
	Serial numbers with comma
	You can insert more than one serial number. Delimiter is comma:
	`serial-a,serial-b,serial-c ...`
	Limitation: max. field size is 1024 characters.
	
	Serial number with definition string
	The numbering must be inside brackets: { and }
	
	Example: `AB{0001}C` produce follow serial numbers:
	`AB0001C, AB0002C, AB0003C,AB004C,...AB012C ...`

Batch attribute 1 Batch attribute 2	Define the Batch attribute 1 and 2
Price	Define the price: Only visible for material positions, not for assemblies. If you prefer manual price entry, active this in production types (can be determined depending on production types) . ***see*** Production type – manual entry of price. Price entry is only allowed for negative

© 2026 Boyum IT Solutions A/S

Field	Description

	BOM items. For assemblies (pos 2=0) are valued as default, which is set up in the Configuration wizard.
	
	Automatic pricing
	If no price is entered for negative BOM items they are valued as for negative material postions. ***see*** Material price list negative BOM
	
	Customizing:
	With beasscript the price can be manipulated: available functions:
	`workordermanagement:getprice_negativposition`
	The following variables are available:
	`e_type=receiptwo, e_belnr_id, e_belpos_id, e_pos_id, e_itemcode, e_towhscode, e_price`
	In variable `e_price` the price can be returned. This process cannot be cancelled.

Date of entry	Post-in date
Date of production	Production date
Shelf life	Shelf life for assembly positions: if not defined, the system calculates the shelf life automatically. ***See*** Item - Batch - Shelf Life in Days

- Right window

In the right window you can see all items, for which you defined the quantity

Field Descriptions

Field	Description
/	Delete current line

© 2026 Boyum IT Solutions A/S

Field	Description
Document	Work order document number
Pos 1	Work order position
Pos 2	If work order: 0 If Bill of Material: The BoM Position number
Item	The Item No.
I-Version	The Item Version
Warehouse	The defined Warehouse
Bin location	The defined Bin location
Batch	The defined Batch. If empty, the system defines this automatically.
Quantity / UoM	Receipt quantity and Warehouse unit
Close	If active, the system closes the position after the receipt document. This flag is editable (Window settings). Note: If you have more than one entry for the same document line, the system reads the closed information from the last entry.

Buttons

Button	Description
Pre-assign	Pre-assign all planned receipt quantities. **Limitation:** Not possible if warehouse is bin-managed. Only for normal items or Batch/Serial Items with automatic Batch number determination.
Apply	Take the current line and insert this in right window
Booking	Create the receipt document

8.2.3 Assembly

Work orders

WO structure view

Work orders list

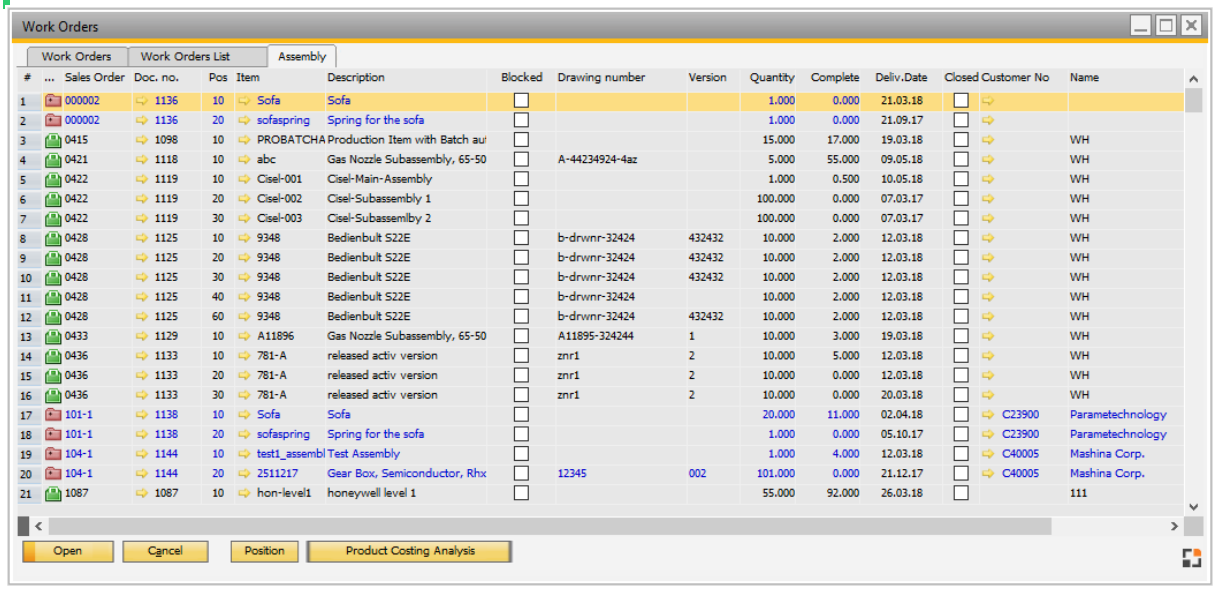
Work order document

Assemblies

This tab provides a view on assemblies. In contrast to the Work order structure view, the Assembly list can be configured freely. Use windows settings to define the display order of selected columns. With the template system, additional formats and graphics are adjustable.

Multiple selection is possible, but affects only the function "Material requirement". This means that material requirement is displayed for all selected work orders.

PATH: Production > Work Orders > "Assembly" tab.



Window fert_fthaupt_browse.psr

Click on a row to open the document position to edit.

Field	Meaning
Position	Unique position number.
Sales order	Number of the linked sales order.
Doc. no.	Work order number.
Pos	Position number in work order.

© 2026 Boyum IT Solutions A/S

Item	Item number of the assembly.
Description	Item description as per item master. Can be changed here.
Blocked	Field is active if item is blocked.
Drawing number	Drawing number.
Version	Version number of the item (10 digit text field only for information purpose).
Quantity	Quantity to be produced in consumption units of the assembly.
Complete	Completed.
Deliv.Date	Planned delivery date of the assembly. Date relates always to the upper level of the work order structure. ***See*** Assembly – Delivery date.
Closed	Production assembly closed. (in window settings "assembly closed")
Customer No	Customer number.
Name	Customer name.
Priority	Selected Priority for this assembly.

Functions

Function	Meaning
Open	Open work order item for editing.
Material requirement	Material requirement for all marked entries.
Product Costing Analysis (in right-click menu: "Post calculation"	Opens the WO post-calculation window.
Search	▫ Opens a pop-up dialog box to search by a number of values:

© 2026 Boyum IT Solutions A/S

	Position	Opens the WO Position editing window.
Reports	Open the reports window.

back to work order general

8.2.4 Work order document

Work order structure view - click on a document line to edit a work order (upper level), and the the window "Work order document" opens. This document contains an overview on all assemblies which are to be produced. When editing a line, you can enter detailed information. The production document is also structured:

Work orders
- Work order document
  - Master data
  - Project
  - Attachments
  - Settings
  - Work order item
    - Edit work order item
      - BoM
      - Routing

© 2026 Boyum IT Solutions A/S

Quality control

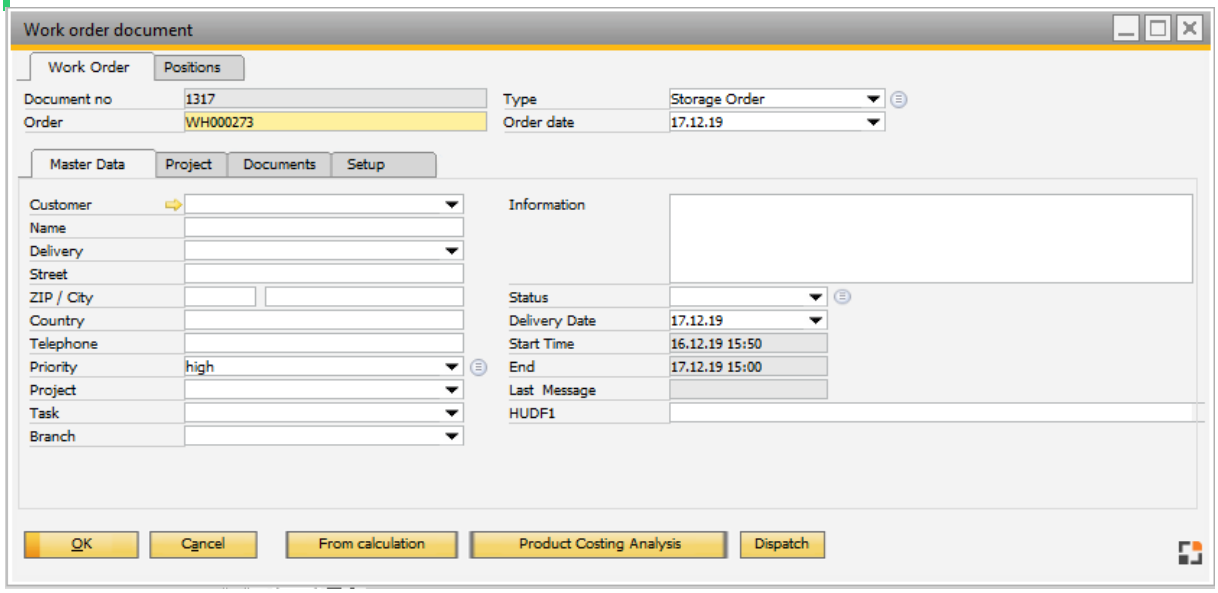
When clicking in the structure view on a document line or creating a new work order, the production document window opens.

Four different ways to create a work order in Beas:

Production document field description

back to work order (general)

PATH: Production > Work Orders > **Open** an entry.



Window fert_fthaupt_edit.psr

Upper tabs

Work order tab

Field	Description
Document No.	Unique document number; assigned automatically. This consecutive number cannot be changed. The number to be assigned next can be defined via right-click – next – document number.

© 2026 Boyum IT Solutions A/S

	Note: The next number to be assigned can be defined via right-click – next document number.
	How to change the Work order Numbering
	
	Another number "CustOrder" is available. Its configuration can be set up in Configuration wizard.
	
	Manipulate document number
	It is not recommended to manipulate the document number. If this is required, please consider that it may have at most 6 digits to generate the bar code correctly.
	
	Possibilities of manipulation:
	The next consecutive number is always used. There is no separate counter. If using a SQL statement to change beas_fthaupt.belnr_id, the following document receives the following number.
	
	The number can also be changed by script. To do so, extend the file workordermanagement.src in project folder.
	
	Example script: counting in steps of 5
	
	`workordermanagement.src`
	`function createbelnrid`
	`select coalesce(max("BELNR_ID"),0) + 5 into e_belnr_id`
	`from "BEAS_FTHAUPT"`
	`end function`

Order No.	Sales order or work order number (editable, alphanumieric document number)

© 2026 Boyum IT Solutions A/S

	 *Window fert_fthaupt_edit.psr* In case of call up via customer order to work order, the Work order number is stored here. In case of manual creation, a Work order number is manually specified or a number is generated. The structure of the generated number can be set in the options. ***See*** Configuration wizard ***See*** Number creation
Type	Type of work order, such as manual customer order, make-to-stock, repair order, etc. Additional information on production types The production types are configured in **Configuration Wizard > Production > Master Data > Production Types**. ***See*** Production types The most important parameters can be specified here. These parameters are then transferred automatically to the work order when the production type is chosen. The production types can be processed using the orange arrow beside this field. Here, you can also store which production type should be used by default. Set up which type to be used as default Configuration wizard – Production – Create new.
Order Date	Document date or Valuation date of the work order. Used as default date for Post-calculation – Reference date.

Material Requirements	Opens material requirements list for this work order. Available via right-click menu.
Dispatch	Dispatch for capacity planning.

© 2026 Boyum IT Solutions A/S

	The work order is dispatched to the capacity planning and the times are reserved. Normally, this happens automatically. However, if the delivery date is changed retroactively, the start date can be calculated on the spot with this mechanism.
Close document	The work order is closed including all assemblies. This feature is only available if there are no open time receipts. Assemblies are treated depending on closing rules. ***See*** Configuration wizard.

Reopen document	Open a closed work order.
	Available only if the work order was closed and if you have editing rights for this work order.
	
	After a security query the work order is re-opened. Similarly, related assemblies can also be re-opened.
	
	User needs authorization "Production release closed/post" or Administrator rights.
	
	Note: After re-opening, you can book additional costs. It is not saved in which period the work order was closed. If you try to evaluate e.g. "only work orders open until date..." you may get incorrect results.
	
	Use customization to block this option:
	`windowevent reopenworkorder`
	`messagebox=error$You can't reopen the work order!`
	`return failure`
	`end event`

Next document number	Define the next document number. The number must be higher than the last one used. The setting affects the next created work order, regardless of how it is created.

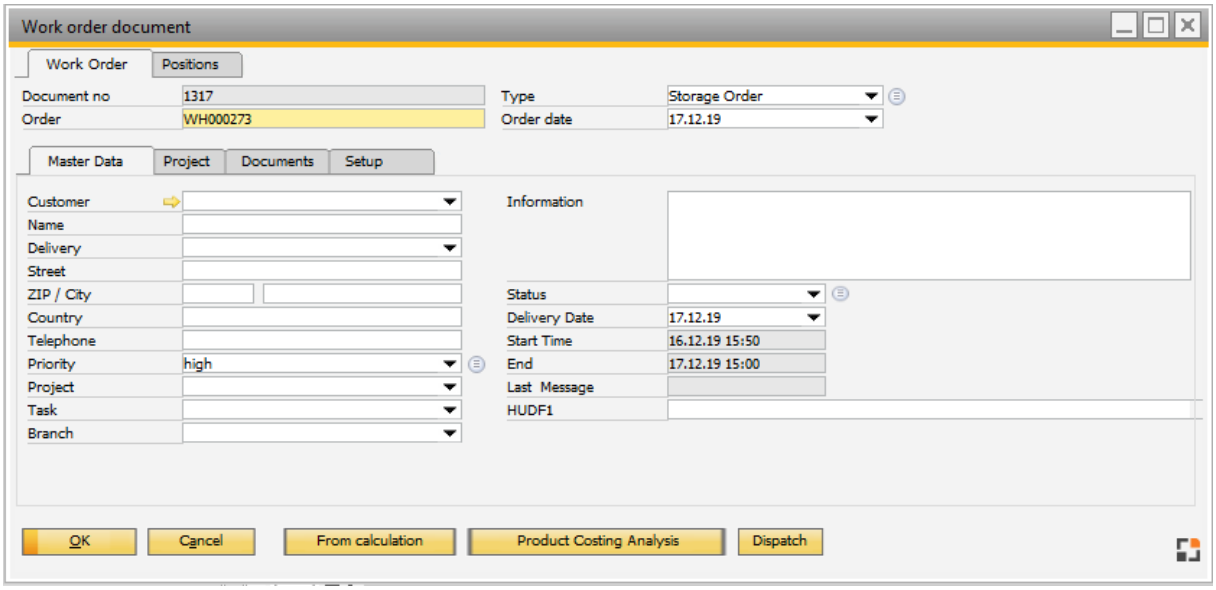
back to work order document (general)

8.2.4.1 WO document master data

Production > Work Orders > **Open** Work order document

© 2026 Boyum IT Solutions A/S

The **Master Data** tab contains the basic information for the work order, like customer information, priority, linking to projects, observations, and its scheduling dates.



Window fert_fthaupt_edit.psr

Field	Description
Customer	Customer assigned to the work order All customer Work orders should either be created through Sales order to production or through the MRP run. This field is automatically filled if the work order is created from a sales order. If a work order is created without a customer reference, the value as per **Configuration Wizard > Production > Create > Default Name** is entered here. Note: The customer can be a vendor or Lead, as well.
Name, Street .. Country	Customer address taken from master data.
Priority	Priority of the work order. It has precedence over a priority set in the Item Master. Sorting and filtering according to priority can be done in the **Assemblies** tab. For more information, ***see*** Priorities that can be set in the Configuration Wizard.
Project	Define which project the WO belongs to Only active, valid and not blocked projects can be selected. **Note**: If other project references are entered on an assembly level, they have higher priority.

© 2026 Boyum IT Solutions A/S

Task	Define with which project task the WO is to be linked to.
Branch	If branch solution is used, define which branch the order belongs to **Note**: A work order can only be assigned to one branch and all warehouses used in the production process have to be assigned to the same branch. This is checked by the program.

Information	Text information.
Status	Manually selectable status of the work order Status is for information purposes only, and is displayed in several lists. Use the icon on the right to manage statuses. ***See*** Status. *(beas9.0-004-042-000)*
Delivery Date	Delivery date of the work order: If the work order is created from a sales order, a certain number of work days are subtracted from the delivery date of the work order, according to the settings, and the date is entered as the delivery date. A security buffer can be defined in **Configuration Wizard à Materials Management > MRP Wizard > Calculation > Average Lead Time**. For manual work orders, the delivery date must be entered manually.
Start Time	If the work order is scheduled, the calculated start date is displayed there. A change in the start time has no influence on the calculation. If the work order is not scheduled automatically, the planned start time can be entered here.
End time	If a work order is scheduled, the calculated completion time is displayed there. A change in the time has no effect on the calculation. If the work order date is not scheduled automatically, the planned end time can be entered here.
Last message	Displays the date when the last Time Receipt was created using the Field Data Capture function.
HUDF1 ...4	Four additional, optional fields can be defined in **Configuration Wizard > Production > Display > Work Order**.

Buttons:

Button	Description

© 2026 Boyum IT Solutions A/S

Close Document	If active, the work order is closed. **WMS Integration:** Beas considers all supported WMS locks (Batch, LUID, Detail) and can delete existing locks when closing a work order.
From calculation	Open the list of the available precalculation.
Dispatch	Dispatch the order and the required resources.
Product Costing Analysis	Opens the post-calculation window.

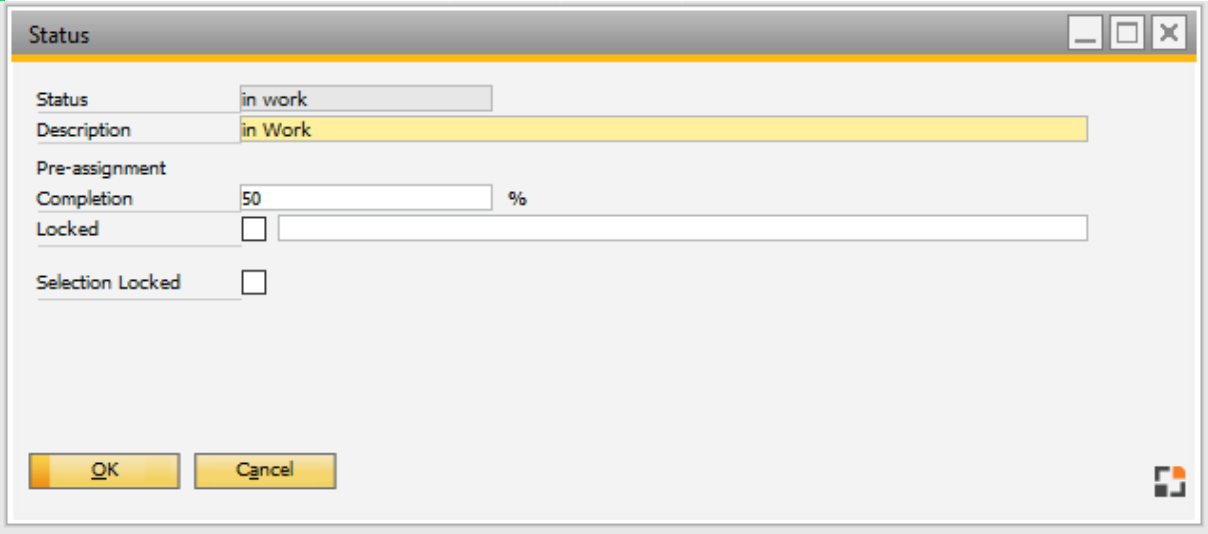
8.2.4.1.1 Status

In this window, status types can be defined and saved to be used in QC, Project management and Production.

A status has an ID; you can add a description and Completion percentage value, and define it as "Locked" with a reason in a freely editable field.
Sorting Save: Statuses can be sorted via Drag&Drop. Click this button to save the current sorting.
Statuses are only displayed, there is no function.

Example:

PATH: Production > Project > Project/Tasks tab > **Open** a task > select .



Window basis_prjstatus_edit.psr

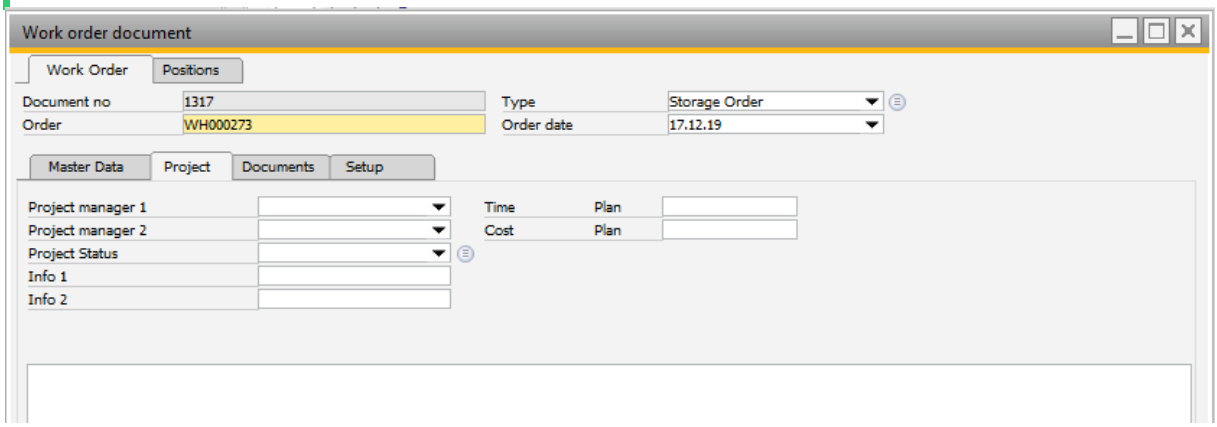
8.2.4.2 WO document project

The **Project** tab should be used only if not working with the Beas project management, and is intended for managing very small and simple projects, consisting of only one work order. This is not connected with the Beas project management module.

© 2026 Boyum IT Solutions A/S

As an alternative, you can use the milestone feature or event system. ***See*** Milestones, Events.

Production > Work Orders > **Open** Work order document > Project tab.



Window fert_fthaupt_edit.psr

Field	Description
Project manager 1,2	Project managers assigned to the project work orders. The field lists all SAP Business One users for selection. If a milestone event is inserted, the project manager can be selected as recipient. The actual project manager is determined from this field.
Project status	Status of the project. This field is for information only, and all status changes must be done by the users (Beas does not change the status automatically).
Info 1,2	Free text fields.
Times	Enter a default time for this project in days.
Costs	Enter a budget for this project.

See buttons descriptions here.

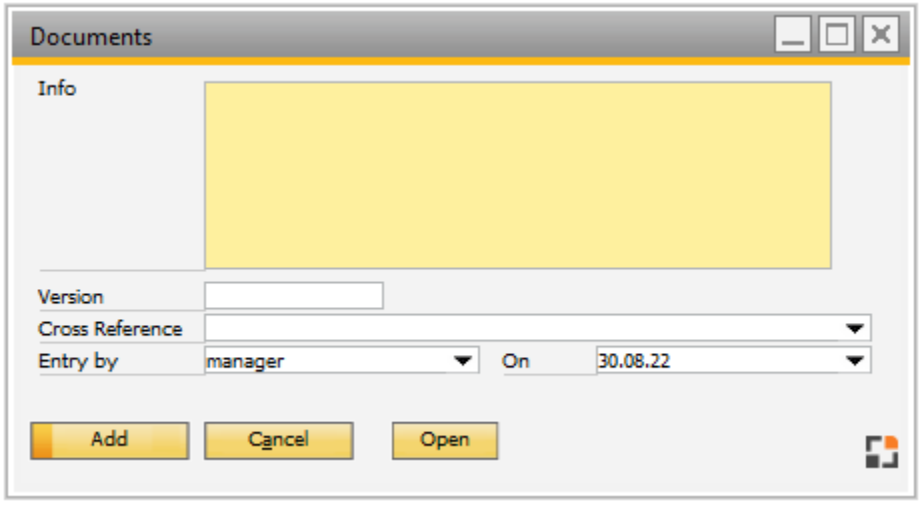
8.2.4.3 WO document attachments

It is possible to insert attachments to the work order.

Production > Work Orders > **Open** Work order document > Documents tab.

Click the **Open** button to open the selected line or click the **New** button, to add a new document:

© 2026 Boyum IT Solutions A/S



Window system_document_edit.psr

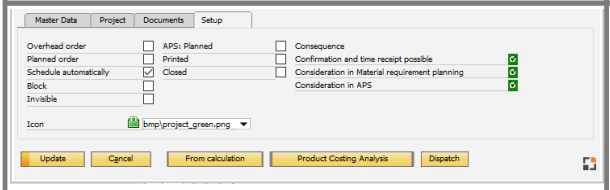
Field	Description
Info	Free text.
Version	Free text.
Cross Reference	Path and document name. Browse for a file using the drop-down arrow.
Available	Active: Reference is valid, the document has been found. Inactive: Reference is not valid, the document was not found, or the user has no access to the folder.
Entry by	Name of the user.
Entry on	Date of the entry.

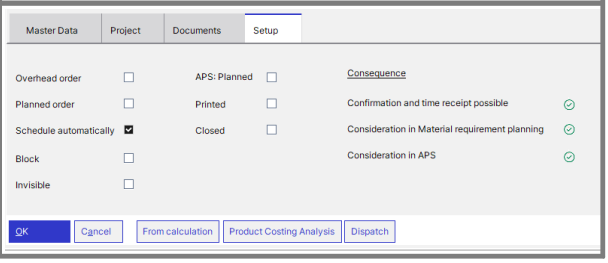
8.2.4.4 WO document settings

This tab contains global settings for work orders. The fields in this tab are filled with standard values from the type assigned to the work order, but they can be changed individually for each work order. Changes made in the settings can have consequences when creating time receipts, in MRP and APS. Beas shows these effects on the right side with red or green flags.

Production > Work Orders > **Open** Work order document > Setup tab.

© 2026 Boyum IT Solutions A/S

Traditional style	Boyum Style
	




Window system_document_edit.psr

Field descriptions

Field	Description
Overhead order	Define WO as overhead order. If active, the work order is an internal order for monitoring overhead costs. Only overheads such as machinery repair, cleaning work, training measures, etc. are recorded here. This cannot be closed using the time report. Various overhead evaluations are available. ***See***: Overhead costs. *Field: BEAS_FTHAUPT.GEMEINKOSTEN (1/0)*
Planned order	WO is only planned. If active, the work order is blocked (not released for production), but still valid for material and capacity planning. ***See*** Production types. ***Workflow – Example "planned":*** Create WO – unplanned, schedule backwards. APS – detailed planning is running and is set to planned. Planned WO cannot be changed in APS. Only a "Catch up"– calculation is allowed. ***See*** Production types. *Field: BEAS_FTHAUPT.PLANNINGSTATUS*
Schedule automatically	Define if the WO must be scheduled automatically. **Active**: The work order is scheduled automatically and can be planned in APS. This option is not recommended for overhead and project orders.

© 2026 Boyum IT Solutions A/S

	Deactivated: WO is not scheduled and cannot be planned in APS. Date information can be inserted manually and is not deleted or changed by the program.  *Field: BEAS_FTHAUPT.TIMECALCULATE (1/0)*
Block	Work order is blocked. **If this is activated:** All time reservations are removed. Material postings, order time receipts, material plannings, reservations, etc. are not possible. The WO does not appear in the order MRP.  **Exception:** This is a planned production order. In this case, it can be included in APS and MRP. **Note**: Already existing order MRP is not changed. Existing reservations cannot be deleted. **Deactivated:** WO is released. Time reservations are not recreated automatically. A rescheduling is necessary.

© 2026 Boyum IT Solutions A/S

	Field: BEAS_FTHAUPT.SPERRUNG (J/N)
Invisible	Visibility of the Work order. If active, the order is hidden from the MRP, APS and work order list, but times and material can still be reported.  *Field: BEAS_FTHAUPT.UNVISIBLE (1/0)*
Icon	The icon that is displayed in the WO list.
Color	The color of the WO in the WO list.

APS: planned	Button: Work order was planned via APS. Indicator to show if the work order has been planned by APS or not. This field cannot be changed directly. Different work flows can be created using APS. **ATTENTION**: Only the WOs that have this flag checked are available for login in the Terminal. For this you must activate the parameter "Work order must be set to planned" in the FDC section of the Configuration Wizard. If that parameter is inactive, the "APS: planned" WO document setting has no influence on the login process. Different work flows can be created using filters in the APS Scenario and in the APS calculation types in depending on the setting in the configuration wizard. *Field: BEAS_FTHAUPT.APSSTATUS*
Printed	Note if the Work order has already been printed. If activated, the work order is marked as printed. If you mark this in this window manually, the system marks all not printed sub-positions as printed, as well. *Beas 2020.02* If you disable the Print flag, the system does not disable this on position level.

© 2026 Boyum IT Solutions A/S

APS: planned	Button: Work order was planned via APS. Indicator to show if the work order has been planned by APS or not. This field cannot be changed directly. Different work flows can be created using APS. **ATTENTION**: Only the WOs that have this flag checked are available for login in the Terminal. For this you must activate the parameter "Work order must be set to planned" in the FDC section of the Configuration Wizard. If that parameter is inactive, the "APS: planned" WO document setting has no influence on the login process. Different work flows can be created using filters in the APS Scenario and in the APS calculation types in depending on the setting in the configuration wizard. *Field: BEAS_FTHAUPT.APSSTATUS*
	If all sub positions are printed, the system define the complete work order as printed
Closed	Note if the Work order has already been closed. *Field: BEAS_FTHAUPT.ABGKZ (J/N)*

Default settings are taken from Production Types.

8.2.4.5 WO document positions

Overview on all positions of this work order. The list is sorted by structure, in the same way as work order structure view. Window settings and Templates are supported.
For some fields, editing can be activated. There is no automatic scheduling when dates are changed.
For field descriptions ***see*** Edit WO position.

Functions

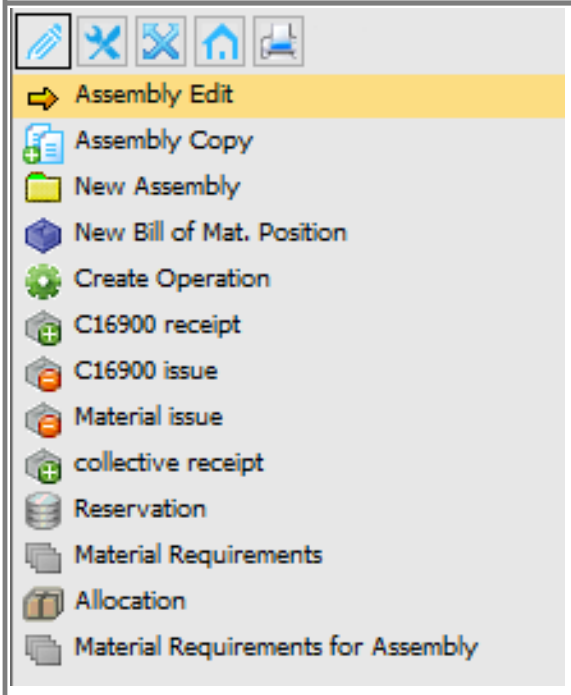
Field	Meaning
Open	Open work order item.
Add	Create new work order item.
Remove	Delete all marked items or the currently selected one. Deletion is possible only if there are no postings or time receipts.
Post-calculation	Post-calculation for the currently selected item.

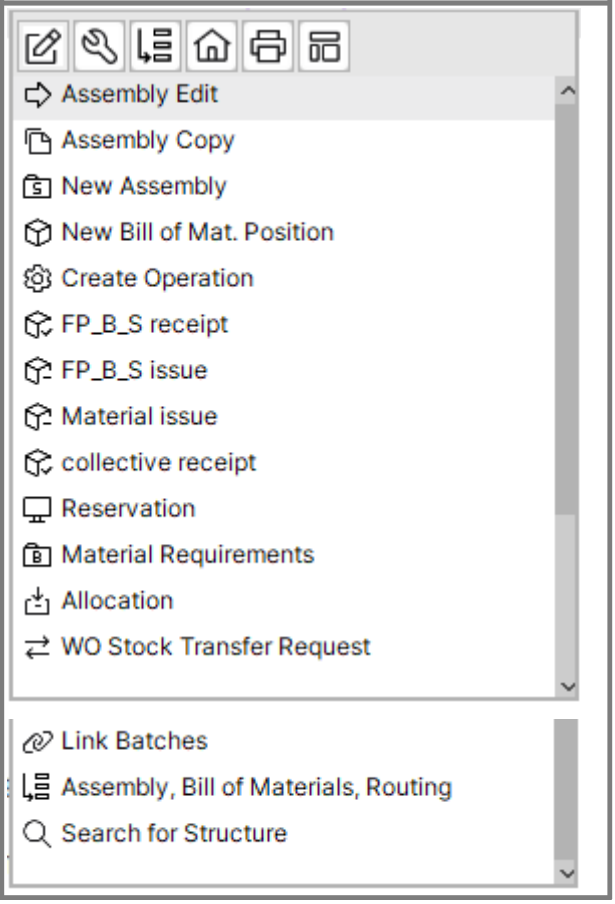
© 2026 Boyum IT Solutions A/S

	(No multiple selection)
Material requirement	Material requirement for all marked rows or the currently selected one.

The following additional columns can be selected via window settings.

Right-click basic functions for open and closed work order positions

Traditional style	Boyum Style
	




Functions

Option	Description
Assembly Edit	Opens the work order position to edit.
Assembly Copy	Copy the work order position to the clipboard. After selecting Assembly Copy, the Assembly: Insert function is available when right-clicking on work orders and work order positions. The Assembly: Insert function creates the copied assembly inside the selected document.
New Assembly	Opens a Work order position window to create a new work order position.

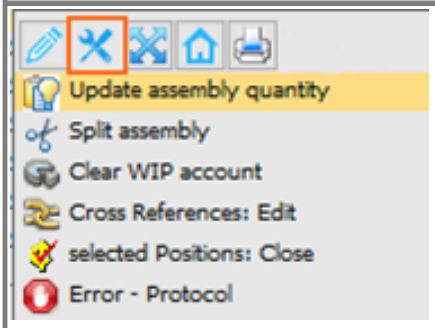
© 2026 Boyum IT Solutions A/S

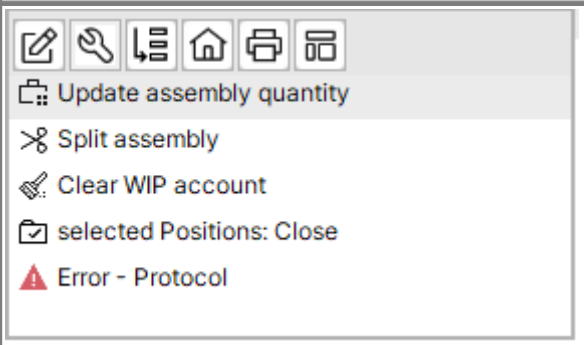
Option	Description
New Bill of Mat. Position	Opens a Bill of Materials window to create a new Bill of materials position for the selected work order position.
Bill of Materials Item XX Delete	If there are documents (e.g. Reservation) linked to the selected BoM position, you can only delete the BoM position if you delete the linked documents first. In this case, the system prompts: *'To remove the selected Bill of Materials position, you must first delete all documents linked to it.'* in a red error message in the bottom notification bar.
Create Operation	Opens the Operation window to create a new routing position for the selected work order position.
Product Receipt	Opens the Receipt window to create a production receipt for the item that is produced in the work order position.
Product Issue	Opens the Issue window to create a material issue for the item that is produced in the work order position.
Material Issue	Opens the Issue window to create materials issues for all the components related to the Bill of materials of the work order position.
Collective Receipt	Opens the Collective Receipt window to create multiple production receipts for the selected work order position.
Reservation	Opens the Reservation window to create materials reservations for all the components related to the Bill of materials of the work order position.
Material Requirements	Opens the Material Requirements report for the selected work order position.
Allocation	Opens the Allocation window to create materials allocations for all the components related to the Bill of materials of the work order position.
Material Requirements for Assembly	Opens the Material Requirements for Assembly window and lists all assemblies.
Invent. History	Opens the Inventory History report for the selected work order position.
Assembly, Bill of Materials, Routing	Expands the selected work order position to show Bill of materials, routing for the work order position and all its sub-assemblies.
Search for Structure	Opens the Search for Structure window that allows searching for a specific component in the selected work order positions and their sub-assemblies. If the component is found, the containing assembly position is expanded, and its line is highlighted.

© 2026 Boyum IT Solutions A/S

Option	Description
Reservation	Opens the Reservation window, but creating a new reservation is not allowed when the work order position is closed.
Link Batches	Opens the Link Serial Numbers / Batches window. This function allows linking the consumed batches or serial numbers of raw materials to the produced batches or serial numbers to enhance traceability functions.
Assembly, Bill of Materials, Routing	Expands the selected work order position to show Bill of materials, routing for the work order position and all its sub-assemblies.
Search for Structure	Opens the Search for Structure window that allows searching for a specific component in the selected work order positions and their sub-assemblies. If the component is found, the containing assembly position is expanded, and its line is highlighted.

Right-click extended functions work order positions

Traditional style	Boyum Style
	




Option	Description
Update Assembly Quantity	Allows changing the quantity of the assembly and then recalculates the corresponding quantity for the sub-assembly. This function only recalculates the first sub-assembly, therefore it should not be used when a work order position has more than one linked sub-assembly.
Split Assembly	Splits the selected work order position into two assembly positions but does not split the sub-assemblies related to the selected work order position.

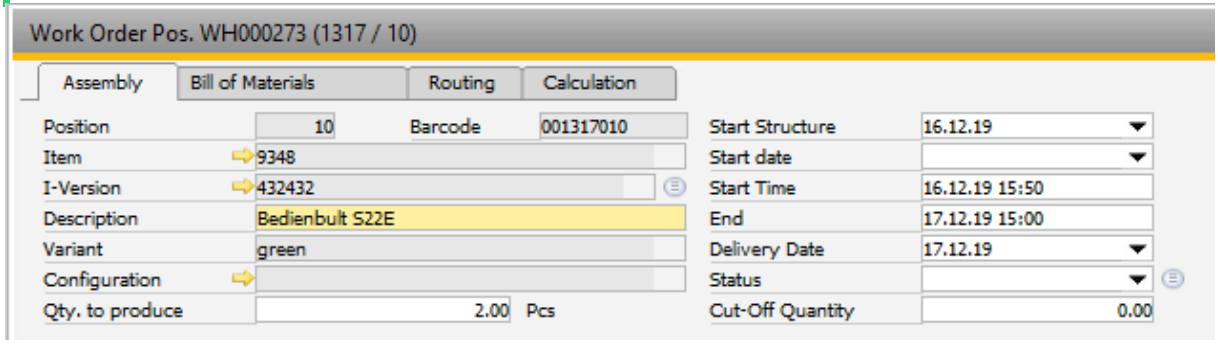
© 2026 Boyum IT Solutions A/S

Option	Description
	When performing the split of the assembly, all existing material reservations are removed, but the existing serial number reservations are maintained and split among the assemblies. A window opens where the serial number reservations can be assigned to each assembly. The split process does not consider the Lot Size field when creating the new work order positions.
Clear WIP Account	Creates a journal entry to clear the existing balance of the work in progress account for the selected work order position.
Cross References: Edit	Opens the Cross Reference - Edit window. Here you can edit the documents linked to the selected work order position.
Selected Positions: Close	Closes the selected work order position.
Error - Protocol	Displays all the protocols and error messages for the selected work orders. If the work order has an error message, the Status Error Delete option is also available. The Status Error Delete option deletes all error messages for the work order.

8.2.4.5.1 Edit Work Order Position

The **Positions** tab contains all the items that are going to be produced in the work order. In the production position, the data of the assembly to be manufactured is defined. Window settings and Templates are supported.

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position.



Window fert_ftpos_edit.psr

- Notes on sorting

© 2026 Boyum IT Solutions A/S

The list is loaded completely and is sorted by structure by default. Sorting by SQL (e.g. Template settings) is ignored.
Only the DataWindow sorting (e.g.: via right-click on header) is allowed.
Sorting by structure is saved in column "Structure Pos".

Field	Description

Position	Unique position number.
	It can only be changed when the position is created. Beginning and end of the range can be set up in the Configuration Wizard.
	Customization
	The definition of the position number can be manipulated using the following function:
	`workordermanagement.precreatebelpos()`
	Example:
	`workordermanagement.src (in Project folder)`
	`// For Items Axxx use Position 100, 101...`
	`// for all other: 200,201...`
	`function precreatebelpos`
	`// aviable:`
	`// e_belnr_id, e_belpos_id, e_itemcode, e_project`
	`if <e_itemcode,left 1> = A then`
	`  setvar=ll_group=100`
	`else`
	`  setvar=ll_group=200`
	`end if`
	`select <ll_group> + ifnull(max("POS_ID"),0)+1 &`
	`  into e_pos_id`
	`  FROM "BEAS_FTPOS" &`
	`  where "ItemCode"=<e_itemcode,dbstring>`
	`end`
	field: BEAS_FTPOS.BELPOS_ID

Barcode	Unique bar code for this position. This bar code is printed on documents and it can be entered in various windows for selecting the production assembly. The bar code is automatically generated. Configuration: xxxxxxyyy x=Document number, 6 digits y=Position number, 3 digits

© 2026 Boyum IT Solutions A/S

	If 6 digits for a document number or 3 digits for position number are not sufficient, counting is continued alphanumerically.
	
	Example for position from 999:
	998, 999, A00, A01, A02 .. A09, A0A ..
	
	Bar code for document 28, Position 1050 would be **000028A1E**
	
	Example document number from 999999:
	999999, A00000, A00001, ... A00009, A0000A ..
	
	The bar code for document 20500100 position 2050 would be **ABLYDGAT6**
	
	The highest possible document number is 2117316159, the highest possible position number: 34695.
	
	Bar code determination
	The Bar code can be determined as follows using Beas script:
	`belnr_id` = document number *(BEAS_FTPOS.BELNR_ID)*
	`belpos_id` = work order item *(BEAS_FTPOS.BEPOS_ID)*
	
	`// generate Barcode`
	`object=ue_fert_tools=barcode=<belnr_id>=<belpos_id>`
	`// show result (variable e_barcode)`
	`messagebox=info$$barcode = <e_barcode>`
	field: BEAS_FTPOS.BARCODE

Item	Item number of the assembly. The item that is produced in the production position. This entry can no longer be changed after saving. All items with procurement method Make can be selected. Release Item needs to be released for production. If the item is not released, the following error message appears: *prdrel40$Item is not released for production.* ***See*** Item master - Release for production

© 2026 Boyum IT Solutions A/S

	Standard costs method If standard costs method is enabled, a current and valid batch calculation is required. If there is no batch calculation of that type or if it is outdated, the following error message appears: *stdpricek423984$Standard cost valuation: the last item valuation is too old, does not exist or there is no calculation schema for it. Work order <belnr_id>, item <itemcode> cannot be created.* ***See:*** Standard costs method Assembly valuation – Standard costs method Concept: assembly valuation Edit Batch-calculation – standard costs
I-Version	Version number of the item to be used. When creating a position, the version stored in Item master is used. If it is changed, the item designation, drawing number and, if necessary, BoM and routing are refreshed.
Description	Item designation as per item master data record. This can be changed. This is the Item Name from the item master data If you defined an item version and an item name in the item version, then the name of the item version is shown. If you choose a configuration, Beas executes formulas or inserts a description from the configuration. ***See*** Configuration
Variant	Variant designation (A-Z) The name of the variant, which can be defined in the item master, is displayed. BoM and routing are dependent on the variant. This is not changeable. If a variant is included automatically in extended warehouse settings, ***see*** Edit warehouse master data, Variants.
Configuration	Product Configuration Id ID of the product configuration to produce. It is possible to choose one of the existing configurations with the Complete status, if the

© 2026 Boyum IT Solutions A/S

	item has a product configurator definition. All External Configurations which were created for the currently selected item are also displayed. For more information, ***see*** Product configurator. **Note**: All Configurations created with Beas version 9.3 PL 1 or older have the status "Complete" at all times. If the product configurator creates the item name automatically, Beas uses the generated item name from the configuration. *(beas 9.3 PL 2)*
Qty. to produce	The quantity to be produced in Production UoM of the assembly **Important:** If the assembly quantity is changed, quantities in BoM are recalculated automatically, but the affected sub-assemblies are not. To update these use **Work order structure > right-click > second tab > update assembly quantity**. If lot sizes are considered in the sub-structure, adapting the total quantity of all sub-structures is only possible when using the WO refresh function. **Important:** It may be necessary to check reservations as there is no automatic check.
Cut-off quantity	Additional demand according to scrap factor and offcut information in the item master data. ***See*** Cut-off > consider cut-off quantity option.
Start structure	Production start date of the structure This may differ from the start date of the assembly in case of a multilevel work order, as the sub-assemblies are produced before the main assembly. This field contains the start date of the sub-assembly which must be produced first.
Start date	Scheduled start date of the assembly. This can be used to define the planned start date (top assembly only), which is considered by forward scheduling in the APS.
Start Time	Start date and time of the currently selected assembly. Calculated automatically by forward or backward scheduling.

© 2026 Boyum IT Solutions A/S

End time	Automatically calculated completion date of the currently selected assembly.
Delivery date	Planned delivery date of the assembly This date refers to the top level of the work order structure. For sub-assemblies, this date does not apply, as the calculated start or end date is used. If a work order is created from a sales order, the delivery date is set to: delivery date from sales order minus the average delivery time parameter. Serves as reference for backward scheduling. ***See*** Configuration wizard > Materials management > Computation > Average delivery time If this date is changed, and capacity planning is active, the work order is rescheduled, using the last used calculation method. Notes on settings in work order In **work order document > master data** set up: • Disable blocked • Enable automatic scheduling • Disable planned • Enable capacity planning ***See*** Backward scheduling Work order document > Master data Configuration wizard > Production > Capacity planning
Status	Status of the assembly. This field is for information only. Status changes must be done by the users, Beas does not change the status automatically.
Last Message	Information on when the last FDC report was carried out.

Function	Description

© 2026 Boyum IT Solutions A/S

Add	Create new assembly position If a new production assembly is created, it is broken down when saved. For additional information ***see*** Item breakdown.
Remove	Delete assembly Delete the assembly and their sub-assemblies including BoM and routing information. Only those BoM items and routing positions are deleted that are not linked to other documents (Material postings, Order time receipts etc.) If all entries cannot be deleted, the assembly is closed. If the assembly contains sub-assemblies, they are closed as well. If one sub-assembly may not be closed, the superordinate assembly is not deleted, otherwise it would not be possible to display it in the structure view. Assemblies which may not be deleted are closed after all BoM items and routings without links have been deleted. The WIP-account is balanced.
Reports	Opens the reports (macro menu).
Preceding entry	Displays the previous entry.
>>	Displays to next entry.
Update assembly quantity	If the assembly contains sub-assemblies and the order quantity was changed, the requirement of the sub-assemblies are changed. This function calculates the requirement of the sub-assemblies and updates the values. Details If the quantity of a BoM item is changed, the quantity of the dependent assemblies and sub-assemblies is not adjusted. This is important, because in case of a storage related work order the quantity must not be necessarily equal. If the number is to be matched, this can be done automatically using this button. **Note**: If lot sizes are considered in sub-assemblies, this function is not executable. In this case WO refresh is to be used.
Close Document	Close assembly position Only possible if the position is not closed yet, and if there are no open time receipts. With continuous stock enabled, further journal

© 2026 Boyum IT Solutions A/S

	entries may be created. ***See*** WIP functions. If the assembly has sub-assemblies, you can set up whether these are closed as well. ***See*** Configuration wizard. A work order position can be re-opened at any time. ***See*** re-open WO position
Re-open	Open a closed WO position Only visible if the WO position has been closed before. A work order position can be re-opened any time. If then, costs arise and the order is closed again, all costs are posted correctly to the WIP account. **Note**: Working with **Post-calculation > Reference date function**, a work order should not be re-opened, as then the calculation of the reference day would not be possible.
Structure refresh	Refresh work order based on item master data
Post-calculation / Product Costing analysis	A post-calculation on the current assembly can be created.
Journal of entries	Opens the transaction journal
Inventory history	Opens the inventory history of the assembly.
Cross reference	Links between a work order item and an origin document (Sales order, advance invoice, production BoM item) Note: Only displays information for "stock related" items because this sort of information is related to reservations. In case of non-stock items, no cross-reference is displayed.
Variable	If variables were created manually for variant production, they are saved in table `beas_ftcaft_varentry`. You can edit or delete the variables. If the work order is updated, existing variables are used, a new entry is not necessary. To enter new variables, delete the old ones first.
Protocol	Opens protocol.

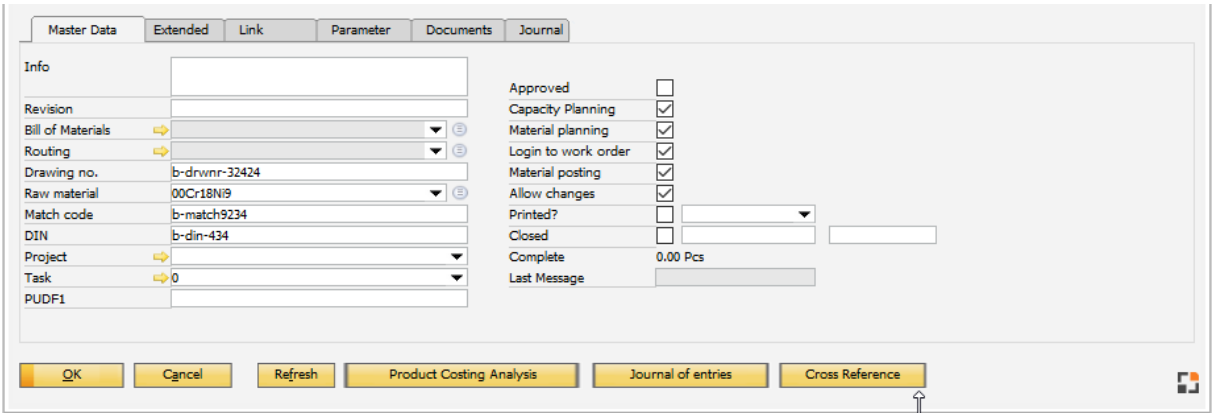
© 2026 Boyum IT Solutions A/S

Formulas recalculate	If variant formulas are stored, these can be recalculated This function is used, for example, after formulas have been updated. Fields like lead time can be recalculated. Restrictions: Only those formulas and tables are affected which are stored directly behind a field. Scripts are not executed. The structure cannot be manipulated, e.g. by exchanging a material item. BoM items cannot be activated or deactivated. The following cannot be calculated: • Designation or description of the operation • Resources • BoM – Material requirement • Material-dependent breakdown No rescheduling, re-dispatching or correction of reserved times is performed. Variant production If variant production is used, parameters can be queried when an item or work order is created. Variants are saved and used in case of an update, they do not need to be entered again. (Table `beas_ftcaft_varentry`). For more information, ***see*** the Variable function. In work order list several orders can be marked and calculated simultaneously. ***See*** WO structure .

8.2.4.5.1.1 Master Data tab

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Assembly" tab > "Master Data" tab.

© 2026 Boyum IT Solutions A/S



Window fert_ftpos_edit.psr

Field	Description
Info	General information. Free text.
Revision	Revision number of the selected item version, copied from item version control, if activated. This is for information only.
BoM	The BoM to use for assembly breakdown This field is only visible if the item version control is activated. Select the BoM to be inserted in the work order. This is defined in Item or Item version. If the field is empty, no BoM is added. Depending on the settings, the routing is determined in the BoM. Note: SAP BoM is ignored at Beas work order creation. *(BEAS_FTPOS.StlItemCode)*
Routing	The routing to use This field is only visible if the item version control is activated and if the routing is not firmly linked to the BoM, but may be selected independently of the BoM. ***See*** Configuration wizard. The selected routing is used in the work order. This is defined in Item or Item version.

© 2026 Boyum IT Solutions A/S

	Depending on the settings, the routing is determined in the BoM. *(BEAS_FTPOS.RoutingId)*
Drawing No.	Drawing number from the item master data.
Raw Material	Raw material from the item master data.
Match Code	Match code from the item master data.
DIN	DIN from the item master data.
Unlock Manually	Only available when created in the function: If this switch is activated, the user can determine which mill of material positions and routing positions should be added to the work order. For this purpose, all positions are shown in advance and you can define which positions should be used for this using a check mark.
Printed?	The check mark and the date is set if the WO is to be printed. This can also be done manually. In work order structure view you can print a work order position. This defines the work order position as "printed". Here you can activate or disable the printed flag manually. If all positions are printed, the system activates the printed flag on work order level, as well. If you disable the printed flag on work order position level, the system disables the printed flag on work order level similarly. *Beas 2020.02*
Closed	Check mark is active if the WO position is closed. The position can be closed using the **Close** button and can be reopened with the **Reopen** button.
Complete	Number of assemblies that were reported as finished. The number of entries plus the manual assembly yield is counted. It is also possible to issue manual "Finished" messages. Use the input field beside the finished quantity to do this. The field is

© 2026 Boyum IT Solutions A/S

	only visible if the option **manually input of completion** has been activated in **Configuration Wizard > Production > Display > Position**. Time receipts of non storage related assemblies, which do not cause a material posting are counted in this field.
Project	Reference to a project (**SAP Administration > Definition > Financial > Project**).

Release

At assembly level, release (set check mark) or blocking can be managed (remove check mark). By default, everything is enabled.

You can control these switches in Item version > Status.

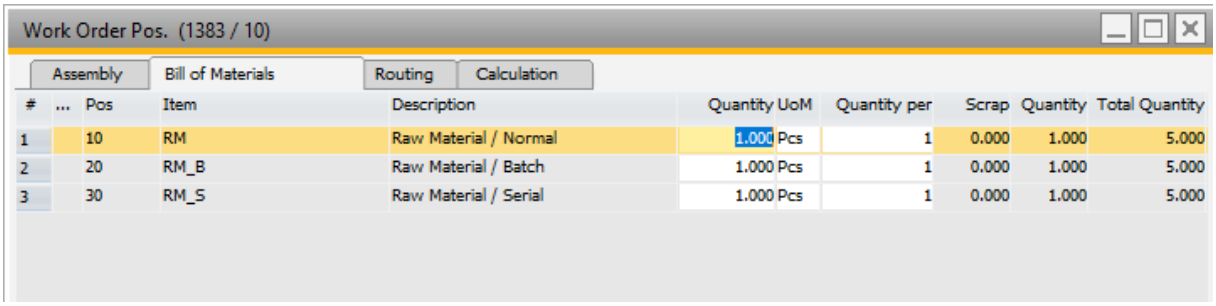
Attention: The following authorization is necessary: Production Release.

Field	Description
Approved	Work order approved? This information is displayed in MRP and in other lists. It set automatically, with the respective settings in Configuration wizard. It can be used for release procedures.
Capacity planning	Active : Capacity planning allowed.
Material planning	Active : Material planning allowed.
Login to work order	Active : Login to work order allowed.
Material posting	Active : Material posting allowed.
Allow changes	Defines if the changes in BoM and routing are allowed. Active: BoM and routing can be changed Inactive: BoM and routing cannot be changed
Printed?	Shows whether the work order position has been printed, as well as the printing date. This field can be changed if needed.
Closed	Set a check mark and chose a date (calendar in drop down field).
Completed	Reported number of completed assemblies.

© 2026 Boyum IT Solutions A/S

8.2.4.5.1.2 Bill of Materials tab

Display all Bill of Materials positions of the current Work order Position.



Window fert_ftstlpos_browse.psr

Window Settings and Templates supported.

It is possible to change a number of properties directly in this window. Activate the Editable fields in Window settings.

Changes in Bill of materials for this work order do not change master data of the assembly.

If the work order position is closed, *Allow changes* is disabled, or the authorization level is not sufficient, all editing functions are disabled.

- Sorting

The position is alphanumeric information and does not define the sorting.

A sorting can be changed in the following way:

1.Click on the field position and hold the mouse button. A right hand shaped cursor appears.

Note: The selected field may not have the focus.

2. Move the cursor with pressed mouse button to the desired row.

3. Release the mouse button.

The row will be moved to the new row position accordingly.

Note: The position number will not be renumbered automatically. This can be executed via right-click > renumber.

For more information on Position Number, Sorting and Field Description: ***See*** Field description "Position"

Field information: ***See*** Bill of Materials Detail

Functions

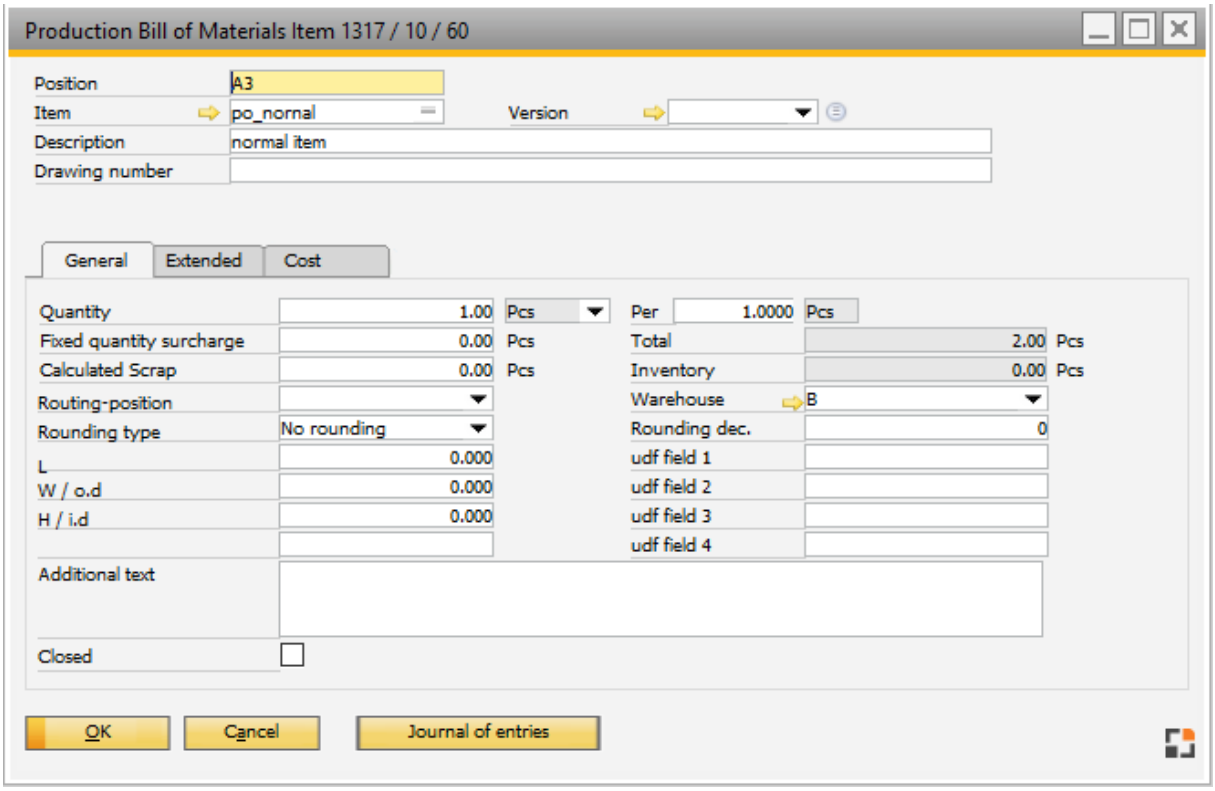
© 2026 Boyum IT Solutions A/S

Right-click function	Description
Open	Open detail
Search	Open the search menu.
New	Create new work order item.
Copy	Copy item.
Delete	Delete item.
Reports	Open a list of reports.
Window settings	Opens the window settings. Additional columns can set to be displayed or amended. For example, if the routing position is set this to changeable, you can choose operations from the list by drop down.
Inventory Movements list	Open the Inventory Movements list.
Invent. History	Open Inventory history history for this item.
Change log	Change log for this work order.
Material requirement	Material requirement for this entry.

back to Work order position

Display all details of a work order Bill of Materials position.

© 2026 Boyum IT Solutions A/S



Window fert_ftstlpos_edit.psr

See Field descriptions

In the General tab you can see and edit all details of a work order BOM position.

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Bill of Materials" tab > **Open** WO BoM position > "General" tab.

fert_ftstlpos_edit.psr

Field descriptions

Field	Description

Quantity	Requirement in Input units
	Determines the requirement in input UoM per assembly in input unit (***See*** Input UoM , Units of measure)
	
	Calculation of total quantity
	The total quantity is always in inventory UoM
	Calculation is
	
	`total quantity = input UoM`
	`* Conversion factor to production UoM`
	`* Scrap % (formula: see scrap%)`
	`* Conversion factor to inventory UoM`
	`* (Quantity from work order position * Conversion factor to inventory UoM)`
	`: Quanity per (see per)`
	`+ fixed quantity surchase`

© 2026 Boyum IT Solutions A/S

Field	Description
	IMPORTANT: When an UoM Group is defined for an item, the UoM Conversion is applied based on SAP definitions and NOT the conversions defined in Beas. Not planned Material position (Quantity = 0) You can define Material position with Quantity = 0 ***Example***: For Material positions which you need only in processes related to the business work flow or production processes of a company. **Valuation** In precalculation / post calculation you can define if Beas should valuate this Plan/Real cost. ***See*** Configuration Wizard Value negative quantity. By-products, coproducts, disassembly (negative quantity) Sometimes the user needs to indicate that several products are a result of a work order. These products can be: • Co-product: Usable product, automatically generated during the production of the main product. • By-product: A product that occurs incidentally or undesirably during the manufacturing of the main product. • Dismantling: Disassembling of assemblies and returning components to the inventory. In these cases, the BoM quantity is entered as a negative entry. **Negative BoM quantity behavior**

Procedure or module	Negative Bom quantity is treated as
Order recommendations	Planned receipts.
Backflushing	Posted automatically or manually.
Work order structure	Displayed in the same color as assemblies but with another icon. Displayed positive (as receipt).
Posting	Manually, backflushed or posted in via collective receipt. ***See*** Collective receipt.
Merging work	Individual receipts are inserted as negative BoM items and

© 2026 Boyum IT Solutions A/S

Field	Description

Procedure or module	Negative Bom quantity is treated as
orders	posted correctly to the WIA account.
Sales order	Negative items can be reserved for sales orders.
Pre-calculation	Valued according to Configuration wizard > Precalculation > Value negative quantity.
Post-calculation	Valuation based on post-calculation is not possible.

Order related sub assemblies

A Bill of materials position can be a sub-assembly with own Bill of materials list and Routing position.

How to manage this in the areas:

Procedure or module	Result
Pre-calculation	Bill of materials defined as receipt (negative costs) Valued according to Configuration wizard > Precalculation > Value negative quantity. Routing positions cannot produce negative costs. These are always zero.
Post-calculation	**Planned cost:** Bill of Materials: negative costs Routing position: zero **Real costs:** Bill of Materials: Sum of all transactions Routing position: Sum of all time receipts. It can only be positive value.

Configuration example for disassembling:

For disassembling, there is no main product. Use a service item (not storage-related) and define the resulting products in the BoM. Expected quantities are entered as negative.

© 2026 Boyum IT Solutions A/S

Field	Description

```
Service item
|_ Product 1
|_ Product 2
```

Configuration example for a by-product:

For by-products indicate a main product on top level. This way you can work with off-cut and reuse waste material.

```
Main item
|_ Material
|_ By-product
```

Information on field names

Area Master Data

Quantity input UoM	BEAS_STL.INPUT_QTY If the stored value is NULL, MENGE_VERBRAUCH will be used. In th entry window, INPUT_QTY is entered, using INPUT_FACTOR the column MENGE_VERBRAUCH is calculated.
Input UoM	BEAS_STL.INPUT_UNIT Input UoM
Factor	BEAS_STL.INPUT_FACTOR Conversion factor from input unit to production UoM
Quantity Production UoM	BEAS_STL.MENGE_VERBRAUCH Requirment in production UoM. Reference quantity for all following calculations
Production UoM	OITM.U_me_verbr Production UoM from item master
Quantity warehouse	BEAS_STL.MENGE_LAGER Requirement in Inventory UoM – Information only
Inventory UoM	OITM.InvNtryUom Inventory UoM as per item master

INPUT_QTY, QUANTITY_USE

Note:

© 2026 Boyum IT Solutions A/S

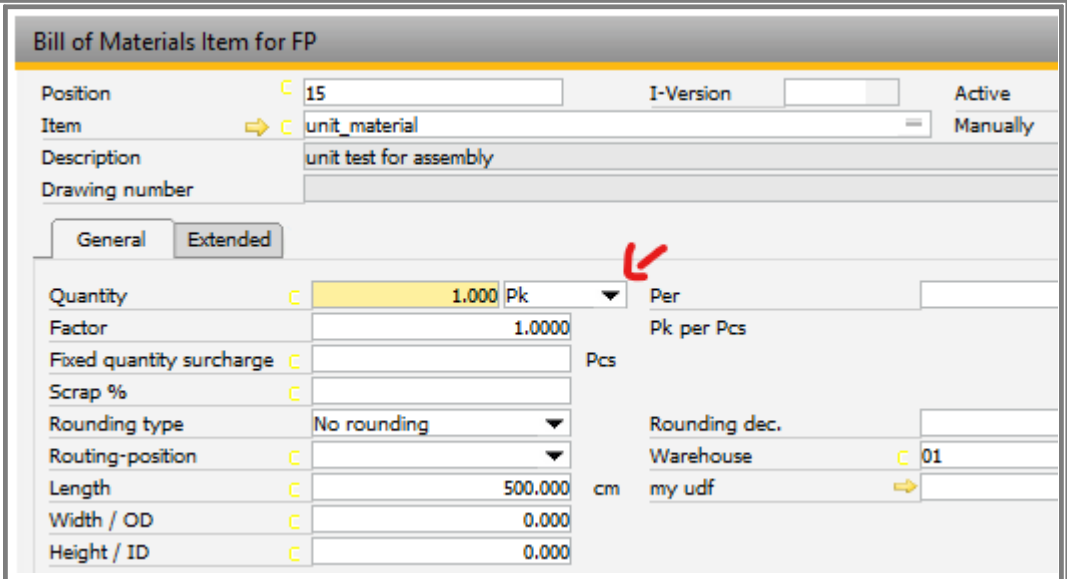
Field	Description
	If an issue or receipt document is created for this position or the position has order-related sub-assemblies, it is not possible to change the quantity. *INPUT_QTY, QUANTITY_USE*

Quantity per ..	Defines in which unit the quantity specification takes.
	The quantity specification relates to the assembly quantity x the factor specified here.
	At quantity 2 and "Quantity per 10 pieces", 2 pieces are needed per 10 assemblies. The default for "Quantity per" can be stored in the options.
	
	Requirement (quantity per) means: how much material is needed per assembly (quantity given in "quantity per")
	Assembly quantity "1" relates to the consumption unit of the assembly
	BoM quantity relates to the consumption unit of the BoM item
	
	Quantity per = 0
	`Entered quantity = Total quantity`
	Note: It is recommended to use "fixed quantity surcharge" instead of 0.
	
	Quantity per = 1
	`Entered quantity * Assemblies to be produced in Production UoM`
	
	Quantity per > 1
	`Entered quantity * Assemblies to be produced in Production UoM : Quantity per`
	MENGE_JE

Unit	Determines the unit of the quantity to be entered This is the field right of Quantity without title. Here you can choose the Unit of Measurement, in which you want to define the needed Quantity (***See*** field Quantity) Standard is Production UoM ***See***: Units of measure

© 2026 Boyum IT Solutions A/S

Field	Description



Inventory / Bill of Materials

It is possible to change this field every time and to every UoM which is defined in the Unit of measurement.

UoM Group is defined in defined item

If a Unit of Measurement Group is defined in the Master Data of this Material, you can choose only an UoM defined in the UoM Group. It is not possible to change the Factor in this window.

Related to the conversion formula and current values of this BoM Position, the system calculates the Quantity in Production UoM and then the Inventory UoM.

UoM Group is not defined in the item

If the item does not have a UoM Group, you can choose every UoM.

You can define a factor between this input unit and production unit only if the defined UoM is not the Production UoM of this item.

Note: Beas ignores length/width/height change as these are part of the Conversion factor - formula.

If you change the UoM factor in the item master data, or if you change the formula in the UoM, it does not affect the existing Bill of materials positions. The system takes the conversion factor defined in this window.

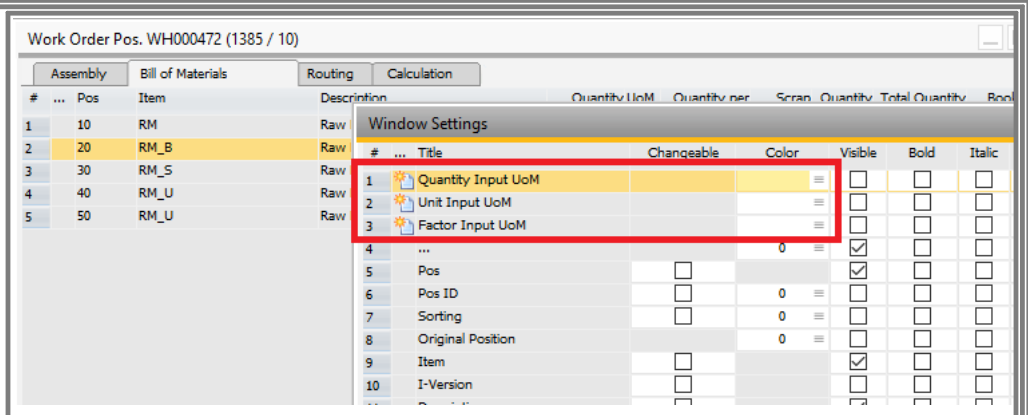
If you create a work order and the UoM Group is not defined, the system ignores

© 2026 Boyum IT Solutions A/S

Field	Description
	the UoM and UoM Factor definition, and always works with production UoM. Related to the conversion factor, the system calculates the Quantity in Production UoM and then the Inventory UoM.
	Precalculation It is possible to change this field every time and to every UoM, which is defined in the Unit of measurement. if a Unit of Measurement Group is defined in the Master Data from this Material, you can choose only an UoM defined in the UoM Group. Note: It is important that a UoM Conversion factor is defined in UoM Conversion. Related to the conversion formula and current values of this BoM Position, the system calculates the Quantity in Production UoM and then the Inventory UoM.
	Work order In **Work order > Bill of Materials** the input unit is only changeable: - if no transaction exists - a Unit of Measurement Group is defined in the Master Data from this Material You can choose only UoM if - Defined in the Unit of Measurement Group - UoM Conversion exists for this UoM and Inventory UoM If you change the Input unit, the Quantity will be calculated based on quantity in production UoM and on the Conversion formula defined in the UoM Conversion. If you change the Quantity in input UoM, the system calculates the quantity in production UoM and in inventory UoM based on UoM Conversion. If you change the quantity with BeasScript or import hub, the system overwrites the Input Unit with Production UoM. If you refresh the work order, the system overwrites the Input Unit with Production UoM. In Work order Bill of Materials you can activate the Input Unit via window settings. But this fields is not changeable.

© 2026 Boyum IT Solutions A/S

Field	Description



If you change the quantity in Production UoM, the system overwrites the Input unit with Production UoM.

UoM Conversion

If Unit of Measurement Group is defined in the Master Data of this Material, the system tries to use the conversion factor defined in the UoM Group.

If it is not stored there, the system searches the UoM Conversion table. If it does not exist, the system searches the opposite in the same table and creates the formula

"1 : [the defined formula]

If the opposite does not exist, the system returns an error and continues with Conversion factor 1.

Note on UoM Groups

In Bill of Materials you can define the Quantity in Input Unit. This will be converted in Production UoM and this in Inventory UoM.

Problem: If the Production UoM is not the same as the Inventory UoM and the Input UoM is not Production UoM, the system cannot find an entry in the UoM Group. In this case, the system searches for the conversion in the UoM Conversion table to convert the quantity from Input Unit to production Unit.

Unit factor and UoM Tool tip

In the work order position, the system displays the unit in green which means that the unit factor is inside (***see*** image below). Moving the mouse over this field, the system displays a tool tip with information on the factor and the UoM (***see*** image below).

The system can calculate with 20 decimals rounded up to 6 decimals for display.

© 2026 Boyum IT Solutions A/S

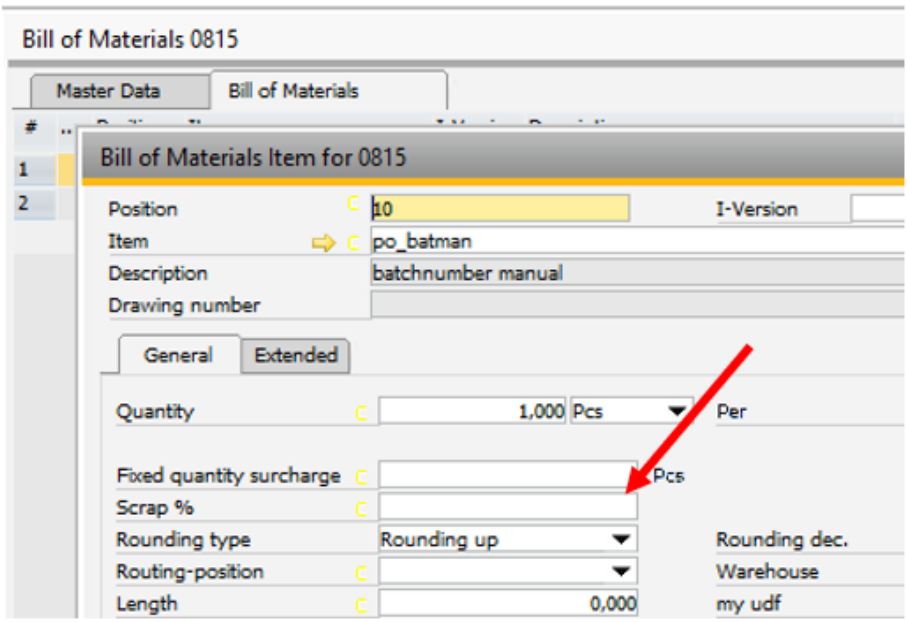
Field	Description
	 When you change the UoM, the system calculates the Quantity and the factor automatically (***see*** image below). The new Quantity is based on the current production unit. NOTE: This is only possible if a Conversion factor was defined previously). ***Example:*** Conversion: 1 TPcs =1000 Pcs Old Qty = 2000 Pcs Change UoM to TPcs. The System display Quantity = 2 TPcs If the Quantity in TPcs is changed, the system calculate the Production UoM and from this the Inventory UoM If length/width/height, density or item code self is changed, the base quantity is always the quantity in Production UoM and the system always calculates the quantity in the Production UoM and Inventory UoM.
Factor	Conversion factor between entry unit and consumption unit Only in Master Data and Precalculation: Displayed only if consumption unit and entry unit are different. Enter the conversion factor between the quantity indicated here and the consumption unit. Quantity is divided by the indicated factor.

© 2026 Boyum IT Solutions A/S

Field	Description
	12 decimal places are supported. ***Example*** Quantity 10, Factor 5 Results in a Requirement of 2 in consumption units of the material position per consumption unit if the assembly. Note: The "Exceeding planned quantity allowed" production configuration setting affects the Conversion factor: The Minimum/Maximum percentage is calculated based on total quantity. ***see*** Configuration setting. *BEAS_STL.INPUT_FACTOR*
Fixed Quantity surcharge	Defines a fixed and unique quantity surcharge Share of the surcharge – used for the Precalculation and production. The scrap factor at assemblies relates not the assembly, but only to its material requirement. The scrap is calculated per lot size: ***Example:*** Assembly lot size 500, required 1000, scrap 1 in assembly equals to 1 per 500 = 2 There is a total requirement of 1002 if a material 1x per assembly is required This value will be calculated in production and cannot be changed.
Scrap %	Determines Percentage of scrap Indicate material scrap which is added to the calculated requirement.

© 2026 Boyum IT Solutions A/S

Field	Description



Note:

This field is visible in Master Data and Precalculation.

In Work orders you can see the calculated scrap.

Set the formula to be used in the Configuration Wizard.

Available formula definitions:

`Scrap = Quantity * ( Scrap % )` (= default setting)

`Scrap = Quantity / ( 1 - Scrap%/100 )`

Example:

Definition with `Scrap = Quantity * ( Scrap % )`

Requirement: 10 Pcs

Scrap: 10%

Total requirement: 11 Pcs

Definition with `Scrap = Quantity / ( 1 - Scrap% / 100 )`

Requirement: 10 Pcs

Scrap 10%

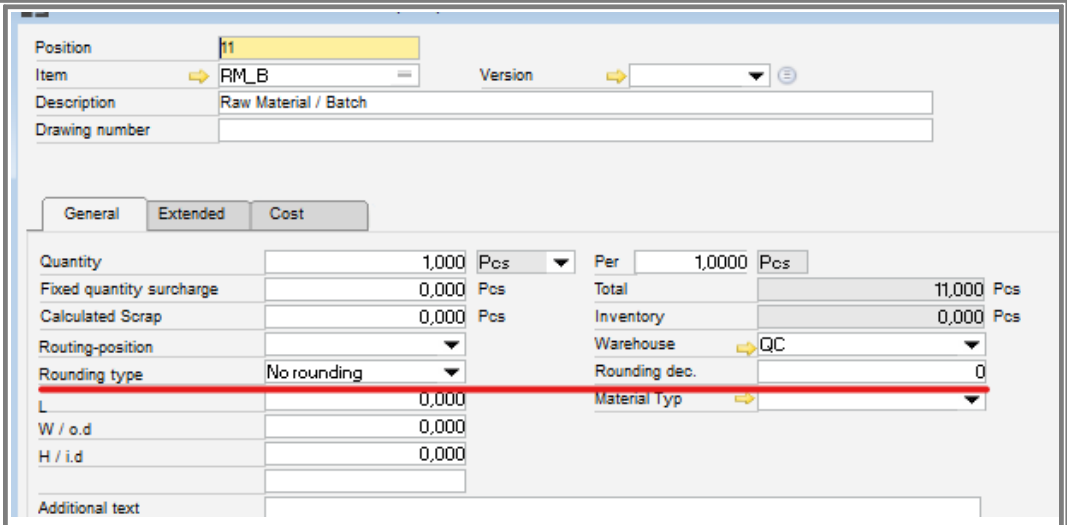
Total requirement:

© 2026 Boyum IT Solutions A/S

Field	Description
Scrap %	Calculated from scrap values This value is calculated when the work order is created. It cannot be changed; it is a one-time surcharge. (Assembly quantity * BoM quantity) + "calculated scrap" If the assembly quantity is changed, the "calculated scrap" does not change. To re-calculate, a Work order update is required. ***See*** - scrap factors in routing, ***see*** Routing - material scrap - scrap of superordinate assembly or phantom assembly, ***see*** Scrap - offcut factor of superordinate assembly or phantom assembly, ***see*** Offcut factor For purchase parts additionally - scrap as per master data, ***see*** Scrap - off-cut factor as per item master, ***see*** Offcut factor Note: If in BoM position "Do not post scrap" is activated, scrap will not be determined. ***See***: Master data – edit BoM Offcut Option consider offcut
Rounding type Rounding dec.	Determines the rounding rule The rounding rule can be defined here:

© 2026 Boyum IT Solutions A/S

Field	Description



Available settings:

No rounding	There is no rounding defined.
Round up	The number is rounded up. The exact decimal place can be defined in "Rounding Dec." ***Example:*** You have defined 1 piece per 18: the factor is then = 0.055556 If you multiply 0.555556 x (17+1) = 1.000008 After this you apply a round up --> The final result is 2.
Round off	
Rounding at 5	From 0,5 (1 Decimal place) or 0,5 (2 Decimal places) will be rounded up. Lower will be rounded off ***Examples:***

Requirement	Decimal place	Rounded
1,45	2	1,45
1,45	1	1,50

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>
<table>
<tr><th>Requirement</th><th>Decimal place</th><th>Rounded</th></tr>
<tr><td>1,45</td><td>0</td><td>1,00
Note: Only the last decimal place is considered. Thus, there is no rounding up of the second decimal place.</td></tr>
<tr><td>1,49</td><td>0</td><td>1</td></tr>
<tr><td>-1,5</td><td>0</td><td>-2</td></tr>
<tr><td>-1,45</td><td>0</td><td>-1</td></tr>
<tr><td>-1,45</td><td>1</td><td>-1,5</td></tr>
</table>
</td></tr>
<tr><td>multiple of</td><td>Always the multiple will be formed, which will be indicated in "Rounding Dec."
Example:
Multiple order of 4
4, 8, 12, 16 is counted
At quantity 3 is rounded to 4
At quantity 4 the quantity 4 remains unchanged
At quantity 5 is rounded to 8

Example:
Multiple order of 10
10,20,30,40 is counted
At quantity 1 is rounded to 10
At quantity 10 the quantity 10 remains unchanged
At quantity 11 is rounded to 20</td></tr>
</table>

Example 1:
A palette per 100 pieces is required
Quantity of requirement corresponds 0.01 palette per piece. But at least one palette has always to be required and from 101 pieces even 2 palettes. The BOM position will be adjusted as following for this:
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
	Quantity: 0,01 Rounding type: multiple of Rounding Dec. 100 ***Example 2:*** A half piece is required. because there is no half piece. It must always be rounded up to 0 decimal place because there is no half piece. Thus a requirement of 0,8 will actually be rounded up to 1 piece. The following setting occurs: Rounding type: round up Rounding Dec: 0 Note: Negative statement of decimal places are not supported. Rounding results are always in Inventory UoM.
Routing-position	Determines the routing position for which the material is required For backflushed material, the material is issued on receipt of this routing position. The MRP run and APS consider the start date of this operation when calculating the material requirement. **Phantom assembly group:** Routing-assignments work with restrictions for nested phantom assemblies: The routing assignment of the above located main assembly group always applies instead of the phantom assembly group assignment within a sub-phantom assembly group. **Master data:** Which routing is to be used can be defined in the BOM. The routing with the same ID will be used if none have been defined. A checking of the assignment is not possible because a routing can be assigned to multiple Bill of materials. The assignment will not be checked even at a change of a routing.

© 2026 Boyum IT Solutions A/S

Field	Description
	Production: Assignment is always done at the routing of the current production position.
Total	Calculated total quantity in Inventory UoM Only in Work order Bill of Material window More information see concept "Total Quantity"
Inventory	Current Inventory in Inventory UoM on Warehouse, which defined in field "Warehouse". Only in Work order Bill of Material window

Warehouse	Default warehouse for planning and backflushing
	If a warehouse is specified, the material is issued from this warehouse by default when backflushing. Warehouse information is mandatory.
	You can choose any warehouse defined for this item, and active on item-warehouse side and active on warehouse side.
	It is allowed to select a warehouse, which is locked for issue transactions.
	
	MRP checks the warehouse defined in the BoM Position.
	Precalculation: It is possible to select locked warehouses.
	
	If the material position is an order-related sub-assembly, the system creates a new work order position for this sub-assembly but does not take the warehouse from the Bill of materials position.
	For the new work order position, the system uses the standard rules for warehouse definition. ***See*** warehouse rules.
	Example:
	Assembly A, default Warehouse 01
	BoM Order-related Assembly B, default Warehouse = 01, Bill of Materials Warehouse 07
	
	If you create a work order:
	`Work order Position 10: Assembly A = Warehouse 01`
	`Bill of Material Position 10: Warehouse 07`
	`Work order Position 20: Warehouse 01`
	
	Note: At "Production backflushing" you can specify an issue warehouse which has a higher priority.
	See Production backflushing

© 2026 Boyum IT Solutions A/S

Field	Description
Bin Location	Bin location number - available for bin-managed warehouses. Only valid "Bin Locations" for the selected warehouse are allowed. After changing the warehouse, the bin location content is set to empty in this field. **Work Order BoM and Precalculation:** A work order created from an Item, or Precalculation copies this field automatically for the BoM. If there is not enough stock to pre-assign quantities from this, pre-defined bin location, Beas continues to pre-assign them from further bin locations based on the sorting rules.
Length Width / OD Height / ID	Length, width, height or outer/inner diameter Determines the measurements of the materials. The requirement of the consumption unit can be indicated. The required quantity in warehouse unit can be defined in Quantity unit - Conversion The measurement can be indicated in the conversion. e.g. Requirement: 100mm (Consumption unit) Conversion to piece: 1 piece = 1000mm A requirement of 0.1 piece is then determined.
Completed	Production: defines the position as "completed" It is set automatically according to the settings if the default quantity has been reached. The completed BOM positions are no longer considered in the material requirement list and MRP.
Info	Any information This field is unnamed in the basic installation. The name of the field can be configured in **Configuration Wizard > Master Data > Bill of Materials > View > Info Field**.
Closed	Close this Bill of Materials position Only available in Work order Bill of Material position Displays if the Position is closed or not if this position not closed, you can close this position

© 2026 Boyum IT Solutions A/S

Field	Description
	If you want to reactivate this Bill of Material position, you must choose "right mouse click" – "Position re-activate"

In the "Extended" tab you can edit additional information for the WO BoM position.

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Bill of Materials" tab > **Open** WO BoM position > "Extended" tab.

8.2.4.5.1.3 Routing tab

Work order item

Edit work order item

Routing

Edit routing

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Routing" tab.

This tab displays all operations for the current routing.

With versions earlier than Beas 9.2 PL02 it was not possible to edit values directly in the routing list of a work order position.
Now you can change several values directly in the list:

1. Right-click on a Routing position and Go to Window settings.
2. Set the fields for editing directly in the list to "Changeable".

© 2026 Boyum IT Solutions A/S

Window Settings

#	...	Title	Changeable	Color	Visible	Bold	Italic	Sum	ToolTip

Window arbplanpos_edit.psr

Header

Field	Meaning
Operation sequence	Consecutive position number, representing the sequence of the positions (nor for operation definition). Normally in increments of 10 to allow intermediate positions to be added. This behavior can be set in options. Note: For Phantom items routing positions are always renumbered - even when the parameter is off.
Type	Select a type from operation catalog.
Operation	Reference to operation catalog. This can be used to adopt the information stored in the master data/operation, thus accelerating input. Changing an operation, values (data of cost elements) are loaded from operation catalog master data.
Resource	The work station, personnel group, machine or machinery group or also external operation supplier or person on or through which the operation is conducted. Changing a resource, data of cost elements is loaded from the master data of the selected resource. ***See*** Resource

© 2026 Boyum IT Solutions A/S

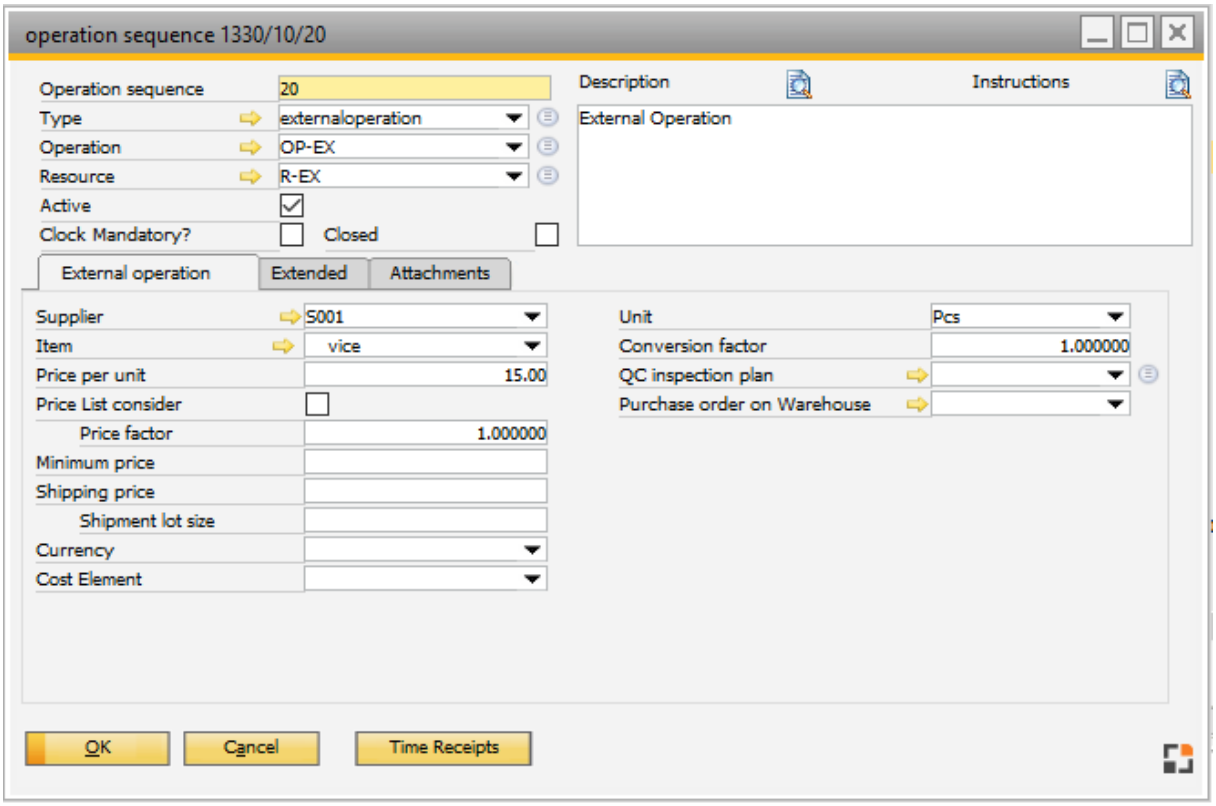
Clock Mandatory?	Defines whether clocking (factory data recording) is mandatory. ***See*** Edit routing. Last Routing position
Active	Operation active? If the operation is deactivated, it is treated as if "not existing" for all functions and will be displayed in grey in the structure view. As result, it will not be considered in - FDC logon/logoff - Pool administration - Determine first / last operation for backflushing - APS - MRP order recommendation - Post-calculation - even for planned costs
Description	Description of the activity. **see** routing description.
Instruction	Additional Instructions for this operation .

Buttons

Time receipts: The button opens overview on all time receipts for this operation sequence.

Production > Work Order > **Open** WO position > **Open** operation > "External operation" tab

© 2026 Boyum IT Solutions A/S



Window arbplanpos_edit.psr

The "External Operation" tab is only visible if an external operation has been selected as a resource.

An external operation can consist of a pure service (the entry is then on this page only) and / or possess a proprietary throughput time and debit the capacity of a resource, as well as allow costs to arise (entry in General tab)

For further information ***See*** External production.

Field	Description
Supplier	⊟ Default supplier Assign the supplier linked to this external operation If specified, it is loaded by default in purchase orders or quotations. Pricing considers the special price list of the supplier if no price was specified for unit price. Suppliers are available depending on settings "select supplier" Clicking on the ➪ will open the Business Partner Master Data window. Note: By default, Beas allows to predefine an item for purchase

© 2026 Boyum IT Solutions A/S

Field	Description
	order creation. If the field is filled, it is protected in the purchase order. Pricing depends on **Production > External production > Purchase and provision.** - Pricing for purchase - supplier selection - consider special price list
Item	Assign a non-warehouse item to manage all external operation transactions like purchase orders. If no unit price is specified, pricing is carried out for this item. Clicking on the will open the Item Master data window. Specify service item Only non-inventory-managed items are used for purchasing a service. No material is posted except when provision parts are used. Pricing: ***See*** Pricing for purchase. In purchase, the unit of the item is used. Note: The system ignores UoM Group definition of this item. It is always allowed to choose any UoM for the routing position.
Price per unit	Set the price for purchase orders. Service price per price factor. ***See*** Pricing for purchase.
Price List consider	Check box. Allows Beas to consider pricing, extended price lists, special price lists and blanket orders. ***See*** Pricing for purchase.
Price factor	Include a factor to be used according to the price per unit defined. **Note**: If "Price list consider" is enabled, "Price factor" is hidden, as prices in price list are always stored per Inventory UoM of the service item.
Minimum price	Set a minimum price for the purchase order If the total unit price is below the minimum price, the value specified

© 2026 Boyum IT Solutions A/S

Field	Description
	here is used. ***Example***: €10 € per 1000 units, minimum €30. For 1000 units €30 is calculated (minimum price). For 10000 units €300 is calculated (unit price higher than minimum price).
Shipping price	Transport surcharge Set the transportation price to be included in the total price. Payable per transport lot size. ***Example***: €10 € per 1000 units, minimum price €30, transport price €100, lot size 5000 1000 units are €30 + €100 transport price = 130 € For 10000 units: €300 € €200 € transport price (2 x lot size) = €500 .€
Shipment lot size	Set the lot size that can be shipped. ***See*** transport price. ***Example:*** 10€ per 1000 units, minimum price 30€, transport price 100€, lot size 5000 1000 units are 30€ + 100€ transport price = 130€ For 10000 units: 300€ + 200€ (transport price x 2 lots) = 500€
Currency	Specifies the currency in which the amounts are expressed. If no currency is used, the local currency is used.
Cost element	Change the account in which the standard costs from the external operation is booked. If a cost element is stored, and in the cost type an account is stored, costs arising at goods receipt are booked to the WIP account. ***See*** External operation goods receipt, Cost types.
Unit	Unit in which the purchase is registered Usually you purchase in units of the service item as prices are stored in this unit. ***See*** next Field description in this table titled "Conversion factor".
Conversion factor	Conversion factor between time receipt unit and assembly unit In the purchase the warehouse unit of the service item is usually

© 2026 Boyum IT Solutions A/S

Field	Description
	indicated. There you can define the conversion factor between consumption unit of the item to be produced and the warehouse unit of the service item. ***Example***: Production UoM of the assembly: `pieces` Inventory UoM service item: `kg` Conversion factor: `3` For a requirement of `60 pieces, 20kg` of service items `(60 : 3)` needs to be purchased. **Note:** By default, Beas allows to predefine a conversion factor for purchase order creation. If the field is filled, it will be protected in the purchase order. For more Information ***See*** Collective Purchase Order – Quantity.
QC-inspection plan	Define if this external operation has to be inspected by the quality control team when producing the item or performing the task and link to stored QC-inspection plan. Clicking on the opens the the editing screen of the selected plan, and clicking the opens the list of QC inspection plans.
Purchase order on Warehouse	Define the warehouse for purchase order. If you create the purchase order, the system takes this warehouse for the purchase order. This is the own warehouse for the invoice or/and ship back warehouse. For more Information ***see*** Collective Purchase Order.

Additional fields in Precalculation

Warehouse	Determines the warehouse of the service item. This is required for pricing, if you work with "price per warehouse".
from Quantity / Price	Only visible if "consider price list" was activated. Up to 4 quantity-

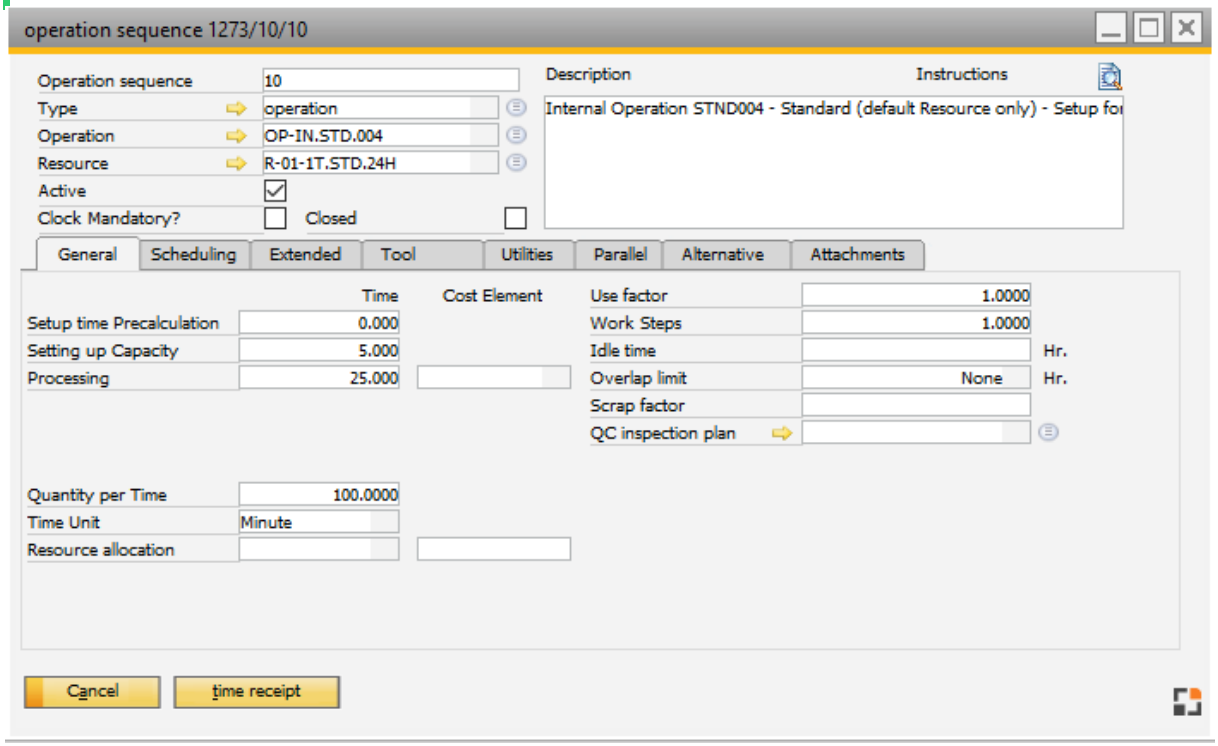
© 2026 Boyum IT Solutions A/S

Warehouse	Determines the warehouse of the service item. This is required for pricing, if you work with "price per warehouse".
	dependent prices can be entered. Quantities are given in units of the service item.

See

Collective Purchase Order

Production > Work Order > **Open** WO position > **Open** operation > "General" tab



Window arbplanpos_edit.psr

Field	Description
Setup time	Setup time for Pre- and post-calculation The setup time in hours or minutes is taken into account in production and costing analysis as well as in Precalculation. Note: Designation can be changed in Configuration wizard – Resource –

© 2026 Boyum IT Solutions A/S

	Definition Time types. **Precalculation and Lot size** Setup time is calculated per calculation lot size. ***Example:*** Lot size 10, setup time=5 minutes, calculated: 19 pieces Result: total setup time 10 minutes or 0,52 per piece If a sub-assembly has its own calculation lot size, it will be taken into account. ***See*** Precalculation – View and lot size. **Production and lot size** If a work order is created automatically (e.g. via order recommendation report or sales order to work order, a separate work order position per item-lot size is created. The setup time indicated here refers to the lot size in item master. **Separate reporting of setup times** If "Extend to cost elements" was set to 2 or more in the Resource, the setup time can be reported separately via FDC and evaluated separately in calculation. Enter the cost element to which the accrued costs are posted.
Setup time Capacity	The set-up for scheduled capacity in hours or minutes is considered in capacity planning and throughput time calculation. This setting has an effect on calculation of target time.
Mach+Labor Time/unit	The actual processing time per work step. The field designation can be changed in **Configuration wizard > Master Data > Resources > Time types** or via Ctrl+ double-click in the text field. Times are specified in units "Times in ..." (hour/minute) and refer to "Times per .. " finished parts taking account of the utility and work steps in units of usage of the assembly. The Cost Element field specifies the cost element for which the planned or accumulated costs should be totaled, facilitating detailed analysis. Tools that determine the throughput time and also alternative operations

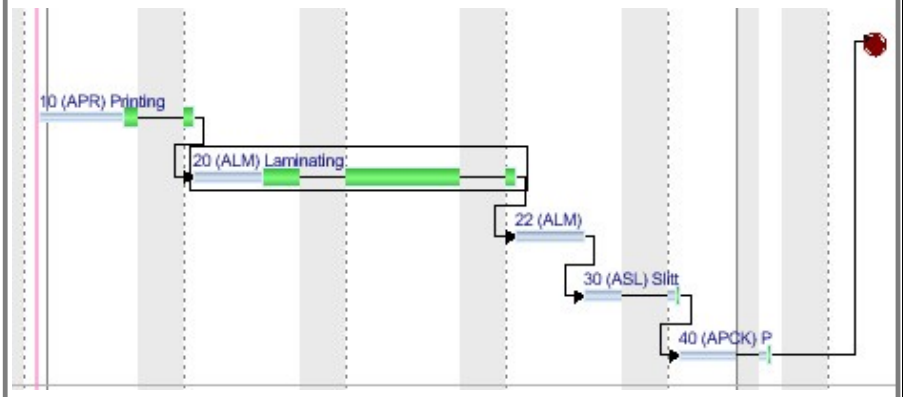
© 2026 Boyum IT Solutions A/S

	can only influence the job time (processing time). ***See*** Calculation of planned time.
Secondary, main time	Secondary time and main time. In addition to the job time, two other secondary processing times can be specified if "Extend to cost element" is set to 3 or 4 in the resource. The secondary processing times are designated in Configuration Wizard or via Ctrl+Double click in the text field. ***See*** Concept Time types.
Quantity per Time	Determines the assembly quantity the time refers to. Enter to which assembly quantity (Production UoM) the time refers to. Thus you can indicate even short lead times correctly. ***Example:*** Lead time 0,0001 minutes per piece To make it more readable, you can enter 1 minute per 10000 pieces If it is a fixed time, enter 0 at "quantity per", that means this time is needed only once per lot size. Same effect as for setup time. ***Example:*** Lot size 10 Production 50 pieces Time = 2 Minutes per 0 Total time: 5 lot sizes a` 2 minutes = 10 minutes **Fix Quantity: Quantity per Time = 0** This means you need the time per lotsize ***Example***: 3 Minute per 0, you produce 100 Pcs. The System calculates 3 Minutes for all 100 Pcs. For additional information on lot sizes ***see*** Precalculation – Display and lot sizes.

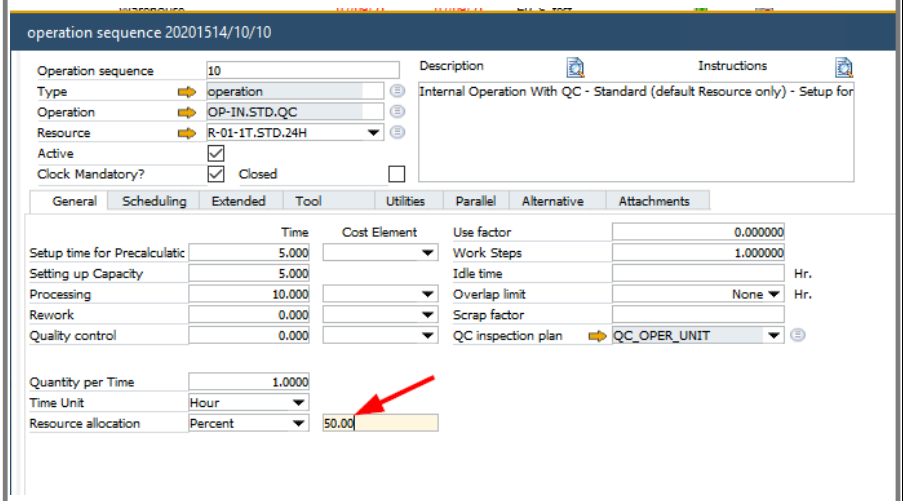
© 2026 Boyum IT Solutions A/S

Time Unit	Unit of time in which times are stored – hours or minutes. The default can be stored in the options.
Resource Allocation	The extent of utilization of a resource.

Determines the utilization of the available resource capacity.



See Default Calculation type: Reallocate forward.



Type	Description
Number	Number of resources used (subject to the prerequisite that the resource exists more than once, e.g. if the resource is a group of persons. Where 2 is input for 5 persons, the resource of 2 persons is scheduled at most. Note: If this is not 1, the system uses the calculation method Exploit Full capacity for this routing position.
Percent	Percentage utilization of the resource.

© 2026 Boyum IT Solutions A/S

Type	Description
	Example 1: Group of 6 persons. At a utilization of 50% the resource of 3 persons is used at most. ***Example 2***: Machine which is only partly utilized. To extend the throughput time, a lower utilization can be specified here. If 20% is specified, throughput time is quadrupled while costs remain the same. Note: If this is not 100%, the system uses the calculation method Exploit Full capacity for this routing position.
Simple	Default setting: For "Simple", only one resource is 100% utilized.

Note:

For Detailed planning (i.e. a resource should be planned to the minute) the option must be set to "Simple".

Operation active

Determines whether the operation is active and can be used

You can set here whether the operation should be included. Apart from Yes/No, a condition is also possible, such as production quantity greater, in between or smaller than a specification defined here.

Example: The operation in which a small machine has been defined should only be used when the production quantity is smaller than 30. If it is greater, an operation should be used in which a large machine with a respectively higher set-up time but smaller mach+labor time is stored. Quantities refer to "per units of usage" of assembly.

Note: This switch is only visible if in the Configuration wizard – Routing – Operation field show is activated.

Operation catalog:

In operation catalog this field is not available.

Routing:

In routing it can be set up depending on the quantity:

© 2026 Boyum IT Solutions A/S

Yes: Always active.
No: Not active.
Quantity bigger: Only active if quantity exceeds the given value.
Quantity smaller: Only active quantity falls below the given value.
Quantity between: Only active if the quantity is between two given values.

Thus you can activate a routing depending on the quantity.

Example:
Depending on the quantity, a certain resource is to be used.

until 10 kg (active quantity < 10 kg): Resource "small bowl", planned duration: 10 minutes
from 10 kg (active quantity > 10 kg): Resource "big bowl", planned duration: 20 minutes

Field description
The value is saved in `aktivformel` with the following configuration `Id=Value1=Value2`
G = "Quantity bigger"
K = "Quantity smaller"
Z = "Quantity between"
N = "Not active"
J = "Active" (Default)

If the field is empty, the entry is treated as active.
Example: Only active for quantity between 10 and 20 "`Z=10=20`"

Note regarding variants / formulas

Only the following values may be returned here if a formula has been stored via the – icon: Y for "Active" or N "Not active". "bigger", "smaller" or "between" are not allowed via the formula system.

Generate Work order

© 2026 Boyum IT Solutions A/S

By defining value "N" in the formula, the system does not insert the routing position in the Work order. This is to be activated in **Configuration wizard > Production > Create >** Apply inactive work order sequence.

Generate Precalculation

In Precalculation the system always transfers inactive routing positions. *(beas 9.3 PL 2)*

Generate new Item (Product Configurator)

By defining the value "N" in the formula, the system does not insert the routing position in the Work order. This is to be activated in **Configuration wizard > Production > Product Configurator >** Apply inactive work order sequence *(beas 9.3 PL 2)*

Active field as Script

If you click in field Pos on – icon, you can define all fields with `setvar=e_[fieldname]=value`

If you want to disable a routing position, use the following script: `setvar=e_aktiv=N`

With *beas 2020.02* the Variable "`e_aktivformel`" is not supported.

Pre-calculation

In Precalculation there is an active-field and an "only if quantity" .... The second field has the same meaning as in routing. The operation is only active if the condition is met.

Work order

Only active routing positions are transferred to the work order. If you make a selection in the Configuration wizard to accept inactive routing positions as well, these will be transferred to the work order, and deactivated.
You cannot log on to these operations and they do not cause time

© 2026 Boyum IT Solutions A/S

	demand. This switch can be disabled manually.
Valid Period	In Precalculation Operation: Select the From - To dates of a validity period.
Use factor	Determines the use factor of the operation If several parts are produced with only one work step, the use factor is higher than 1. ***Example*** Cut a plate with a saw Duration: 1 minute Result: 2 plates, per 1 plate, only 30 seconds are required. Use factor in this case:2 ***Example 2:*** Injection molding with 12 nozzles. One process creates 12 parts, the use factor is 12 in this case. ***See*** Calculation of planned time.
Work steps	Works opposite to the use factor. Define how many work steps are needed for one part If several steps are needed to finish one part you can enter the number here ***Example:*** Tighten 10 screws. Per screw, 15 seconds are needed. Piece time is `15 seconds` Work steps `10` Total time `15 * 10 seconds = 150 seconds` ***See*** Calculation of planned time
Idle Time	Idle time in hours in which the semi-finished part must not be further processed, e.g. drying time, cooling etc. `|--- Transfer time --| |-- Planned time --| |--- Idle`

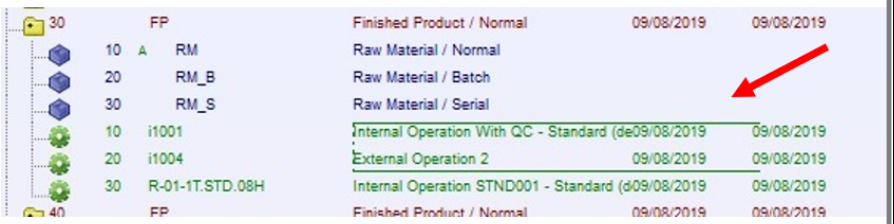
© 2026 Boyum IT Solutions A/S

	time---| The resource is available at this time for other orders. There are no arising costs . Forward Scheduling: The next sequence of operations can begin only after the idle period. The idle time should not be used for the extension of lead times. It is recommended to use transit time (***see*** resources). By default, factory calendar and resource calendar are not considered. These can be taken into consideration by changing the settings in the Configuration wizard.
Overlap Limit	The overlap time to the next operation is stored in hours. By using overlap settings, you can define the delay for the subsequent work sequence or define to start it in parallel. Unlike parallel resources, the subsequent work sequence can be moved freely. You can define the overlap limit in **Routing position > Overlap limit**. Choose "Parallel", "No" or insert the number of hours/minutes manually. If this is defined in Position 10, the next position will be parallel. This means: "Clocking mandatory" must be disabled, because you can start with Position 20 before closing Position 10.  *Window fert_arbplanos_edit.psr*

© 2026 Boyum IT Solutions A/S

In Item Structure view you can see parallel / overlap limit information in this way:

In this example in Position 10 the "Overlap limit" is defined:



Note:

Overlap calculation runs correctly only with forward calculation.

Value	Meaning
0	No overlap.
Parallel	Next Routing position will have same or next possible start date Forward calculation The earliest start date of the following operation can be the same as the first one or the next possible start. The next possible start may also be earlier than the one of the previous operation. ***Example 1 :*** Pos 1 is defined as parallel, so Pos 2 can start parallel to Pos 1 
© 2026 Boyum IT Solutions A/S

Value	Meaning
	View in Beas  Start of 3. routing position is after the end of the latest parallel routing position. ***Example 2***: Pos 2 needs less time than Pos 1.  View in Beas  Start of next routing position is always after the end of the latest parallel routing position.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	Example 3: *Scenario:* Position 3 is parallel to Position 2, but after Position1 finishes, resource for Pos 2 is not available. For example Resource is reserved by another work order. If the resource is not available immediately, the routing position starts at the next available time. In this example, the position 3 can start **BEFORE** the first position:  ***Example 4:*** Scenario: 2 work order positions. Both WOs have defined the 2. operation as parallel. Start date is same. First operation has different resource, but the second parallel operation has same resource for both WOs. Explanation: The parallel resource uses the start date, on which the resource is free. For the first WO this is the time when operation 1 starts. In the second work order position you see that the start date of second operation does not start together with the first operation. The reason is that WO 1 already occupies the

© 2026 Boyum IT Solutions A/S

Value	Meaning
	resource. So the second operation of WO can only start after the operation 2 of WO 1 stopped. In that case the the second operation does not start parallel but delayed:  You can set parallel-defined operations to always run in parallel in the Configuration wizard. Result with setting "Overlap limit = fix" Start date of Pos 40 on Resource i1001-1 start later, because the next resource i1004 is not available before.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 ***See*** APS fix parallel routing positions Backward Calculation The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration. Parallel resource: The system calculates the following:  If duration of Pos 2 is less than that of Pos 3, then Pos 1 ends with the start of Pos 2.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 In this case, the system is working different from forward calculation. If you work with backward calculation, the first parallel position must have the longest duration. Differences between parallel resource and parallel operation Parallel resource: - is always parallel - 100 % - Parallel resource have always same start / end time - Use Parallel resource, if you don't need this resource 100% (Example: A worker is the "parallel resource", but is working on 4 machines in parallel. In this case he must invest only 25% for his time for this operation) Parallel Operation: - is not always parallel. Only if the resource of parallel operation is available - can have different work time - can work with resource optimization - can have own parallel resource, tools and so on
> 0 Overlapping	Overlap of the following routing position or assembly if it is the last routing position. Forward Calculation

© 2026 Boyum IT Solutions A/S

Value	Meaning
	The Overlap time define, when the next operation can be started. The time, which you define, is the delay in hours/minutes, until the next operation starts. The defined time is the earliest time. **Example:** 2 hours means, the next operation can start - 2 hours after start current operation or after end of this current operation (if the current operation is less than 2 hours) - if resource of next operation is not available after 2 hours, then at the time, when the resource is available. **Example:** In this scenario the start date of the third routing position is the real start date of the second routing position + defined overlapping time in hours, here 1 hour.  An overlap is specified in hours – based on a 24-hour day. The specified overlap always applies to the following routing position. The overlap time is not bound to a resource calendar. This is purely hour-based time excluding time reservations or other factors.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	The overlap time begins AFTER the transit time. The next routing position cannot possess a transfer time, otherwise it will be appended to the transfer time. ***Example:*** Scenario: 2 Work orders, same routing plan. In first operation different resources. Overlap limit = 0.5 hours First work order: Position 20 start 0.5 hours after start of position 10 Second work order: Position 20 start later, because the time is reserved from first work order 
© 2026 Boyum IT Solutions A/S

Value	Meaning
	If you want, that the overlap have always exact the same overlap time, a setting is available. ***See*** Configuration wizard ***Example:*** Scenario: Work time of second work order position is less than the work time of the first operation. In the first operation, overlap time is defined:  In this case you're ready with second routing position before you're ready with first routing position. But you can start with third routing position only, if all parallel / overlapped routing positions are done. In this case after end of Routing position 10. Backward calculation In a simple example the result of backward calculation is same as forward calculation Example: Work time 1 hour, overlap 0.5 hour in first operation  But is the duration of second operation is not same as first operation, then the result is different

© 2026 Boyum IT Solutions A/S

Value	Meaning
	to forward calculation: The system calculate backward: First 30, then 20 - from 20 the overlap is calculated (Start time from Operation 20 + Overlap time from Operation 10 = End time from Operation 10.  Alternative for backward calculation is "forward late as possible" Note: The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration.

Note:

The last operation corresponds to the last "reportable operation".

If an overlap is also configured in the last operation, Beas does not recognize this as the last operation.

However, the automatic assembly receipt or adjustment of the backflushed material depends on this.

Overlapping using assemblies

Assemblies can also overlap in an order-related structure.

Example:

```
        |- Main assembly -|
|--- Subassembly -|
```

© 2026 Boyum IT Solutions A/S

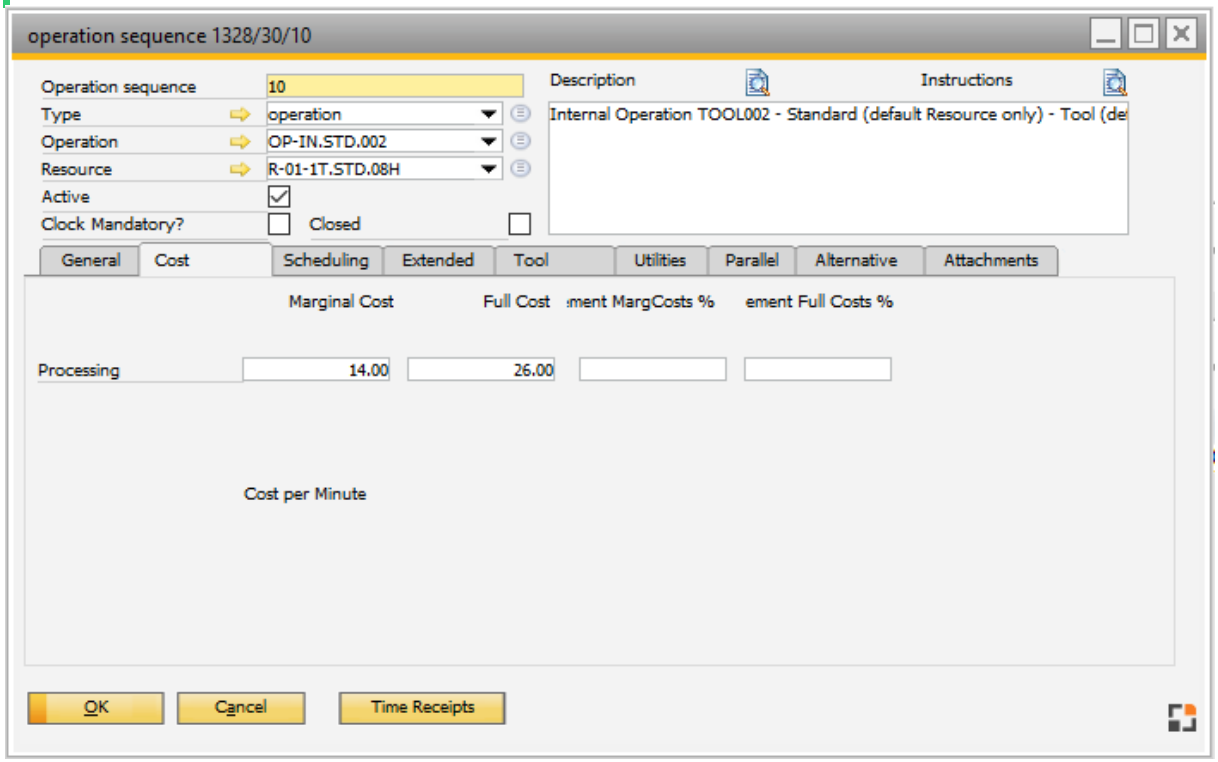
	Start date of the main group is normally the end date of the last routing position of the subassembly. If this last routing position has an overlap, this is also considered. ***Important***: If an overlap is entered in the last routing position, it is no longer recognized as the "last routing position" in the backflushed posting transactions.
Scrap Factor	Scrap factor related to this routing position in % In this field an additional Scrap factor on routing position level can be defined. This is calculated as (Mach+Labor) / 100 * Scap Factor Example: Production 8 Pcs Setup Time = 60 Minute Labor Time = 10 Minute Scrap Factor = 5 % Total Time = 60 + (8 * 10) + (8 * 10 : 100 * 5) = 144 Min.
QC Inspection Plan	Store a QC-inspection plan in operation If a QC-inspection plan is stored, – depending on the settings – a QC order will be created. ***See*** Configuration wizard Measured values can be registered via QC-order, Terminal or WEB-Apps. If respective rules are defined, the release of the next operation may depend on that. ***See*** Configuration wizard – FDC – login rules ***See*** QC-inspection plan Quality control order
Number of payslips	Information field – if applicable, for information on number or pay slip

© 2026 Boyum IT Solutions A/S

	printouts.
Expand to Cost Elements	In Precalculation Operation: Select the number of cost rates. The default is one cost element (processing time), which can represent a mixed calculation of machinery and personnel costs. Select the number of cost elements you are to use in Precalculation, update the window, and the selected cost elements appear in the Costs tab. ***See*** more details in Costs.
Value Labor costs separately	In Precalculation Operation: If this option is activated, a separate cost rate can be stored for personnel costs and the "Labor cost rate" field appears in the Cost tab. ***See*** also Costs.

For job time and the personnel cost rate you can enter marginal costs, full costs and cost types at full and marginal costs.
Costs are plan costs (Precalculation values) from the moment the work order or Precalculation was created. Order time receipts are created always at current resource costs.

Production > Work Order > **Open** WO position > **Open** operation > "Cost" tab



Window arbplanpos_edit.psr

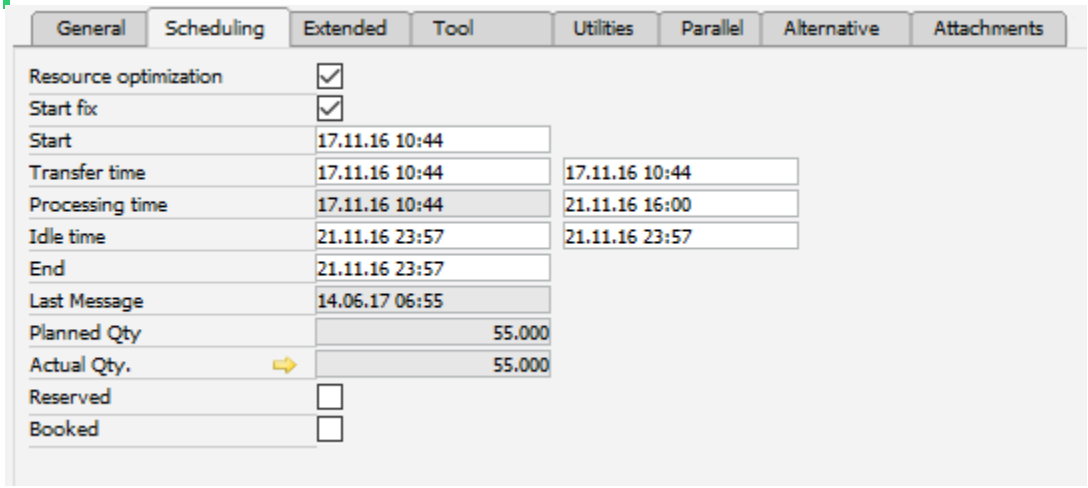
© 2026 Boyum IT Solutions A/S

By default, this tab is hidden. It is visible only, if activated in Configuration wizard

see Resource costs

back to Production Routing.

Production > Work Order > **Open** WO position > **Open** operation > "Scheduling" tab



Window fert_arbplanos_edit.psr

Field	Meaning
Resource optimization	Check to enable resource optimization
Start fix	If active, the start date of the operation is fixed, for example in APS. A re-scheduling does not move this operation.
Start	Given start date from-to
Transfer time	Transfer time from -to ***See***: Transfer time and idle time
Processing time	Planned processing time of the operation This date is used to calculate the requirement date in MRP.
Idle time	Idle time from-to ***See:*** Transfer time and idle time

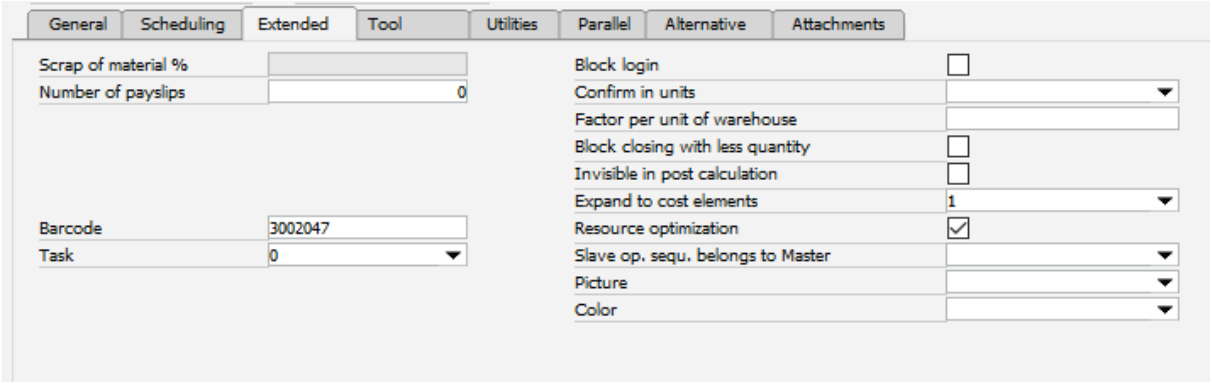
© 2026 Boyum IT Solutions A/S

	Configuration wizard - Capacity planning - Idle time
End	End date
Last Message	Date and time of last time receipt
Planned qty	Planned quantity
Actual qty	Actual quantity
Reserved	If the check box is active, material has been allocated for this operation. Only for information purposes.
Booked	If the check box is active, material has been posted already. Only for information purposes.

back to Production Routing.

Production > Work Order > **Open** WO position > **Open** operation > "Extended" tab

Extended settings for an operation.



Window fert_arbplanos_edit.psr

Some fields are used from Routing – Extended. The black fields contain the extended information for this operation

Field	Meaning
Scrap of Material %	Material scrap%.
Number of payslips	Information field - may be used for printing payslips.
Barcode	Unique number for time receipt. This number can be printed as bar code on the work order. Using this bar code you can logon to this operation in terminal

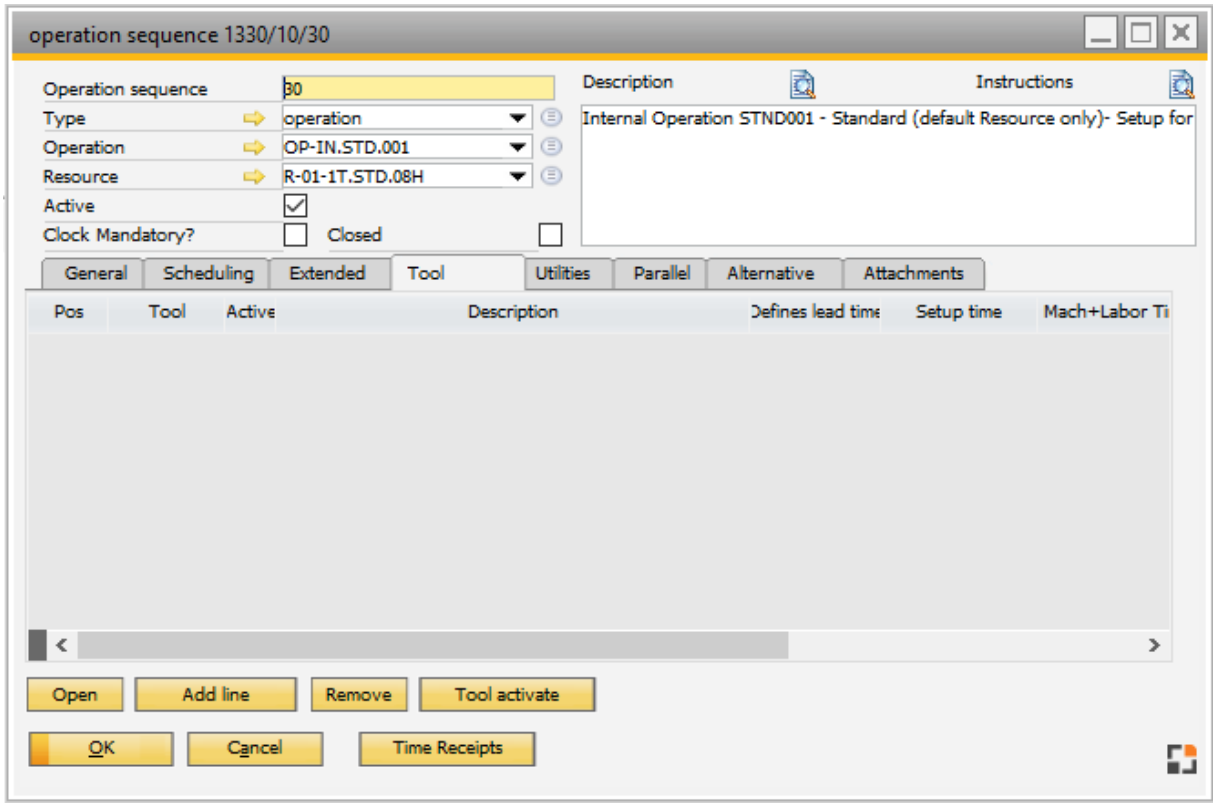
© 2026 Boyum IT Solutions A/S

	The number is generated automatically. It is a continuous number, which cannot be manipulated. ***See*** Report order times Logon order Logoff order *(Field: BEAS_FTAPL.NUMMER)*
Task	Link to a Project-Task .
Block login	Check mark, to block logon to this operation.
Confirmation (Time receipt) in Unit	Selection of time receipt units. ***See***: Units of measure.
Factor per Production UoM	Conversion factor to warehouse unit. ***See***: Conversion.
Block completion with quantities below minimum	Block completion with less quantity .
Invisible in post-calculation	If active, the position is hidden in post-calculation .
Expand to cost elements	Drop down: if you expand to several cost elements, you can separate the costs at a time receipt and distribute them to the cost elements set up previously. Note: To avoid incorrect operation time: After reducing the number of cost elements, delete the prices of the cost elements not in use.
Resource optimization	Check mark, if resource optimization was enabled.
Slave op.sequ. belongs to Master	A master operation sequence can be selected. Information on the master-slave concept . ***see*** Slave-to-Master.
Image	Image for this operation, for better recognition.
Color	Operation is displayed in this color in all windows.

back to Production Routing.

Production > Work Order > **Open** WO position > **Open** operation > "Tool" tab

© 2026 Boyum IT Solutions A/S



Window arbplanpos_edit.psr

Field description of the Tool tab

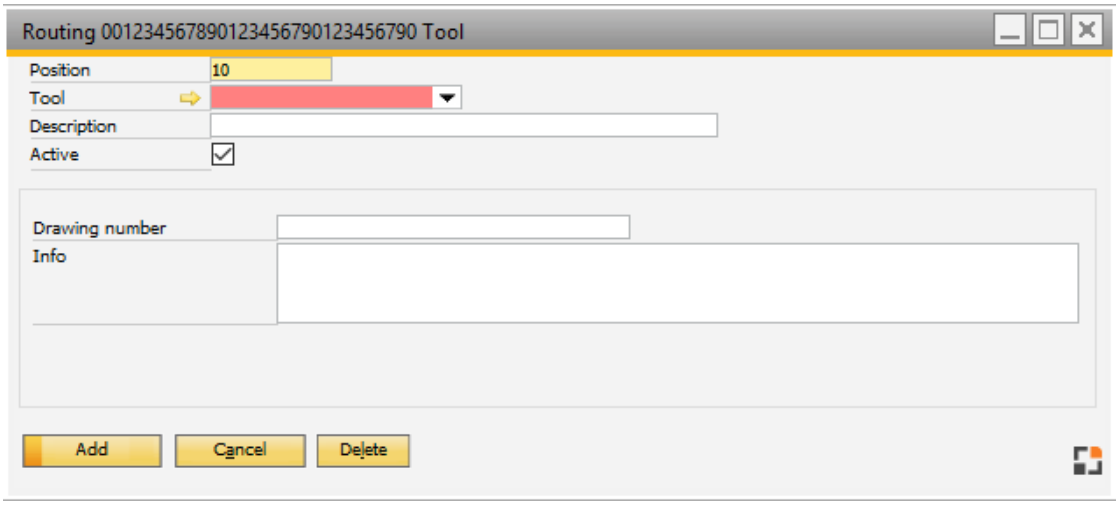
Field	Description
Position	Consecutive number, but not a primary key. The list output is sorted by this number.
Tool	Tool key (selection from master data / tools).
Active	Checked if entry is active.
Description	Designation of the tool (cannot be changed).
Defines lead time	Does the tool determine the lead time? If enabled, the default times of the tool are transferred to the operation. In this case, the tool influences lead time. Only values are used, which had been entered in "planning". Empty fields are ignored. If more than one tool was stored in an operation and for both "determine lead time" was enabled, only one tool can be activated.

© 2026 Boyum IT Solutions A/S

	Activating or exchanging the tool is possible in Work order structure or in APS – graphic view.
Setup time	Setup time.
Mach + Labor Time/unit	Job time. Machine + operation time per unit

Adding a new tool

To assign a new tool to the selected operation sequence, click on "**Add line**" under **Routing > Tool tab** and the following window opens:



Window artikel_arbplanpos_Edit_werkzeug_edit.psr

Field	Description
Position	Field used to sort the tool lists from the routing. It is a consecutive number but not a primary key.
Tool	Field used to assign the tool to perform this operation. This field is mandatory.
Description	Field used to display the tool description. This field cannot be changed because it automatically comes from the chosen tool.
Active	Check box field used to set the tool as active in the routing.

Important: Tools that define lead time cannot be simultaneously active for the routing position. Only one of them can be active at the same time, but the active tool can be switched directly in work orders. The time information is copied to the operation. Therefore, the user must check one tool as “Active”; all other tools that define lead time are deactivated automatically.

© 2026 Boyum IT Solutions A/S

(Previously Resources tab, in which tools, alternative work sequences, and parallel work sequences were listed in a table)
A second row of buttons has been inserted here now. The top row of buttons relates to the tool list. Care should be taken here during processing.

General tab

Field	Description
Drawing Number	The technical drawing number. This field cannot be changed because it is read from the chosen tool.
Info	Additional free text information on the tool entry.

Planning tab

This tab is only active if you have selected a tool with capacity planning.

Field	Description
Idle Time	Defines the time in hours after which the tool can no longer be used for other work orders (e.g. cooling, quality control, maintenance, etc.).
Next work sequence begins after idle time	If activated, the next work sequence can only be started after the idle time. Example: If the tool is a bin and this must be cooled before the finished product can be removed from the bin, the next work sequence can only be started after cooling. However, if the idle time is for quality control of a tool, you can begin with the next work sequence immediately (i.e. switch deactivated).

Default Time tab

This tab is only active if the tool defines the throughput time.
If this tool is activated (only one tool can ever be activated which defines the throughput time), its throughput time information is copied to the operation.

Note:
Only fields are considered where entries have been stored in the tool. Consequently, you can remove all entries. Work step and use factor are only used if > 0.

Example:

© 2026 Boyum IT Solutions A/S

Setup time of tool = nothing entered
Processing time in tool = 5 mins
Setup time is not changed in operation, thus it comes from tool.

Please make sure that you work the same way for all tools.

If a tool which determined the time is activated, it is transferred automatically to the operation at saving.

Field	Description
Setup time	Enter the setup time to start using the tool. Time specified per "Time per". **Important**: This replaces the operation setup time when this tool is used.
Processing time	Set the time the tool takes to produce the items. This is the actual processing time per unit produced in the routing position. The processing time for a unit of quantity per "Time per" in consumption unit per "Quantity per" finished parts. **Note**: Secondary processing times cannot be specified here.
Quantity per ..	Defines the number of finished parts in consumption units during the processing time refers to, e.g. 10 minutes per 1000 kg.
Time per	Specify whether the time unit for the setup and production processes is hours or minutes.
Use Factor	Split the production time amongst more finished goods.
Number	Number of required work steps e.g. 10 work steps in "processing time".
Utility	Utility factor, e.g. 10 units are produced at once per step or hub and per processing time.
Cost Element	Set the account in which the standard costs from the usage of this tool is booked. Accumulated costs are written to this cost element.

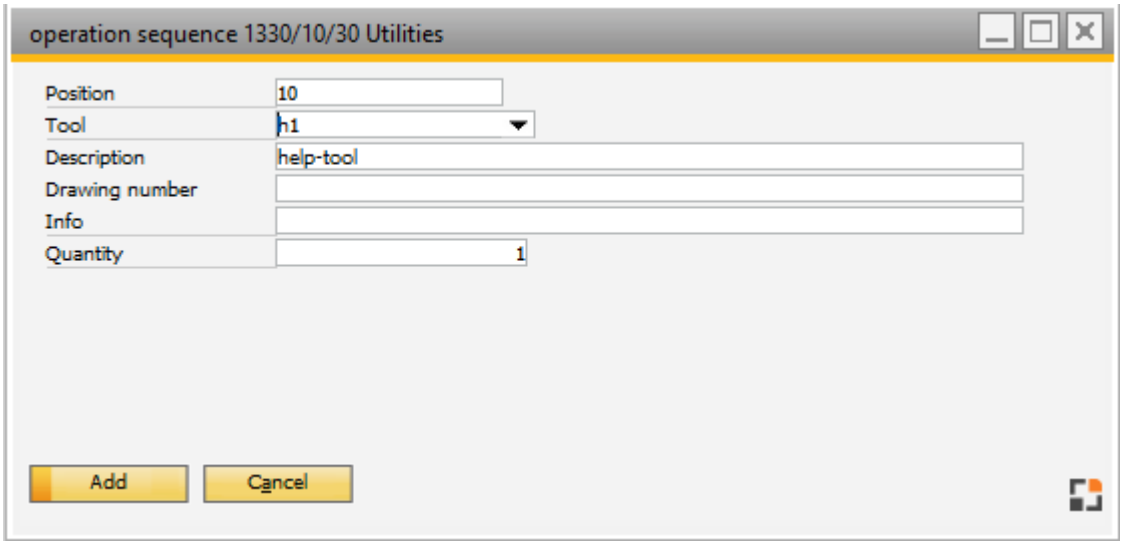
General settings on tools:
See: Tool administration.

© 2026 Boyum IT Solutions A/S

Production > Work Order > **Open** WO position > **Open** operation > "Utilities" tab

Add a new Utility

To assign a utility, click on "**Add line**" under **Routing > Utility tab** and the following window opens:



Window artikel_arbplanpos_edit_hilfswerkzeug_edit.psr

Field descriptions

Field	Description
Position	Sort the utilities list from the routing. It is a consecutive number, but not a primary key.
Utilities	Utility key (selection from Master Data / Tools / utilities). Assign the utilities to perform this operation. This field is mandatory.
Description	Displaya the utilities description. This field cannot be changed because it is read from the chosen utilities.
Drawing Number	The technical drawing number. This field cannot be changed because it is read from the chosen utilities.
Info	Additional free text information.
Quantity	Specify the number of utilities needed to perform the operation. This field is for information only and has no influence on the routing position.

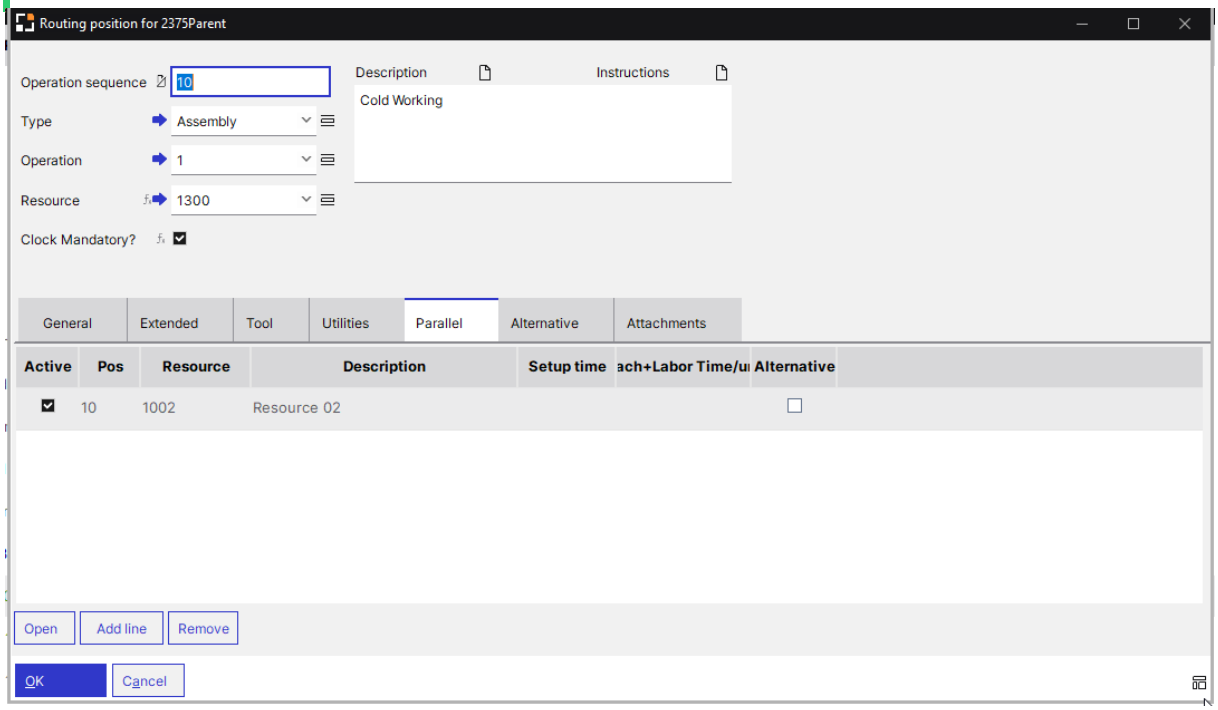
Buttons:

Open: Click button to open the editing window of the selected utility (***see*** image above "Add a new Utility")

© 2026 Boyum IT Solutions A/S

Remove: Delete utility for this routing position.

Production > Work Order > **Open** WO position > **Open** operation > "Parallel" tab



Window arbplanpos_edit.psr

In the Parallel tab, Beas displays a list of all resources that will be used in parallel with the main resource assigned in the Header. The user can insert, edit and delete resources.

Important: Only use parallel resources if a separate time planning is required for parallel resources.

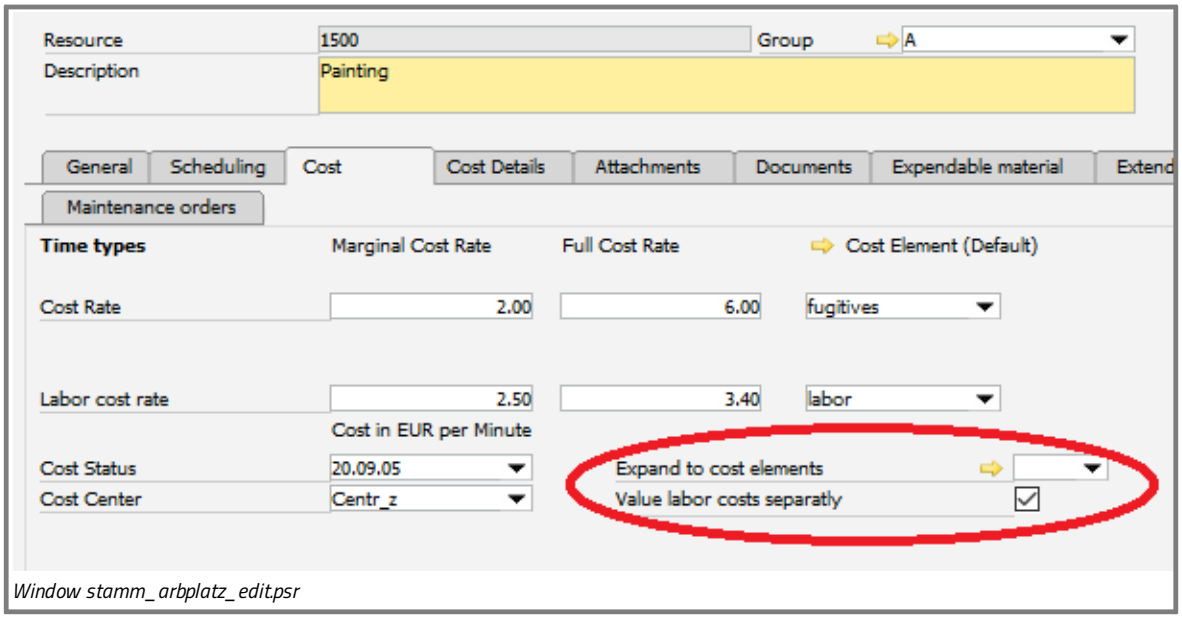
NOTE: Parallel operations do not consider quantities and do not manage Open/Close status!

- Alternative possibilities:

a) Define personnel costs separately. Thus these costs will be calculated separately.
b) Up to 4 separate cost elements can be defined, which can also be receipted separately.

PATH: Resources > Resource Master Data XXX > Cost tab.

© 2026 Boyum IT Solutions A/S



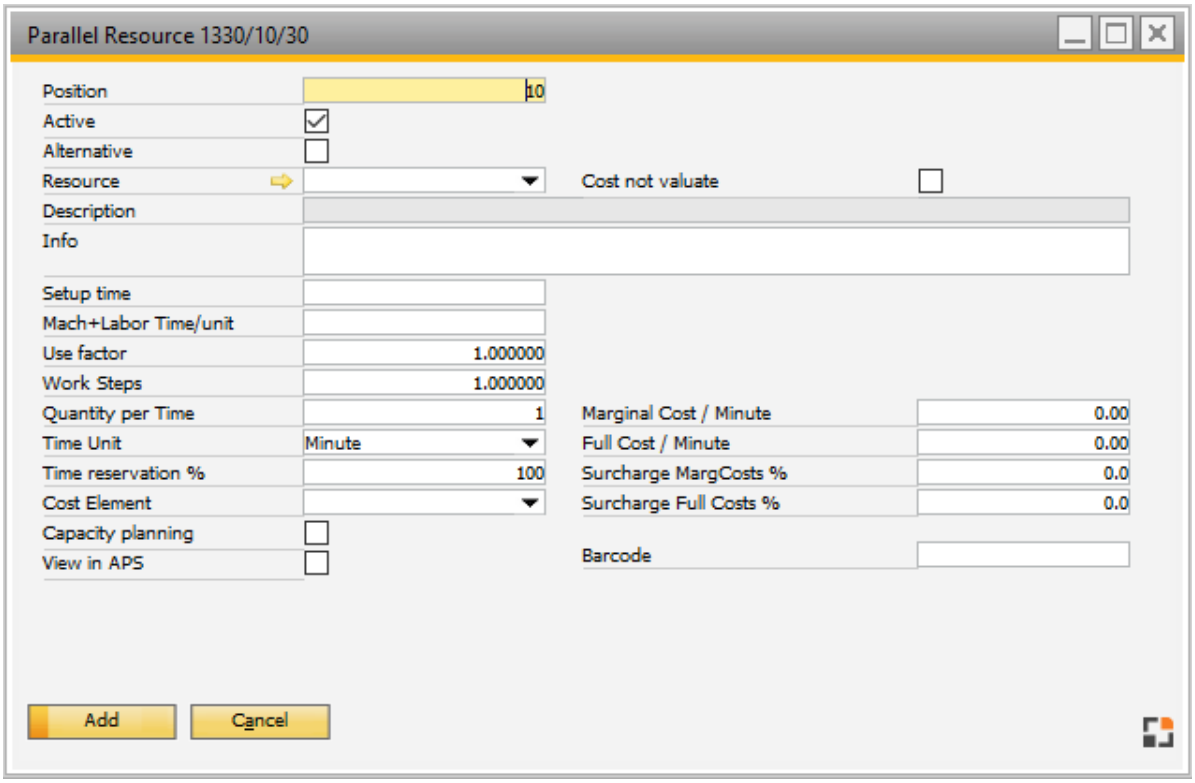
Window stamm_arbplatz_edit.psr

To assign a parallel resource, click on New and a new window opens:

PATH: Inventory > Item report >

1. "Open" an entry >
2. Routing tab >
3. "Open" routing position >
4. "Parallel" tab >
5. "**Open**" / "**Add line**".

© 2026 Boyum IT Solutions A/S



Window artikel_arbplanpos_edit_parallel_edit.psr

Field	Description
Position	Used for sorting the parallel resource list from the routing. It is a consecutive number, but not a primary key.
Active	Set parallel resource active. If enabled, only one position can be active. **Important**: Only one parallel resource can be activated which defines the throughput time per routing. This information is copied to the operation, therefore, the user must check one parallel resource as "Active", and all other resources should have "Active" unchecked.
Alternative	Set if this parallel resource can also be alternative to other parallel resources for the same operation.
Resource	Resource ID of the parallel resource **Note**: No external resources or resources with extended cost rates , for example personnel costs, are allowed.

© 2026 Boyum IT Solutions A/S

Cost not valuate	Determine whether to consider resource costs in calculation If enabled, the resource costs of this parallel resource are ignored. Precalculation and post-calculation are affected. Costs created with time receipts are not taken into account. Use this option if the cost is included with the main resource. Disabled by default. *beas 9.1 PL: 08*
Description	Description of the resource that comes from the resource master data and cannot be changed.
Info	Additional free text information.

Throughput Time area

This information relates only to Business performance, not to the throughput time of the work sequence itself, as this is ALWAYS parallel to the main work sequence and always has the same start and end time.

Field descriptions

Field	Description
Setup time	Setup time of the parallel resource process.
Mach+Labor Time/unit	The Mach+Labor time for a unit of quantity using the *Time unit* in consumption units *Quantity per time* finished parts. **Note**: Secondary mach+labor times cannot be specified here.
Use factor	Split the production time amongst more finished goods ***See*** Calculation of target time.
Work steps	Used as a multiplication factor for the production times ***See*** Calculation of target time.
Quantity per Time	Used as a multiplication factor for the production times
Time Unit	Defines times in hours or minutes. To register a processing time independent from the quantity you can enter 0. ***See*** Calculation of plan time.
Time reservation (%)	If no setup and edit time was entered, the time of the main operation * time reservation is used as reference.

© 2026 Boyum IT Solutions A/S

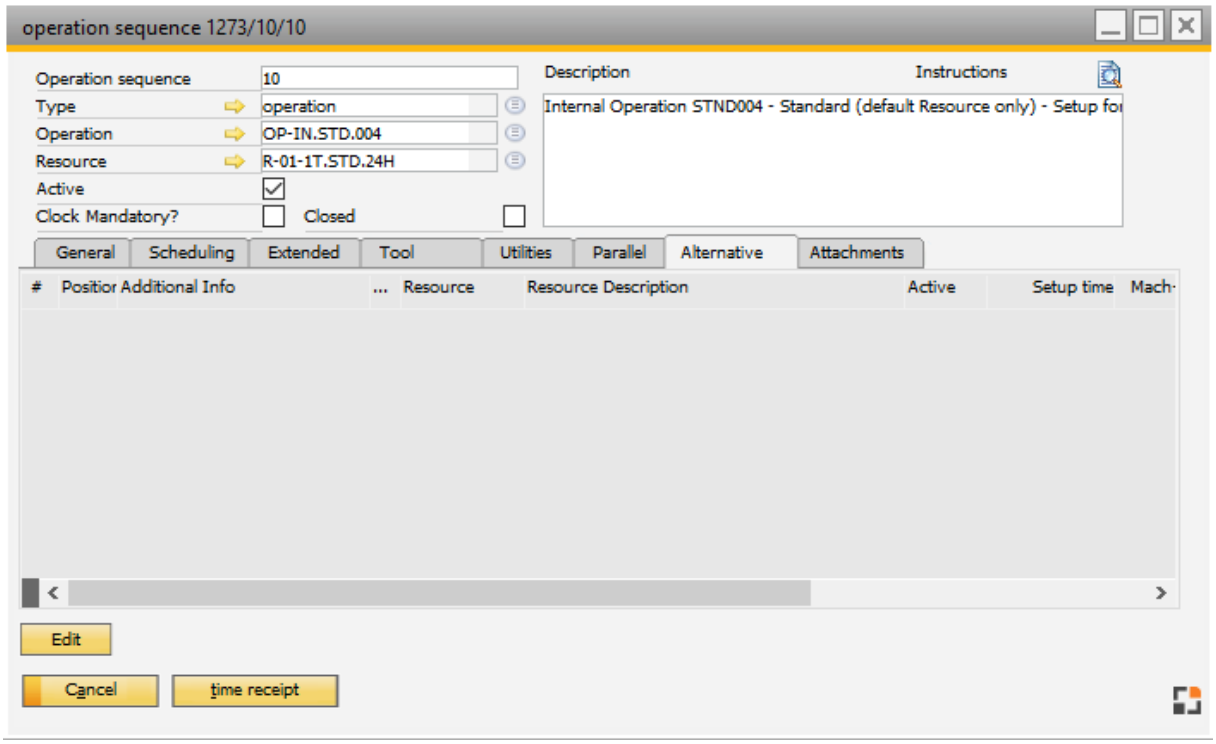
	At which % should the resource be scheduled? ***Example***: The parallel resource is an employee operating four machines at once. He needs to be available for the machine at the whole time but only at 25%. ***Example***: The parallel resource should work during 30% of the main resource time, the user can enter the value “30” in the Time Reservation field, and Beas calculates the times for the parallel resource automatically. If the setup time or processing time is entered, in Precalculation this value is ignored. ***See*** Calculation of plan time.
Cost element	Accumulated costs are written to this cost element.

Technical information:
Parallel resources share a database table with tools, utilities, and alternative operations.
Structure of bar code on routing card: 6-digit beas_ftapl.number + 3-digit beas_ftapl_wkz.pos_id

back to routing

Production > Work Order > **Open** WO position > **Open** operation > "Alternative" tab

© 2026 Boyum IT Solutions A/S



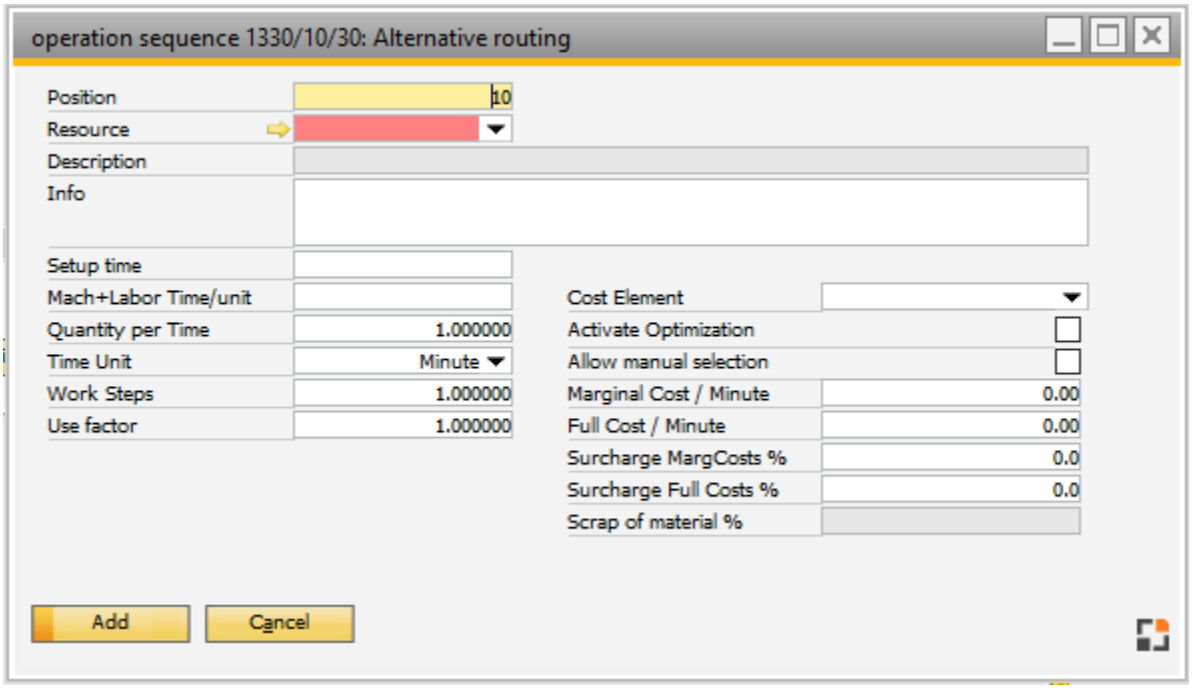
Window arbplanpos_edit.psr

In this tab you can define alternative resources related to a routing position.
In APS and Work order you can change the alternative resource with one mouse-click.
The alternative resource can have its own parameters as setup time, processing time etc.

The option "Optimization"checks whether a faster production would be possible using this alternative resource.

The user can insert, edit and delete resources. To assign an Alternative resource, click on **Add,** and a new window opens:

© 2026 Boyum IT Solutions A/S

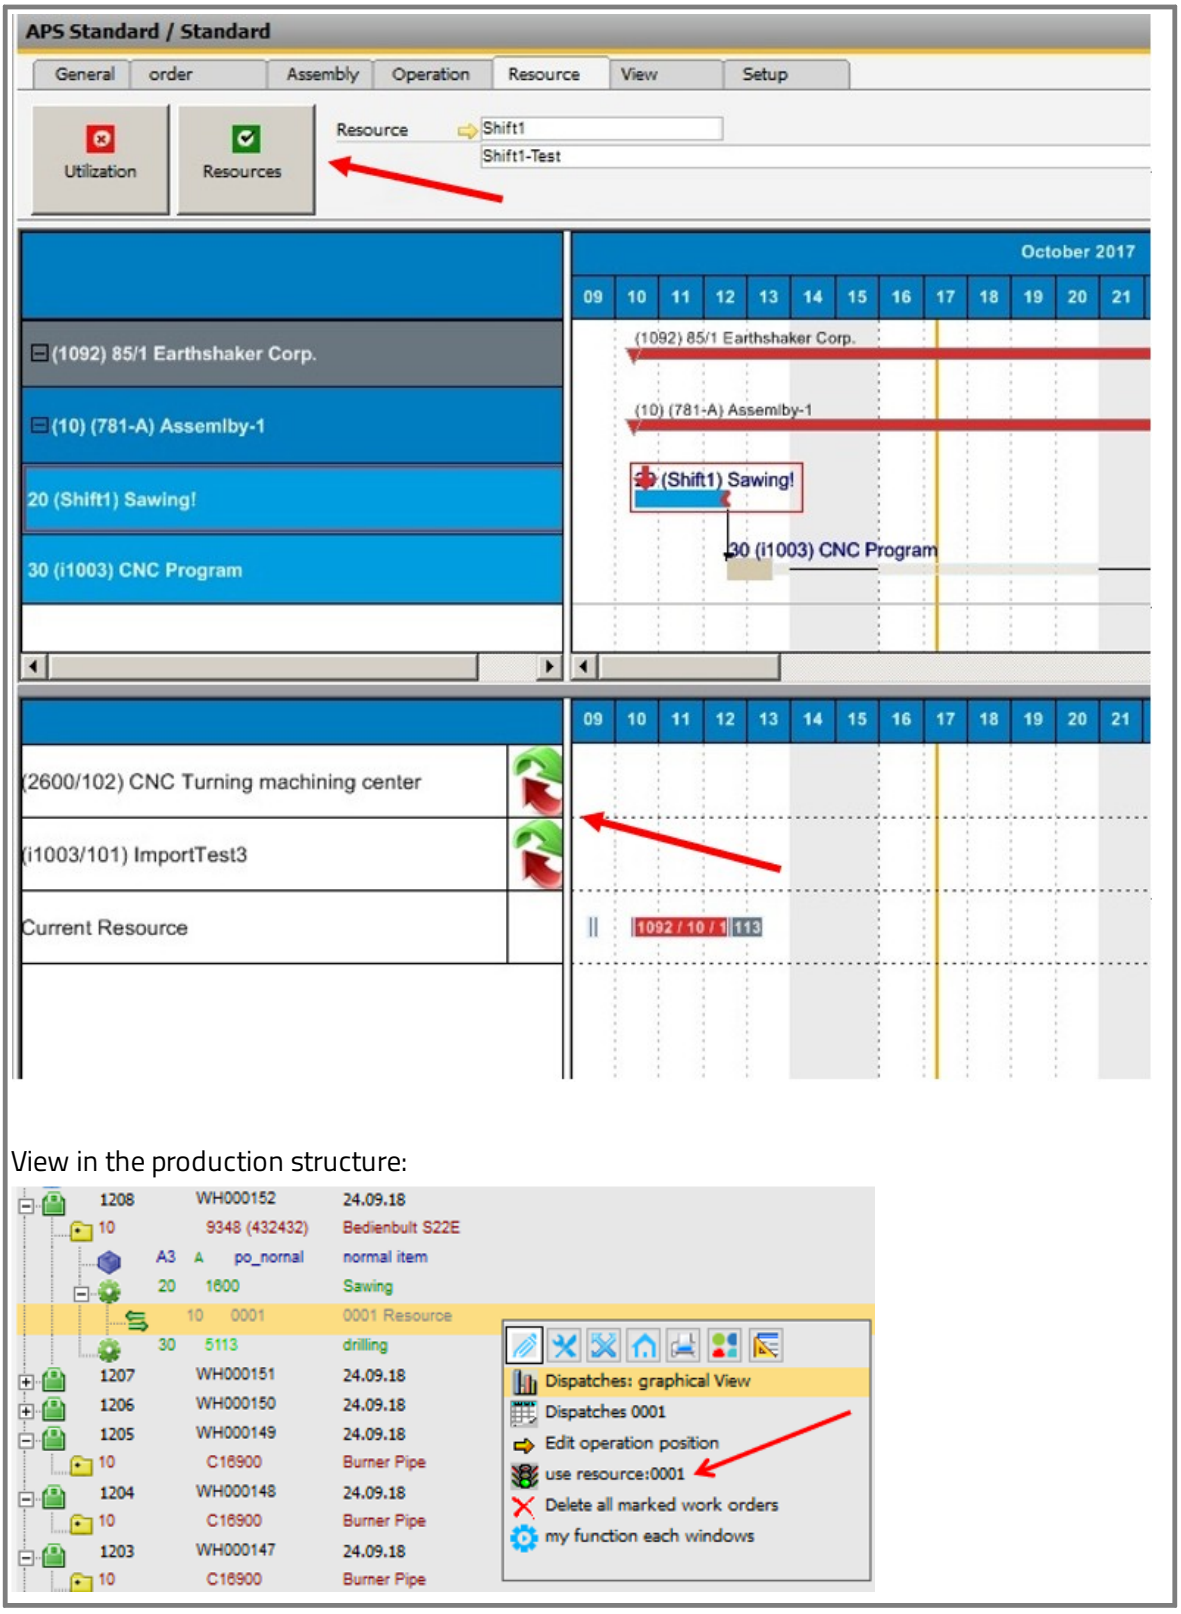


fert_arbplanpos_edit_alternativ_edit, artikel_arbplanpos_edit_alternativ_edit, stamm_ag_alternativ_parallel_edit

- The alternative resource can be selected manually in APS – graphical view and in production structure view.

  Selection in the APS view:

© 2026 Boyum IT Solutions A/S



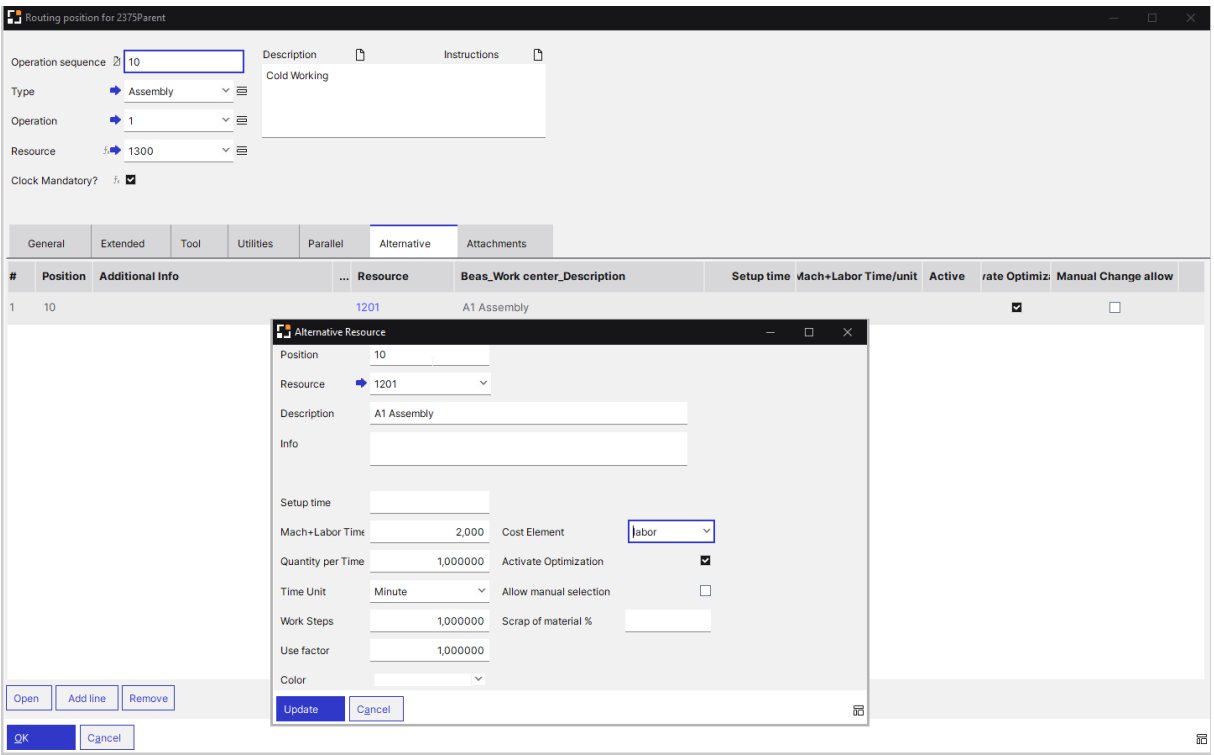
View in the production structure:

See Overview alternative resources

© 2026 Boyum IT Solutions A/S

The alternative resource can be selected manually in the APS – graphic view and Production structure display.

Note: Alternative resources are not supported in the Precalculation.



Field	Description
Position	Used for sorting the parallel resource list from the routing. It is a consecutive number, but not a primary key.
Resource	Select the resource ID of the parallel resource from the existing resources. The alternative resource can be selected manually in the APS - graphic view and production structure display.
Description	Description of the resource that comes from the resource master data and cannot be changed.
Info	Additional free text information.

Throughput Time area

Field	Description
Setup time	Setup time of the alternative resource process. Default time can

© 2026 Boyum IT Solutions A/S

	be specified in the *Quantity per time* parameter.
Mach+Labor Time/unit	The Mach+Labor time for a unit of quantity using the Time unit in Production UoM Quantity per time finished parts. **Note**: Alternative resources do not manage Secondary+Labor times. Therefore, if a main resource manages secondary times when switching to an alternative resource, the information of the secondary values in the operation will be lost, especially if you want to return to the main resource again. In this case you will have to add those data manually or refresh the order if applicable.
Quantity per Time	Defines the number of finished parts in Production UoM to which the processing time refers, e.g. 10 minutes per 1000 kg. ***See*** Routing position.
Time Unit	Defines whether times are specified in hours or minutes. ***See*** Routing position.
Work Steps	Number of required work steps used as a multiplication factor for the production times e.g. 10 work steps in "processing time" are required .
Use factor	Use factor to split the production time amongst more finished goods, e.g. 10 units are produced at once per step or hub and per processing time.
Cost element	Accumulated costs are written to this cost element.
Activate Optimization	If active, define whether Beas should automatically select the most adequate resource, amongst the main and alternative resources in the APS calculation. The resource is replaced automatically.
Allow manual selection	⊟ Allow the manual selection of this alternative resource. This alternative resource can only be selected manually if this option is enabled. The event is canceled and receipted with the error message *'(aktivaplatz440)Resource cannot be selected when flag 'allow manual change' is off'* if this option has been disabled and an attempt has been made to select the resource. **Note**: A change is only possible if change has been allowed according to the production position (**Production position**

© 2026 Boyum IT Solutions A/S

	> **Allow change** has to be activated).
Scrap of material %	Define Scrap of Material. If the user uses this alternative resource, the system replaces the Scrap material % too and recalculates the scraps per Material for all routing positions. ***See*** Concept Scrap of Material Note: If you switch the resource with another Scrap of Material entry in the work order, the system calculates the new quantity of the related BoM Position, but not the quantity of order related sub assemblies. ***See*** this video: *Beas 9.3 PL 1*

Work order item

BoM

Routing

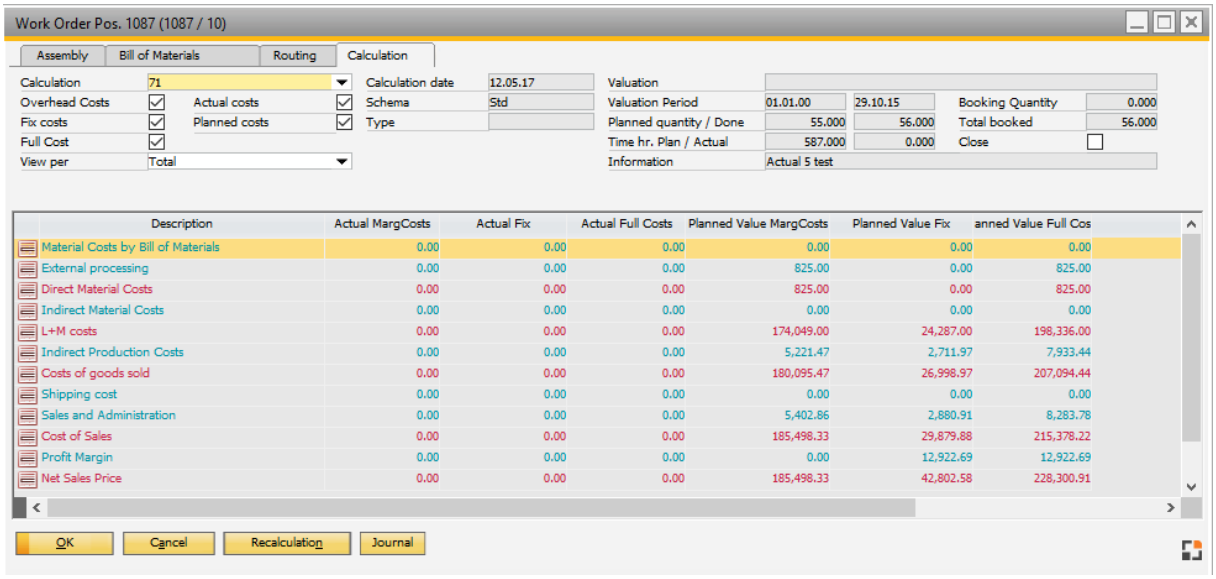
Calculation

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Calculation" tab.

In this area the results of all manual and automatic calculations are displayed.

For account postings and price valuation a calculation is also executed when an assembly is posted. This can be displayed here afterwards.

The results for full, fixed and marginal costs for planned and current costs can be displayed.



© 2026 Boyum IT Solutions A/S

Window fert_ftpos_postcalc_master.psr

Field	Meaning
Calculation	Number of post-calculation.
Calculation date	Date of the last calculation.
Valuation	Valuation type. A post calculation is executed when a posting is made depending on the valuation type. The valuation type used for this is displayed here. This field is empty if the post-calculation was executed manually. All fields and switches that are not relevant for a calculation for planned costs are hidden if the valuation "Planned costs" was selected. ***See*** Configuration wizard - Valuation assembly, Production type
Costs (overhead, actual, fixed planned or full costs or standard price)	Select, which cost rates are used for the calculation. The selection is reduced for valuation for planned costs.
Schema	Selected calculation schema.
Planned quantity	Plan values have been calculated with this quantity. **Valuation form to post-calculation** Only visible for valuation form to post-calculation and manually created post-calculation. For final posting or for manual post-calculation this is the planned quantity **Valuation to planned costs** Only the quantity to be posted is calculated for valuation of planned costs. The columns "Post quantity", "Total posted"

© 2026 Boyum IT Solutions A/S

	and "Finished" are hidden, since these are not relevant for calculation.
Done	Quantity already posted. Only visible for valuation form to post-calculation and manually created post-calculation. The quantity to be posted is considered at a evaluation if the finished quantity at the time of the post-calculation or valuation.
Total booked	Total posted quantity. **Valuation form to post-calculation** At the time of calculation: Quantity posted so far + quantity to be posted. **Valuation to planned costs** These fields are not displayed here.
Type	Type of post-calculation (standard / single step / accumulated) Type of post-calculation **Manual post-calculation** Type of the selected calculation: standard / single step / accumulated. **automatic post calculation (Entry process)** This field is not filled. A single step calculation is always made.
Time hr. Plan / Actual	Planned / actual time The planned and the accumulated time is displayed. Only the calculated planned costs for the to be posted quantity are displayed at the valuation for "planned costs".

© 2026 Boyum IT Solutions A/S

Information	Free text
View per	Select view: per 1 unit, per ... units, lot size, total Determine for which quantities to convert the view. Note: **Total** refers to the previously posted assembly quantity. Means "Total costs"/ "Planned quantity" * "already posted quantity" For valuation with calculation objects with "price per piece" and "price per lot size" the price is displayed in relation to the posting quantity and not to calculation quantity. By selecting in view a unit different from "total" the view will be incorrect, because it is converted per calculation quantity. The total sum is correct.

Buttons:

Recalculation: A recalculation is performed .

Journal: Open the transaction journal.

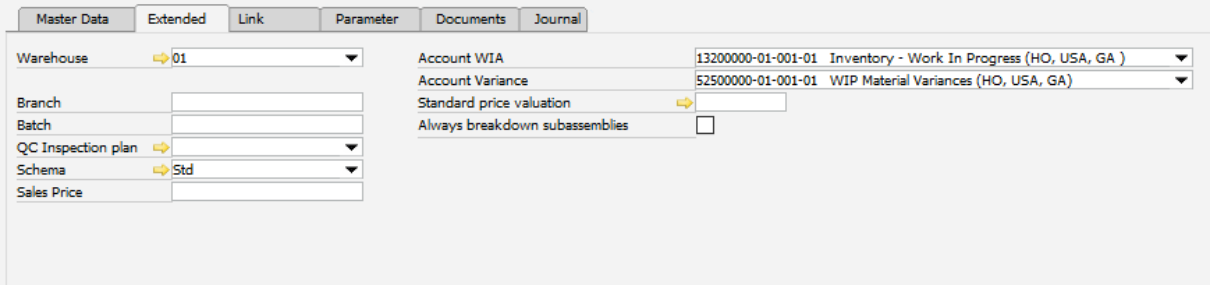
8.2.4.5.1.5 Extended tab

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Assembly" tab > "Extended" tab.



Window fert_ftpos_postcalc_master.psr

© 2026 Boyum IT Solutions A/S

Field	Description
Warehouse	Assembly receipt planned for this warehouse Defined in: a) Warehouse rules – Document type production create new. Warehouse rules can be stored in the Item master. b) **Configuration wizard > Production > Valuation and posting assembly > Posting > Post finished parts to warehouse** c) Standard warehouse of the item. This warehouse is used to determine the WIP accounts. For that reason, the warehouse should not be changed. If the work order has already started, WIP accounts may be warehouse-dependent. This warehouse is the suggested warehouse at receipt. The System supports WMS, SAP and Beas Bin Managed warehouses *beas 9.3 PL 2*
Bin location	Default bin location This field is only visible if a bin location warehouse was selected. The bin location to post in the finished part to. Use Warehouse rules for automatic pre-allocation.
Branch	The branch in which the production item is manufactured, determined automatically, based on the warehouse. The field is only visible if the multi-branch solution was activated in SAP Business One.
Batch	Information on batch This field is for information only without any further function. Can be used for customization. Batch number reservation, similar to serial numbers, is only possible using customized extensions. ***See*** Configuration wizard > Batch management.
QC-inspection plan	Which QC-inspection plan to use for this assembly Determined automatically using the QC-settings in the item. If changed during the creation of a new work order item, the system checks whether another warehouse is to be used (***see*** Warehouse rules).

© 2026 Boyum IT Solutions A/S

	At the first receipt the QC order is created. If the entry is emptied, the QC-inspection plan is determined at the moment of receipt.
Schema	The calculation schema used for automatic post-calculation Determined automatically. It defines which schema is used for valuing the work order. 1. If defined in the Calculation schema: the setting form Configuration setting. if not defined 2. from item master data - Calculation schema. if not defined 3. Schema "Std". You can change this manually, but only before the work order is saved. ***See*** Calculation schema Configuration Wizard
Sales Price	Sales price defined in the precalculation or manual input.
WMS production line	Select a WMS production line. The field is only visible when Produmex WMS AddOn is installed in the database. Predefined values come from WMS definition. **Automatic assignation of Production line** If the item or the warehouse are changed, the production line is also updated automatically. To define the production line at the position at work order creation the system checks: 1. If the BoM is Linked to an operation, the production line of the routing is used 2. If there is a production line in the Warehouse rule 3. The default production line on warehouse Level. ***See*** also WMS picking for production work flow

© 2026 Boyum IT Solutions A/S

Account WIA	The WIP account used for the assembly Only visible if continuous stocktaking is activated. Warehouse and accounts can be changed any time. If the warehouse is changed of the correct accounts are determined automatically. Except for when a new assembly is created, a warning is issued before changes, because a subsequent change of accounts could result in differences in account balances, when time receipts have already been posted. **Note**: The standard account determination of SAP Business One is used. Extended account determination is supported. The selected warehouse needs to be defined as WIP warehouse. ***See*** **Configuration wizard > WIP-accounts.**
Account Variance	The variance account used for the assembly. Cannot be changed. Only visible with continuous stocktaking activated.
Standard price valuation	Only active for the default valuation method: References the last valid precalculation at standard price valuation. This is used as a reference in post-calculation. The results of the calculation can be retrieved directly.
Always breakdown assemblies	If enabled, everything is broken down as order-related Breakdown takes place regardless of the scheduling ID. This option can only be changed when creating a new work order. If enabled, even storage-related assemblies (scheduling ID storage-related) are also broken down and included as receipt. This option cannot be changed for existing work order items. It has a higher priority than the settings in Master data > BoM and Production types. The settings have no effect if the work order was created from a calculation. This option can only be changed when a new assembly is created. The default can be stored in the production type. ***See*** Production types > always breakdown assemblies.

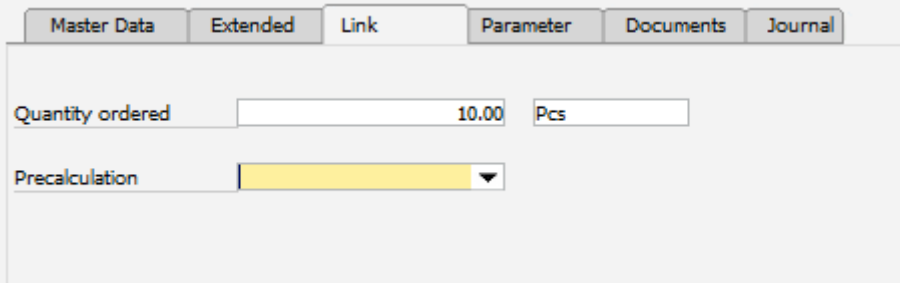
8.2.4.5.1.6 Link tab

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Assembly" tab > "Link" tab.



Window fert_ftpos_postcalc_master.psr

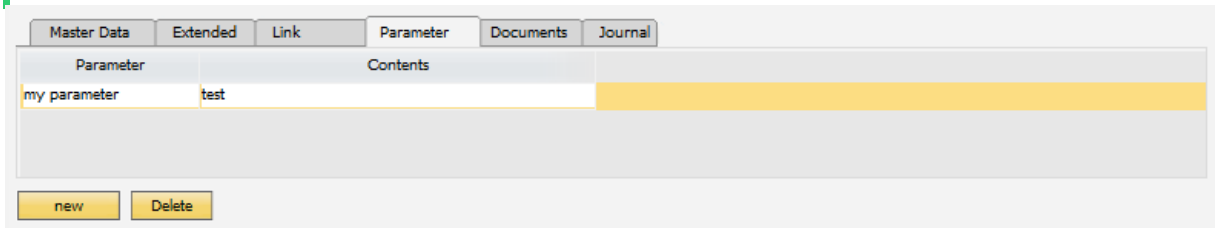
Note: This tab is only visible on top level. In Sub positions this tab is not available.

Field	Description
Basic document	Defines the type of base document. Available types: • Sales order • Proforma invoice • Production order If one of these options has been selected, the document information can be selected. Click the orange arrow to open the basic document. Note: Field is only available if Reservation system is disabled. If you work with reservation, you can manage this via Button Cross references.
Quantity ordered	The quantity ordered or requested from the work order in storage units.
Precalculation	If the work order was created from a calculation, the internal calculation number is displayed here. ***See*** Calculation

© 2026 Boyum IT Solutions A/S

8.2.4.5.1.7 Parameters tab

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Assembly" tab > "Parameter" tab.



Window fert_ftpos_postcalc_master.psr

In this tab, copies of the parameters from the item master are displayed and can be changed if necessary.
These can be used e.g. as a reference in variant production.
The parameters can be changed, added, or deleted here.

Note: UDF's set in the Item Master are not copied into the UDF fields of this tab.

8.2.4.5.1.8 Documents tab

It is possible to insert attachments to the work order position. Click the **New** button and a new window opens to insert the attachment.

See Work order document attachments.

8.2.4.5.1.9 Journal tab

PATH: Production > Work orders > **Open** work order > Work order document "Positions" tab > **Open** selected work order position > "Assembly" tab > "Journal" tab.

This tab is only active if continuous stocktaking is activated.
All journal entries belonging to the work order are displayed here, grouped by account.

Field	Description
Account	The account number.
Description	Account name.
WIP	Indicates if it is a WIP account.
Amount	The amount posted (summarized per account).

© 2026 Boyum IT Solutions A/S

8.2.4.5.1.10 Structure Refresh

In Beas it is possible to "Refresh" existing work orders from master data.
Related to settings in the Configuration assistant you can refresh only Bill of Materials, Routing, not started work order and started work orders.

How Refresh works

BoM and routing are read again from the item master data and the work order is updated. The full sub-structure is updated. Each position is analyzed separately, deleted, replaced, added or completed.
In the selected position, the following fields are updated:

- Drawing number
- Match code
- DIN
- Raw material

If version control is active, the drawing number and description is taken from the respective version.

If deleting is not possible, the relevant items are completed. The following remains unchanged when updating:

- Position number of the assembly
- Operation sequence
- Material item
- Bar code number
- Information whether assembly was completed

As long as the operation sequence or the material item number is not changed in the master data, the production item is firmly connected to the master data This makes it possible to update the work order regardless of the manufacturing item number.

The following information is not changed when updating:

1. Item number of the assembly, operation sequence and material item
2. Deposited bar code number of the assembly, operation sequence and material item
3. Information on status (completed)

If an operation sequence or a material item is completed, it is updated, but remains closed. If an assembly is completed, it is not changed anymore and there is no further breakdown or update of the operation sequences, BoM and sub-assemblies.
If in master data a material item (which is an order-related assembly) is deleted, the material item and the associated assembly are also deleted during the work order update. If deletion is not

© 2026 Boyum IT Solutions A/S

possible due to existing time receipts, only the deletable items are deleted and all related operation sequences, BoM items and assemblies are closed. The WIP account for the affected assemblies is cleared.
Thus, it is always possible to refresh work orders including multi-level work orders. Phantom assemblies do not cause issues.

Inactive operations
Control the behavior of inactive operations during Structure refresh in the Configuration wizard.
See the different setting descriptions of parameter Apply inactive work sequence.

Material change in the existing BoM:
If the item number in an existing material item is changed in the master data, the link to the production BoM is lost during the update. First it is deleted, then it is inserted as new. A new number and bar code are assigned to the BoM item. If the BoM item cannot be deleted, it is set to completed. The same applies to the corresponding sub-assemblies.

> **Note**: The update process uses the item number in master data. For this reason, BoM and operation sequence position numbers may not be changed.

Refresh only BoM
In the Configuration wizard you can define to refresh only the BoM but not the routing. This can be used in case the routing is managed in the work order and not in the master data.

Variant production
If variant production is used, parameters can be queried when an item or work order is created. These are saved and used in case of an update, they do not need to be entered again.
(Table `beas_ftcaft_varentry`). For more information ***see*** function Variable.

Multiple update
In the work order list several orders can be marked and calculated at once. The drawing number, description, DIN, raw material and match code of the selected assembly are NOT updated. ***See*** WO structure.

Change Log support:
All the important changes performed in the WO Refresh function (that we improved in our previous version) are now recorded in the Change Log.

© 2026 Boyum IT Solutions A/S

Limitations

The work order can be updated if
- it was not created from a precalculation,
- it is not a collective order (merged work orders)
- APS planned flag is not activated
- Rules are defined in Configuration assistant

An update is also possible if time receipts or material postings exist. In this case, each position is analyzed separately, deleted, replaced, added or completed.

If material summary is enabled, refresh is not possible. If you click the button, the error message `(auftrs340) "material summary enabled, no work order update possible"` is displayed.
Related option for material summary is in **Configuration wizard > Production > Create new > Summarize phantom assemblies by item numbers**.

If the "Changes allowed" flag is not active at the work order position, the Refresh button is not visible. If the "Changes allowed" flag is not active in a sub-position of a current work order position, the refresh function does not refresh the sub-position or any related positions of this sub-position.

If an assembly was split, (***see*** split assembly) , the split assembly is not updated any more. The quantities of the original assembly are changed back.

Phantom items - limitation:
In case:
- there are several instances of the same phantom item in the work order structure,
- the internal Position ID is changed in the structure,
- the WO is already started (includes Time receipts, issue/receipt documents)
- and the WO refresh behavior Configuration parameter is set to "Refresh",

the refresh process is discontinued.

8.2.4.5.2 field description extended

Additionally available columns in a production document:

Field	Description

© 2026 Boyum IT Solutions A/S

Document No	Production document number (internal, unique, not changeable).
Pos	Production position number.
Structure-Pos	Structure position number. Sorting by this number, the work order is displayed in the correct structured order.
To Pos	For sub-assemblies there is shown to which main assembly they belong.
To BoM Pos	Reference to BOM item of the main assembly.
Order quantity	Quantity according to customer order in warehouse units.
Quantity consumption	Production quantity in consumption units.
Quantity storage	Production quantity in warehouse units.
Unit warehouse	Warehouse unit.
Conversion	Conversion from consumption unit to warehouse unit.
Finished	Quantity reported as completed in consumption units.
Manually finished	Quantity reported manually as completed. ***see*** assembly tab – master data tab – column "ready")
Quantity finished	Completed quantity in warehouse units. Sum of postings of this assembly, less cancellations, plus the value from "manually finished".
Deliv. Date	Delivery date of the item = delivery date of customer order less the entered number of work days . Double-click entry to change the date directly.
Closed	Position closed?
Start time	Calculated start time of item.
End time	Calculated end time of item.
Actual time	Previously reported actual time.
printed	Printed production document.
Additional text	Free text.
Barcode	Barcode printed on the routing card. Structure yyyyyyxxx where y is the document number and x the item number.
Sales price	Can be entered manually - required for planned - actual post calculation.

© 2026 Boyum IT Solutions A/S

Last post-calculation	When was the last post-calculation performed for this work order and a price determined?
Mat marg cost plan	Material overhead costs at marginal costs and full costs as per default.
Mat marg cost act	Actual marginal and full costs according to postings.
LMC marg cost plan	Labor+machine costs marginal or full.
LMC marg cost act	Actual marginal and full costs according to time receipts from FDC.
COGS marg full plan	Calculated costs of goods sold as per default.
COGS marg full act	Actual costs of goods sold.
Time plan	Calculated planned minutes.
Time act	Calculated actual minutes.

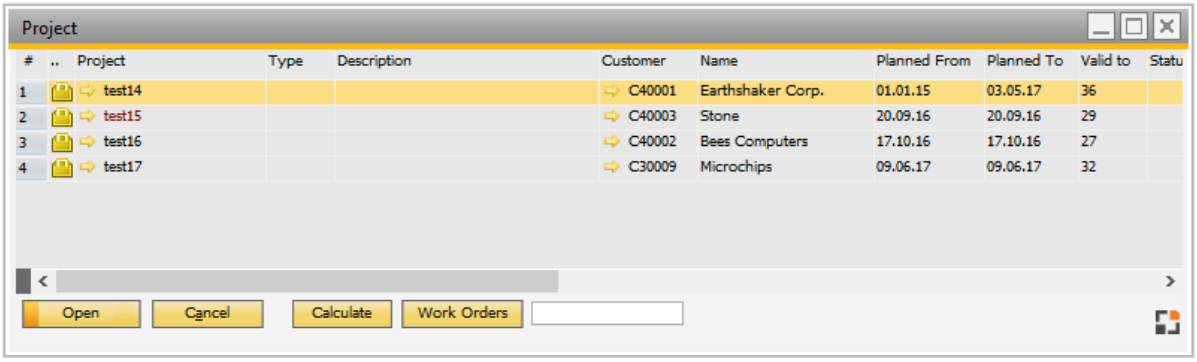
Concepts

Project cost elements

All projects are displayed in the Project list. Inactive projects are hidden by default and can be viewed by using the Search field.

PATH: Production > Project.



Window prj_browse.psr

Functions

Function	Description
Search	Search field to find a project
Open	Open selected project.
Cancel	Close window without changes.
Add	Create new object.
Remove	Delete selected project.
Calculate	Calculate costs.
All calculate	Calculate all costs.
Work orders	Open linked work order.

Work orders

From the project list, you can access the assigned work orders. When adding a new project, Beas creates a work order automatically, to which tasks can be assigned later. Work orders are independent of projects. They can be edited and processed, even if the project was already closed or if there are no more open tasks.

See:

Substructures can also be displayed here, by moving the position and description a bit to the right.
Window settings are supported.
The sequence can be changed via Drag&Drop. If a main task is moved, the whole substructure is also moved.

Field	Description
...	Free bitmap image selected in Task > Extended tab is displayed here.
Structureinfo	Structure information.
Sortid	Numeric order of task in the list.
Position	Task position.
Description	Task description.
Start	Planned start of the task.
End	Planned end of the task.
Days	Days planned for this task.
Locked	If the task is blocked, the task is marked with a Stop-Icon.
Status	Selected status for this task.
Complete%	Rate of completion.
Budget	Defined budget (costs) for this task.
Reported	Previously reported costs for this task.
Days	Planned days for this task.
Reported	Previously reported days for this task.
Responsible	Person in charge for this task.

Functions

Field	Description
Open	Open selected task.
Cancel	Close window without saving changes.
Calculate	Click this button, and the system reads all documents linked to the current project and fills all relevant information based on them.
Sorting: Save	Sort the items of the list via drag & drop, then click this button to save your fresh sorting.
Add	Add a new task. The function opens the Task editing window.
Remove	Delete task.

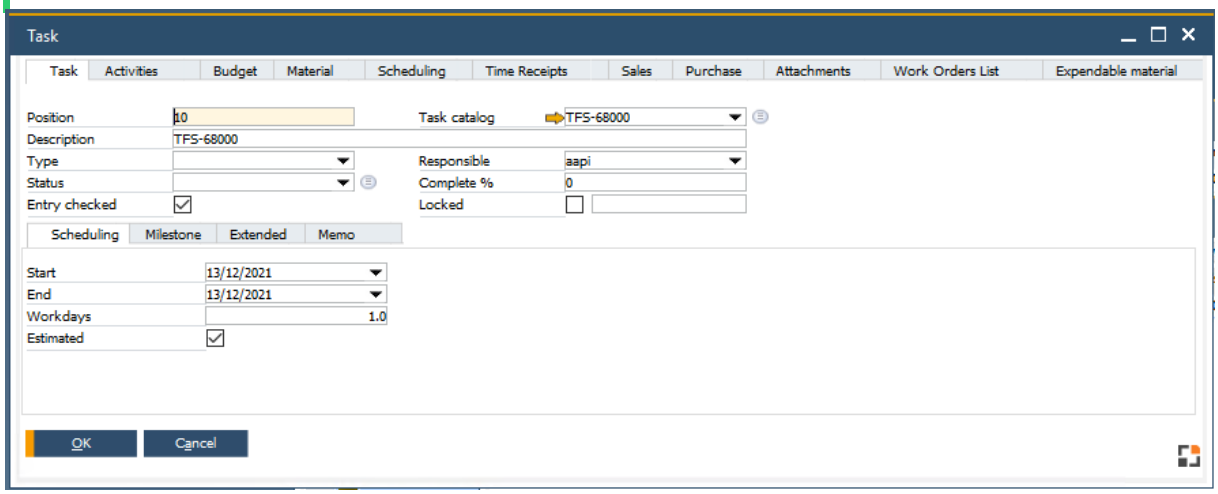
© 2026 Boyum IT Solutions A/S

Click on an entry to open the Editing window for this task.

8.3.2.1 Edit task

In this window you can edit a Project task / Project Template / Task Catalog.

PATH: Production > Project > **Open** a project >"Tasks" tab > **Open** a task from the list.



Window prj_line_edit.psr

Task tab / Master Data

Field	Description
Position	Position of the task. Can be alphanumeric, the number does not determine the order of processing. Order is set up by sorting with drag&drop in the list. Notes on data structure: `beas_prj_line.prjcode` = Project number `beas_prj_line.lineid` = Task ID (same number as in template) `beas_prj_line.pos_id` = Visible position number `beas_prj_line.sortid` = Sorting `beas_prj_line.prjuid` = Unique ID of the task over all projects. Used for linking to other documents.
Description	Task description.
Type	Type of task: Milestone or Standard.
Status	Status of the task.

© 2026 Boyum IT Solutions A/S

	Select a status. Only information, no function here. You can edit the statuses by pressing the selection icon. Values "complete%" and "blocked" are accepted after selection, but can still be changed afterwards. For more information, ***see*** Status
Entry checked	Determines whether an entry is marked as "checked". Unconfirmed tasks are marked with a warning, with icon .
Task catalog	Select a predefined task from task catalog. Visible when opened from Project Task and Project Template.
Responsible	Person in charge for this task.
Complete%	Determines the rate of completion for this task. In percent If in "Planning" tab - "Production % Processing" was not set to "manual", this field is blocked.
Blocked	Use this to block the task. When no more activities are possible, the task is marked with a Stop-Icon. Additionally, you can enter a blockage reason.

Tab: Task - Activities
Manage all activities assigned to a task. Create new and edit existing ones.

Tab: Task - Budget
All assigned budgets are displayed with planned and actual values (times and money). Use the "**Calculate**" button to display all related budgets.

Tab: Task - Material

Tab: Task - Purchase
This tab within a Project task is visible only if the option "Purchase" was selected under **Task > Extended**. All assigned purchase documents are displayed. Use "**Open**" button to open the purchase documents.

Tab: Task - Sales
This tab within a Project task is visible only if the option "Sales" was selected under **Task > Extended**. All assigned sales documents are displayed. Use the "**Open**" button to open the sales documents.

© 2026 Boyum IT Solutions A/S

Tab: Task - Scheduling
This tab within a Project task is visible only if the option "Scheduling" was selected under **Task > Extended**.

Tab: Task - Time receipt
This tab within a Project task is visible only if the option "Order times" was selected under **Task > Extended**. The resource selected for order time receipts is displayed. All reported order times are displayed. Use "**add**" to create new order related project times.

Tab: Task - Attachments
Manage attachments assigned to the task. Edit attachments and create new ones of type file or text.

Tab: Task - Work orders list
Work orders associated with the Task are listed in this tab. You can edit the WO document from here and create post-calculation for it as well.
This Project task tab is visible only if the option "Production" was selected under **Task > Extended**.

Tab: Task - Expendable material

Lower tabs

Scheduling tab:

Field	Description
Work days	Work days planned for the respective task.
Budget	Define a budget available for the task.

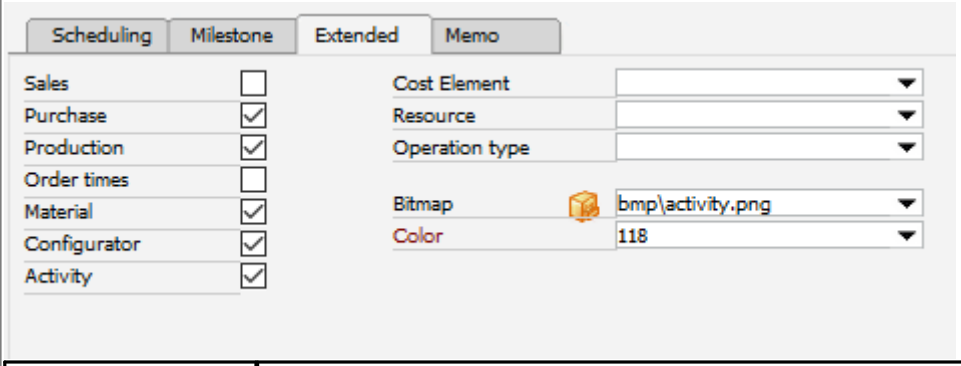
Milestone tab:

Field	Description
Milestone	Assign a mile stone to the task or define a new one using the selection icon next to the drop down field.
Acceptor 1,2	Acceptor 1 of the event defined in the milestone.
Text	Text, displayed to Acceptor.

Extended tab:

© 2026 Boyum IT Solutions A/S

In this tab you define, which documents can be created for which business objects.



Field	Meaning
Sales	When active, the following documents can be created from the task: Quotation, Sales order, Delivery, A/R down payment invoice, invoice, A/R credit memo.
Purchase	When active, the following documents can be created from the task: Purchase order, Goods receipt, A/P invoice.
Work order	When active, the following documents can be created from the task: work order.
Order times	When active, you can register or edit order times from the task. **Note:** Order times are meant to be project times not linked to a normal work order. This could be installation time, meetings or project administration. If the flag order times has been activated, the fields cost element, resource and operation type are important to be filled, because the order times are booked using the project work order.
Material	Without function.
Configurator	Activating this flag allows the creation of a configuration from the task (only if the product configurator is used).
Activity	Activating this flag allows the creation of an activity.
Cost element	Cost element assigned for this task.
Resource	Assigned resource for this task.
Operation type	Assigned operation type for this task.
Image	Select an image for the task to be displayed in lists.
Color	Select a color for the task to be displayed in lists.

Memo tab:

In the editor window you can edit and store task-specific texts.

In the Service contract tab you can add new or edit existing service contracts.

Field	Descriptions
Number	Number of service contract in SAP B1
Customer	Customer to which the service contract was assigned
Name	Customer name to which the service contract was assigned
Status	Status of service contract in SAP B1
Description	Description service contract in SAP B1
Start	Start date of service contract in SAP B1
End	End date of service contract in SAP B1

Service call tab

In the Service call tab you can add new or edit existing Service calls.

Field	Descriptions
Number	Number of service call in SAP B1
Subject	Topic of service call in SAP B1
Status	Status of service call in SAP B1
Name	Name of customer, to which the service call was assigned to
Date	Creation date of service call
Complete	Date the service call was closed
Status	Status of service call in SAP B1
Contract	Contract number assigned to service call in SAP B1

8.3.8 Attachments

Project

Edit project

Tasks

Budget

Activities

Purchase

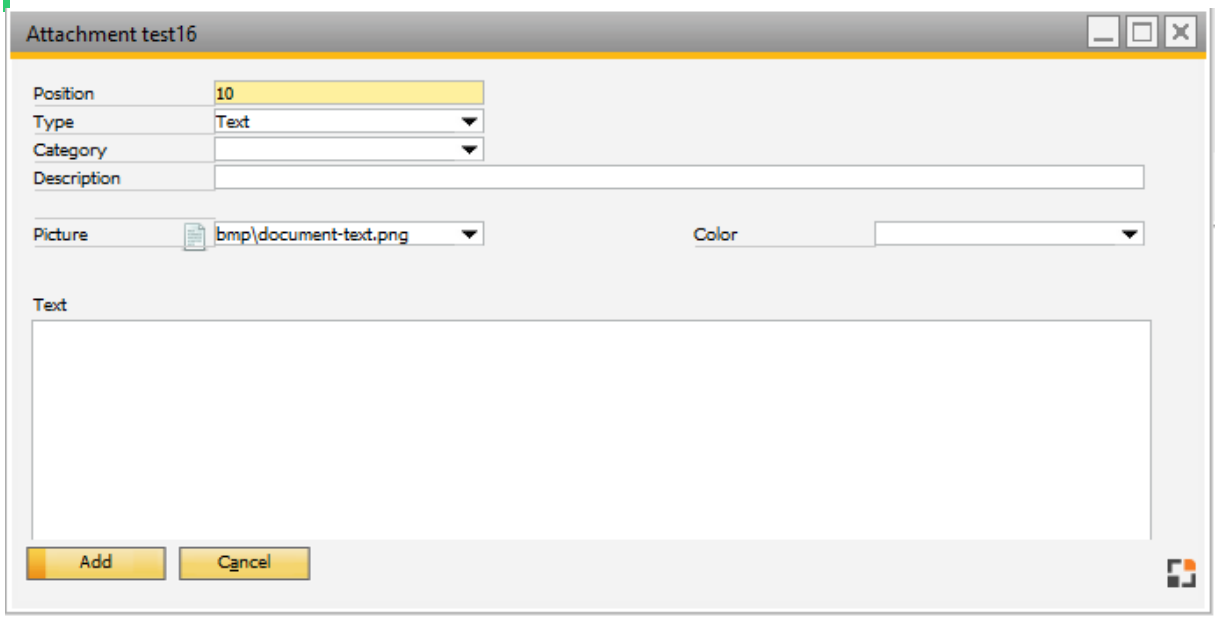
Sales

Service

Attachments

In this tab it is possible to add new or edit existing Project attachments.

PATH: Production > Project > **Open** selected project > Attachment tab > **Add** new attachment.



Window prj_attachment_edit.psr

Field descriptions

Field	Descriptions
Position	Position number.
Type	Text: Define the text in field "Text" (no attached file).

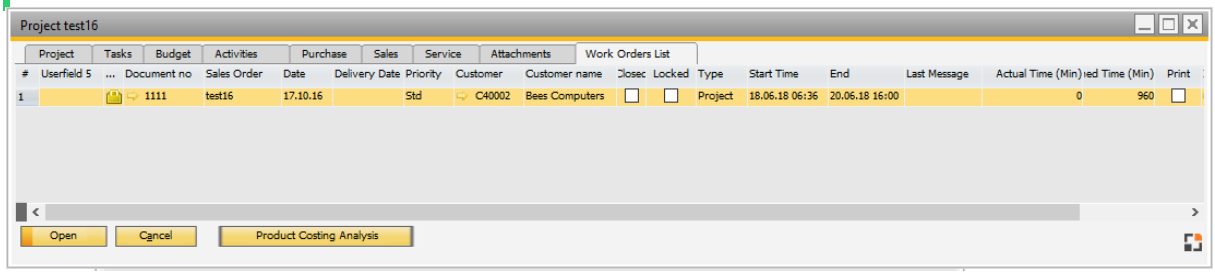
© 2026 Boyum IT Solutions A/S

	File: Choose the file which you want to link to this project.
Category	Define a category of your own choice for the attachment. All new category definitions are stored by the system and can be selected later for newer attachments from this dropdown.
Description	Description of attachment.
File	Select a file: This field is only available if type="File". After adding a file to the attachments, when you reopen it, the button **Creation Open** appears. The button opens the file with an associated program. ***For example***: a JPG file with an image viewer program, or Excel sheet with MS Excel. **Attention:** The system saves complete path + file. Choose only the Network folder so that other users may have access to it, as well.
Image	Bitmap image to link to the attachment.
Color	Define a color for the attachment to be displayed in.
Text	Enter text which you want to display. Only if Type = "Text".

8.3.9 Work Orders List

This tab provides a list of all work orders associated with the selected project.

PATH: Production > Project > **Open** a project > "Work Orders List" tab



Window fert_fthaupt_browse.psr

© 2026 Boyum IT Solutions A/S

Functions

Field	Descriptions
Open	Open selected work order.
Cancel	Close window without saving changes.
Product Costing Analysis	
Search	Open pop-up search window to get hits for the following information:
Add	Add new work order.
Reports	Opens the Reports window.

Field	Description
Order No	WO number
Only when active	Search for active orders only
Doc No	Document number
Customer Number	Customer Number
Customer Name	Customer Name
Project	Project
Type	Project type
Employee	Employee
Item	Item number
Drawing Number	Drawing Number
Material Group	Material Group
Raw Material	Raw Material
Matchcode	Matchcode
DIN	DIN code
only not printed	Search for not printed documents only
Search	Start search
Cancel	Close pop-up window without changes
New search	Start new search

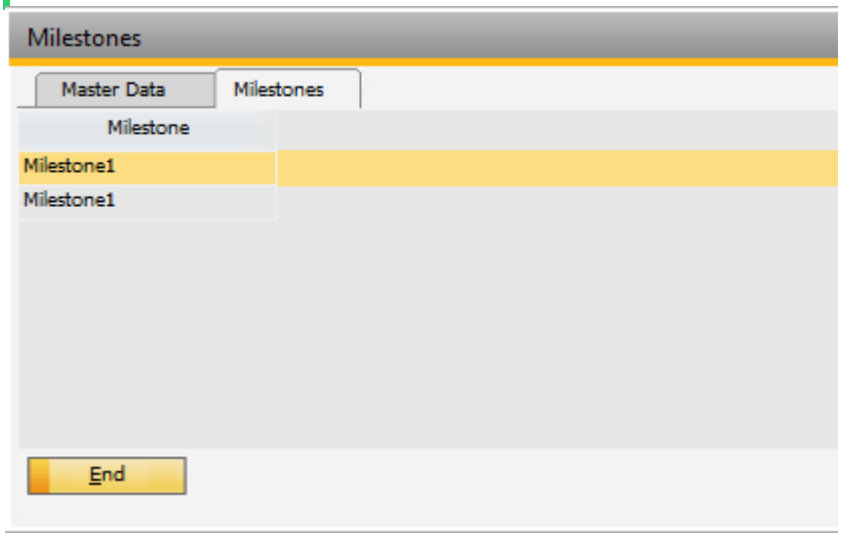
© 2026 Boyum IT Solutions A/S

Post calculation	Opens the post-calculation window.
Material requirements	Opens the WO material requirements report window.

8.4 Milestones

In operation, routing, production scheduling and in calculation, milestones can be added. These are predefined in **Production > Milestones**.
In Operation type the check mark "Milestone" is required. In the production routing, a date for the milestones can also be entered.

PATH: Production > Milestones



Window stamm_milestone_result.psr

Tabs:

Tab	Meaning
Master data	List of milestones.
Milestones	List of milestones stored in the routing positions. This list can be used for an analysis, exported to Excel, and filtered and sorted as necessary. This can be set up using the window settings.

Functions

© 2026 Boyum IT Solutions A/S

Open/Add: Open existing milestone or create a new one.
Remove: Remove selected milestone.

Milestones tab – Window settings entries:

Field	Meaning
Milestones	Milestone flag.
Description	Milestone description.
Document	Document.
Position	Assembly position.
WO Stat.	Position.
Resource	Resource ID.
Activity	Activity description.
Milestone date	Specified milestone date in the routing sequence (in the work order).
Plan date	Planned start date of the routing position.
Last Message	Last time receipt for this routing position.
Closed	Routing position closed?
Work Order	Work order - order number.
Customer Name	Customer Name.
Additional Text	Additional text in work order.
Item	Item number of the assembly to be produced.
Item Description	Item description of the assembly to be produced.
Drawing Number	Drawing number of the assembly to be produced.
DIN	DIN.
Raw Material	Raw Material.
Match Code	Match Code.
Material Group	Material Group.
Date of Print	Print date of the work order.
Date closed	Date the production position was closed.
Project	Project ID.

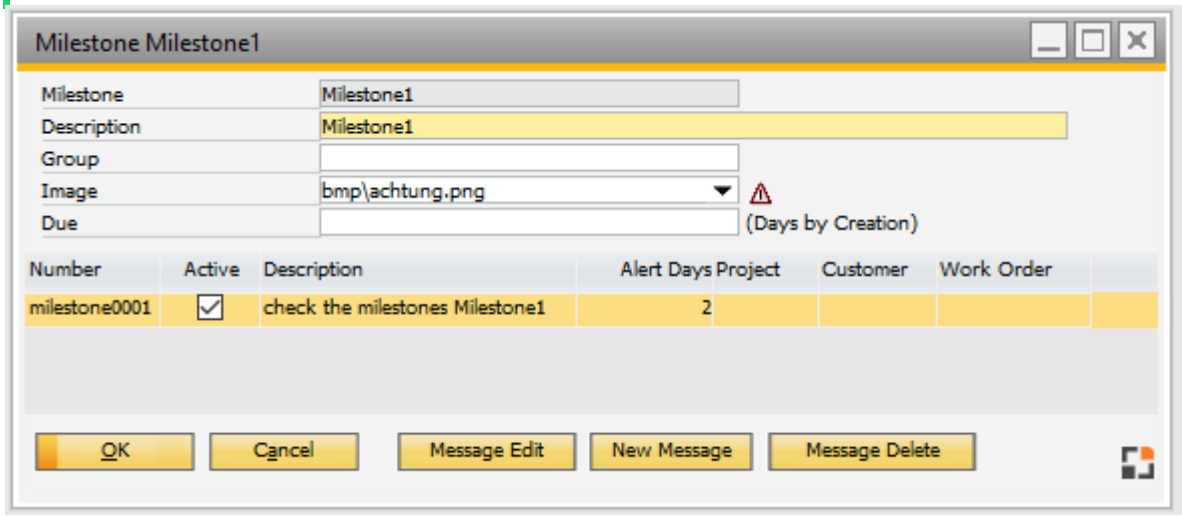
see Event control

© 2026 Boyum IT Solutions A/S

8.4.1 Edit Milestone

In this window you can edit / add new milestone.

PATH: Production > Milestones > **Open** an entry.



Window stamm_milestone_edit.psr

Field descriptions

Header

Field	Description
Milestone	Name of the opened milestone.
Description	The description of the milestone
Group	Group categorization
Image	Select icon to represent the milestone in list views.
Due (Days by Creation)	Due date of the milestone counted from the day of creation.

Lower Columns

Field	Description
Number	Milestone number
Active	Flag is active if it was set in the corresponding event.
Description	The description of the milestone.
Alert Days	Alert days
Project	The corresponding project

© 2026 Boyum IT Solutions A/S

Field	Description
Customer	The corresponding customer
Work order	The corresponding work order

Buttons

Message Edit / New Message: Open selected milestone event / create a new milestone.

Message Delete: Opens the selected milestone event with a prompt to confirm deletion.

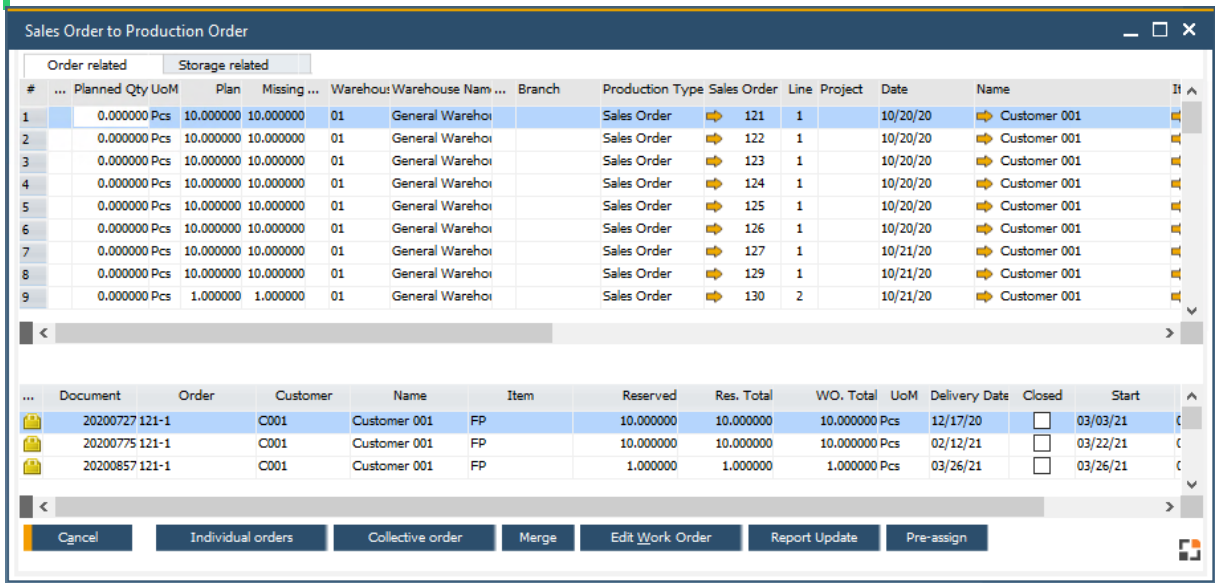
8.5 Sales order to Production order

In this window you can create new work orders based on Sales orders or Pre-invoices.
The list is dynamically adjustable; Window settings and templates are supported.
The windows are divided into 2 parts. In the upper area the customer orders are displayed and in the lower area work orders are displayed.

Tabs:

Tab	Description
Order related	Filter: list for order-related production. All customer orders and advance invoices including an order-related assembly are displayed.
Storage related	List for order-related production of stock-related items.

PATH: Production > Sales Order to Production Order window



fert_kdauftrag_zu_fertauftrag.psr

© 2026 Boyum IT Solutions A/S

Note: Duplicate items are not combined. This is not always desired due to structure production. Alternatively, the MRP run (inventory related production) can be used here.

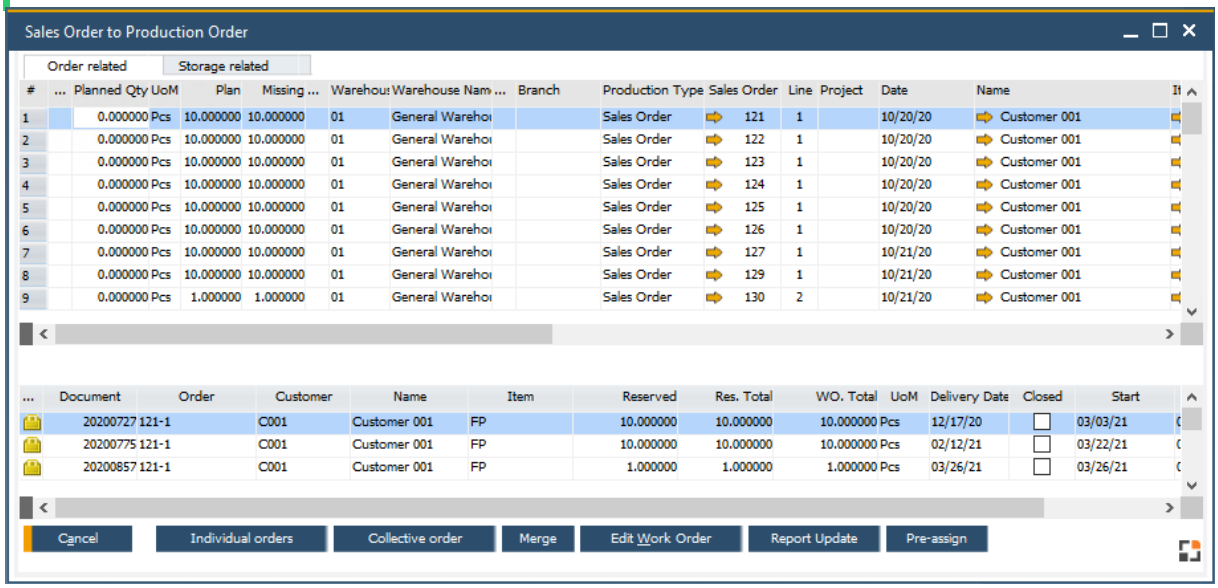
8.5.1 Order-related tab

This window can be used for order-related production, e.g. when working with the Product configurator, pre-calculation, variants or item version control.
Individual work orders are created based on information inside a sales order/pre-invoice.

Note: Only order-related items are visible in this list.
Window settings and templates are supported.

See Item-breakdown which are released for production and for which no or not enough work orders have been created yet. Warehouse reservations are considered, as well. The default filter can be changed. ***See*** Change default filter.

PATH: Production > Sales Order to Production Order window > Order-related tab.



Window fert_kdauftrag_zu_fertauftrag.psr

Note:

The list is only working correctly if **Configuration wizard > Production > Reservation > Reservation - Receipt reservation only at** is **not** disabled!

If Reservation is not active, the field "Missing" may malfunction. ***See*** field description Missing for more details.

© 2026 Boyum IT Solutions A/S

- SAP Business One BoM

Items containing a SAP Business One – BoM, are displayed only if the stored BoM is not of type "Set", "Template" or "Assembly". The type "Production" allows for a subsequent change to Beas. SAP Business One-BoMs are not considered. (OITM.TreeType must not be S, T or A).

- Notes on Templates

This list provides information on reserve invoices and sales orders.

If additional fields are defined in the template, these refer to sales orders and reserve invoices *(beas 9.3 PL 0)*.
The stored SQL instruction uses a UNION ALL – instruction for this purpose. For this reason, there are restrictions.

- Sorting and filtering is possible within the result. Only the "DataWindow" variant can be used for this purpose (Field sorting (DW) / Filter (DW)
- Additional fields are supported. However, fields from ORDR/RDR1 are not possible due to UNION ALL.

Instead `header` for field from ORDR or OINV and `line` for fields from RDR1, INV1
New fields for templates via header and line are therefore equally possible for customer orders and invoices.

Example: `line."ItemCode"`

Field description

Field	Description
...	Barrel icon: At reservation, it displays the already produced quantity.

Traditional style	Boyum Style	Description
		Grey: goods produced, but planned quantity not reached. In Boyum Style (Beta): an empty barrel.

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Traditional style</th><th>Boyum Style</th><th>Description</th></tr>
<tr><td> </td><td>
 </td><td>Green: required planned quantity produced. In Boyum Style (Beta): barrel with a check mark in the right bottom of the icon.

Red overflown: too much produced. In Boyum Style (Beta): barrel with an exclamation mark in the right bottom of the icon.</td></tr>
</table>
</td></tr>
<tr><td>Planned quantity</td><td>Entry field: Quantity of units to be produced (enter manually).</td></tr>
<tr><td>UoM</td><td>Inventory unit of measure</td></tr>
<tr><td>Plan</td><td>Total quantity as per customer order or advance invoice in warehouse units.</td></tr>
<tr><td>Missing</td><td>Present the missing quantity.
Display the missing quantity.
Beas calculates this quantity as follows:

Reservation system is active
In Configuration wizard > Production > Reservation - Receipt reservation only at you can activate the reservation system. If this is activated and it is a stock related item, Beas calculates as follows:
<code>Open Quantity from Sales order / Pre Invoice
- Reservations (linked to Work order and Sales order)</code>
If you create a work order, Beas creates the reservation for sales order linked to the work order automatically.

If you create a receipt document for the produced assembly, Beas converts the reservation to a stock warehouse. In this way the result is always correct.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description

Non Stock items

```
Total quantity from Sales order / Pre Invoice order
- manual reserved quantity (RDR1.U_beas_von_lag)
- Total quantity from linked work order
```

It is not possible to see an actual view.

Reservation system disabled.

Calculation of this field

```
Open quantity from Sales order / Pre Invoice order
- manual reserved quantity (RDR1.U_beas_von_lag)
- Total quantity from linked OPEN work order
+ Booked quantity from linked OPEN work order
```

Without reservation it is not always possible to calculate the missing quantity in the correct form.

If work order is closed, the system ignore this work order

Example:

Action	Order Quantity	Open Quantity	Open Work order	Booked	Missing
Sales order 100 Pcs created	**100**				100
Work order 60 Pcs created	100	100	**60**	0	40
Receipt assembly 30 Pcs	100	100	60	**30**	70
Assembly delivered 30 Pcs	100	**70**	60	30	40

© 2026 Boyum IT Solutions A/S

Field	Description

Action	Order Quantity	Open Quantity	Open Work order	Booked	Missing
Work order closed	100	70	**0**	0	70

If you receipt the assembly in stock, the "missing quantity" is wrong.
After the creation of Deliver document, the missing quantity is correct again.

Explanation:
If the assembly is in stock, Beas cannot see which sales order this assembly is reserved for. The reservation system is disabled. If you have a work order related without reservation, you **must create the delivery document as fast as possible.**

Merged work orders
If you merge a work order, the assemblies are inside Bill of Materials position.
Beas displays only full quantity at all times. Not working with full quantity will result in wrong figures.

Action	Order Quantity	Open Quantity	Work order	Booked	Missing
Sales order created	100				100
Work order created	100	100	60	0	40
Receipt assembly	100	100	60	30	40

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Action</th><th>Order Quantity</th><th>Open Quantity</th><th>Work order</th><th>Booked</th><th>Missing</th></tr>
<tr><td>Assembly delivered</td><td>100</td><td>70</td><td>60</td><td>30</td><td>40</td></tr>
<tr><td>Work order closed</td><td>100</td><td>70</td><td>0</td><td>0</td><td>70</td></tr>
</table>

Note:
If reservation is disabled, this field is not always working correctly.
In this case it is important to create the Sales Delivery directly after the Receipt of the Item.

It is recommended to work with reservations if you work order-related.

In MRP you will get a different result, because the MRP does calculation per warehouse and not per sales order.
</td></tr>
<tr><td>Work order type</td><td>Default: type defined in configuration wizard, possible to select another type.
To do so, change field properties to "changeable" in window settings.</td></tr>
<tr><td>Quantity from Inventory</td><td>How much should be taken from inventory. This quantity is not further broken down in the MRP run. Quantity is specified in units of store.
Option is only considered if receipt reservations are not used.</td></tr>
<tr><td>Warehouse</td><td>Storage location stored in the customer order.
Note: If you create a work order, the system use the standard rules for the work order warehouse.</td></tr>
<tr><td>Inventory</td><td>Inventory in the storage location stored in the customer order.</td></tr>
<tr><td>Total Inventory</td><td>Total inventory across all stores.</td></tr>
<tr><td>Item</td><td>Item name.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
Quantity	Quantity.
Reserved	Is it reserved?
Factor	Use factor.
Variant	Variant ID. Changes here affect only this customer order.
Configuration	Number of configuration with orange arrow for direct access.

Additional fields

Field	Description
UoM	Unit of measurement. ***See*** Inventory UoM.
Sales Order	Number of sales order.
Origin	Preceding document.
Row	Row of sales order.
Date	Date of sales order.
Quantity	Order quantity – not yet delivered.
Item	Item number.
Description	Item description.
Delivery date	Delivery date of sales order.
Desired delivery date	Desired delivery date. (*field rdr1.U_beas_requestdel*).
Delivery confirmed	Check marked if confirmed. (*field rdr1.U_beas_delconfirm*)
Released for production	Check marked if released for production. (*field rdr1.U_beas_delconfirm*)
Released	Customer order released for delivery ? (*field rdr1.U_beas_delconfirm*)
Customer reference no	Optional, if reference number exists.
Project	Indicated if applicable.
Customer	Customer name.
Drawing number	Indicated if applicable.
Clerk	Person in charge "owner".
Ordered	Already ordered?
Sales order quantity	Current quantity in open sales orders (SAP-B1 reservation system, *field oitm.iscommited*).
Release production	Confirmation of delivery date from production. (*field*

© 2026 Boyum IT Solutions A/S

Field	Description
	rdr1.U_beas_requestdel)

Lower area work order

All work orders are displayed which are linked to the customer order selected above. The behavior of the reservation is set up in: **Configuration wizard > Production - Reservation – Receipt reservation only at**

Field	Description
Document	Work orer document.
Customer	Customer from customer order.
Order	Work order number.
Name	Customer name .
Item	Item to be produced.
Reserved	Reserved goods for the selected customer order. It deviates from "WO total" quantity only if receipt reservations are used. If in this case an assembly is posted in, the receipt reservation is reduced and a warehouse reservation is created.
Res.total	Total quantity assigned to the selected customer order It is the quantity which was assigned based on the link from customer order to work order. It deviates from "WO total" quantity only if receipt reservations are used. Only then can you assign an arbitrary quantity or subset to a customer order – independent from the quantity to be produced.
WO total	Total quantity from work order.
Delivery date	Delivery date as per work order.
Closed	Work order position closed?
Start	Planned start.
End	Planned end.
Locked	Work order locked.

© 2026 Boyum IT Solutions A/S

Note:

The list does not include the inventory with the suggested "SHORTFALL" quantity. It is optimized for order-related production.

Right-click menu / Buttons

Function	Description
Filter	There are 3 different criteria according to which the customer orders can be filtered: Only Orders with Shortage All not completely delivered
Cancel	Closes the window "Customer order for work order".
Individual orders	A separate work order is generated for each customer order line.
Collective order	A single work order is generated for all selected customer order lines.
Merge	Merges several work orders into one. ***See*** merge.
Edit Work Order	Allows the customer order to be edited.
Inventory history	Opens inventory history.
Report Update	Updates the lists.
Pre-assign	Quantity to be produced is filled in automatically.

Change default filter

The default filter can be changed
- via Template: define additional filters
- via Script: set up a basic filter

2 variables are available
`is_orderrelated_masterfilter` = contains default filter
`restmenge > 0 and oitm_u_dipso='A'`
(Remaining quantity >0 and item is order related)
`is_prodrelease` = contains a second filter, which will be consider pressing button "Filter"
`oitm_u_beas_prodreleas='Y'`
(Release item for production)

Use this script to display items which have not been not released for production
for MSSQL:

© 2026 Boyum IT Solutions A/S

```
windowevent formload
setvar=is_orderrelated_masterfilter=restmenge>0 and oitm_u_dispo='A'
setvar=is_prodrelease=
end event
```

for HANA:

```
windowevent formload
setvar=is_orderrelated_masterfilter=restmenge>0 and oitm_u_beas_dispo='A'
setvar=is_prodrelease=
end event
```

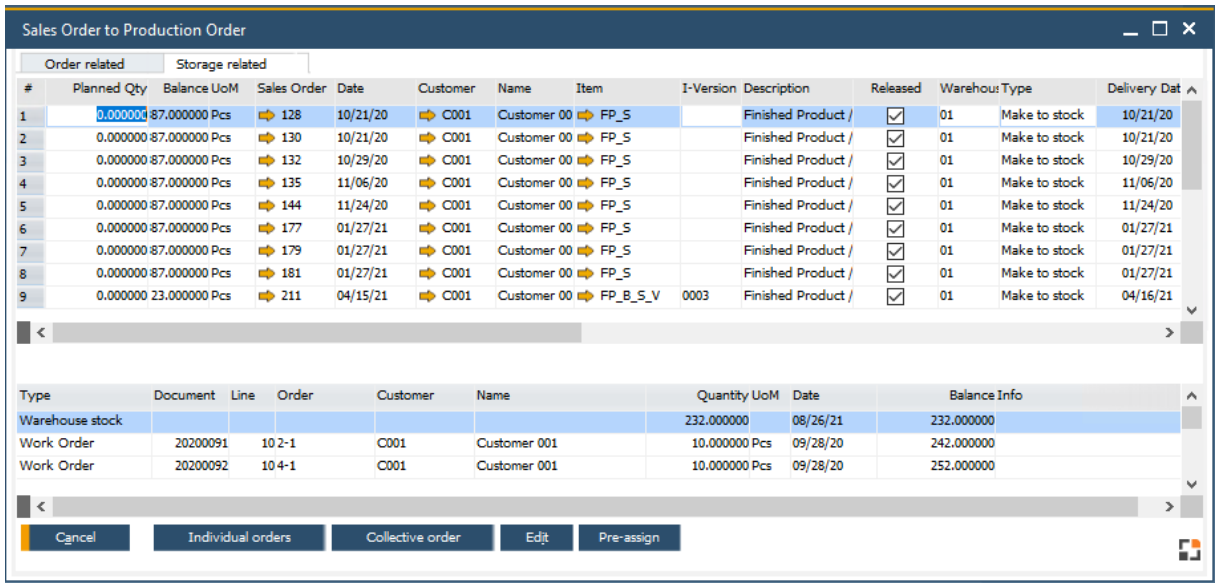
back to Sales order to work order

8.5.2 Storage-related tab

PATH: Production > Sales Order to Production Order window > Storage-related tab.

This tab displays all customer orders and advance invoices which include an storage-related assembly.

See Item – breakdown.



Window fert_kdauftrag_zu_fertauftrag_bgrp.psr

Note: The Order recommendation report is normally used for storage-related customer orders, because this provides a view on orders – not on stock.

Field description

Additional field description

Field	Description
Balance	Balance of in and outflow.
Order Quantity	Order quantity.
Remaining Qty.	Remaining quantity.
Inventory	Inventory stock.

© 2026 Boyum IT Solutions A/S

Total sales Order	Total quantity of the current sales order.
Production	Quantity currently in production.
Minimum Inventory	Minimum inventory.
Lead T.	Replenishment time.
Match Code	Match code.
Raw Material	Raw material.
DIN	German industry standard code.

Functions

Function	Meaning
Cancel	Closes the window "Customer order for work order".
Individual orders	A separate work order is generated for each customer order line.
Collective Order	A single work order is generated for all selected customer order lines.
Edit Work Order	Allows the customer order to be edited.
Pre-assign	⊟ Open sales order quantity is pre-assigned as planned quantity. The open sales order quantity is pre-assigned as planned quantity. As open quantity counts the quantity not yet delivered. There is no order related production. That why, work orders are not linked to sales orders. Note: because it is not order related, it may happen, that too much is produced. *(beas9.0-004-048-000)*

⊟ Notes on Templates

In the list sales orders (ORDR,RDR1) and advance invoices (OINV,INV1) are displayed. 6 available fields are considered only for sales orders. For sorting and filtering, use "UNION ALL". Use sorting or filtering only on data window level.

back to sales order to work order

Post-calculation – Concept

8.6.1 Post-calculation master data

In this window you can define which work orders are calculated (Selection tab) and how the calculation takes place (Calculation tab)

Post-calculation - List

Post-calculation - Master data

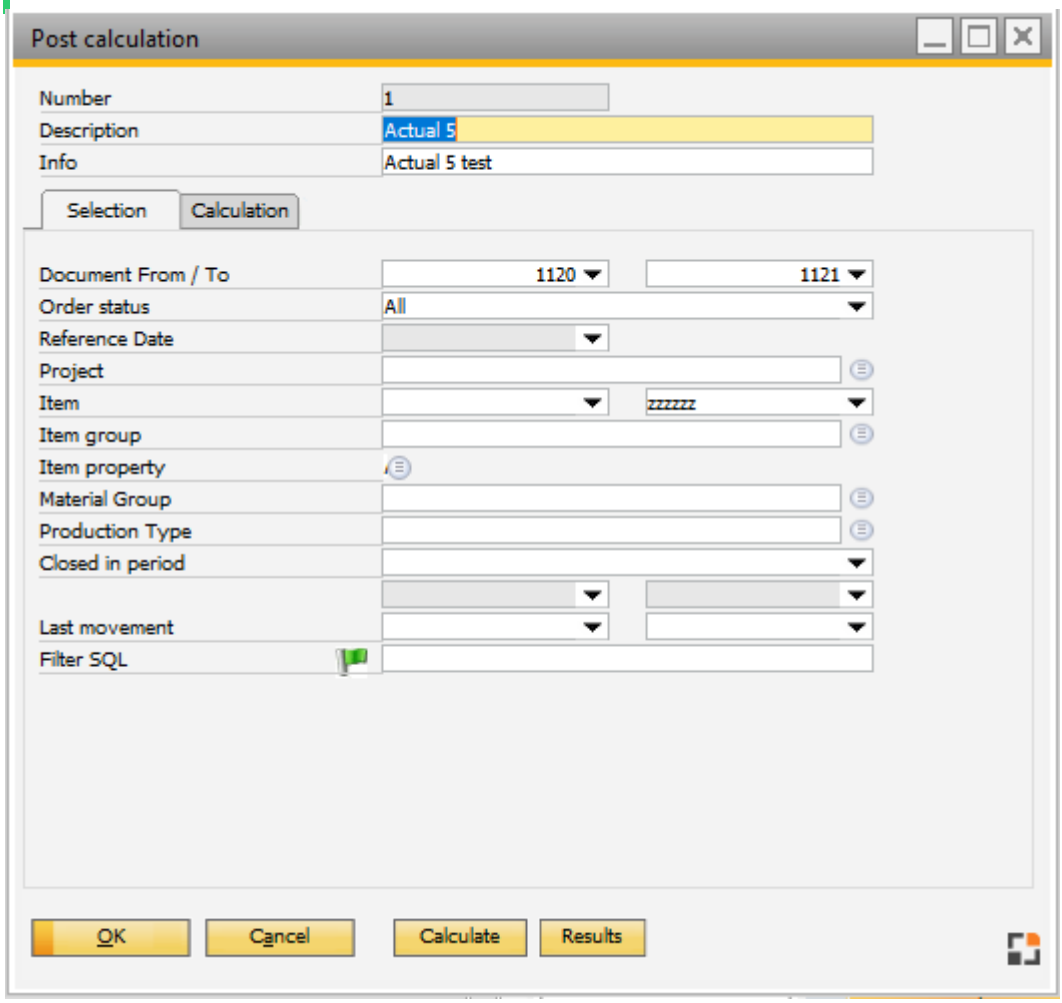
Post-calculation - Results

Post-calculation - Details on calculation

Results profit centers

Results detail

PATH: Production > Post calculation > **Open** calculation.



Window postcalc_header_browse.psr

© 2026 Boyum IT Solutions A/S

Selection tab

Field	Description
Number	The calculation is saved with this number.
Description	Free text.
Info	Additional information.
Document number from to	Select for items to perform a post-calculation. If in field "from" a number is entered, this limits the field "to" (no earlier number may be entered there).
Order status	Status of the work order. Filter **all** = independent of manufacturing status **only open** = only production items that are not completed **only closed** = only production items that are currently closed **active on reference date** = only production items that will be active by the given date (***see*** below) With this selection, the "type" is set to "single step" automatically.
Reference date	Date for order status "active on due date". If this filter is set, only the following work order items are considered: - WO items that have a document date before the given date (***See*** Work order - Order date). - WO items that are currently **active** or which have been **closed** after the reference date The date of completion of the work order is checked. This field can be selected only if "active on reference date" was selected at "order status". Note: Re-open closed work order positions. If a closed work order position is re-opened subsequently, the result can be falsified, because the period is not saved in which the position was opened and closed again.

© 2026 Boyum IT Solutions A/S

	⊟ Canceled order times. If an order time entry is canceled or deleted, it will be treated as deleted. ***Example***: Order time registered for 1.5.2015, canceled 1.6.2015 Reference date is 10.5.2015 – the order time is not considered, although it existed on 10.5. ⊟ Problems with production type different than "single step". If another type than "single step" was selected, sub-assemblies are always calculated, even if these were not active on the reference date. ***Example***: `Pos 10` Open `Pos 20` closed, out of reference date Running a calculation of type "standard" or "accumulated" position 20 is included in the calculation.
Project	Project Id (optional) (Multiple selection).
Item from to	For which items to perform a post-calculation.
Item group	Filter by item group (Multiple selection).
Item property	Selection for properties (Multiple selection).
Material group	Selection of material group (Multiple selection).
Production types	Selection of Production types (Multiple selection).
Closed in period	⊟ Only production items that were closed in the period defined there. It is possible to define a time period – today, last X days or a date area 
© 2026 Boyum IT Solutions A/S

	If Date area is selected, it is possible to insert a from–to date. **Attention**: The post calculation checks only the last "close date". If the user reopens the work order and closes it later again, Beas ignores the first "close date". *Beas 9.3 PL 1*
Last movement	Filter: only work orders with movements in the given period. The valuation date is considered for material posting, external operation – delivery notes and for Order time receipts.
Filter SQL	Define an own filter. Here you can define an own filter with an SQL statement. If you click on the SQL icon, you can define this in a simple way in the sql editor. The flag displays if the SQL statement is correct or incorrect: red = wrong, green = correct. The following tables are available: Work order header: *BEAS_FTHAUPT* Work order position: *BEAS_FTPOS* Item: *OITM* The command must start with "and"- ***Example***: Only work orders with the word "red" in field "UDF1" `and "BEAS_FTPOS"."UDF1" = 'red'` *Beas 9.3 PL: 01*

Calculation tab

Field	Description
Type	Type of calculation. ***See*** WO post calculation - Type.
Value assemblies	Determines the valuing of sub-assemblies

© 2026 Boyum IT Solutions A/S

	See Configuration wizard - post calculation - assembly .
Valuation to	Defines the value at which the material postings are valued. ***See*** Pricing-Types.
Resource cost rate	Defines which cost rate to use for resource valuation Standard: no entry, planned and actual values are used. If a cost rate is selected, planned and actual values are valued at this cost rate. ***See*** Cost rates.
Schema	Selected calculation schema (from Precalculation). All settings are transferred (e.g. cost types, surcharges etc.).
Valuation price date	The valuation period can be set for long-running projects. Only the costs occurred in the specified period are calculated. **Warning**: If this function is used, a plan-actual comparison is no longer useful. If "Plan=Actual if no time receipt" is active in the options, this will lead to false results.
Purchase order valuate	If this switch is enabled, purchase orders are considered as actual costs. (No need to wait for Purchase invoice).
Material always to Planned costs	When active, material cost is considered as planned cost.

Functions

Button	Description
Calculate	This button runs the calculation. As it is not performed in the background, it may take long depending on the number of work orders. Notes on automatic calculation Post-calculation can be run automatically, for example once a week, at night etc. ***See*** tasks. Call up via BeasScript `object=ue_fert_naka=batchnaka=x` x = Number of post-calculation ***Example***

Overview of the most important fields:

Work order	Work order number
Position	Work order position
Structure	Structure information, example 10-30 (30 is sub position from 10)
Post Calculation	Batch Calculation Id
No.	Calculation Number (unique number)
Info	Information field
Schema	Calculation schema
Calculation on	Calculation date
Calculation: Type	Calculation Type (example: one step)
Valuation: Type	Valuation type
Valuation to / From	Valuation period (date from/to)
Resource Cost Rate	Id from Resource Cost Rate (empty = Standard resource codst)
Item	Item code
Description	Description of item
Drawing number	Drawing number from item
Origin Type	Type of the original document - Sales order, Work order
Origin Document	Document number
Quantity Plan / Actual	Planned quantity according to the work order / Sum of postings to this assembly including completed quantities manually reported in the position
Time Plan / Actual	Total of planned and actual time
Material Actual / Plan	Actual / Planned Material
Material Total MargCosts/FIX/Full - Actual/Plan	Material costs for marginal/full costs of respective plan and actual value.
Surcharge for material MargCosts/FIX/Full costs - Actual/Plan	Surcharge for material costs for marginal/full costs of respective plan and actual value.
External Production MargCosts/FIX/Full - Actual/Plan	External Production costs for marginal/full costs of respective plan and actual value.

© 2026 Boyum IT Solutions A/S

Work order	Work order number
Production Surcharge Full Costs/MargCosts/FIX - Actual/Plan	Production surcharge costs for marginal/full costs of respective plan and actual value.
Production Total MargCosts/FIX/Full Costs - Actual/Plan	Production costs for marginal/full costs of respective plan and actual value.
Manufacturing Total MargCosts/FIX/Full Costs - Actual/Plan	Manufacturing costs for marginal/full costs of respective plan and actual value.
Cost of Sales MC/FIX/FC - Actual/Plan	Sales cost related to calculation schema
Net MargCosts/FIX/Full Costs - Actual/Plan	Net price related to calculation schema
Gross MargCosts/FIX/Full Costs - Actual/Plan	Gross price related to calculation schema
Production: Type	Production type
Customer	Customer code
Customer name	Customer name
Order	Order document
Project	Project number
Additional text	Additional text
Project Manager 1,2	Project Manager 1,2
Project Status	Project Status

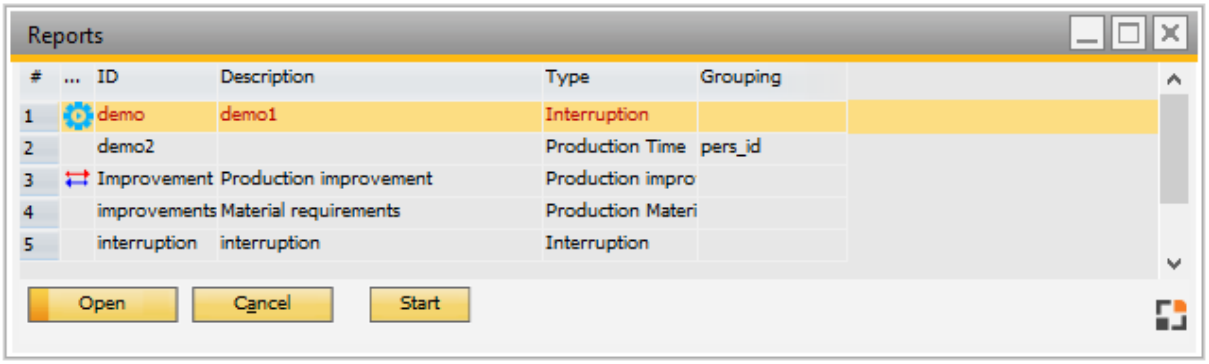
8.7 Own Work Order reports

You can create your own reports from a selection of default reports .

PATH: Production > Own Reports Production



Window report_myreport_browse.psr

The following default reports are available in the "Production" area:

© 2026 Boyum IT Solutions A/S

Type	Function	Grouping	Graphic
Dispatches	Show all currently reserved time dispatches on a resource.		
Scrap	Show all scrap reports.	Item, Resource, Personnel, Project, Scrap.	
Production time	Show all order time receipts. Particularity: The effectiveness key data or productivity key data will be displayed for groups. Evaluations on personnel, resources, projects and items can be generated here.	Item, Resource, Personnel, Project.	Yield and Scrap quantity. Yield quantity per employee. Yield quantity per item. Yield quantity per resource.
Interruption	Show all interruptions.	Interruption, Resource.	
Production material Reservation	Open the Production – material reservation window.		
Production issue material	Open the Production – issue window.		
Production material allocation	Open the Production – allocation window.		
Production material requirement	Open the material requirement list	Item	
Production progress	Evaluation production progress.		
Milestones	Evaluation per milestones.		
Work List	Open Work list (Work order planing on routing level)		

Own Production Report

8.7.1 Concept of own reports

Beas provides multiple default reports from which you can generate your own personal reports using many settings.

© 2026 Boyum IT Solutions A/S

Use the setup window to define filters and groups. In some list you can set up diagrams, to be included in the window.
Templates and Window settings can be used in some lists. Also, the access rights to all reports can be set up.

You can define time ares as dates, months, year etc. then, a repeated input of the dates will not be required.

Example production times:

Production times: A list, which shows all reported order times
If the list is grouped by "Personnel", a productivity list is created. If the diagram is activated additionally, a performance curve showing effectiveness can be displayed.
If you group by resources, you can create a resources utilization evaluation. You can determine the production quality by item when grouping items and consider scrap reports.
You can create more useful lists with filters by location, production type (e.g. only repair orders), employee, item group etc.

Example production material reservation

You can even open the Production – Reservation window. In own lists you can set up, which work orders or assemblies are to be considered.

Difference between reports and "Lists" and "Own lists"

Lists

Macros can be stored. Default lists and Crystal reports are available for "Lists".
Parameters can be defined, but the values cannot be saved. Macros are very useful for storing crystal reports.

Own Lists

From a selection of default reports own lists can be created and parameter can be saved.

Field description

Field	Description
ID	Accurate ID per own report.
Description	The report can be described here. This text will be shown in the selection list.
Type	The report default can be selected here.

© 2026 Boyum IT Solutions A/S

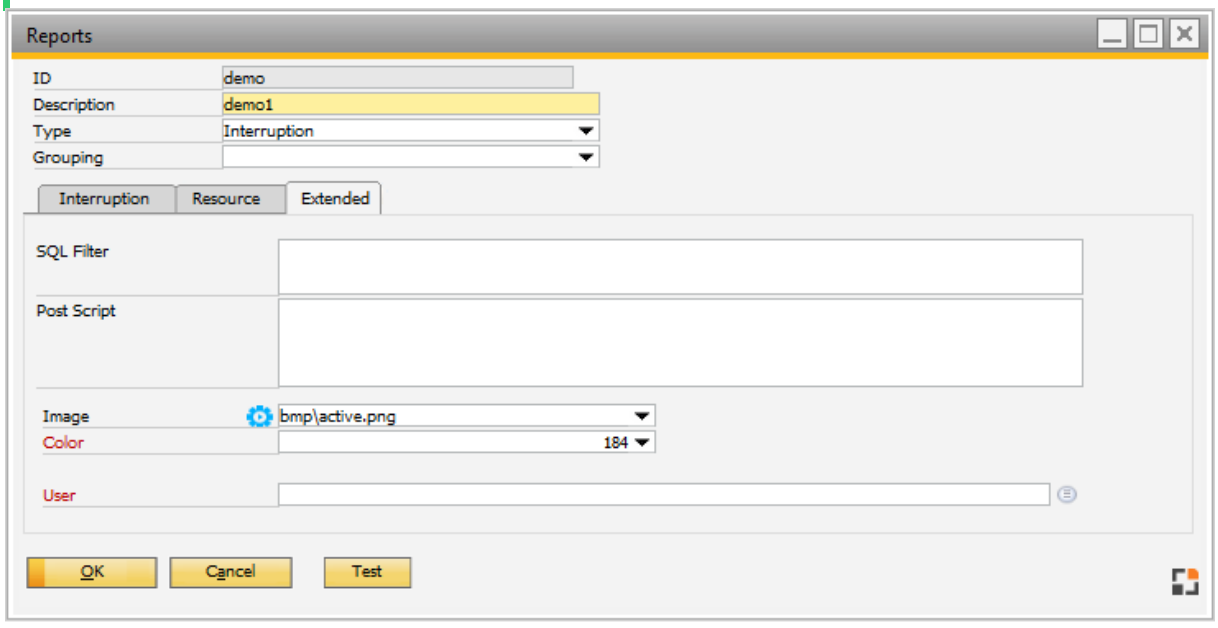
Grouping	According to the selected report the groupings are available here.
Diagram	Only visible if the selected report default supports a diagram. Define which reference date has to be used for the diagram.
Unit	At diagrams which shows the time line, a grouping unit can be set up: day, month, year.
Position	Defines where the diagram will be displayed e.g. left or right above the list. With "overlapping" the diagram will be shown before the list and its position can be moved and the size can be changed freely.
Size %	Define the relative size of the diagram. Default = 50% At 100% you can only see the diagram.

Tab time receipt, production order, assembly, resources etc.

Define which values are to be displayed. These tabs will be hidden or displayed according to the selected report.

Tab extended

PATH: Production > Own Reports Production > Open a report > "Extended" tab.



Window fert_report_parameter.psr

Field	Description
SQL Filter	An own SQL filter can be defined here, which is considered in this report.

© 2026 Boyum IT Solutions A/S

	Note: The SQL-filter is not considered for all report types. At the input there is still no error checking. Check the SQL statement which is executed in the selected report.
Post Script	This script is executed in the report after setup. Note: This is not considered at all report all report types.
Image	Icon in the own reports – selection list.
Color	Color of the entry in the own reports – selection list.
User	Defines which user is allowed to use this list.

beas 9.2

8.7.2 WO Reports

Manufacturing progress: In a horizontal line, operations are to be processed and finished ones are displayed.

Milestones: Status of milestones stored in work order item.

Via window settings up to 30 additional columns can be displayed, unnecessary columns are hidden.

Templates are supported.

The milestone progress list shows the name of the milestone and its current status (e.g.: assembly, QC). Only work order positions with deposited milestones are displayed.

Upper selection fields

Field	Meaning
Date	Select from calendar from – to.
Customer from - to	Selection from drop down.
Project from - to	Selection from drop down.
Document	Enter document number from / to.
Item from - to	Selection from drop down.
Status	Select from **All / Active / Only closed** work order are displayed.
Reports **Manufacturing progress** **Milestones**	Select, then press button "Display": the display below is defined: **Manufacturing progress** shows current status of all work orders. In each operation-field the required resource is displayed. Status is displayed by colors:

© 2026 Boyum IT Solutions A/S

	Green Operation closed Blue Time receipt exists (operation not closed) Red: Active login Grey Not yet started Note: Active login has higher priority. Milestones: displays current status of Milestones (example: assembling, QC). Only work order positions with stored milestones are displayed. **Colors in milestone progress list:** Green Completed Blue Open Violet Open, due today Red Open, due date in the past
Item group from - to	Only work orders with assemblies belonging to this group.
Material group	Only items of this material group.
Resource type	Only work orders with at least one resource of this type. Parallel resources are not taken into account. The resource type is defined in Resource – "General" tab.

Note: using filters, overhead orders are not considered!

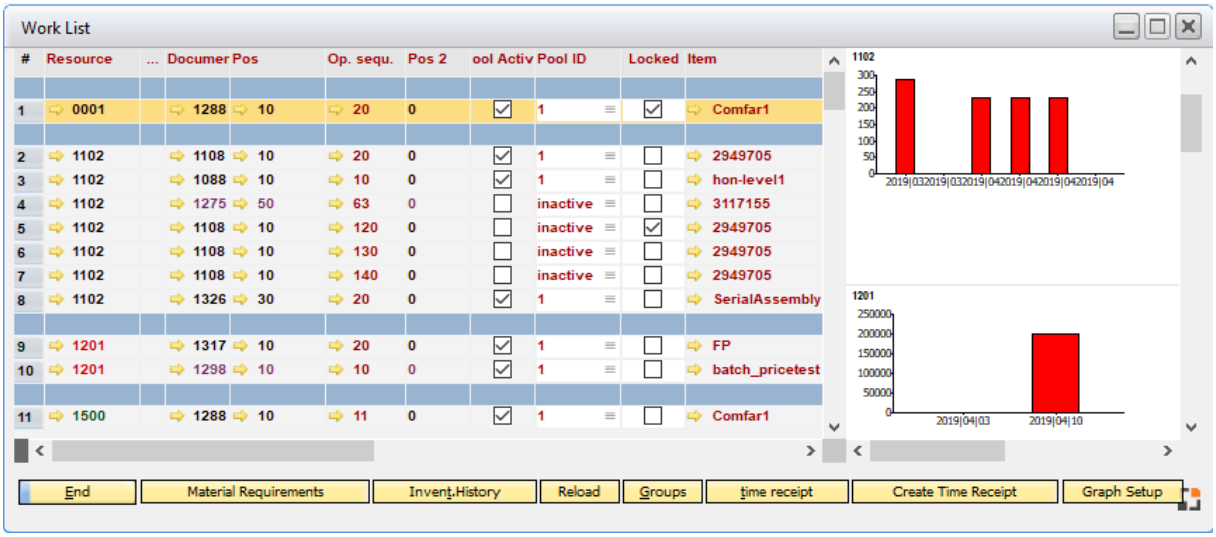
The evaluation requires intensive computation with several accesses on SQL server, because a separate calculation is started for each line.

back to work order general

© 2026 Boyum IT Solutions A/S

8.7.3 Work list

The work list displays all open Routing positions.



bde_worklist.psr, basic license,

This list can be used for:

Administration of open work order positions

- Check situation
- Define Pool
- Lock/Unlock Routing position for Time receipt
- View existing Time receipt
- Create different statistics
- Define the operator employee
- Check material situation

Use as Work list for Employees with Beas basic license

for employees owning a Beas basic license

- access to work order, stock and item information
- create time receipts

It is possible to define the list in several ways:

- Own report settings with grouping and graphs
- Template and Window settings

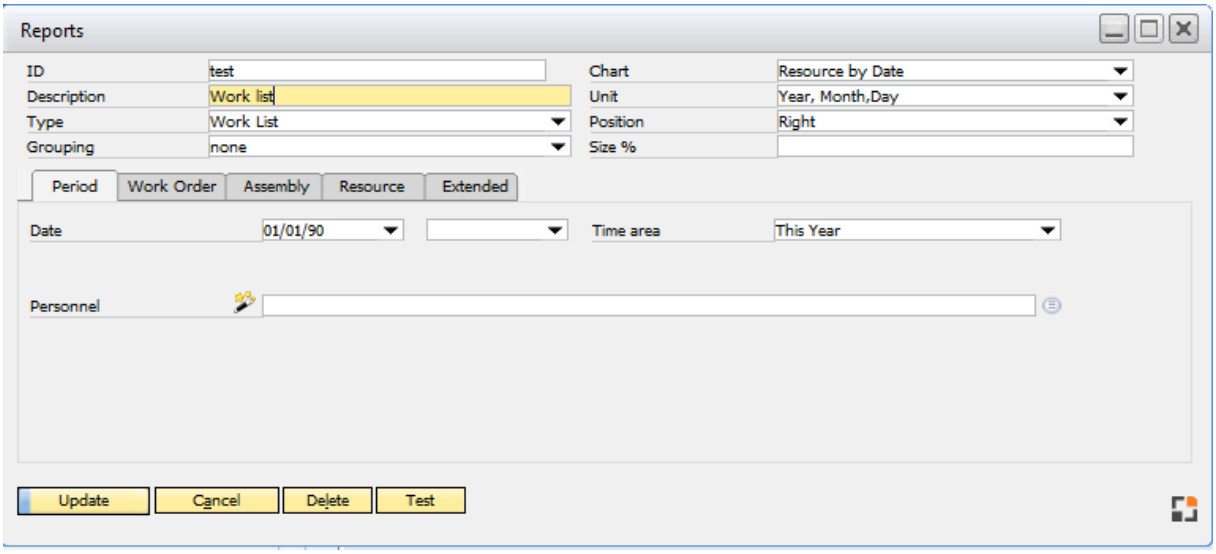
Pool result

© 2026 Boyum IT Solutions A/S

In the list you can only see entries which are defined inside the pool. This is an entirely automatic process.
Recalculation is also possible via **right-mouse click > Pooling, Scheduling.**

Definition in own report

in "Own reports" it is possible to define a number of properties for this report.
After the definition you can execute this directly from Own report or you can insert this with B1UP as separate Menu point in SAP.



Settings

Setting	Description
ID	Unique ID for the report.
Description	Description of this report.
Type	Work List.
Grouping	Create grouping. If defined, only the result is visible with fewer fields. **Resource:** Group by Resource Display resource ID, total duration by resource and all visible resource fields. **Personnel:** Group by Personnel (must be defined in the routing position). Display Personnel ID and Duration.
Chart	Define a chart. **The following charts are available:**

© 2026 Boyum IT Solutions A/S

Setting	Description
	Resource by Date: Display the Date line for every resource. Resource: Display all Resource and Duration in one graph. Item by Date: Display the Date line for every Item. Item: Display all Items and Duration in one graph. Personnel by Date: Display a graph by date for every Personnel ID. Personnel: Display one graph for all personnel ID's.
Period - Date	Define the filter for Date area for Routing start. This is related to field Processing Start. You can define this manually or for a time area.
Personnel	Define, for which personnel entries you want to see open routing positions. This checks the resources defined in personnel entries or in the personnel entry saved in the routing position. For employee: Click on left icon to choose "CurrentEmployee". In this case you can always see your own routing positions. Note: This is only working if you defined the SAP User ID in the Beas personnel entry .
Work order	Define all filters related to work order.
Assembly	Define all filters related to the assembly.
Resource	Define all filters related to the resource.
Extented – SQL Filter	Define extended SQL Filter. With the left icon it is possible to choose templates. - Only current pool: Insert SQL fragment for filter "Only current pool". - Only not blocked: Insert SQL fragment for "Only not blocked routing positions".
Post script	Here you can insert a BeasScript, which is executed after opening the window.

Field descriptions

A large number of fields are available which you can activate or disable in window settings.

The settings are saved in the own report.

One template is available. It is not possible to create additional templates, because the template definition is part of the own report.

Overview on all special fields:

© 2026 Boyum IT Solutions A/S

Setting	Description
Document / Pos / Op.seq	The Work order, Position and Routing Position. With the yellow row you can open the related window.
Pool active	Check box is active if the Routing position is inside the current pool.
Pool ID	Define the number of the Pool In Pool report the employee can only see the entries that are inside the current pool. The next pool is visible only if the employee is ready with the preview pool. In this way it is possible to define which group of entries the employee must work on before starting with the next group. "Inactive": no time receipts in preview routing position. In Standard this field is not editable. Activate this in Window settings.
Locked	If this field is active, the time receipt function for this field is locked. This is related to **routing position > extended > Block login**. With this field you can define whether the employee is allowed to work on this routing position. In Standard this field is not editable. Activate this in window settings. If you change this field, Beas saves it in the change log of the work order: "routing pos lock flag changed in work list to "1"/"0"
Personnel number	Define the personnel ID of the employee working on this routing position. In Standard this field is not visible. Activate this in window settings. If you change this field, Beas saves it in the change log of the work order: "routing pos personnel ID changed in work list to "..." Note: Only the "Work list" can check this field. The Pool report in terminal window and WEB APP's do not check this Personnel field.

Functions

© 2026 Boyum IT Solutions A/S

Setting	Description
Material requirements	Open window "Material requirements" for this routing position.
Invent.History	Open Invent. History window for the current assembly.
Reload	Reload current window.
Time receipt	Display all time receipts for the current entry. Note: This function displays all time receipts for the routing positions and parallel resources of this position.
Create time receipt	Open window for creating a time receipt
Graph setup	Open the Graph definition window. Only visible if the graph function is activated.
Pooling. Scheduling	Open the "Pooling, Scheduling" window. Here you can recalculate the pool.

8.8 Report work order

Default reports and own crystal evaluations can be issued from this window. More reports can be stored via **right-click > window settings**. ***See*** Macro settings.

Only the user with the required authorization can see the lists or report entries.

Report	Description
Evaluation: Resource interruption	Evaluation of the reported interruptions.
Evaluation: Dispatches	Evaluation of the dispatched operation sequences (reserved times).
Evaluation: Production times	Evaluation of the reported order times. Can be used to create effectiveness statistics for resources and personnel .
Evaluation: Scrap	Evaluation of the scrap reports, per resource, item or employee.
Evaluation: Production improvement	View of the progress per work order position and operation sequence.

© 2026 Boyum IT Solutions A/S

Evaluation: Material requirements	Material requirement for active work orders opens the material requirement list, and also allows a cumulation per item.

Note:

Existing lists were replaced and functions were reworked in *beas 9.2.*

The "old" allocation function is now deleted. If you still want to use this function, add it manually.

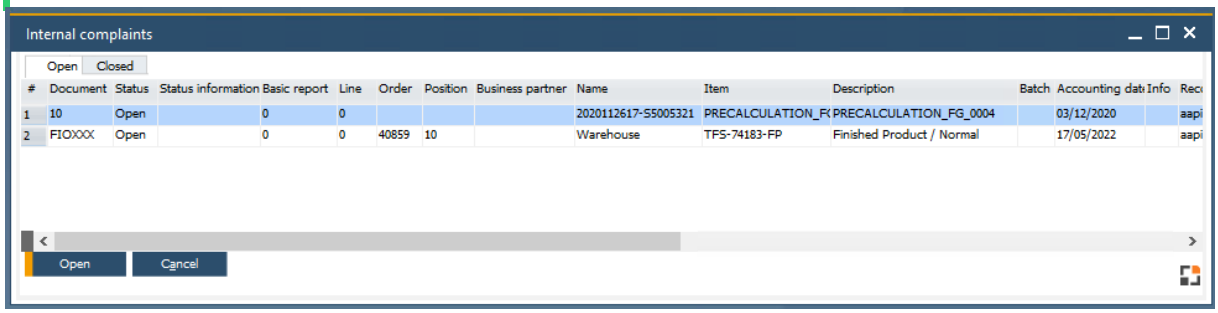
- Instruction: Add the old allocation function.

> Note:
> Only use the "old" allocation function if necessary. Please inform us if you miss some functions in the new allocation function or in the material requirement list.
>
> 1. Create new macro, store name.
> 2. Choose Api "ProdReservationList".
> 3. Deactivate check box "Simple input" and update entry.
> 4. Insert new macro tab "Macro step".
> 5. Create with "BEAS-Formt".
> 6. Insert report-Name: fert_report_materialverfuegbarkeit.psr.

8.9 Internal complaint

In this window you can add/open internal complaints.

PATH: Production > Internal complaints.



Window reclamation_browse.psr

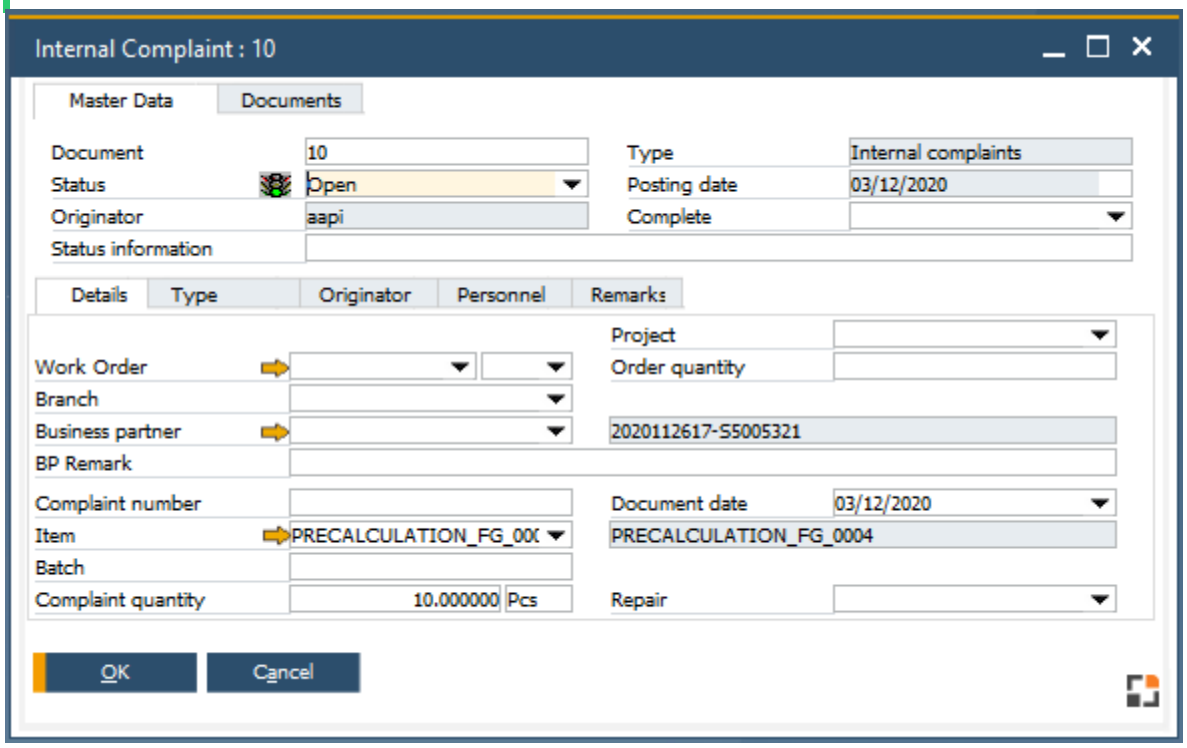
See field descriptions and editing window description.

© 2026 Boyum IT Solutions A/S

8.9.1 Internal Complaint - Edit

In this window you can add new / edit existing internal complaint.

PATH: Production > Internal complaints > **Open** a complaint entry.



Window reclamation_edit.psr

Upper tabs

Master data tab

Field	Description
Document	Document number.
Type	Type of complaint : internal / customer / supplier complaint.
Status	Choose current status: - Open: When set, the icon left of the field turns green: / - In work: When set, the icon left of the field turns yellow: / - Closed: When set, the icon left of the field turns red: /

© 2026 Boyum IT Solutions A/S

	It is possible to click the actual icon and it alternates between the 3 selections (also changing the drop-down value) Open / in work / closed.
Posting date	Date of entry.
Originator	The creator of the complaint.
Complete	Enter the target date when it is expected to be finished.
Status information	Enter The current status.

Documents tab

You may enter any document related to the complaint. Click **Add** specify the path with the **Choose file** button, and save by clicking **Update**.

Lower tabs

Details tab

Field	Description
Project	Select Project (if applicable).
Work order	Work order number. Right of the field you can select the WO position in a drop-down field.
Order quantity	Quantity of the WO.
Branch	Select branch from the drop-down.
Business Partners	Select Customer / Supplier from the drop-down.
BP remark	Additional remarks to business partner.
Complaint number	Enter a complaint number.
Reference date	Enter a reference date.
Item	Item number.
Batch	Batch number (if applicable).
Complaint quantity	Number of items subject to complaint.
Total Costs	Enter the costs.
Repair	Select a repair type from the drop-down.

Type tab

Enter the type of the complaint, description and notes ("Information").

© 2026 Boyum IT Solutions A/S

Originator tab

The Originator is the person who caused the error. There may be multiple originators. Where this is the case, a percentage (%) can be used to assign the proportion of responsibility of the originator.

Choose one of the already created originators. The description is linked, and you can provide further information in the "Info" field.

Personnel tab

Which employee has caused the issue? Multiple employees can be entered. In this case there is a percentage specification.

The complaint is divided into four areas:

Field	Description
Complaint description	General data for the complaint is lodged in this section of the template. It is possible to feed in more data (type, originator, employee) only once this section is filled and saved.
Types (Area A)	Type of defect, e.g. defective paint, deviations from dimensions, etc. Any number of types can be stored simultaneously. Select one of the already created complaint types.
Originator (Area B)	The person who caused the error. There may be multiple originators. Where this is the case, a percentage can be used to assign the proportion of responsibility of the originator. Choose one of the already created originators.
Employee (Area C)	The employee/s who caused the problem. Multiple employees can be specified. In this case, a percentage responsibility is assigned.

Remarks Tab

Remarks can be stored in this tab. An editor window for formatted texts is available if it is enabled in the Configuration wizard.

- UDF

  In these tabs 4 UDF can be set up:

  To make them visible, use script.

  Example:

```
windowevent postopen
dw_4.item.beas_reclamation_causeruser_udf1.visible=1
dw_4.item.beas_reclamation_causeruser_udf1_t.text=hello world
end event
```

© 2026 Boyum IT Solutions A/S

8.10 Capacity Planning, APS

An Advanced Planning System is a software system for the configuration, planning and control of supply chains. They should enable a realistic representation of the entire supply chain from the raw material supplier to the end consumer. APS have a modular structure and are divided into three application levels which are based on each other in terms of time and logic and which differ from each other in terms of the planning horizon and the planning objects considered.

Work with APS
APS Scheduling
Graphic View
Pooling, Scheduling
Pool Structure Report
Graphic Utilization Display
APS Calculation Types

APS flow demo - English
APS flow demo - in German language
The Power of APS with Beas Manufacturing - Webinar

- On strategic level (configuration level, supply chain configuration), various design options in the supply chain – alternative production and warehouse locations, their capacities and the associated internal and external processes – are modeled and evaluated with regard to the associated costs and the achievable performance level.

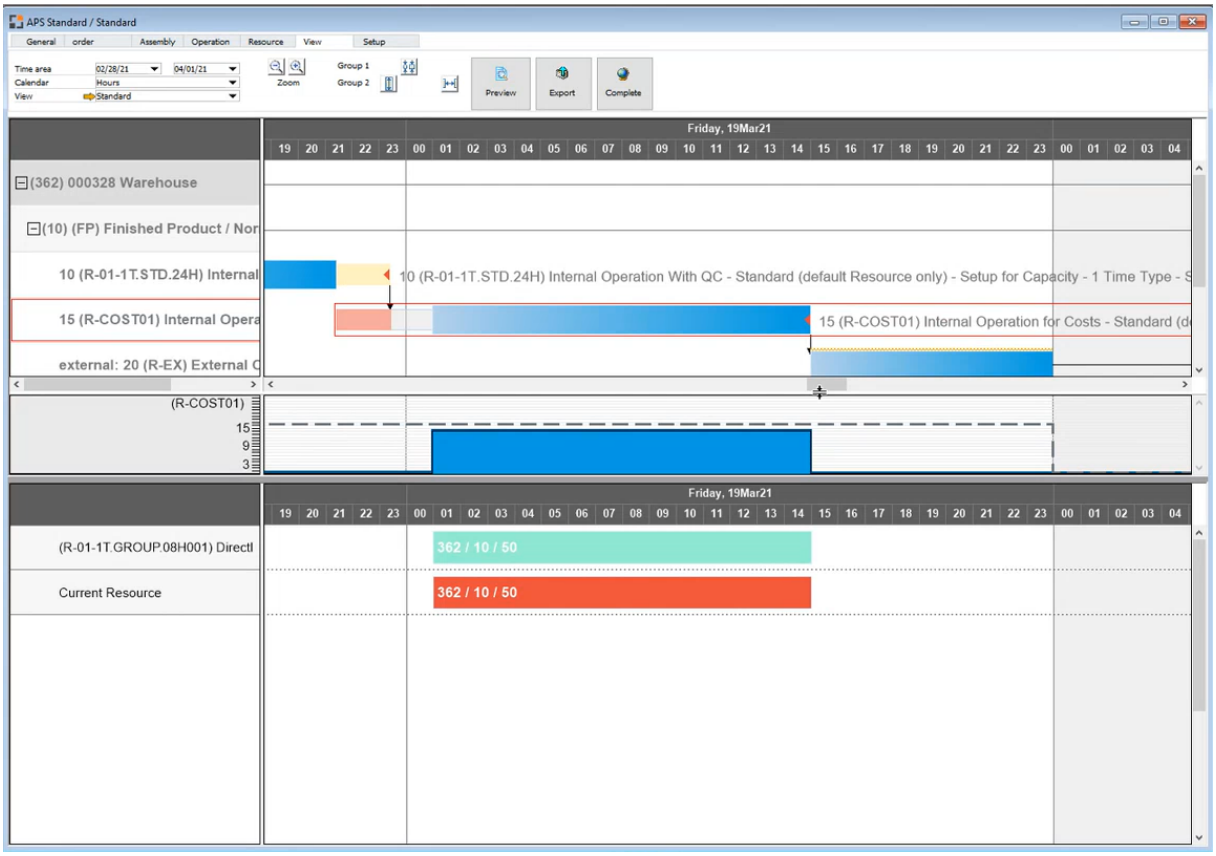
- On tactical level (planning level, supply chain planning), rough planning for procurement, production and distribution is carried out on the basis of medium-term demand planning and sales forecasts. The aim of the planning activities is to synchronize the production and transport plans across the entire supply chain, taking into account all capacity and scheduling dependencies.

- On operational level (execution level, supply chain execution), the necessary detailed planning for the short-term coordination of quantities and capacities takes place. The functions range from sales planning to quantity, schedule and capacity planning and the resulting procurement planning to distribution and transport planning throughout the entire supply chain. Planning and optimization are based on simulations of various alternatives with regard to feasibility, costs and delivery times.

© 2026 Boyum IT Solutions A/S

Software systems with planning functionality for supply chain management in production and logistics systems. Advanced Planning Systems complement traditional PPS systems. In addition to the usual data management, they contain modules with which truly integrated planning is possible. All available information is included in the planning. The best known representative of these software solutions is SAP's Advanced Planner and Optimizer (APO).

Core functions for operational planning is Production Planning / Detailed Scheduling (resource planning).
In Beas the APS module is available with wide functionality, and is fully integrated in every process.



Based on the priorities, machine capacities, factory calendars and many other factors, the latest possible start date for a work order is calculated. The calculation is performed automatically. The start of the complete work order for each production item and also for each individual operation is determined. All types of resources can be reserved and the utilization can be represented graphically.

LIMITATION ON TOOLS:

Important: In APS, the system calculates interruption time ONLY for resources. Tools do not have a precalculated calendar, and Beas does not check interruption on Tool level.

© 2026 Boyum IT Solutions A/S

APS functions are not bound to strict mathematical rules like traditional planning and scheduling methods. Therefore, APS is rather a tradeoff between many factors to find the best solution.
In this sense, the APS system enables planners to automate, optimize, and compare production plans and schedules that reflect actual resource capacity and material availability. It synchronizes processes across plants and work centers to accurately manage labor and inventory, and meet delivery dates and increase profitability.

The simple backward scheduling method dispatches work orders only on the basis of the factory calendar and does not check the resource limits, and whether another work order has been dispatched for the same day. Therefore, without an automatic consideration of these factors, overloads can occur. To avoid this, the APS must be used, which can take into account existing time reservations, as well. The material availability can provide additional checks, so that the associated operation is started first when material is available.

The capacity calculation is a core function that is used to the same extent for rough planning, MRP run, schedule specification and APS. Any methods can be set for APS in Calculation Methods . The standard package includes Default Calculation Methods which can then be used in APS planning

Pool control uses the result of capacity planning and informs the employee in the shop about the operations that must be completed. For more general information, ***see*** Pool Control. Pool control is automatically updated and can be recalculated using Pooling/Scheduling.

Overview of functions

- Order-oriented view
- Resource or operation oriented view
- Planning at production order level or operation level
- Consideration of data from Beas work orders
- Scheduling and optimization of manufacturing processes
- Flexible calculation methods
- Flexible views and groupings

The heart of APS – capacity planning – is used by the standard program (backward scheduling) as well as by MRP, Pool Administration and all other relevant program components equally.
A change in the APS has a direct effect on production order management and pool management and also directly on MRP. All information is always available online. The information from FDC and MDE is available directly in the APS. Both rough and detailed planning is possible. Once a work order is roughly scheduled by Beas, that means if a work order BoM and routings are available, the

© 2026 Boyum IT Solutions A/S

processing can be done with APS.

The orientation is user-definable; it can be resource-oriented, order-oriented, project-oriented or by employee, material, production line, location-specifically or separately for detailed machine planning or the management of laborers. There is choice for rough planning on production order level or detailed planning as far as individual machine planning is accurate to the minute. The APS supports any priority control including user-definable nesting, tool management, user-definable multi-machine and multi-order operation, parallel processing and overlaps. Material requirements planning works directly with APS. APS is preconfigured for rapid familiarization.

Pool control

Pooling, Scheduling

Pool Structure Report

8.10.1 Work with APS

The APS is located in **Production > Capacity planning > APS.**

The typical sequence of operations is as follows:

1. Select the type of planning: Planning types

2. In the Planning view, work orders are sorted by resource use and other criteria, and dispatched. For this purpose, you may set different flags. Following this, the work orders are scheduled and calculated.

3. In the Graphical view, all currently planned production orders can be tracked.
If necessary, operations can be moved and will be recalculated.

Training unit 13 APS

Topics:

- Generate and edit calculation types

© 2026 Boyum IT Solutions A/S

- Generate and edit calculation scenarios
- Carry out planning in the graphical / detailed view

8.10.1.1 Scheduling

This chapter describes how the lead time is calculated:

Delivery Date

If a production order is created from a customer order, the delivery time is considered first. The delivery time is the time between production order delivery date and customer order delivery date and is defined in the settings.

Customer order delivery date	Scheduled in the customer order.
Work order delivery date	Defined in the production position, generally delivery date of customer order minus x workdays at time y. Both can be configured.
End time	Calculated completion date.
Start Time	Calculated start date.
Start date	Calculated or manually specified start date.

- Forward Scheduling

Use forward Scheduling for

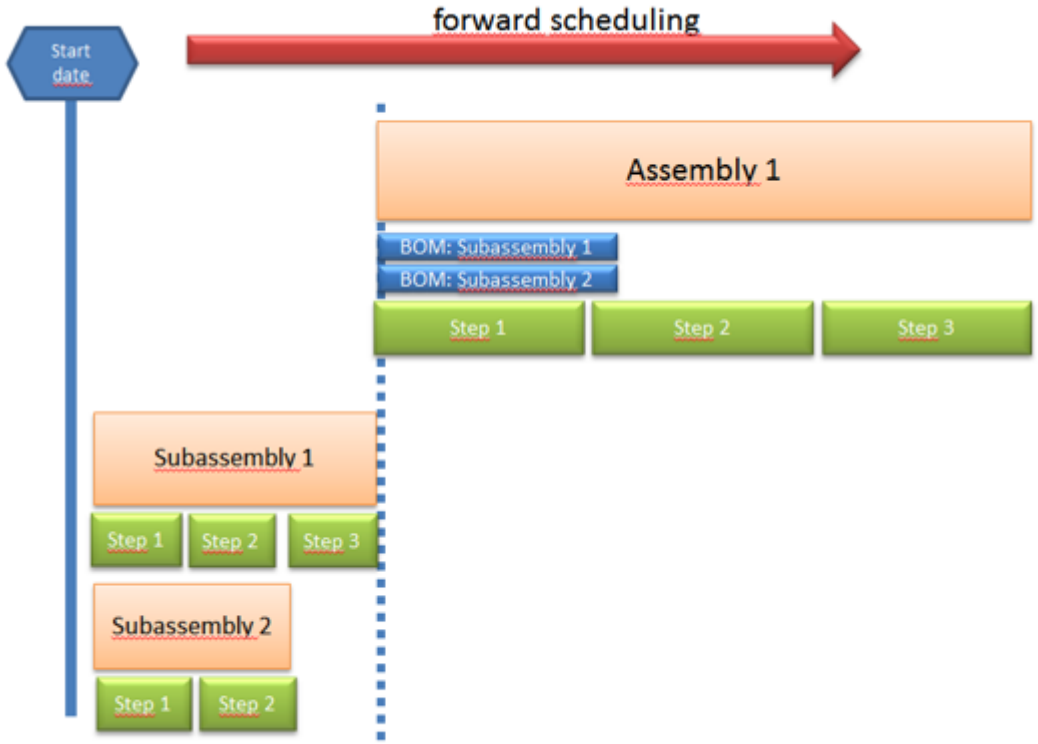
- planning exact start date for every routing step
- if you need resource resource-optimized planning

The forward scheduling starts with defined Start date and calculates the complete structure. The system starts with the sub level and then continues with the main level.

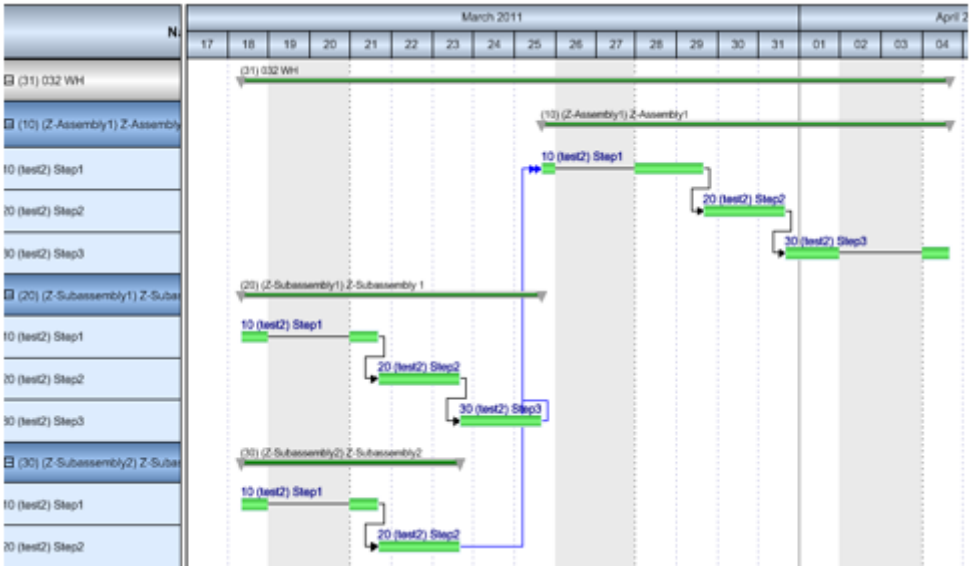
In this example

- "Assembly 1" can be produced only after all sub-assemblies have been finished.
- last operations of the sub-assemblies are linked to the first operation of "Assembly 1".

© 2026 Boyum IT Solutions A/S



In APS Gantt view:



Note:

For forward scheduling the APS License is mandatory.

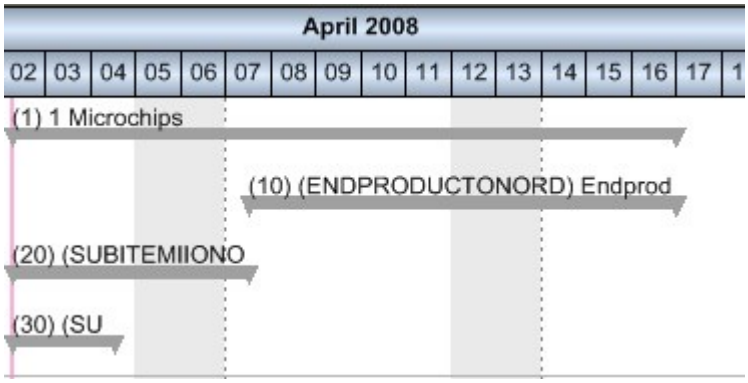
© 2026 Boyum IT Solutions A/S

Structural processing

The structural calculation is shown in this example:
The "Endproductonord" assembly consists of "subitemiionorder" and "subitemionorder"

Production structure view

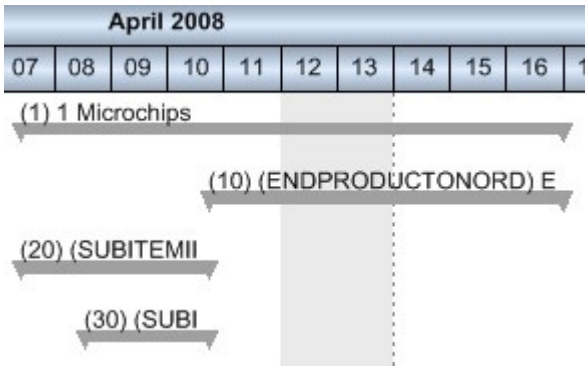
Before "Endproduct" can be started, the two subcomponents must be processed.



APS view, lines minimized – forward-scheduled

The image clearly demonstrates that in the time line work sequences 20 and 30 are started first and the upper assembly "Endproductonord" is only started when the assembly with the longer throughput time is ready.
Forward scheduling always works in a resource-oriented way here, i.e. earliest possible start.

Conversely, backward scheduling



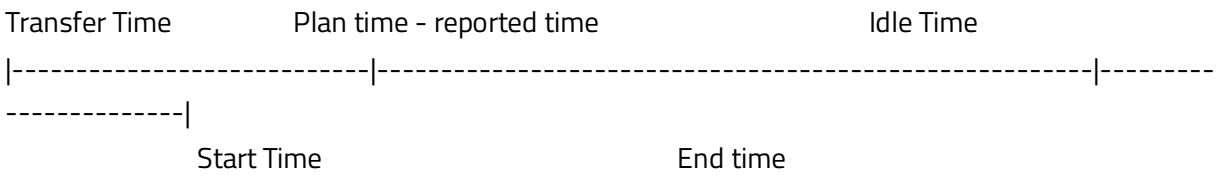
APS view, lines minimized – backward scheduling.

© 2026 Boyum IT Solutions A/S

In backward scheduling you start as late as possible (start 7 April). It can clearly be seen that assembly 30 starts later than assembly 20.

Routing Position

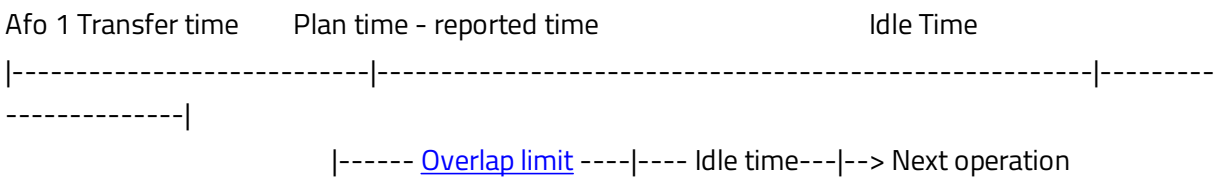
The time line of a work sequence consists of multiple parts.



Times for the resource are only reserved in the time between the start and end times. Closed work sequences are not calculated. Active logins are not considered.

For information on Calculation of target time ***see*** Calculation of target time

The next operation is dependent on the overlap time, i.e. the next operation starts on transfer time + overlap time + idle time excluding plan time (graphical view for forward scheduling only):



Transferred times are specified in Resource under *Resource -> Planning -> Transfer Time in Days* or *Resources -> Planning -> Transfer Times* . Using the priorities, the idle time and the transfer time can be influenced.

Special feature: overlap and transfer time

© 2026 Boyum IT Solutions A/S

If the following routing position is overlapping or parallel, the transit time does not apply to the following routing position, but rather to the routing position that is no longer defined as overlapping or parallel to this routing position.

Special feature: backward scheduling

Certain functions such as firming and material requirements inspection are not available and do not work in a resource-optimized way. Overlaps are supported but are not displayed correctly graphically.

Backward scheduling supports no detailed planning. Instead, it uses a "daily pot for a resource". This means that upon check of existing dispatches from other work orders only the time, but not the point in time (start) is checked.

8.10.1.2 Scheduling: Forward

Use forward Scheduling for

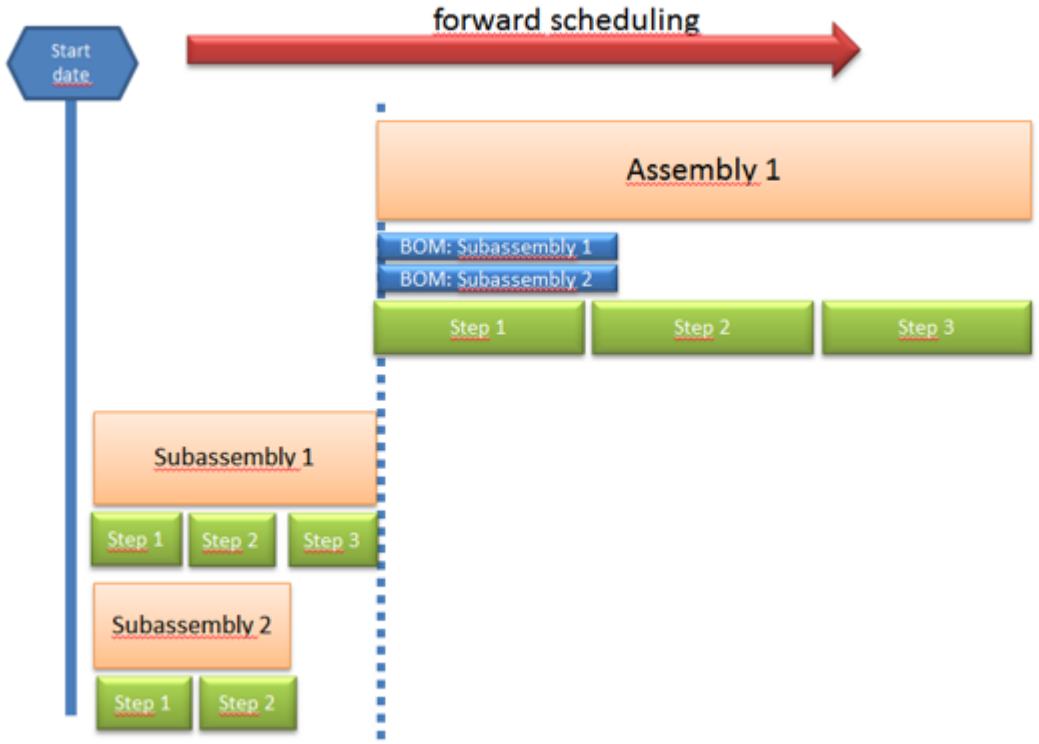
- planning exact start date for every routing step
- if you need resource resource-optimized planning

The forward scheduling starts with defined Start date and calculates the complete structure.
The system starts with the sub level and then continues with the main level.

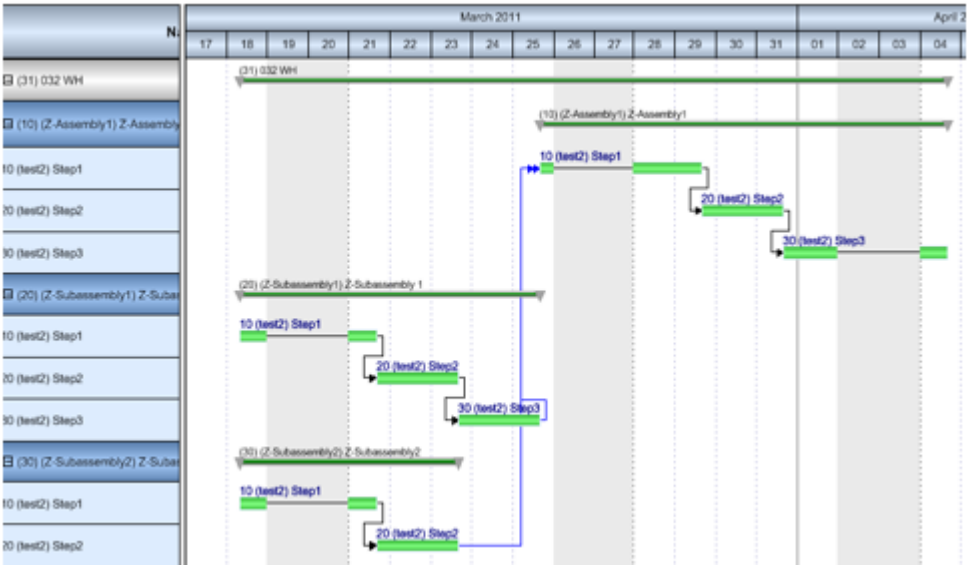
In this example

- "Assembly 1" can be produced only after all sub-assemblies have been finished.
- last operations of the sub-assemblies are linked to the first operation of "Assembly 1".

© 2026 Boyum IT Solutions A/S



In APS Gantt view:



Note:

For forward scheduling the APS License is mandatory.

© 2026 Boyum IT Solutions A/S

8.10.1.3 Expansion and Compression (APS)

There are many ways to expand and compress a work order along the timeline.

Priority

Priority can influence transit time and utilization.

Transit Time

```
|--- Transfer time --| |-- Plan time --| |--- Idle time ---|
```

You can specify the % of transit time to be considered.
For ***example***, if you input 50%, the transit time is compressed to 50% and the lead time reduced accordingly.

Utilization

You can use the utilization to specify the % to which an order can be dispatched to a resource.

- ***Examples:***

Example 1.

Resource has 8 hours / day and consists of one machine. No other time reservations.
10 hours are to be dispatched, utilization is set to 100% (default).

```
Day 1         Day 2
|--------|    |--------|

Order
|********|    |**------|
```

The order is dispatched for 2 days here.

At 150% utilization this would look as follows:

```
Day 1         Day 2
|--------|    |--------|

Order
|**********| |--------|
```

In this case, simply more is dispatched on day 1 than is available. An overload up to 150% would occur here.
The shift definition for the resource is adapted here order-specifically: Instead of 8 hours, the program then assumes 8 * 150% = 12 hours, i.e. from 6am to 6pm instead of 8am to 4pm.

© 2026 Boyum IT Solutions A/S

Example 2: Expansion

Utilization at 50%

```
Day 1         Day 2
|--------|    |--------|

Order
|--****--|    |--****--|
```

For the calculation of this order, the shift definition is changed here to 12 - (8 : 2) = 8am to 12 + (8 : 2) = 4pm
Therefore, only 4 hours are available per day and the throughput is expanded accordingly.

Expansion / compression by resource allocation

The priority always refers to the overall production order. If only one operation should be expanded, the "Resource Allocation" option is available. This value can be specified in % or number of machines/persons per resource.

- ***Examples:***

Example 1:

1 machine on the resource, 8 hrs/day, work sequence with 10 hours, default resource allocation

```
Day 1         Day 2
|--------|    |--------|

Order
|********|    |**------|
```

Changing the resource allocation to 200%

```
Day 1         Day 2
|--------|    |--------|

Order
|xxxxx---|    |--------|
```

The shift definition is not changed here; each x corresponds to 200% utilization

© 2026 Boyum IT Solutions A/S

This results in an overall utilization of 200% in the first 5 hours. The throughput time is reduced accordingly.

It is reduced to 50% for expansion

```
Day 1         Day 2         Day 3
|--------|    |--------|    |--------|

Order
|oooooooo|    |oooooooo|    |oooo----|
```

The shift definition is not changed here; each o corresponds to just 50%.
Another position can thereby be dispatched in parallel to this position.

Example 2:

2 positions with 10 hours each, 1x with 50% resource allocation and 1x 100%

```
Day 1         Day 2         Day 3
|--------|    |--------|    |--------|

Order1
|oooooooo|    |oooooooo|    |oooo----|

Order2
|******--|    |****----|
```

Order 2 is dispatched to 75% in the first day, but to 100% at 6 hours.
Reason: Beas always calculates: daily capacity minus allocated time (8*25% = 2 hrs, 6 free hours remain)
On the second day the remaining 4 hours are scheduled to 100%.

> Note:
>
> Expansion and compression is **not possible** in Detailed planning.
>
> The program switches automatically to calculation method Exploit full capacity.

See

Resource - Planning - Planned capacity
Shift schedule for resources
Resource - Transit time
Priorities

© 2026 Boyum IT Solutions A/S

APS Calculation Method

8.10.1.4 Time Reservation (APS)

If a production order is dispatched, times are reserved for it.

Note:
in this case:
- The throughput time is calculated to the minute.
- The reserved times are saved to the minute but are only considered to the day.

You can perform planning to the minute by using the graphical view.

However, APS also offers user-friendly calculation formats such as resources, which consist of multiple persons/machines and can be planned in any way without time-consuming, detailed planning.
Note particularly: Resource allocation and the function Expansion and Compression.
A plan accurate to the minute would have a very negative effect in many application cases.

Examples:

Example 1 (Planning to the day):

Two orders with the same start date and same resource are dispatched in parallel.

```
Day 1
Order 1
|---x----|

Order 2
|---x----|
```

If sufficient resources are available, both orders have exactly the same throughput.
If a plan accurate to the minute is required, Beas offers the necessary tools
See Resource-optimized Detailed Planning).

Example 2:

For day 1 + 2, multiple time reservations already exist through other orders

An order with 6 hours should now be dispatched (o). The (x) represents time reservations of other orders.

© 2026 Boyum IT Solutions A/S

The dispatch is performed as follows – based on the throughput time. The "Bind operation" option is deactivated in the calculation settings. Planning to the day:

```
Day 1         Day 2         Day 3
|xxx-xxxx|    |xx-xxxxx|    |xxx-----|
|o-------|    |o-------|    |oooo----|
```

Same ***example***, but "Bind operation" is activated

```
Day 1         Day 2         Day 3         Day 4
|xxx-xxxx|    |xx-xxxxx|    |xxx-----|    |--------|
|--------|    |--------|    |ooooo---|     |o-------|
```

Same ***example***, but as detailed planning

```
Day 1         Day 2         Day 3         Day 4
|xxx-xxxx|    |xx-xxxxx|    |xxx-----|    |--------|
|--------|    |--------|    |---ooooo|     |o-------|
```

Example 3 (Planning to the day):

1. Order resource allocation set to 200%, only 1 machine, work sequence with 8 hours. No other time reservations.
2. Order normally 8 hours

```
Day 1         Day 2
Order 1
|xxxx----|    |--------|

Order 2
|--------|    |xxxxxxxx|
```

The second order is only dispatched on the second day, as on the first day the first order consumes the full resource (4 hours * 200% = 8 hours).
This example illustrates the problem with planning to the minute. For this reason, planning to the minute is only possible in the graphical display.

Example 4 (Detailed planning):

3 identical orders with the same start date

```
Day 1         Day 2
|aaaa----|    |--------|
|----bbbb|    |--------|
```

© 2026 Boyum IT Solutions A/S

```
|--------|    |cccc----|
```

Not only are the resource limits and the times of the dispatched orders considered here, but the start and end dates of the dispatched times also.

8.10.1.5 Transit time (APS)

Transit time can be

- Transportation time from one to another place

- Drying time

- Expand lead times. In this way, urgent work orders can be squeezed in by reducing transit times in APS-calculation types or Priorities.

Example:

Step 1 is machine a, Step 2 is machine B

When the employee is finished with Step 1, he returns the goods to a collection point.

Later, the next employee collects the goods from the collection point and starts with step 2.

This time in between is an average transit time.

The transit time is always the time from the preview operation to the next operation and is defined in the resource from preview operation.

Transit time is entered in days.

Resource calendar is not taken into account. The factory calendar is considered only if this was enabled in the Configuration wizard.

Minimum transit time is entered: Configuration wizard – Master data – Resources.

Configuration of operation sequence:

```
|--- Transit time --| |-- Planned time --| |--- Idle time--|
```

First operation has no transit time.

Example with 2 operations:

```
Plan time operation 1
Idle time operation 1
Transit time of resource of operation 1
Plan time operation 2
Idle time operation 2
```

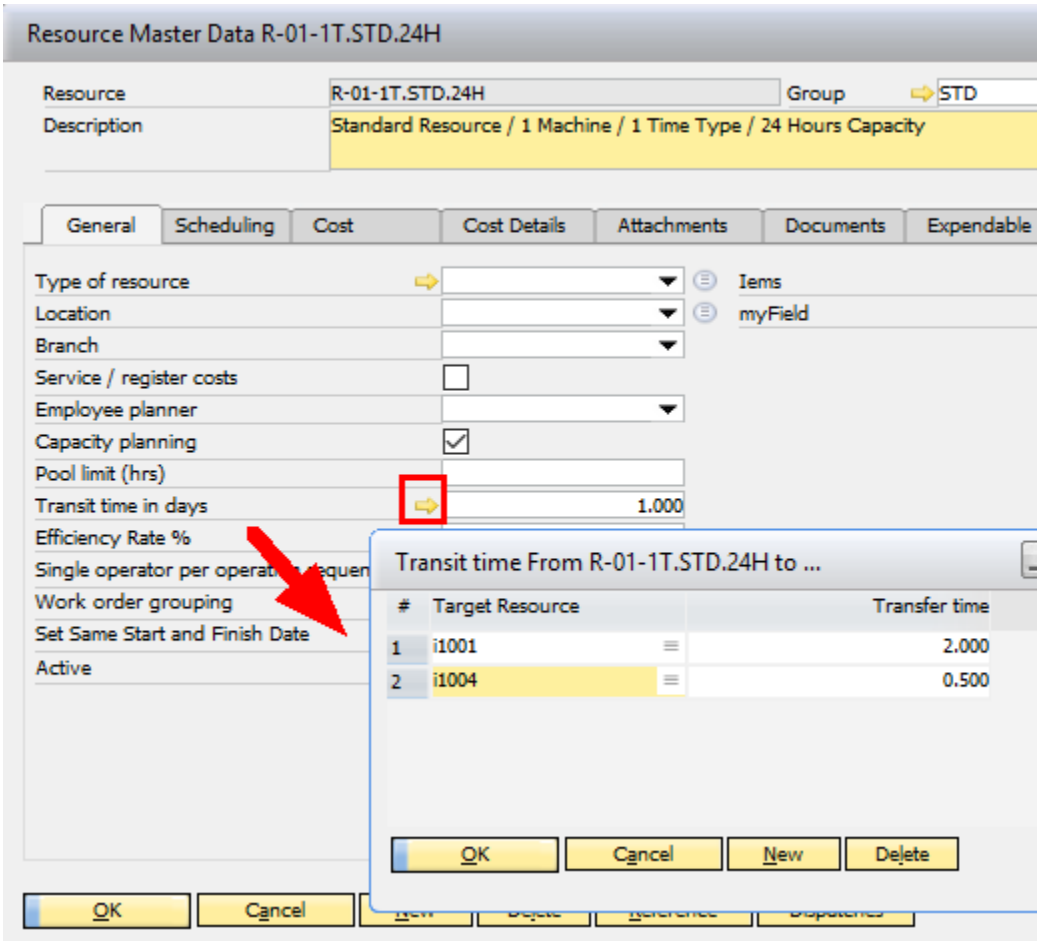
Resource-related transit time

It is possible to define different transit times to the next resource.

Example : 1 day to Resource A and 2 days to Resource B.

© 2026 Boyum IT Solutions A/S

Click on the yellow arrow left of the entry field "Transit time". In this window it is possible to insert the target resources with the resource related transfer time.



stamm_arbplatz_uebgzeit.psr

Transit time can be used to expand lead times. In this way, urgent work orders can be squeezed in by reducing transit times in APS-calculation types or Priorities

Example

You have transit time 0.5 days

With forward calculation you see: It is not possible to deliver it to the planned delivery date

Now it's possible to decrease the Transit time in APS-calculation types or Priorities

© 2026 Boyum IT Solutions A/S

Overlapping

In case of overlapping, always the largest transit time is used. The factory calendar is considered only if this was enabled in Configuration wizard.

See Parallel Operation and Overlapping

Example

Operation sequences 1,2 and 3 are parallel: 2 hours each, A2 has a transit time of 2 hours.
Operation 4 is normal with 2 hours duration

```
A1     Start 8:00 - 12:00
A2     Start 8:00 - 12:00
A3     Start 8:00 - 12:00
Idle time A2: 12:00 - 14:00
A4     Start 14:00 - 16:00
```

Note:

The system works with internal cache. If you change the transit time per target resource, you must reopen the APS Graphical view.

8.10.2 APS Scheduling

APS Scheduling

- APS edit Scheduling
  - Master data
  - Resources
  - Views
    - View
    - Sub view
    - Field description
  - Calculation type

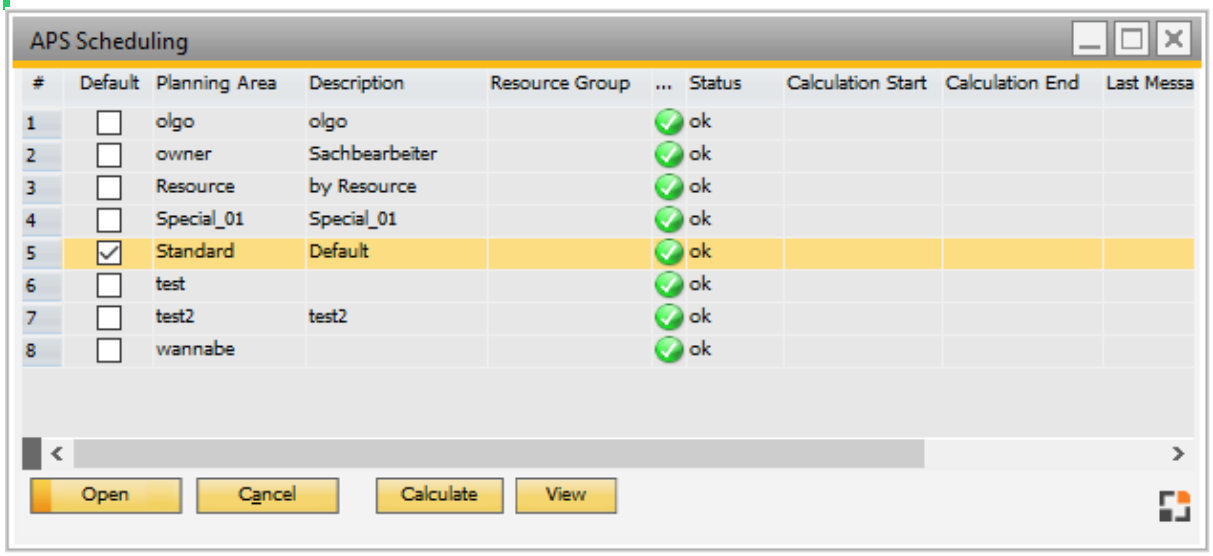
© 2026 Boyum IT Solutions A/S

Planning view

Each APS planning starts in the Planning types window. As long as no detailed scheduling on resource level is required, the planning view is the perfect tool for production scheduling on work order level. You can create a new scheduling or select from the existing ones. 2 pre-defined schedulings are delivered:

Resource	Resource-oriented
Standard	Order-oriented

PATH: Production > Capacity Planning > APS.



Window fert_xgantt_planing_browse.psr

Columns

Field	Meaning
Default	Flagged: this scheduling is used as standard.
Planning area	Name for planning area.
Description	Description of planning.
Resource group	Order-related planning for a resource group (assembly line XY).
Employee	Planning with reference to employee. In the resource the employee is deposited. Only work orders are displayed which require resources managed by the appropriate employee.

© 2026 Boyum IT Solutions A/S

Project	Project-related planning for project X.

Window settings for further fields are available.

Functions

Field	Meaning
View	Displays the APS View. ***See*** planning view (= double-click).
Remove	Deletes the scenario.
Open	Opens the scenario definition.
Add	Creates new scenario definition. ***See*** APS – edit planning.
Import Default	Reload the pre-defined schedulings If you start the APS the first time, or if you click on the button, the system loads the default scenarios and APS calculation types. NOTE: APS Standard methods have a description. If you click on "Default", the system imports the description in the current language and not in the language defined in the System language of the Configuation wizard, ***See*** APS Calculation Type - Description NOTE: If you click on this button, the system overwrites all currently defined scenarios and calculation types defined in the standard! The system does not delete own created calculation types or views. ***Example:*** You create a calculation type "Test" and change the view "Resource" and click on "Reload": - all changes in view "Resources" are deleted. The system overwrites this with the standard variant. - the system changes nothing in the calculation type "test" because it is not part of the standard variant.

© 2026 Boyum IT Solutions A/S

Calculate	Calculate the APS Scneario This function allows you to calculate the planning scenario directly in fore- or background: Note: If you want to calculate this automatically, for example overnight, you can define an activity. ***See*** Server activities Use the following command in the script, for example, which calculate scenario "olgo" `object=ue_aps_browse=calculate=olgo` or leave the scenario ID part of the script empty to calculate the default APS scenario.
Duplicate scheduling	Create a new, duplicate scheduling of the selected one. The "Copy" dialog box opens to enter new ID.

8.10.2.1 APS Edit scheduling

APS Scheduling

APS edit Scheduling

Master data

Resources

Scheduling view

Master data

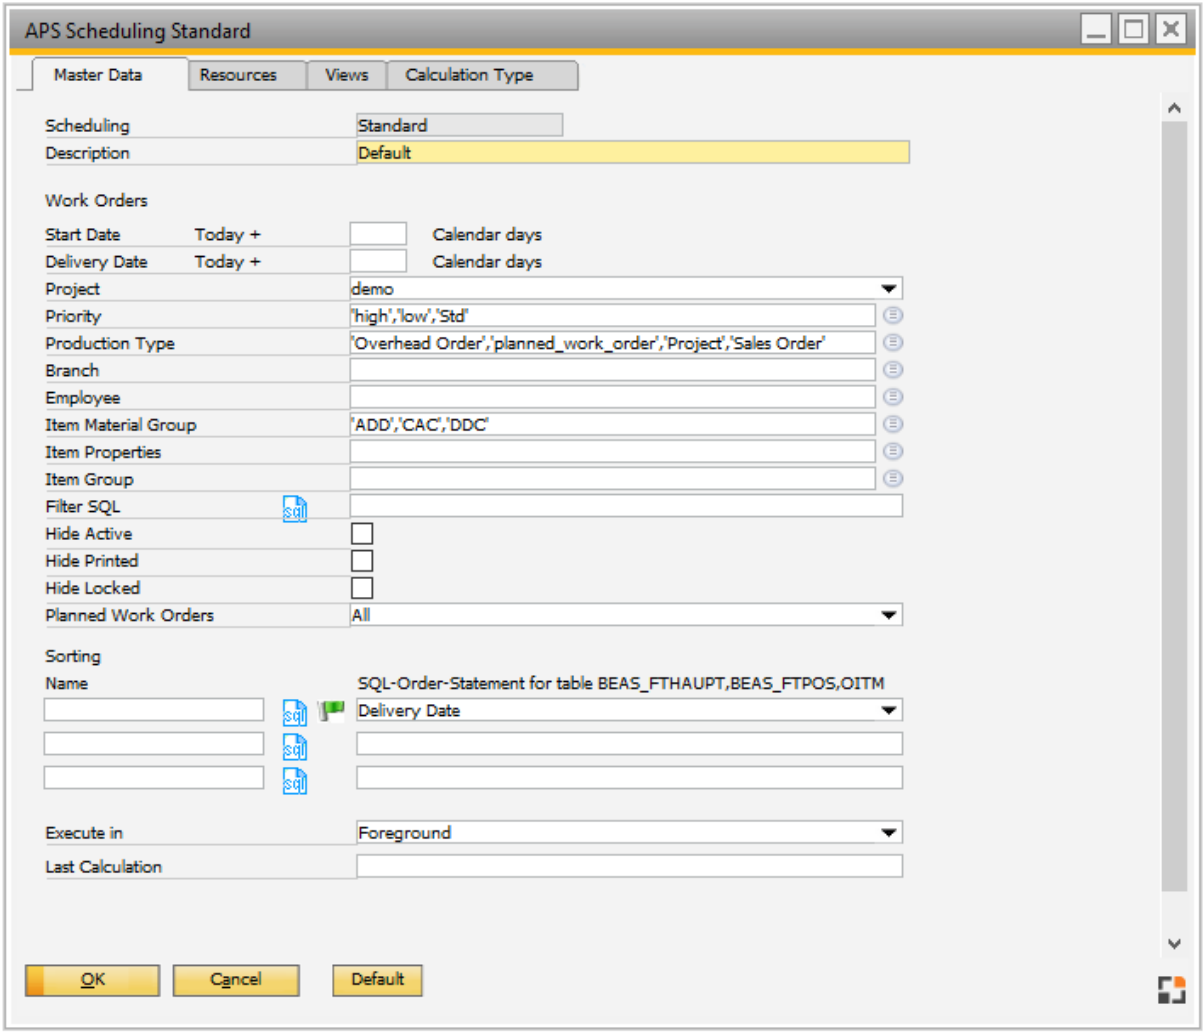
This tab includes the specific information for the APS execution: the name of the scenario, the work orders to be scheduled and special sorting.

© 2026 Boyum IT Solutions A/S



Window: fert_xgantt_planing_edit

Field descriptions

Field	Description
Scheduling	Name of scheduling.
Description	Description of scheduling, still changeable at this moment.
Resource group	If selected, only work orders from this group are displayed.
Employee	If selected, it displays only work orders containing a resource which is assigned to the respective employee. ***See*** resource master "employee planner".
Start date today+	⊟ Consider start date If a number is entered, it displays only work orders having a start date today + the given number of calendar days.

© 2026 Boyum IT Solutions A/S

	Beas uses the date which you defined in Production position – Start Date. If this was not defined, Beas uses the Start time field of the Production position which is determined automatically during work order creation using backward scheduling. **Important:** This works only if a start date was entered. Delete the entry to remove the filter. *Table fields:* *'BEAS_FTPOS'.'STARTZEIT'. If null: 'BEAS_FTPOS'.'ANFZEIT'*
Delivery date today +	Only work orders with a delivery date within the given period are displayed.
Project	Project filter: only work orders related to this project are displayed.
Priority	Define which work order to display filtered by priority.
Production type	Define which work order to display filtered by production type.
Branch	Define which work order to consider filtered by branch.
Employee	Define which work order to consider filtered by assigned employee (**Item master > Employee**).
Item material group	Define which work order to consider filtered by items linked to the material groups.
Item properties	Define which work order to consider filtered by items linked to the properties.
Item group	Define which work order to consider filtered by items linked to item groups. ***Example***: For example, if the user has created an item group called "Finished Products" in SAP, it can be selected here. Then, the APS scheduling window only displays work orders with items that are assigned to this item group.
Filter SQL	You can define which WO to be shown with a customizable filter. You can define a customized filter with an SQL statement. Click on the SQL Symbol to define the filter. In the SQL Editor, all available fields are shown. The filter can be defined and tested. The code entered is inserted behind “WHERE” and before “ORDER BY”. This filter uses the following tables: Work order BEAS_FTHAUPT

© 2026 Boyum IT Solutions A/S

	Work order position `BEAS_FTPOS` Item `OITM` ***Example:*** Only show items for which the item code starts with "A" `substring ("OITM"."ItemCode",1,1)='A'` Beas marks correct SQL statements with a green flag and incorrect SQl statements with a red flag. For more Information ***See*** SQL Editor Tips and tricks (sorting, filter, task descriptions) 10/2017
Hide Active	Enable to hide active work orders which are logged in or confirmed partly.
Hide Printed	Enable to hide printed work orders.
Hide Locked	Enable to hide blocked work orders. Exception: Planned work orders are still displayed.
Planned Work orders	Define view in dependence of the APS planned – flags. Work orders can be set APS planned, either automatically at calculation of the lead times or in Work order - Settings. ***Example :*** Only check already calculated WOs: In this case set to "Only planned". Only WO set to "APS planned" have to be considered (in this case e.g. released). In this case, select "Hide planned". Selection: **Hide planned**: Hide planned work orders. **All:** Show work orders. **Only planned**: Show only planned work orders.
Sorting	Sorting in List view Sortings can be set up. For the first sorting you can select from a list of templates or enter an SQL-Order-Statement. The standard sortings are as follows: **manual sorting:** Work orders can be sorted using drag & drop per scenario

© 2026 Boyum IT Solutions A/S

planned start: Work orders can be sorted by start time of the manufacturing assembly *('BEAS_FTPOS'.'STARTZEIT')*

Delivery date: Work orders can be sorted by delivery date of the assembly *('BEAS_FTPOS'.'LIEFERDATUM')*

Document number: Work orders can be sorted by document number and assembly position number

Project: Work orders can be sorted by project number and start time of the manufacturing assembly

Customer: Work orders can be sorted by customer number and start time of the manufacturing assembly

Item: Work orders can be sorted by item (assembly) and start time of the manufacturing assembly

Priority: Work orders can be sorted by priority ID *('BEAS_FTPOS'.'ABGKZ')*

For the next two criteria the name and the SQL-Order-Statement is to be entered.

Note: No syntax check is performed by Beas. If an invalid value is entered, this leads to error when opening the planning list. The entered sorting templates are displayed in planning view at the end of the templates list.

Tables `BEAS_FTPOS, OITM` and `BEAS_FTHAUPT` are available.

Example: `"BEAS_FTHAUPT"."AUFTRAG"` sort by order number

To define this, click on the SQL symbol. In the SQL editor you can only see the available tables.

Choose a table and a double-click on all necessary fields

If you execute the SQL statement, you can see the result.

If you click on update, Beas inserts this information in the scheduling window.

Tips and tricks (sorting, filter, task descriptions) 10/2017

Execute in

Select how to execute the calculation:

Setting	Description
Background	When starting the calculation, a separate task for the calculation is opened. While the calculation is running, it is possible to work with Beas, and the APS Browser shows the status of the calculation. **Note:** Background execution does not support "Windows authentication" login mode. Use standard login to Beas for background operations.
Foreground	The calculation is done directly in the application. While the application

© 2026 Boyum IT Solutions A/S

	<table><tr><th>Setting</th><th>Description</th></tr><tr><td></td><td>is running, it is not possible to work in Beas.</td></tr><tr><td>Ask always</td><td>When starting the calculation, you can choose if the calculation should be done in back- or foreground.</td></tr></table> Note: If you want to calculate this automatically, for example overnight, you can define an activity. ***See*** Server activities
Last calculation	Date and time of the last calculation of this scenario.

Functions:

Function	Description
Duplicate	Create a new, duplicate scheduling of the selected one. The "Copy" dialog box opens to enter new ID.
Remove	Delete current scheduling scenario.
Default	A dialog box opens to confirm making the current APS Scheduling a default scenario.

8.10.2.1.2 Resources

APS Scheduling

APS edit Scheduling

Master data

Resources

Views

View

Sub view

Field description

Calculation type

Scheduling view

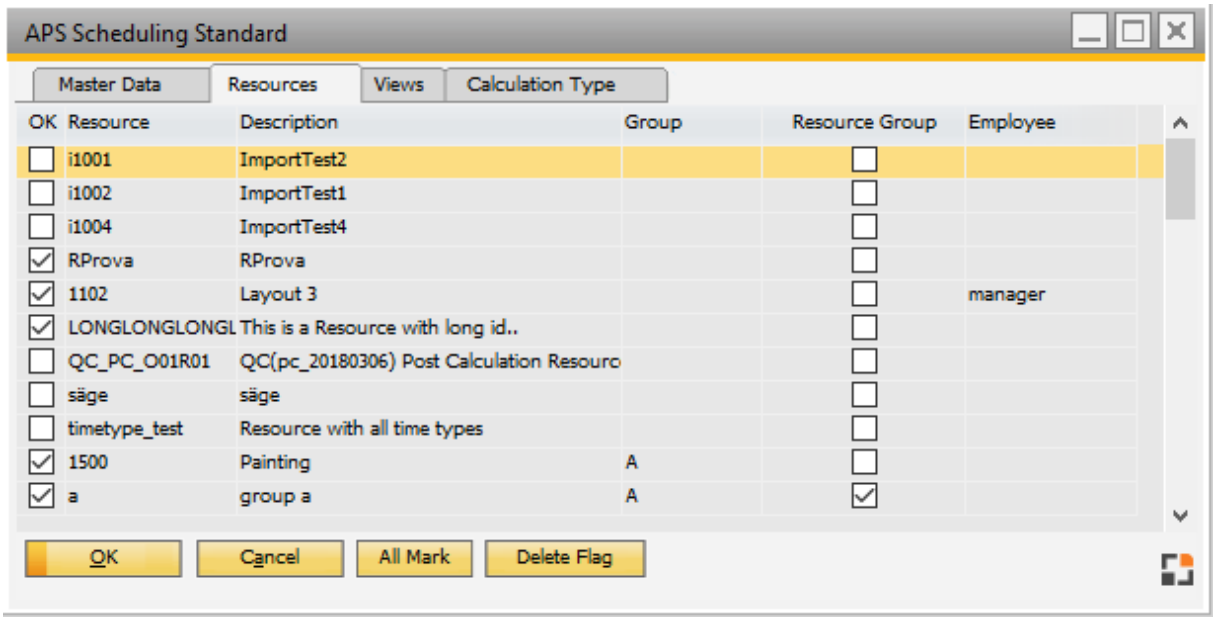
Resources filter

Define the filter on resource level here. This is active if at least one entry has been selected.

The resources are displayed by resource group + resource ID or resource optimization sorting if this function is enabled for this resource group.

The filter has the following meaning:

Display all work order positions if the resource was stored somewhere in the work order on routing level.



Window fert_xgantt_planing_ressource.psr

Column	Meaning
OK	Activate to select this resource.
Resource	Resource ID.
Description	Resource ID.
Group	Resource belongs to the indicated resource group .
Resource Group	This resource is a resource group.
Employee	Responsible employee.

Functions:

All Mark: By clicking on this button, you can easily select all resources to be considered for the scheduling.

Delete flag: Click on this button to clear all the existing checks for resources.

© 2026 Boyum IT Solutions A/S

Note:

- The belonging resources also have to be selected if a resource group has been selected
- Parallel or alternative resources are not considered.

LIMITATION ON TOOLS:

Important: In APS, the system calculates interruption time ONLY for resources. Tools do not have a precalculated calendar, and Beas does not check interruption on Tool level.

- Always searched on WO level

Example:
Order 1, assembly 10: includes resource A1
Order 1, assembly 20: includes resource A2

Filter on resource A2:
Display assembly 10 and assembly 20 in this case.

Reason: A structure search would be alternatively, so check if this resource is stored somewhere in the assembly structure. This can also be in the sub-assembly. But a structure search per SQL is not possible. The speed would be greatly reduced.

This problem appears only if multiple assemblies are inserted in a WO on top level (Summarized order). Should be avoided.

- Adjust of the resource filters

The function of the filter changed completely *(beas 9.2 PL: 02)*

```
windowevent setresourcefilter
// value -> the new sql statement
// e_resourcefilter -> all choosed resources, example 'A001','A002'
```

Default SQL Statement for this Filter

```
(SELECT count(*)
FROM "BEAS_FTAPL" a
INNER JOIN "BEAS_FTPOS" p on a."BELNR_ID"=p."BELNR_ID" and
a."BELPOS_ID"=p."BELPOS_ID" and isnull(p."ABGKZ",'N')<>'J'
WHERE a."BELNR_ID"="BEAS_FTPOS"."BELNR_ID" and isnull(a."ABGKZ",'N')<>'J' and
isnull(a."AKTIV",'J')='J' and a."APLATZ_ID" in (<e_resourcefilter>)) >0
```

© 2026 Boyum IT Solutions A/S

Example:

Check only current work order position and not all work order positions from current work order

```
windowevent setresourcefilter
#define value
(SELECT count(*)
FROM "BEAS_FTAPL" a
WHERE a."BELNR_ID"="BEAS_FTPOS."BELNR_ID" and
a."BELPOS_ID"="BEAS_FTPOS."BELPOS_ID"
and isnull(a."ABGKZ",'N')<>'J' and isnull(a."AKTIV",'J')='J' and a."APLATZ_ID"
in (<e_resourcefilter>)) >0
#end
end event
```

Window fert_xgantt_view_edit.psr

View tab

Field	Description
View	Unique name of the view
Description	Description of the view.
Show only selected resources	Only displays resources which were selected in the planning (APS / VIEW). The operation sequences are not linked to the arrows. Resources can be arranged in groups in the Gantt view.
Date area from today minus days	Define the time range in which the work orders are going to be displayed. This is defined in calendar days. ***Example***: If the user enters from "1" to "30", all work orders are displayed from 1 day in the past to 30 days in the future.
Optimal daily adjustment	Determine whether the day view should be scaled automatically. In most cases, it is better not to use this parameter and to define a fixed value.
Gantt object move behavior	The behavior of APS after moving an operation sequence can be defined here Determines the behavior when the user moves an operation in the Gantt chart graphical viewer.

© 2026 Boyum IT Solutions A/S

	<table><tr><th>Action</th><th>Description</th></tr><tr><td>No action</td><td>Operation sequences can be moved freely. Useful if group function is used. An automatic optimized dispatch has to be done afterwards.</td></tr><tr><td>Mark</td><td>The operation sequence is fixed and marked after the scrolling. If a scheduling is done afterwards, all work orders with marked operation sequences are re-calculated. The operation sequence is not moved because of the fixing.</td></tr><tr><td>Dispatch</td><td>The operation sequence is fixed and marked and immediately dispatched after moving. Thus the change is immediately recognizable in the dispatch display. Resource limits are not considered. The "Forward scheduling" method is dispatched. Possibly the operation sequence is moved again automatically up to the first work hour. The duration is corrected accordingly.</td></tr><tr><td>Dispatch with resource limits</td><td>The resource limits are considered. After this, the movement of the operation sequence could be moved again – up to the first free time of the resource, and the duration is adjusted accordingly (depending on the resource capacity of this date).</td></tr><tr><td>Fix, dispatch and hold together</td><td>The next free time slot is searched and the operation sequence can be fully inserted in it.</td></tr></table>
Xgantt Style	Select Gantt viewer style:

© 2026 Boyum IT Solutions A/S

	- Fiori style (old): View APS results as in Beas Manufacturing versions older than 2021.03 **- Boyum new Style:** View APS results that is based on Boyum color codes and fonts, and that provides enhanced user experience. ***See*** Boyum new Style Gantt viewer.

Planning view

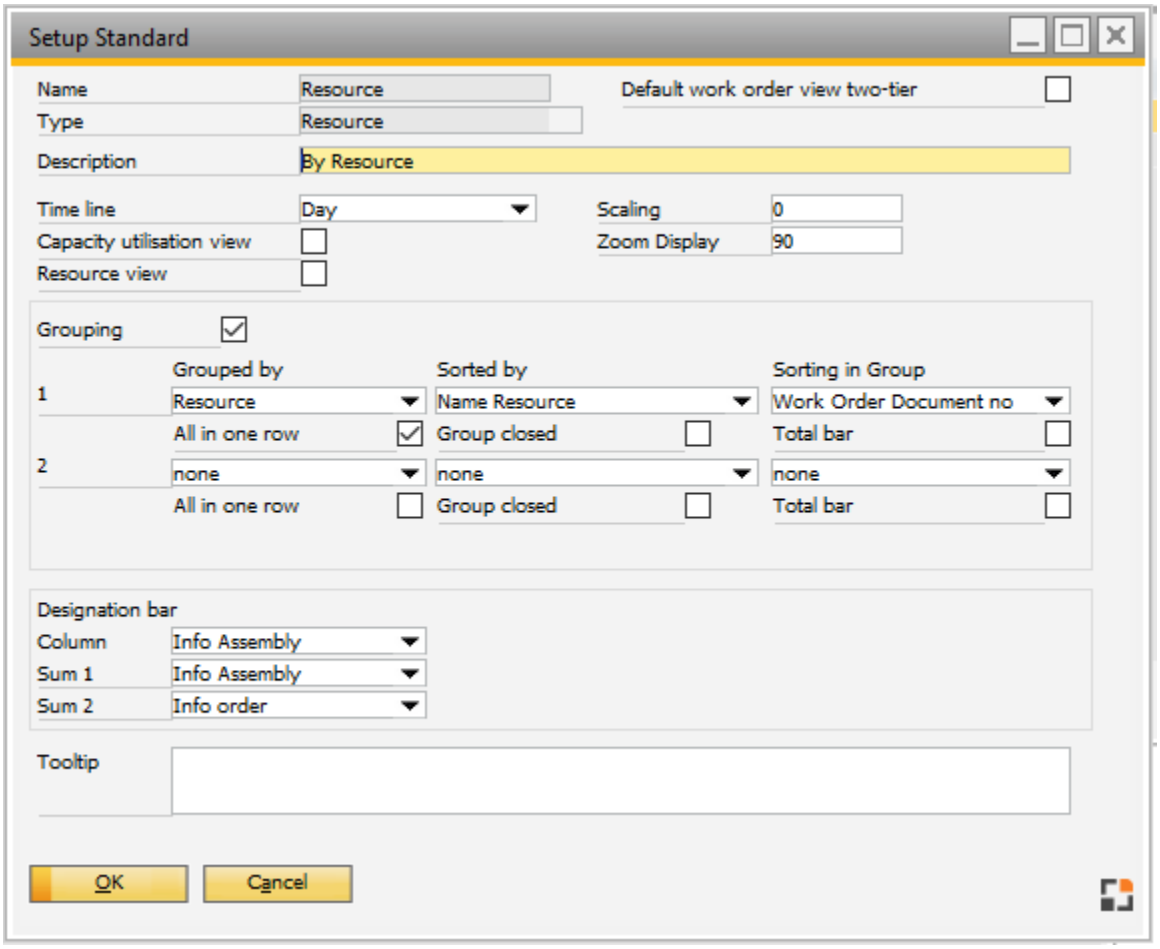
Sub view

Grouping, sorting and field descriptions are defined in the sub view.

The sub view can be changed in Gantt without leaving it.

> Production > Capacity Planning > APS > **Add** > **Views** tab > **Add** or **Open** > Sub views tab > **Add** or **Open**

© 2026 Boyum IT Solutions A/S



Field	Description
Name	Name of the sub view.
Default work order view two tier	Set the standard sub-view as default instead of the one defined in the grouping area. If this field is enabled, all previous information saved in the grouping area is replaced by the standard sub-view parameters. ⊟ Example Before setting this parameter:

© 2026 Boyum IT Solutions A/S

Field	Description
	 After setting this parameter:
Type	Define whether the view is “Resource” or “Order” type.
Description	Description of the sub view. **Note**: The text in the description is displayed later in the selection list in the graphical view. As a recommendation, do not select a long description, as the selection list can only display a limited number of characters.
Time line	Determine whether the graphical view should be displayed in hours, days, weeks, months or years. By default, Beas sets this with the value “Day”.
Scaling	Set the scaling factor based in time units. This factor is taken into account in the time line scaling (Time units per mm. Set to1000 by default).
Zoom Display	The total Gantt-display can be decreased / increased. (Display in percentages.)
Dispatch Display	If enabled, graphically displays the utilization of the resources in addition to the graphical display of work orders in the Gantt view.
Resource Display	If enabled, graphically displays the reservation of the resources in addition to the graphical display of work orders in the Gantt view.

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>Important: Since the available space is limited, the user should only activate what is really needed.</td></tr>
<tr><td>Grouping</td><td>If a grouping has to be done. A grouping can totally be done on two levels, e.g. Resource group - Resource or Document - Document Position or Project - Document number.</td></tr>
<tr><td>Grouping by</td><td>Provide field name as the basis of sorting.
The selected field name will be displayed on the left side. That is why sorting by "Info Order" is possibly by which the information to the work order will also be displayed instead of only the document number.
Useful grouping possibilities:
<table><tr><td>Order oriented</td><td>Info Order - Info Assembly</td></tr><tr><td>Resource oriented</td><td>Resource name</td></tr><tr><td>Resource oriented by resource groups</td><td>Resource group, Resource name</td></tr></table>
Own fields are also definable (Views - Field Description) and then sortable, eg. raw material, material thickness etc.</td></tr>
<tr><td>Sort by</td><td>Sort criteria of the group</td></tr>
<tr><td>Total bar</td><td>If a total bar has to be displayed for the grouping (gray bar above the process). This bar is only useful in a order oriented view.
 Example with display of a total bar</td></tr>
<tr><td>Sorting in group</td><td>Determine the sorting in a group</td></tr>
<tr><td>Field
Sum1
Sum2</td><td>How the fields and sum bars are described can be determined here:</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
	 **Description field bar and sum bar** The default caption is: Field: Info operation sequence Sum 1: Info assembly Sum 2: Info order A field can be selected or (better alternative) the field (Info operation sequence) can be changed directly in Views - Field Description.
tooltip	After the mouse has been placed on an operation sequence but no mouse click has been done, a tooltip opens automatically. The resource as well as the information to this operation sequence are displayed there. ⊟ Details: Which field has to be displayed can be determined in this field. The default will be used if this field is empty. ***Example***:

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>

```
Resource: <xgantt.datafield.17>
<xgantt.datafield.18><cr_lf><xgantt.datafield.20><cr_lf><xgant
t.datafield.21><cr_lf><xgantt.datafield.22>
```

Following fields are available:

See: Table Setup.

A script can be stored alternatively.

For this the syntax has to begin with the word "`script`" and the variable "`value`" returns what must be displayed in the tool tip.

Example:

Valuation of the field Resource type (16)

A	Parallel Resource
W	Tool
F	External operation
R	Operation sequence (green area)
L	Delivery date (red point)

```
script
if <xgantt.datafield.16> = A then
  setvar=value=<spr:Parallele Ressource>
  return success
end if
if <xgantt.datafield.16> = W then
  setvar=value=<spr:Werkzeug>
  return success
end if
setvar=value=<spr:andere Ressourcen>
return success
```

</td></tr>
</table>

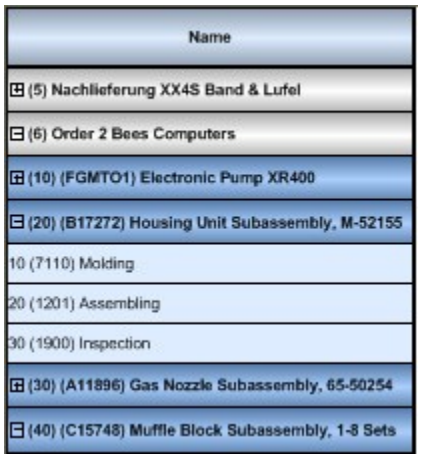
1. Definition of the sum description and operation sequence description
2. Up to 4 additional freely definable fields

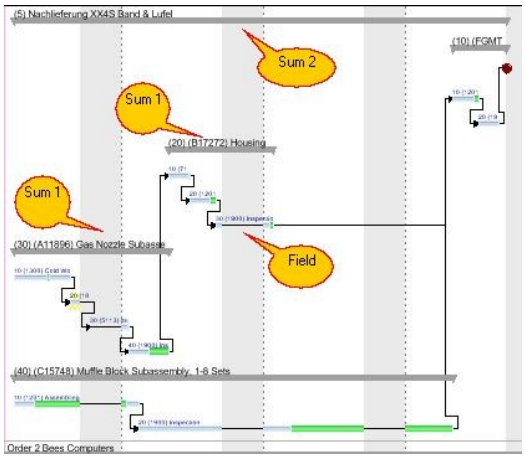
These pieces of information are determined directly using SQL-fragments. Although this method is not very simple, it is very flexible.

Designation information

The sum bar and operation sequences can be described in Gantt. The grouping and the description of the task can be done additionally at this information on the on the left side.

© 2026 Boyum IT Solutions A/S





The grouping and so the view on the left side can be defined in the Sub view.

The designation can be defined using SQL-Instruction. The SQL-Instruction is allowed to recall only one Varchar-String. Numbers have to be converted in string via the convert-instruction. The field is formatted correctly and converted if it has been selected by adding. The result is displayed immediately in the field "Result". The green/red flag shows if the instruction is correctly.

Default setting designation:

Column	Document position, Resource, Activity
Sum 1	Document position, Item, Item description
Sum 2	Document position, Order, Customer name

There is an access to the following tables to insert additional fields:

BEAS_FTAPL	Operation sequence
BEAS_FTPOS	Assembly
BEAS_FTHAUPT	Work order
OITM	Item information of the assembly

An access to all others tables is also possible via sub instruction.

```
(select x from mytable where y=z)
```

Example:

Examples are displayed in HANA-Syntax. These examples can also be used in the MSSQL-environment, because Beas converts these in MSSQL-Syntax for runtime.

© 2026 Boyum IT Solutions A/S

Operation sequence with item + describe material

Field - Description - Column "Sum 2"

```
RTTRIM("BEAS_FTPOS"."ItemCode") || ' '+rtrim("OITM"."U_WST_ID")
```

Work order position:

Statement position number, Item number, Description, Already posted in quantity, Total quantity

Cancellation or "manual complete" are no considered at this example.

```
'('||rtrim(CAST("BEAS_FTPOS"."BELPOS_ID" AS varchar(10)))||') ('||
rtrim("BEAS_FTPOS"."ItemCode")||') '|| rtrim("BEAS_FTPOS"."ItemName")||' '||
CAST(CAST(ifnull(
  (select sum("InvQty") from "IGN1" where "U_belnrid"="BEAS_FTPOS"."BELNR_ID"
and "U_belposid"="BEAS_FTPOS"."BELPOS_ID" and ifnull("U_posid",0)=0)
  ,0) AS int) AS varchar(20)) || ' <spr:von> ' ||
CAST(CAST("BEAS_FTPOS"."MENGE" AS int) AS varchar(20))
||' '||rtrim("BEAS_FTPOS"."ME_LAGER")|| ' <spr:fertig>'
```

Relevant commands for formatting:

`rtrim()`	delete subsequent spaces
`convert(varchar(10),field)`	Convert number or date to characters
`ifnull(field,'')`	Pre-assginment of the result with space string, if it is not already assigned

Note:

Not all fields are always filled. You must ensure that a ZERO is not returned.

You can intercept this e.g. using is zero():

```
coalesce(rtrim("OITM"."U_BEASWST_ID"),'')
```

User-definable fields for APS view

Up to 4 freely definable fields can be defined for the graphic view and 4 fields can be defined for the APS Work order list.

Available fields:

© 2026 Boyum IT Solutions A/S

Field name	Description of the field (will not be translated)
SQL - Checking - Flag	Display if the entered SQL-instruction is correctly SQL-instruction is correct An error was detected in the SQL-instruction
SQL Instruction	SQL - fragment. Here will be displayed which information has to be displayed. **Available tables:** In list and graphic view: Work order position `BEAS_FTPOS`, Work order `BEAS_FTHAUPT` as well as Item master `OITM`. Only in the graphic view: Routing `BEAS_FTAPL`, Resource `BEAS_APLATZ`

Example:

A field can be defined as "Material" if a Grouping for eg. by "Material is required

Field name: Material

SQL: `coalesce(rtrim("OITM"."U_BEAS_WST_ID"),'')`

The sorting and grouping of the material is immediately available in the Sub view definition.

8.10.2.1.4 Calculation type

APS Scheduling
- APS edit Scheduling
  - Master data
  - **Resources**
  - Views
    - View
    - Sub views
    - Field description
  - **Calculation type**
- Scheduling view

Define which calculation types are available for this view. Add and remove a calculation type from the right-click menu.

© 2026 Boyum IT Solutions A/S

Column	Description
Calculation type	Choose the calculation type.
Description	Description of chosen calculation type.

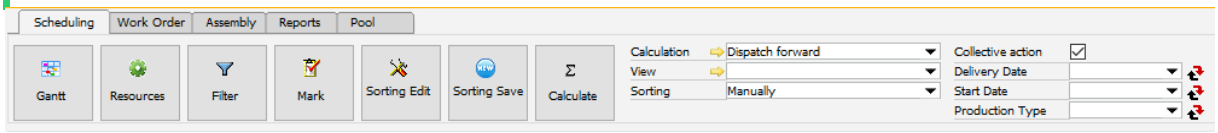
8.10.2.2 Planning view

APS Scheduling

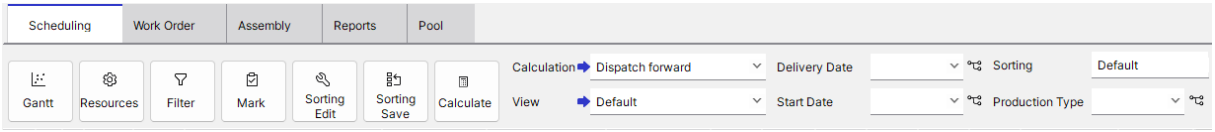
APS Edit Scheduling

Scheduling view

PATH: Production > Capacity planning > APS > select an entry > click **View**.



Boyum Style top bar design:



Window fert_aps_browse.psr

The planning view provides the following possibilities:

1. Filter production orders by resource usage and other criteria
2. Sort production orders
3. Plan and dispatch production orders
4. Change/set flags

Multiple selection and mass operations are supported. ***see*** Multiple selection.

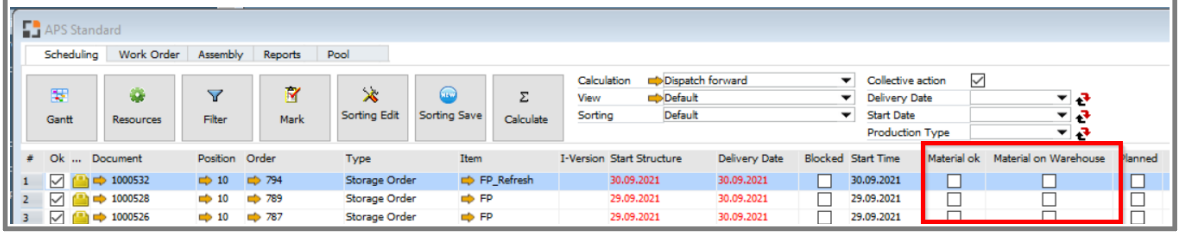
Only work orders are displayed which:
- correspond to the above chosen filter settings
- require at least one of the selected resources.

The structure of the production can be freely defined via right-click > window settings. There a number of columns available that can be displayed.
Further filtering and sorting is possible at any time by right-clicking on a column heading.

© 2026 Boyum IT Solutions A/S

Note on Item breakdown

Important: If no Breakdown method is defined in the Item Master data, "Material ok" and "Material on Warehouse" flags are displayed incorrectly, and therefore the item will not be considered correctly in the APS calculation!



Scheduling

Functions in upper ribbon:

Button	Meaning
Gantt	Open the Gantt view, display all work orders, for which the column "OK"- was checked.
Resources	Open a selection window, which are considered at the Planning. ***See*** Notes APS - Planning - Resources
Filter	Open filter settings (priority, document number, start-/delivery date, project etc)
Mark	Multiple entries can be marked by using the multiple marking function. These selected entries can be activated / deactivated for the calculation or other collective actions via the button "**Mark**" (Check mark in column "OK" will / will not be set) The selected work order is marked (In the first column of the production list a check mark is set (OK).
Sorting edit	Active: you may sort the work orders by drag and drop. It is possible to select multiple entries and to move the highlighted area. When the mouse cursor points on the icon of the list, the cursor changes to a up/down arrow to point that you can

© 2026 Boyum IT Solutions A/S

Button	Meaning
	move the entry with drag and drop up or down. To do so, keep the Ctrl key pressed and use the left mouse button to select multiple entries. To select a range, click on the first entry, hold the Shift key and click the last entry with the left button.
Sorting save	Saves the current sorting and exits the "Sorting edit" mode. **Explanation on sorting:** If 2 production orders start simultaneously and both require the same resources, the first production order receives the free resource first and the second can only be scheduled afterwards. The sequence therefore determines which production order receives the free resources first.
Calculate	Starts the scheduling of all marked work orders.

Field descriptions

Field	Description
Calculation	Shows the current calculation type. The orange reference arrow opens the setting APS Calculation types .
View	Current view (default) The orange reference arrow opens the settings of planning view.
Sorting	Select from different sortings. ***see*** APS edit planning.
Collective action	Set check mark, to perform the action selected in lower field for all marked work orders.
Delivery date	Select delivery date, with click on the red/black icon the change is applied to all marked work orders.
Start date	Select start date, with click on the red/black icon the change is applied to all marked work orders.
Production type	Select production type, with click on the red/black icon the change is applied to all marked work orders.

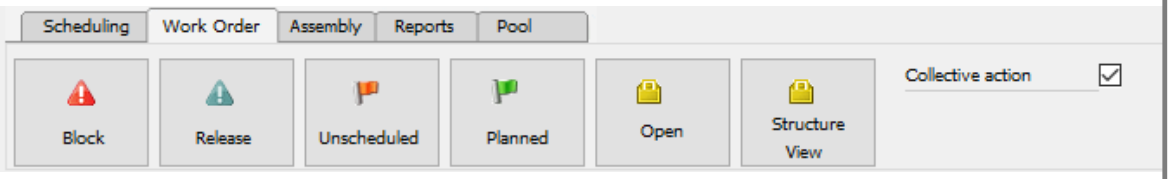
Right-click functions:

© 2026 Boyum IT Solutions A/S

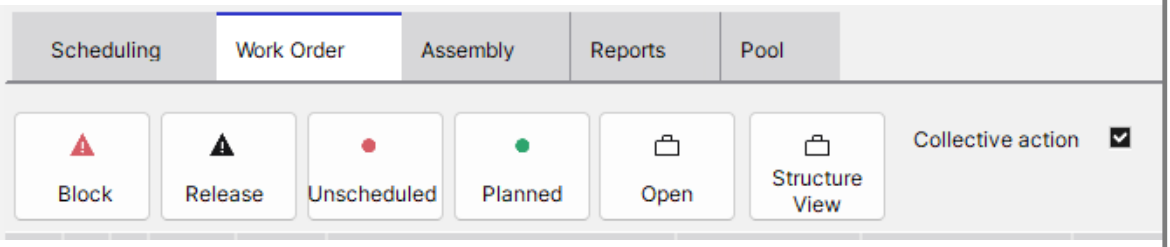
Function	Description
Open	Open selected order.
View Update	Update the scheduling view.

Work Order

In this tab you can manage work order capacity planning.



Boyum Style top bar design:



Work order tab

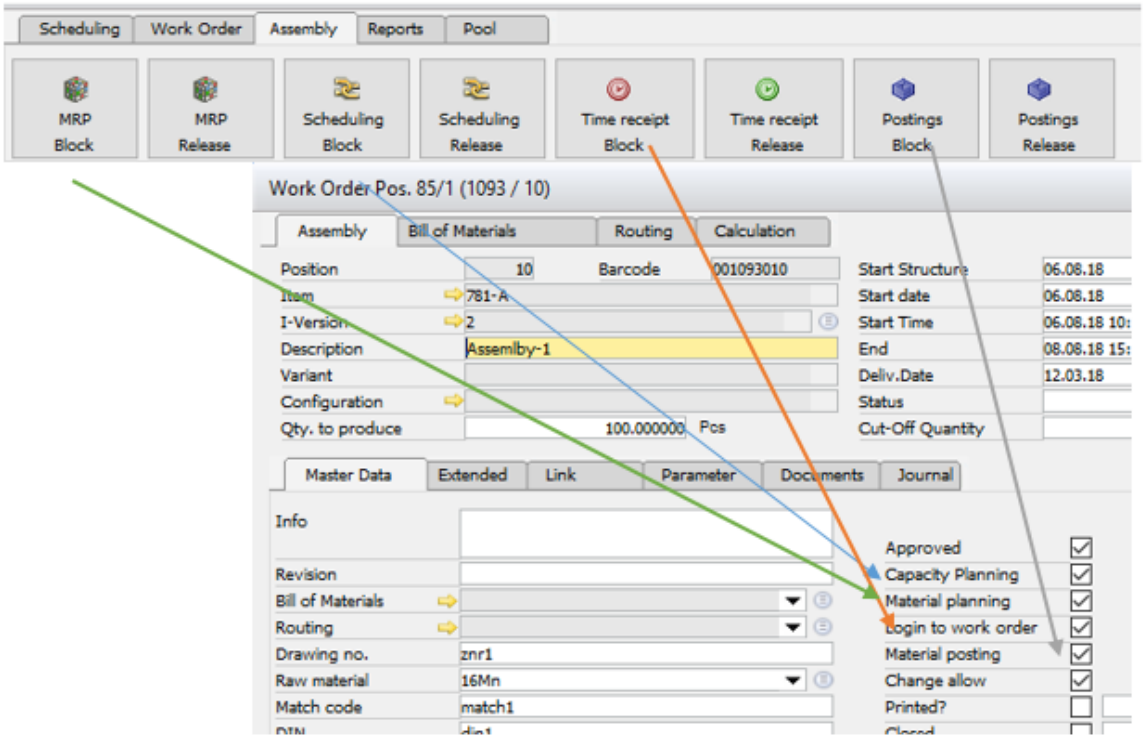
Button	Meaning
Block	A blocked work order is not dispatched, it has no calculated start or end date, and no times are reserved. You cannot select the work order via FDC or posting windows.
Release	Work order is released for planning.
Block scheduling	Set selected scheduling scenario(s) to blocked.
Release scheduling	Set selected scheduling scenario(s) to is released.
Unscheduled	Set all marked work orders to unplanned.
Planned	Set all marked work orders to planned. More detailed settings: Calculation types: e.g."do not reschedule planned work orders".
Open	Open the selected work order.
Structure view	Open the structure view for the selected work order.

© 2026 Boyum IT Solutions A/S

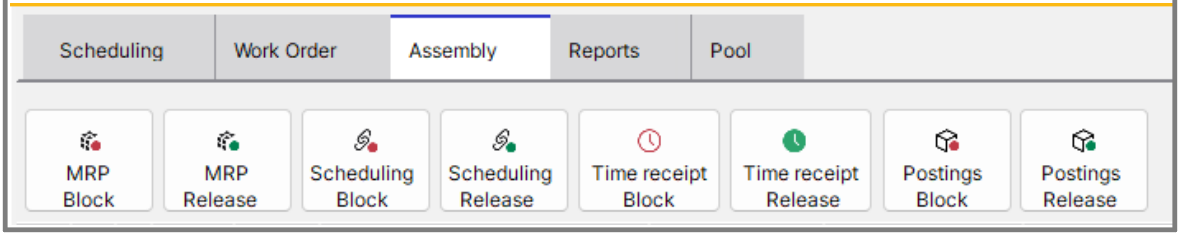
Field	Meaning
Collective action	Perform the selected action for all marked work orders.

- Assembly

Here you can change flags directly from APS View in a work order position.

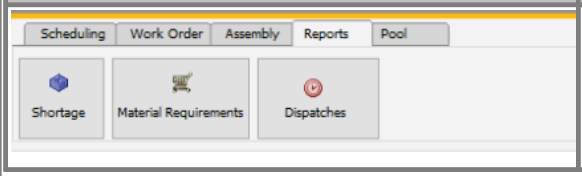


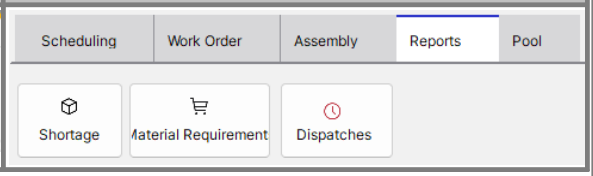
Boyum Style (Beta) top bar design:



- Reports

Under the Reports tab you can handle 3 main attributes of the selected work order:

Traditional style	Boyum Style
	




© 2026 Boyum IT Solutions A/S

Window fert_aps_browse.psr

Reports tab buttons

Button	Meaning
Shortage	Opens a list of shortages for the selected work order. ***See*** Shortage
Material requirements	Opens the material requirement list for the selected work order. ***See*** Material requirements
Dispatches	Shows all dispatches of all resources for the selected work orders. Filter works by work orders, not by assemblies. ***Example***: Work order 5 Assembly 10 – Resource 1001 Assembly 20 – Resource 1002 If now, at work order 5, assembly 10 is selected, all dispatches for resource 1001 and resource 1002 are displayed. ***See*** dispatches

Pool

Button	Meaning
Calculate	Calls the function pooling.
Administrate	Open the Pool structure list.

Available fields in the list view

Field	Meaning
OK	If marked, work order is selected and will be considered for the current action.
Document	Number of work order document.
Position	Word order position.

© 2026 Boyum IT Solutions A/S

Work order	Work order number.
Type	Production type.
Item	Item.
Blocked	If active, the item cannot be scheduled.
Planned	Already planned?
Printed	Already printed?
In work	Work order already started? Active if there is a time receipt registered for the work order assembly.
Start fix	Fixed start date If there is a routing position within the work order position (and sub-structure) with the flag "start fix" is activated, the flag "Start Fix" is active. ***Example***: if you move a routing position inside the APS graphical view, Beas activates this flag automatically. Note: Beas refreshes this field only if you recalculate the work order position.
Schedule automatically	Work order is automatically rescheduled if relevant information is changed.
MRP	Visibility in MRP: if active, released for material scheduling.
Scheduling	Capacity planning: if disabled, resources are not reserved.
Time	Disable: no display in pool list, order time receipt blocked.
Booking	Disable: Material postings on this BoM item are blocked.
Start structure	Planned date: if red, start is in the past. You can edit this field directly in this window after setting it to Changeable in Window settings.

© 2026 Boyum IT Solutions A/S

Start date	Actual planned start of assembly production (calculated).
End date	Actually calculated end date.
Delivery date	Delivery date of work order. You can edit this field directly in this window after setting it to Changeable in Window settings. You can insert the Date directly or can open the calendar by clicking on the drop-down icon. Note: Right-click function is not working here.
Material OK	Display Material status. **When calculated before scheduling** Active if there are planned receipts or sufficient stock. **When calculated after scheduling** Active if there are planned receipts or sufficient stock, or if material can be replenished in time. Even if planned receipt would be too late, this check box is active. If "Material OK" is **not active**, in **APS-list > right-click** information on shortage can be displayed. This report shows which production receipts or purchases are too late and to which date we can order materials. Sub-assemblies for storage related items in the Work order are considered. Links between Work orders are considered. it is possible to link a WO that produces a sub-assembly that is needed for another WO. This link is like a reservation, meaning that the WO of the sub-assembly serves the WO that it is linked to. Dependent Work Orders that have a "linked dependency" have a higher priority than a "normal" WO that just delivers other Work orders. *Window fert_struktur_browse.psr* *Window fert_ftpos_edit.psr*

© 2026 Boyum IT Solutions A/S

	ATTENTION: The material calculation is only performed for the selected Work Orders. Not calculated entries keep the current state for the "Material OK" value and will not be refreshed. **IMPORTANT**: If no Breakdown method is defined in the Item Master data, this field may display incorrect information, which results in incorrect APS calculation! **LIMITATION on Storage-related items:** When an item is defined as "Storage related", APS calculation with the "Material OK" setting ignores work orders that are manually linked to the main assembly and only checks the inventory. For Order-related items the system checks assemblies. This is why Material OK is set for "Order related" items and not set for "Storage related" ones.
Material on stock	Flagged if the required material is on stock and could be withdrawn for the work order. Material is allocated following the order of the APS list. Planned receipts from purchase or production are not taken into account. **IMPORTANT**: If no Breakdown method is defined in the Item Master data, this field may display incorrect information, which results in incorrect APS calculation!
Too late	Flagged if stock is not sufficient or if there is no receipt in due time. This check is only performed, if "material control after scheduling" is activated. ***See*** APS planning types.
Last calculation	Type of last calculation. The ID of the last calculation for this work order is displayed. (forward, backwards, etc.) If the work order was not calculated at last calculation due to settings, "fixed" will be entered there. ***see*** APS - Calculation types.
Priority	Priority of the work order. ***see*** Priorities.
Quantity	Quantity to be produced.
I-Version	Item version.

© 2026 Boyum IT Solutions A/S

Print date	Print date.
Warehouse	Assembly warehouse = Planned warehouse for posting in the assembly.
Material warehouse	Material warehouse: the warehouse where the first BoM item is charged off.
Calculation sorting	Display sorting based on the order of calculations. **INFO:** When calculating the orders (in a forward calculation scenario) Beas may change the sequence for calculation (e.g. when a WO is dependent of another WO). After the calculation, this displays the order based on when the calculations were performed.
Original sorting	Display the original sorting - that is the sorting before the calculation started. Beas changes back to this order after the calculation.

Insert of additional fields in the APS list YouTube

8.10.2.2.1 Scheduling

Functions in upper ribbon:

Button	Meaning
Gantt	Open the Gantt view, display all work orders, for which the column "OK"- was checked.
Resources	Open a selection window, which are considered at the Planning. ***See*** Notes APS - Planning - Resources
Filter	Open filter settings (priority, document number, start-/delivery date, project etc)
Mark	Multiple entries can be marked by using the multiple marking function. These selected entries can be activated / deactivated for the calculation or other collective actions via the button "**Mark**" (Check mark in column "OK" will / will not be set)

© 2026 Boyum IT Solutions A/S

Button	Meaning
	The selected work order is marked (In the first column of the production list a check mark is set (OK).
Sorting edit	Active: you may sort the work orders by drag and drop. It is possible to select multiple entries and to move the highlighted area. When the mouse cursor points on the icon of the list, the cursor changes to a up/down arrow to point that you can move the entry with drag and drop up or down. To do so, keep the Ctrl key pressed and use the left mouse button to select multiple entries. To select a range, click on the first entry, hold the Shift key and click the last entry with the left button.
Sorting save	Saves the current sorting and exits the "Sorting edit" mode. **Explanation on sorting:** If 2 production orders start simultaneously and both require the same resources, the first production order receives the free resource first and the second can only be scheduled afterwards. The sequence therefore determines which production order receives the free resources first.
Calculate	Starts the scheduling of all marked work orders.

Field descriptions

Field	Description
Calculation	Shows the current calculation type. The orange reference arrow opens the setting APS Calculation types .
View	Current view (default) The orange reference arrow opens the settings of planning view.
Sorting	Select from different sortings. ***see*** APS edit planning.
Collective action	Set check mark, to perform the action selected in lower field for all marked work orders.

© 2026 Boyum IT Solutions A/S

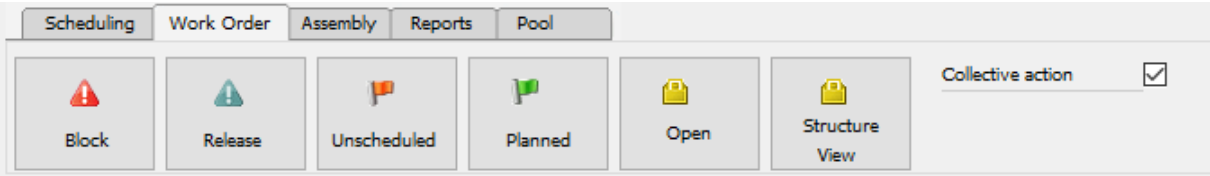
Field	Description
Delivery date	Select delivery date, with click on the red/black icon the change is applied to all marked work orders.
Start date	Select start date, with click on the red/black icon the change is applied to all marked work orders.
Production type	Select production type, with click on the red/black icon the change is applied to all marked work orders.

Right-click functions:

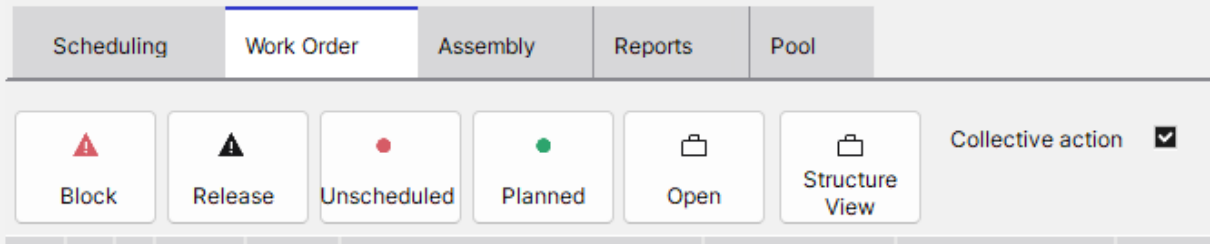
Function	Description
Open	Open selected order.
View Update	Update the scheduling view.

8.10.2.2.2 Work order

In this tab you can manage work order capacity planning.



Boyum Style top bar design:



Work order tab

Button	Meaning
Block	A blocked work order is not dispatched, it has no calculated start or end date, and no times are reserved. You cannot select the work order via FDC or posting windows.
Release	Work order is released for planning.

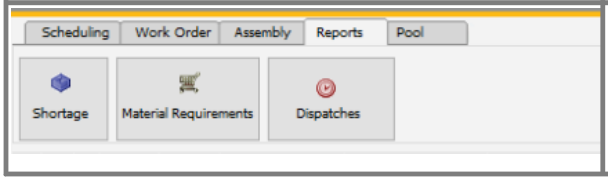
© 2026 Boyum IT Solutions A/S

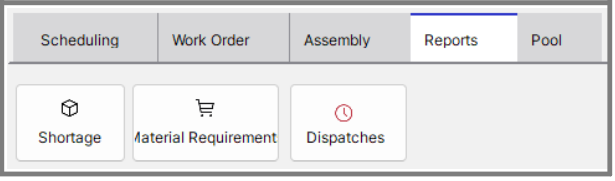
Block scheduling	Set selected scheduling scenario(s) to blocked.
Release scheduling	Set selected scheduling scenario(s) to is released.
Unscheduled	Set all marked work orders to unplanned.
Planned	Set all marked work orders to planned. More detailed settings: Calculation types: e.g."do not reschedule planned work orders".
Open	Open the selected work order.
Structure view	Open the structure view for the selected work order.

Field	Meaning
Collective action	Perform the selected action for all marked work orders.

8.10.2.2.3 Reports

Under the Reports tab you can handle 3 main attributes of the selected work order:

Traditional style	Boyum Style
	




Window fert_aps_browse.psr

Reports tab buttons

Button	Meaning
Shortage	Opens a list of shortages for the selected work order. ***See*** Shortage
Material requirements	Opens the material requirement list for the selected work order. ***See*** Material requirements
Dispatches	Shows all dispatches of all resources for the selected work orders. Filter works by work orders, not by assemblies. ***Example***: Work order 5 Assembly 10 – Resource 1001 Assembly 20 – Resource 1002

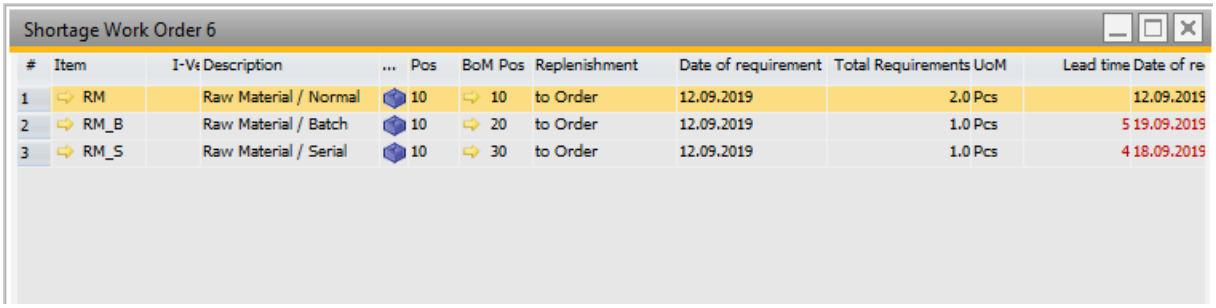
© 2026 Boyum IT Solutions A/S

	If now, at work order 5, assembly 10 is selected, all dispatches for resource 1001 and resource 1002 are displayed. ***See*** dispatches

8.10.2.2.3.1 APS shortage

By clicking on the **Shortage** button under **APS Standard > Reports tab**, the Shortage Work Order XY opens, displaying a list of calculated shortages for the current production WO position.
All rules of the last calculation are considered, e.g. in which sequence the work orders have to be produced.

Beas calculates shortages in a work order only if Material calculation is activated in the used calculation type, and displays result from last calculation. ***See*** APS Calculation Types



Window fert_aps_browse.psr

Columns to be displayed are configurable in Window Settings within the right-click menu.

Columns description

Field	Meaning
Item	Item number
I-Version	Item version according the BoM position
Description	Item description according to the BoM position
Drawing number	Drawing number according to the BoM position
Image (...)	Image according to the BoM
Pos	Work order position
BOM-Pos	BoM position (Position Text)
Internal Pos	Internal BoM – Position ID

© 2026 Boyum IT Solutions A/S

Replenishment	Pegging covered
Requirement date	Requirement date (Delivery date - Lead time)
Total requirement	Total requirement for this Bill of materials position at time of calculation. - booked quantity ***Example***: Position needs 10 Pcs. Currently 6 booked. The rest = 4 Pcs 3 Pcs reserved. In this case you will see 4 Pcs in this column.
Not Available	The quantity for which no reservations exists and no purchase orders or work orders are temporarily linked.
EH	Unit of measure (Inventory UoM)
Lead time	Lead time according to item master
Date of receipt	Next receipt date that the BoM position was assigned to according to the calculation rule (usually the latest possible)
Purchase order number	Assigned purchase order which has been assigned to the BOM position in the last calculation.
Purchased quantity	Assigned quantity of this purchase order in the last calculation
Confirmed delivery	Delivery time: Confirmed delivery (Column u_beas_delconfirm)
Purchase order release	Purchase order: Released?
Purchase order I-Version	Item version in the purchase order
Customer reference number	Customer reference number from the purchase order
On stock	Current warehouse stock without external stock (current stock situation without locked warehouses). Note: The current stock situation should not be the same as at calculation time.
Inventory extenral	Current warehouse stock on external warehouses
Purchase order	Total purchase quantity
Production	Total requirement for all work orders
Reserved	Reserved quantity for this WO position (current reserved)
Total reserved	Total reserved quantity (current reserved) without Reservation for this Bill of Material position

© 2026 Boyum IT Solutions A/S

Invent.History: Clicking on this button displays the relevant information on stock-related figures, reservation, goods issue for production, goods receipt from PO and production, inflow and outflow figures. The lower list section displays the MRP run results with the latest calculation on the top. ***See*** Inventory History.

8.10.2.2.4 Multiple selection

The APS-view supports bulk actions like multiple selections.

Bulk actions as well as the Gannt view always consider all entries in which the "OK" column has been activated. The following options are available for selecting multiple orders at once:

Select / deselect all entries:
Right-click on title heading "OK". With "select all", all entries are selected, while by indicating "no", all entries are deselected.

Select an entry:
By double-clicking on an entry, all other entries will be automatically deselected and the selected item is highlighted.

Choose more entries:
To select other entries, just click the OK field.

Multiple selection / deselection:
With the help of the multiple selection feature multiple entries can be highlighted and selected or deselected.

Range selection:
Choose the first entry, press the Shift key, select the last entry: Now the entire area is selected.

Single selection:
Ctrl + click additional items. These are added to the previous selection.

Activate the selected range only:
After highlighting, double-click the last selected entry. Now the selected entries can be activated (OK on) and all other entries disabled.

© 2026 Boyum IT Solutions A/S

Additionally, activate the selected area:
After highlighting, right-click and select highlighted entries. All selected entries are enabled (OK on). The already enabled items are not changed.

Disable the selected area:
After highlighting right-click and deselect the marked entries. All selected entries are disabled (OK off). The already enabled items are not changed.

back to Planning view

8.10.3 Graphic View

You can access the graphical view via **Production > Capacity Planning > APS > View > Gantt button** or
Production Structure – Right-click > Graphical View

Data Structure

Beas uses the Gantt system from the firm Netronic (R) for visualization.

License is required for the graphic view. This is station-related and has to be released separately in the license administration.

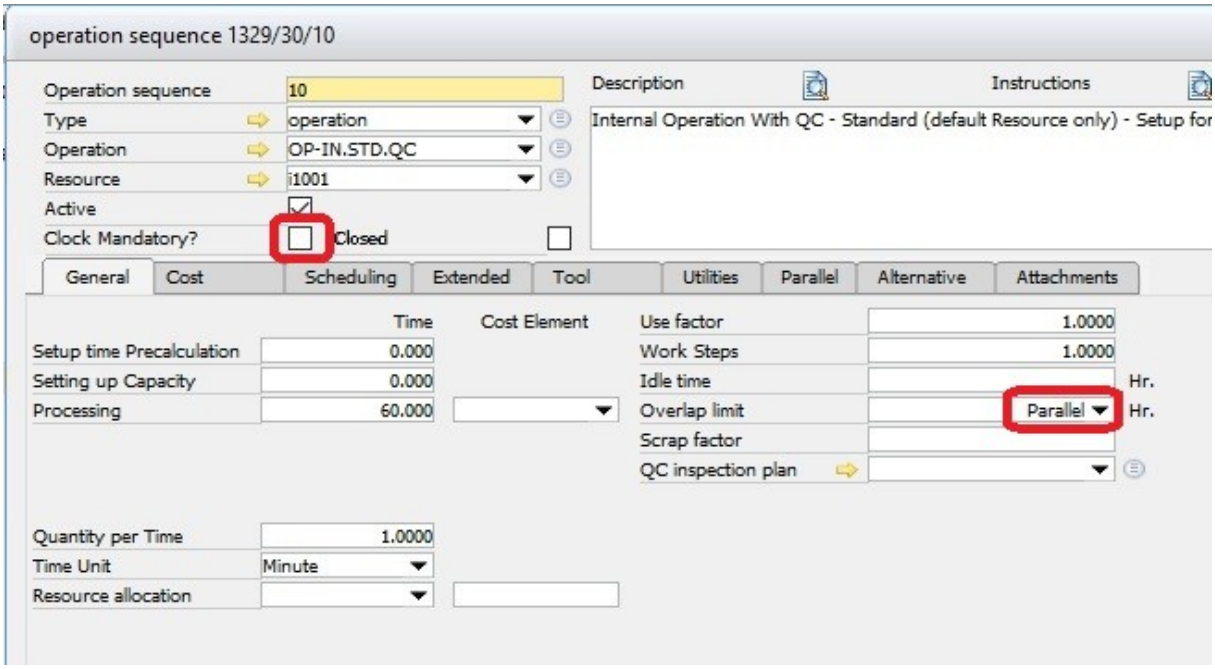
The view depends on the selected planning method.

© 2026 Boyum IT Solutions A/S

8.10.3.1 Parallel Operations and Overlapping

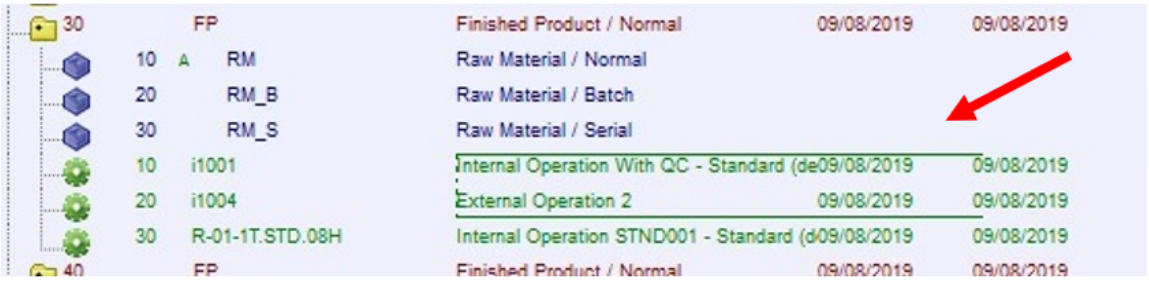
By using overlap settings, you can define the delay for the subsequent work sequence or define to start it in parallel.
Unlike parallel resources, the subsequent work sequence can be moved freely.

You can define the overlap limit in **Routing position > Overlap limit**.
Choose "Parallel", "No" or insert the number of hours/minutes manually.
If this is defined in Position 10, the next position will be parallel.
This means: "Clocking mandatory" must be disabled, because you can start with Position 20 before closing Position 10.



Window fert_arbplanos_edit.psr

In Item Structure view you can see parallel / overlap limit information in this way:
In this example in Position 10 the "Overlap limit" is defined:



© 2026 Boyum IT Solutions A/S

Note:

Overlap calculation runs correctly only with forward calculation.

Value	Meaning
0	No overlap.
Parallel	Next Routing position will have same or next possible start date Forward calculation The earliest start date of the following operation can be the same as the first one or the next possible start. The next possible start may also be earlier than the one of the previous operation. ***Example 1 :*** Pos 1 is defined as parallel, so Pos 2 can start parallel to Pos 1 
© 2026 Boyum IT Solutions A/S

Value	Meaning
	View in Beas  Start of 3. routing position is after the end of the latest parallel routing position. ***Example 2***: Pos 2 needs less time than Pos 1.  View in Beas  Start of next routing position is always after the end of the latest parallel routing position.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	Example 3: *Scenario:* Position 3 is parallel to Position 2, but after Position1 finishes, resource for Pos 2 is not available. For example Resource is reserved by another work order. If the resource is not available immediately, the routing position starts at the next available time. In this example, the position 3 can start **BEFORE** the first position:  ***Example 4:*** Scenario: 2 work order positions. Both WOs have defined the 2. operation as parallel. Start date is same. First operation has different resource, but the second parallel operation has same resource for both WOs. Explanation: The parallel resource uses the start date, on which the resource is free. For the first WO this is the time when operation 1 starts. In the second work order position you see that the start date of second operation does not start together with the first operation. The reason is that WO 1 already occupies the resource. So the second operation of WO can only start after the operation 2 of WO 1 stopped. In that case the the second operation does not start parallel but delayed:

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 You can set parallel-defined operations to always run in parallel in the Configuration wizard. Result with setting "Overlap limit = fix" Start date of Pos 40 on Resource i1001-1 start later, because the next resource i1004 is not available before.  See APS fix parallel routing positions Backward Calculation

© 2026 Boyum IT Solutions A/S

Value	Meaning
	The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration. Parallel resource: The system calculates the following:  If duration of Pos 2 is less than that of Pos 3, then Pos 1 ends with the start of Pos 2.  In this case, the system is working different from forward calculation. If you work with backward calculation, the first parallel position must have the longest duration. Differences between parallel resource and parallel operation <u>Parallel resource:</u> - is always parallel - 100 % - Parallel resource have always same start / end time - Use Parallel resource, if you don't need this resource 100%

© 2026 Boyum IT Solutions A/S

Value	Meaning
	(Example: A worker is the "parallel resource", but is working on 4 machines in parallel. In this case he must invest only 25% for his time for this operation) Parallel Operation: - is not always parallel. Only if the resource of parallel operation is available - can have different work time - can work with resource optimization - can have own parallel resource, tools and so on
> 0 Overlapping	Overlap of the following routing position or assembly if it is the last routing position. Forward Calculation The Overlap time define, when the next operation can be started. The time, which you define, is the delay in hours/minutes, until the next operation starts. The defined time is the earliest time. **Example:** 2 hours means, the next operation can start - 2 hours after start current operation or after end of this current operation (if the current operation is less than 2 hours) - if resource of next operation is not available after 2 hours, then at the time, when the resource is available. **Example:** In this scenario the start date of the third routing position is the real start date of the second routing position + defined overlapping time in hours, here 1 hour.

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 An overlap is specified in hours – based on a 24-hour day. The specified overlap always applies to the following routing position. The overlap time is not bound to a resource calendar. This is purely hour-based time excluding time reservations or other factors. The overlap time begins AFTER the transit time. The next routing position cannot possess a transfer time, otherwise it will be appended to the transfer time. ***Example:*** Scenario: 2 Work orders, same routing plan. In first operation different resources. Overlap limit = 0.5 hours First work order: Position 20 start 0.5 hours after start of position 10 Second work order: Position 20 start later, because the time is reserved from first work order

© 2026 Boyum IT Solutions A/S

Value	Meaning
	 If you want, that the overlap have always exact the same overlap time, a setting is available. ***See*** Configuration wizard ***Example:*** Scenario: Work time of second work order position is less than the work time of the first operation. In the first operation, overlap time is defined:  In this case you're ready with second routing position before you're ready with first routing position. But you can start with third routing position only, if all parallel / overlapped routing positions are done. In this case after end of Routing position 10. Backward calculation

© 2026 Boyum IT Solutions A/S

Value	Meaning
	In a simple example the result of backward calculation is same as forward calculation Example: Work time 1 hour, overlap 0.5 hour in first operation  But is the duration of second operation is not same as first operation, then the result is different to forward calculation: The system calculate backward: First 30, then 20 - from 20 the overlap is calculated (Start time from Operation 20 + Overlap time from Operation 10 = End time from Operation 10.  Alternative for backward calculation is "forward late as possible" Note: The backward calculation cannot calculate the correct start date. It is only capable of calculating the duration.

Note:

The last operation corresponds to the last "reportable operation".

If an overlap is also configured in the last operation, Beas does not recognize this as the last operation.

© 2026 Boyum IT Solutions A/S

However, the automatic assembly receipt or adjustment of the backflushed material depends on this.

Overlapping using assemblies

Assemblies can also overlap in an order-related structure.

Example:

```
          |- Main assembly -|
|--- Subassembly -|
```

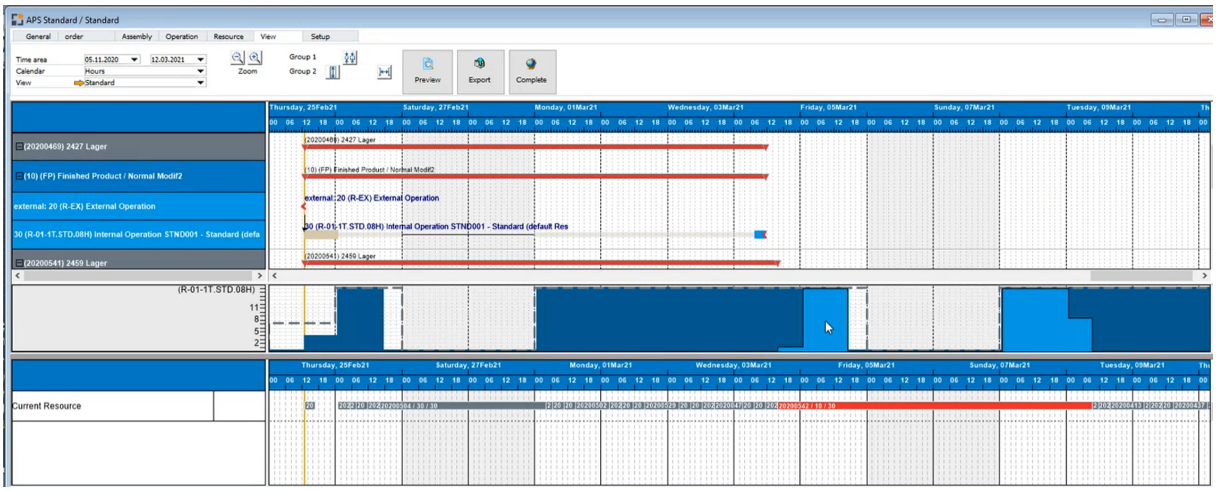
Start date of the main group is normally the end date of the last routing position of the subassembly. If this last routing position has an overlap, this is also considered.

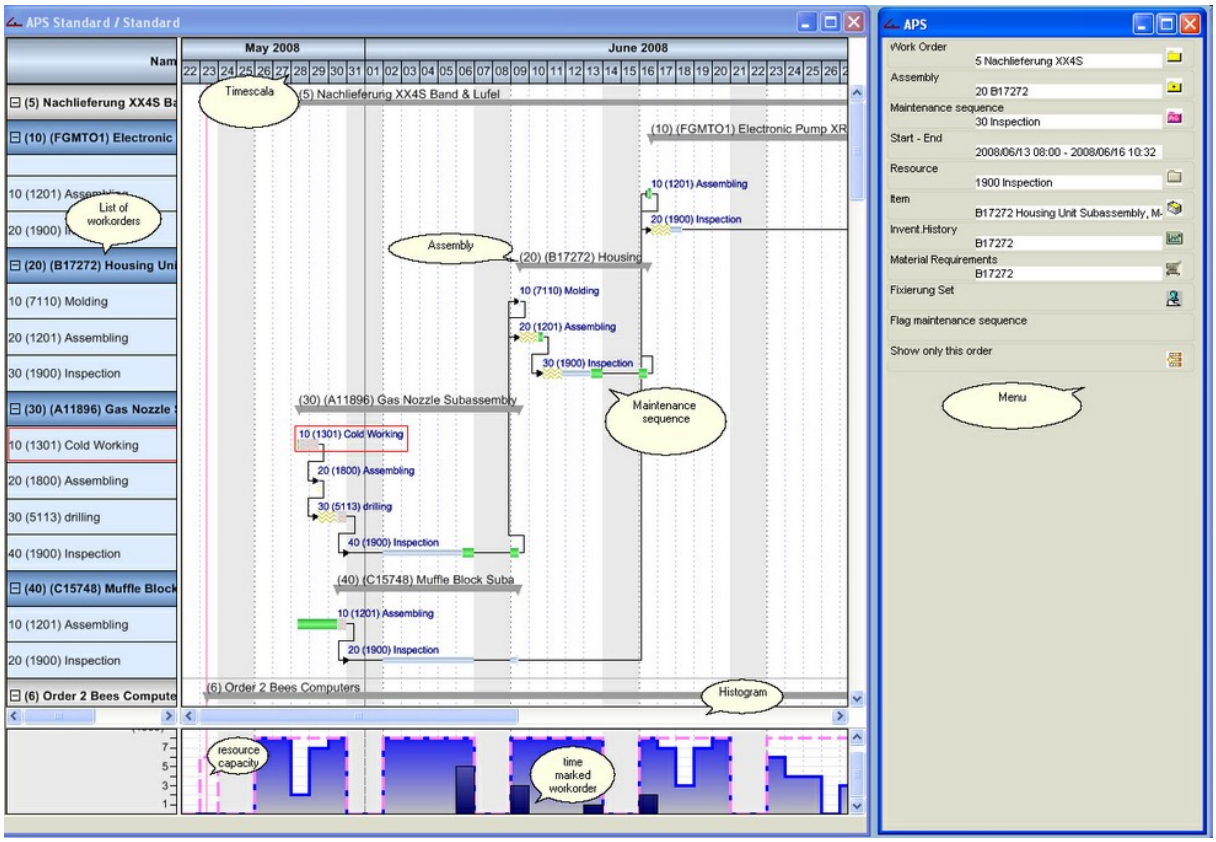
Important: If an overlap is entered in the last routing position, it is no longer recognized as the "last routing position" in the backflushed posting transactions.

8.10.3.2 Structure

This chapter details the structural elements of the graphic view of the APS calculation result.

You can switch to the **"Boyum new Style" view** in the View settings.





Structure in detail

Description	The groupings (production order / resource) and work sequences are described here.
Time/date area	Date / time line with the following options: • Left-click, hold and move left/right: The time line is compressed or expanded. • Right-click on time line: The right-hand menu lists options for the time line, e.g. area to be displayed, time line type (day/hour/month, etc.)
Gantt	The work sequences and totals bars (groupings) are displayed here **The following functions are available here:** • Left-click on an empty area: The menu lists all relevant functions such as e.g. calculation functions and display options including print and export options. • Left-click on a work sequence: The menu lists all relevant functions for the work sequence. You can access further information and also calculation functions or alternative resources.

© 2026 Boyum IT Solutions A/S

Description	The groupings (production order / resource) and work sequences are described here.
	• Right-click on a position: The utilization of the resource stored in the operation is displayed in the histogram area • Left-click on a work sequence, hold and move: This moves the work sequence along the time line and you can then instantly fix and schedule it depending on your configuration. • Selection of multiple positions (left-click and drag to form a rectangle or select individual work sequences using Ctrl+key+left mouse button): Group functions are displayed in the right menu window. For more, ***see*** Group functions.
Histogram	The resource utilization's are displayed in this area when you right-click on a position. If you click the histogram, all work orders that have a time reservation for this resource are displayed in the menu. The period and / or display in Gantt chart do not matter.

8.10.3.3 Gantt Display

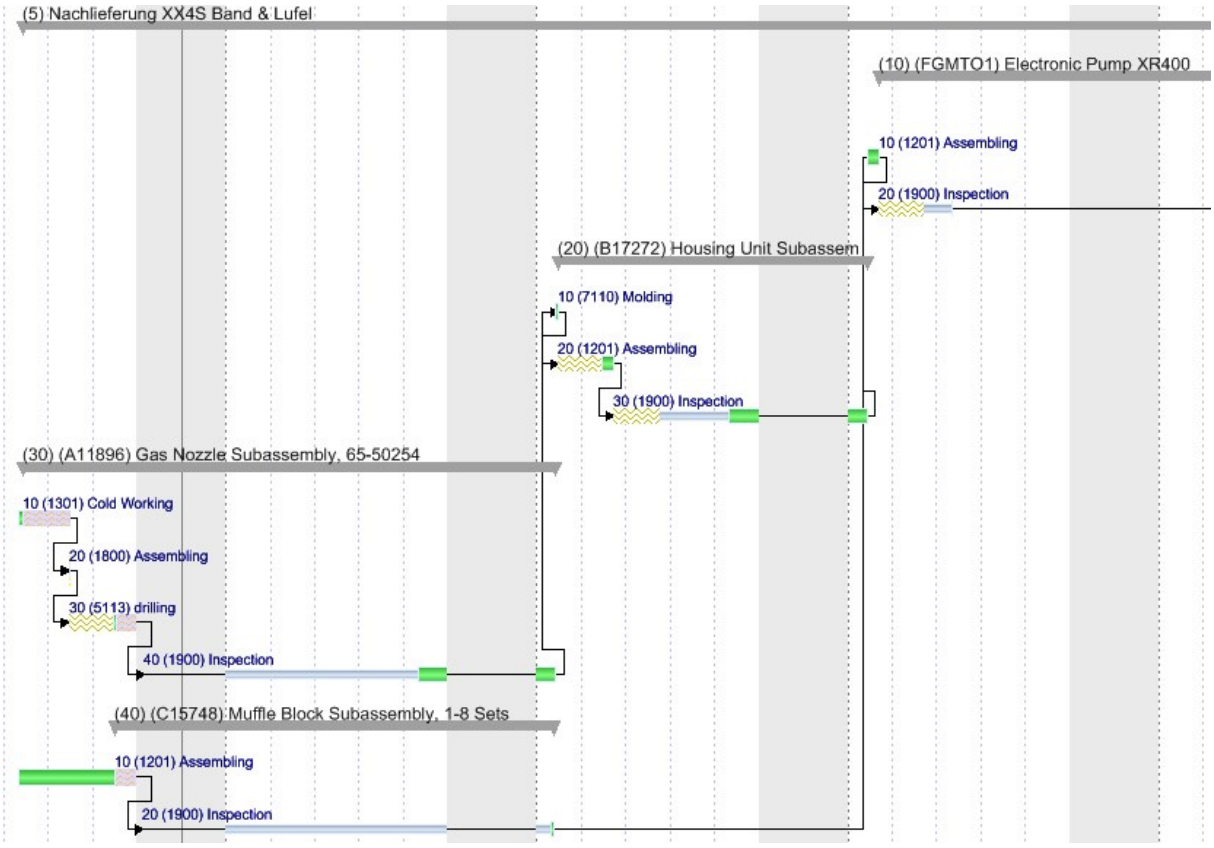
A production order is displayed in the graphical view from left to right.
You can switch to the **"Boyum new Style" view** in the View settings.

IMPORTANT: To use the Gantt graphical display for APS scheduling, you must also install the 32-bit version of Beas Manufacturing, as this third-party provider does not support 64-bit version software products.

The production order receives a totals bar (first gray bar at the top edge).
The individual assemblies in turn have their own bar (bar below this).

The individual work sequences are linked together by an arrow and represent the processing sequence in the time chart.
The delivery date is indicated by a red dot.

© 2026 Boyum IT Solutions A/S



Example: Throughput of a production order

Structure of a work sequence

The timeline of a work sequence is subdivided into three parts:

1. Transfer time, which is stored in days in the resource
2. The job time, based on set-up time and job time x number of units as per work sequence
3. The idle time as per work sequence.

In the graphical view, there are other symbols or color displays that indicate e.g. the status of the production order.

	External operation (orange background).
	Normal operation consisting of transfer time, setup + processing time (green range) and idle time.
	Work sequence currently logged in.
	There has already been a partial login to this work sequence.

© 2026 Boyum IT Solutions A/S

	External operation (orange background).
	Normal work sequence, position has already been printed.
	Parallel resource.
	Resource of type Tool.
	Production order is marked as "Planned".
	Work order is planned by APS.
	Delivery date.
	Delivery date cannot be met.
	Work sequence is fixed to a deadline. This is considered in forward scheduling.
	Marked work sequence. In the event of rescheduling, all production orders in which a work sequence is marked are recalculated.
	Overlapping: The following work sequence was fixed and its start is BEFORE THE END of the previous work sequence. In this case, red shading is applied.

Icon changes:

Green/Red flag: Within/past the delivery date.

8.10.3.4 Gantt Display 2021.03

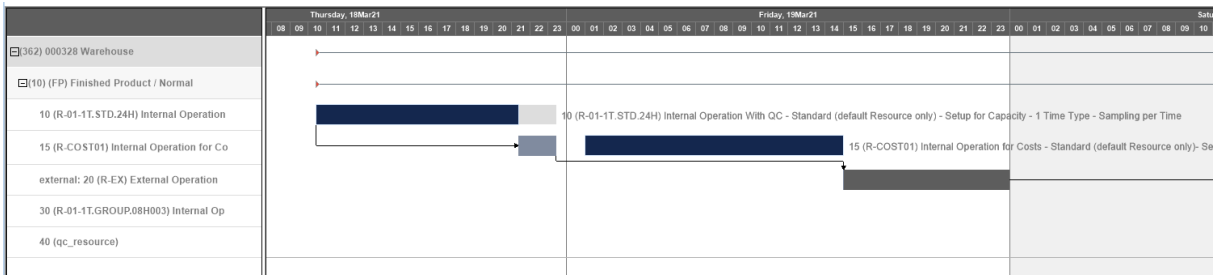
Beas Manufacturing 2021.03 delivers an improved look-n-feel of the Gantt viewer.
If you wish to work with the old variant, you can select it in the APS View settings.

IMPORTANT: To use the Gantt graphical display for APS scheduling, you must also install the 32-bit version of Beas Manufacturing, as this third-party provider does not support 64-bit version software products.

This graphical visualization of the APS results delivers bigger font sizes, bar sizes and objects compared to the old variant, new color codes and enhanced readability.
Entire information (for example of a resource) is at hand without zooming in or out, and space and standard minimum width between each small element are increased.

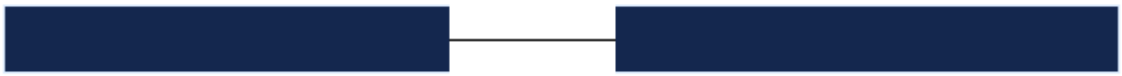
Hierarchy Tree:

Top color: RGB 93, 93, 93 (Dove Grey)
WO level: RGB 221, 221, 221 (Alto)
Routing level: RGB 247, 247, 247 (Off White)
Position level: RGB 255, 255, 255 (white)
Font color: RGB 125, 125, 125 (gray)



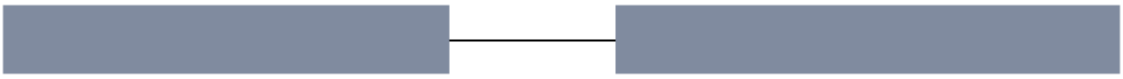
Gantt Colors:

Normal Resource color
RGB(20,39,78)



Transit Time:
RGB(128,139,159)

© 2026 Boyum IT Solutions A/S

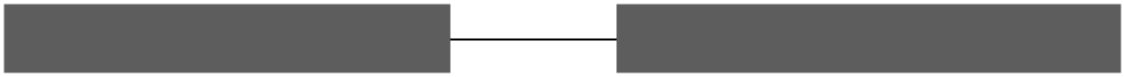


Idle Time:

RGB(221,221,221)

External Order time:

RGB(93,93,93)



Tool Resource:

RGB(52,98,108)

Alternative Resource;

RGB(94,170,168)

Parallel:

RGB(163,210,202)

Icon changes:

Green/Red flag: Within/past the delivery date.

8.10.3.5 Compress

The view can be compressed in several ways:

The functions for closing groups or the "Everything on one line" compression function are included in the menu when you click on a white part of the Gantt area.

Normal view	Each work sequence is displayed on a separate line.

© 2026 Boyum IT Solutions A/S

	Close group	When you close a group (main group or sub-group) – from the normal view, the individual work sequences are hidden:
Everything on one line	If you select "Everything on one line" in the normal view, the APS tries to display everything on one line. If there are overlaps, the display is optimized: Everything on one line Closed	On the display "Everything on one line" - "Closed", the compressed position bar is displayed, not the totals bar: 
© 2026 Boyum IT Solutions A/S

8.10.3.6 Timescale

The timescale is displayed above the view.

The available time range is stored in the planning settings.
You can do this either by specifying the days (today +/- days) or by automatic calculation, depending on the selected positions.

If a position is outside the range, you can click on the (right) side of the table. This timescale is automatically adjusted and the position displayed.

Timescale: Change resolution

The resolution, i.e. the space available for a time unit, can be adjusted as needed.
To do this, click on the timescale and hold. To enlarge the time units drag the mouse to the right, to reduce drag to the left.

Timescale menu
Other functions are available for the timescale.
To access the menu, right-click on the timescale.

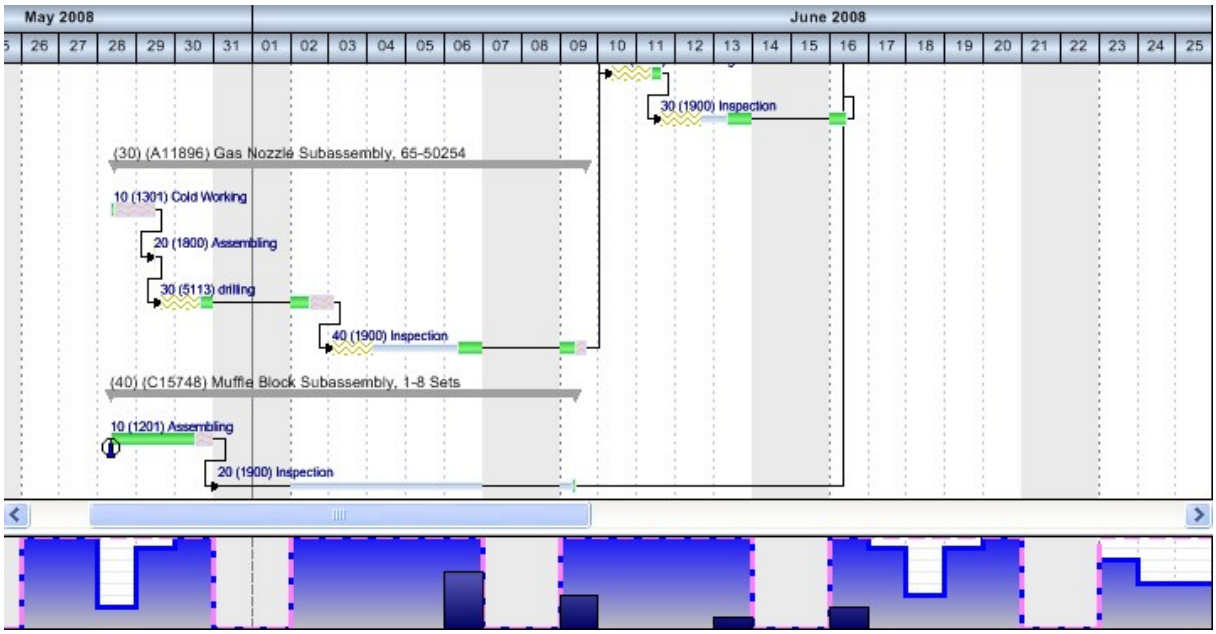
The date range to be displayed can be customized. This only relates to the visualization.
If work orders have been loaded for a specific time range only, there is no speculative loading of work orders outside the range to be displayed.

Different timescales can be selected under Calendar.

Type of timescales

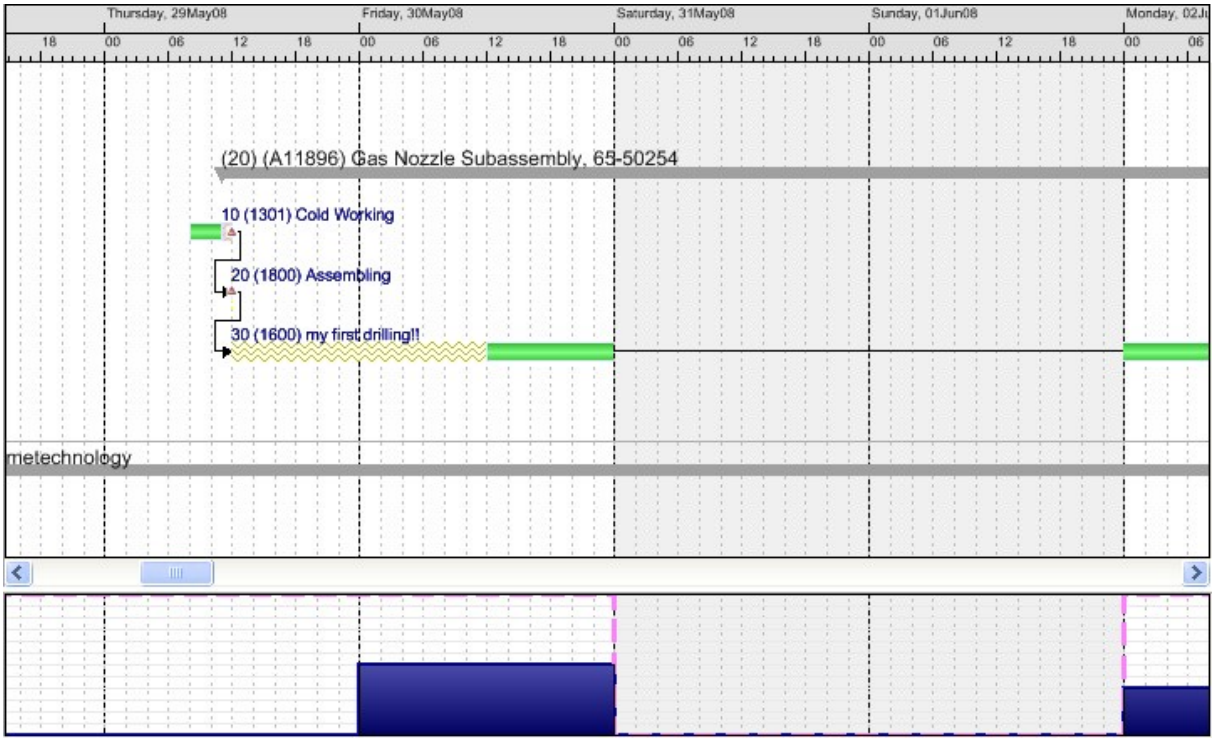
Timescale day:
In the top bar the month + year are displayed; in the bottom bar the day

© 2026 Boyum IT Solutions A/S



Timescale hour:

In the upper area the day is displayed; in the lower area the hours. There is a dash every 24 hours

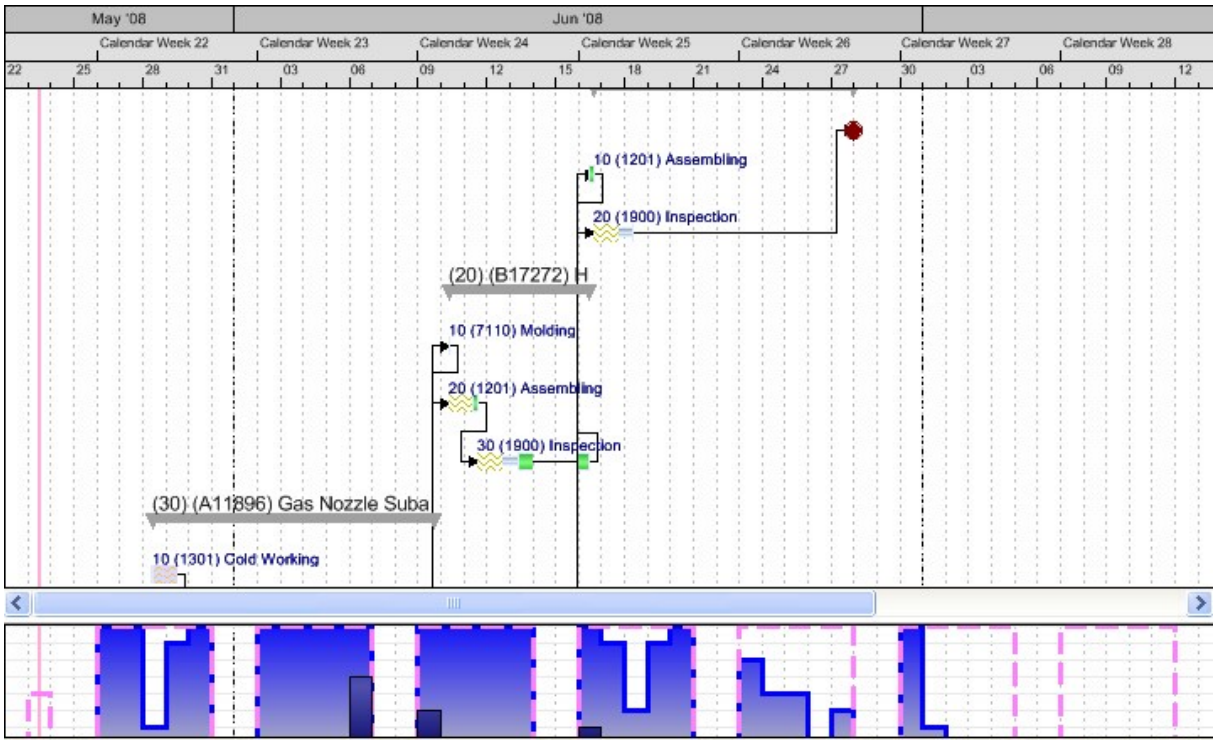


Timescale month

This range is intended for rough planning over several months.

© 2026 Boyum IT Solutions A/S

Top range: Month, with calendar week underneath, and the days underneath that

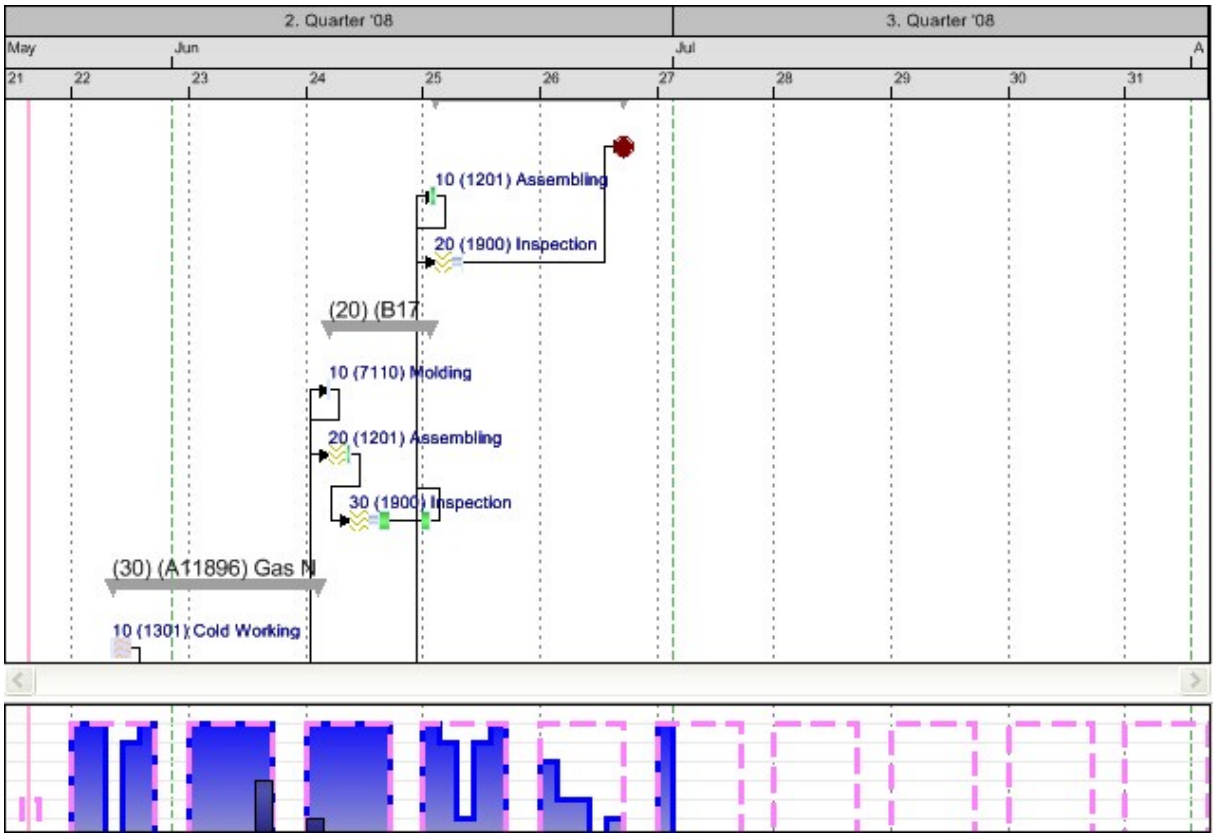


Timescale year

This range is intended for long-term resource planning.

Top bar: Quarter + year, with month underneath, and the calendar week underneath that

© 2026 Boyum IT Solutions A/S



Timescale detailed planning

This special timescale displays a rough plan and a detailed plan simultaneously.

The green range is the detailed planning range, the pink range the rough planning range.

The start of the rough planning range is user-definable. Click on the vertical line between the two ranges and drag.

The resolution can be set separately for each range.

8.10.3.7 Group Function

Multiple positions can be selected simultaneously as follows:

1. Hold down the Ctrl key and click on the positions.
2. Click on the blank Gantt area, hold and drag a rectangle over all positions to be selected.
3. Hold down the Ctrl key and click on the scale (upper timeline): all positions from that day are selected.

If multiple positions have been selected, a special group menu is available.

© 2026 Boyum IT Solutions A/S

Forward scheduling	This is used to re-schedule all positions marked with a red arrow. The first calculation method stored in the plan is always available.
Dispatch by date	This is a detailed planning function and should only be used in the resource view. This arranges the selected (red border) positions in order to the minute, and dispatches and fixes them. ***see*** resource-optimized detailed planning.
Break fixed specification	Any fixed specifications set are removed (blue marking)
Set selection	All selected positions receive a "red" arrow. Re-scheduling of these selected positions is then possible.
Deselect	This removes the red arrow.
Hide all not selected	All positions that are not selected (red border) are removed.

8.10.3.8 Recalculation

If a schedule is to be recalculated, you must proceed as follows:

1. At least one work sequence must be selected.
   A position work sequence is selected if
   a) The position work sequence is moved.
   b) You click on the position work sequence and choose "Select" from the menu.
   b) You select several positions work sequences and choose "Select" from the menu.

2. Click on a white area in the Gantt chart. The menu now includes additional functions,
e.g. the available calculation functions. Now you must click on the selected calculation function, e.g. forward scheduling.

8.10.3.9 Move

Work sequences can be freely moved in the graphical view.
You can configure what happens after the move:

© 2026 Boyum IT Solutions A/S

No action	Work sequence can be moved freely. The position or positions is/are dispatched to new position, but not selected and not booked During re-scheduling, the position may be moved again to a different point.
Mark	After the move, the positions is re-dispatched and highlighted. If scheduling is then performed, all production orders in which the work sequences are marked are recalculated. As there is no fixing, the work sequence may be moved again during re-scheduling.
Selecting and fixing	After the move, the work sequence is specified, marked and immediately dispatched, making the change immediately visible in the utilization display. Resource limits are not considered. The "forward scheduling" method is used for dispatching.
Select, fix at resource limits	After moving, APS searches for the first "time gap", i.e. the work sequence may be shifted to the future if no resources are free. At this point it is then fixed, selected and dispatched forward without further resource limits.
fix, dispatch and bind	The next free time window is sought into which the position can be inserted completely.

The setting is entered under Edit plan - Views (this is then the default setting) or
Right-click on a white part of the graphical view. The menu then includes the setting
"After Movement" available. A change remains active until the window is closed.

Important:
Once moved, the position is calculated or dispatched.
The following work sequences are NOT rescheduled.

For this reason, the moved work sequences are marked with a red arrow (except for the “No action” movement type).
The "Dispatch forward" function or other calculation methods are used to completely re-schedule work sequences selected in this way.

8.10.3.10 Resource-optimized Detailed Planning

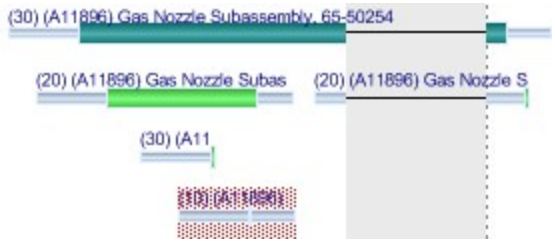
Situation:

A resource (machine) should be utilized 100%.
To achieve this, the work sequences dispatched on it must be lined up after each other seamlessly.
(Setup times are included in the duration of the work sequence).

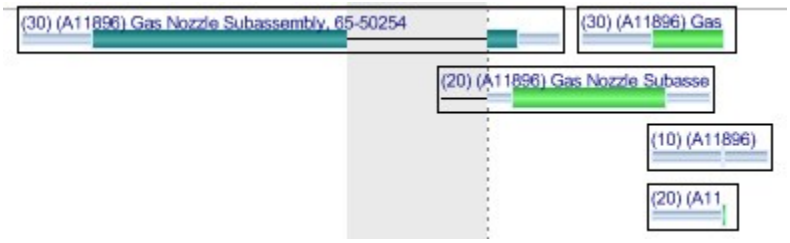
© 2026 Boyum IT Solutions A/S

Concept:

1. In the resource-oriented view, the corresponding machine is selected and displayed.
2. Set move mode to "No Action" (click on a white part of the Gantt area – in the menu under "After moving", click on "No Action".)
3. Move the work sequences into the correct time sequence according to the sequence in which they should be processed. Time/date do not need to be taken into account here.



4. Mark the work sequences (Ctrl + mouse click or click and hold mouse button and drag a rectangular selection). At least more than one work sequence must be affected.
5. Dispatching after deadline: Taking account of the resource limits, the selected work sequence is now dispatched in the order of the previously determined timeline (first work sequence is dispatched first). The work sequences are moved together to optimize resources. The transfer time is not taken into account.



6. Fix work sequences: This fixes and marks the selected work sequences.
7. Click on a white part of the Gantt area and select the required calculation type (e.g. forward scheduling).

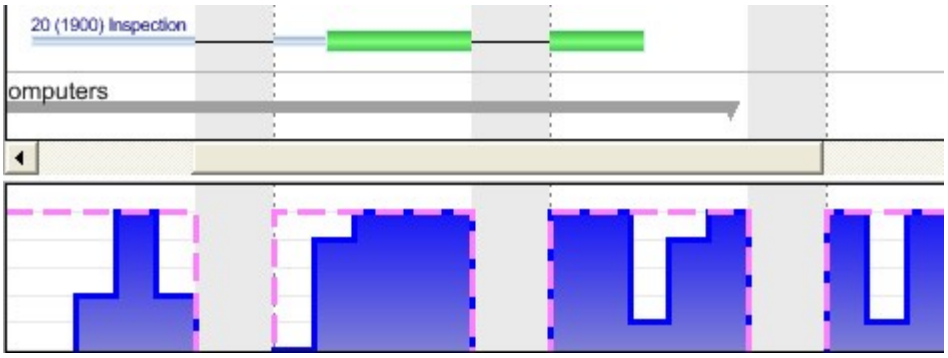
8.10.3.11 Resource Utilization

If you right-click on a work sequence, the resource utilization is displayed in the histogram area.

Dashed line: The planned capacity.

Blue surface: Reserved times.

© 2026 Boyum IT Solutions A/S



This displays not just the reserved times of the production orders displayed, but also those of all production orders currently planned.

The resource utilization view is always one of the visible area and only in the future.
If you move the view left or right, you must update the view by right-clicking on the work sequence.

The utilization view is accurate to the day, e.g. there is no calculation to the minute, the daily planned time is compared with dispatched times.

8.10.3.12 Alternative Resources

For detailed machine planning, it is necessary to determine in an easy way the resource to which a work sequence should be dispatched.

There are different concepts for this:

Multiple machine resources	The easiest and most effective way is to create a resource that maps multiple machines or persons. To do this, you must enter the number of machines in the "Machines/Persons" column in the resource, e.g. 4 if there are 4 machines in this group. **Advantage:** The APS automatically distributes resources between the 4 machines. **Disadvantage:** Detailed planning is not possible in this way (to which machine exactly). However, it should be examined whether this option would be beneficial.
Alternative Resources	Alternative resources will be defined in the operations. It is possible to define item specific alternative resources, or to indicate separate lead time, if these differ from resource to resource. An automatic optimization is also possible.

© 2026 Boyum IT Solutions A/S

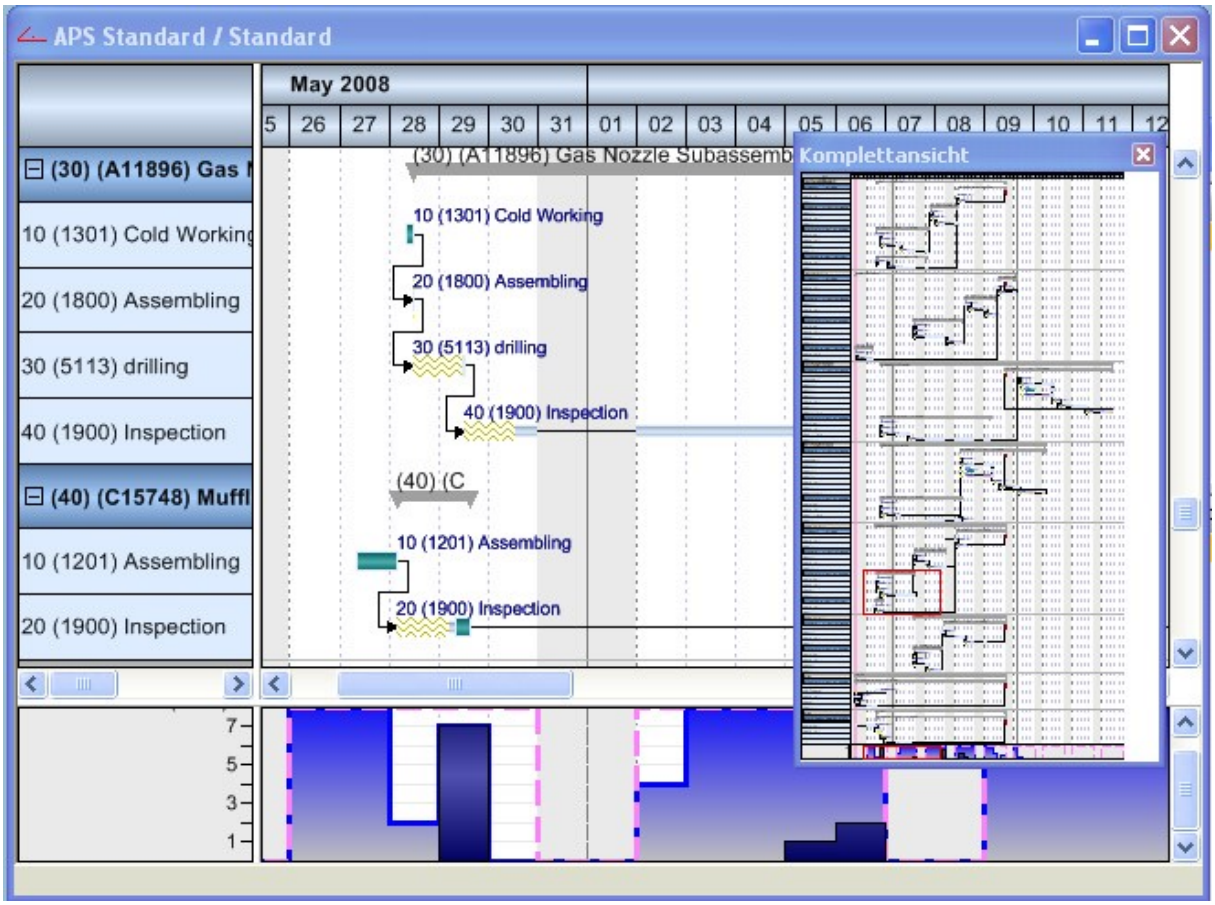
Multiple machine resources	The easiest and most effective way is to create a resource that maps multiple machines or persons. To do this, you must enter the number of machines in the "Machines/Persons" column in the resource, e.g. 4 if there are 4 machines in this group. **Advantage:** The APS automatically distributes resources between the 4 machines. **Disadvantage:** Detailed planning is not possible in this way (to which machine exactly). However, it should be examined whether this option would be beneficial.
	Advantage: You can specify exactly which machine is to be used and which throughput time it has. **Disadvantage:** This entails a great deal of effort and only makes sense in very specific circumstances. For more, ***see*** Alternative resources.
Resource Groups	In Master Data / Resources, a resource group is created and the individual machines are then stored. In the resource group, you must insert a resource type "Group" and store this in turn in the routing sequences, i.e. dispatching is performed to a group, not to a machine/person. You only actually specify which machine processes this work sequence during planning. **Advantage:** Accurate planning is possible at machine/person level. **Disadvantage:** This accurate planning takes up time on the user side and is not always advantageous.

8.10.3.13 Show All

The full view is activated from the main menu (click on a blank area in the GANTT view) – Show all
This opens another window entitled "Full view".

The full GANTT chart is displayed here, including the sections not in the visible area. It is therefore an overview of the entire GANTT chart.

© 2026 Boyum IT Solutions A/S



The visible range is indicated as a red box.

You can use the mouse to move, enlarge and reduce this.

The selected area is always displayed automatically in the full view.

This view is a good utility for navigating in larger GANTT views.

8.10.3.14 Data Structure

This chapter describes the table structure and important commands which can be used to change or adapt APS.

Table Structure

8.10.3.14.1 Table Structure

The graphical view has an internal table with the following structure:

All information can be accessed in the menu definition using `'<parent.xgantt.datafield.[id]>'` .

© 2026 Boyum IT Solutions A/S

<table>
<tr><td>0</td><td>ID</td><td>ID of the work sequence (string).</td></tr>
<tr><td>1</td><td>Start</td><td>Start of the work sequence (start of transit time).</td></tr>
<tr><td>2</td><td>End</td><td>End of work sequence (end of idle time).</td></tr>
<tr><td>3</td><td>Fixstart</td><td>1/0 work sequence specified at start of routing.</td></tr>
<tr><td>4</td><td>routingstart</td><td>Start of processing time (green range).</td></tr>
<tr><td>5</td><td>routingend</td><td>End of processing time.</td></tr>
<tr><td>6</td><td>routingcut</td><td>1/0 deadline exceeded (red shading).</td></tr>
<tr><td>7</td><td>deliverycut</td><td>1/0 delivery deadline exceeded?</td></tr>
<tr><td>8</td><td>time</td><td>Duration.</td></tr>
<tr><td>9</td><td>linenumber</td><td>Consecutive number – sorted by structural layout of the production order.</td></tr>
<tr><td>10</td><td>strutcrcode</td><td>Structural layout (as string information).</td></tr>
<tr><td>11</td><td>sortnumber</td><td>Sorting by structural layout (number).</td></tr>
<tr><td>12</td><td>Doc. no. id</td><td>Document No.</td></tr>
<tr><td>13</td><td>Doc pos</td><td>Doc. Position.</td></tr>
<tr><td>14</td><td>pos_id</td><td>Operation internal position number.</td></tr>

<tr><td>23</td><td>priority</td><td>Priority of the work order.</td></tr>
<tr><td>24</td><td>prjcode</td><td>Project number.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

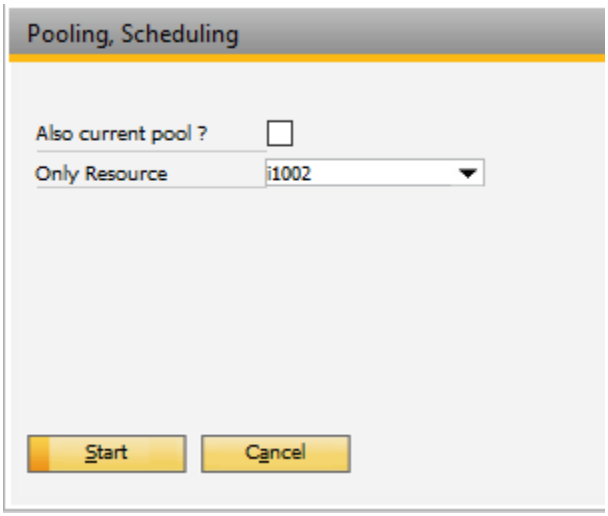
0	ID	ID of the work sequence (string).
25	marker	Position marked Y/N.
26	Status	Work order status new – Newly created print – Printed inwork – Currently logged in work – Partially logged Info: Closed or blocked production orders or work sequences are not displayed, as these are not scheduled and do not require any resources.
27	APS	1/0: Marked as planned.
28	free	Transit Start.
29	free	Transit End.
30	free	Idle Start.
31	free	Idle End.
32		
33		
34		
35	udf1	Material Date.
36	udf2	Material failed.
37	udf3	User-definable field.
38	udf4	User-definable field.
39	lieferdatum	Delivery date.
40	stufe	Wok order position level.
41	sortid	Operation – sorting.
42	pos_text	Operation alphanumeric position number.

8.10.4 Pooling, Scheduling

This batch function defines pools or recalculates all pools.

PATH: Production > Capacity Planning > Pooling, scheduling.

© 2026 Boyum IT Solutions A/S



Window fert_pool_batch.psr

Field	Description
Also current pool?	Should the current pool also be calculated? If **disabled**, all pools except the first one are recalculated. If **enabled**, all pools are recalculated. Make sure that no employee is working operations of the current pool, because the pool list is recalculated and current orders may not be displayed anymore.
Only resource	Select the resource to be considered for pooling.

The calculation can be started with the **Start** button.

An automated calculation can be scheduled, for example to run during the night. For this the *calculate pool* event is available in activity administration.

Also see:

Pool Control

Capacity planning

Priorities

8.10.4.1 Pool Control

Pool control is a good alternative for a scheduling board. This way, manufacturing can be controlled manually without using APS. Based on priorities, time receipts and material stock, the pool control calculates which operations should be performed next on a resource. Using the pool report – accessible through logon/logoff (terminal) – employees can log on or off their operations.

© 2026 Boyum IT Solutions A/S

A pool is the operation queue for a certain resource. You can define the number of work hours which the pool can contain in the resource master data (Resource – Pool limit in hours). This indicates to employees that they must first process the most important work orders.

Priority

Before the positions are sorted in the pools, they are sorted according to priority. The oldest start date has the highest priority. The start date is determined according to the operation, calculated through capacity planning. This information is then aged by the pool days stored in production priority multiplied by the number of days stored in the Configuration wizard – Pooling – Multiplier.

Also see Pooling, Scheduling.

Current pool

The employee always sees the current pool. These are orders that can be started, have the highest priority, and fit into the pool size. Instant orders are always in the current pool. The current pool is pool number 1. After it has been processed, pool 2 is activated as the current pool, etc.

Pool 0

This pool contains all routing positions which cannot yet be reported as the preceding reportable routing position has not yet been finished. As soon as the previous position has been reported, the position automatically moves from pool 0 in the next available pool.

Pool > 0

This includes all positions that can be started but that do not fit in the first pool. Generally, a daily recalculation (Pooling, Scheduling) is required to allow the most important positions to move to the active pool.

Manual changes

Using the Pool Structure Report positions can be moved manually from one pool to another. Manual sorting is also available in the pool structure list.

Also see:

Pooling, Scheduling

Pool Structure Report

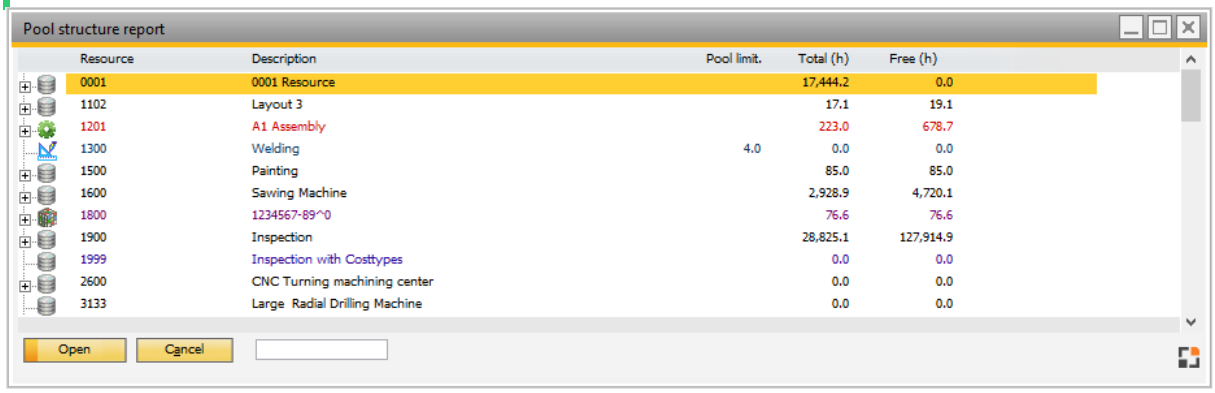
8.10.5 Pool Structure Report

The pool structure list is used for production planning and monitoring. Operation sequences are assigned to pools. Operations then can be moved from one pool to another. In the pool list only the current pool (usually Pool 1) is visible.

© 2026 Boyum IT Solutions A/S

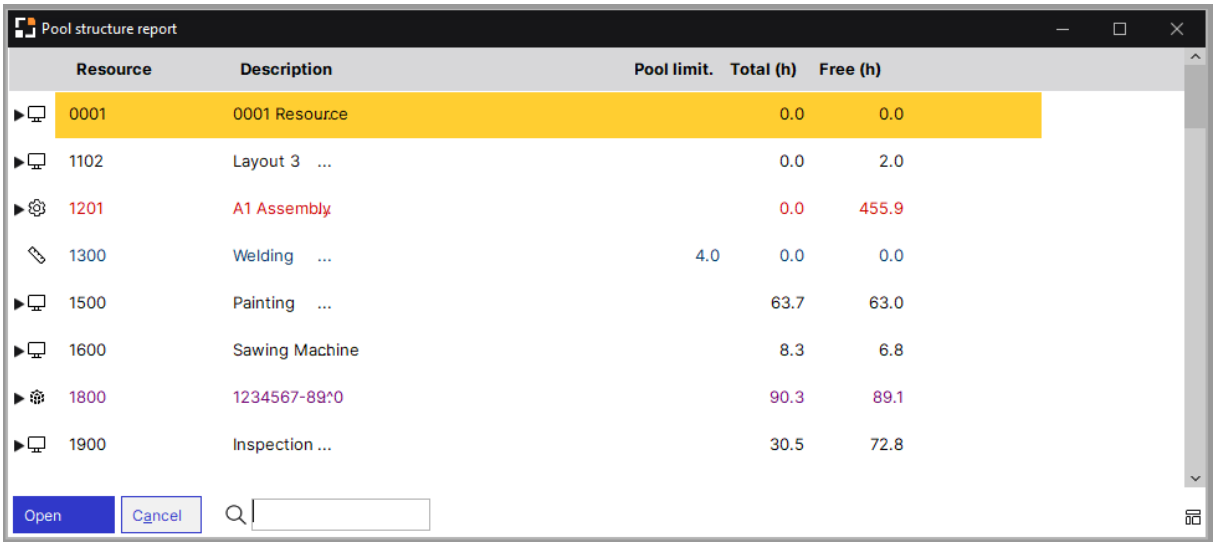
See Pool control.

PATH: Production > Capacity Planning > Pool Structure report.



Window fert_pool_struktur.psr

Boyum Style design:



Window fert_pool_struktur.psr

Field Description

Resource level

Field	Description
Resource	The resource that is being used.
Description	Optional description.
Pool limit	Total pool size (pool limit).
Pool size Total (h)	Total of dispatches – hours in the current pool.

© 2026 Boyum IT Solutions A/S

Pool size Free (h)	Number of free hours in this pool. Note: Setup total pool size in Resource.

Pool level

Field	Description
Resource	Pool number. First pool is number 1, which is followed by Pool 2, 3, 4. Pool number 0 contains all operations that can not be started, because the preceding operation needs to be reported first.
Document	Production document.
Pos	WO position.
Operation	Operation.
Activity	Activity description from operation.
Valuation date	Calculated valuation date that determines sorting. ***See*** Priority – Pool factor and Pool control.
To	Complete by this date according to operation.
Duration	Planned remaining time (planned time minus already reported time).
Login	Checks whether the preceding operation has been reported already and the operation can be logged into. Further rules are not considered.

More functions

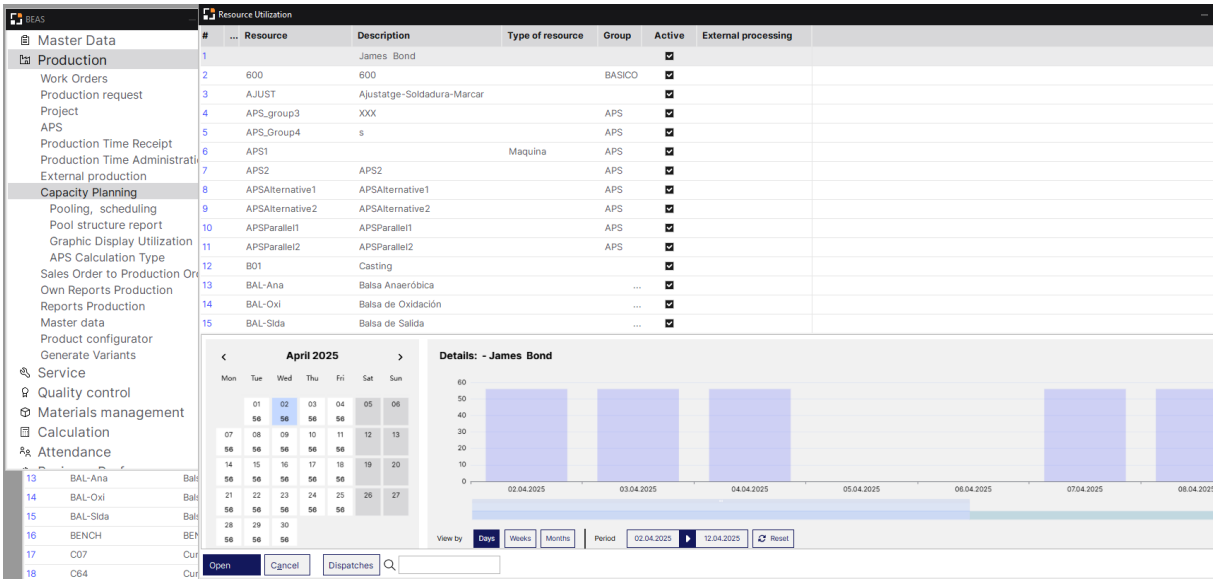
Function	Description
Add from Pool	The pool from which the operation is added.
Move To	Move into a subordinated pool. ***For example:*** Move from pool 1 to 2. The employee can no longer access this operation. The operation is now in the subordinated pool. The operation can only be started when the first pool has been finished. If there is no pool 2, it is created by this action.

See Pool Control

© 2026 Boyum IT Solutions A/S

8.10.6 Graphic Utilization Display

In the graphic utilization display, the planned times can be displayed by day, week, or month for each resource.



Window kapa_arbplatz_edit.psr

Graphical display

The graphical display provides a summary of all Resource utilization and the relevant details of a selected resource in a chart view.

You can dynamically set the window structure of your preference by selecting the placement of the graphical display in the contextual menu. The appearance is user-dependent and can be set in each screen individually.

Adjust display size by Ctrl + Scroll up/down.

Controls

- Selection list

  Select resource or resource group from the list to be displayed.

- Calendar

  The calendar visualization provides a monthly overview at resource utilization. The number of resource capacity hours are indicated under the date numbers.

  Color codes and tool tips assist usability.

  Color codes of calendar days:

© 2026 Boyum IT Solutions A/S

- Grey: Non-labor day (no capacity or holiday)
- Red: Day with overloaded capacity
- White: Any day with capacity planning
- Blue: the currently selected day

Hovering over a calendar day shows a tool tip on the relevant details of resource utilization:

Tool tips

Tool tip entry	Description
Date — shift type	Displays the date of the day over which the mouse is hovered. Right of it, the shift of this day is displayed (***see*** image above).
Overloaded	When the "Workload" exceeds the dispatching index of a resource, the system indicates this with a red "Overloaded" note (***see*** image

© 2026 Boyum IT Solutions A/S

Tool tip entry	Description
	above).
Workload	Scheduled hours for the displayed resource.
Capacity	The available capacity of the resource in hours.

Controls:
Left-right arrows to navigate between calendar months.

- Utilization (Details) view

Workload / Time

This graphics section displays the capacity and workload (number of hours on the "Y" axis) of one, selected resource under a defined time range ("X" axis). You can select a resource to be viewed here for a period in the numbered list or by clicking on it in the "Resources summary" chart.

- **Tool Tip Description**

Tool tip entry	Description
Date / Week 01-52 / Month 01-12	The date / Time range being viewed.
Overloaded	When the "Workload" exceeds 90% of the dispatching index of a resource, the system indicates this with a red "Overloaded" note (***see*** image above).
Workload	Scheduled hours for the selected resource.
Capacity	The available capacity of the selected resource in hours.

- **Controls**

Control	Description
View by	
Days / Weeks / Months	Select the unit of time range to view utilization details of the resource.
Period	Select a start- and end date for the period that you wish to

© 2026 Boyum IT Solutions A/S

Control	Description
	view.
Reset	Click this button to set the viewing period to the default starting date: today
Slider bar	The slider bar below the X axis shows the total time of the selected period to refine/re-adjust time selection or easily jump to any part of a longer period.

Functions

Button	Meaning
Day	Utilization display on the right: by day.
Week	Utilization display on the right: summarized by week.
Month	Utilization display on the right: summarized by month.
Dispatches	Opens a list of dispatches for the selected resource.
Work orders	Not completed work orders containing the currently selected resource are opened in the work order structure. Alternative and parallel resources are considered.

back to capacity planning

8.10.7 APS Calculation Types

APS means Advanced Planning and Scheduling. The APS extends the planning functions of the Beas Basic license with further functions for detailed planning.

New or existing work order positions are calculated by using predefined calculation types. Depending on the calculation type, the work order positions are calculated forwards or backwards and the material availability is checked. The work order then is automatically scheduled, while considering the resource limits. The calculation can be done forwards, starting from a start date (resource-optimized) or backwards, starting from a delivery date (stock-optimized). The calculation type is used to reduce the transition times in two steps.

In a calculation type, various parameters are defined to control the behavior of the calculation:
- the scheduling direction

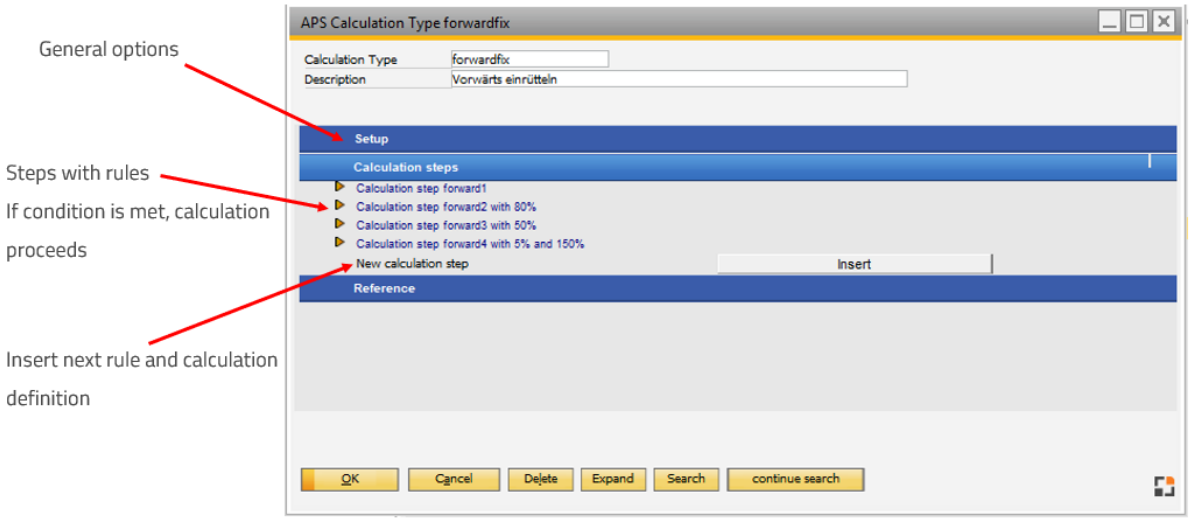
© 2026 Boyum IT Solutions A/S

- the consideration of material receipts
- buffer times.

There are five (5) default calculation types in beas. ***See*** Default Calculation Methods. Besides using the predefined calculation types it is possible to create your own in APS.

Define calculation types under: **Production > Capacity planning > APS Calculation type**. In the planning settings (**Production > APS > Open scheduling**) you can configure which calculation method is available in this plan. If a new calculation method is defined, you must remember to store this in the planning, as well.

A calculation method has the following structure:

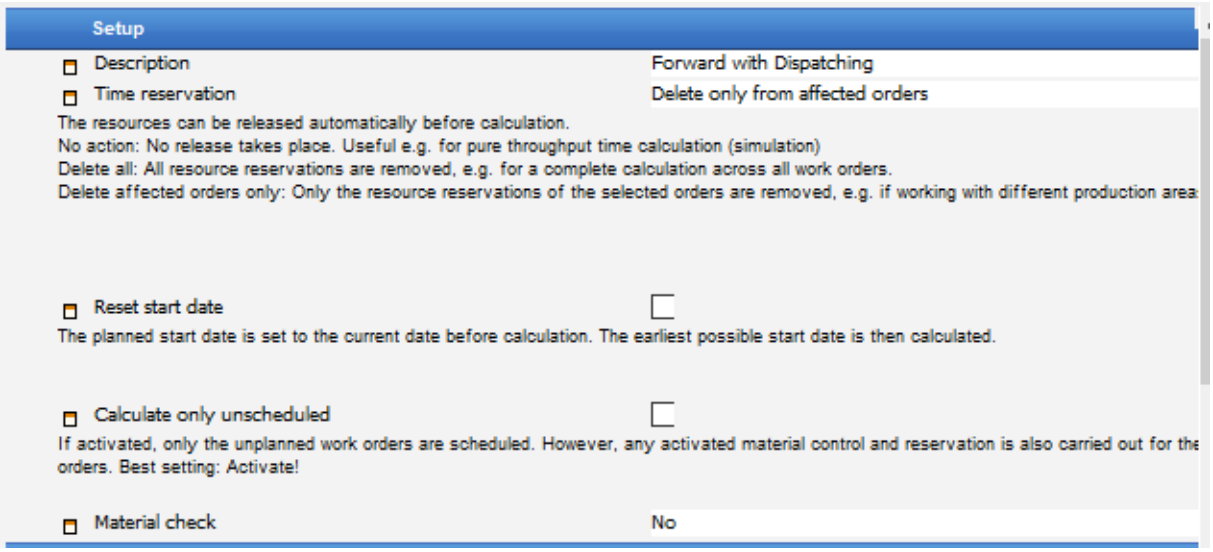


Window fert_xgantt_methode_edit.psr

To facilitate configuration, the setting is specified using a wizard. The settings are well-documented there and can generally be made without documentation.

Master data

© 2026 Boyum IT Solutions A/S



Window system_option_struktur.psr

Field	Description
Calculation type	Unique ID, the name of the calculation type.
Description	Description of the calculation type Note: The standard description is defined in the system language set in the Configuration wizard, not in the current user language, because the description is changeable and online translation is not available here.
Time reservation	Processing time reservations **Delete all:** All time reservations are deleted before calculation, including those from not visible and previously planned work orders. All resources are available to the new work orders to be dispatched. Work orders that are not recalculated, do not have any time reserved. **Delete only from affected orders:** This option is the standard setting to be used Only the resources of the orders that are recalculated are removed. This ensures that the resources of previously planned orders are retained except the resources of fixed positions. **No action:** Time reservations are not removed. As a result of which the times cannot be calculated optimally or by priority.

© 2026 Boyum IT Solutions A/S

Field	Description
Reset start date	If activated, the planned start date is set to the current date before the calculation. The earliest possible start for a production structure is then calculated.
Calculate only unscheduled	If activated, only the unplanned work orders are scheduled. However, any activated material control and reservation is also carried out for the planned work orders. It is recommended to enable this option. Work orders marked for calculation, but not calculated due to this setting, receive the "fixed" value in field "last calculation".
Material check	Type of material check. A material check can be activated which reserves the material stock or all planned accesses for the work orders by priority (soft reservation). A copy of the warehouse stock of goods issues is created and these are then assigned to the work orders by priority (sorting of the production list). If no planned issue is available, a possible issue is used: current day + lead time of the item in question. **Note**: The material check is only performed if the calculation is started in the APS view (List). For a material check, the entire production must always be seen, and the previously planned work orders must be considered. For this reason, it is important that all work orders planned and to be planned are displayed in the list, and that the previously planned work orders are at the start of the list. In this manner, during the material check the *Only calculate unplanned* option is ignored for the material check itself. Only items with positive stock inventories, which are not blocked and are released from Beas side, are taken into account. If a material is unavailable for a work order, this is displayed in the Gantt chart using a symbol. The missing material and the planned receipts can also be displayed in the list display and the Gantt chart.

© 2026 Boyum IT Solutions A/S

Field	Description
	After scheduling *1 In the material calculation after scheduling, the latest possible material receipt is calculated. The material is not correct if the previously calculated start date of the position cannot be fulfilled. **Before scheduling *2** In material calculation before scheduling, the earliest possible material receipt is calculated irrespective of the required date and this is entered as the earliest material receipt in the position. If *Consider material entry* is activated in the calculation step, the material entry determined here is considered and the operation is only started if the material is available. This only works for forward scheduling. If the missing material is an assembly (not order related) and there is already a work order, this assembly and this work order has a lower priority according to APS y View > Production List, the priority is changed automatically, i.e. the work order is moved up in the list. If *Consider material entry* is activated in the calculation step, it ensures that the sub-assemblies are always scheduled before the higher-level assemblies. **Pre- and post-scheduling** Under certain circumstances, it may be logical to activate both variants. **Important**: The "earliest possible start date" information is overwritten in the operation with "latest possible". Notes on material control: • A stock reservation has always higher priority (beas 9.3 PL 2 HF 4)

© 2026 Boyum IT Solutions A/S

Field	Description
	• Order-related assembly BOM items are completely ignored, because it is assumed that the associated manufacturing position exists in the same amount. The system ignore higher or lower quantity sub-assembly Reservation between bill of material position and work order positions are ignored. • Material requirement coverage is tested as follows: o Is stock available? o Does a planned production receipt exist? (* 2) • Stock allocation: o Check only Stock, which not reserved ▪ Is stock available? ▪ Inventory allocation? ▪ Earliest production receipt ? (* 1) ▪ Earliest purchase order ? (* 1) ▪ Earliest replenishment date ? (* 1) o Temporarily Reservations (late as possible, for material control after dispatching) ▪ Is stock sufficient? ▪ Latest possible production receipt, completed before the requirement date ▪ Latest possible purchase order receipt ▪ Inventory allocation? ▪ Earliest production receipt - possibly at a later date? (* 1) ▪ Earliest purchase receipt - possibly at a later date? (* 1) ▪ Earliest replenishment date? (* 1) (* 1) Special features of this calculation steps: In "Material check after scheduling" "too late" is active if the planned receipt is over the requirement date. The requirement date is the calculated completion date or the start date of the assigned work order. The planned receipts are assigned to the position and can be represented in the GSP list. (* 2) Only with "material check before scheduling":

© 2026 Boyum IT Solutions A/S

Field	Description
	If a work order is determined, it is first scheduled. This ensures that the work order is finished earlier and can cover the requirements as soon as possible. **Consider WareHouse** • Negative Stock is not allowed. • Ignore locked Warehouses. • Type not "Blocked WareHouse" • Reservations always have the highest priority. • If a locked batch is in a production warehouse, then the batch number is available for production. • Item Versions are not considered (no check on Batch/Serial number level) **Material linked to external routing positions** Material positions linked to an external routing position can reserve quantity which is available in an external warehouse. *(beas 9.3 PL 2 HF 4)*
Consider planned WO not in list (BETA)	If activated, the Material check will consider all open work orders that already have the status "APS planned". This means all the planned Work orders will influence the available material, regardless of whether they are part of the orders to be calculated or not. **How it works** Before the previous material check takes place, Beas collects all open WO's with the status "APS planned" and which are not part of the calculation list. These WO's influence the available stock, storage-related sub-assemblies, existing purchase orders, by reducing the available quantity.

Calculation steps

© 2026 Boyum IT Solutions A/S

Any number of calculation steps can be defined.

Calculation step	Unique ID
Sorting	Sequence. By default, this value is set to “2”. If the user inserts a new calculation step (last field in this section), the system creates a new sub section “Calculation Step 3 3” adding 1 to the previous counter in the Sorting and Description fields.
Description	Description of calculation step.
Execution condition	Defines the condition under which this calculation step is executed

Always	The step is always executed.
Date > Delivery Date	The calculation step is executed only if the calculated end date is after the delivery date.
Date < Start Date	The calculation step is executed only if the calculated start date is before the stored start date or in the past.

This system can be used to perform for example a re-allocation:
Step 1: Calculation using default (forward).
Step 2 and following steps: Reduce transit times, increase overload and calculate again, and try to adhere to the delivery date in this way.

Scheduling Direction	Determines the calculation method or direction

Backwards	Backward from delivery date, material-optimized. Fixed operation specifications are not considered. Forward	Forward from start date, resource-optimized.

© 2026 Boyum IT Solutions A/S

Calculation step	Unique ID
		Catch Up: Forward from present, only operations in the past and overlaps are moved. Idle time, transit time and fixed operation specifications are not considered for the work sequences in question.
Latest start	Calculates the latest start date The system tries to start as late as possible but uses only forward calculation. Beas calculates forward. If the calculated end date is earlier than the delivery date, Beas calculates again with another start date. If end date is too late, Beas attempts the same calculation with an earlier start date Use this if you want to work with material optimization and if you need forward calculation. Note: The system starts with the first work order related to the priority. If all resources are free, the system can start late. For next work order with the same delivery date, the resources are not free and the system must start earlier. Problem with this concept: The work orders with lower priority have an earlier work order start.
Consider scheduling ID	Defines handling with Consider planning flag If you do not filter out planned production orders in the planning view, you can also define the use of the planning flag using the calculation step.

© 2026 Boyum IT Solutions A/S

Calculation step	Unique ID
	Planning indicator Delete: All flags are removed and calculation is performed. at Planned not Calculate: No calculation is performed. Always Calculate and Set: A calculation is performed and the flag is always set afterward.
Work step fixation	Defines the use of fixed operation specifications All Delete: All fixed specifications are removed on calculation Delete incorrect only: Fixed specifications that are in the past are removed. Fixed specifications producing a date overlap are not removed.
Consider material entry	If this is activated, the receipt date calculated from the material control is used at the earliest start date for the affected positions. However, this does not affect fixed positions.
Fix logged task	Specify how currently reported positions are treated. If an operation is in work (started) and a calculation is started in APS, the operation is not moved. The position is fix. Only applies to forward scheduling.
Simulation	The calculation is performed as a simulation. This means that calculated times are not reserved or written to the reservation table and visualization table. Only the start date or end date is calculated. By default, this option is unchecked. When the simulation check box is active, the system does not update fields calculation "Start time" or "End Time" in any scenario.
Consider capacity limits	Determines whether resource limits are to be considered **Enabled:** The resource with the enabled "observe capacity limits" option is never dispatched with more than 100%. All time reservations are considered, even work orders which are not currently calculated. Exceptions: • Operations are fixed manually in APS

Calculation step	Unique ID
	Work order is set to have the master data fieldÂ Number of machines/Pers = 1. **How Detailed planning works:** The detailed planning checks to the minute when a resource is available, and whether the work sequence can be completed in the available time windows. Assumptions: our resource is the same on all routing position on the below reported examples and has a total capacity of 12 hours per day. ***Example 1:*** Work order No. 1 and Work order No. 2 start at 6am on the same date/time. Both work orders only have one routing position and each position has an entire duration of 6 hrs. The result of an APS forward scheduling will be: Work order 1 starts at 6am, Work order 2 starts at 12pm because between 6am and 12pm the resource is not available and is occupied by work order No. 1.  ***Example 2:*** Work order No. 1: one routing position with a duration of 6 hours, work order No. 2: one routing position with a duration of 3 hours and work order No. 3: one routing position with a duration of 6 hours.

© 2026 Boyum IT Solutions A/S

Calculation step	Unique ID
	The result of an APS forward scheduling will be: Work order No. 1 will start on day 1 at 6am, Work order No. 2 will start on day 1 at 12pm, Work order 3, even if you have set the same start date/time for the APS forward calculation, will be moved forward to start on day 1 at 3pm but will finish on day 2 at 9am.  ***Example 3*** Work order No. 1: one routing position with a duration of 6 hours, work order No. 2: one routing position with a duration of 3 hours and work order No. 3: one routing position with a duration of 6 hours. **ATTENTION:** The following example assumes that you are working on the APS Gantt and you have set work order No. 2 manually (by dragging it on the Gantt chart) to start at a specific time (and the operation is also then fixed by APS). In this example, Work order 3 can start only start on the second day, because between Work order 1 and Work order 2 the free time is not enough. ***See*** Capacity planning - APS, Exploiting the full capacity Enabled: Exploit Full Capacity This method checks the total available capacity on a day for a

© 2026 Boyum IT Solutions A/S

Calculation step	Unique ID
	resource. **Note:** It does NOT check when the capacity is available.  ***Example 1:*** 2 work orders, one routing position per work order, each routing position with a total duration of 6 hours. Both work orders are planned in APS with forward scheduling and with the same start date/time. The result of an APS forward scheduling will be: Both work orders will have the same start date and time because Work order 1 needs 6 hours and 6 additional hours are available for Work order 2. The start/end time of each work order is not checked by Beas.  ***Example 2:*** 2 work orders, one routing position per work order, each routing position take 8 hours. We have a total duration of 16 hours for both work orders with a total available capacity of 12 hours on the machines. The result of an APS forward scheduling will be:

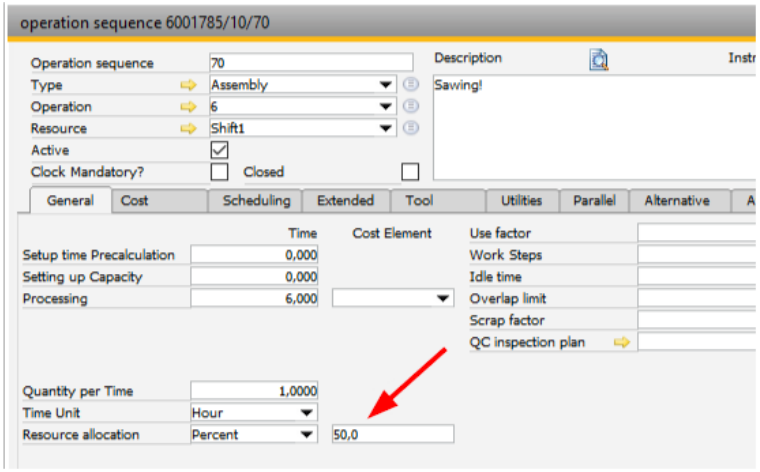
© 2026 Boyum IT Solutions A/S

Calculation step	Unique ID

Here again both work orders start at same time but the time span by which Beas assigns the second work order is longer. The routing operation of the second work order will still be 8 hours (as well as the capacity occupied on the resource), but can take only 4 hours from Day 1 and will have to take 4 hours from the second day. This is why you will have representation in the APS GANTT for the second work order that is longer than the first one. If you check the **Resource > Dispatches > Detail**, you will see the calculated time zones for the second work order: Day 1: 6am – 10am (4 hours, as the remainder of the capacity has been taken by work order 1) Day 2: 6am – 10am (the remaining 4 hours of work order 2)

Example 3:

Work order 1 and 2 have been set to start on the same Day by APS with forward scheduling. Each of the work orders has one routing position and each of them lasts for 6 hours. You have assigned a resource allocation of 50% for each of the routing positions.



© 2026 Boyum IT Solutions A/S

Calculation step	Unique ID
	In this situation, the Detailed planning will not be used. The result of an APS forward scheduling will be: The system plans the complete day, but on both work orders it will have the same start date/time, and they will be in parallel because of the 50% setting at the routing position resource allocation. The system will represent both work orders with a longer time span (12 hours each), but each of them will still occupy only 6 hours of resource capacity.  ***See*** Capacity planning - APS, Detailed planning
Transit time in %	Specifies the % of transit time to be considered. By default it is the stored priority setting according to the production order. A percentage value can be entered. The lower the value, the lower the throughput time is. ***See*** Transit time.
Capacity overload limits in %	Specifies the percentage the resource may be overloaded by. ***Example***: If the resource has a planned capacity of 8 hours / day and 150% is set, the order can schedule this resource for 12 hours. By default it is the stored priority setting according to the production order. A percentage value can be entered. The lower the value, the lower the throughput time is.
External operation: Consider goods receipt from PO	☐ Affects the finishing date of the external operation Note: Only adjustable for forward scheduling.

© 2026 Boyum IT Solutions A/S

Calculation step	Unique ID
	• **If there is no purchase:** The finishing date is calculated based on the deposited job times (if time calculation is active). Then, the idle period is added. **Note**: idle time is often used for calculating the lead time. • **If there is one open purchase**: The finishing date is delivery date + time of day as per calculation setting. Idle time is ignored (see above). • **If there are several open purchases**: The finishing date is delivery date + time of the first purchase + time as in calculation settings. • **If start date of the operation is after delivery date:** The finishing date is the same as start date of the operation (0 processing time) idle time is set to 0. Only transit time is taken into account. ***See*** External production - Delivery date determination / Lead times
External operation: Time of inflow	This option is available only if the field **External Operation: Consider Good Receipts from PO** is checked. At purchase only the date can be entered, not the time, so an default time (standard: 3pm (15:00)) is defined. The usual warehouse delivery time should be entered.
Set work sequences logged in	If a work sequence is currently logged in and this option is active, the start time for this work sequence is ALWAYS the present. This only works for forward-scheduling.

Reference

Report	Enable to make the calculation type as available in APS list view. By default, this option is unchecked.
Gantt Display	Enable to make the calculation type as available in the Gantt display. By default, this option is unchecked.

Choose calculation type

8.10.7.1 Default Calculation Methods

The calculation methods are user-definable in APS. The most important methods are pre-configured in Beas.

© 2026 Boyum IT Solutions A/S

(Backward) Backward simulation
(Backwardres) Backward Dispatch
(forward) Dispatch forward
(forwardfix) forward Re-allocate
(Catch_up) Catch Up
(forward material) forward with Material check
(forward_opt) forward with optimization

(Backward) Backward simulation

Backward simulation determines the latest possible start date without considering time reservations and material availability. This start date is written in the production order. No times are reserved. Fixed operation specifications are not considered in backward scheduling. Work orders that are logged in (started) are not specified as fixed.

(Backwardres) Backward Dispatch

In this method, dispatching is performed to the latest possible date, taking time reservations into account. The planning flag is removed. Fixed operation specifications are not considered in backward scheduling. Work orders that are logged in (started) are not specified as fixed.

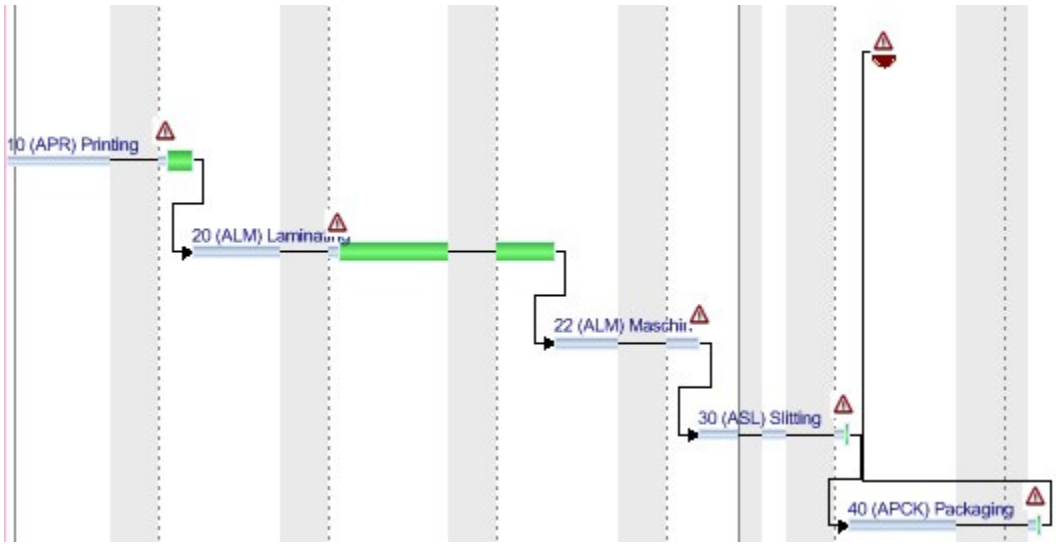
This method is used if the material should be purchased as late as possible. This method therefore works in a material-optimized way. Conversely, forward scheduling works in a resource-optimized manner.

(forward) Dispatch forward

This method calculates on a resource-optimized basis. Time reservations are considered. The planning flag is removed. Fixed operation specifications are considered. Work orders that are logged in (started) are fixed.

This calculation method is the default method for rough and detailed planning. In the graphical view you should generally work with forward scheduling. Resource-oriented planning is only possible with this method.

© 2026 Boyum IT Solutions A/S



Example: Dispatching commences from today regardless of the delivery date.
If the delivery deadline is exceeded, the operations are highlighted with a question mark.

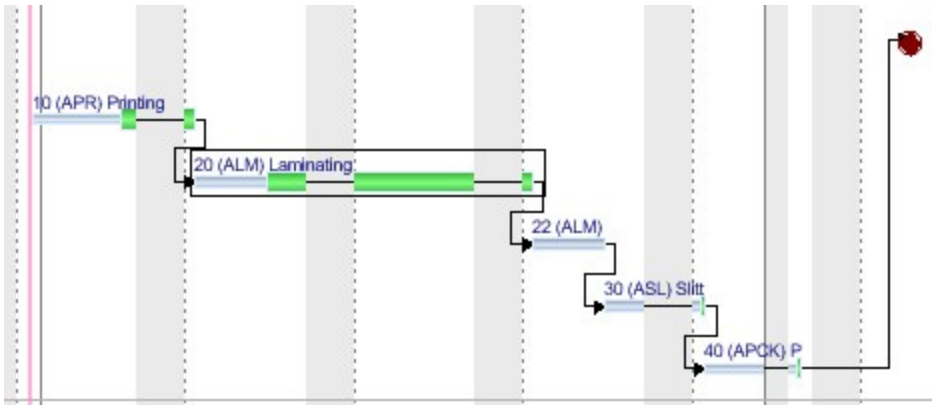
(forwardfix) forward Re-allocate

The "Dispatch forward" method calculates from the start date on a resource-optimized basis. Time reservations are considered. The planning flag is removed. Fixed operation specifications are considered. Work orders that are logged in (started) are fixed.
Special feature:
If the delivery date cannot be met, the transit time is reduced gradually and the resources are overloaded. An attempt is made to dispatch the order using different calculation concepts, so that the delivery date can be met. Where necessary, the resources are overloaded or the transit times are severely reduced, but the delivery date cannot be guaranteed at all times.

The procedure:

- Default forward scheduling with saved priority
- Reduce transit times to 80% and schedule forward
- Reduce transit times to 50% and schedule forward
- Reduce transit times to 5%, resources are overloaded by up to 150%

© 2026 Boyum IT Solutions A/S



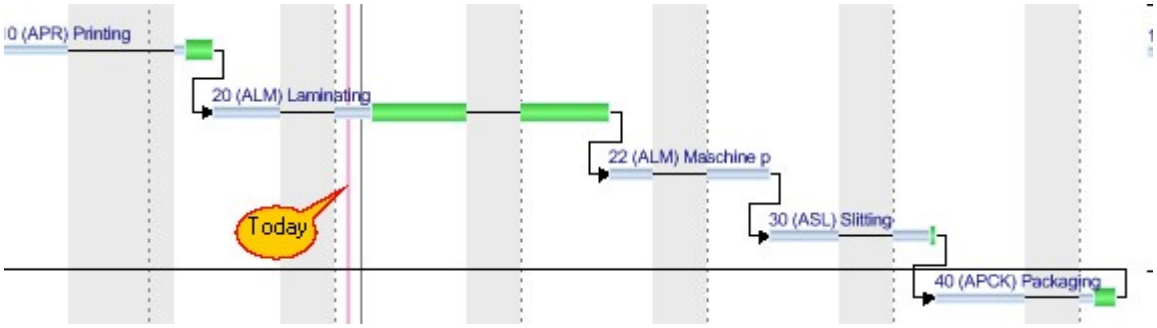
Example: Same situation as with dispatching forward. The transfer times are compressed, which reduces the throughput time.

(Catch_up) Catch Up

If an order is scheduled but not processed, the time reservation is in the past the next day. In this case, the time reservations must be moved to the present. The "Clear backlogs" calculation function is available for this.

All time reservations are moved from the past to the future. However, the order is retained. Resource limits, idle time, transfer time, and fixed operation specifications are not considered, which compresses the work sequences extremely. This compression is only performed for the work sequences that must be moved because they were not processed.

Example: 2 work sequences are in the past.

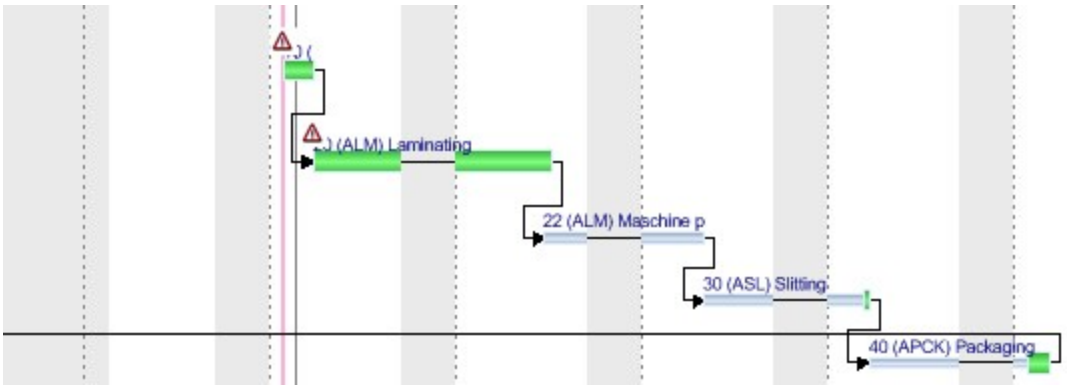


After clearing the backlog:

Transit and idle times are cut and the first work sequence is moved forward.

The work sequences from 22 are not moved.

© 2026 Boyum IT Solutions A/S



(forward material) forward with Material check

Forward calculation with Material check before calculation.

Start calculation as fast as possible (resource optimization), but not before Material is available (simple material check with temporal material reservation).

(forward_opt) forward with optimization

Forward calculation with the latest start.

Calculate always latest possible start with Material check. For more information ***see*** "latest Start".

8.11 Quality control

Beas includes an extended quality control module.

The quality control module is available from **Production > Quality control.**

Define QC-inspection plans where the behavior and parameters of the quality control procedure can be set. Complex rules can be stored.

Define in the Item master - Quality control which QC-inspection plan is to be used for the specific item. A QC-inspection plan is always related to a document. ***See***: Document types

Quality control orders can be created in different ways for the items. ***See*** Quality control orders.

During the quality control process, values can be registered per sample or per measurement position. Measured values or attributes (numbers) can be registered. Each measurement position, sample or QC-order can be valued and scrap reasons can be entered. Material is released by entering the measured value, by manual confirmation, or by performing a check using the four-eyes principle, and additionally, with electronic signature. In the last step, released goods are transferred to a Standard warehouse or released by releasing the batch status.

You can create documents per QC-order. Reading of the created documents can be made mandatory. A reading confirmation can be set.

© 2026 Boyum IT Solutions A/S

Test equipment and samples are supported. Samples can be generated for a time internal, fixed quantity, scale quantity or per serial number.

Concepts

© 2026 Boyum IT Solutions A/S

Work with QC warehouse	Goods are posted to a QC warehouse first, then the release is posted to the standard warehouse. A QC warehouse must be created: 1. Create a warehouse: SAP B1 - Setup - Warehouse 2. Set up the warehouse as a Quality control warehouse. Warehouse administration - Edit - Warehouse type. 3. Go to Configuration wizard > Quality control to adjust further behavior. 4. Create a QC-inspection plan and store it in the Item master- Quality control. Depending on the settings in Configuration wizard, when posting the goods, the Quality control warehouse is automatically selected. In the Quality control order measured vales can be registered and the order can be released. Use the Transfer window to post the material to the release warehouse or to the blocked warehouse. This is defined in Warehouse rules.
Batch release	Release via batch status. The release can be performed using batch status when working with batches, and a further processing of blocked batches can be prohibited this way. In this case you can work without a QC warehouse and transfer of goods. It is necessary to create a QC-inspection plan and to store it in Item master - Quality control. **Important:** the batch needs to be blocked when it is posted. This is set up in Configuration wizard > Materials management > Purchase goods receipt > Batch administration or Production - Valuation and posting the assembly - Batch administration.

© 2026 Boyum IT Solutions A/S

Work with QC warehouse	Goods are posted to a QC warehouse first, then the release is posted to the standard warehouse. A QC warehouse must be created: 1. © 2026 Boyum IT Solutions A/S

I-version	I-version according to source document.
Drawing number	Drawing number of the item.
Current Date	The creation date of the present QC order.
Quantity	Quantity already posted or to be checked. The quantity is displayed in Inventory UoM.
QC-inspection plan	Link to QC-inspection plan.
Source	Source document The source document can be opened via the arrow. **Note:** Multiple sources are also possible, eg. a receipt for a work order document. In this case the receipt document is opened as direct origin of the QC order. The production structure view with this work order is displayed if the source document is a production-operation sequence. The operation sequence is opened directly if the work order has more than 2 production positions. Otherwise an assignment in the structure view would be very difficult. *beas 9.2 PL: 02*
Business partner	Link to Business partner in origin document.
Item info	Information from Item QC-note that can be edited.
Information	Free text information on the QC order.

Status information

Field	Description
Sample open	Number of samples not yet released.
OK	Number of released samples.
Error	Number of samples marked as faulty.
Transfer	Transfer status. ***Also see*** Transfer, Concept Goods receipt warehouse. • no: no transfer needed • open: not yet transferred or not completed • posted: item completely posted
Transfer Open	Information related to transfer documents. This field shows open transfer items.

© 2026 Boyum IT Solutions A/S

Transfer Good	Information of good items.
Transfer Rejected	Information of rejected items.

Release and Valuation

Field	Description
Blockage reason	Enter blockage reason Enter the possible blockage reasons. You can only select blockage reasons that match the QC-inspection plan group or have no entry in the group and they need to be visible in the respective area (Order, sample, measurement). Blockage reasons may have further effect. ***See*** Blockage reasons
Valuation	QC valuation. Field only visible if Valuation was not set to "no" in QC-inspection plan . Entry is mandatory if Valuation was set to "mandatory" in QC-inspection plan. Valuation reasons are setup under Valuation You can only select valuation reasons which match the QC-inspection plan group or which have no entry there. Furthermore, they need to be visible in the respective area (Order, sample, measurement).
Release	Release the QC order Automatic release depending on the settings. Conditions are defined in QC-inspection plan - Release An electronic signature may be required. Release affects the release name and release date fields. Depending on the settings, the order is either closed automatically or transfer or batch release is allowed.

© 2026 Boyum IT Solutions A/S

	Note: If parallel QC-inspection plans have been defined, a QC-order may only be released, after all related QC-inspection plans had been released. An automated release may be blocked. *(beas 9.1 PL: 08)*
Close	Close the QC-order. If the QC-order is closed, it is displayed in the quality control list only, if Search for Archive was used. If the order is closed: • The "closed by" / "at" fields are automatically set. • The order can no longer be edited, measured values can not be changed, material can not be posted. A closed QC-order can be re-opened using right-click > Open document.
Batch	Display linked batch. Field is only visible if a batch related item was stored. If only one batch is linked, the field cannot be edited. In other cases, the batch can be selected. Use release to release or block the batch. Click the orange arrow to display batch details.
UDF1..UDF4	User definable fields can be set up in the Configuration wizard.

Right-click functions

Function	Description
Change log	The Change Log displays all changes for the Quality Control order.
Document open	Open selected document.
Remove	Delete current QC order. Note: You can only delete an existing QC order that has no measurement positions or released positions.

© 2026 Boyum IT Solutions A/S

8.11.1.1.1 Input per sample

Input per sample can be used if the complete checking process is performed subsequently for every sample or for every unit to be checked. You can select between "per piece" or "per x pieces" or "per x minutes". The behavior is set up in QC-inspection plan. If "per serial number" was stored in the QC-inspection, a separate sample will be created for every serial number.

All samples for this order are displayed in the list. Window settings and Templates are supported. Samples can or must be released depending on the settings in QC-inspection plan – Release. The Four-eyes principle and the electronic signature are supported. If a reading confirmation of the documents is required, editing is prohibited.

User example:
You have a QC order with 4 Measurements positions.
There is a Goods receipt with 10 Serial Numbers, and you have 1 Sample per 1 Serial Number.
Produce 10 Samples / Measurements

TO DO: Check Serial 1 for all 4 measurement positions, and then Serial 2... for all 4 measurement positions.

The window is split into the following parts:
Ribbon
Samples list
Release and Valuation

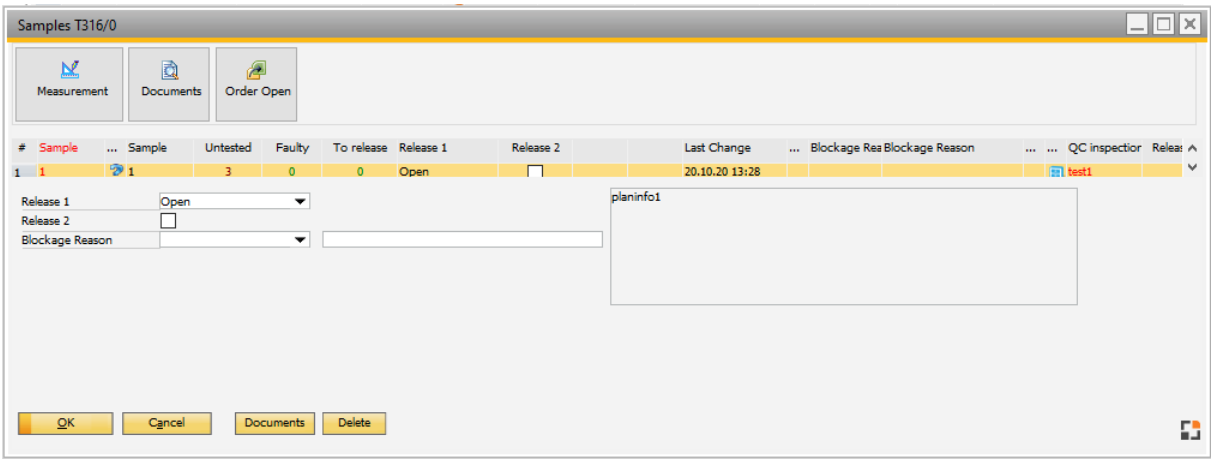
Ribbon

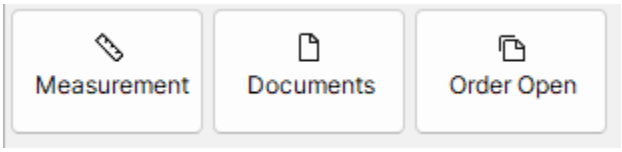
PATH: Production > Quality Control > Samples > select an entry > **Samples** button.

Button	Meaning
Measurement	Open selected sample to edit in window Measurement samples.
Documents	Open Documents window to read or edit linked documents. ***See*** QC-inspection plan – Documents.
Order Open	Open the QC-order. If the Sample is opened from the QC order, this button is not displayed.



Window qs_ftmessung_browse.psr

Boyum Style top bar button design:



Samples list

Field	Meaning
Status (...)	An icon indicates the status of the sample.
Sample	Position number
Untested	Number of unchecked measurement positions .
Faulty	Number of measurement positions marked as faulty (with blockage reason).
To release	Number of measurement positions to be released.

© 2026 Boyum IT Solutions A/S

Release 1/2	Release ID.
Last change	Data/Time of the last change.
Blockage reason	Stored blockage reason.
Valuation	Stored valuation.
Release Date / Name / Station	Release 2 – Date, Name, Station etc..
QC Inspector	The personnel performing QC inspection.
Info	Information on the QC process, e.g. the type of inspection / pieces.

Windows settings are supported.

Release and Valuation

Feld	Meaning
Release 1	Status Release 1

Status	Description
Open	Not all values have been registered.
Released	Status is automatically set to "released" after all measured values have been registered and no errors were reported. Additionally, the system will set samples with deactivated flag "relevant" to "release" status . This validation is executed every time a measured value is registered. ***See*** the definition of this flag here. Flag "relevant" is stored per each quality work order sample. It means that if you change "relevant" field in the definition of the QC plan, all previous existing QC orders will not apply the new value. It is not possible to change this flag manually.

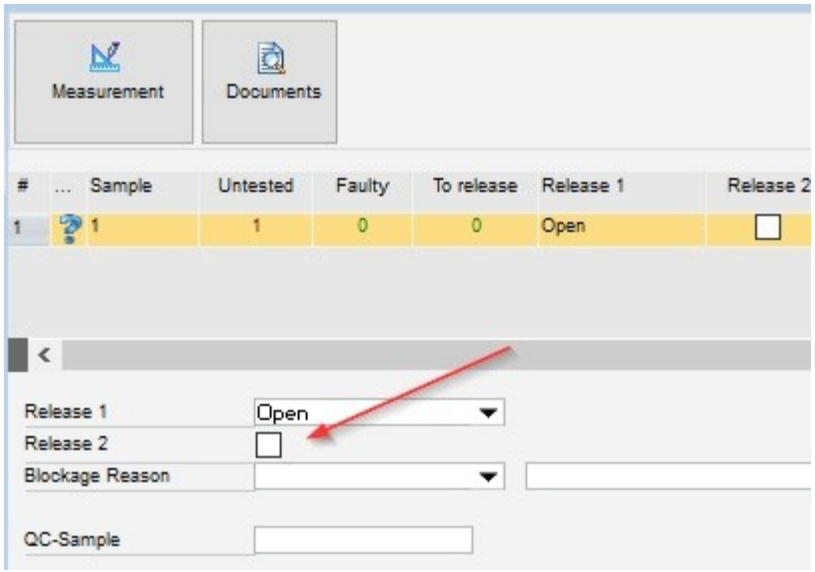
© 2026 Boyum IT Solutions A/S

Status	Description
Blocked	For all relevant measurement positions a blockage reasons was stored, with activated flag "block release". It is not possible to change this flag manually.
Manually Locked	Define this if you want to define this Sample as locked without definition of all Measurements. Only available if Status is "opened manually" or "Released" and QC order not released. This flag disables the flag "Release 2".
Manually Opened	If all entries are OK and you want to open the entry, you can choose "manually opened". Only available if Status is "released" or "Blocked" or "manually Blocked" and QC order is not Released. This flag disables the flag "Release 2". *beas 9.3 PL 2 HF 1*

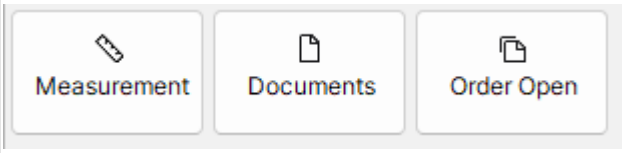
Note: The sample is not released automatically if it has no testing position or relevant testing position.

Release 2	Status Release 2

© 2026 Boyum IT Solutions A/S



Boyum Style top bar button design:



For samples the Four-eyes principle is supported. Depending on the settings, the status is set automatically or manually. Electronic signature may be necessary.

Behavior is defined in QC-inspection plan - Release.

Possibly required prerequisites:
- Release measurement positions completely,
- electronic signature,
- Valuation ,
- Reading confirmation for documents.

Blockage reason	For incorrect measuring a blockage reason can be stored Enter the possible blockage reasons. You can only select blockage reasons that match the QC-inspection plan group or have no entry in the group and they need to be visible in the respective area (Order, sample, measurement). Blockage reasons may have further effect.

© 2026 Boyum IT Solutions A/S

	See Blockage reasons
Valuation	Value the sample Define the Valuation . Field can be hidden in QC-inspection plan Release-settings or set to mandatory.  Valuation reasons are setup under Valuation You can only select valuation reasons which match the QC-inspection plan group or which have no entry there. Furthermore, they need to be visible in the respective area (Order, sample, measurement).
UDF1 ... UDF4	Free definable UDF setup in Configuration wizard.

Functions

Function	Meaning
Add	Create another sample This may be necessary, for example, if further samples are required or another QC plan should be used due to differences occurring.

© 2026 Boyum IT Solutions A/S

	The QC plan stored in the "QC plan" tab is used at all times. The current inspection plan is used at all times. To use the same inspection plan as for the other samples, apply "copy" instead of "new".
Duplicate	Duplicate sample Alternative to "New". The currently selected sample is copied without a measurement result. Use this option if a exact same second sample is needed. In contrast to "new", possible changes in the inspection plan are not taken into account, but values changed in the sample are considered.
Change log	The Change Log displays all changes for the Quality Control order.
Remove	Remove selected sample entry.
Documents	Open the browse window listing documents attached to the current QC order.

Note: Registering measured values and release is performed using the personnel number. A linkage between User and Personnel number is mandatory.

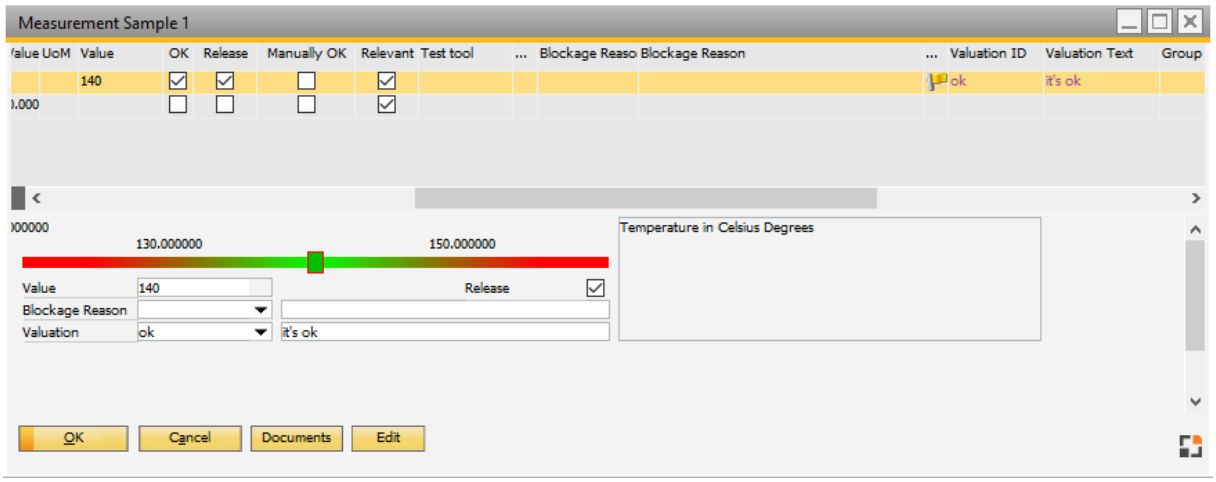
back to Edit QC order.

8.11.1.1.1.1 Measurement samples

In this window all measured values can be entered for a Sample.
Window is dynamically adjustable. UDF and Templates can be stored. The authorization for QC-order is required.

PATH: Production > Quality Control > Samples > select an entry > **Samples** button > double-click/**Open** an entry.

© 2026 Boyum IT Solutions A/S



Window qs_qsftpos_edit.psr

After all measured values have been registered, in the sample "release 1" is set to status "released". Depending on the settings, a second release follows, "Release 2", a "batch release", a release of the QC-order or the QC order may be automatically closed. ***See*** QC-inspection plan – Release.

- Definition "Sample ok"

A sample can consist of several measurement positions. A sample is considered "OK", if - "OK" and "Release" are active for all relevant measurement positions, - No blockage reason was stored for no measurement position causing "Block release", - Samples have been set manually to "released", - "Release 2" was activated.

- Definition "Sample blocked"

A sample is blocked, if - the sample was set to "manually blocked", - in all measurement positions blockage reasons are stored, in which the ID "Block release" is active. There is no automatic blockage of a sample only due to measurements outside the allowed range.

Measurement positions list

Field	Meaning
POS	Number of measurement.
QC-Test	Test title.
Methodology	Description of method.
Minimum	Allowed minimum.
Maximum	Allowed maximum.
Target	Target value.
UoM	Unit of measurement.
Sample	Sample ID.
Measurement value	Enter the current value or text.
OK	check mark, if OK or manually, without entering a value.
Release	Release measurement position? See Personnel > FDC > QC Release
Relevant	check mark, if relevant for release.
Blockage reason ID	Blockage ID. With right-click a blockage reason can be selected. if a valid ID is entered, the blockage reason is filled automatically. Any value can be entered as ID, due to downward compatibility, there is no check .
Blockage reason	Description of blockage reason. (Remark).

Additional fields can be displayed using window settings.

© 2026 Boyum IT Solutions A/S

Register measuring values

Measured values and attributes can be registered. Blockage reason, valuation and up to 4 additional fields.

Control

Enter data on the lower part of the window. Use *Cursor up / down* and *ENTER* to jump in the list to the next or previous position.

- Graphical display of measured values

  In the entry area measurement value registration is visualized, similar to scales – ***see*** image above. The minimum value is indicated on the left, and the maximum value is displayed on the right. Once set, the target value appears between them.
  In the red-green bar the value is visualized: Green area = OK, red area = faulty.
  The rectangle above shows the current measuring value. If green, the value is within range, if red, it is outside the set range.

The graphic is hidden for texts and attributes. Also, if no minimum or maximum values are given, the graphic is hidden.

Field	Meaning
Value	- Enter measured value If the value fits the target (between minimum and maximum), the field is set to "OK". If the Four-eyes principle is disabled, the measurement position is released immediately. Additionally, the measurement position also stores the employee, the work station and time and date at which the values were registered.
OK	- Measured value - Status If a measured value is entered between maximum and minimum, OK is set automatically. If the value is outside the allowed range, the field OK is disabled. In QC-inspection plan - Measurement position you can store, whether it is possible to set "OK" manually **Attributes**

© 2026 Boyum IT Solutions A/S

	Registering attributes (= no default range of values) the field "OK" is changed manually. Special case: If minimum and maximum values = 0, this will be interpreted as if no values were set. The maximum value is then 99999, any numeric positive entry will lead to "OK". **Release** The measurement position can only be released if "OK" is active. If in QC-inspection plan the setting "Disable additional release" is enabled, setting the OK field, release is automatically enabled.
Release	Release measurement position Following the Four-eyes principle a second user can release the measurement position. The user who entered the measured value may not release the measurement position. Exception: The Four-eyes principle was disabled in the inspection plan. In this case, the measurement position is released automatically, after marked as "OK". Release not possible: - If a blockage reason was stored - this prevents the release. ***See*** Blockage reasons. - Sample has been released already (Release 2). - QC-order has been closed already. - The current user registered the measuring value (Four-eyes principle).
Blockage reason	Blockage reason. For each measurement position a blockage reason can be stored. Enter the possible blockage reasons. You can only select blockage reasons that match the QC-inspection

© 2026 Boyum IT Solutions A/S

	plan group or have no entry in the group and they need to be visible in the respective area (Order, sample, measurement). Blockage reasons may have further effect. ***See*** Blockage reasons After selecting a blockage reason "OK" will be disabled if "Block release" was activated in the blockage reason. If a measured value or an attribute has already been stored, the entry is checked and if necessary, "OK" is set again.
Valuation	Valuate Measurement position. Valuation reasons are setup under Valuation You can only select valuation reasons which match the QC-inspection plan group or which have no entry there. Furthermore, they need to be visible in the respective area (Order, sample, measurement).
UDF1 ... UDF4	Free definable fields are set up in Configuration wizard.

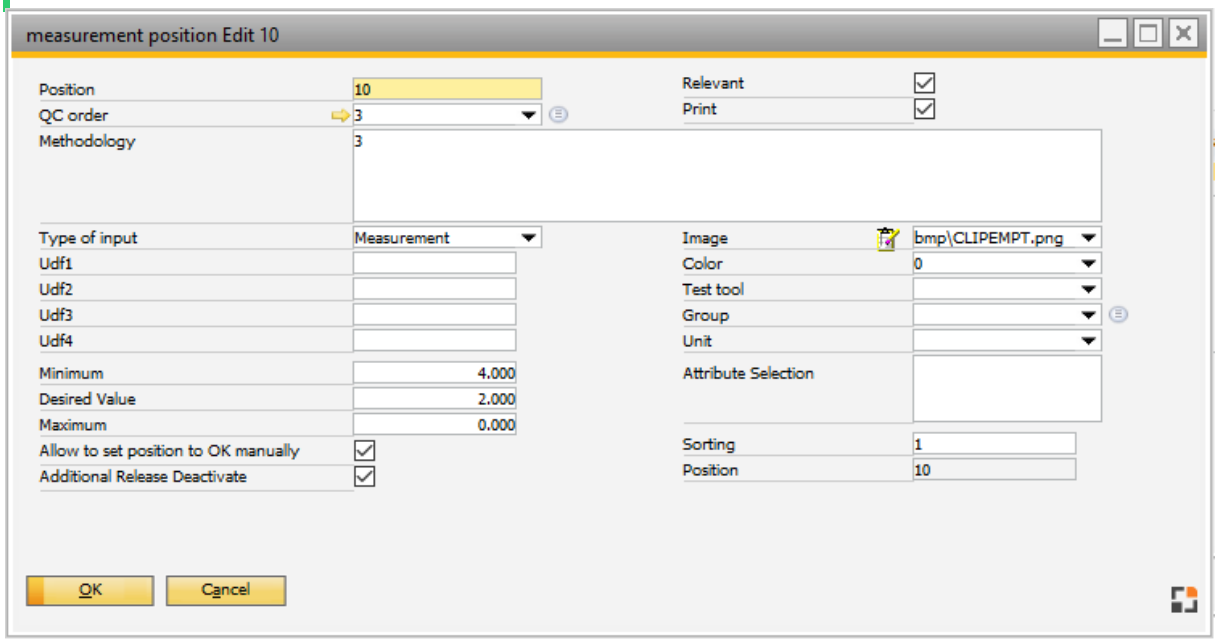
Functions

Field	Meaning
Update	Entered measuring values, valuations and blockage reasons are saved. Before saving, it is checked if the sample may be released. The complete release process is performed as defined in Inspection plan - Release.
Documents	Open the Documents screen, in which linked documents are displayed
Edit	Edit measurement position or create new. Create new or change a measurement position. Button is visible only if the user has the authority Change QC order. In Terminal-Mode this function is not available. ***See*** Edit measurement position
Change log	The Change Log displays all changes for the Quality Control order.

© 2026 Boyum IT Solutions A/S

In this window a measurement position can be subsequently changed, deleted or inserted new.
Authorizations for Edit QC order is required.
For field descriptions ***see*** QC-inspection plan - Edit measurement position.

PATH: Production > Quality Control > QC Orders > **Open** an entry > **Input by Sample** button > Double-click a sample > **Edit** a position.



Window qs_qsftpos_edit_detail.psr

Field Descriptions

Field	Meaning
Position	The list is sorted by this number. You can re-sort using Drag&Drop. Alphanumeric characters are allowed, position numbers can be assigned twice.
Batch/Serial	Batch/Serial number
QC-Order	Short description for the measurement position. Right-click to select a default from the default texts. After selection, the method description is also transferred. ***see*** Manage default texts.
Methodology	Long description. Edit by double-clicking or clicking the "**Description**" button.
Type of input	Type of entry. **Available types:**

© 2026 Boyum IT Solutions A/S

<table>
<tr><td></td><td>
<table>
<tr><td>Measurement</td><td>Minimum / Maximum values are considered. The "measurement" tab is displayed. The measured value is OK if it is between the minimum and maximum.</td></tr>
<tr><td>Attribute</td><td>A measuring position can be marked as "OK"
Values can be entered, but will not be checked.
Example:
Check of color
Enter "red" and "OK" for confirmation.</td></tr>
<tr><td>Text</td><td>Position is only displayed. No confirmation or entry.</td></tr>
</table>
Attribute: you can only specify whether it is okay, and include information.
Measurement: Minimum / maximum values are considered.
Text: Only a header line.</td></tr>
<tr><td>Desired value,
UoM</td><td>Specify target value and unit of measure (mm, kg, % etc., UoM is mandatory)</td></tr>
<tr><td>Minimum / Maximum</td><td>Enter minimum and maximum value for a measurement point.
The measurement position is released when the measured value lies within this range.

Only possible for entry type "measurement" not for "attribute" or "text".

If no value is entered, "allowed to set OK manually" will be activated automatically at checking.</td></tr>
<tr><td>Relevant</td><td>This option must be activated if this measuring point is relevant for the release of the test plan.
This option is always deactivated for type "Text".
Note: For automated release at least one relevant position is required.</td></tr>
<tr><td>Print</td><td>This option must be activated if the measuring position should</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

	be printed in a quality control protocol.
Test tool	A test tool can be selected. Only information – no effect. No reservations or dispatches. ***see*** Tool administration
Condition	Only inserted if the stored value matches the selected values in query. ***see*** conditional testing positions
Item rule	Measurement position is only inserted if this field is empty or matches the value entered in Item QC-link. The measurement position can be hidden or displayed depending on the item or document. ***See*** Item QC-link - Measurement position - Rule.
Manual OK	Determine whether the measurement position may be set to "OK" manually. If the option is active, the icon "OK" is displayed in the Measurement sample . There, it is possible to set the position to "OK" even if the measured value is out of allowed range. For type of entry "Attribute" this option is always active. Entering values, this option is automatically enabled if no minimum or maximum value was defined.
Additional release Deactivate	Disables the four-eye principle. By default, each measurement position needs to be checked and released by a second person. Four-eye principle Important: The person who entering the measured values is not allowed to release them, as well. If this option is disabled, the measurement position is automatically released, after the field "OK" was set. Electronic signature is not supported at this level.

Right window section:

Field	Description
Text	Add any information on the attached document here.

Functions:

Add: Attach new document.

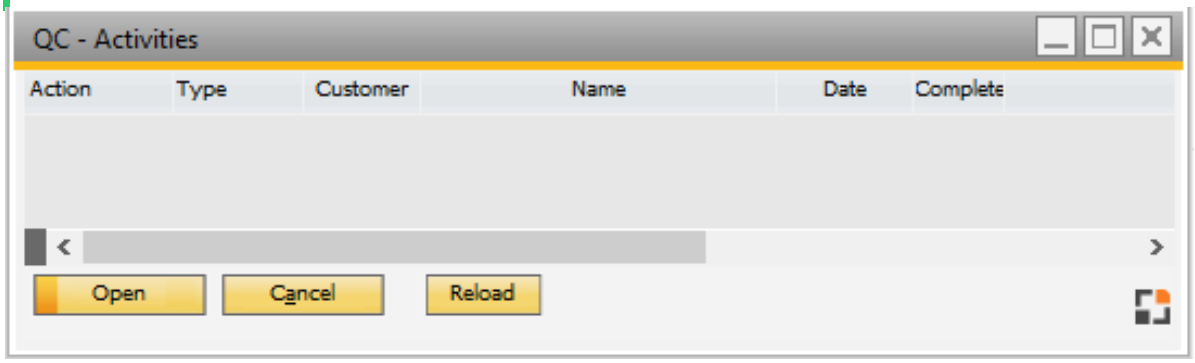
Remove: Delete current document attachment.

8.11.1.3 QC Activities

Manage all activities assigned to this QC Order, edit and create new.

For field description ***See*** SAP Business One help.

PATH: Production > QC orders > double-click/**Open** an entry > **Activities** button.



Window qc_activity_browse.psr

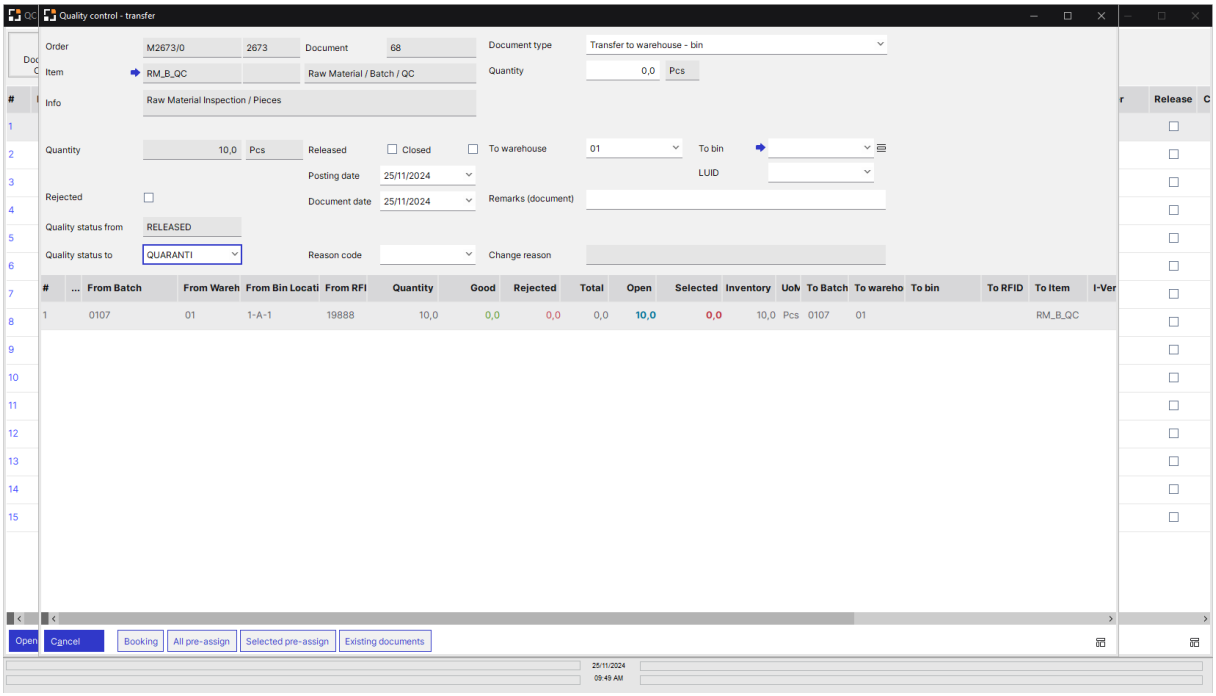
Functions

Function	Meaning
Open	Opens the selected activity.
Cancel	Close window without saving changes.
Add	Opens the window to create new activities in SAP Business One.
Reload	Reloads the window (needed after the creation of a new activity in SAP Business One).

8.11.1.4 QC Transfer

In this window goods to be checked can be transferred from the QC warehouse to the release warehouse.

© 2026 Boyum IT Solutions A/S



Window qs_transfer_header.psr

Note: The window can only be opened if the goods have been posted to a goods receipt warehouse. Alternatively, a QC inspection plan can be set up making transfer possible from any warehouse.

See QC inspection plan – Release, Warehouse master data – Type of warehouse

See our QC Transfer WebApp dedicated to this function.

QC by Sample - QC by Test - QC Transfer (WebApps 2.1) demonstration

Authorization for QC-Order is required. ***See*** concept Work with QC-warehouse.

The booking process

A booking is always performed from the warehouse/bin location that has been posted for the quality control order.

A pure bin location transfer is performed in case of a new bin location.

A transfer transaction is performed if the target warehouse is another warehouse. A manual posting and issue is performed in case of another item or batch number.

After the complete quantity was posted, the QC-order is marked as posted. Various rules can be applied to this process.

Header details

Booking details are displayed for the entry currently selected in the lower list.

© 2026 Boyum IT Solutions A/S

List of items to be posted supports windows settings and templates.

Field	Description
Order	QC order ID. The first character indicates the document type. For details, ***see*** Edit QC orders.
Document	Unique document number. **NOTE:** **WMS Bin Warehouse – Limitation:** The function does not support source documents that contain lines with more than 1 batch.
Item	For transfer: a transfer to another item number is possible.
Info	Information text.
Quantity	Available quantity from the QC order
Released	Conditions are defined in QC-inspection plan - Release.
Closed	If the order is closed the order can no longer be edited, measured values cannot be changed, and material cannot be posted.
Posting date	
Document date	
Rejected	⊟ Post document line as scrap If the option is enabled, the item is posted or transferred as "rejected" and warehouse determination uses "scrap" type. Note: When enabled, the "Rejected" check box for the current transfer document in the bottom summary area is also enabled for the current document. ***See*** Warehouse rules
Document type	⊟ Available document types The following selections are available in the drop-down menu:

Document Type	Description
Create Transfer to Warehouse WebApp 2.1: "Transfer to Warehouse"	Transfer the Item from Quality Control warehouse to target warehouse The warehouse can be for good material or scrap (Reject = active)

© 2026 Boyum IT Solutions A/S

Document Type	Description
Create Goods Issue from current Warehouse WebApp 2.1: "Issue"	Goods are only issued Use this if you cannot use the material (scrap)
Change current item by another one (Issue Document + Receipt Document) WebApp 2.1: "Create a new item (issue and receive)	This action generates a Goods Issue document for the original item and a goods receipt for the new item. If the new item has another Unit if you activate the "Change quantity" in the Configuration wizard, you can define the quantity which you want to post out and which quantity you want to post in. **Define price for a receipt document** It is possible to define price for a receipt document (if a receipt is created) with the parameter "Receipt price":  *Window system_option_struktur.psr* **Additional, available values:** **Name** | **Description**

<table>
<tr><th>Document Type</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>Source Item – Actual Cost</td><td>The system reads price from the issue document of the original item.
Note: this option applies only to Quality Control.</td></tr>
<tr><td>Source Item – Price from entry</td><td>The system reads price of the last receipt document of the original item.
Note: this option applies only to Quality Control.</td></tr>
</table>
see Configuration wizard.</td></tr>
<tr><td>Create Purchase Return document from Current Warehouse

WebApp 2.1: "Create goods return document"</td><td>A SAP Business One purchase return document is generated. Warehouse is always the warehouse defined in the original document. This option is only available when original document is a "Goods receipt PO".
For all other kind of documents this option is not visible.</td></tr>
<tr><td>Inventory Transfer Request

WebApp 2.1: "Transfer Request"</td><td>Transfer request for an Item from Quality Control warehouse to target warehouse
The warehouse can be for good material or scrap (Reject = active)

Note: Bin-managed warehouses are NOT supported, and so these warehouses are excluded from the drop-down once this option is selected.
The option is hidden when the source warehouse is a bin located warehouse.</td></tr>
<tr><td>Change Quality Status</td><td>When this Document type is selected, the Quality Status to field is enabled to modify the quality status of the moved stock.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

	For each action you can select if the document should be generated as "Rejected" or as "Good" quantity.
Quantity	Quantity to be posted in the unit of measure.
To Quantity	Visible only if "Change current item by other one (Issue Document + Receipt Document)" document type has been selected. Here it is possible to define the quantity for the new item. The UoM is predefined.
To Item	Visible only if "Change current item by other one (Issue Document + Receipt Document)" document type has been selected. Here it is possible to define another item code for this item.
I-Version	Selectable item version in case of an I-version-managed item. Visible only if "Change current item by other one (Issue Document + Receipt Document)" document type has been selected.
To Warehouse	Target warehouse: Defined by Warehouse rules. Visible only if "Create Transfer to Warehouse" or "Change current item by other one (Issue Document + Receipt Document)" document type has been selected. From Beas version 9.2 PL 2 it is possible to allocate to an SAP Bin warehouse. From Beas 9.3 PL03 it is possible to allocate to a WMS warehouse. The Transfer process can be initiated from and to any of the 4 warehouse types: Default Default with bin locations SAP bin warehouse WMS warehouse
Batch/Serial	The batch/serial number(s) to be transferred. Visible only if "Change current item by other one (Issue Document + Receipt Document)" document type has been selected.
Remarks	Remarks attached to the QC order.

© 2026 Boyum IT Solutions A/S

To bin	Target bin location

Also defined in Warehouse rules

Visible only if "Create Transfer to Warehouse" or "Change current item by other one (Issue Document + Receipt Document)" document type has been selected.

IMPORTANT: Stock movement between 2 bin locations of the same warehouse is supported. WMS bin locations are supported.

Beas 2025.06

Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3)

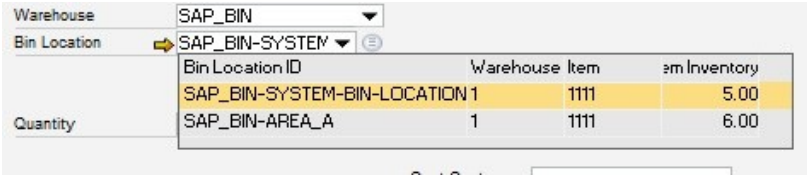
The field has the following components:

Arrow icon /

List of all bins where the item is located.

Selection (Drop-down)

A list opens to select the desired bin location.



The selected drop-down option displays the following information in receipt documents:

- Bin Location
- Warehouse Area
- First item in this bin location
- Stock of the first item in this bin location

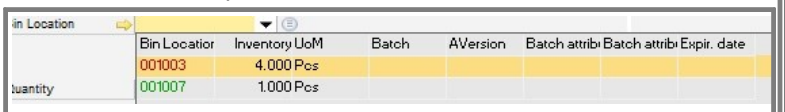
The list can be modified in the Configuration wizard.

The selected drop-down option displays the following

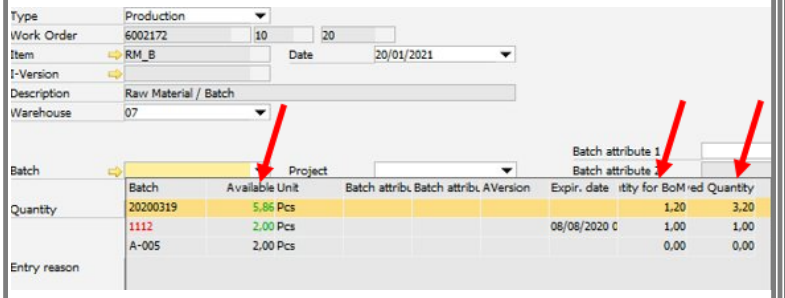
© 2026 Boyum IT Solutions A/S

information in issue documents:

- All stock information of all bin locations with batch- and serial number information.
- ⊟ Reserved Batch quantities information



The drop-down contains information on reserved quantities in 3 columns:



The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking

© 2026 Boyum IT Solutions A/S

Field	Description
	types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

Select or List - Icon

By using the selection icon, an adjustable selection list opens. Window settings and templates are supported.

- Notes: Beas Bin Warehouse

  The Definition of the bin location is mandatory.

- Notes: SBO Bin Warehouse

  If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type.
  This is entirely managed by SAP Business One.

  Drop-down for volume or weight is not supported. Columns are always 0.

  beas 9.3 PL 2

- Notes: WMS Bin Warehouse

  Bin location is mandatory.
  Drop-down for volume and weight not supported.

- Customizing of the drop-down list in Beas 9.3 PL 2 or newer release

  This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

  The following priorities are considered:

  1. Window-related customization (`windowevent setbindropown`)
  2. General changes (`stockmanagement.src`)
  3. Settings in the Configuration wizard

© 2026 Boyum IT Solutions A/S

In the `e_bindropdownbsl` variable, the ODATA command can be defined.

It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.

The standard functions for receipt and issue are as folows:

```
file stockmanagement.src

function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$mask=1
end function

function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,
BatchAttribute2,ExpirationDate&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered by
OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$select=BinLocation/BinCode,BinLocation/BinColor
,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where OnHand >
0 of the selected ItemCode, ordered by OnHand
descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand
desc, BinLocation/BinCode asc
end function
```

Customization of the drop-down list in Beas 9.3 PL 1 or earlier

© 2026 Boyum IT Solutions A/S

release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent`)
2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

Window-specific adjustments:

Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.

Example:

```
windowevent setbindropdown
setvar=e_bindropdown=ddsql=select "BINCODE" from
"BEAS_WHSBIN" where
"WhsCode"=<e_binwhscode,dbstring> order by
"STORAGESORT"
end event
```

Note: This window event is supported in every window where the selection field is available.

General adjustment

Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.

```
file stockmanagement.src
function binreceiptdropdown
setvar=e_bindropdown=ddsql=select "BINCODE" from
"BEAS_WHSBIN" where
"WhsCode"=<e_binwhscode,dbstring> order by
"STORAGESORT"
end function
```

© 2026 Boyum IT Solutions A/S

LUID	Define LUID number. ***See*** LUID behavior settings.
Date	Valuation date for document (Transfer, issue)
Quality Status from	**WMS Integration:** The Quality Status of the item to be transferred (not editable).
Quality Status to	**WMS Integration:** Select the "Quality status to" value in the drop-down list. Only valid quality status types are available for the current quality status. **Use together with QC Transfer:** Change the quality status for the transferred stock in the new bin location. Define a value in this field, and the stock will be transferred with the new Quality Status. If no quality status is defined, the system will move the stock with the same (QS from) Quality Status.
Reason Code	**WMS Integration:** Select a QS reason code from the drop-down list. This field is only editable if the "Ask for Reason" field is also enabled in WMS. ***See*** WMS documentation.
Change Reason	**WMS Integration:** Enter additional text for the reason code. This field is only editable if the "Requires Extra Reason Text" WMS field is activated in the **WMS Organizational Structure > Reasons tab**. ***See*** WMS documentation.

Information Columns/fields in lower screen section

Fields/Columns	Description
...	Transfer status: / partly transferred / transferred completely
from warehouse	QC warehouse from which to transfer
from bin location	from which bin location

© 2026 Boyum IT Solutions A/S

Good	Previously transferred yield quantity
Scrap	Previously transferred scrap quantity
Total	Previously posted quantity
Selected	The quantity that is defined to be transferred in the current document. Note: The field only contains information for the document that is currently edited, not for already created documents.
Open	Quantity to be posted
Transfer	Quantity to be posted now Note: If the SAP Business One - approval procedure is active, the quantity will not be updated. ***See*** General settings.
Stock	Stock on goods receipt warehouse
UoM	Unit if measurement
I-Version	Item version. Note: The field only contains information for the document that is currently edited, not for already created documents.
To Item	Transfer to Item. Note: The field only contains information for the document that is currently edited, not for already created documents.
To RFID	Transfer to RFID. Note: The field only contains information for the document that is currently edited, not for already created documents.
To Warehouse	Transfer to Warehouse. Note: The field only contains information for the document that is currently edited, not for already created documents.
To bin	Transfer to bin location The selection item on the right opens the list of available bins. This window supports search and window settings. Note: The field only contains information for the document that is currently edited, not for already created documents.
Rejected	Radio box is active once it is enabled in the upper, editing area. After the document is created, the field is displayed as default

© 2026 Boyum IT Solutions A/S

	(disabled) again. Note: The field only contains information for the document that is currently edited, not for already created documents.
Document type	The type of the created document. Note: The field only contains information for the document that is currently edited, not for already created documents.

Functions

Function	Meaning
Cancel	Close the transfer window.
Booking	Booking of the selected item or batch or serial number Booking is related to document type and is performed based on the parameter defined in the Configuration Wizard. ***See*** Receipt price parameter settings. ***See*** also the description of the process above. The booking document is printed afterwards if there is a print macro "Default". ***See*** Print below.
Warehouse rules	Opens Warehouse rules window. Available in the right-click menu
All pre-assign	All quantities to be transferred are pre-allocated The goods to be transferred can be pre-allocated. All rows are pre-allocated in the required quantities for that. Additionally the warehouse for all according rows will be set to the warehouse which has been selected to "To warehouse" Use if serial number related items are to be posted and the quantity is too big for manual entry.
Selected pre-assign	Pre-allocate only marked entries
Existing Documents	Click this button to open a list of documents on all actions related to the actual transfer. A "Isql" window is opened with existing generated documents related with the current QC Transfer.

Print

© 2026 Boyum IT Solutions A/S

If you create a **transfer** document, the Macro named "default" (if existing) is executed automatically.
The parameter "e_docentry" and "e_docnum" is available. Separated by a comma, all created document numbers are available.
Created documents may be transfers, issues and receipts.
For further information ***see*** customized extensions.

- Customized extensions

The following extensions are executed:

beas 9.3 PL 3

```
windowevent pretransfer (for all document types)
```

For every created document, the system will post the following events:
Variable "e_docentry" / " e_docnum" is the reference to created document
Information of dw_2 is not deleted
It is not allowed or possible to cancel or close the running process:

```
windowevent transfercreated
windowevent issuecreated
windowevent receiptcreated
windowevent poreturncreated

windowevent posttransfer (for all document types)
```

If "pretransfer" is ended by "return failure", the process is canceled.
For posttransfer the variable "`e_docentrys`" is available, in which the created documents are available comma-separated (transfers, issues and receipts). The event is called up before the print.

Data connection
In the created transfer document the following information is stored:
`WTR1.U_beas_basetype` = QC (good quantity), QB (bad quantity)
`WTR1.U_beas_basedocentry` = BaseDocument.Docentry
`WTR1.U_beas_baseline` = BaseDocument.Linenum

The BaseDocument is goods receipt, credit note, receipt etc.
Posted items and quantites are stored in

```
beas_plandocument_line.docentry=<docentry>  = BEAS_QSFTHAUPT.DocEntry
beas_plandocument_line.doctype='QC'
```

- **Linked QC Transfer documents**

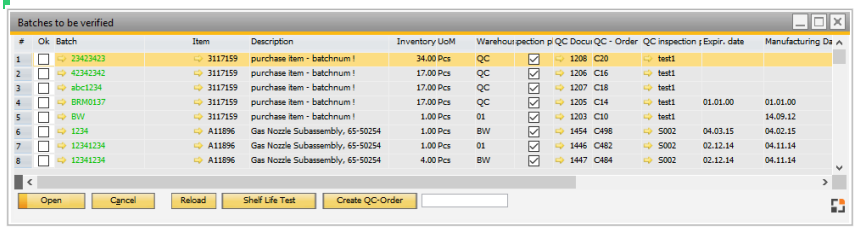
8.11.3 Batches to be verified

The "Batches to be verified" list includes all batch items that are not released. This status is set e.g. on entry from goods receipt or production receipt (if configured accordingly), or if a batch is set to "not released" manually in SAP Business One. Blocked batches are not displayed.

If there is a QC plan for the batch, the batch is displayed in green. Columns are dynamically adjustable, (Window settings) UDF and templates are supported.
If an entry is edited, a QC order is created automatically if it is not already in the system. If no inspection plan is stored, the entry cannot be edited. If a QC order already exists, it is opened.

PATH: Production > Quality Control > Batches to be verified



Window qs_oibt_browse.psr

Idea of this window:

- Changing the status of all released batches to "not accessible", if Expiry date is reached or exceeded.
- Creating QC order for all "not accessible" batches. With the QC order you can check the Batches and define a new Expiration date.

Field	Meaning
OK	This flag is active if it is possible to create QC order automatically. Activate this if you want to create a QC order with the **Create QC-Order** button.

© 2026 Boyum IT Solutions A/S

	It is not possible to activate this if a QC order exists in the system or no QC inspection plan is defined. Activate all rows with right-click on title.
Batch	Batch number. The yellow arrow opens detailed information on the batch. green: QC order exists red: No QC Inspection plan is defined
Item	Item number. Orange arrow opens the item master.
Description	Item description
Inventory	Current stock
Warehouse	Warehouse in which the item is stored.
QC DocNumber / QC Order	Number of QC order if available with the yellow arrow you can open the existing QC Order.
QC inspection plan	Number of QC inspection plan.
Expir. date	Expiration date
Manufacturing date	Manufacturing date
Date of permission	Date of approval
Location	Additional Information
Batch details	Info
Purchase info	Info

Functions

Function	Meaning
Add	Open window "Create new QC Order". Only available if no open QC order exists
Update/Reload	The complete list is updated.
Open	Open the existing QC order. Only visible if QC order exists in the system.
Shelf life test	The system checks whether the shelf life date of batches has expired and changes Batch Number to "not accessible" This function checks all released batches which are currently in stock. Only if Expiration date is defined Only if on stock

© 2026 Boyum IT Solutions A/S

	If you start this function, the program asks for "Includes number of days" For ***example***, if you enter 5 days, all batches are "not accessible" with a shelf life date that has passed already or will pass within the next 5 days. Note: In the old Version, the system created the QC order automatically . From *Beas 2020.08* the system does not create QC orders with this function. If released after a quality control check, the expiration date is set to new. (***see*** Item master - Batch - Shelf life in days) Check from manufacturing date (Compatibility mode) A second udf field "U_beas_haltpark2" is existing. In the standard solution this field is not visible, but in list of Item UDF available. Second option is to check by manufacturing date + "Shelf life in days 2". In the standard version this field is not available. But you can fill this field "OITM"."U_beas_haltbark2". If this field is filled and manufacturing date + "OITM"."U_beas_haltbark2" in calender days < today - "include number of days" and a expiration date is defined in the batch, the system changes the status of these batches to "not accessible". In this case the expiration date is ignored. In this way you can define a max. expiration date.
Create QC-order	Create QC Order for all batches with the following rules A QC order is created for all batches which - is in this list - has a QC Plan linked to it

© 2026 Boyum IT Solutions A/S

	- has The flag in field "OK" activated. With a right-click on the title you can mark all entries
Search field	Entry field for free search.

Additional settings in Configuration Wizard determine the behavior of batches.

Window qs_qsartikelhaupt_edit.psr

Header fields

Field	Meaning
QC-inspection plan	Unique ID for inspection plan, not changeable subsequently. If in **item > QC** no link to an inspection plan was stored, the item number can be entered here. In this case the QC inspection plan will be linked directly to the item.
Information	Description of QC inspection plan.
Group	QC-inspection plan can be assigned to a group. Scrap reasons and valuation reasons can also be assigned to a group. If a group was created, only matching entries are displayed. ***See*** Blockage reasons. A new group can be entered. All previously entered groups are selectable.
Copy from	Copy measurement positions from inspection plan. Field is available for new creation only. An inspection plan can be selected from which measurement positions are used. This way a template for new inspection plans can be created without having to copy the complete inspection plan. *beas9.0-004-000-000*

© 2026 Boyum IT Solutions A/S

Functions

Function	Meaning
Add	Create new QC inspection plan.
Remove	Delete QC inspection plan. Deletion is not possible if the inspection plan is stored in an operation catalog, routing, item link or work order. ***See*** routing
Duplicate	Copy the QC inspection plan.
Parallel QC Inspection Plan	Additional inspection plans can be linked to this inspection plan. If a QC-order is created for one inspection plan, a parallel QC-order is created for the second inspection plan. This can be used, if several employees are working on quality control tasks. Note: QC-order can be released only after all parallel QC-inspection plans have been released.
Match	All measurement positions of all samples in open QC orders are matched. All measurement positions are deleted and inserted new. All open quality control orders without measurement results are affected. Possible manual changes made directly in the QC order will be deleted.
Cross Reference	The button opens the Cross Reference for Work Center window.
Change Log	Opens the Change log for this entry.

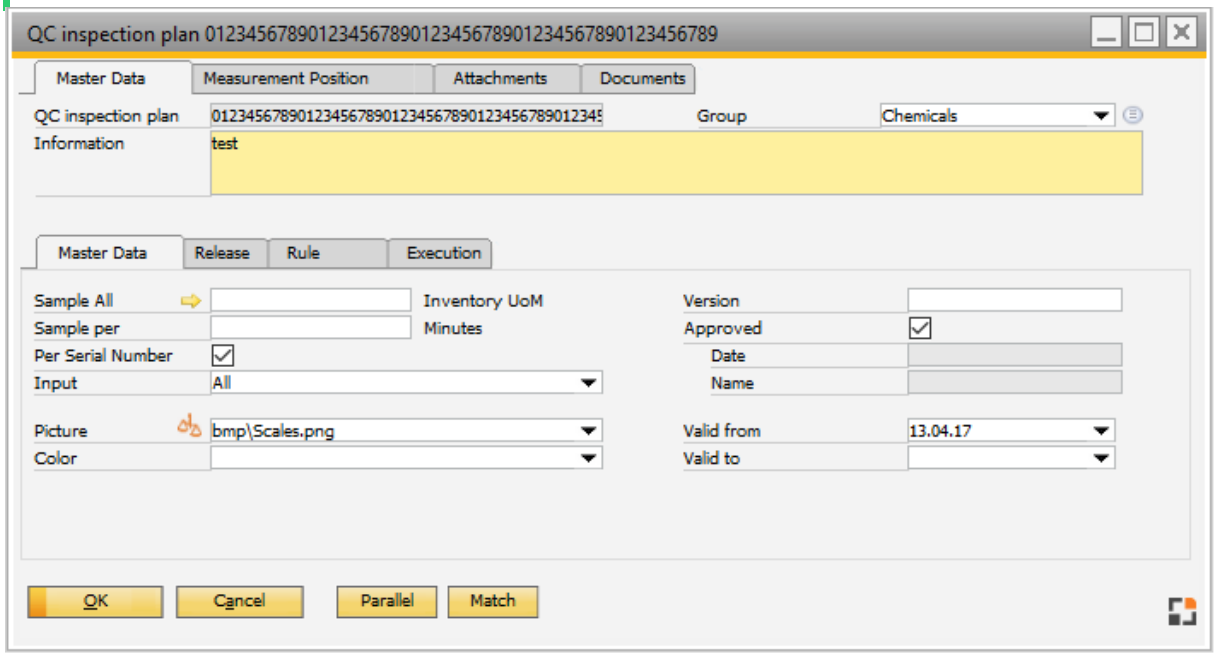
Release

Rules

Execution

PATH: Production > Quality control > QC inspection plan > **Open** an entry > lower Master Data tab.



Window qs_qsartikelhaupt_edit.psr

Field	Meaning
Sample All	For each inspection plan samples are inserted. With this field you can indicate how often a sample is taken (set the interval: every n number of test items or units). For 0, only one sample is inserted. For ***example***, if quantity is 1, and this value is 10, one sample is inserted. If the quantity is 10, one sample is inserted, and two samples if the quantity is 11, 15 or 20. Alternatively, a quantity-dependent number of samples can be stored in a table. To do this, click the orange arrow left to the input field. ***See*** Measurement per

© 2026 Boyum IT Solutions A/S

	Note: If a QC plan is stored with a position, the "Measurement per" option is ignored. Only one sample is ever created, and further samples can be created as needed.
Per serial number	If active, creating a QC-order the link to a serial number is created. The serial number is then displayed in window "Samples per test". The option is ignored, if the QC-inspection plan is stored in an operation. Use the option only for serial number related items. If all conditions apply, this option has a higher priority than "Measurement per".
Samples per .. minutes	Number of samples "per x minutes". The option is only active if the QC-inspection plan is stored in an operation. The total planned time is used to calculate the number of samples. The option "Samples per" is ignored in this case.
Input	Type of registration. Per sample: Measurements are indicated per sample. Per measurement position: registration of samples per measurement position All: both kinds of registration are possible The setting affects the visibility of various buttons. With "per measurement position" the button "per sample" is hidden. ***See*** Routing – QC-inspection plan
Image	Store an icon to be displayed in various lists.
Color	Set up a color to mark the entry.

Release area

There the inspection plan can be released. As long as not released, it can not be selected.

Field	Meaning
Version	Version of QC-inspection plan (for revision purposes). Only information
Approved	Release QC-inspection plan for use

© 2026 Boyum IT Solutions A/S

	Can only be used, if active. Note: If release is disabled, and the inspection plan is stored in an item, QC order creation might fail. At least one released QC inspection plan must be stored in the item. ***See*** Item – Quality control
Date / Name	The employee releasing the inspection plan and the date of release.
Valid from / to	The validity period of the inspection plan (from-to). **Note:** If the inspection plan is not yet valid and stored in an item, QC order creation might fail. At least one released QC inspection plan needs to be stored in the item. ***See*** Item – Quality control

Good Receipt	Created Samples
3 Pcs	3
20 Pcs	10
200 Pcs	20

8.11.4.1.1.2 Parallel QC Plan

Edit QC-inspection plan

Master data sheet

Master data

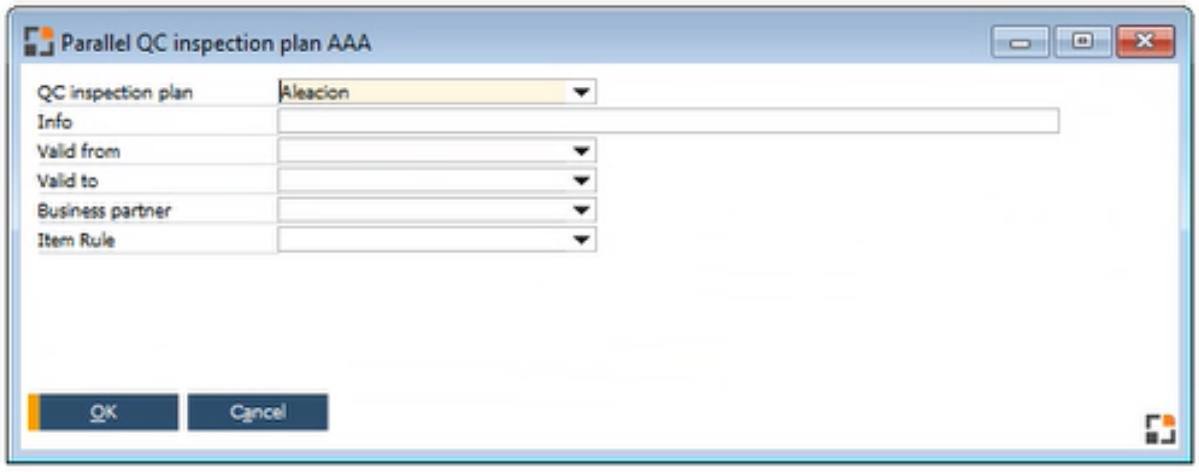
Parallel

Release

Rules

Execution

PATH: Production > Quality control > QC inspection plan > Open an entry > Click Parallel > Click Open/Add.



Window qs_qsartiklsub_edit.psr

If a QC-order was created for this QC-inspection plan, a parallel running QC-order is created for the related QC-inspections plans.
Example of use: multiple employees execute different parallel QC-checks.

Plans which have been created previously, can be defined as parallel using the button "Parallel".

© 2026 Boyum IT Solutions A/S

Note: If a parallel QC-inspection plan was defined, the QC-order can only be released if all inspections had been also released.

Field	Meaning
QC-inspection plan	Select QC-inspection plans, to be executed in parallel
Info	Arbitrary Information
Valid from / to	This parallel inspection plan is inserted only, if the QC-order was created in the date indicated here.
Business Partner	This parallel inspection plan is inserted only, if the QC-order was created for the indicated business partner.
Item Rule	This parallel inspection plan is inserted only, if Item / Quality Control contains the selected rule.

Functions:

Remove: Delete current inspection plan.

8.11.4.1.1.3 Release

Edit QC-inspection plan

Master data sheet

Master data

Parallel

Release

Rules

Execution

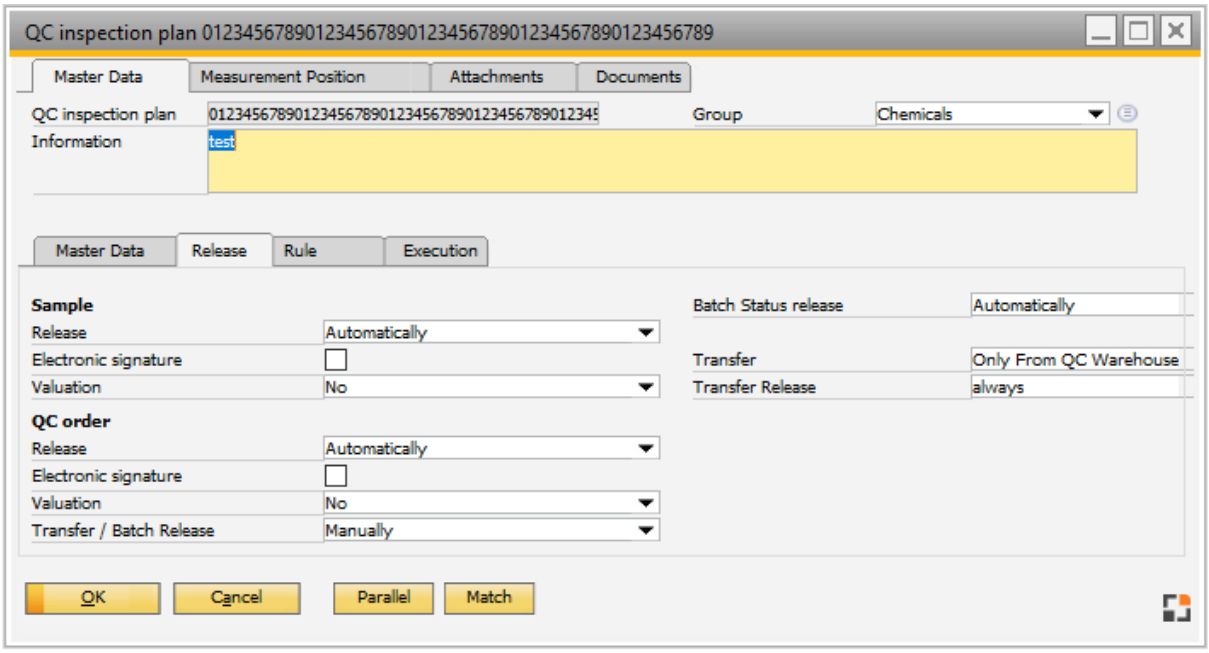
The definition of the workflow for release or blockage can be edited in the Release tab. The release can be performed on the level of measurement, sample or order.

You can define the 4-eyes principle of control on every level depending on the valuation.

For process of release on measurement position level ***see*** Measurement position.

PATH: Production > Quality control > QC inspection plan > **Open** an entry > "Master Data" tab > "Release" tab.

© 2026 Boyum IT Solutions A/S



Window qs_qsartikelhaupt_edit.psr

Sample

Field	Meaning
Release	Define the release for Sample (four-eyes principle). Related to Sample – Release. Define when Release 2 is activated. The QC Inspection Plan can only be released if all Release 2 for all Samples are activated: 
© 2026 Boyum IT Solutions A/S

Available variants:

Variant	Description
Automatically	If "Release 1" is "released", the system activates "Release 2" automatically. Working with this variant is not possible if "Electronic Signature" is activated. If the user changes "Release 1" to "manually locked" or "opened manually", the system disables "Release 2".
Manually only if OK	You must Release the sample manually. Use this if you work with "Electronic signature" / 4 eyes concept. It is not possible to Release the sample if not all Measurements are OK. If one of the measurements is locked, the status "Release 1" switches automatically to "Locked". You can reopen the sample if you define "Release 1" as "opened manually".
Always manually	Release can be performed entirely manually. The system ignores status "Release 1". The user can activate "Release 2" at any time.

In the next step, after releasing the sample, the QC order can be released.

Note:
No automatic release is executed if the inspection plan has no inspection-relevant measurement position.

See Four eye principle

Electronic signature

Activate this if you work with the 4-eye concept

Concept of this function:

User 1 checks the measurements position. If all ok, User 2 check the result again.

© 2026 Boyum IT Solutions A/S

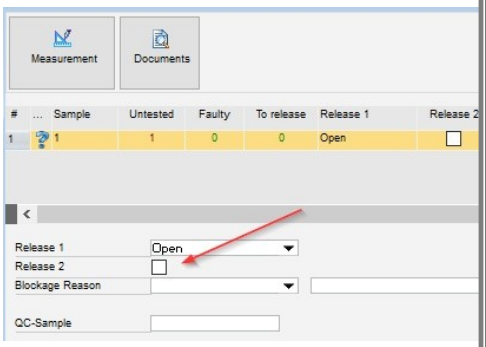
	Only if all OK can the user release the Sample, as well. User 1 cannot release this sample. Only possible if setting "Release" is "Manually only if OK". For release a password needs to be entered. ***See*** Personnel - Login ***See*** Glossary - electronic signature.
Valuation	Is the Sample to be valued? This setting defines the field "Valuation" in Sample. 
Setting	Description
No	No valuation is possible and the fields are hidden. They can be displayed in lists using window settings.
Yes	Valuation possible.
Mandatory	Valuation mandatory. The sample cannot be released until it is valued. Note: If "**Valuation**" was set to "**mandatory**" the combination with "**Release**" set to "**automatically**" is not allowed. In this case, the program switches "**Release**" to "**manually only ok**".

QC-Order

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Meaning</th></tr>
<tr><td>Release</td><td>Define the release status of QC Order

With this setting you can define the automatic release of a QC Order.

<table>
<tr><th>Setting</th><th>Description</th></tr>
<tr><td>automatically</td><td>Automatic release as soon as "Release 2" in all Samples are OK.
 


Switching to "automatic" the "Electronic signature" is disabled and "Valuation" is set to "yes".</td></tr>
<tr><td>manually only if OK</td><td>Manual release if all values are OK. In this case one person can enter values and release the sample.</td></tr>
<tr><td>always manually</td><td>Same as automatic, but you can release this sample every time.</td></tr>
</table>

In the next step, after releasing the sample, the QC Order can be released.</td></tr>
<tr><td>Electronic signature</td><td>A password needs to be entered for release. See Personnel - Logon.</td></tr>
<tr><td>Valuation</td><td>Value the QC Order?

No: No valuation possible. Valuation fields are hidden at entry.
They can be displayed in lists by applying window settings.

Yes: Valuation possible.

Mandatory: Valuation mandatory. As long as the sample was not valued, it cannot be released.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

	Note If "**Valuation**" was set to "**mandatory**", the combination with "**Release**" set to "**automatically**" is not allowed. In this case the program switches "**Release**" to "**manually only ok**".
Transfer / Batch release	Determines whether a transfer or batch release is possible This parameter reflects how the QC Order is going to work when the Order is closed. Details Batch status can only be set to "released" after the order has been released. When the Work order being closed, the system automatically checks the status of the transfer and the status of the batch. The system will only close the WO when the transfer process is finished and the batch status is released. Values of the parameter: - **Manual:** When this value is selected, the system does not do the validation. - **Mandatory:** When this value is selected, the system does the validation. This parameter only affects when the WO is going to be closed automatically, when user tries to close in manual way, this parameter is ignored.
Automatically close	Close the order automatically? Refers the field **QC Order, Field "close"** **automatically:** QC Order is closed automatically if released (**QC Order, Field "release"**). When the QC order is to be closed, the system checks if there are any Open Transfer documents for the current QC Order. If any Transfer is open, the system will not close the QC Order, and will leave it open. The user will have to close the order later, manually . **manually if OK:** QC Order can be closed manually if a blockage reason was stored or the QC Order was released (**QC Order, Field"Release"**).

© 2026 Boyum IT Solutions A/S

	manually without check: The QC Order can be closed at any time.

Batches, Transfer

Field	Meaning
Batch Status release	Determines whether the batch status is released automatically. **Manually:** Batch is not released automatically. **Automatically:** Batch is released automatically after the QC Order was released. **Manually only By Release**: Manual release only after the QC Order has been released. ***See*** Concept - Batch release
Transfer	Transfer by warehouse **From all warehouses**: Transfer request always, regardless of which warehouse the goods were received from. **Only from QC warehouse**: Transfer request only for the warehouse which was defined as goods receipt/QC-warehouse. ***See*** Warehouse master data - Type of warehouse QC Transfer
Transfer Release	Can the item be transferred to the yield warehouse ? Affects the Transfer window; allows to lock the transfer process. **always:** Item to be checked; can be posted at any time to the yield warehouse. **only by release:** The QC-order needs to be released (**QC Order, Field "Release"**) before the item can be transferred to the yield warehouse.

8.11.4.1.1.4 Rules

Edit QC-inspection plan

Master data sheet

© 2026 Boyum IT Solutions A/S

Master data

Parallel

Release

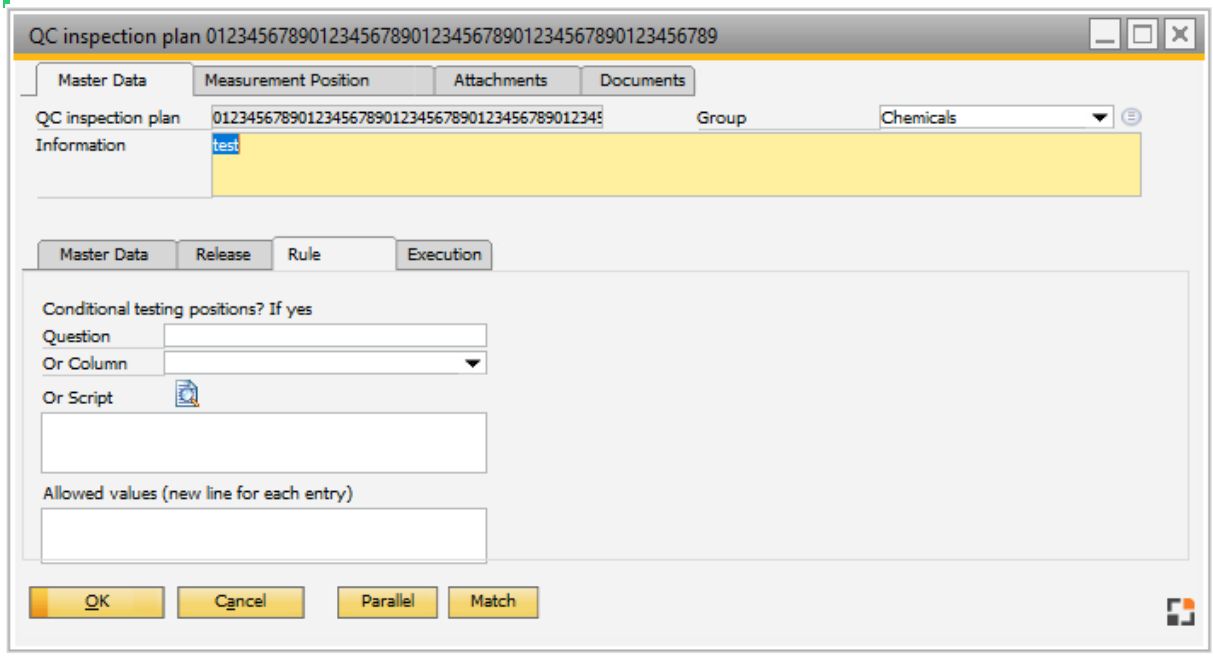
Rules

Execution

Measurement positions can have conditions. This can be a value which is determined here and stored in the measurement positions to be compared.

Only if the value matches, the measurement position is created.

PATH: Production > Quality control > QC inspection plan > **Open** an entry > "Master Data" tab > "Rule" tab.



Window qs_qsartikelhaupt_edit.psr

Example: Question for "color," allowed values "red" and "blue".

For measurement position 1 "red" and for 2 "blue" is entered.

When creating the QC order, if "blue" is selected to the question of color, only measuring position 2 will be created.

Alternatively, a script can be deposited or for work orders you refer to a data base field.

Note:

Parallel QC orders ignore the rules.

© 2026 Boyum IT Solutions A/S

Field	Meaning
Question	Question for value. Only if no field and no script was stored. Message box with the question. The user can insert a value. Note: Not supported in the WEB-application, WEB Services or if QC order created by SAP Transaction Notification procedure.
or Column	Select a Beas-field, from which values for checking are taken. Only considered for work orders of type E or F).
or Script	By BeasScript it is determined which conditional value is set. The variable "condition" is returned: `setvar=contidion=red` The following variables are available `e_qcorder` = QC-order `e_typ` = Type QC-order. ***see*** Types `e_itemcode` = Item `e_base_belnr_id` = work order document number (Type E or F) `e_base_belpos_id` = work order number (Type E or F) `e_base_pos_id` = operation (only Type F) `e_basetype` = origin document (eg. posting document, goods receipt etc.) `e_basedocentry` = origin document number `e_baselinenum` = line number in origin document number `e_baselinenum2` = line numer 2 (for example work order item) in origin document number `e_basebasetype` = caused by document Note: If a QC order is created per batch, the type is "B", but the origin document is a goods receipt. then basetype can differ from typ.

© 2026 Boyum IT Solutions A/S

	Note: Is not supported in the WEB-application if an input or an output has to be executed, because this is run by the server.

Allowed values (new line for each entry)	Definition of allowed values.
	Allowed values for the above fields can be specified here.
	One value per line, e.g.:
	`blue`
	`green`
	`red`
	Note: WEB-application is not supported.

Note: No query can be displayed in the WEB-application. That is why these functions are not supported in the WebApps.

8.11.4.1.1.5 Execution

Edit QC-inspection plan
- Master data sheet
  - Master data
  - Parallel
  - Release
  - Rules
  - **Execution**

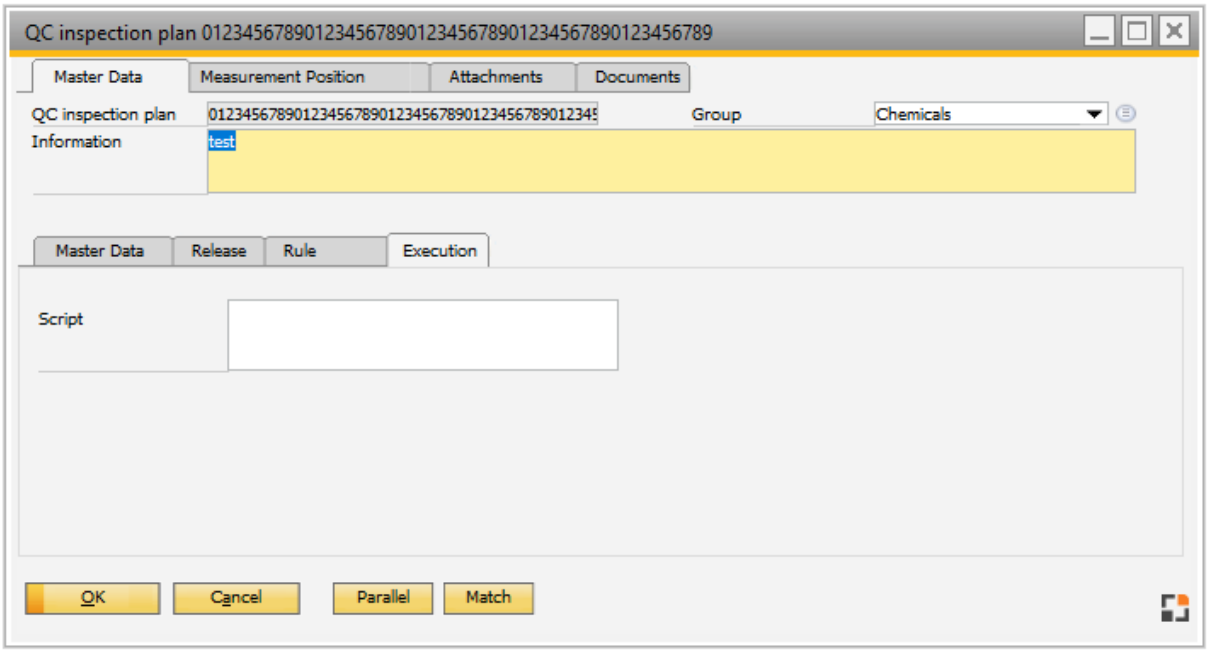
You can store a script to manipulate the creation of a QC order:

`return failure` -> QC order will not be created

`return success` -> QC order will be created

PATH: Production > Quality control > QC inspection plan > **Open** an entry > "Master Data" tab > "Execution" tab.

© 2026 Boyum IT Solutions A/S



Window qs_qsartikelhaupt_edit.psr

Available variables

Variable	Meaning
`e_qcorder`	QC-order number to be generated (alphanumeric)
`e_qsqcorder`	QC-inspection plan to be used
`e_qcbasetype`	Origin document type
`e_qcbaseorder`	Origin document number
`e_qccardcode`	Origin document business partner number
`e_qsitemcode`	Item

Example:

Use this script to prevent QC order creation for business partner C5001:

```
if <e_qccardcode> = "C5001" then
  return failure
end if
```

8.11.4.1.2 Measurement position

Master data

Field	Meaning
Position	The list is sorted by this number. You can re-sort using Drag&Drop. Alphanumeric characters are allowed, position numbers can be assigned twice.

Measurement

Field	Meaning
Position	The list is sorted by this number. You can re-sort using Drag&Drop. Alphanumeric characters are allowed, position numbers can be assigned twice.
Batch/Serial	Batch/Serial number
QC-Order	Short description for the measurement position. Right-click to select a default from the default texts. After selection, the method description is also transferred. ***see*** Manage default texts.
Methodology	Long description. Edit by double-clicking or clicking the "**Description**" button.
Type of input	Type of entry. **Available types:** Measurement: Minimum / Maximum values are considered. The "measurement" tab is displayed. The measured value is OK if it is between the minimum and maximum. Attribute: A measuring position can be marked as "OK" Values can be entered, but will not be checked. ***Example:*** Check of color Enter "red" and "OK" for confirmation. Text: Position is only displayed. No confirmation or entry. **Attribute**: you can only specify whether it is okay, and include

© 2026 Boyum IT Solutions A/S

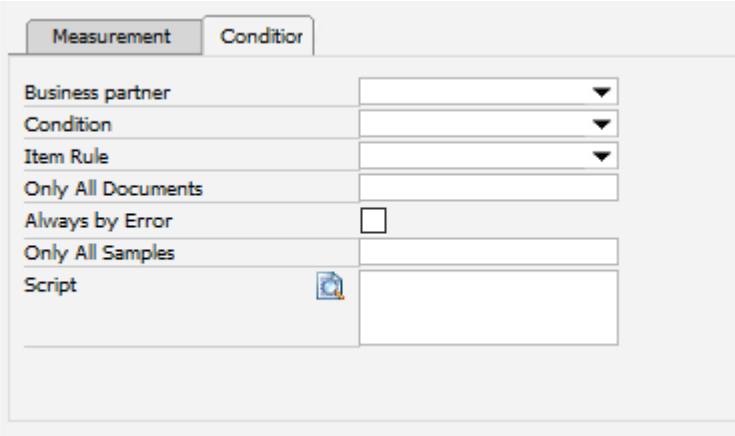
	information. **Measurement**: Minimum / maximum values are considered. **Text**: Only a header line.
Desired value, UoM	Specify target value and unit of measure (mm, kg, % etc., UoM is mandatory)
Minimum / Maximum	Enter minimum and maximum value for a measurement point. The measurement position is released when the measured value lies within this range. Only possible for entry type "measurement" not for "attribute" or "text". If no value is entered, "allowed to set OK manually" will be activated automatically at checking.
Relevant	This option must be activated if this measuring point is relevant for the release of the test plan. This option is always deactivated for type "Text". Note: For automated release at least one relevant position is required.
Print	This option must be activated if the measuring position should be printed in a quality control protocol.
Test tool	A test tool can be selected. Only information – no effect. No reservations or dispatches. ***see*** Tool administration
Condition	Only inserted if the stored value matches the selected values in query. ***see*** conditional testing positions
Item rule	Measurement position is only inserted if this field is empty or matches the value entered in Item QC-link. The measurement position can be hidden or displayed depending on the item or document. ***See*** Item QC-link - Measurement position - Rule.
Manual OK	Determine whether the measurement position may be set to "OK" manually.

© 2026 Boyum IT Solutions A/S

	If the option is active, the icon "OK" is displayed in the Measurement sample . There, it is possible to set the position to "OK" even if the measured value is out of allowed range. For type of entry "Attribute" this option is always active. Entering values, this option is automatically enabled if no minimum or maximum value was defined.
Additional release Deactivate	Disables the four-eye principle. By default, each measurement position needs to be checked and released by a second person. Four-eye principle Important: The person who entering the measured values is not allowed to release them, as well. If this option is disabled, the measurement position is automatically released, after the field "OK" was set. Electronic signature is not supported at this level.

Condition

In the condition area you can determine under which conditions a measurement position is included in the QC-order



Window qs_qsartikel_edit_detail.psr

Field descriptions

© 2026 Boyum IT Solutions A/S

Field	Meaning
Business partner	If a business partner was entered: only for this BP.
Rule	Rule according to QC-inspection plan rules.
Item Rule	Measurement position is inserted only, if this field is empty or matches the value, entered in QC-Item link. The measurement position can be hidden or displayed depending on the item or document type. ***See*** QC - Item link, measurement position rule.
Only all x documents	⊟ Measurement position is displayed only per .... documents. If you enter 5, the measurement position will be inserted for the first and the 6th document. Every QC-Item link is counted. ***Example:*** In item master there are 2 entries - for document type "purchase goods receipt" - for document type "all" The counter for purchase goods receipt will be created independent of all other document types.
Always by Error	⊟ In case of error "only per ... documents" - reset counter. This setting is only taken into account if a value was entered for "only per ... documents" If a QC-order was marked as faulty, the counter is reset and the measurement position is inserted at the next or the next QC-order. ***Example:*** "Only per ... documents": 5, "always after error" active 1. Goods receipt: measurement position inserted 2. No 3. No ... QC-oder marked as faulty

© 2026 Boyum IT Solutions A/S

	4. Measurement position inserted 5. ...7 no 8. Measurement position inserted
Only All x Samples	The system creates a measurement for all "x" samples defined in this field. IMPORTANT: The number of samples belongs to the current document. Beas does not apply any accumulative number of samples from other documents.
Script	Rule Script. A script can be stored to determine, whether to create a measurement position. ***See*** beas script. The following variables are available:

Variable	Meaning
e_qcorder	QC-order (Field BEAS_QSFTHAUPT.CHARGE_ID)
e_qcbelnr_id	QC-order (Field BEAS_QSFTHAUPT.BELNR_ID)
e_qcdocentry	QC-order (Field BEAS_QSFTHAUPT.DocEntry
e_typ	Typ
e_ruleid	Order rule (from **item master - QC-link - Rule**, BEAS_QSFTHAUPT.Ruleid)
e_itemcode	Item
e_cardcode	Customer
e_base_belnr_id, e_base_belpos_id, e_base_pos_id	Reference to work order
e_basetype, e_basedocentry, e_baselinenum, e_baselinenum2, e_basebasetype	Reference to origin document, eg. purchase goods receipt
e_measurement	Sample number
e_quantity	Total quantity

© 2026 Boyum IT Solutions A/S

	At the moment of creating the sample, the QC-order is already saved in (BEAS_QSFTHAUPT), you can access it via SQL.
	Return: if the script is ended with "`return false`" the measurement position will not be created.
	
	Example: scale quantity.
	Execute measurement:
	from 100 pieces: 10 samples,
	until 100 pieces: 5 samples,
	less than 10 pieces: 2 samples
	`setvar=ll_max=10`
	`if <e_quantity,#0.000000> n< 100 then`
	`  setvar=ll_max=5`
	`end if`
	`if <e_quantity,#0.000000> n< 10 then`
	`  setvar=ll_max=2`
	`end if`
	`if <e_measurement> n> <ll_max> then`
	`  return failure`
	`end if`

Attribute selection	Selection list for attributes.
	Field is visible only if the measurement position is of type "Attribute".
	
	A selection list can be stored which will be available registering attributes. Then, manual entry is not possible.
	
	Enter a value per row: e.g. a color table.
	`red`
	`yellow`
	`green`

Master data

Field	Meaning
Type	Determine type of attachment. **Text:** text can be entered directly (Text tab). ***See*** Text **File:** A file can be selected. **IMPORTANT**: A file need to be located in a folder accessible by all employees.
Category	Document can be linked to any category. Only information field, category can be entered freely. All previously used categories can be selected.
Description	Description of the document.
File	Select file. **IMPORTANT**: Attach a file containing various information or other measurements to the inspection plan. You can insert images or various documents, like MS Excel sheets with information. The file needs to be located in a folder accessible by all employees. ***See*** File settings. Programs to view the file need to be installed on every station. Beas does not display the content.

© 2026 Boyum IT Solutions A/S

Confirm	Select whether the user who entered measured values, needs to confirm documents. This can be used to ensure that the user could view documents before registering measured values. Beas logs, when and on which station the user viewed the document. **no:** User does not confirm the document. **single time:** User needs only once to confirm the document. Refers to the inspection plan, not the file name. If the document is changed, a new confirmation can be made necessary. To do: right-click - reset - confirm. **once per order:** user needs to confirm the document for every QC-order. Use button "Confirmed" to view all previous confirmations.
Copy file	If enabled, the file is copied when creating the QC-order. Copy is linked to the QC-order. This can be used if additional information is entered directly to the document. When you open the file to modify it according to the latest changes, this function will create a copy in the system. ***See*** File settings.
Version	Version number of the documents – information only.
Release	Release document: if not active is will not be transferred to the QC-order.
Release by	Released by whom- automatically filled.
Release date	When released - automatically filled.
Image	Icon for view in documents list.
Color	Display in documents list.

Text

Tab only visible if "Text" was selected as "Type" . A text can be entered, for example a work briefing, information on checks etc. In the QC-order only the entered text is displayed. Storing a file is not possible.

© 2026 Boyum IT Solutions A/S

Condition

Determine whether the document is transferred to the QC-order.

Field	Meaning
Valid from	Only if no date of validity was entered, or if the date is smaller than the current date. The creation date of the QC-order serves as reference, not the valuation date of the dependent document.
Valid to	Only if no date of validity was entered, or if the date is later than the current date.
Business partner	Only if no business partner was entered or in the dependent document (for example goods receipt) the same business partner was stored.
Item rule	Only if the rule in Item – Quality control matches or if the field is empty.
Script	Add script.

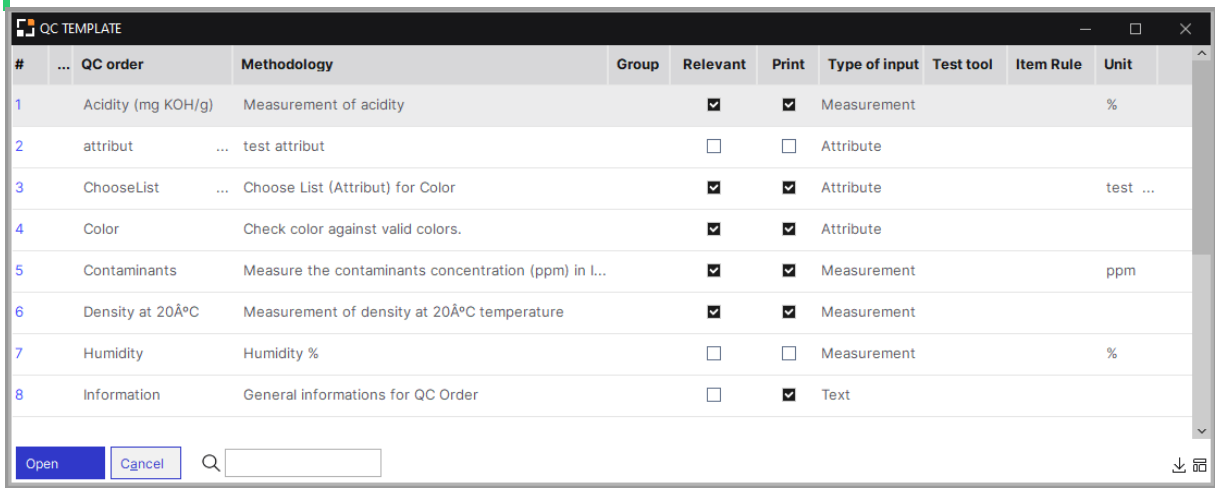
Execution

If a script is entered, it is executed instead of opening the document.

8.11.5 QC templates

Templates for QC-Measurement positions can be created and used in **QC-inspection plan > Measurement positions**. Authorization for QC template are required.

PATH: Production > Quality control > QC TEMPLATE.



Window qs_qs_browse.psr

Window settings and Templates are supported.

Field descriptions

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>QC Order</td><td>Short description for the measurement position. Right-click to select a default from the default texts. After selection, the method description is also transferred.
see Manage default texts</td></tr>
<tr><td>Methodology</td><td>Long description. Edit by double-clicking or clicking the "Description" button.</td></tr>
<tr><td>Group</td><td></td></tr>
<tr><td>Relevant</td><td>This option must be activated if this measuring point is relevant for the release of the test plan.
This option is always deactivated for type "Text".
Note: For automated release at least one relevant position is required.</td></tr>
<tr><td>Print</td><td>This option must be activated if the measuring position should be printed in a quality control protocol.</td></tr>
<tr><td>Type of input</td><td>Type of entry.
Available types:
<table><tr><td>Measurement</td><td>Minimum / Maximum values are considered. The "measurement" tab is displayed. The measured value is OK if it is between the minimum and maximum.</td></tr><tr><td>Attribute</td><td>A measuring position can be marked as "OK"
Values can be entered, but will not be checked.
Example:
Check of color
Enter "red" and "OK" for confirmation.</td></tr><tr><td>Text</td><td>Position is only displayed. No confirmation or entry.</td></tr></table>Attribute: you can only specify whether it is okay, and include information.
Measurement: Minimum / maximum values are considered.
Text: Only a header line.</td></tr>
<tr><td>Test tool</td><td>A test tool can be selected. Only information – no effect. No reservations or dispatches.
see Tool administration</td></tr>
<tr><td>Condition</td><td>Only inserted if the stored value matches the selected values in query. see conditional testing positions</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
Item Rule	Measurement position is only inserted if this field is empty or matches the value entered in Item QC-link. The measurement position can be hidden or displayed depending on the item or document. ***See*** Item QC-link - Measurement position - Rule.
Only All documents	Measurement position is displayed only per .... documents. If you enter 5, the measurement position will be inserted for the first and the 6th document. Every QC-Item link is counted. ***Example:*** In item master there are 2 entries - for document type "purchase goods receipt" - for document type "all" The counter for purchase goods receipt will be created independent of all other document types.
Only All Measurement Positions	Measurements are taken only per ... positions If you insert e.g. 10, measurements are taken after each 10th piece. ***Example:*** You produce 100 units, and set this field to 10, QC measurements will be taken for the 10th, 20th, 30th, ... samples.
Always by Error	In case of error "only per ... documents" - reset counter. This setting is only taken into account if a value was entered for "only per ... documents" If a QC-order was marked as faulty, the counter is reset and the measurement position is inserted at the next or the next QC-order. ***Example:*** "Only per ... documents": 5, "always after error" active 1. Goods receipt: measurement position inserted 2. No

© 2026 Boyum IT Solutions A/S

Field	Description
	3. No ... QC-oder marked as faulty 4. Measurement position inserted 5. ...7 no 8. Measurement position inserted
Manual OK	Determine whether the measurement position may be set to "OK" manually. If the option is active, the icon "OK" is displayed in the Measurement sample. There, it is possible to set the position to "OK" even if the measured value is out of allowed range. For type of entry "Attribute" this option is always active. Entering values, this option is automatically enabled if no minimum or maximum value was defined.
Automatic Release	Disable the four-eyes principle. By default, each measurement position needs to be checked and released by a second person. ***See*** Four-eye principle Important: The person entering the measured values is not allowed to release them. If this option is disabled, the measurement position is automatically released, after the field "OK" was set. Electronic signature is not supported at this level.
Supplier	Supplier number
UDF 1–4	User-defined fields 1–4
Unit	Unit of measure
Template fields 1–6	Template fields 1–6

8.12 Factory data capture

8.12.1 Terminal

Certain functions which are optimized for the use in a workshop are available from the terminal window.

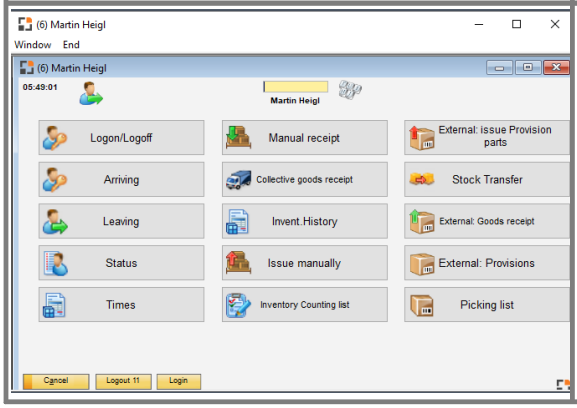
The terminal window is a platform in which any number of apps can be seen.

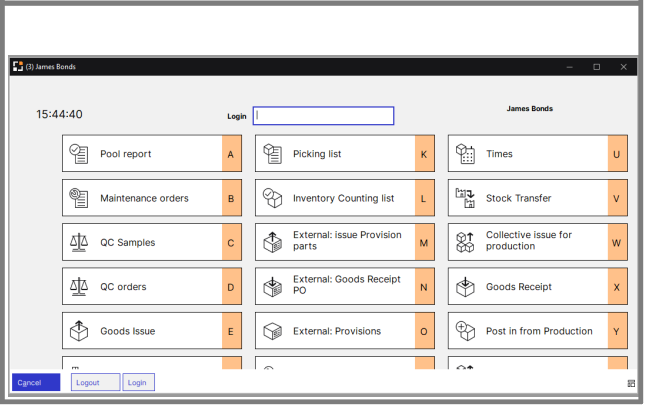
Login types:

1. Enter personnel-card number to log in.
2. Connect to the Terminal using the SSO (Single sign On) functionality.

To use this login type, send the following parameter in the command line: **sso=true**

© 2026 Boyum IT Solutions A/S

Traditional style	Boyum Style
	




The terminal can be started via the terminal mode. This requires a windows link called "Beas Terminal".

- Installation

The installation of SAP Business One DI-API 32 Bit and Beas Standard is necessary.

A windows - link will be inserted on the station. The current "Beas" – link can be copied and can be renamed to "beas terminal" for this.
At "Target" will be inserted after "....\beas.exe" other parameters.

Terminal: ID for "Start in terminal mode"
User: The user ID (not user name!), e.g. Terminal1
PW: Password of the user
Database: name of the data base (according to SQL-server)

Important: Blanks are not allowed at "user" and "pw". Blanks have to be replaced with "³", e.g. my³database.

Example:
"....beas\beas.exe\ terminal user=station1 pwd=abc database=trainingdb

- License concept and installation

SAP License rule:
For using the functions of the Beas Terminal, you need a SAP Business One - indirect license.

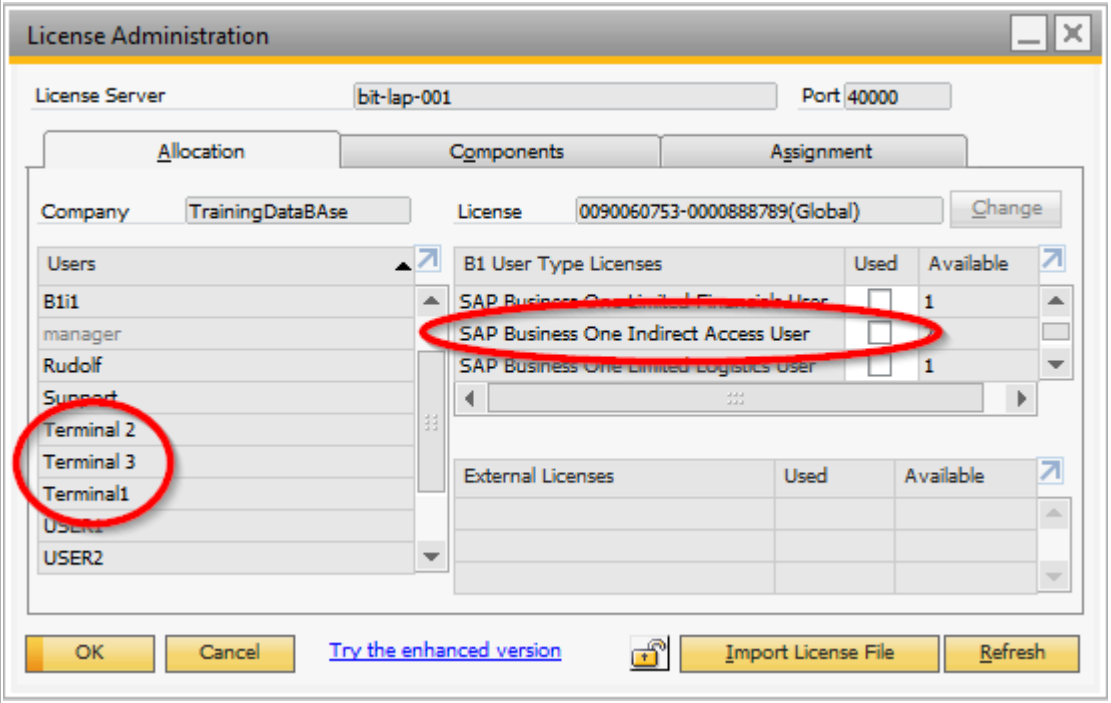
Note: consult also the actual License rules of SAP Business One.

© 2026 Boyum IT Solutions A/S

SAP B1 License for Terminal

For every station you need a separate SAP B1 User, e.c. Terminal1, Terminal2 etc.

For this user you must define the following SAP Authorizations:

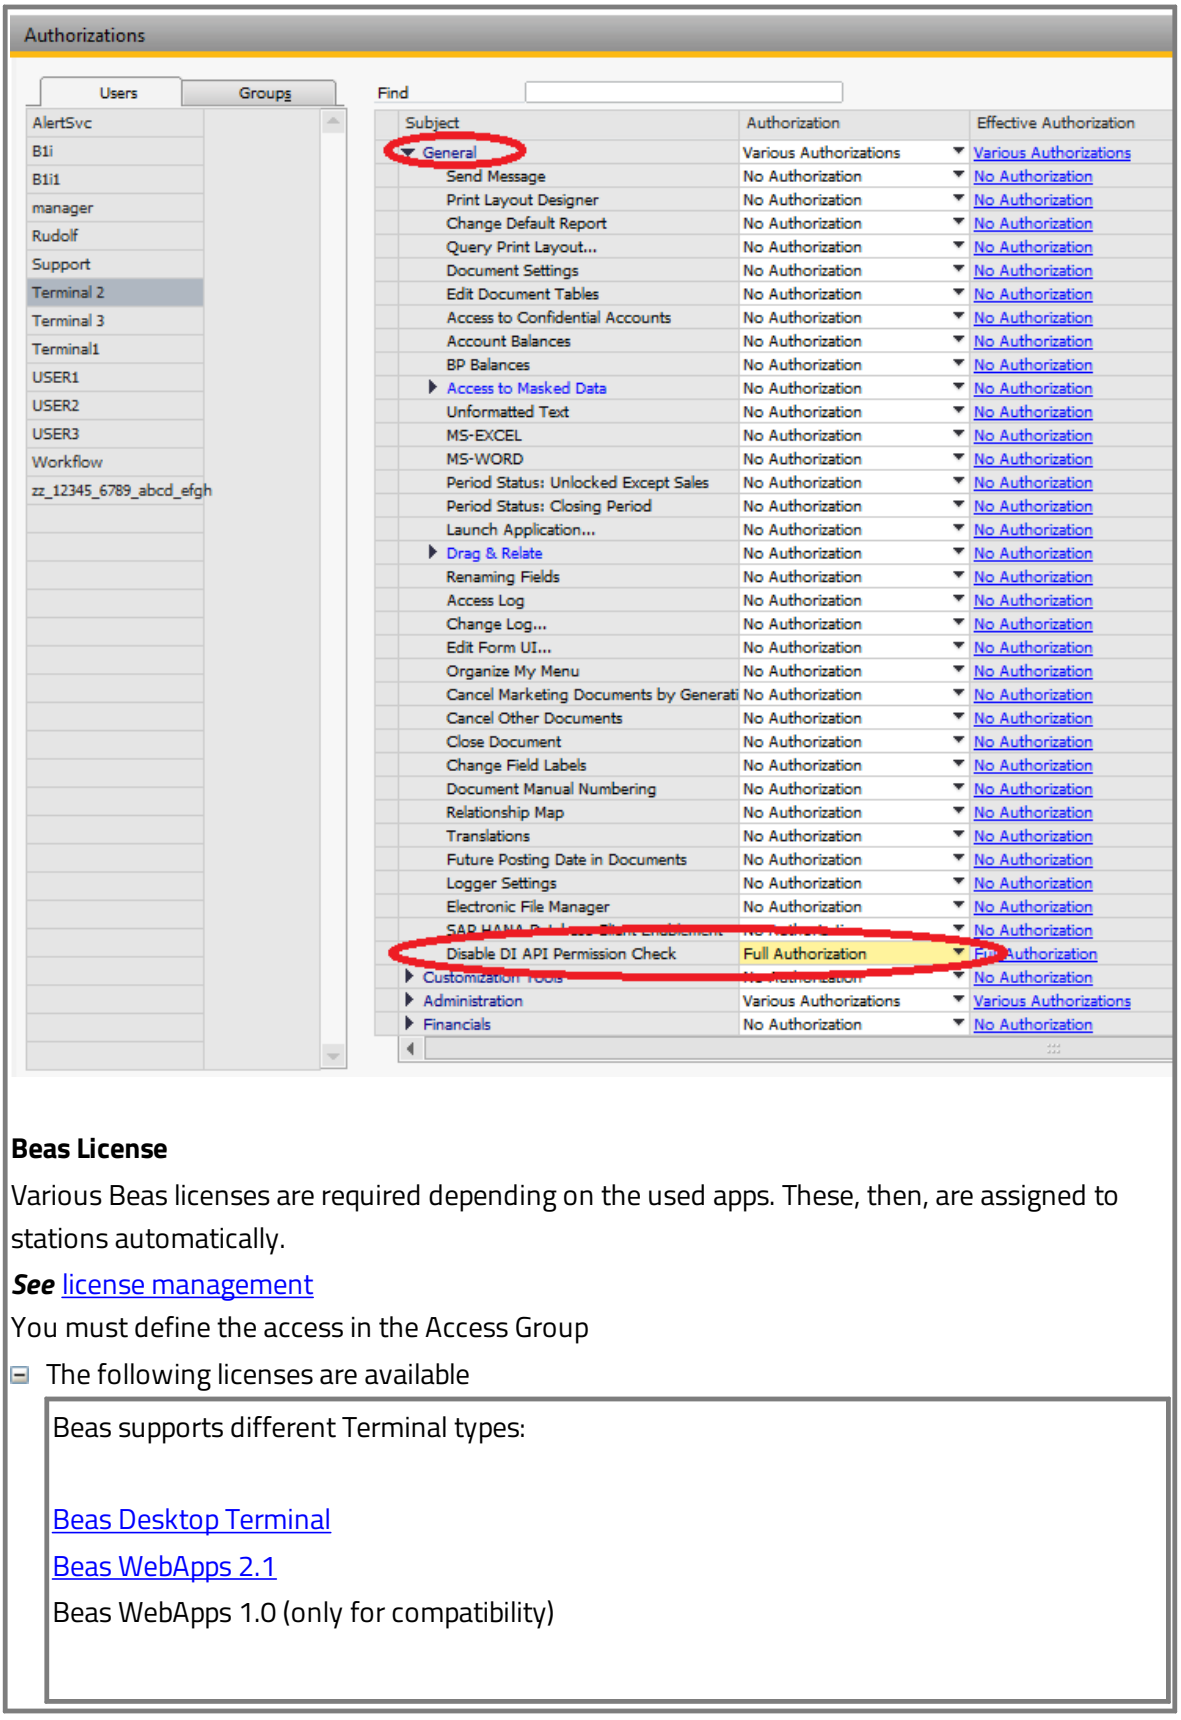


SAP B1 Authorizations

Administration - System initialization > Authorization > General Authorizations

General > Disable DI API PERMISSION CHECK on "Full authorization".

© 2026 Boyum IT Solutions A/S



Beas License

Various Beas licenses are required depending on the used apps. These, then, are assigned to stations automatically.

See license management

You must define the access in the Access Group

- The following licenses are available

Beas supports different Terminal types: Beas Desktop Terminal Beas WebApps 2.1 Beas WebApps 1.0 (only for compatibility)

© 2026 Boyum IT Solutions A/S

All use the same license pool with the same concept:

In **Terminal Functions > Edit Group > Choose apps** you can see the License needed for the apps.

Concurrence of users

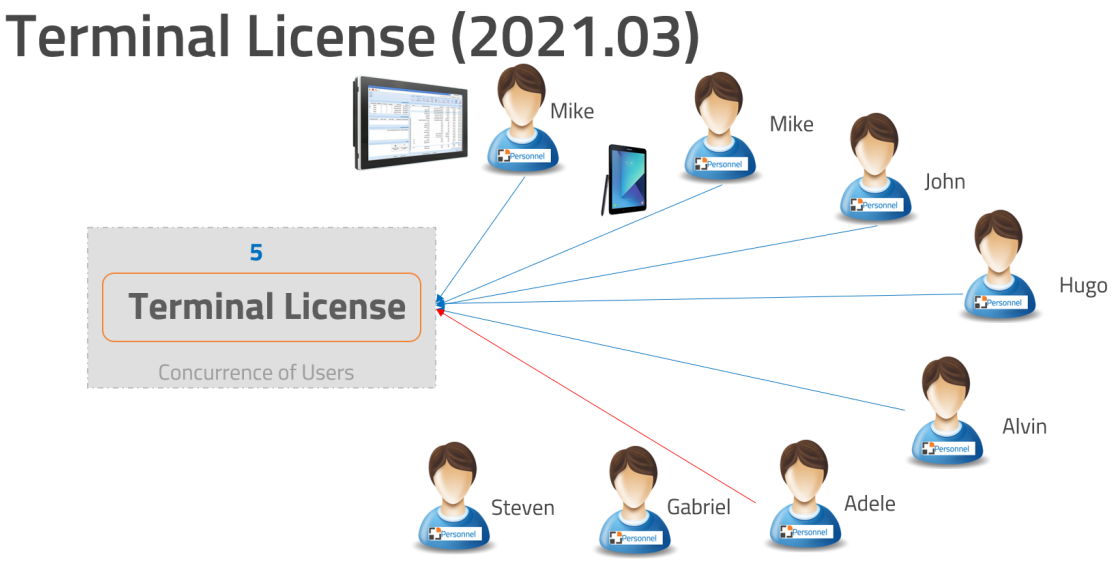
IMPORTANT: User login blocks all licenses that are assigned to the user! These licenses are released for use again once the user logs out.

Licenses can be reserved by user, machine or Beas operators.

See License Administration (Beas)

Article on License administration questions and answers

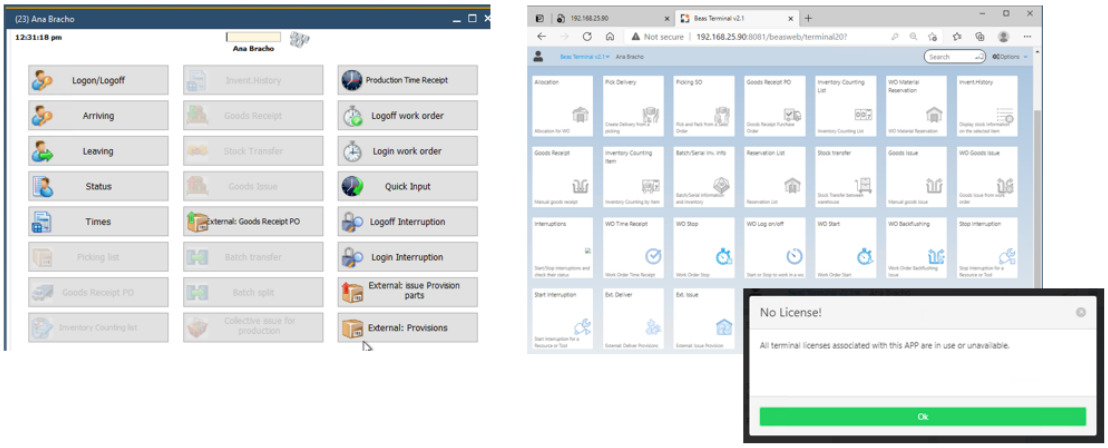
Example: A company has 5 Terminal licenses. Five users are using the 5 licenses each - therefore, the number of available licenses is 0.

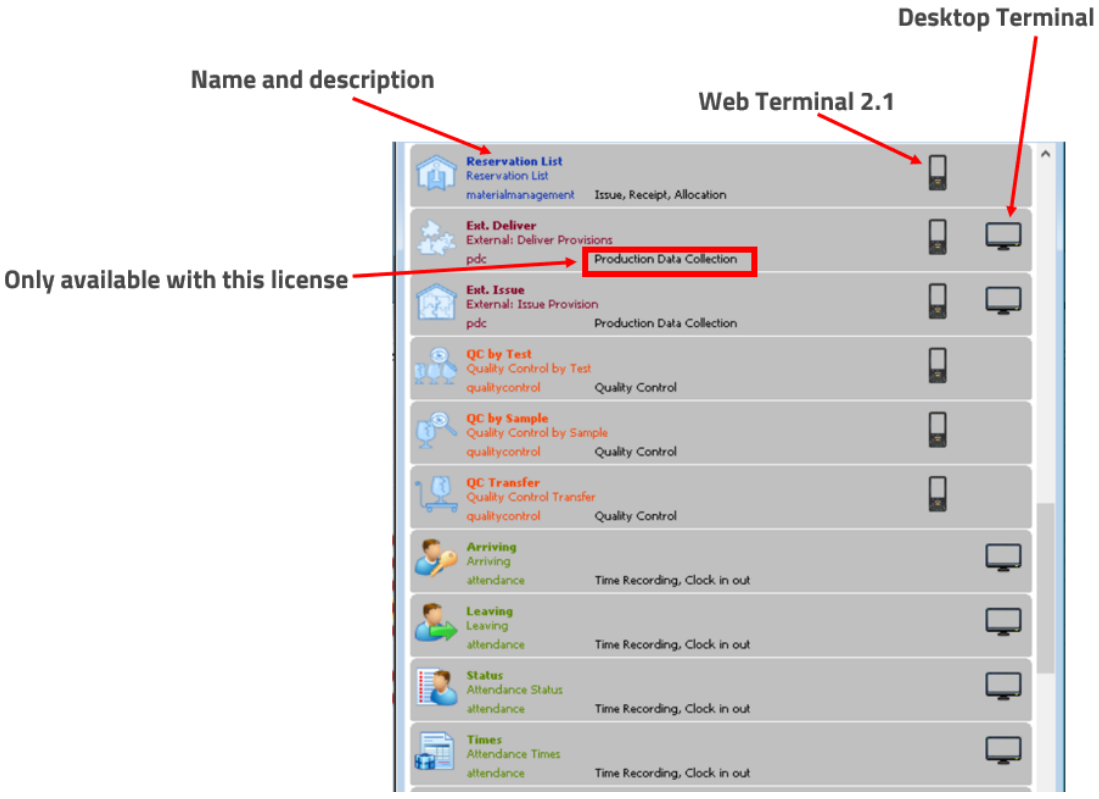


Apps that are not available for the user in lack of license are grayed out (disabled).

© 2026 Boyum IT Solutions A/S

License In Use: *when a license is not available*





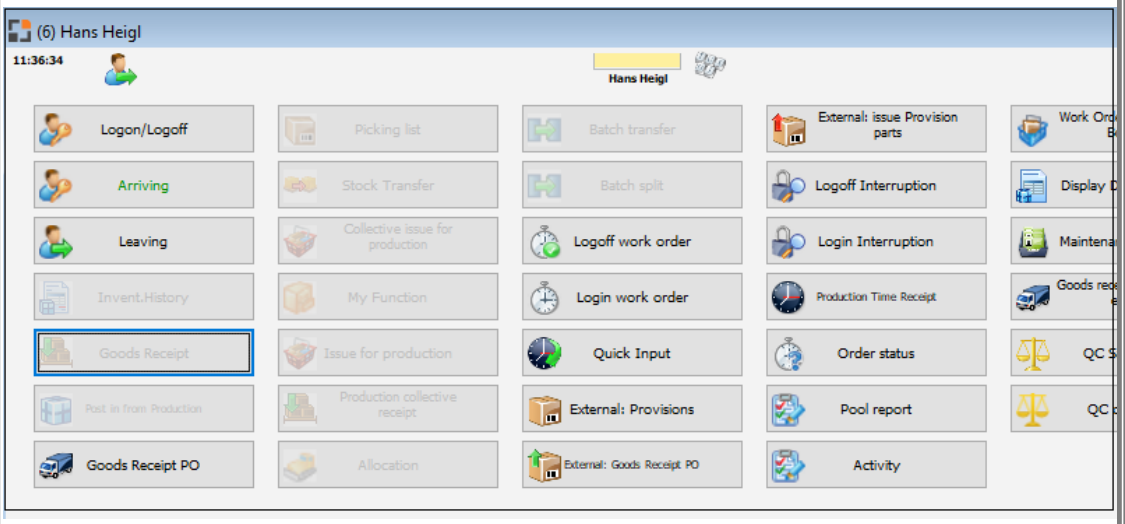
NOTE: Upon login all available licenses related to the authorization groups will be set as "In Use".

Desktop Terminal

If you start the Desktop Terminal, you do not need any license.

© 2026 Boyum IT Solutions A/S

If you login in Desktop Terminal, the system tries to use needed licenses. If available, the license will be reserved. If not, the app needing the license is grayed out. If you hover the mouse over or click on the button, you can see the info that the license is not available.



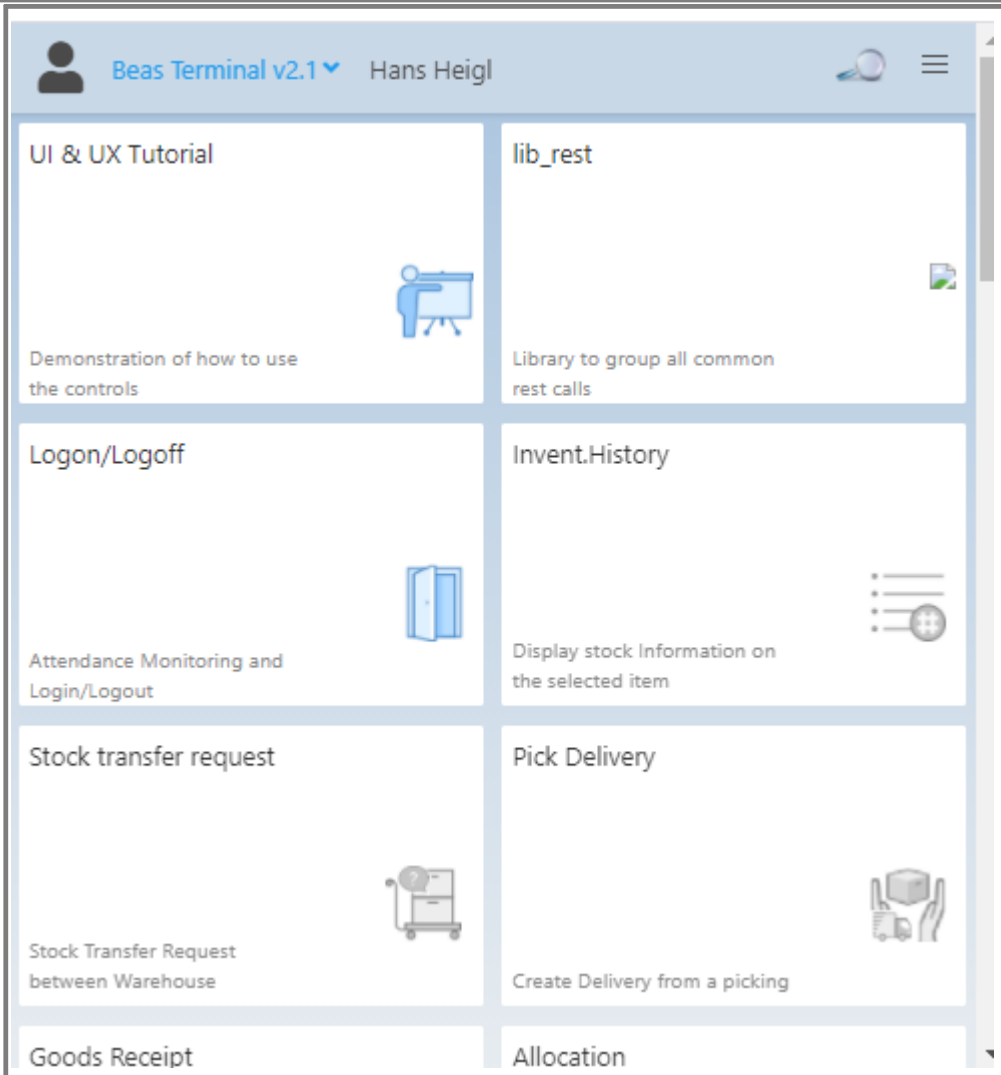
WEB APP

In WEB APP the license is reserved in the moment of Login.

Note: The user must choose "Logout", otherwise other users cannot use the license up to 10 Minutes.

If the license is not available, the system displays the APP in gray.

© 2026 Boyum IT Solutions A/S



Note:

Do not try to manipulate the system. If you delete the license information, the back-end will not work correctly.

ATTENTION: If you close WebApps without logging out, the system keeps the license in use for several minutes. After that the system automatically releases the license.

- Time Synchronisation

© 2026 Boyum IT Solutions A/S

The terminal does use the server time, not the time of the client. Time zone settings of Windows **System - Time zone** is taken into account.
For permission reasons Beas does not synchronize with the time of the operating system. It may be that on the client a time is displayed which is different from the terminal program.
The terminal program synchronizes with the server in 30 minute intervals. This way, a correct time is always guaranteed, as long as the time on the SQL server is set correctly.

Logon:

Enter card number to log in. All released apps are displayed. After 60 seconds of idle time, the user is logged off automatically. This timeout can be set up.
At logon it is checked, which applications are to be used. (set up in Station settings). If a person logs on, it is checked, whether a satin specific menu was set up. If there is none, the menu is used, set up in Personnel master.

Note:
As long no Authorization group was created, Standard-Apps are displayed. After an authorization group was created, you need to store on in Personnel master of an employee, otherwise they will not have access to the Terminal
In station settings, you can set up: Control (mouse/keyboard), Image (Logo), preview screen, menu.

Right-click menu:

Function	Meaning
Cancel	Terminal is closed. If started in terminal mode, the user needs to enter their card number before, to prevent an accidental logoff. Note: If the terminal is not started in terminal mode and another user logs in there than in the application, all postings and material movements outside the terminal screen are connected to the user who logged in to the terminal. This situation continues until a logoff in the terminal screen.
Logoff	Employee logs off immediately. The ESC-key can also be used. After 20 seconds of idle time, the user is logged off automatically if no other window is opened. This logoff time (timeout) can be changed in the Work station settings.

© 2026 Boyum IT Solutions A/S

Function	Meaning
	For attendance time registration, a shortened timeout can be activated in Configuration wizard - Attendance - Terminal.
Zoom	Only in Terminal-Mode: "Zoom"-Function accessible via right-click or Ctrl+Z. Enter a value between 90 and 170 to apply a zoom factor (in percent) All sub-screens are affected.
Mode: Keyboard	Switch to keyboard control. For each button a letter is displayed to call the function. This settings can also be set up globally for all work stations in Station settings wizard - Edit.
Mode: Mouse	Switch to mouse control, optimized for mouse or touchscreens. This settings can also be set up globally for all work stations in Station settings wizard - Edit

see

Personnel master data

Program group Administration

8.12.2 Production Time Receipt

This menu option can be used to call the receipt window for manual time receipt.
If data is entered via bar code, this is recorded in the Bar code field. After the first input, the cursor remains in the Bar code field for each new input.
Only new entries are possible; existing entries cannot be changed.

The behavior of the visible fields is set up in **Configuration Wizard > Production > FDC - Time receipt view.**
All other rules can be configured in **Configuration Wizard > Production > FDC.** The login rules are not considered.
Further rules are stored in the operation itself (***See* Master data > Edit Item Master > Routing** - in the tab Extended).
WMS Integration: Produmex WMS Batch attributes are supported.

This window can also be reached from:
- Manage production times

© 2026 Boyum IT Solutions A/S

- FDC time receipt
- Work order structure - Right-click on routing position – Create receipt
- Production list - Double-click on a receipt report
- Terminal – Close work order

Note: Because material postings and journal entries are created, extended rights in SAP B1 are required if you do not work with the terminal solution.

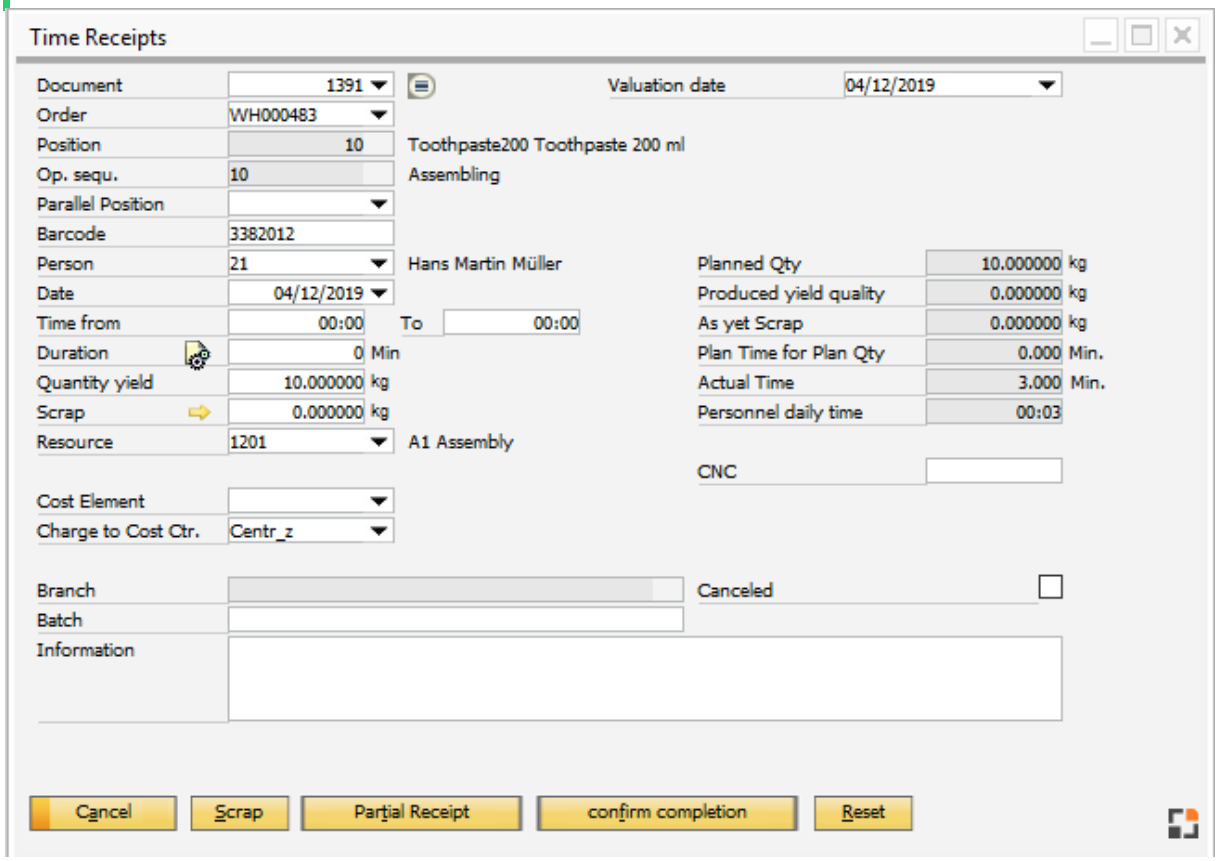
See Mandatory SAP-B1 rights

Material posting, assembly posting

With a report, material is also issued where applicable or the assembly received. For further information ***see*** Material posting.

The "Exceeding planned quantity allowed" Configuration parameter affects Production Time receipt: Minimum/Maximum values are related to receipt quantity.

PATH: Production > Factory Data Capture > Production Time Receipt



Window fert_arbzeit_erfassen.psr

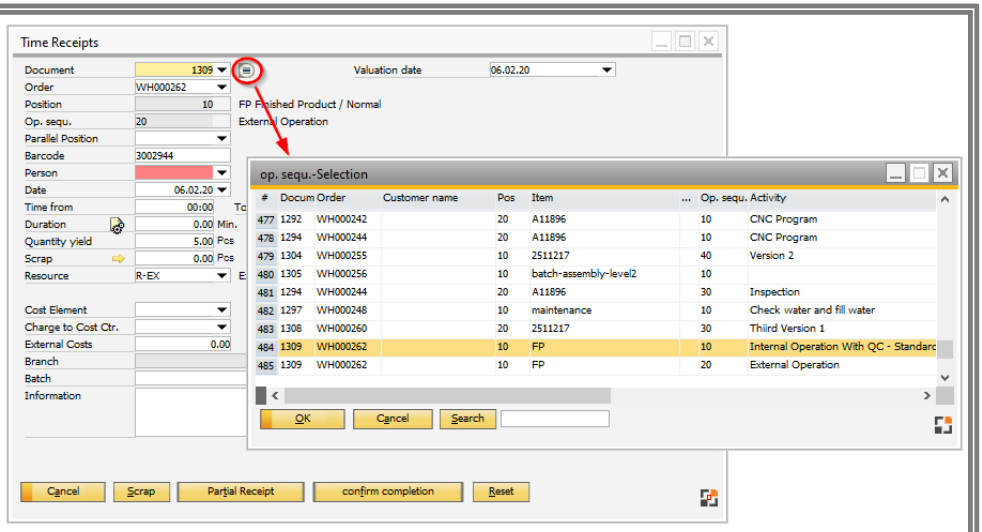
© 2026 Boyum IT Solutions A/S

Choose Routing position in time receipt window

Field Description

Field	Description
Document	Search by Work Order Number (Order Number) Search work order by work order document number. In this field there are always 2 modes to choose a work order. **Drop-down Icon:** Search for work order, on which you made last time receipts. ***Example***: There are employees working many times on the same routing positions and thousands of open routing positions. In this way you can simply find your last routing position. The system searches for the last 190 time receipts and groups them by routing position. This only works if the personnel number is defined.  **Choose by Icon** If you click on the icon, the system displays all open operations. The system does not check any rules. All open routing positions are displayed. Window settings and templates are available.

© 2026 Boyum IT Solutions A/S



Window fert_arbzeit_erfassen_afoauswahl.psr

Valuation date	Enter the desired valuation date Material postings are carried out on this date. Determining the resource costs is independent of the valuation date. The current costs are always used. ***See*** Resource costs Post-calculation – last movement; refers to the valuation date, even for order time receipts. If the order date was changed, the valuation date is adapted as long as the order date is not set to the future. The valuation date can be changed any time, independent of the order date.
Work Order	Work order number. The drop-down field lists all open documents. When selecting a number, the order is opened. When entering a number, the first open work order with that number is opened.
Position	Work order position of the selected work order.
Op. sequ.	Operation sequence position to be reported. **Master-Slave operations - time receipt creation** **IMPORTANT NOTE:** When the user defines Master-Slave operations when creating a Time receipt for a "master" operation, Beas first generates all Time receipts for the slave operations, and *then* the time receipt for the master operation.

© 2026 Boyum IT Solutions A/S

	Due to this sequence, if something fails during the time receipt process of the master operation, the previous Time receipts are **not** rolled back.
Parallel position	Selection of a parallel resource in case there are parallel resources defined in the routing. **NOTE:** Parallel operations do not consider quantities and do not manage Open/Close status! Time receipt creation does not close a parallel operation.
Barcode	Unique number to identify the work order number, position and operation. If the user enters the bar code, the work order number, position and operation are recognized. This is a fast way to identify the operation in a work order routing. The Barcode is stored in the operation and is printed on the production document. Also displayed in Work order routing – Position – Extended – Barcode *(BEAS_FTAPL.NUMMER)* and in Parallel Resource *(BEAS_FTAPL.NUMMER + BEAS_FTAPLWKZ.POS_ID)*
Person	Personnel number of the employee who performed the work (configurable in **Human resources > Personnel**) Entries are checked for validity. A card number can also be entered to search for personnel number (in case it exists). The selection list is sorted by name, first name and middle name. Only employees with login authorization are displayed at a work order.
Date	Date of the time receipt. "Date To" is only visible if multiple date entry is configured. ***See* Configuration Wizard > Production > FDC > time receipt View > Multi-day Input.**
Time from-to	Optional start and end time of the activity. The duration can be reported without time from / to. After the time is provided, the duration is re-calculated automatically. Visibility of the fields can be stored in the settings.
Duration	Duration of order time. This can also be changed after automatic calculation. Data is input in time hours, time minutes or industry hours. NOTE: Beas does not support entering times in any units smaller than minutes, e.g. seconds/milliseconds and so on.

© 2026 Boyum IT Solutions A/S

The type of the entry is selectable of the input via the gear symbol / .
This setting is station-specific and can only be entered in the input screen.

- Note on industrial hours:

  Full minutes are used, seconds are not supported. The entered time in industrial hours is rounded down to normal minutes.

  Example: 14,09 → 14:05 Minutes and 24 Seconds. Rounded to 14:05, equals 14:08 Industrial minutes

In case of automatic calculation, additional rules are considered which can be stored in the Configuration Wizard.
See Time linking, parallel calculation.

See the option "Calculation result" to see how the duration was calculated.

Reported time is subtracted from reserved time immediately. This is displayed in graphical resource utilization display, in the bar right below, in the work order structure and in other windows.

Note: Time receipts can only be entered in minutes. For planned times, more digits can be entered because of multiple quantities.

- Display calculation results

  Use the cogwheel icon to display the result of the calculation, to see how the duration was computed and which factors had an effect.
  Function is available from *beas 9.1 PL: 07*

- Why is time receipt not available in millisecond accuracy

  This feature is a factory data capture, not machine data capture.

  For capturing machine data, connect an MDC-device. Beas offers an interface to ILS. The MDC device can register times in seconds or milliseconds. Then, you can run evaluations. The MDC-device only transfers to Beas the start/end-time, yield and scrap quantity.

© 2026 Boyum IT Solutions A/S

	Negative cycle time Another possibility of cancellation is to enter negative cycle time. This is only possible if no costs were stored. At order log-off negative values are blocked. You can enter negative values only in production time receipt.
Quantity yield	The produced, defect-free quantity in receipt units If backflushed material is assigned to the routing position, the material is automatically posted with the appropriate quantity (yield quantity + scrap rate). In the case of the last reportable routing position: • the appropriate number of the assembly to be produced is received (converted to units of store), if in **Configuration Wizard > Production > Valuation and Posting of Assembly > Posting > Booking Finished Items when > Like Material (Last Operation or Backflushing)** is configured. • the production position and the work order are closed – depending on the setting under **Configuration Wizard > Production > Valuation and Posting of Assembly > Close production position** **Specification of the quantity to be reported:** The quantity to be reported can be specified. This is activated in **Configuration Wizard > Production > FDC > Login Rules > Suggest Remaining Quantity**. The planned quantity is then proposed minus the previously reported yield quantity + scrap quantity. If **Maximum previous quantity reportable** is also activated in the same area, the yield quantity reported in the preceding reportable routing position minus the quantity reported to this previously reported yield quantity + scrap quantity is proposed. **Unit of measure** For time receipt, the unit stored in the operation is used. If not set up, the consumption unit of the assembly is used and is converted, if it is different from the warehouse unit (order time to consumption unit and material to warehouse unit). ***See*** Edit routing - Extended. Material is posted with this quantity ***see*** Material Entry.
Scrap	Scrap quantity in reporting units

© 2026 Boyum IT Solutions A/S

	Quantities that are considered rejected during the process. If a goods issues process links to the time receipt, this quantity is considered as total scrap quantity at the goods issues. Use the orange arrow to enter a scrap reason. A new window opens to select scrap reason and quantity. Scrap reasons need to be defined before they can be used. If you want to make further use of the scrap material in **Configuration wizard > Production > FDC > view time receipt –** there is a possibility to **post back scrap material**. Enable this, to get a list of issued items in the Cancellation screen after the issue is processed. In this screen scrap quantities can be allocated and posted back to the original warehouse. Material is posted – ***see*** Material posting. Entry quantity is in entry units defined in the operation sequence. ***See*** Production – Routing – Extended – Time receit unit **Note:** If working with scrap, Cut-off and scrap may not be considered in the planned quantity, because otherwise the material would be posted twice. In case of incorrect settings, a warning screen opens once per program start. ***See*** Configuration wizard – backflushing.
Resource	The resource or machine on which the work is performed The cost rate of the activity comes from the resource. If a resource group was defined at the routing, a resource must be selected from the specified group on the time receipt. Available resources depend on personnel settings. Only resources allowed for each employee in **Human Resources > Personnel > FDC Tab** can be selected from the drop-down list. **NOTE:** The default data loaded by the system may contain a resource that the selected personnel has no rights to. By default, Beas allows a time receipt to be created for this resource. To avoid this situation, and block this resource from the list, you can add the following customization: Production Time Receipt resource selection codes: fert_arbzeit_erfassen.src fert_arbzeit_erfassen_afoauswahl.src

© 2026 Boyum IT Solutions A/S

	See Personnel master
Time Type	Time type of the time receipt If time types are stored in the resource, the time type (setup time, processing time and so on) can be selected. If the time type is changed, the cost element of the routing position is entered into the Cost element field. ***See*** Configuration wizard – Master data – Resource – Time types Concept time types
Cost element	Cost element to which the costs are to be posted. Entry is determined automatically according to the information of the resources and time type. It is possible to manually change the selection. ***See*** Cost elements
Cost Center	The cost center to be charged The default cost center can be defined in **Configuration wizard > Production > FDC >** Cost Center determine by If a journal entry is set up in the time receipt, the cost center applies to the journal entries created by the time receipt. Yet, this cost center does not apply to material transactions. For material transactions, the system reads the cost center from the item.
Branch	The branch that the time receipt is made from The branch from which the time receipt was made. If the multi-branch solution is activated, the branch is displayed in which the order time receipt was created. Only the branches, that are stored in a work order position can be used for time receipt.
Batch	The batch (temporary batch for the reported quantity) **Note:** This batch does not affect the batch number of the assembly. The information is for reporting purposes only. This field is used if working with a temporary batch. Beas does not take this input into account. The batch number can be displayed in various time reports using the right-click menu window settings option, marking the batch field.

© 2026 Boyum IT Solutions A/S

Canceled	Marking: Message canceled Under certain conditions it is not possible to delete an order time receipt. It can only be canceled at that point. Canceled time receipts are hidden in most evaluations. In work order structure they are displayed in gray. A cancellation cannot be undone. A time receipt is canceled instead of being deleted if the cost elements are stored in the operation which creates the journal entries. Thus, the order time receipt is linked to a journal entry. For better traceability, it is possible to enable **Configuration Wizard > Production > FDC > Order Time Receipt: protocol.** In this case, a journal entry is created for every time receipt, even for time receipts without a cost.
Information	Free text for information.
Price	For external operations: the costs incurred.
Logout attendance	If active, the employee is logged off from attendance automatically This field is only visible if attendance linking is activated in the Configuration Wizard. For further information ***see*** Attendance linking.

UDF 1–15	User-defined fields
	UDF 5–15 fields are not visible in the window.
	
	Make UDF5-15 fields visible:
	The user can create text boxes and link with those fields or assign them via BeasScript:
	
	`dw_1.item.udf5.value=prueba`
	`message=<dw_1.item.udf5.value>`
	
	Create a text box in the window and link it with UDF5:
	`windowevent open`
	`//Create a field for codebar`
	`create=column=x=2030,y=80,width=457,height=52,id=udf5,name=udf5`
	`create=text=x=1445,y=80,width=562,name=udf5_t,text=UDF5 example`
	`end event`

© 2026 Boyum IT Solutions A/S

	The system saves the information automatically when the time receipt is created.

The following are displayed on the time receipt screen, but can be deactivated:

Field	Description
Planned Qty	Quantity to be produced in receipt units.
Produced yield quality	Quantity previously reported defect-free in receipt units.
Produced Scrap	Previously reported scrap.
Planned Time for Planned Quantity	Default time.
Actual Time	Previously reported time.
Personnel daily time	Time reported today for the selected person.
Tool	Field is only displayed, if a tool entry was found which determines lead time. In this case, all active tools are displayed for the selection.

Button	Description
Delete	Delete time receipt Only available if working in change mode and if the work order item has not yet been closed. **Note:** If a cost type is stored with accounts, a journal entry is created. On deletion, a reversing entry is made first to this booking. For more information ***see*** Production Time Administration. **Important:** Existing time reservations are not restored. Re-scheduling may be necessary. To make all confirmations comprehensible, a cancellation can be performed instead of a deletion. This can be activated in Configuration wizard > Production > FDC > Production time receipt: block deletion This function has the following effect:

© 2026 Boyum IT Solutions A/S

	• It is no longer possible to remove the operation sequence from the work order structure window. • The operation is not be deleted but canceled. Time and quantity is set to 0, and the cancellation switch is activated. A canceled order time receipt can no longer be activated. If costs are booked at the moment of time receipt creation, this option should be enabled. Canceled order time receipts have no value and they are not displayed in lists (for example, post-calculation). In the work order structure view, the canceled entries are displayed in light gray. ***See*** Webinar: Adjustment user mistakes at the work orders 10/2017 At cancellation these values are entered to the activity log: • Key1 = "cancel" • Key2 = Duration (minutes) • Key3 = Yield Quantity (in assembly unit) • Key4 = Scrap (in assembly unit) • Key5 = Costs to marginal costs • Key6 = Costs at full cost • Key7 = Assignment to the journal entry, if existing
Scrap	Opens a new window to provide the scrap quantity and scrap reason. The total quantity is transferred to the scrap quantity at the time receipt.
Partial Receipt	Create a new, partial receipt Creates the time receipt document without closing the operation. Users can continue reporting at this operation. Only available at a new entry: • Saves the order time • Posts the assigned, backflushed material. ***See*** Material Entry • If it is the last routing position: post the assembly to be produced In case of the last routing position a security prompt is displayed: With this time receipt the assembly will be posted. Continue? (Id ftpos_lastafo239545).

© 2026 Boyum IT Solutions A/S

	This prompt can be disabled in Configuration wizard Note: if "Close operation sequence automatically" is activated and total receipt quantity + scrap quantity >= planned quantity and no additional employee is working on this operation, the system closes this operation and ignores that you clicked on "Partial receipt".
Intermediate report	Intermediate report, behavior of this button depends on these settings.
Confirm completion	Creates the time receipt document closing the routing position. Workflow: • Saves the order time • Posts the assigned, backflushed material. ***See*** Material Entry • If it is the last routing position: post the assembly to be produced • Close routing position If another is working on this routing position in parallel, it is not possible to close the routing position. The system returns an error message "*(bdeostmp45) There are Clock times for this Operation! Cannot close!*" Close work order position automatically If this is the last operation and If "close work order position automatically" is activated, the system closes the work order position. For more information ***see*** Configuration wizard Note: The system does not check the quantity. If you post 0 from 10Pcs and click on "Confirm completion", the system closes the work order position, too. If "Close work order automatically" is activated, the system closes the complete work order if all work order positions are closed.

© 2026 Boyum IT Solutions A/S

	NOTE: If it is the last routing position, it closes the production position including any necessary journal entries (WIP balancing) After closing, it is not possible to report any other information at this operation. The button "**Confirm**" is only visible if the following conditions apply: • the operation is not an overhead order. ***See*** Production types • no other employee is currently logged on to the operation • in the respective time type close operation is not disabled. ***See*** Configuration wizard – master data – resource – time types • only when creating a new entry
Save	Saves the changes. Only available in change mode. **Note:** If a cost category is stored and in turn accounts are stored in the category, a journal entry is made when creating the report. If the order report is changed, the journal entry is canceled, and then a new journal entry is created with the new values.
Change log	List of all changes. ***See*** Change log.
Time protocol	Detailed protocol, of how the duration is calculated.

Note: If the production position is closed, time receipt can no longer be changed.

Videos

Function: Open material issue form from time receipt window

Change log in the database

Every change is logged in the change log. As the costs cannot be changed directly, because they are calculated automatically, if a change is made a separate data record is inserted with the following content in the information field: "Change to information: Marginal costs previously ... new, full costs previously ... new"

© 2026 Boyum IT Solutions A/S

The new key fields contain:

- Key1= “change info“
- Key2= duration (minutes)
- Key3 = yield quantity (in assembly units)
- Key4 = scrap (in assembly units)
- Key5 = costs at marginal costs
- Key6 = costs at full costs
- key7 = assignment to journal entry, if available
- key8 = allocation to cancellation journal entry, if available

8.12.3 Work order Backflushing Booking

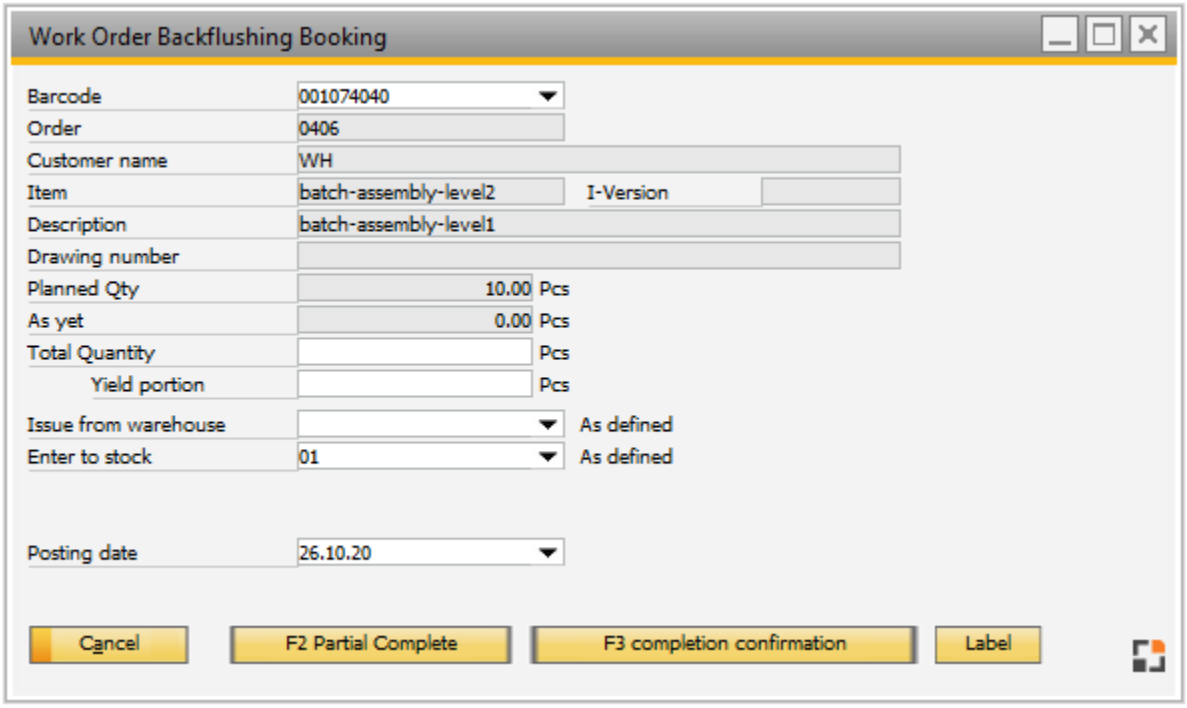
With this function you can create a receipt for the finished goods item and backflush all necessary materials.

For this you only need:

- Bar code of the work order position

- Quantity

PATH: Production > Factory data capture > Work Order Backflushing Booking



fert_retrograd_abbuchen

© 2026 Boyum IT Solutions A/S

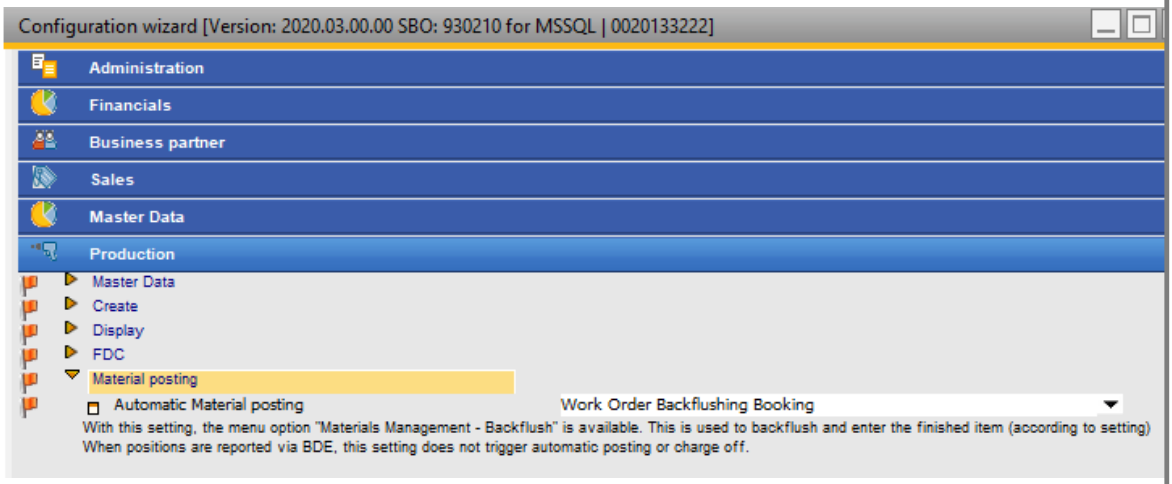
Backflushing is used to automatically remove material that is allocated to a work order and is marked as "backflush". The work order is selected for this (alternatively, the routing slip bar code can be scanned). Then, you specify the total quantity to be reported and the yield to be received. After inputting the number of units, the corresponding quantity of materials is issued and the finished good is entered.
The material is issued from the inventory location stored in the BoM and the primary item inventory, respectively. If an inventory location is specified for "Issue from storage location", the material is posted from this inventory location.

WMS Integration: Produmex WMS Batch attributes are supported.

You can use this window only if this window is activated in the Configuration wizard.

- Setup

In the Configuration wizard you must activate **Production > Material posting**: **Work Order Backflushing Booking**



Note:

It is not possible to use this window in parallel to the backflushing functionality on the last/first routing position!

In **Configuration Wizard > Production > Material posting > Backflushing** you can define all additional Backflushing options.

The "Exceeding planned quantity allowed" Configuration parameter affects WO material backflushing: Minimum/Maximum values are related to receipt quantity.

Setup: Configuration > Production > Work Order Backflushing Booking

© 2026 Boyum IT Solutions A/S

These settings affect the following functions:
- Desktop version Work order backflushing
- WebApp WO Backflushing
- Manual receipt window.

They are visible only if in Configuration wizard > Production > Material posting > Material posting automatically at "Work order backflushing" was selected.

PATH: Administration > System Initialization > Configuration wizard > Production.

Parameters

Name	Description
Selection warehouse location issue Selection warehouse location at receipt	Activate the warehouse fields for issue and receipt process in backflush window Standard: use default warehouse defined in work order or in issue process related to issue rules. If you activate this setting, the user as additional fields: "Issue from warehouse" and "Enter to stock"  Note for receipt: If the receipt warehouse is changed, problems may arise with the WIP account. That is why this option should not be activated when working with different warehouse-dependent WIP accounts.
Book times	When active, planned times are reported as actual times confirming the last

© 2026 Boyum IT Solutions A/S

Name	Description
automatically	position. If this option is activated, the times are also automatically booked in the backflushing process.  This function is available in Work order backflushing WebApp WO Backflushing Manual receipt for work order (only if ".. to employee" is defined !) It creates time receipts for the following routing position: - Clock mandatory is activated - Routing position is active - Duration time is defined - Routing position - Extended - "Block login" is disabled. **The default time is computed as follows:** First confirmation: `(planned processing time per unit * reported quantity) + setup time` Second confirmation: `(planned processing time per unit * reported quantity)`

© 2026 Boyum IT Solutions A/S

Name	Description
	 Setup Time: field "`Setting up Capacity`" Planned processing time: field "`Processing`" For correct calculation, the system checks Quantity per, Time Unit, Use factor and Work steps. "`Personnel`", "`Quality Control`" Parallel resources are supported. Fix times (Quantity per time=-1): The system calculates `Processing time / reported quantity` Only Cost type for processing is supported. Master Slave settings are ignored. The system creates the time receipt for all routing positions. Quality control orders in Routing positions are supported. Start/End Date for time receipt is Current or the Date defined in the receipt/backflushing window. Employee in time receipts is the currently logged in employee. For more information ***see*** setting "..to employee no" below. **ALTERNATIVE METHOD** As an alternative, use the option in **Configuration wizard > Calculation > Post-calculation > "Plan=Actual if no time receipts"**, or use the valuation method in **Configuration wizard > Production > Valuation and Posting of assembly - Valuation -** planned costs.
... To	Only displayed if option above "Enter times automatically" was enabled.

© 2026 Boyum IT Solutions A/S

Name	Description
employee no	Define t the employee number can be entered here for automated booking, if no employee is connected. **Terminal / WEB APP**: The system use always the current logged in Employee and ignore this setting **Beas Desktop**: If an Employee is linked to current use, it use the linked Employee, otherwise this setting.

see Material posting, backflushing

Partial posting or final posting

The posting process without closing the WO is done via button "Partial posting" or clicking on F2.
The posting process with closing the WO position or WO is done via button "Final posting" or clicking on F3.

Completion confirmation – Button only visible if
a) There are no uncleared time records.
b) It is not about an overhead costs-order (definable in production type).
c) **Configuration wizard > Production > Valuation and posting of the assembly > Post finished parts when** is not set to manually.
d) The variable "lb_cannotclose" is not set to 1 in windowevent "cancloseorder".

Example script: General hide of button "Completion confirmation"

```
windowevent cancloseorder
setvar=lb_cannotclose=1
end event
```

Automatic Pre-allocation

For items, set to "backflushing", quantities to be posted are automatically pre-allocated. Other entries are not pre-allocated.

Batches and serial numbers are only pre-allocated automatically, if in **Configuration wizard > Production > Material posting and reservation > Backflushing > "Post batches also" or "Post serial numbers"** has been enabled. Click on "pre-allocate" to pre-allocate batches or serial

© 2026 Boyum IT Solutions A/S

numbers manually. If batches or serial numbers has been reserved, independent of settings, these are always pre-allocated automatically.

Order of withdrawal is defined as:

1. Reserved goods
2. Allocation warehouse
3. Standard warehouse (as per BOM item or standard warehouse of item)
4. BoM definition, Bin location (when bin location is defined)
5. Within this order the withdrawal rules from **Configuration wizard > Production > Material posting and reservation > "Automatic batch issue by ..."** apply.

All other warehouses are not considered, but you can withdraw manually from these warehouses.

Field description

This window can be accessed from the menu as well as from the terminal.

Field	Meaning
Bar code	Drop-down selection. Displayed: routing card no, bar code, order, item, item description, customer name.
Order	Order number from Work order.
Customer name	Customer name.
Item	Item.
I-Version	Item version (with activated item version control).
Description	Free Text.
Drawing number	Drawing number.
Planned Qty	Planned Qty from work order. Display in Inventory UoM.
As yet	Confirmed until now. Entry in Inventory UoM.
Total Qty	Total reported qty of the current time receipt.
Yield portion	Yield portion of the total reported quantity.
Issue from warehouse	From which warehouse to issue.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	This field is only displayed if activated in **Configuration wizard - Production > production backflushing > Warehouse selection for issue** If active, this warehouse is used for issue. This has a higher priority than the default warehouse in BoM.
Enter to stock	Receipt the assembly to which warehouse This field is only displayed if activated in **Configuration wizard > Production > production backflushing > Warehouse selection for issue** By default, the assembly is posted to the warehouse, given in work order item. ***See*** Warehouse rules. NOTE: Changing this warehouse with warehouse depending account determination active can lead to differences on the WIP account.
Bin Location	Define target Bin location Only visible if the receipt warehouse is a bin managed warehouse. Here you can define the bin location for the assembly. ***See*** Warehouse rules. Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3) The field has the following components: **Arrow icon** / List of all bins where the item is located. **Selection (Drop-down)** A list opens to select the desired bin location.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	 **The selected drop-down option displays the following information in receipt documents:** • Bin Location • Warehouse Area • First item in this bin location • Stock of the first item in this bin location The list can be modified in the Configuration wizard. **The selected drop-down option displays the following information in issue documents:** • All stock information of all bin locations with batch- and serial number information. • ⊟ Reserved Batch quantities information  The drop-down contains information on reserved quantities in 3 columns:  The batch entry in the list is displayed in RED color if the Batch is not free. **Quantity-related information:**

© 2026 Boyum IT Solutions A/S

Field	Meaning

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

Select or List - Icon

By using the selection icon, an adjustable selection list opens. Window settings and templates are supported.

- Notes: Beas Bin Warehouse

  The Definition of the bin location is mandatory.

- Notes: SBO Bin Warehouse

  If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type.
  This is entirely managed by SAP Business One.

  Drop-down for volume or weight is not supported.

© 2026 Boyum IT Solutions A/S

Field	Meaning

	Columns are always 0.
	beas 9.3 PL 2
	Notes: WMS Bin Warehouse
	Bin location is mandatory.
	Drop-down for volume and weight not supported.
	Customizing of the drop-down list in Beas 9.3 PL 2 or newer release
	This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.
	
	The following priorities are considered:
	1. Window-related customization (`windowevent setbindropown`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	In the `e_bindropdownbsl` variable, the ODATA command can be defined.
	It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.
	
	The standard functions for receipt and issue are as folows:
	`file stockmanagement.src`
	
	`function binreceiptdropdown setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bsl>)?$mask=1 end function`
	
	`function binissuedropdown setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode,bsl>)?$select=BinLocation/BinCode,BinLocation/BinColor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,BatchAttribute2,ExpirationDate&$filter=ItemCode eq <e_itemcode,bsl>`

© 2026 Boyum IT Solutions A/S

Field	Meaning

```
and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations,
ordered by OnHand descending, BinCode
ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhs
code,bsl>)?$select=BinLocation/BinCode,BinLoc
ation/BinColor,OnHand&$orderby=OnHand
desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where
OnHand > 0 of the selected ItemCode, ordered
by OnHand descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_bin
whscode,bsl>)?$select=BinLocation/BinCode,Bin
Location/BinColor,OnHand,UoMCode,Batch&$filte
r=ItemCode eq <e_itemcode,bsl> and OnHand gt
0&$orderby=OnHand desc, BinLocation/BinCode
asc
end function
```

- Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent`)

© 2026 Boyum IT Solutions A/S

Field	Meaning

	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	Window-specific adjustments:
	Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.
	
	Example:
	`windowevent setbindropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE"`
	`from "BEAS_WHSBIN" where`
	`"WhsCode"=<e_binwhscode,dbstring> order by`
	`"STORAGESORT"`
	`end event`
	
	Note: This window event is supported in every window where the selection field is available.
	
	General adjustment
	Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.
	
	`file stockmanagement.src`
	`function binreceiptdropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE"`
	`from "BEAS_WHSBIN" where`
	`"WhsCode"=<e_binwhscode,dbstring> order by`
	`"STORAGESORT"`
	`end function`

Posting date	Select a valuation date. **Important:** If a work order time receipt is edited subsequently or canceled, the revaluation or cancellation of the linked journal entries is performed on the new valuation date. NOTE: This date only affects "receipt" documents. For "Issue" documents, the system sets the current date by

© 2026 Boyum IT Solutions A/S

Field	Meaning
	default and the only way to modify that date is to modify "Issue quantity changeable" to 'Yes'.

- Label - Printing

If a report is stored, the button "Label" is displayed automatically, as soon as the work order was selected or posted. Always the information of the last posting is printed.
There is no default report.

Setup:
1. Create a report.
2. Store the report in this window in the macro.
3. Close window and re-open.
4. Printing is available now.

Available variables:
<docentry> = docentry from last document from table OIGE.DocEntry
<docnum> = Document number OIGE.DocNum

Compatibility:
Until beas9.0 Patch3 the button "Label" was displayed always and the report "Box label" was printed. If it was not existing, no label was printed.To enable printing, setup this report as described above.

See Macro

Webinar 8/2017, Part Work order Backflushing Booking

8.12.4 Production Time Administration

This window is the dashboard for administration and creation of all time receipts.

The following tabs are available:

Tab	Meaning

© 2026 Boyum IT Solutions A/S

Production Time Administration	Entry from scratch and changing existing order reports.
Quick Input	Quick input of order times in list form.
Active Work Order Times	View and processing of order reports logged in but not yet logged out.

Production Time Administration

(first tab)

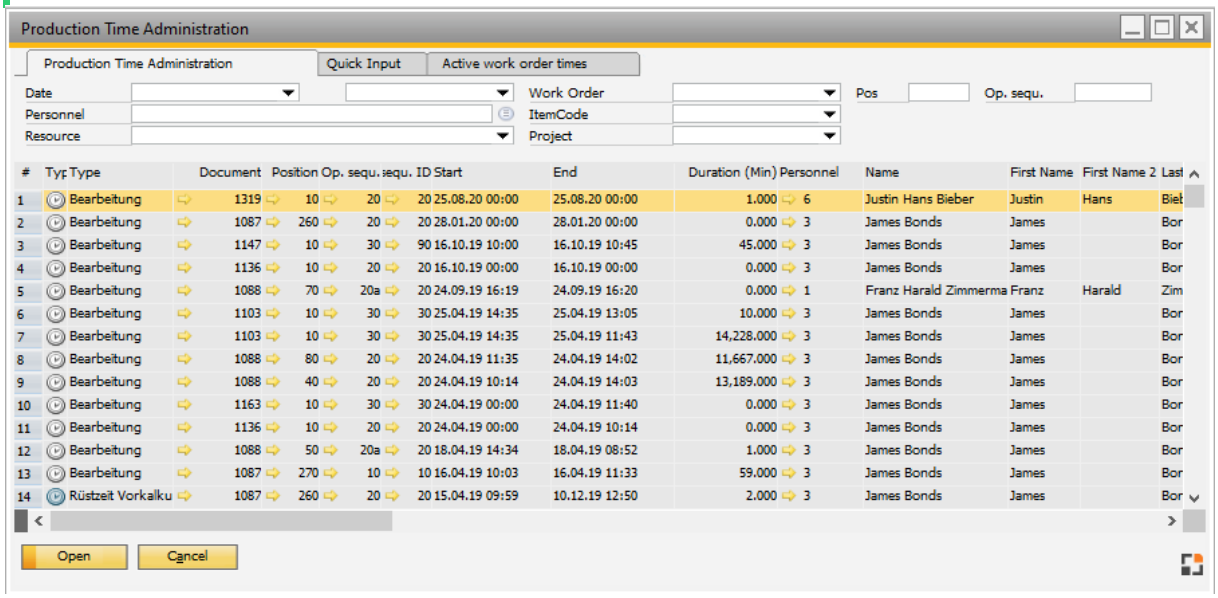
This window is used to display and edit all Production time entries.

Clicking on an entry opens the Time Receipt window for an operation.

PATH: Production > Factory Data Capture > Production Time Administration

or

Human Resources > Personnel > **Open** an entry > Personnel Administration XXX > Tab "Orders"



Window fert_arbzeit_browse_alle.psr

Window settings and Templates are supported.

Filter

Field	Description
Date	Define Date From/To If you change "Date From", the system inserts the same Date in field "Date To"
Personnel	You can choose one or more Personnel ID's

© 2026 Boyum IT Solutions A/S

Field	Description
	Note: If you open this window from **Personnel Administration XXX > Tab "Order"**, this field is not visible. You only have access to the selected Personnel entry.
Resource	The Resource used by the operation.
Work order	The number of the work order.
Pos.	Work order position number
Op.sequ.	Operation sequence - Routing number
Item Code	Item Code.
Project	Project information of the work order.

Columns

Many fields related to time receipt are available.

For more information ***see*** Production Time Receipt.

Functions

Functions	Description
Add	Create new Time Receipt If called from Personnel Administration -> Only for current Personnel Entry
Remove	Delete current entry.

Recalculate	- Only available for databases with the SAP setting "Use Perpetual inventory" deactivated.
	This function recalculates times for open Work orders:
	The system executes the following script for every open Work Order:
	`wotime=woreset`
	`wotime=load=<beas_arbzeit_buchnr_id>`
	`wotime=timecalc`
	`wotime=save`

8.12.4.2 Quick Input

The Quick Input tab is used to report several time receipts in a list form.

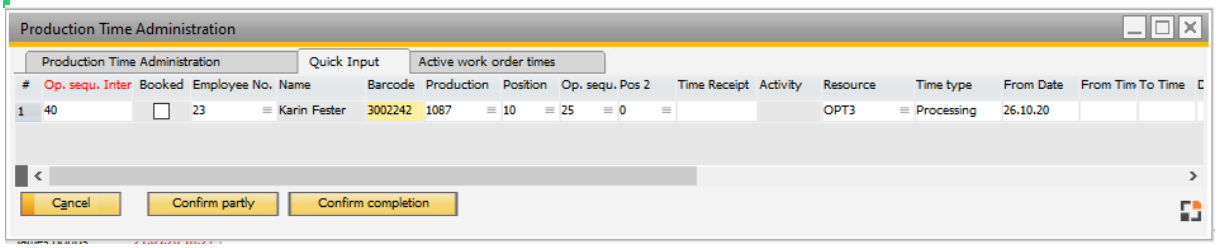
All fields available at the time receipt are also available in quick input but in a grid format. Each row is a time receipt and the columns are the fields.

For field descriptions ***see*** Production Time Receipt.

© 2026 Boyum IT Solutions A/S

Several lines can be added with the required information and then the information is added to the database when the confirmation buttons are used.

PATH: Production > Factory Data Capture > Production Time Administration > "Quick Input" tab.



Window fert_arbzeit_schnellerfassung.psr

Button	Description
Cancel	Closes the window without any action.
Add	Adds a new line.
Delete	Removes the selected line from the list.
Confirm partly	Part confirmation for all entered operations or complete confirmation if in the Close column a check mark was set.
Confirm completion	All operations on the provided list are posted and closed.

Important: Parallel calculations and the automatic division of the reported times to resources does not work from this window. The time receipt must be created in the terminal. This setting is available in **Configuration Wizard > Production > FDC > Parallel calculation**.

Field	Description
Booked	Check mark is displayed when booked.
Pers.No.	Employee number of person reporting the time receipt (setup in **Attendance > Personnel**).
Name	Name of the employee.
Default branch	Default branch of the item.
Barcode	Bar code printed on the work order document (***see*** **Routing > position > extended > Barcode**).
Production	Work order number.
Document	Work order of the previously selected document.

© 2026 Boyum IT Solutions A/S

Position	Position of the work order document.
Op. sequ.	Operation to be reported.
Pos 2	Parallel resources of the operation (previously resource pos).
Activity	Reported activity.
Resource	Resource Pre-assign a resource stored in the operation. Use right-click to select resources available for this employee. Any resource can be entered manually, resource groups are not allowed and therefore not selectable. ***See*** Resource rule Personnel Resources Resources
Cost type	Cost type on which costs are to be booked.
Cost center	Cost center to be charged (Business performance).
Time type	Time type In the resource up to 4 time types can be stored. With right-click the time type can be selected.After selection, it is checked, whether the time type is allowed for the current resource. If not, the default type is inserted. For more information ***see*** Time type *beas9.0-004-000-000*
From Date	Start date.
To Date	Date of valuation.
From time	Start time.
To time	End time.
Duration	Duration of work order time. Can be changed after calculation.
External price	External price.
Valuation date	Valuate to the specified.
Closed	Shows if the operation closed.

© 2026 Boyum IT Solutions A/S

Quantity yield	Produced quantity that is free from defects.
Quantity yield RE	Entry quantity in entry units, defined in operation. ***See*** Production – Routing – Extended – Time receipt unit.
Scrap	Scrap quantity in reporting units.
Unit	Quantity unit.
Item	Item number.
Information	Additional information.
Drawing number	Optional field.

back to production times administration

8.12.4.3 Active Work Order Times

In the "Active Work Order Times" window, all order reports are displayed have been logged in via **Attendance > Login and logout > Login work order** but not yet logged out.
These can also be deleted or modified. New entries are not possible.

As long as an active clock in/clock out exists, the affected production position cannot be closed.

back to production times administration

8.13 External Production

External production is an external service which creates external costs (Purchase Order, Purchase Invoice) and lead times. Administration of external operations is performed exclusively in work order structure view or the external operation system, divided in collective orders, provisions, goods receipt and posting of provision parts.

Webinar External Production (2017, english, 35 minutes)
Powerpoint for the Webinar from 2017

External manufacturing: process description.

Prerequisites and important settings.

- Customized adaptation
  - Data structure

Data structure in external operation

8.13.1 External production

External production is ordered as a service item by default: Purchase Order with service item.
If additional material is needed for the external production order: Purchase Order with service item and provision.

Process:
An external production is worked off in the following steps:

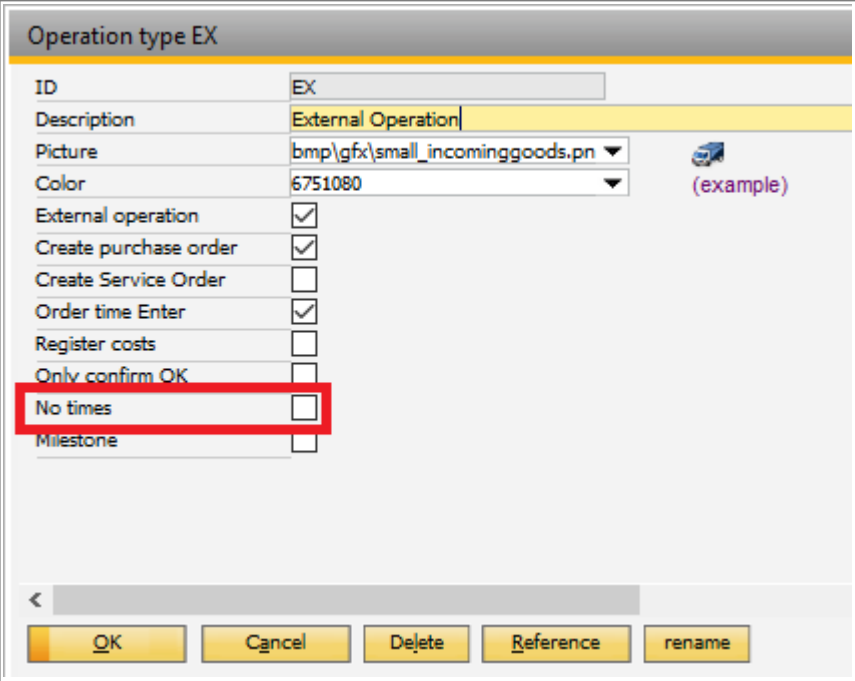
Preparation
Create service items, set up warehouse, operation and resource. Create external operation, assign suppliers and items.
Pricing is indicated in the configuration wizard.
Work Order is created.
Purchase Order is created.
Incoming Goods are posted.
Provision parts are posted.

The following procedure is not recommended: Purchase Order as a Service Order. This is available only for compatibility Reasons.

- Time reservation and lead time

  "Type" has to be deactivated in operation if a calculation of the lead time is required for external production.

© 2026 Boyum IT Solutions A/S



Window basis_agtyp_edit.psr

The tab "Standard" is now available in operation to enter time information.

An external work order can also reserve times on its stored resource. All calculations are made exactly as with a normal routing position.

Note: External production does not normally have a resource limit. To deactivate observation of resource limits, go to "Observe resource limits" in the resource.

Pure lead times (the time from purchase order to delivery) can be specified as follows:

With consideration of the factory calendar:

Mach+labor time (if quantity-dependent) or setup time (not quantity-dependent)

Specification in hours. To specify in days:

Open the corresponding resource

Specify the planned capacity / day = 1 hour

Now 1 hour in the external operation sequence corresponds to a day.

Without consideration of the factory calendar:

If you do not want to consider the factory calendar, the lead time is specified in idle time (in hours).

24 hours correspond to one day.

© 2026 Boyum IT Solutions A/S

The calculated end date is the to be awaited delivery date for the external production - delivery. The planned delivery date can be considered at a forward scheduling.

See

APS Calculation Types external production

Collective Purchase Order - Delivery date

see Pricing and transport costs

8.13.1.1 Collective Purchase Order

In this window, purchase orders for external operations can be created. Choose the external operation in the upper window section and enter detailed information in the lower window section. If several rows are registered, the purchase is summarized in case the supplier and target warehouse match.

Note: It is recommended to activate the parameter Only if Order closed when working with External production, as it does not allow the closing of a work order if an existing purchase order is opened.

The window is dynamically adjustable, templates are supported.

See Window settings and Templates. Info: In this window it is not possible to define a filter or other sorting in templates.

Access: External production Purchase order *(FRBEST)*

License: Basic

PATH: Production > External production > Collective Purchase Order

Window: fert_external_toorder_browse

Field Description selection list

Field	Meaning
Document	Document Number of work order.
Position	Position of assembly.
routing po	Routing position.
Order	Work order number.
Item	Item number of the assembly.
Description	Activity description (100 characters maximum).
(large text field)	Activity description from the second line.
Quantity	Required amount (remaining) of the assembly in consumption units.
CU	Consumption unit (assembly).
Ordered	Previously been ordered.
Order Quantity	Total requirement of purchase order (planned quantity).
max. quantity	max. order quantity (including consideration of the logon rules).

© 2026 Boyum IT Solutions A/S

Provision parts	If the check box is active, the provision is available.
Check	Can be ordered? (according to logon rules).
Price	Price per unit per "price per".
Price per	Price Factor.
Currency	Currency.
Total	Calculated total price including transportation costs.
Minimum Price	Minimum Price.
Shipping price	Transport price.
Shipping, per	Transport price is for each batch size.
Supplier	Supplier (service provider).
Delivery date	Requested delivery date.
target bearing	For provision parts: storage of the supplier (service provider) (External Storage).
Drawing number	Drawing number of the assembly.
DIN	DIN of the assembly.
Raw Material	Raw material of the assembly.
Matchcode	Match code of the assembly.
Group	Material group of the assembly.
Project	Corresponding project.
Resource	Resource of the operation sequence (External operation – resource).
Activity	Activity description of external operation.
Order Item	Service items included in the purchase order.
Cost center	Cost center to be debited.
Ordered (as a check box)	Already ordered Y / N.
UDF1-4 from work order position	Display UDF of work order position
UDF1-4 from work order routing position	Display UDF of Routing position
UDF1-4	Display up to 4 empty columns. It is possible to fill this field with Script. ***See*** Configuration wizard.

© 2026 Boyum IT Solutions A/S

Field description entry fields

For the entries selected in the upper list in the lower are the details that can be entered for the purchase of external services. Several rows can be registered successively to create a collective purchase order.

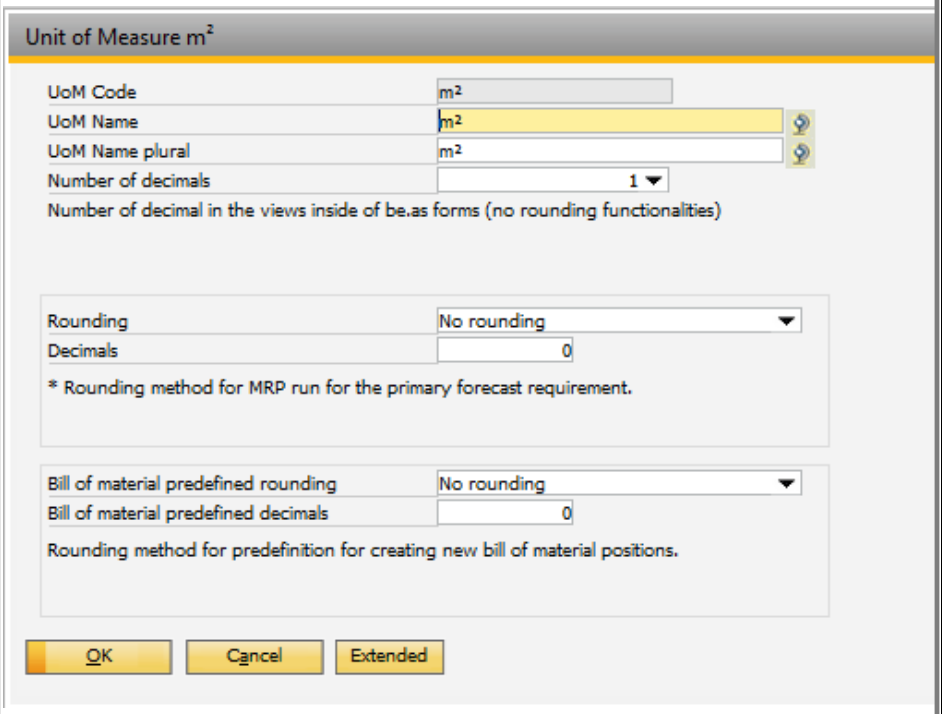
Field	Meaning
Supplier	Supplier / service provider. Selection takes depending on the setting. ***See*** Configuration wizard – Choose supplier.
Quantity	Quantity of the service item (service) to be ordered. Quantity is specified in Inventory UoM saved in the service item master data. The quantity is based on the Conversion formula defined in the UoM settings. ***See*** Edit operation – External operation Note: At the moment the quantity is changed, standard pricing is performed. If a price is found at that point, it is entered, overwriting the price stored in the operation. Only the maximum allowed quantity can be entered. Rules set up in **Configuration Wizard > Production > FDC > Registration rules** apply here. Depending on the setting, only the maximum Quantity allowed (***see*** list – column maximum quantity). The unit can be defined right of the quantity field. Usually, it is the warehouse unit of the service item. The conversion factor between consumption unit if the assembly and warehouse unit of the service item is defined in "factor" field. If conversion is active, the figures and the corresponding factor field text is green. As soon a purchase order is created, the "unit" field turns inactive. **Allocation** If you click on the icon next to the edit field, the maximum quantity is inserted. (allowed quantity is the one from column max.quantity)

© 2026 Boyum IT Solutions A/S

Rounding

The Allocation function using the rounding, defined in Unit of Measure to .. > Rounding – based on Purchase Unit

See Unit of Measure



Window basis_me_edit.psr

Based on the rounded Purchase Quantity, Beas recalculates the Factor between Work order UoM and Purchase UoM.

Example:

Requirement = `10 Pcs`

Purchase Unit = `Box`, Factor = `2.3333`

Rounding for Box = `Round up, 0 Decimal places`

Click on "Allocation" (golden arrow or button Allocate).

Calculation = `10 : 2.3333 = 4.28632`

Round up, 0 decimal places = `5`

Result = You need `5 Boxes` for creation of `10 Pcs`. We've a Purchase Order related conversation factor from `2.0000` and not `2.3330`. All follow processes use the order related factor (provision, issue, receipt)

© 2026 Boyum IT Solutions A/S

	Attention If the quantity is changed manually, Beas does not change the UoM – factor.
Unit price	Single price of service per price factor Price is determined automatically or entered manually. ***See*** Configuration wizard – Pricing If field "price list" was active and the price changed, it will be disabled afterwards.
Price list	If active, automatic pricing is performed. ***See*** Configuration wizard – Pricing.
Currency	Currency of unit price.
Price factor	Price factor for service-item. Field is visible only if "price list" was disabled.
Minimum price	Minimum price for purchasing service.
Shipping price	Transport price per lot size.
Total price	Calculated total price.
Delivery date	Delivery date The finishing date from the operation sequence which will be calculated at the scheduling or APS is the default for the delivery date. ***See*** External production - Time reservation and lead time A forward scheduling can consider the planned delivery date. ***See*** APS Calculation Types External production *(field "BEAS_FTAPL"."GESAMT_ENDZEIT")*
Target warehouse	For provision parts: warehouse of the supplier (of service) This is the target warehouse, on which you can transfer the Provision. Only available if you must transfer provision to the supplier (linked Material to this routing position). This is an internal warehouse, because you need the costs of the material in your own company.

© 2026 Boyum IT Solutions A/S

Beas transfers the material to this warehouse, but in reality the material is sent to the supplier.
If the product comes back, you make an issue directly from this target warehouse.

The target warehouse must be defined as an external warehouse. ***See*** Warehouse master data - Warehouse type
You can define
- one warehouse per supplier. For this, you can define the supplier in ***See*** Warehouse master data - Warehouse type
- one warehouse for all suppliers
- if the warehouse is a Beas Bin-managed warehouse, the system creates one Bin Code for every Supplier.
in this way you can see the stock per Supplier with only one warehouse. This makes the handling more simple.

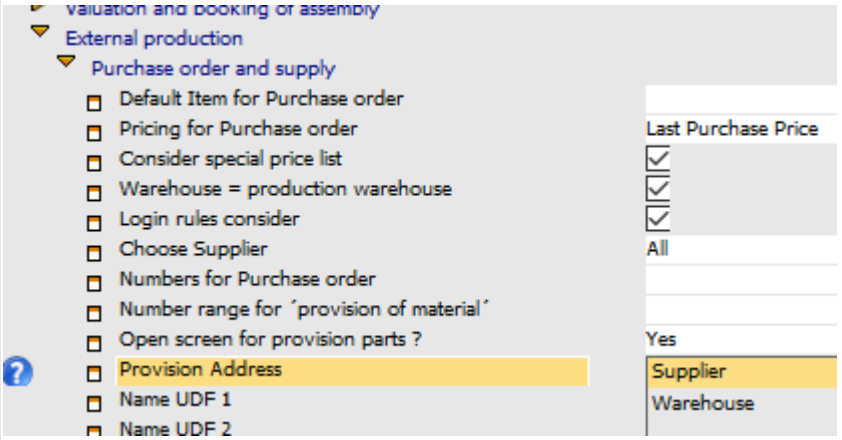
Warehouse Rule:
If an external warehouse is set for a supplier, the system takes this warehouse.
If no special warehouse is set for the supplier, the system takes the first external warehouse that is not linked to a supplier.
If no external warehouse is set, it is not possible to create the purchase order.

Delivery Address
This is the address from the Production of the supplier and not related to the purchase order.
The system inserts this address in the transfer document created from "Deliver provision".

The Address is taken from Warehouse or Supplier
Define this in **Configuration wizard > Production > External Production >**

© 2026 Boyum IT Solutions A/S

Purchase order > "Provision Address"



You can select the following warehouses:
All warehouses linked to:
- the supplier
- the same branch as the work order item

Multi-Branches
Due to accounts determination, the external warehouse needs to be of the same branch as the work order item.

Description	The first line of the activity description is displayed and transferred to the purchase order.
Long description	Extended long description

The text of the activity description on the routing from the second line is displayed. It is saved in the purchase order in field "freetxt". It can be printed on the document using this field which is limited to 100 characters.

Note: if a longer description is required, customization is necessary.

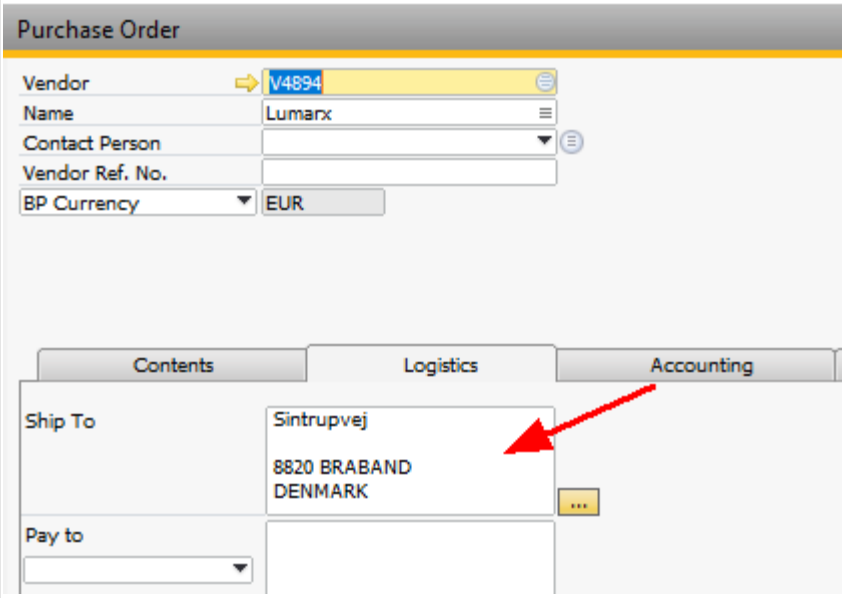
1. Create UDF on document line, Type "Text" e.g. "U_LongText"
2. Extend the document by this field
3. Enter the script:

© 2026 Boyum IT Solutions A/S

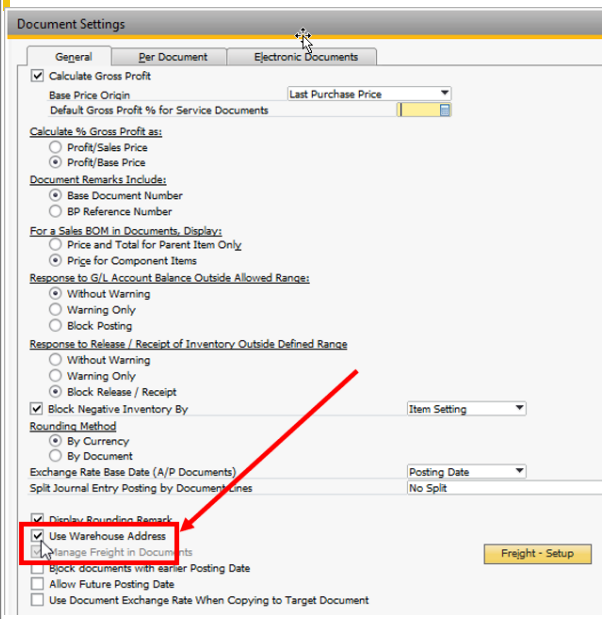
	`windowevent open`
	`// Activate Long-Text-Edit`
	`setvar=ib_longtext=true`
	`end event`
	
	`windowevent purchaseorderline`
	`porder=line=U_LongText=<item.longtext.value>`
	`end event`

Project	Related project.
Item	Service-item, included in purchase order. If the item is changed, the purchase unit and the factor between the purchase assembly unit is also determined, inserted and applied to the work order routing position. This factor applies for all purchase orders related to this operation sequence. From the first purchase order on, the factor may not be changed anymore. Consequently, the item is not changeable once the first purchase order was executed. ***See*** Edit operation – External operation – Item.
Factor	Conversion factor between consumption unit of the assembly and warehouse unit of the service item. When changing this value, changes are written back to work order routing. As soon a purchase order was created, the "unit" field is no more changeable. ***See*** Edit operation – External operation – Conversion factor.
Purchase order on Warehouse	Define the Warehouse for Purchase order Define the purchase warehouse and optional "Ship to" address for the Purchase order.

© 2026 Boyum IT Solutions A/S



Note: The system uses the address from warehouse only if "use address from Warehouse" is active.



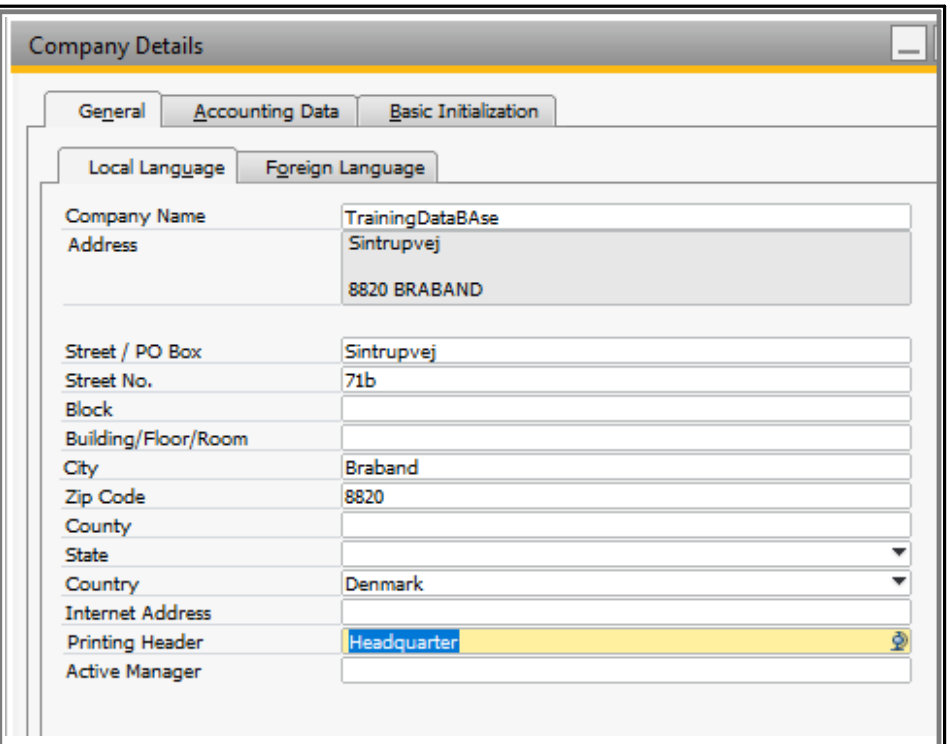
You can define this warehouse in operation catalog - Purchase address.

see Concept Address format

© 2026 Boyum IT Solutions A/S

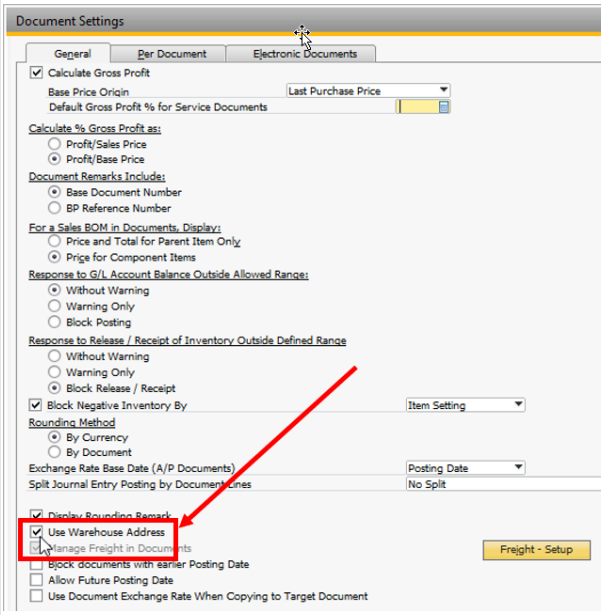
	Note: Beas use the Address Format defined in SAP Business One. For more information ***see*** Concept Address format
Address	Pay to - Address This is the address on which the supplier has to send the product back to their own company. The system saves this in **Purchase order > Logistics tab > "Ship To":**  This address is defined in **SAP Company Details > General tab > Local language sub-tab**:

© 2026 Boyum IT Solutions A/S



If in **Administration > System initialization > Document settings > General > Warehouse address** is activated, the address given here is used.

Warehouse = Purchase order on Warehouse.



Note:

© 2026 Boyum IT Solutions A/S

	This address is used only for the purchase order. The address for a provision document can be set up separately, and is related to the target warehouse. ***See*** Configuration wizard.

Further functions

Function	Meaning
Order	Create purchase order for all displayed rows, in which quantity and supplier do match and a correct date is stored. Note: a collective document is created only if the supplier and the warehouse match. ***See*** Configuration wizard – External operation – Warehouse = Production warehouse.
Cancel	Close window without saving changes.
Draft pur. Order	Create a drafted purchase order.
Only Shortage	Display only entries with shortage.
Window settings	Setup of columns, colors, etc.
Pre-assign	Automatic pre-assignment of purchase qty and price for all rows. The field "purchase quantity" is automatically filled for all visible rows. Additionally, the price is determined and the total price is calculated. Dates from the past are set to "today". The maximum allowed quantity is filled at most. All rules stored in the configuration wizard are taken into account.

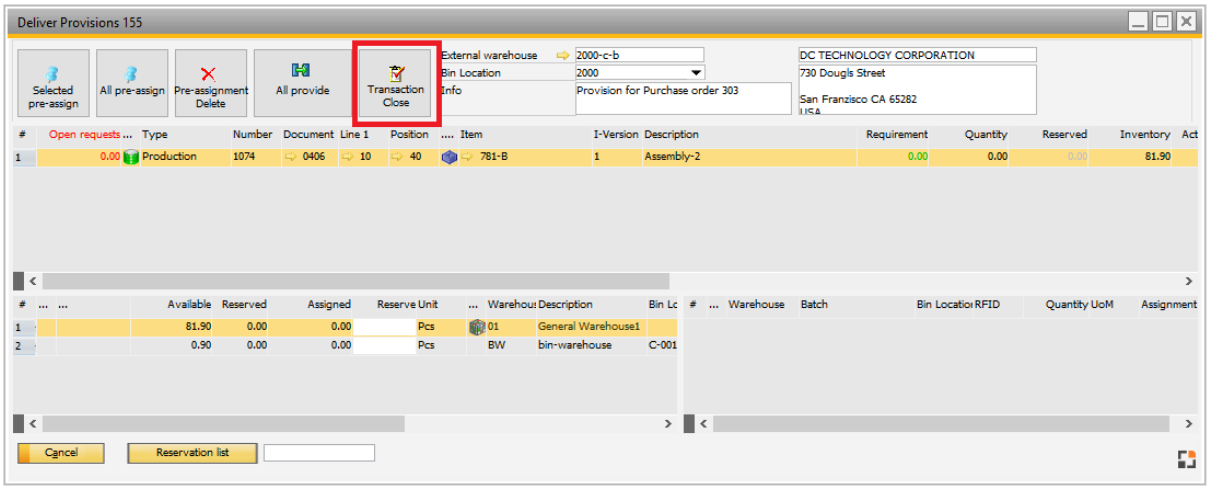
8.13.1.2.1 Deliver Provision XXX

In this window you can deliver provisions for an external operation.

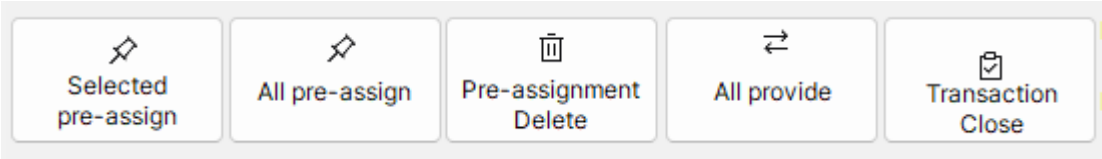
PATH: Production > External production > Provisions > **Open** an entry

© 2026 Boyum IT Solutions A/S



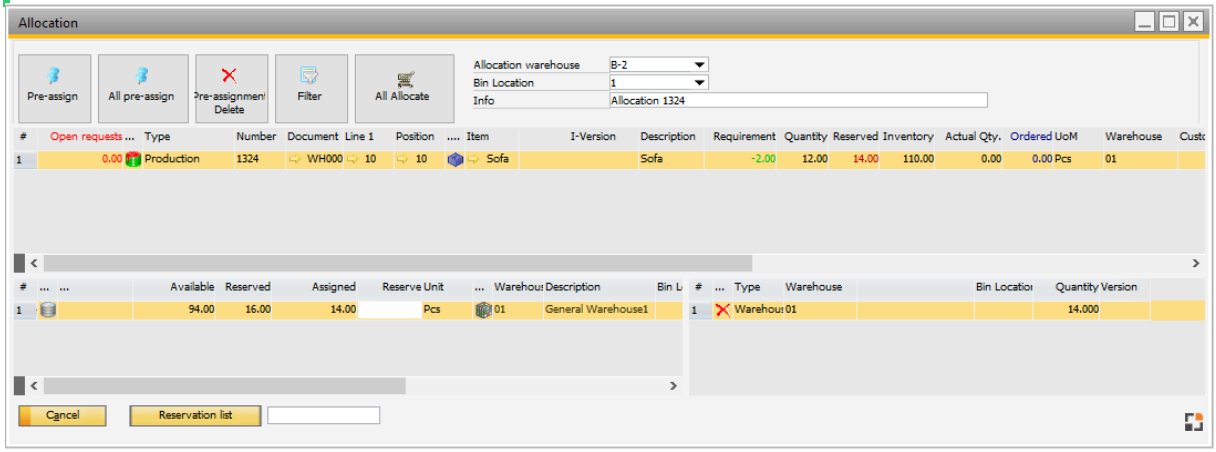
Window reservation_set_master_psr

Boyum Style Top bar buttons design:



The allocation/deliver function is used to transfer material needed for a work order from a default warehouse to an allocation warehouse. The material is also reserved for that work order. When doing an allocation, Beas creates a transfer document. Usually this is cost-neutral and not assigned to the work order.

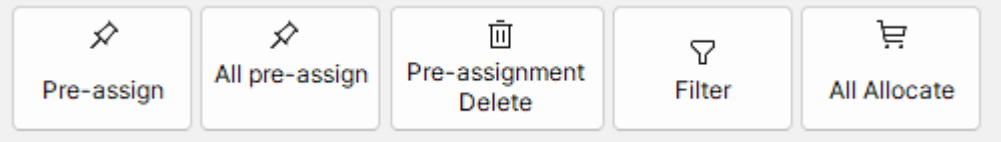
PATH: Production > Work Orders > right-click an allocation in the WO structure / right-click an item > "Allocation".



Window reservation_set_master.psr

© 2026 Boyum IT Solutions A/S

Boyum Style top bar buttons design:



- Prerequisites

[Reservation system](#) must be activated.
[Allocation warehouse](#) has been defined as type.

- Process of allocation

Transfer from standard item warehouse or from warehouse defined in BoM to the allocation warehouse. Goods are transferred via SAP Business One-transfer function to the allocation warehouse, a reservation is created. After finishing the product: manual or automatic backflushing of the material.

See: [Reservation system](#)
[Backflushing](#)

[Charge off reserved material](#)

Window structure

Header [Functions in header](#)	
[Requirement list](#)	
[Inventory list](#)	[selected material](#)

- Scanner support

The active field is always the entry field in the lowest line. This can be used for registration via scanner. There are two settings:
Production > Material posting > Backflushing > [Material posting with scanner](#).

Active:
A matching batch or serial number is searched. If an entry is found, it is used and the required quantity is accepted. If no entry is found, an error message is issued: no entry found.

© 2026 Boyum IT Solutions A/S

If the entry is blocked, (batch status, blocked bin location) the entry is not accepted, a message is issued.

Inactive:
Beas searches for the following entries: Batch number: field is selected, the cursor is set to quantity field.
Serial number: quantity is accepted immediately.
Item: entry selected, cursor is set to quantity field.

If no matching entry was found and the entry is numeric, the current entry is accepted including the quantity.
Error messages are issued in no case.

See
Configuration wizard – Material posting with scanner
Reservation
Material issue
Allocation
External operation Allocation

Fields right of the ribbon

Only some fields explained in the table below are displayed, depending on the work flow.

Field	Meaning
Posting date	**Postings**: select the posting date.
Allocation warehouse	**Allocation**: allocation warehouse. Setting is saved per work station. Note: this has no effect on the reservation and issue screen. ***See*** Reservation window, Material posting.
Bin location	Bin location of the external warehouse to which material is transferred (field is only displayed if the warehouse has bins). For reservation the definition of Bin Location is mandatory
Address	Address of the external warehouse.

© 2026 Boyum IT Solutions A/S

Functions in upper ribbon:

Button	Meaning

Pre-assign Quantity (manually)	Visible in WO Stock Transfer Request window.
	With this option the user can manually pre-assign quantities for each material line based on the equivalent amount of the parent product. In the quantity field you can specify the quantity of the parent product. Apply changes for the selected lines.
	
	Example:
	To manufacture 1 product A, you need:
	• 2 MA
	• 3 MB
	  • 20 MA
	  • 30 MB
	  • 2 * 2 = 4 MA
	  • 2 * 3 = 6 MB
	  • If Quantity is <= 0, the status bar message appears: "a quantity is required for pre-assigning"
	  • if Quantity is > 0, calculation is made for each Material in the list, considering part of the quantity of this BoM according to the Parent Quantity Field on the pre-assign button. Consider proportion of calculated scrap quantity. The result will be in the Column "Request" of the Material List.
	  • If you have reservations, the system will assign the reserved quantity to the right matrix.
	  • Beas create a transfer request document in background. This don't support any Bin management system. It is possible to choose item from bin managed warehouse, but the bin location information is not saved in the transfer request document
	
	Pre-assign Batches and Serials:
	Attention: In WO Stock Transfer Request, the pre-assign process does

© 2026 Boyum IT Solutions A/S

	not select any batch/serial numbers, unless there is an existing reservation. ***See*** WO Stock Transfer Request creation process.
Pre-assign	All entries selected in the upper list will be pre-allocated automatically Sorting 1. Reserved goods for this order line 2. Allocation warehouse 3. Default warehouse as per BoM or standard warehouse of the item Within this, batches and serial numbers are sorted by withdrawal rules according to the configuration wizard. ***See***: Configuration wizard. Normal items (not batch- or serial number related) will be pre-allocated only if the issue method was set to "automatic" in the Item master. ***See*** Item master – Issue method. Allocation rules **Batch and serial numbers** Within this, batches and serial numbers are sorted by withdrawal rules according to the Configuration wizard. ***See*** Configuration wizard – Backflushing **Warehouse** Only warehouses allowed to be used for the relevant process are considered (Reservation, issue etc.) ***See*** extended warehouse settings Available at **General settings > Warehouse > Warehouse master data > Extended**

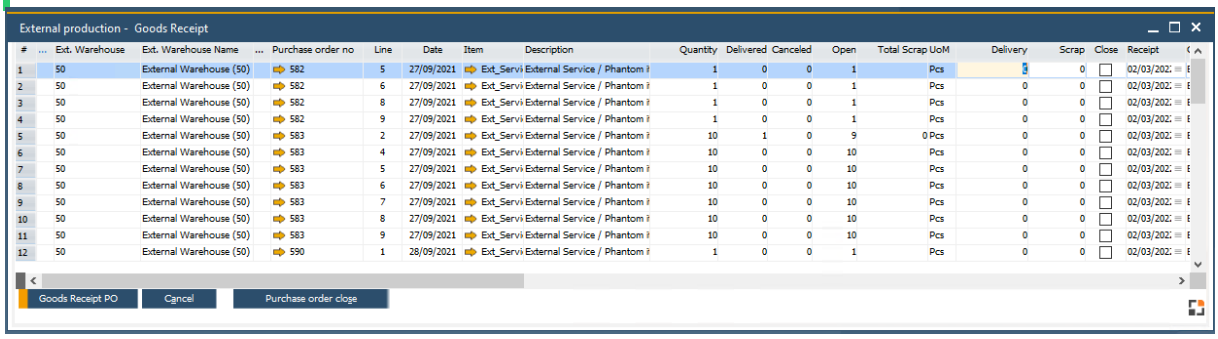
8.13.1.3.1 External Production - Goods Receipt of Supplier XXXXX

Goods receipt from external operation is processed and completed in this window.
The delivered quantity and scrap can be entered here.
If less than the full quantity was delivered, the operation stays open. To complete it, the switch "closed" needs to be activated.

PATH: Production > External production > Goods receipt from external production > click **Goods Receipt PO** button.



Window fert_external_openorder_edit.psr

Further action

Goods receipt can call other actions which depend on further settings:
- Last goods receipt: automatic posting of the assembly or issue the materials (backflushing)

© 2026 Boyum IT Solutions A/S

- Provision parts: issue provision parts.

See Configuration wizard – External operation – Goods receipt, Production – Material issue.

- Stored cost type in assigned operation sequence: create a journal entry. ***see*** Routing – Cost type, Cost types

- Create Quality control orders if an Inspection plan was stored in the assigned operation.

The following fields are displayed by default. Use window settings or templates to adapt the window.

Field	Meaning
Barrel icon	Empty: no quantity Green half -full: not enough quantity Green full: correct quantity Red: too much entered
Icon	Icon of external warehouse
Ext. Warehouse	External warehouse ID
Ext. Warehouse Name	External warehouse name
Purchase order no	Purchase order number.
Line	Item line.
Date	Date of purchase order.
Item	Item.
Quantity	Total purchased quantity.
Quantity (Assembly quantity)	Assembly quantity multiplied by the defined Conversion factor. ***Example:*** If Quantity = 500 and the Conversion factor is 0,02, then the Assembly quantity = 10
Quantity (Assembly quantity without factor)	Assembly quantity without factor - the defined Conversion factor is ignored.
Canceled quantity	Canceled quantity.
Delivered	Quantity already posted in via External operation – Goods receipt (including scrap).
Scrap	Total amount of reported scrap.
Delivery	⊟ Delivered Quantity to be posted in. Enter the quantity (in purchase units) which has been delivered and accepted. Scrap quantity may not be

© 2026 Boyum IT Solutions A/S

	considered here. This field is displayed selected in the first line by default. If the option Production > External production > Goods receipt > Max. Purchase quantity was enabled, you can enter the open quantity. If the total purchase quantity has been delivered, the document is closed automatically. Scrap quantity is not taken into account. Subsequently, the purchase order cannot be opened. A new purchase order needs to be created.
Scrap	Quantity of scrap in delivered quantity Enter a quantity which cannot be used anymore. **Note**: Scrap is saved in goods receipt document. That why scrap cannot be reported without entering an amount into yield quantity. Value is saved in pdn1.u_von_lag When issuing provision material, the scrap quantity is taken into account. ***Example:*** For each delivered piece a plug is provided. Goods receipt: 2 yield, 1 scrap: 3 plugs are issued. **Concepts** Reporting scrap the document is not closed automatically if the planned quantities of yield and scrap were reached. The documents needs to be closed manually by using the "close purchase order" button. For subsequent delivery a new purchase order needs to be created.
Close	If active, the order is closed. Receiving the planned quantity, the order is closed automatically.
Receipt	Date of receipt.

© 2026 Boyum IT Solutions A/S

Comments	Comments entered here are transferred to goods receipt document.
Provision	Provision parts.
Supplier	Supplier.
Total scrap	Entered scrap + already reported scrap.

Additional columns are available for references to client, warehouse, operation and item.

Buttons

Function	Meaning
Goods receipt PO	Goods receipt is processed. Per line a separate goods receipt is created. A collective goods receipt is impossible, because SAP Business One would summarize the costs to one journal entry. Then, the entries (work in progress) could not be assigned correctly to the single work orders. To report only scrap is not possible. The scrap quantity is stored in the field `pdn1.u_von_lag`. Further actions may be triggered by goods receipt. ***See*** further actions. NOTE: Beas does not support "Freights from SAP documents", and freight is not copied from the origin document when creating a Goods Receipt PO from external production.
Cancel	Close window without changes.
Purchase order close	The current purchase order is closed, even if the delivery was not complete.

Field Description

Field	Meaning
Goods Receipt	Document of goods receipt.
Date	Date of the document.
Supplier	Supplier of the external operation.
Name	Name of Supplier.
Warehouse	Supplier warehouse.
Delivery Date	Date of goods receipt.
Reference	Reference.

back to external production

8.13.1.5 External production (default)

Prerequisites

Item

Although external production is a service (e.g. powder coating, which is provided by a supplier), it is created as an "Item".

Important: Do not create as a stock item! "Scheduling" is chosen as a planning method, and "Buy" as a Procurement Method.

For recurring items, it is advisable to assign a unique item number as this simplifies price determination.

External operation

In the Operation catalog a new operation for external processing needs to be created with active properties "external" and "create purchase order"

© 2026 Boyum IT Solutions A/S

In the Work Order a new Operation e.g: 1000 "external processing" is created. To this operation the supplier and the item is assigned.

Resources

A resource for outsourcing is required. In this resource an external cost type is to be stored.

External warehouse

An external warehouse needs to be set up and assigned to a supplier. ***see*** Extended warehouse settings

Further settings:

Pricing

Important: You can specify the price, but it will be overwritten by price determination.

Pricing is defined in the Beas Menu under **Configuration wizard > Production > External production > Purchase Order and Provision**

Select an option for the default item (e.g.: Powder coating) and the preferred setting for pricing (e.g.: Last purchase price). This price determination applies to all items.

Work Order

An external work order is defined by including an external resource. There are several possibilities for creating work orders:

- Unique external production: first select the work order, then pick out the appropriate operation using the context menu (right mouse button)

then chose [Create Purchase Order].

- Several selected work orders: chose the desired work orders (press left mouse button, a red plus appears) after this using the context menu (right mouse button) select Collective Purchase Order.
- All work orders in Beas: **Production > External production > Collective Purchase Order.**

A new window "**External production > collective purchase order**" opens.

Collective Purchase Order

If all defaults have been specified, the supplier, price and item are already selected. You only need to enter the required quantity.

The description is displayed in the purchase order as the item description. The long text of the description is displayed in the purchase order as free text.

Press [Order] to create the purchase order in SAP Business One.

© 2026 Boyum IT Solutions A/S

Goods Receipt

If the external delivery by the external supplier has been carried out, goods receipt can be booked.

Beas Menu: **Production > External production > Incoming Goods for external production** or select it in the work order via context menu (right mouse button)

The Incoming Goods of the External production is displayed as grouped by supplier and stock. By double-clicking a line, details appear.

Typing the delivered Quantity in displayed and clicking on [Incoming Goods]. Subsets also can be added to stock.

Partial quantities can also be entered.

8.13.1.6 Pricing and transport costs

The transport costs can be calculated directly for the precalculation and also for the purchase order.

The following fields are available for this:

Field	Meaning
Supplier	Default supplier. If this is specified, it is loaded by default in purchase orders or quotations and the pricing considers the special price list of the supplier if no price was specified for unit price. ***See*** Configuration wzard – Choose Supplier
Item	The service item is specified here. This is a non-inventory-managed item, as it is a pure service. If no unit price is specified, pricing is carried out for this item.
Unit price	Service price per price factor ***Example***: €10 per 1000 price factor corresponds to a price of €0.01 per unit If no price is specified, the price is calculated using the default pricing. ***See*** Configuration wizard – Pricing
Price factor	Unit price is stored per the value entered here
Minimum price	The minimum price is specified here. If the total unit price is below the minimum price, the value specified here is used.

© 2026 Boyum IT Solutions A/S

	Example €10 € per 1000 units, minimum €30 For 1000 units €30 is calculated (minimum price) For 10000 units €300 is calculated (unit price higher than minimum price)
Transport price	The transport price is also added. This is payable per transport lot size. ***Example*** €10 € per 1000 units, minimum price €30, transport price €100, lot size 5000 1000 units are €30 + €100 transport price = 130 € For 10000 units: €300 € + €200 € transport price (2 x lot size) = €500 €
Shipping per	The quantity specified here can be sent per transport. see Transport price ***See*** Transport price

Collective Purchase Order – Price per unit

Configuration wizard – Purchase order and provision

back to external production

8.13.1.7 Concept of External Production

External production as last position

Definition: Last position = last reportable position. When the last position is reported, the assembly is automatically entered, and the work order position is closed (if applicable).

If the external production operation has submitted parts, the receipt is only affected if the posting of the submitted parts is marked as "Done". Otherwise, the receipt is carried out when the goods are received.

© 2026 Boyum IT Solutions A/S

Warning:
If an assembly valuation is performed at costing analysis price or a journal entry is made on the basis of the WIP functionality, and there is no purchase invoice for these incoming goods at that time, the price as per the incoming goods (and therefore) the price as per the order is used as a reference for the order - depending on the configuration of the valuation methods.
If a different value should be subsequently entered in the purchase invoice, this is no longer considered.

Special case – WIP:
If the work order was already closed and the purchase invoice is created with another value only then, correction is possible as follows:
1. Open the work order and the assembly in question
2. Close work order and the assembly in question again
Beas automatically performs the correction postings which are necessary.

Provision on a central warehouse:
If a bin location warehouse is defined as external warehouse and a supplier is not stored there, this warehouse is automatically used for External operation - Provision if no other warehouse with supplier was found. u
IMPORTANT: This warehouse must be a bin Warehouse.

All provisions will now be posted to the warehouse with the ID of the business partner according to the purchase order.
Advantage: you need only one warehouse; goods are distributed on bins. If there is no bin, it is created automatically.
For backflushing (issue provision parts) at automatic pre-allocation, only the inventory on the supplier's bin is considered.

Note: for manual selection all bin locations are available.

As service order

Note: This concept is provided for compatibility reasons and must be activated via Configuration wizard > Production > External production if required. The system is not recommended generally.

© 2026 Boyum IT Solutions A/S

If an "External operation resource" is added to a resource in an operation, no times but costs are defined for this.

An external delivery note can be created via Work Order – Delivery Note.
More parameters can be stored in this way:

Field	Meaning
Supplier	Can be specified in the position.
Delivery Date	Delivery date of the goods produced via external operation
Price	For price determination, ***see*** below.
Quantity	Quantity of external service
G/L Account	Can be selected. Beas stores last input.
Tax ID	This field is normally invisible. You can make this field visible using the window properties. Usually, no change is necessary, since the tax ID as per SAP Business Onesettings is used.
Purchase Order Description	Text on order
Info	Further information

A service order is then automatically generated in SAP Business One. In terms of inventory, no transaction takes place.

External operations do not have to be reported.
However, there will be an invoice for the service order. For this purpose, the invoice is created via a call up from the service order. The production costing analysis considers the price according to invoice.

Service orders do not have any quantities or individual prices.
Beas only saves the total price and the quantity in the "Number to produce" field.
This is the user-defined field u_beas_fpq.
The allocations to the work order are also saved in the 'word order document' (u_belnrid), 'work order position' (u_belposid), and 'routing position' (u_posid) fields.

Price determination

© 2026 Boyum IT Solutions A/S

If a special price list is stored for the assembly for which an external operation is stored, this price list is used as a price for the external operation.
Therefore, this price is not the price of the assembly, but the price for the external operation.

Date definitions and scale prices are supported.

The prices are stored "per quantity" as per the external operation.
This means that if the column contains "per 1000", the price in the price list should be read as "Price per 1000 units"*.

see
Resource
Routing

8.13.1.8 External production with provision

If the external supplier requires material for external processing, that material can be transferred to this supplier stock. This is called "Provision" in Beas.

External operation
For assigning provision material to an operation of external production, it is inserted in the Bill of materials. By choosing a work order position (field Apl.Pos) the provision material is associated with the external operation.

Supplier Stock
For each external supplier a warehouse in SAP Business One has to be created as follows:
Administration > Setup > Stock Management > Warehouse > Add

Example: "L123" fill in address fields, tick the box "nettable" (scheduling-relevant flag)
Add the warehouse. Select it again and click [extended].

> Note: This button is only available in the integrated version (SAP & Beas).

Required settings:
- Warehouse type: External Storage
- Supplier: please select a supplier

Selection of work orders
External production as described in the previous chapter (default)

© 2026 Boyum IT Solutions A/S

Batches:
You must enter batch-managed items using [Single provision].

For batch-managed items, the window is split in two. The batches can be selected in the bottom section. Multiple selection is possible.
Multiple batches can also be used here. (=multiple partial quantities). Double-click on a batch entry to load the requirement quantity into the batch quantity automatically.

When you have finished selecting provision quantities, click on **Finish**. A unique number (= provision number) has been assigned for all items in this provision.

Collective purchase order
A new window, "External production – Collective purchase order" is displayed. It displays the address of the external warehouse to which provision material is to be posted. The long text of the description is displayed in the purchase order as free text. The description is displayed as item description.

Now you just need to enter the required quantity and the target stock of the external supplier. Press **Order** to create the purchase order in SAP Business One. To complete the order, the provision material needs to be transferred from the store to the selected target warehouse. This action allows you to determine how much material is available and from which supplier at any given time.

To perform the transfer, either select the operation in question via the pop up menu [Provisions] or select **Production > External Production > Provisions.**
Double-click on a row to display the details of the transfer. (shown in window "Stock transport")

Use **Fill PO quantities** to insert the quantities from the purchase order. Batch- or serial number-managed items are not inserted. Inventory location-managed storage locations are not supported.
Enter the required quantities (partial quantities are also permitted) and click on [Reserve].
Purchase orders for external operations can be created in this window.
In the top window, the external operation is selected; in the bottom area, the detailed information is input.

Goods receipt
Goods receipt is performed as described in the previous chapter (default).

© 2026 Boyum IT Solutions A/S

To close the goods transaction, you must transfer the inventory from the supplier store. Select in Beas menu **Production > External Production > Issue Parts Submitted**.

All items for which a goods receipt has been performed are displayed. Select a row and [Edit] to display the details.

Enter the required quantity in the Issue field and click on [Issue individually].

The system may only permit batch-managed items to be entered individually, in which case a dialog is displayed for selecting the quantity and batch.

Click on [Finish] when you have completed the transfers.

back to external operation

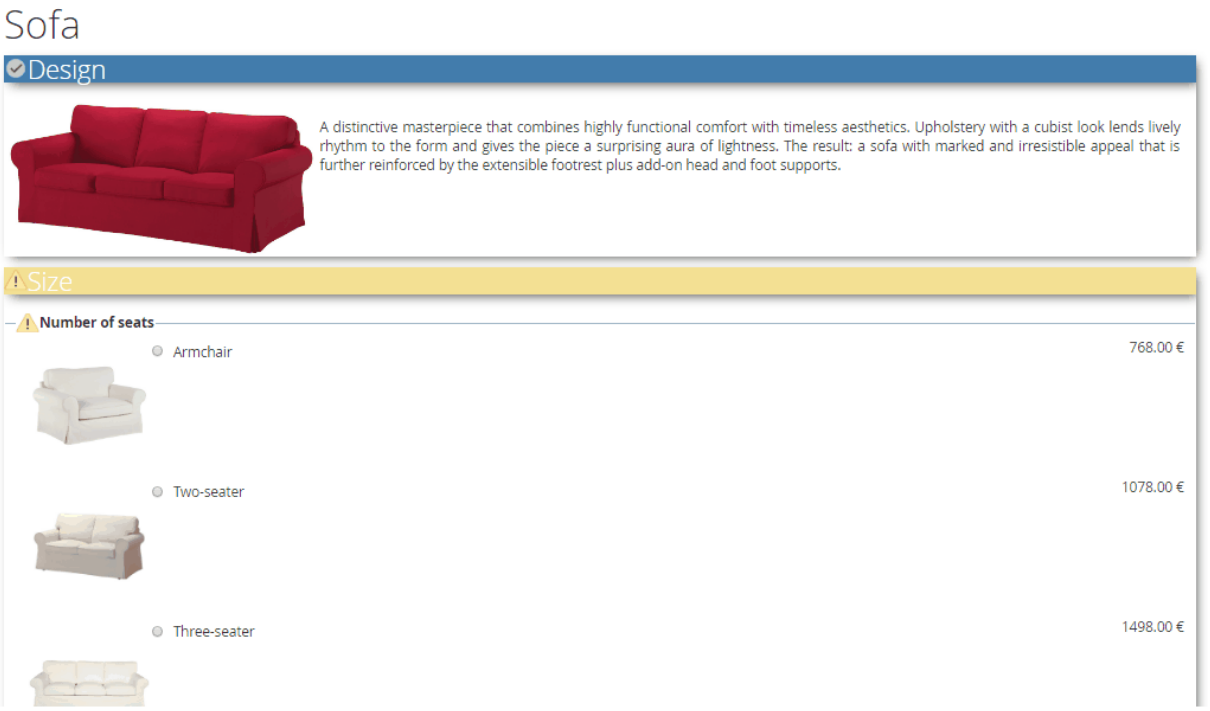
8.14 Product Configurator

Use the Product configurator to configure products in different stages of the business processes. The configurator allows you to generate item, routing, and Bill of materials variants easily. Unlike variants, you have the option of forming an infinite number of configurations.

You can enter important parameters that characterize a product when creating a customer order or customer quote, so that variants of the products can be defined in Sales already. The product configurator provides a convenient visual interface for this purpose.

Taking the example of configuration for a sofa: If a customer order for such a sofa is created, you can open the configurator from within the order. Now, you can make product-specific adjustments, such as the size or cover fabric of the sofa. This defined characteristic of the “sofa” item is called a variant.

© 2026 Boyum IT Solutions A/S



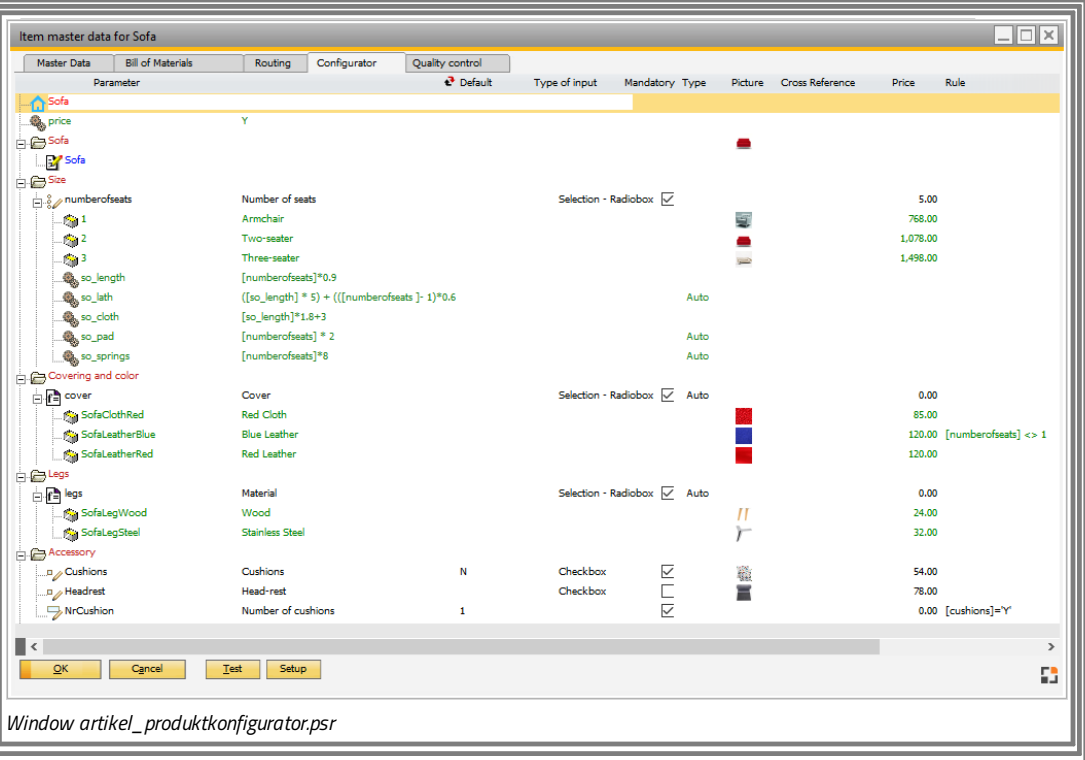
You can then generate multilevel work orders directly from a variant, customizing the bill of materials and the routing according to the specifications from the variant – e.g. by including the selected cover fabric in the BoM. You can also calculate an existing variant.

- Start configurator

  The configurator is available in two variants:
  - WEB variant
  - Beas / SAP Business integrated variant

  - This is available via:

© 2026 Boyum IT Solutions A/S



Window artikel_produktkonfigurator.psr

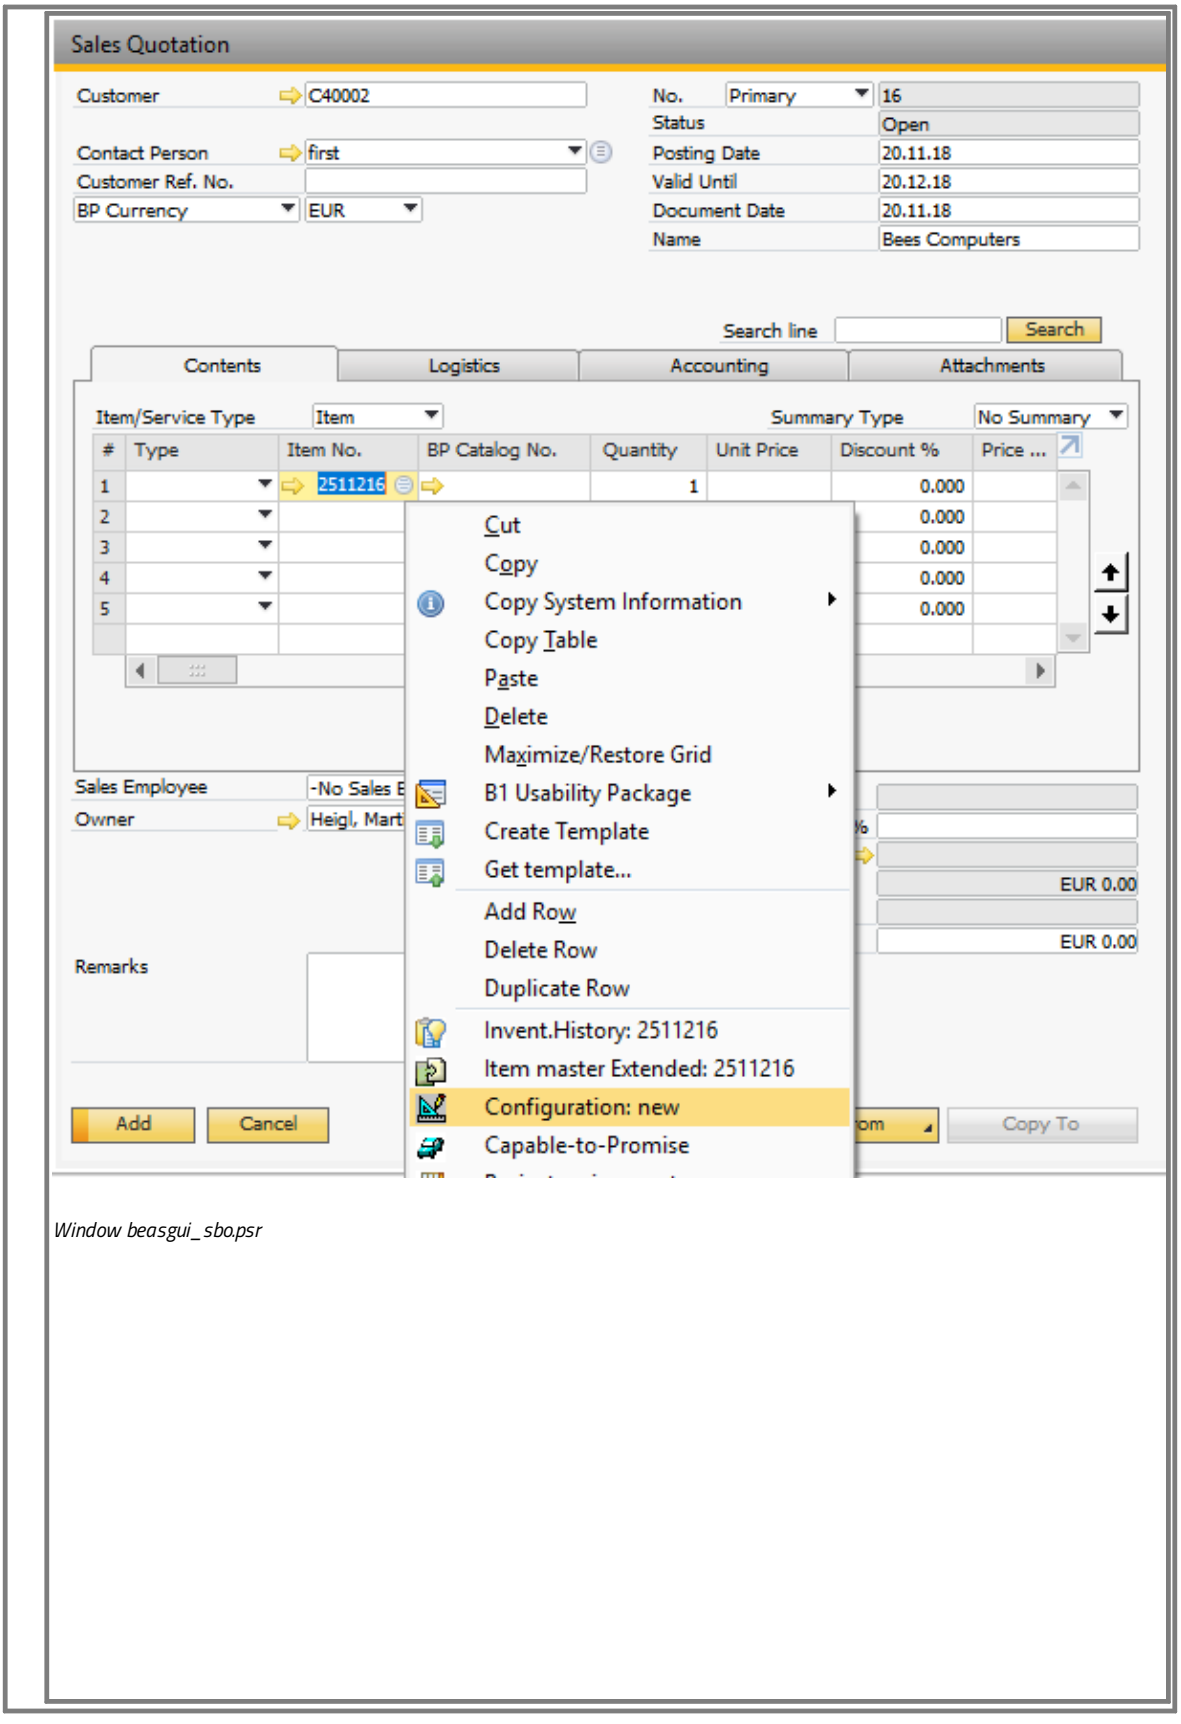
Quotation and Sales order

It is possible to call up the configurator from a Sales Quotation or Sales Order. You can select an item in which a configuration is stored and define data on master level (***see*** image below: Item master Extended: xxx).

After selecting the customer and the item of the SQ or SO, you can call up the configurator by:
right-click on the item > "Configuration: New". ***See*** image below.

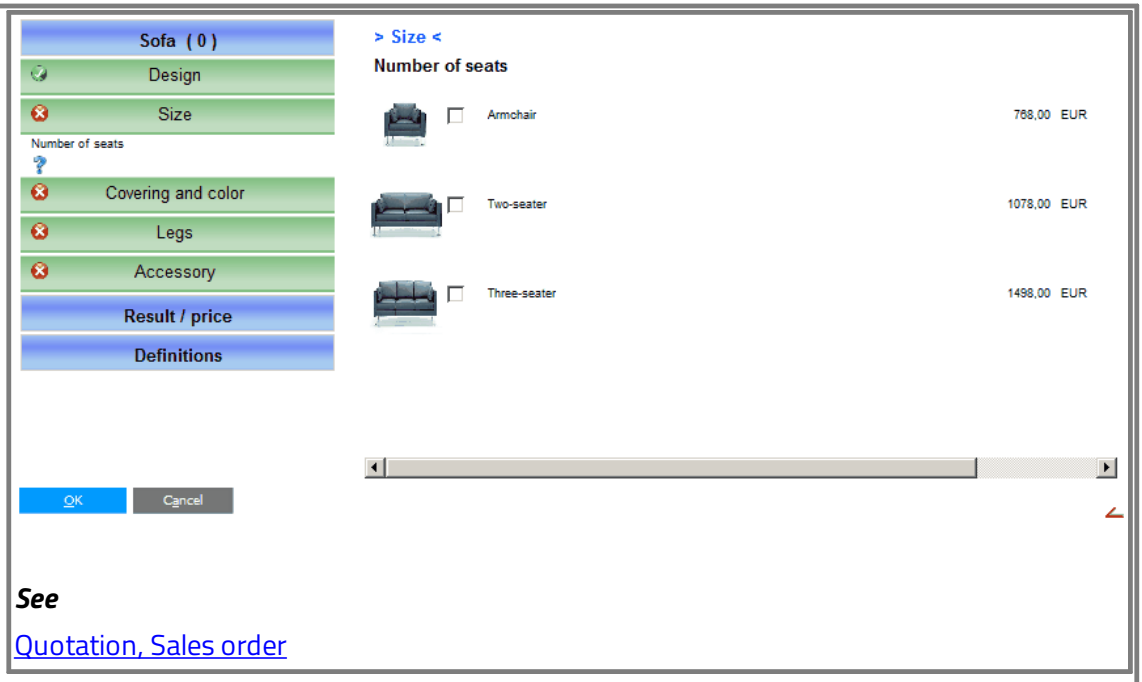
- optional: create Precalculation
- optional: transfer price directly

© 2026 Boyum IT Solutions A/S



Window beasgui_sbo.psr

© 2026 Boyum IT Solutions A/S



See

Quotation, Sales order

Order-related production

The system can also access Formulas, Tables, Variables or scripts that were created in the Variant generator . You can use these references to control variant-dependent BoM quantities or add/remove BoM positions.

An example here would be a sofa produced in different lengths.

The quantity of the cover fabric depends on the length of the sofa. The Beas product configurator now allows you to calculate the required material based on the length of the sofa. To do this, store a formula for its calculation with the quantity in the Bill of materials of the cover fabric. The length - if so defined - can now be used at all levels of the BoM breakdown, so that e.g. the quantity of screws can be calculated depending on the length.

You can also modify operations to determine dependent machines or calculate times.

Another important flag to modify BoMs is the "Active" flag. You can also store formulas here that can then deactivate or activate entire BoM positions with the result "Y " or "N". For the sofa, for example, the sofa cover to be ordered could be selected depending on the color.

Webinar about Product configurator

Video: Product configurator with scripts

- Calculation of item variants during the sales process

  You can perform a calculation for a line, according to its variant, from a quote or order in SAP Business One The calculation is always performed for the line where the cursor is positioned. Parameters not defined in the variant are queried explicitly during the BOM breakdown. A calculation structure modified according to the parameters is created. The result is usually displayed to Beas in the calculation window. You can also convert it into a work order.

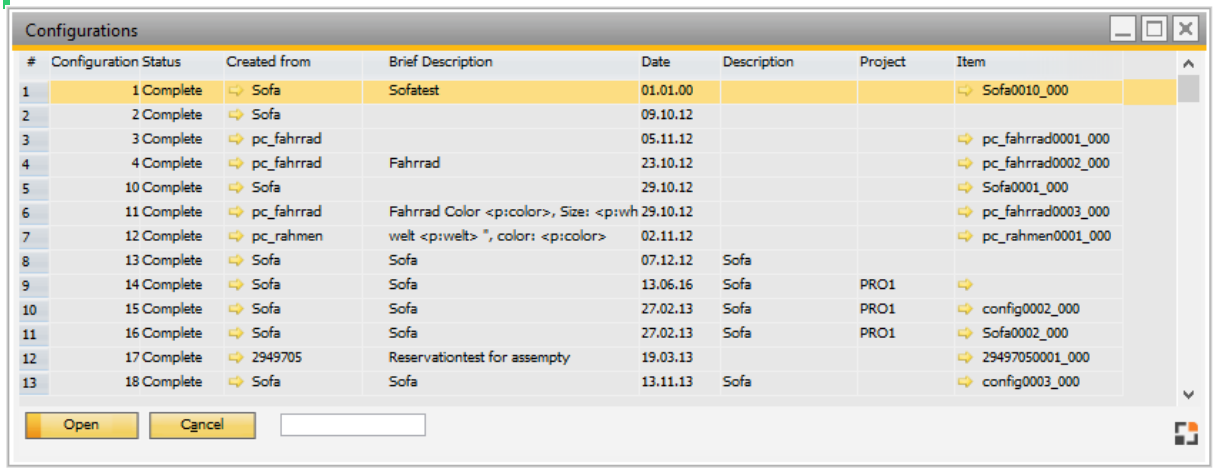
- Production of customer order-based variants

  Use the Beas function "Customer order for work order" function to generate a work order for a customer order line. This transaction considers the corresponding variant. In other words, the parameters are evalued during the breakdown according to their occurrences. An order structure matching the variant is created. Parameters not predefined are queried during the BOM breakdown.

8.14.1 Configurations

This window lists all existing configurations.

PATH: Production > Product Configurator > Configurations



Window caft_variante_kopf_browse

© 2026 Boyum IT Solutions A/S

Field	Meaning
Configuration	Nr. of configuration or variant
Item	Item number
Created from	Item number, from which the configuration was created
Brief Description	Short description (max. 255 characters)
Date	Date of creation
Description	Description (max. 16K characters)
Project	Assigned project

Function	Meaning
Open	Open the Editing window for the selected configuration.
Add	Create a new configuration Create a new configuration.

see:

Configuration wizard – Production – Product configurator

Create new variant

back to introduction Product configurator

8.14.1.1 Configurator (integrated)

The product configurator is usually called when creating quotes or orders in SAP Business One using the right-click menu. (create new configuration, or select configuration No.) After completing the configuration, the variant ID is saved in the document line in field "variant".

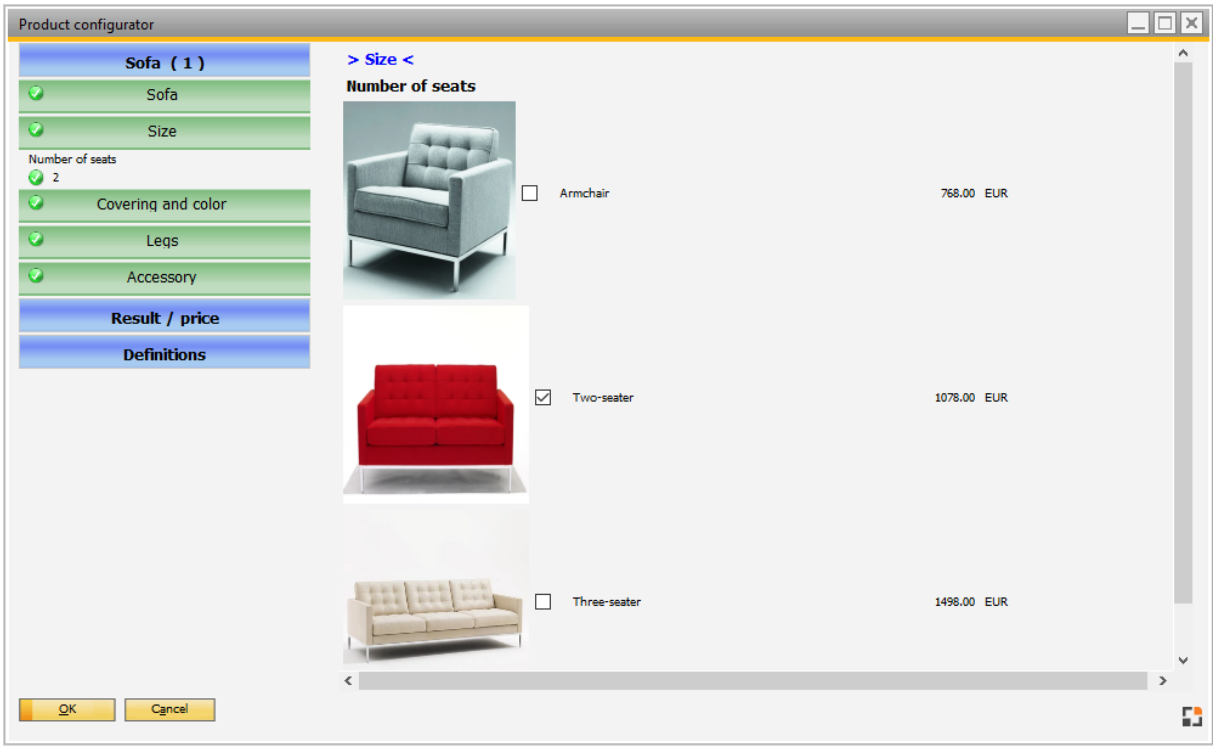
Graphical User Interface

The product configurator basically consists of two areas – the navigation area on the left side, and the detail area on the right.

PATH: Item master data > Configurator tab > item > **Test** button

On the left, elements of the configuration are displayed in green (in sofa ***example***: design, size, legs, accessory). These elements can be expanded.

© 2026 Boyum IT Solutions A/S



Window prd_links2.psr

Blue buttons on Top:

Field	Meaning
Description/Header	Configuration name, defined in dedicated configuration structure. The assigned variant number is displayed in brackets. "0" means new creation.

Blue buttons on bottom:

Field	Meaning
Result/Price:	All elements are displayed in a table form, including description, amount, and total price (if price processing was selected in the header line of the configuration structure). Note on price usage A price calculation takes effect only if the checkbox "use prices" is marked in the configuration structure "Header". ***See*** also: Object-Type "Header"
Definitions:	Displays the configuration data (***see*** fields in table below).

© 2026 Boyum IT Solutions A/S

Field	Meaning
	Additionally, the system checks whether the configuration was saved before. In the Configuration wizard you can set up whether in that case the configuration should be loaded automatically or only when a note is displayed.

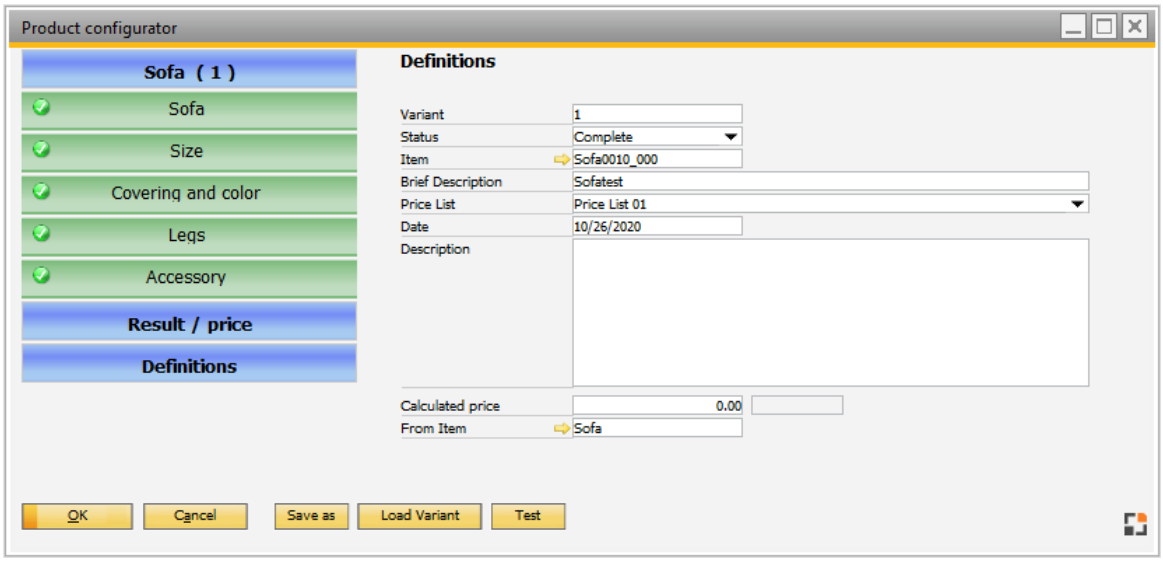
Left navigation area

Clicking on buttons will display detailed information on the right.

- Results/Prices:

Field	Meaning
Item	Content of the assigned variant
Description	Description of the assigned variant
Price	Display the determined price

- Definitions



Window prd_links2.psr

Field	Meaning
Variant	Variant ID (not changeable)

© 2026 Boyum IT Solutions A/S

Status	Current Status of this configuration Status can be - Draft - Complete - Release locked If all mandatory fields are filled, Beas sets the status automatically to complete. You can create a work order, calculation or new item only if the configuration is complete. If the configurator is not complete (all mandatory fields are filled), it is not possible to set the configuration to "complete". You can change the status manually from "complete" to "draft". In this case the system never sets the status back to "complete" and you must define the complete status manually. if you change the status manually, the entry is blue. Define "Release locked" if you want to release (Status Complete) this configuration manually. **Attention:** All configurations created with Beas 9.3 PL 1 or older always have the status "complete". *beas 9.3 PL 2*
Item number	Item number
Brief description	Short description of the configuration Will be created automatically if this is defined in the Configuration definition *(Object-Type Header)* This field is mandatory.

© 2026 Boyum IT Solutions A/S

	If the configurator is opened from sales order, Beas will insert this description in the sales order. If you create an item from this configuration, Beas will insert this in the new item in field "Description" of new item. *only beas 9.3 PL 2 and later* Manual changes have higher priority. If you change this, the font color is blue. If you want to go back to the automatically generated description, you should only delete the Brief description.
Price list	Definition of the price list which is the basis price presentation in the configurator (if price processing was selected in the header line of the coding)
Date	Date of configuration
Description	Description of the configuration Will be created automatically if this is defined in the Configuration definition *(Object-Type Header)* This field is mandatory. *only beas 9.3 PL 2 and later* Manual changes have higher priority. If you change this, the font color is blue. If you want to go back to the automatic generated description, you must only delete the Brief description
Calculated price	Calculated price of the current configuration (if price processing was selected). Note on price usage A price calculation takes effect only if the checkbox "use prices" is marked in the configuration structure "Header". ***See*** also: Object-Type "Header" .
From item	Original item displayed here.
UDF1..4	You can define up to 4 UDF's. ***See*** Configuration wizard.

© 2026 Boyum IT Solutions A/S

	With BeasScript or Beas Usability Package you can define up to 15 UDF's. *beas 9.3 PL 2*

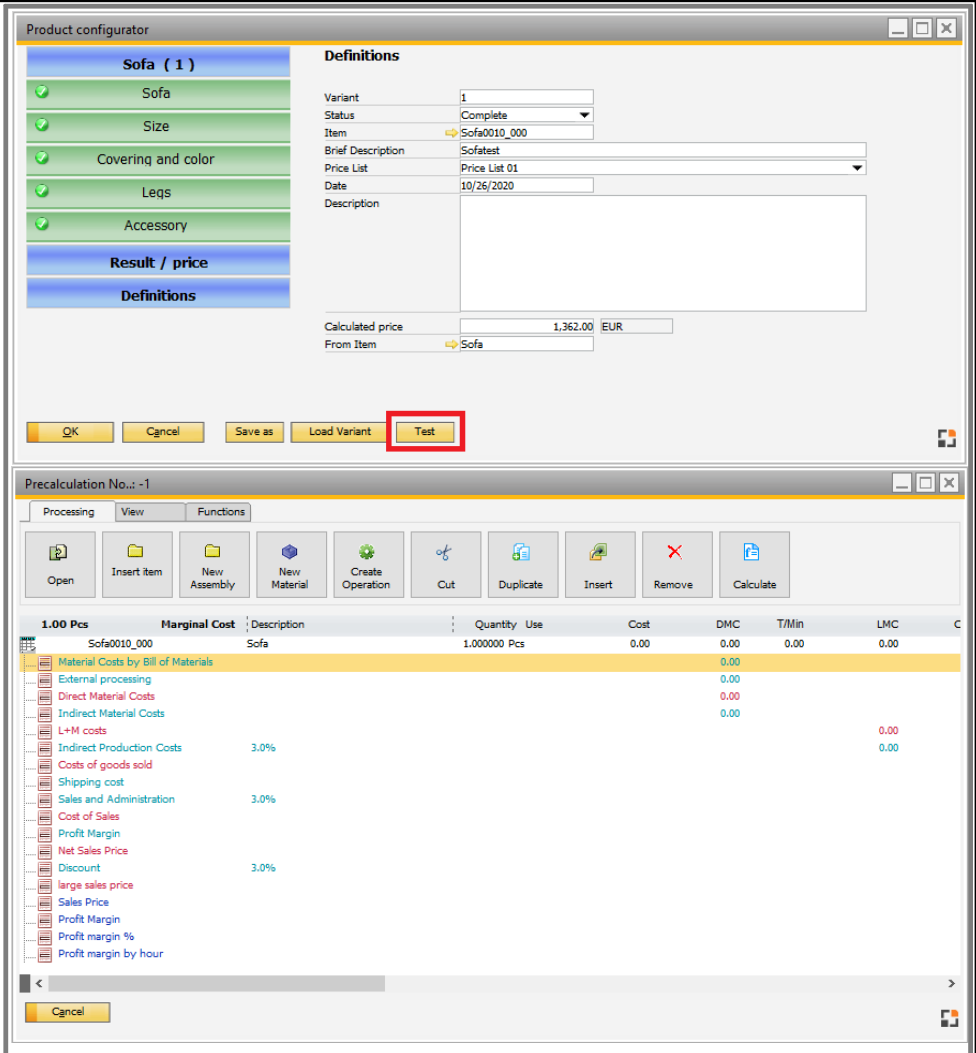
Buttons below

Field	Meaning
OK / Update	Save Configuration If current page is not the last page of the configuration, Beas automatically changes to the last page. You can't save configuration only if Brief Description is filled If a work order, closed sales order, Precalculation or closed quotation exists (with this linked configuration inside), it is not possible to save the configuration. In this case, you can copy the Configuration. If not all mandatory fields are filled, it is not possible to use the configuration. You can save it, but you cannot create a calculation or work order. ***See*** field "Status" The system checks if this Configuration exists with another number. If yes, it can load this existing configuration. ***See*** Configuration Wizard. beas does not check this if you clicked on "Save as" before. If you start this from Sales order or Quotation, beas saves Brief Description, Configuration Number and calculated Price back to the document.
Save	Save current Configuration as new Variant if you click on "Save", Beas deletes the Variant number, sets Status to "Draft" and deletes entry "new item" ***Example***: You would like to open a configuration to change it: This is not possible because the configuration is in "use". For this you need a new number. Click on "Save as" and you can change every piece of information.

© 2026 Boyum IT Solutions A/S

	If you click on "Update", Beas will not check if a configuration with the same settings exists. Beas will always create a new entry.
Load variant	Load an existing variant Beas opens a window with all existing variants. Click on "Load Variant" to load it in the current window. **Attention:** You lose all changes in current window.
Item create	Create a new item from the configuration. You can use the product configurator to create new items. Stored formulas (in item, BoM or routing) are resolved, new entries are created. This Button is only visible if - Calculation is saved - Status = complete - **Configuration Wizard > Production > Product Configurator > Item Creation** is active ***See*** Generate Item
Test	Save the configurator definition and open the Configurator in test mode With the test mode it is possible to check the configuration directly from "Definitions". By clicking the Test button, the Precalculation results window for the current configuration opens:

© 2026 Boyum IT Solutions A/S



Window prd_links2.psr

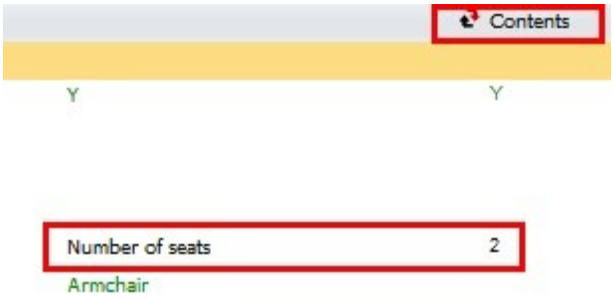
In this test mode the left window is linked directly with the configurator

1. If you change anything in the left window, you can see the changes directly in the right window.
beas does not refresh the following actions:
- if you change order of entries
- if you insert or delete new entries

2. In the definition window > replace icon you can switch from "Default" to "Contents"

© 2026 Boyum IT Solutions A/S

In Contents mode you see directly the value, which you chose in the configurator window.



Window artikel_produktkonfigurator

3. Beas marks lines in red background color if Beas found a formula error in configuration

beas 9.3 PL 1

See Product Configurator and WEB Configurator - Introduction

back to product configurator

8.14.1.1.1 Generate Item

You can use the product configurator to create new items.
Stored formulas (in item, BoM or routing) are resolved, new entries are created.

This Button is only visible if
- Calculation is saved
- Status = complete
- **Configuration Wizard > Production > Product Configurator > Item Creation** is active

NOTE:
New items can be created which require their own warehouse management, prices etc.Beas does not require this functionality, because you can use variants without having item master data. for example via Precalculation → Production or direct creation of work orders.

© 2026 Boyum IT Solutions A/S

Use this functionality only if you want to produce based on stock.

In case of storage-related assemblies, the system checks whether a new item needs to be created for this position. All parameters are checked which are stored in "Configuration" tab of the sub-assembly.
No entry: no check; item will not be replaced
Parameters stored: parameters are only checked

- Order-related structure

The behavior depends on the option "Create items with same configuration"

Configuration Wizard, setting "Default" = always for order-related items

A new item is always created for order-related sub assemblies.
For this purpose, formulas for the configuration are created in the sub-assemblies, as required.

Note:

If there is an item with the same configuration, the new item will still be created if its scheduling ID was set to "order-related" or "phantom assembly".

Benefit:

This provides for the configuration to be considered in all sub-assemblies.

Disadvantage:

A lot of items are created.

Configuration Wizard, setting "Automatically"

Independent of the scheduling ID, a new item will not be created if an existing configuration was found. Instead, this item will be used.

Entries in the Configuration tab of the sub-assemblies are checked:
If there are no entries stored, nothing will be checked and no item will be created.
If parameters are stored, they will be checked.

- Storage-related structure

In case of storage-related assemblies used for an item, the system will check whether a new item needs to be created for a BoM position. The system checks whether these assemblies have a configuration and thus have defined parameters which are stored in the "Configuration" tab of the sub-assembly.

© 2026 Boyum IT Solutions A/S

No entry: Item/Assembly will not be replaced

Parameters exists/stored: Item/Assembly will be replaced during creation of new item.

Example

„Bicycle“: Parameter "color" and "size“

I--------sub-assembly "wheel“ – only "size“ matters

In the product configurator tab the parameter "size" is stored in the sub-assembly "wheel“.

If now an item is generated for "bicycle“, color "red“, size "40“ the following items are created:

Bicycle_0001_001 (Basis item "bicycle“)

Bicycle_0001_002 (Basis item "wheel")

If later an item is generated for "bicycle“, color "blue“, size "40“, the following items are created:

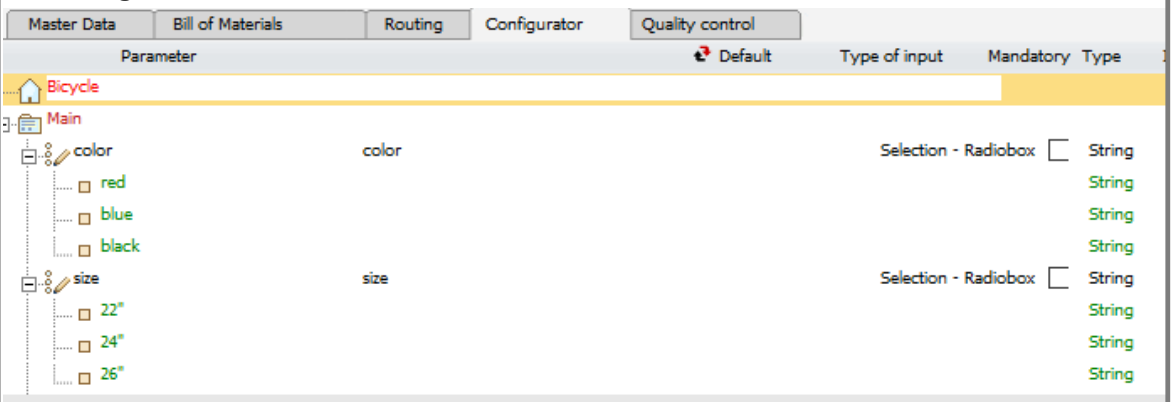
Bicycle_0002_001 (Basis item "bicycle“)

As BoM item "bicycle_0001_002“ is used, because it is of size "40“ and can be re-used.

Example

Item with the following structure,

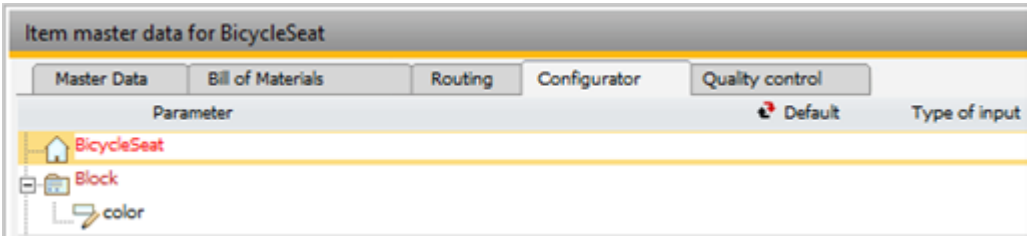
and configuration:



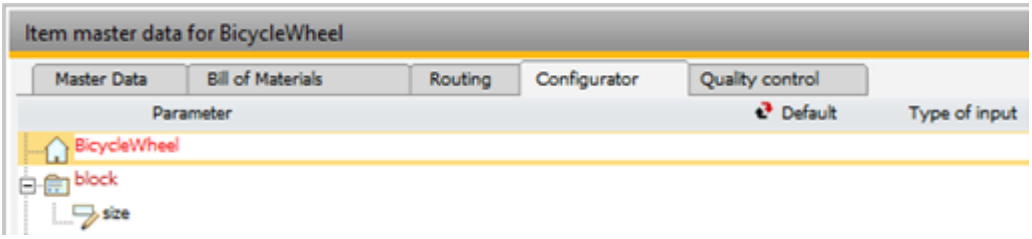
© 2026 Boyum IT Solutions A/S

So that, at runtime, the configurator could also tell that a material or an operation should be changed within an assembly, it must be provided in the assembly with its own configuration.

For changing the color of the seat (property of Assembly “BicycleSeat”):



For changing the size of the wheel (property of Assembly “BicycleWheel”):



The behavior depends on the option "Create items with same configuration" Setting is "automatic".

Creation of an Item for configuration with color=”red” and size=”22”

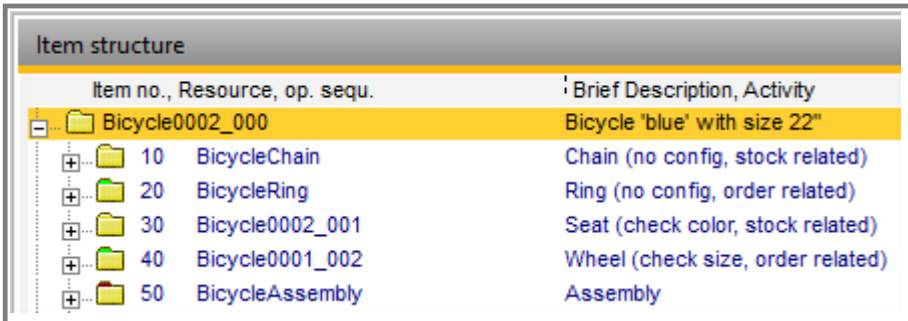
The system creates the following item structure:

In this case, the sub-assemblies are created only for position 30 and 40. This comes from the fact that the two sub-assemblies have a configurator coding with a defined parameter.

Creation of an Item for configuration with color=”blue” and size=”22”

The system creates the following structure:

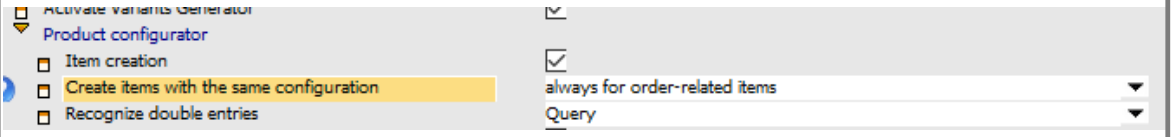
© 2026 Boyum IT Solutions A/S



The system uses the already created sub-assembly “Bicycle0001_002” for the Wheel because its exactly the same size/configuration for 22”. Only for color “blue” a new sub-assembly is created.

Create always

The behavior depends on the option "Create items with same configuration" Setting is "always for order-related items"



(in this example Bicycle001 + 002 are not deleted)

Creation of an Item for configuration with color=”black” and size=”24”

With this setting, the system ALWAYS creates a new item for all order-related items and Phantom items.

The system does not check if there is an item with the same configuration, or if the configuration parameter is defined in the sub-assembly.

Stock-related items, create only if:

- configuration parameter is defined in this item
- the item does not exist. If there is an item with the same configuration parameters, the system uses that (as example, if we had configured for color “red”, not black, an existing item will

© 2026 Boyum IT Solutions A/S

be taken, e.g. “Bicycle0001_001”).

Configuration of the generated item number

The generated item number is built up as follows:

<current item>
<counter 1: 4 items>
<counter 2: 3 items>

Example:
MyItem0001-000

First counter is for generated item. Second counter starts with 0, each sub item receives the following number.

Customization for item generation

Click on "generate item" the Windowevent "checkitem" is called. There you can manipulate the new item number with the variable `e_new_itemcode`

The result is "MyConfigItem0000-000"

```
windowevent checkitem
setvar=e_new_itemcode=MyConfigItem
end event
```

Variable "`e_counterlength2`" manipulates the second counter. "-1" turns off counting.
IMPORTANT: make certain then that a valid item number is generated.

Example setting = -1: Result = "MyConfigItem-000"

```
windowevent checkitem
setvar=e_new_itemcode=MyConfigItem
setvar=e_counterlength1=-1
end event
```

With setting 2 result is "MyConfigItem00-000"

```
windowevent checkitem
setvar=e_new_itemcode=MyConfigItem
setvar=e_counterlength1=2
end event
```

© 2026 Boyum IT Solutions A/S

Variable "e_delimiter" defines the separator. Enter a character, otherwise "_" is used.

```
windowevent checkitem
setvar=e_new_itemcode=MyConfigItem
setvar=e_counterlength1=2
setvar=e_counterlength2=2
setvar=e_delimiter=:
end event
```

Result

Main Item: MyConfigItem01:00

Sub Item: MyCinfugItem01:01

Using the event "generatesubitem" you can use the variable "ee_newitem" to define the item number for the sub-item.

```
windowevent generatesubitem
// ... set own counter
setvar=ee_newitem=<ee_newitem>-<ll_myowncounter>
end event
```

NOTE:

Item creation does not support Item version control or separate BoM.

In Calculation: If an assembly was found with a fitting configuration, the item is replaced in calculation by the configured assembly and displayed in dark green. If no fitting storage assembly was found for the configuration, it is displayed in red - with the basic item. If, then, the item is created using the configurator and the calculation is re-opened, the generated item will now be inserted and displayed in black as usual. For all former red entries, new items have been created.

Work order breakdown

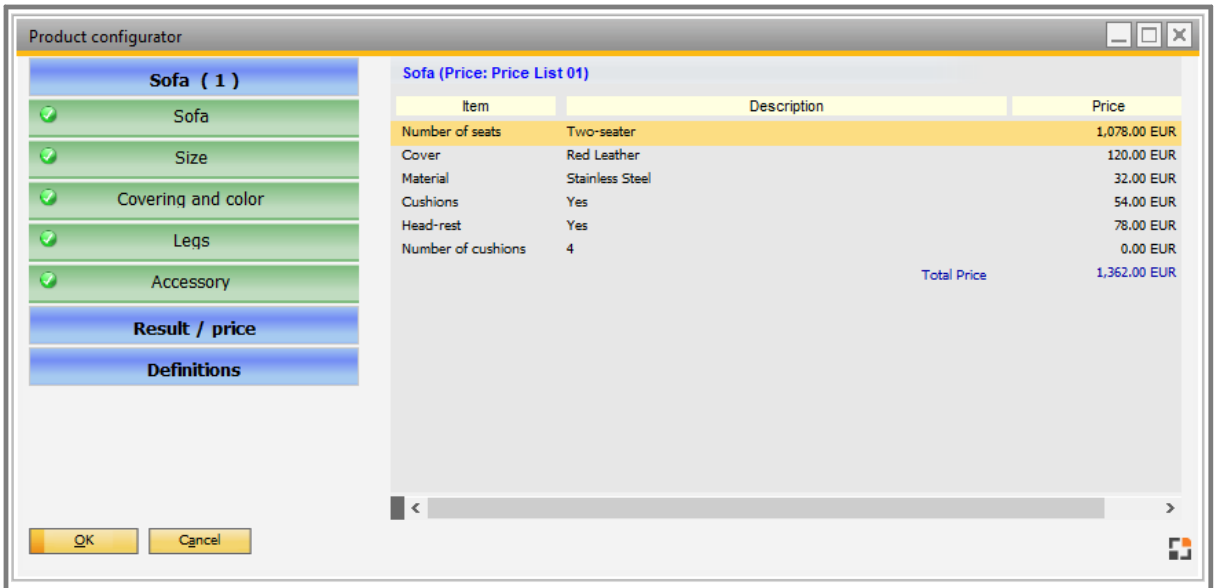
Work orders are checked for assemblies with fitting configuration. If an assembly is found, it is automatically inserted into the BoM replacing the former assembly.

8.14.1.1.2 Customer specific adjustments

Various options are available for the product configurator to make it easier to implement customer-specific adjustments. For example:

- Navigation area "Results/Prices"

© 2026 Boyum IT Solutions A/S



Window prd_links2.psr

e.g. for further use of data from this detail area after the configuration. Reading out the data is only possible at runtime of the configurator. Therefore, the windowevent "**post_result**" is available.

This is, of course, only possible if the detail area is processed during the configuration. Therefore, a Beas script for the configurator window is necessary (file prd_links2.src") and a customer specific table is created in the database for storing these data.

Example

Example for a customer specific table:

Table:
BEAS_CUSTOMER_PC_RESULT

Columns:

VARIANTE	int
LINE	int
PARAMETER	varchar(50)
DESCRIPTION	varchar(200)
PRICE	numeric(19,6)
CURRENCY	varchar(10)

```
//*****************************************************
//* Example for fetching "result/price" data
```

© 2026 Boyum IT Solutions A/S

```
//* from detail area line by line into database
//*
//* (c) Beas GmbH
//*****************************************************
windowevent post_result

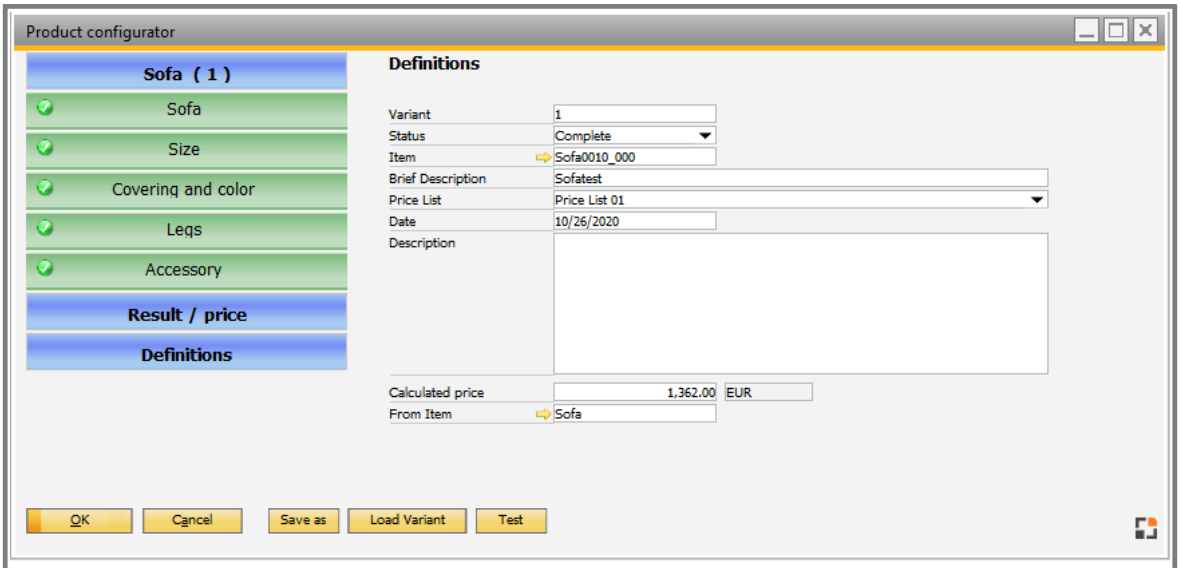
- Navigation area "Definitions"



Window prd_links2.psr

Check entries:

If you want to check the entries after storing a configuration (only if all parameter values are stored in the database), this is only possible via a customer-specific script programming. This check is usually done when the Configuration is finished.

- Example

```
//*****************************************************
//* Short Example for checking parameter entries
//* after storing into database for defined variant
//*
//* (c) Boyum IT Solutions GmbH
//*****************************************************

windowevent open
global function test_parameter
 // test whether parameter 'form' was inserted
 select Coalesce("INHALT",'')  &
   from "BEAS_CAFT_VARIANTE"  &
   where "VARIANTE" = <str_parm.c_parm1,num(0)>  &
     and "Parameter" = 'FORM'
 if <wert1> = then
   message=Value for Parameter 'Form' was not inserted.
   return failure
 end if
 // re-set flag (all checks ok)
 setglobal=v_ok_button=0
end global
end event

windowevent click button_ok
```

© 2026 Boyum IT Solutions A/S

```
 // Button OK/Update pressed
 if <global.v_ok_button> n= 1 then
   // configuration stored,
   // Call function for testing parameter
   test_parameter()
 end if
 if <return> n= -1 then
   return failure
 end if
end event

windowevent postsave
 // set flag to identify, if configuration was stored
 setglobal=v_ok_button=1
end event

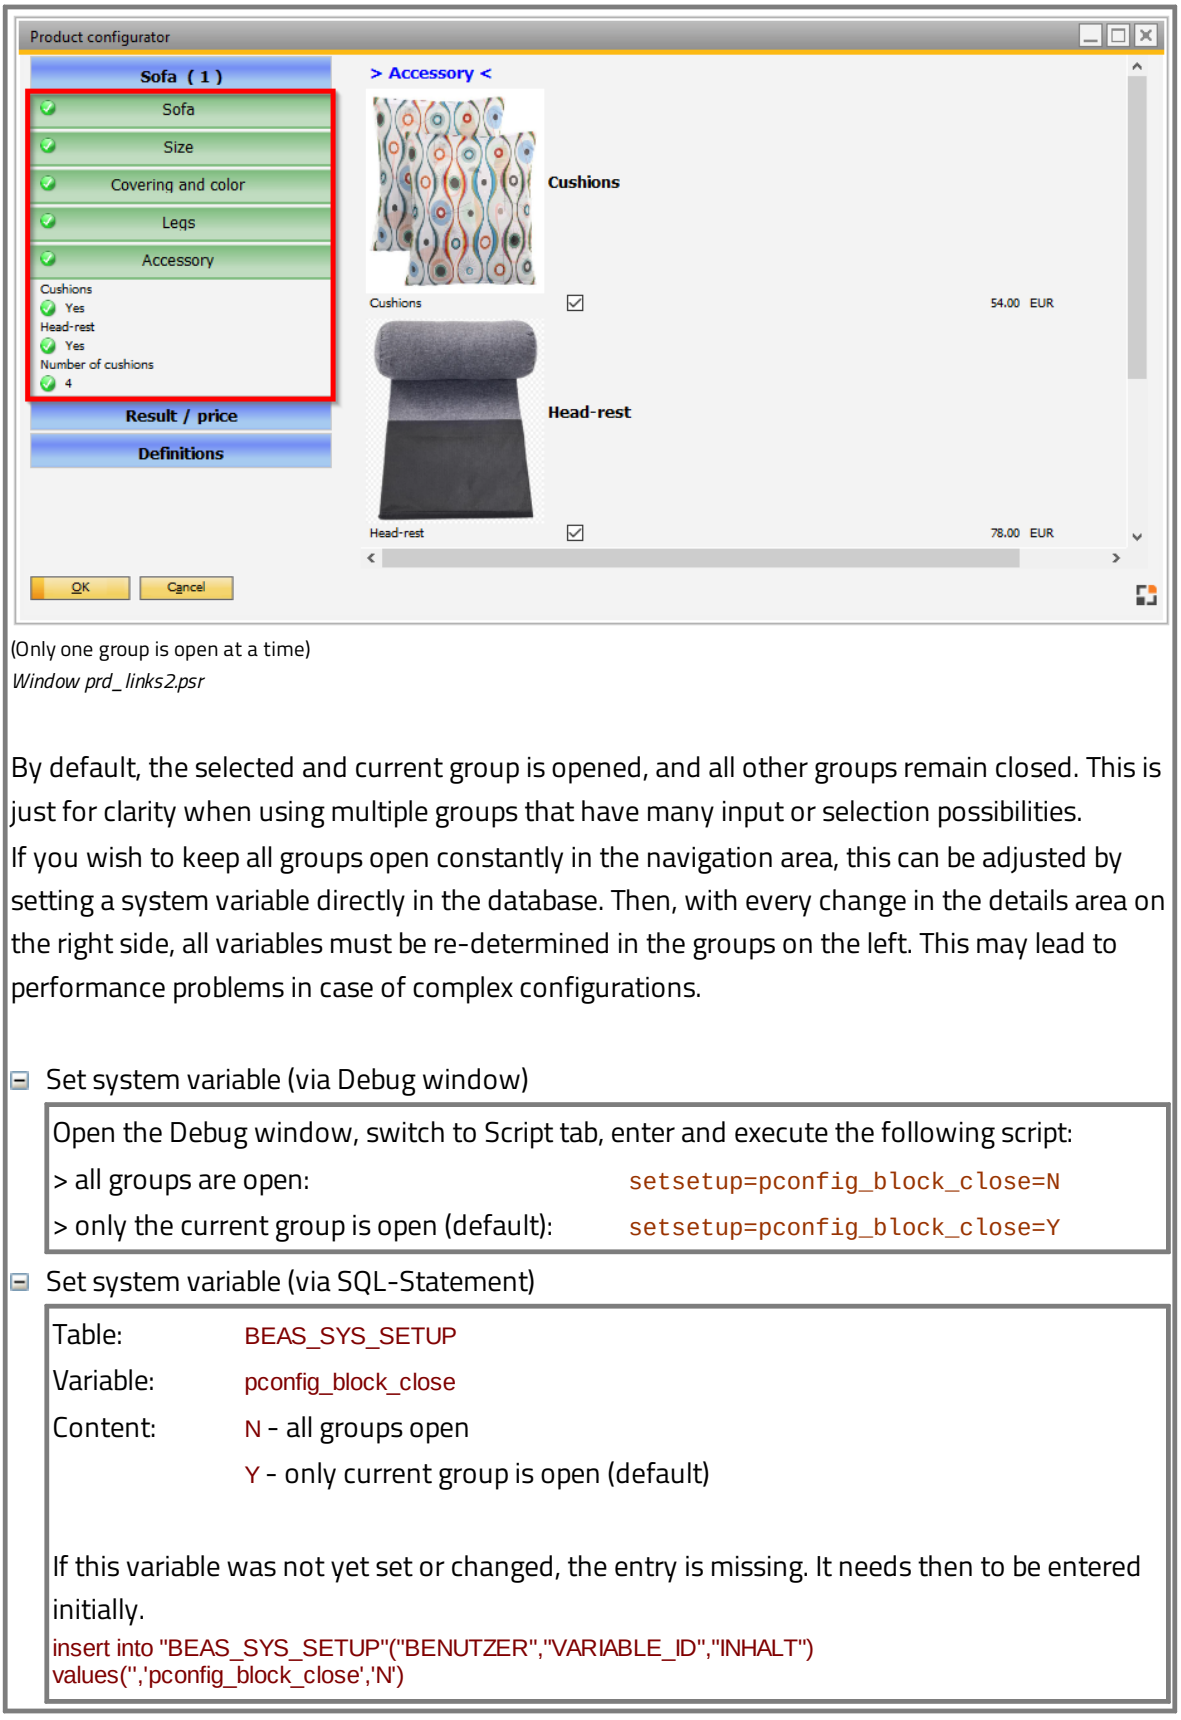
windowevent click button_close
 // Button 'Cancel' was pressed
 // re-set flag
 setglobal=v_ok_button=0
end event

windowevent click button_varianteladen
 // Button 'load variant' was pressed
 // re-set flag
 setglobal=v_ok_button=0
end event

windowevent click button_variantekopieren
 // Button 'Copy variant' was pressed
 // re-set flag
 setglobal=v_ok_button=0
end event
```

- Navigation area "Groups"

© 2026 Boyum IT Solutions A/S



(Only one group is open at a time)
Window prd_links2.psr

By default, the selected and current group is opened, and all other groups remain closed. This is just for clarity when using multiple groups that have many input or selection possibilities.
If you wish to keep all groups open constantly in the navigation area, this can be adjusted by setting a system variable directly in the database. Then, with every change in the details area on the right side, all variables must be re-determined in the groups on the left. This may lead to performance problems in case of complex configurations.

- Set system variable (via Debug window)

  Open the Debug window, switch to Script tab, enter and execute the following script:
  > all groups are open: `setsetup=pconfig_block_close=N`
  > only the current group is open (default): `setsetup=pconfig_block_close=Y`

- Set system variable (via SQL-Statement)

  Table: BEAS_SYS_SETUP
  Variable: pconfig_block_close
  Content: N - all groups open
  Y - only current group is open (default)

  If this variable was not yet set or changed, the entry is missing. It needs then to be entered initially.

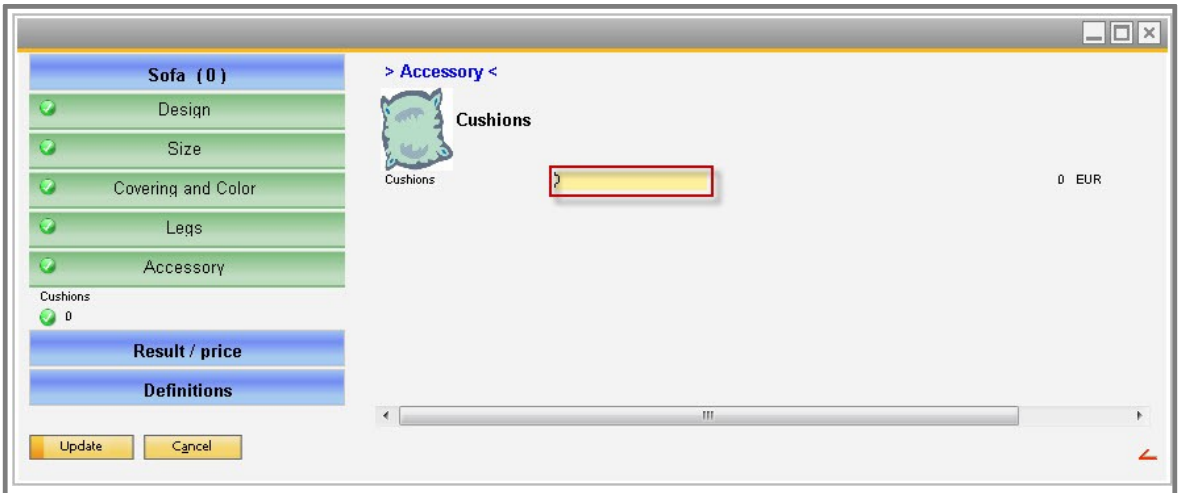
```
insert into "BEAS_SYS_SETUP"("BENUTZER","VARIABLE_ID","INHALT")
values('','pconfig_block_close','N')
```

© 2026 Boyum IT Solutions A/S

If the variable is already in use, you only need to change it:

```
update "BEAS_SYS_SETUP" set "INHALT" = 'Y'  where "VARIABLE_ID" = 'pconfig_block_close'
```

- Details area



Window prd_links2.psr

For changes in the details area (right side of the configurator window) the tabulator can be used to jump to the next field. The cursor is placed at the beginning of the field. In an already filled box, the cursor is positioned before the entry.

If you do not need this functionality, it can be changed via BeasScript to "Auto-Select". Then, if the cursor jumps to the next input field, and if there is already a text, it will be selected/marked.

For this purpose, a script file "prd_links2.src" is required for the product configurator window.

- Script

```
windowevent postopen
   if <dw_2.dataobject> = program\prd_rechts.psr then
       dw_2.modify=inhalt.edit.autoselect=yes
   end if
end event
```

- Check for existing configurations

Before saving a new configuration, based on a parameter string (a string that consists of all the parameters and set-objects and of their assigned content) the program checks whether this configuration already exists. If yes, the existing configuration is loaded. Otherwise, the configuration is created and saved under a new variant number.

© 2026 Boyum IT Solutions A/S

As an additional option, you can also incorporate the short name into the check. Thus, it would be possible to store two configurations with equal but different short names (with different version numbers). For this purpose, an entry must be made in the Beas system table.

Open the Debug window, switch to Script tab, enter and execute the following script:

> normal function (Standard):

```
setsetup=pconfig_check_desc=N
```

> Check for existing configurations via parameter string **and** short description:

```
setsetup=pconfig_check_desc=Y
```

- Get Values when calling the configurator

Should values from the current line or also from the "header" of the Sales Order or Quotation of the SAP form needed for the Beas configurator, this can be done with a simple scripting.

For this, the configurator window requires a stored Beas script in the file "**prd_links2.src**".

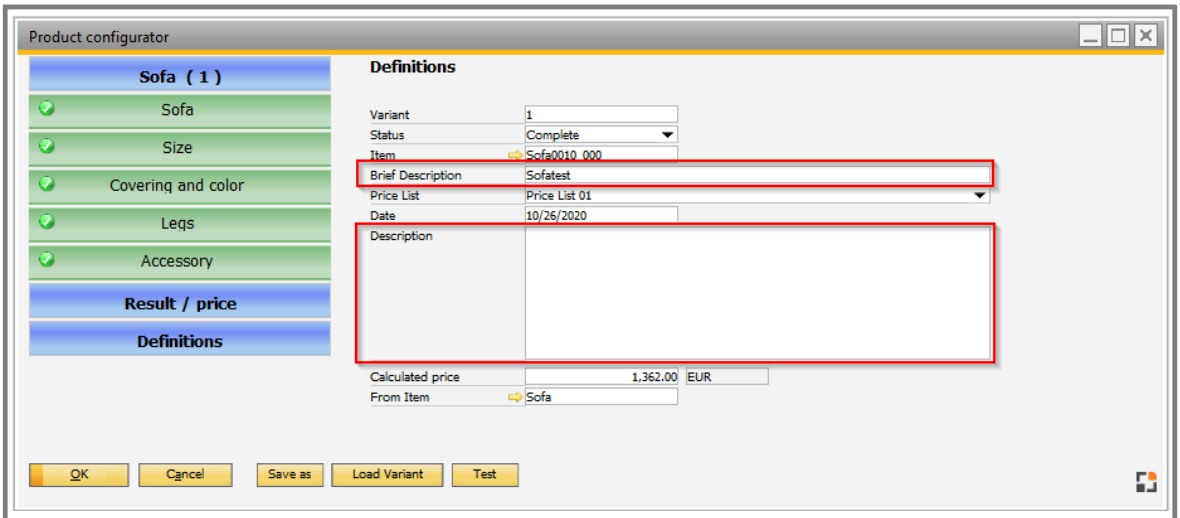
***Example*:**

```
windowevent preopen
  if <parent:sys_formtypeex> n= 139 or <parent:sys_formtypeex> n= 149 then
        // only if Sales Order or Quotation
        // get Cardcode from SAP form
        setvar=e_cardcode=<parent:item 4>
        // get Product-ID
        setvar=e_product=<parent:item 38=col=U_produkt>
  end if
end event
```

With this definition, the variables **[e_cardcode]** and **[e_product]** are known after calling the product configurator and can be used in the coding.

- Configuration description

© 2026 Boyum IT Solutions A/S



Window prd_links2.psr

It is not reasonable to fill the field "Description" with very long information if the configuration is complex (object type "Definitions", tab "Brief Description" and "Description"). The field "Brief Description" is, as the field says, a short name for the currently configured item (max. 255 characters).

With a database query you get all result information of the respective configuration/variant:

Example (MS-SQL)

```
select  bop."PARAMETER"+'' as parameter, bop."BEZEICHNUNG"+'' as description_coding,
        bcv."BEZEICHNUNG"+'' as description, substring(bcv."INHALT",1,1024)+'' as "content"
from "BEAS_OITM_PRODUKTKONFIGURATOR" bop,"BEAS_CAFT_VARIANTE" bcv
where substring(bop."PARAMETER",1,50) = bcv."PARAMETER"
and bop."ItemCode" = 'SE0001'
and bop."TYP" = 0
and bcv."VARIANTE" = 43
```

parameter	description_coding	description	content
numberofseats	Number of Seats	2	2
cover	Cover	SE0070	SE0070
legs	Material	SE0090	SE0090
cushions	Cushions	1	1
headrest	Head-Rest	Y	Y

First, it should be clarified when the data for the respective configuration is needed at all:

- *after leaving the product configurator*

Example file

```
// ****************************************************************
// customer specific development
//
```

© 2026 Boyum IT Solutions A/S

```
// Example: get data of a configurated item after closing
//
// (c) Boyum IT Solutions GmbH
// ************************************************************
windowevent close

 destroy=dtw
 declare=dtw=ue_datastorevalues
 dtw=select bop."Parameter"||'' as "Parameter",   &
          bop."BEZEICHNUNG"||'' as Description_coding,  &
          bcv."BEZEICHNUNG"||'' as "Description",  &
          substring(bcv."INHALT",1,1024)||'' as "Content" &
      from "BEAS_OITM_PRODUKTKONFIGURATOR" bop,"BEAS_CAFT_VARIANTE" bcv  &
      where substring(bop."Parameter",1,50) = bcv."Parameter"  &
      and bop."ItemCode" = <str_parm.s_parm1,dbstring>  &
      and bop."TYP" = 0  &
      and bcv."VARIANTE" = <str_parm.c_parm1,num(0)>

 // put now your coding to process the data appropriately  (with example)
 for loop=1 to <dtw.rowcount>
  setvar=v_param=<dtw.parameter.value>
  setvar=v_desc_code=<dtw.description_coding.value>
  setvar=v_desc=<dtw.description.value>
  setvar=v_content=<dtw.content.value>

  // your coding

 next

 // clear datastore
 destroy=dtw
 return success
end event
```

- *For a report that is called up from a quotation line or a sales order, for example*

(This could be done in a similar way as for leaving the product configurator).

8.14.2 Product configurator definition

From this window you can create new or edit existing product configurations.

Delete	Delete the selected configurator definition
New configuration	Click this button to create a new Variant.
Search field	Filtering field

© 2026 Boyum IT Solutions A/S

8.14.2.1 Configuration structure

The configuration structure is used to create the visual interface of the configurator. Texts and images are added, selection options defined, and formulas and variables are stored here. These variables and parameters can be accessed when creating a Bill of materials or routing (at the time of a calculation or when creating a work order).

To open the configuration structure, go to **Production > Product Configurator > Product Configurator definition**. Here you can find a list of existing configurations and by clicking on **Open**, you can add successive Configuration objects (by right-clicking) or create new configurations.

8.14.2.1.1 Object-Type "Header"

Basic definitions such as usage of prices, item designation, miscellaneous information, automatic generation of the configured variant description and data transfer to SAP Business One sales order / quotation can be set up and stored by clicking the header icon (/) in the 1st row of the product configurators with a double-click. Once provided, the text is highlighted in dark gray and bold font in the navigation area. The header should possibly be the item number.

How to link the definitions of the Price, Text Brief Description and Text Description tabs in a Sales Order:

Field descriptions

© 2026 Boyum IT Solutions A/S

Field	Description
Name	Item name (item number) After calling the Configurator, this name is displayed at the top in the navigation area on the left.
Activate Price Calculation	Activate the price calculation inside the Configurator **Disable:** In the configurator you cannot see any price. It is only a configurator of the product. The price calculation can be created with Precalculation. In Sales Order / Sales Quotation you have the possibility to calculate the price after creating the configuration.  **Enable:** Enable the internal price calculation and display this in configurator - Area "Result"  Note: For using Price calculation: - Define default price list - Activate "Use BP price list", if needed

© 2026 Boyum IT Solutions A/S

Field	Description
	Testing: The Configurator is called from Sales order or Quotation. Here all information for price calculation are available. For testing you must define the Date, Quantity, Customer and optional Variant You can define this in the **Configurator > "Setup" button**:  In all Objects you can define the Price calculation in tab "Price" See Tab Price 
© 2026 Boyum IT Solutions A/S

Field	Description
	 *artikel_produktkonfigurator_detail*

Field	Description
Price determination	Define the price

Value	Description
Formula	Create a formula to calculate the price
Manually	Insert the price manually in the Price field
Price List	Use price from a Price List. - Use default price list, defined in Calculation Header. - Use a special price list of a customer if it is selected from "Default price list" drop-down in the Calculation Header. (previously "Use BP price list" radio box). Supports all price list rules, but unit groups are not supported.

© 2026 Boyum IT Solutions A/S

Field	Description

Field	Description

Value	Description
	If you insert [cprice] in a formula, you see the price determination result by Price List in this parameter.
No	Price determination is not activated for this entry.

Field	Description
Price	Use the entered price if price determination is set to Manually. The logo of the actual currency (for example "$" or "€") is displayed right of the field. Prices are rounded according to the value defined in **SAP Business One > General Settings > Display > Decimal Places (0..6) > Prices**. Up to 6 decimals can be defined.
Item	Define the item to determine the price from a price list Choose the item directly or insert a parameter. For example for the following sofa cushions, there are two parameters: - Cushions Yes/No: whether cushions are needed - Number of quantity: how many cushions are needed In Cushion the price determination is set to

© 2026 Boyum IT Solutions A/S

Field	Description
	Field / **Description**
	No, so it does not affect the price. In Number of Quantity we define the price by a price list. Price comes from price list from "SofaCushion" item that was added to the Item field. Quantity comes from the current "Number of Cushions" parameter (nrcushion), so the [nrcushion] parameter is chosen in the Quantity field.  Result: Beas searches in the price list for the sofa cushion item. Total Quantity = Quantity from Sales Order / Quotation * Quantity from [nrcushion] Result = Price from Price List * Quantity from [nrcushion] Use the Test button in the product configurator definition list to test the setup. Note: **Volume discount** can be applied for the item (parameter), but not the parent item.

© 2026 Boyum IT Solutions A/S

Field	Description

Field	Description
	Limitation: The price value CurrentEntry is not supported in WebApp Terminal 2.1
Quantity	Define the quantity for calculation Insert a number manually or use a parameter. Two quantities are calculated: Required quantity for 1 product (cquantity) Required total quantity (calculated quantity * quantity from sales order = ctotalquantity) For an example, ***see*** Item. *beas 9.3 PL 2*
Script / Formula	Calculate the price using a formula If the price is calculated by a formula (Price determination is set to Formula), insert the formula. The Parameter Insert field provides a shortcut to all available parameters. If the "[price]" field is in the formula, Beas determines the price using the price list. ***See*** Script Syntax The following standard parameters are available. Note: Not supported in WEB Configurator.

Field	Description

Value	Description

To transfer the price or description from the configurator into the SAP Business One form "Customer order"or "Quotation" a script file is used.
This file needs to be created.

Adjust only red lines in order to ensure a correct function.
The created files must be stored in the Beas Project-folder.

Script file

Name of the file: "**product_configurator.src**". The following structure is required:

```
//*****************************************
//* beas product configurator                *
//*                                          *
//* Interface definitions for return value   *
//*                                          *
//* (c) Boyum IT Solutions GmbH              *
//*****************************************
//
//*** initialization of the interface ***
function pk_init
  // please, do not change this function part !!!!
  setvar=v_pk_init=Y
end
//
//*** transfer the TOTAL PRICE from the configurator      ***
//*** into column 14 of actual line (changeable)          ***
//*** to SAP B1 form SALES ORDER or QUOTATION              ***
function write_price
   // the PRICE is in the beas variable "str_parm.c_parm4"
   parent=item=38=col=14=value=<str_parm.c_parm4>
end
//
//*** transfer the BRIEF DESCRIPTION from the configurator ***
//*** into column 163 of actual line (changeable)         ***
//*** to SAP B1 form SALES ORDER or QUOTATION              ***
function write_b_descr
   // BRIEF DESCRIPTION is in the beas variable
"str_parm.s_parm4"
   parent=item=38=col=163=string=<str_parm.s_parm4>
end
//
//*** transfer the DESCRIPTION from the configurator      ***
//*** into column U_item_descr of actual line             ***
```

© 2026 Boyum IT Solutions A/S

Field	Description
	Value / **Description**

	//*** (changeable) ***
	 //*** to SAP B1 form SALES ORDER or QUOTATION ***
	 function write_descr
	 // the DESCRIPTION is in the beas variable "str_parm.s_parm5"
	 parent=item=38=col=U_item_descr=string=<str_parm.s_parm5>

- Visible Rule tab

Some rules can be defined to display the block with specific values or parameters. The rules determine whether a configuration option is presented to the operator, based on previous configuration selection. Therefore, it is possible to restrict options. The rule is created in SQL syntax.

Field	Description
Parameter Insert	Parameters and Set Objects that are already defined, are displayed in a selection list. They can be used to create a rule.
Script	The language syntax that the rule is written in. Available options are: • DW Script • SQL formula • JavaScript formula • Java script • VBScript formula • VBScript ***See*** Script Syntax
Input field	Insert the visible rule for the object. All defined parameters and Set-Objects can be used in the configuration. ***Example:*** [a] = 5 [color] = red [a] > 5 or [b] = 3 To have a parameter not visible (maybe for special cases): 1 = 2 ***see*** Script Syntax

© 2026 Boyum IT Solutions A/S

Field	Description
	Note: When using the SQL formula, database accesses may reduce the performance of the configurator window.
The **check** button	Check for syntax errors in the entered script.
Flag	– The rule is error free – Warning (default) – Error in rule
Result line	Shows the result of the evaluated rule.
Evaluation of the rule	Shows the evaluated rule with status message.

Tab Extended

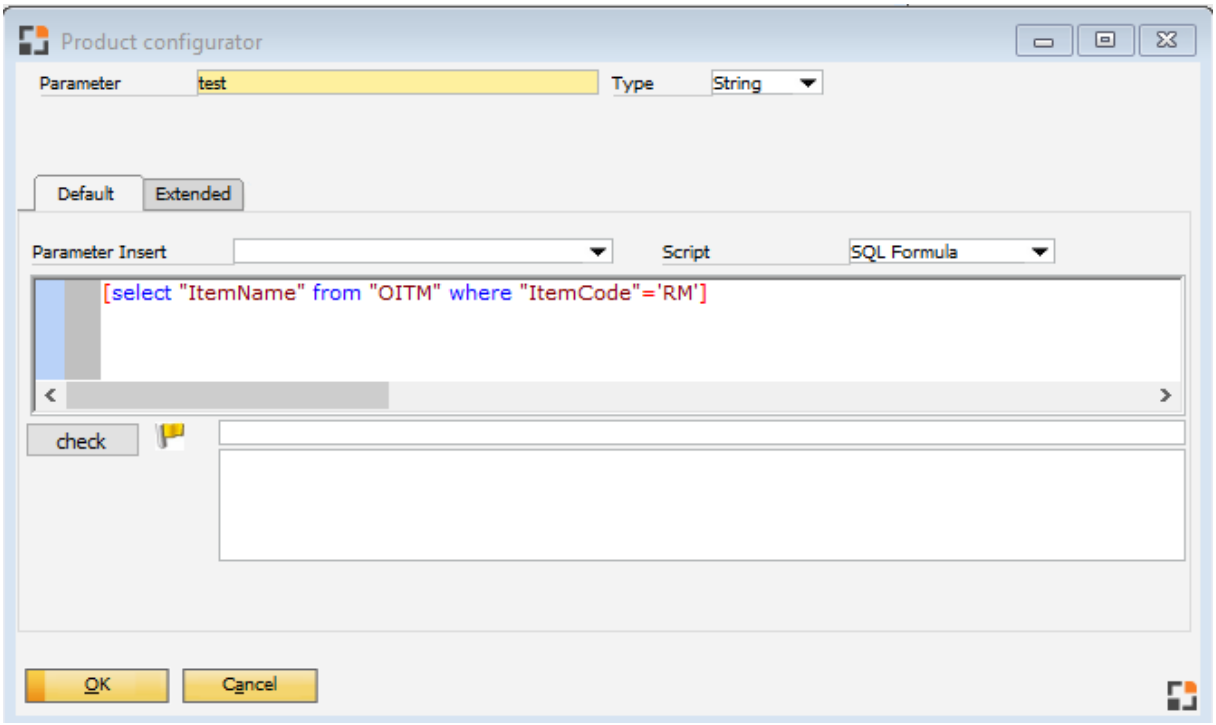
Field	Description
Bitmap	Select the icon for the specific block. By default, Beas selects a folder icon.
Color	Select a display color for the text of the block name.

8.14.2.1.3 Object-Type "Set-Object"

A Set-Object ( ) is a variable, to which you can assign a value or formula.

Use this for caluclation of variables, which you can use in work order or for visible rules / standard values in other parameters.

© 2026 Boyum IT Solutions A/S



Field	Description
Parameter	Object name Name of the object You can read the value of the object by name Note: The name must be unique. It is not allowed to use a object name more then once.
Parameter Type	Type of Parameter (String/Number) **The type of parameter** Auto: Beas determines whether the parameter is a number or a string depending on the value. • If the value is a number or "0", Beas interprets this parameter as a number. • If the value is empty or not a number, Beas interprets this parameter as a string. ***Example 1:*** Parameter: `"color"` is `"red"`

© 2026 Boyum IT Solutions A/S

Field	Description
	Formula: `'the color is ' || [color]` HANA SQL: `select 'the color is' || 'red'` -> all ok Formula: `10 + [color]` SQL: `10 + 'red'` -> produce error ***Example 2:*** Parameter: `"color"` is `"5.3"` Formula: `'the color is ' || [color]` HANA SQL: `select 'the color is' || 5.3` -> produce error Formula: `10 + [color]` SQL: `10 + 5.3` -> all ok The evaluation of a formula is always dependent on the contents of the parameter. All configurations created with *beas 9.2 PL 5 Build 32 or older*, use parameter type "Auto" as standard. Working with Beas system variables or custom defined variables starting with "**e_**", the parameter can be interpreted as a string or number. With the following BeasScript setup the type can be permanently defined as string type, if the value is a Beas variable. This must be executed only once per database or client. `setsetup=config_default_e_type=c`
	String: This parameter type allows a string. If working with formulas, Beas inserts a ‘ (single quotation mark) at the left and right side of the parameter. If you create a new parameter, the string type is the default option. ***Example 1:***

© 2026 Boyum IT Solutions A/S

Field	Description
	Parameter: `"color"` is `"red"` Formula: `'the color is ' || [color] (HANA SQL)` MS SQL: `select 'the color is' + N'red'` HANA SQL: `select 'the color is '  || ' red'` ***Example 2:*** Parameter: `"color_number"` is `"5,3"` Formula: `'10' + [color_number]` MS SQL: `'10' + '5,3'` -> all ok Formula: `'the color is ' + [color]` DataWindow Syntax: `'the color is' + 'red'`
Number	This parameter type allows numbers only. If the content is not a number, Beas replaces it with “0”. The decimal delimiter is based on what it is defined in the system, but Beas internally replaces it with a decimal point. ***Example:*** Parameter: `"color_number"` is `"5,3"` (Regional setting is Germany) Formula: `[color_number] * 3` SQL: `5.3 * 3`
	 If you use a parameter both as a string or numeric value, then it is advantageous to specify this directly in the formula. String formula: `'color is ' || [color,dbstring]` Number formula: `if [color_number,dbnum] > 10 then 1 else 100 end`

Area "Default"

Field	Description
Insert Parameter	Displays defined parameters and set-objects.

© 2026 Boyum IT Solutions A/S

Field	Description
Script	The Value if [and] inside the default value, the system see the default value as formula The following Script variants are supported • DW Script • SQL formula • JavaScript formula • Java script • VBScript formula • VBScript ***See*** Script Syntax When using the SQL formula, database accesses may reduce the performance of the configurator window. Note: `select "ItemName" from "OITM"  where "ItemCode"='FP'` is not working, because no [or] is inside In this case you can set the complete sql command between [and] `[select "ItemName" from "OITM"  where "ItemCode"='FP']` **IMPORTANT:** ***not*** all supported scripts defined above for the Desktop solution are valid for the Web solution. For more information ***see*** Web Configurator definition limitations.
The **check** button	Check for syntax errors in the entered script.
Flag	- Rule is error free - Warning (default) - Error in rule
Result line	Shows the result of the evaluated formula.
Evaluation of the formula	Shows the evaluated rule with status message.

Extended

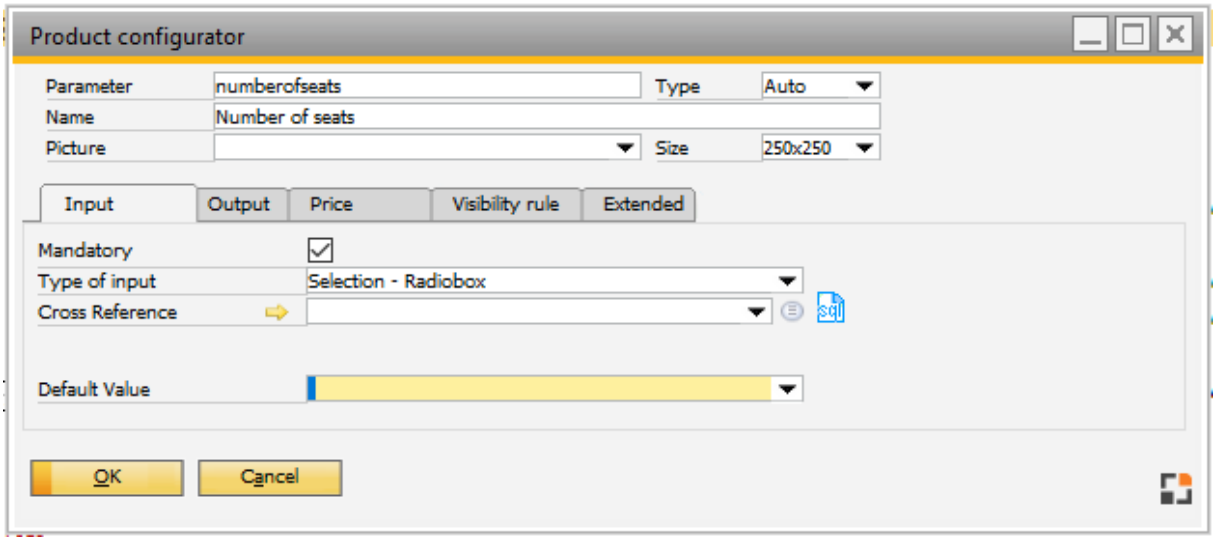
Field	Description
Bitmap	Select the icon for the specific block. By default, Beas selects a folder icon.
Color	Select a display color for the text of the block name.

8.14.2.1.4 Object-Type "Parameter"

A parameter is used for input or selection of possible options in the configuration.

Available parameter types:

- Normal: Alphanumerical values.
- Check box: Enable or disable the option (Yes/No).
- Selection: A selection objects need to be assigned to this parameter type: radio box or drop-down list.



Window artikel_produktkonfigurator_detail.psr

The following fields and properties are available in the header of the window:

Field	Description
Name	Parameter name (ID)
Type	Type of the parameter (string/number) **The type of parameter** Auto: Beas determines whether the parameter is a number or a string depending on the value.

© 2026 Boyum IT Solutions A/S

Field	Description
	• If the value is a number or "0", Beas interprets this parameter as a number. • If the value is empty or not a number, Beas interprets this parameter as a string. ***Example 1:*** Parameter: `"color"` is `"red"` Formula: `'the color is ' || [color]` HANA SQL: `select 'the color is' || 'red'` -> all ok Formula: `10 + [color]` SQL: `10 + 'red'` -> produce error ***Example 2:*** Parameter: `"color"` is `"5.3"` Formula: `'the color is ' || [color]` HANA SQL: `select 'the color is' || 5.3` -> produce error Formula: `10 + [color]` SQL: `10 + 5.3` -> all ok The evaluation of a formula is always dependent on the contents of the parameter. All configurations created with *beas 9.2 PL 5 Build 32 or older*, use parameter type "Auto" as standard. Working with Beas system variables or custom defined variables starting with "**e_**", the parameter can be interpreted as a string or number. With the following BeasScript setup the type can be permanently defined as string type, if the value is a Beas variable. This must be executed only once per database or client. `setsetup=config_default_e_type=c`

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>String</td><td>This parameter type allows a string. If working with formulas, Beas inserts a ‘ (single quotation mark) at the left and right side of the parameter.
If you create a new parameter, the string type is the default option.

Example 1:
Parameter: <code>"color"</code> is <code>"red"</code>
Formula: <code>'the color is ' || [color] (HANA SQL)</code>
MS SQL: <code>select 'the color is' + N'red'</code>
HANA SQL: <code>select 'the color is ' || ' red'</code>

Example 2:
Parameter: <code>"color_number"</code> is <code>"5,3"</code>
Formula: <code>'10' + [color_number]</code>
MS SQL: <code>'10' + '5,3'</code> -> all ok

Formula: <code>'the color is ' + [color]</code>
DataWindow Syntax: <code>'the color is' + 'red'</code></td></tr>
<tr><td>Number</td><td>This parameter type allows numbers only. If the content is not a number, Beas replaces it with “0”. The decimal delimiter is based on what it is defined in the system, but Beas internally replaces it with a decimal point.

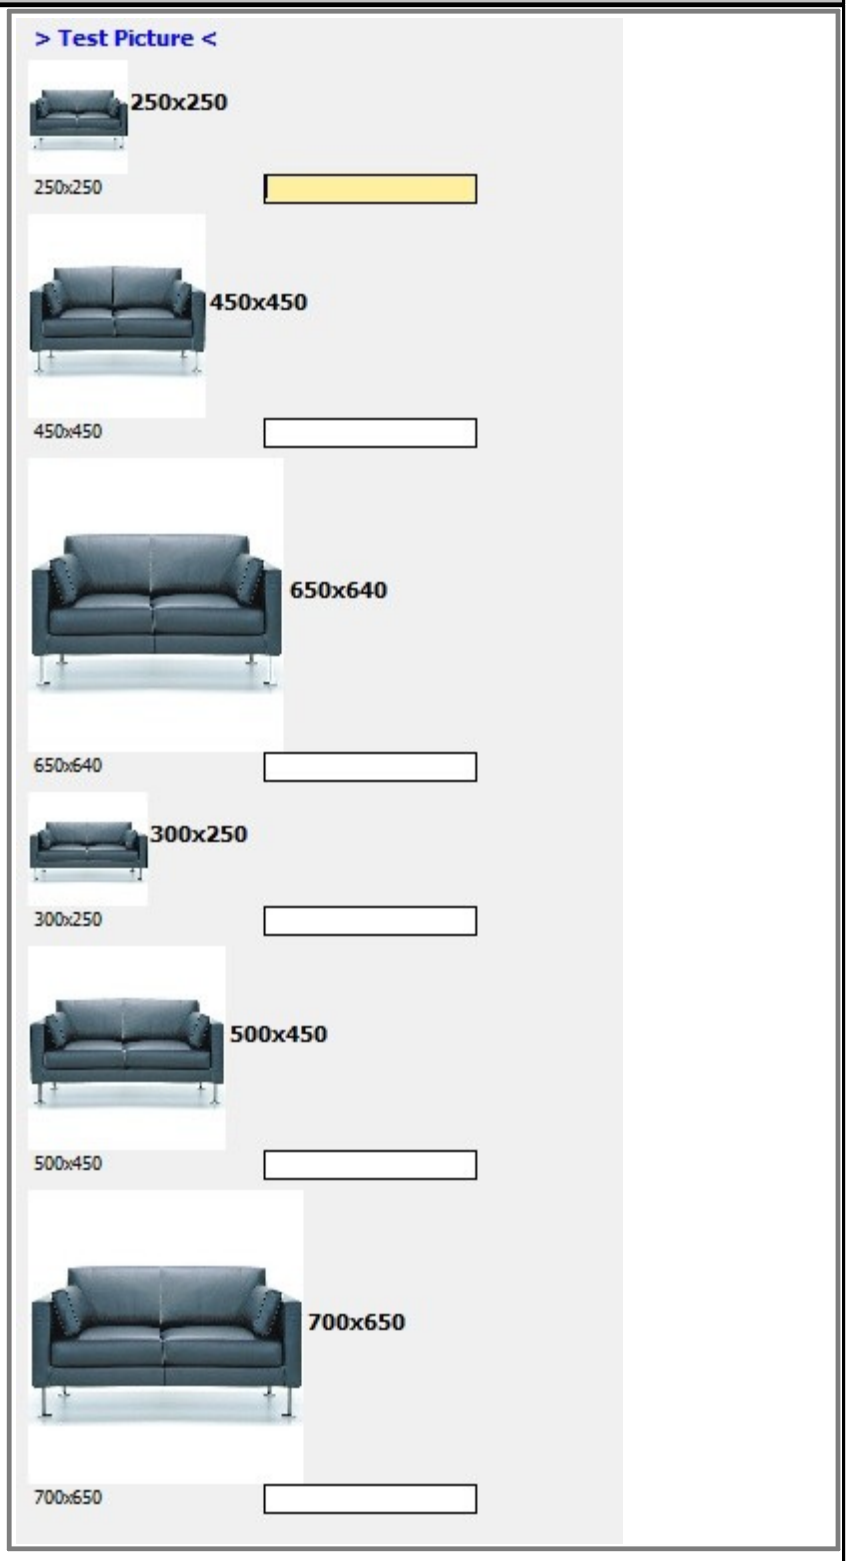
Example:
Parameter: <code>"color_number"</code> is <code>"5,3"</code> (Regional setting is Germany)
Formula: <code>[color_number] * 3</code>
SQL: <code>5.3 * 3</code></td></tr>
</table>

If you use a parameter both as a string or numeric value, then it is advantageous to specify this directly in the formula.
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
	String formula: `'color is ' || [color,dbstring]` Number formula: `if [color_number,dbnum] > 10 then 1 else 100 end`
Image	Select picture A picture to be displayed at this group. When the user selects the group, the picture is displayed. To select a picture, click on the drop-down arrow in the field and a screen opens to browse for the required image. Beas saves the image in the SAP Picture share folder. The image display size can also be defined. The size parameter is not supported fin the WEB version and in the WEB Configurator the image is always the original size. The following sizes are supported in the internal view: 250 x 250 450 x 450 650 x 650 300 x 250 500 x 450 700 x 650

© 2026 Boyum IT Solutions A/S

Field	Description
	


Input tab

© 2026 Boyum IT Solutions A/S

Field	Description
Mandatory	Defines whether the field is mandatory You can define a parameter as mandatory: • Configuration saved with mandatory fields missing have "Draft" status. **NOTE:** The field must be filled, otherwise you cannot create a Precalculation or work order with this configuration.  Mandatory entries are marked with a question mark.  indicates that the area is not completed. indicates that the area is completed. *beas 9.3 PL 2*
Type of input	Defines how the input for a parameter is provided

Value	Description
Normal	Small input field
Normal Large	Large input field

© 2026 Boyum IT Solutions A/S

Check Box	Checkbox with result Y/N (yes/no)
Selection - Radio Box	Radio box. Selection options can be defined: • Using a SQL statement or Cross Reference to generate the radio buttons • By right-clicking on the created radio box parameter in the configurator and adding a New selection Selection - Dropdown	Create a drop-down field. A reference must be defined using a SQL statement or Cross Reference to chose the contents of the drop-down list.

© 2026 Boyum IT Solutions A/S

	Cross Reference	Define values using a SQL Statement or product Cross Rererence This option can be used as a check box, radio box, or drop-down selection. Here you can insert the link to a cross reference, which can return a list of values for list or drop-down columns. **Only Desktop variant (no WEB Support)** Click the SQL icon to insert the SQL statement. Cross Reference: SQL Statement or manual values are supported. **SQL Command** The generated SQL Command must return 3 string parameters: • return value • description • picture (only for radiobox) **Tip** If a SQL statement is used, the configuration can be easily copied from one database to another. ***SQL example:***

© 2026 Boyum IT Solutions A/S

	Create a list of all Items starting with "SofaCloth". Use SQL Editor or type the commands: [select id,description,bitmapname from table where ...] For all items starting with "SofaCloth": `[select "ItemCode","ItemName" from "OITM" where "ItemCode" like 'SofaCloth%']` The result of using this statement for radio box and selection drop-down: Default Value	If a default value is defined, it is assigned to the parameter. Note, that this filed is case sensitive. Possible Default values Working with Default values • Fixed value Text or numeric value (as required) ***Example:*** test or 123 • Variables, which are defined before opening in the Configurator window (that is, with Beas script in "Windowevent open"). These variables must be defined with "e_". ***Example:*** [e_cardcode] • As empty value Choose [CurrentEntry] • Previously defined parameters. These defaults are dynamically changed. ***Example:*** [so_mysetobject]

© 2026 Boyum IT Solutions A/S

Fixed value

A fixed value is set if:

- a new configuration is loaded
- if a previously invalid default value becomes valid

Example of an invalid default value becoming valid again:

A radio box is defined with 3 elements: red, yellow, green. The default value is yellow. But the visibility rule specifies that yellow is invisible, and therefore invalid. In this case, "yellow" is invalid,so there is no default. Every time the configuration is changed, the system checks whether yellow is valid. If it becomes visible again, the parameter is set if the default has not yet been overwritten.

Default is a parameter

If the default value is a parameter, it is always reset if something is changed before the parameter.

Example:

```
WheelSize
defcolor (set object): case
when[WheelSize] <30 then 'red' else 'blue'
end
Color (Default=[defcolor])
```

If `WheelSize` is changed, the content of Color is also reset because `WheelSize` is BEFORE `Color`. If values are changed after `Color`, `Color` the value is not set again.

Manual changes have priority

If `Color` is changed manually, the manual change takes precedence, that is even if `WheelSize` is changed, the default value of `Color` is not reset,

© 2026 Boyum IT Solutions A/S

	except, if the manually selected value loses its validity.
	
	Example:
	
	`Color is a radio box`
	`// Red only available, if WheelSize < 30`
	`// Blue only available, if WheelSize>24`
	`Red = case when [WheelSize] <30 then 1`
	`else 0 end`
	`Blue= case when [WheelSize] >24 then 1`
	`else 0 end`
	
	If Blue is manually selected and then `WheelSize` is set to 22, Blue becomes invalid, so the manual entry loses its priority and the default value is set. In this case red and the entry is marked as "not changed manually".
	If the default value is also invalid, the entry is marked as "not set".

- Output tab

The Description of the Input tab can be replaced with another text defined in this field.

Field	Description
Text	Definition of an the output text

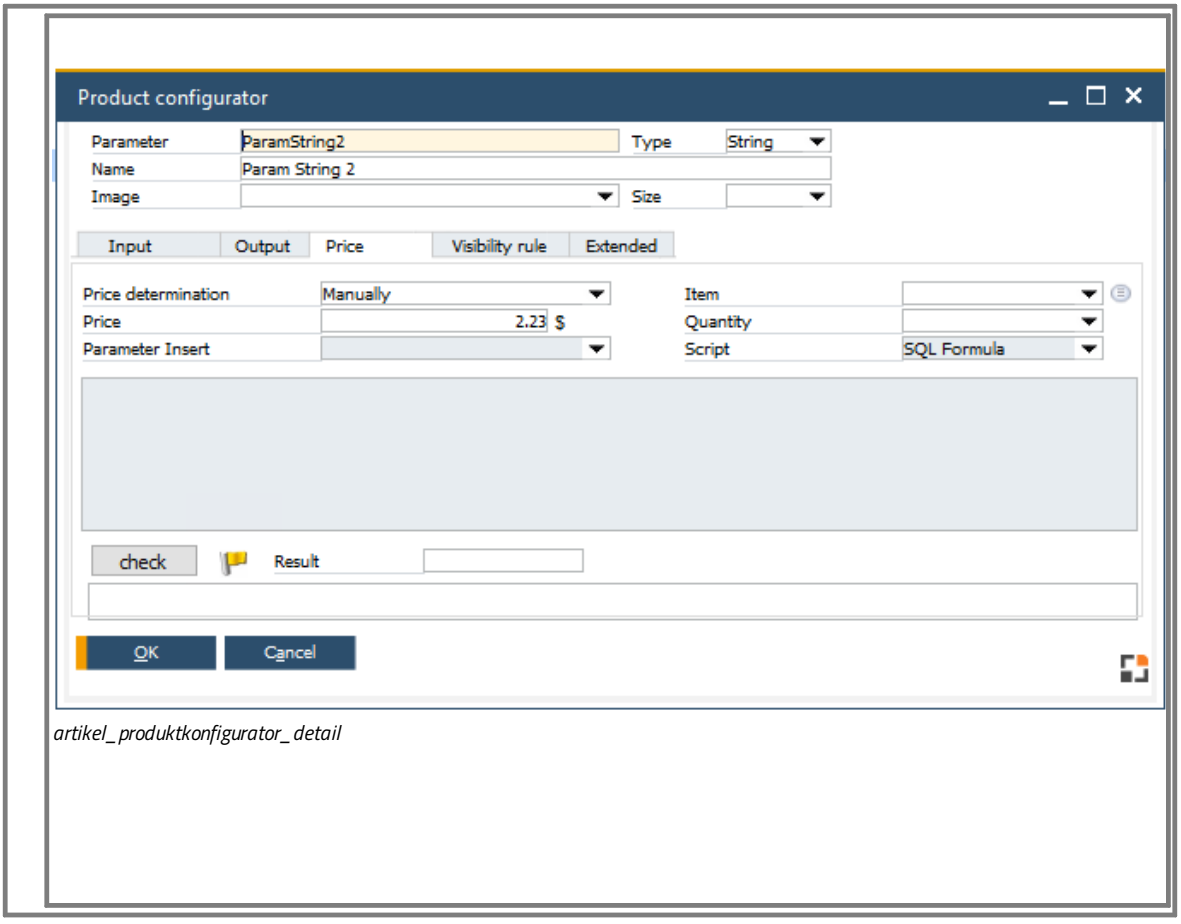
- Tab Price



artikel_produktkonfigurator_detail

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Price determination</td><td>Define the price
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>Formula</td><td>Create a formula to calculate the price</td></tr>
<tr><td>Manually</td><td>Insert the price manually in the Price field</td></tr>
<tr><td>Price List</td><td>Use price from a Price List.
- Use default price list, defined in Calculation Header.
- Use a special price list of a customer if it is selected from "Default price list" drop-down in the Calculation Header. (previously "Use BP price list" radio box).

Supports all price list rules, but unit groups are not supported.

If you insert [cprice] in a formula, you see the price determination result by Price List in this parameter.</td></tr>
<tr><td>No</td><td>Price determination is not activated for this entry.</td></tr>
</table></td></tr>
<tr><td>Price</td><td>Use the entered price if price determination is set to Manually.
The logo of the actual currency (for example "$" or "€") is displayed right of the field.
Prices are rounded according to the value defined in SAP Business One > General Settings > Display > Decimal Places (0..6) > Prices.
Up to 6 decimals can be defined.</td></tr>
<tr><td>Item</td><td>Define the item to determine the price from a price list
Choose the item directly or insert a parameter.

For example for the following sofa cushions, there are two parameters:
- Cushions Yes/No: whether cushions are needed</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
	- Number of quantity: how many cushions are needed In Cushion the price determination is set to No, so it does not affect the price. In Number of Quantity we define the price by a price list. Price comes from price list from "SofaCushion" item that was added to the Item field. Quantity comes from the current "Number of Cushions" parameter (nrcushion), so the [nrcushion] parameter is chosen in the Quantity field.  Result: Beas searches in the price list for the sofa cushion item. Total Quantity = Quantity from Sales Order / Quotation * Quantity from [nrcushion] Result = Price from Price List * Quantity from [nrcushion] Use the Test button in the product configurator definition list to test the setup. Note: **Volume discount** can be applied for the item (parameter), but not the parent item. **Limitation:** The price value CurrentEntry is not supported in WebApp Terminal 2.1
Quantity	Define the quantity for calculation

© 2026 Boyum IT Solutions A/S

Field	Description
	Insert a number manually or use a parameter. Two quantities are calculated: Required quantity for 1 product (cquantity) Required total quantity (calculated quantity * quantity from sales order = ctotalquantity) For an example, ***see*** Item. *beas 9.3 PL 2*
Script / Formula	Calculate the price using a formula If the price is calculated by a formula (Price determination is set to Formula), insert the formula. The Parameter Insert field provides a shortcut to all available parameters. If the "[price]" field is in the formula, Beas determines the price using the price list. ***See*** Script Syntax The following standard parameters are available. Note: Not supported in WEB Configurator.

Parameter Name	Description
`cprice`	Price from a price list (only for the Price calculation field)
`cpricequan`	Calculated quantity for this item (tab Price - field Quantity)

© 2026 Boyum IT Solutions A/S

Field	Description
	<table><tr><th>Parameter Name</th><th>Description</th></tr><tr><td></td><td>  </td></tr><tr><td>cpricetota</td><td>Calculated quantity (= tab Price - field Quantity) * Quantity from sales order or quotation  </td></tr><tr><td>cpricelist</td><td>Price list defined in Configuration Header  </td></tr><tr><td>currentuse</td><td>Current user</td></tr><tr><td>cardcode</td><td>Business partner from the sales order or quotation</td></tr><tr><td>cquantity</td><td>Quantity from the sales order or quotation</td></tr><tr><td>cdocdate</td><td>Date from the sales order in "yyyymmdd" format, example 20220503 for the date 2022/05/03</td></tr><tr><td>cshortvari</td><td>Short variant A-Z from sales order or quotation</td></tr></table>
The **check** button	Check for syntax errors in the entered script
Flag	– The rule is error free

© 2026 Boyum IT Solutions A/S

Field	Description
	– Warning (default) – Error in rule
Result	Shows the result of the evaluated formula. The result must be a number. **Attention:** Price determination by price list is not working here, [cprice] is always 0.
Evaluation of the rule	Shows the evaluated formula with a status message.

Tab Visible Rule

Some rules can be defined to display the block with specific values or parameters. The rules determine whether a configuration option is presented to the operator, based on previous configuration selection. Therefore, it is possible to restrict options. The rule is created in SQL syntax.

Field	Description

Some rules can be defined to display the block with specific values or parameters. The rules determine whether a configuration option is presented to the operator, based on previous configuration selection. Therefore, it is possible to restrict options. The rule is created in SQL syntax.

Field	Description
Parameter Insert	Parameters and Set Objects that are already defined, are displayed in a selection list. They can be used to create a rule.
Script	The language syntax that the rule is written in. Available options are: • DW Script • SQL formula • JavaScript formula • Java script • VBScript formula • VBScript ***See*** Script Syntax
Input field	Insert the visible rule for the object. All defined parameters and Set-Objects can be used in the configuration. ***Example:*** [a] = 5 [color] = red

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description

Field	Description
	[a] > 5 or [b] = 3 To have a parameter not visible (maybe for special cases): 1 = 2 ***see*** Script Syntax Note: When using the SQL formula, database accesses may reduce the performance of the configurator window.
The **check** button	Check for syntax errors in the entered script.
Flag	– The rule is error free – Warning (default) – Error in rule
Result line	Shows the result of the evaluated rule.
Evaluation of the rule	Shows the evaluated rule with status message.

Tab "Extended"

Field	Description
Bitmap	to change the bitmap of the actual configuration object. Possible standard bitmaps via selection in the dropdown list
Color	set the color of text of the configuration object

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description
		Info	An Info-object displays a text and (optionally) an image in the detail area of the associated block. In our Sofa example, the info-object is Design – a full description of the product.
		Parameter	A *Parameter* is used to input or select the possible product options. In our Sofa example above the parameters are the Number seats, the color and the cover, the legs and accessories. Parameter object details A *parameter* ( ) is used for input or selection of possible options. You can access the value of the parameter, i.e. the selection you made, in the configurator within formulas/set objects.There are three possibilities: o *Normal*: Enter alphanumerical values o *Checkbox*: Select Yes/No o *Selection*: To a parameter of this type, selection objects need to be assigned (Separate objects, Radiobox or dropdown list). **The following fields and properties are available:**

Field	Description
Parameter	Parameter name
Type	Type of the parameter (string/number) **The type of parameter** Auto: Beas determines whether the parameter is a number or a string depending on the value. • If the value is a number or "0", Beas interprets this parameter as a number.

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description
			Field / **Description**

- If the value is empty or not a number, Beas interprets this parameter as a string.

Example 1:

Parameter: `"color"` is `"red"`

Formula: `'the color is ' || [color]`

HANA SQL: `select 'the color is' || 'red' ->` all ok

Formula: `10 + [color]`

SQL: `10 + 'red' ->` produce error

Example 2:

Parameter: `"color"` is `"5.3"`

Formula: `'the color is ' || [color]`

HANA SQL: `select 'the color is' || 5.3 ->` produce error

Formula: `10 + [color]`

SQL: `10 + 5.3 ->` all ok

The evaluation of a formula is always

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description
			Field / **Description**
			dependent on the contents of the parameter. All configurations created with *beas 9.2 PL 5 Build 32 or older*, use parameter type "Auto" as standard. Working with Beas system variables or custom defined variables starting with "**e_**", the parameter can be interpreted as a string or number. With the following BeasScript setup the type can be permanently defined as string type, if the value is a Beas variable. This must be executed only once per database or client. `setsetup=config_default_e_type=c`
			String: This parameter type allows a string. If working with formulas, Beas inserts a ' (single quotation mark) at the left and right side of the parameter. If you create a new parameter, the string type is the default option.

Icon	Boyum Style	Object type	Description

Field	Description
	parameters must be edited, to have the complete block processed. icon changes to).
Type of input	This defines how the input for a parameter has to be made. Possible settings are: o Normal: Enter alphanumerical values o Normal - large: Enter alphanumerical values to a large text field o Checkbox: Select Yes/No o Selection - Radiobox: Display as "Radiobox" List (Selection 1 out of n) o Selection - Dropdown: Display as "Dropdown"-List (only possible if values will fetched via "Select"-Statement from Database!!)
Cross Reference	If type of input is selection, add an alternative to the parameter. You can access existing tables in **Production > Product configurator > References**. Saved references can be selected and will be available for selection in product configurator.
Default Value	If a default value is defined, this is assigned to the parameter (**Case sensitive!**) Possible Default values

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description

Field	Description
	a) fix value Text or numeric value (as required) ***Example:*** test or 123 b) Variables, which are defined before opening in the Configurator window (e. g. with Beas Script in "Windowevent open"). These variables must be defined with "e_". ***Example:*** [e_cardcode] c) Previously defined parameters. These defaults are also changed dynamically ***Example:*** [so_mysetobject] **Fixed value** A fixed value is set if a) a new configuration is loaded b) if a previously invalid default value becomes valid **When does an invalid default value become valid again?** This is explained in the following example:

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description
			Field / **Description**

			Radio box with 3 elements: red, yellow, green.
			The default value is yellow. But the visibility rule specifies that yellow is invisible and therefore invalid. In this case, "yellow" is not defined as the default value. There is no default.
			Every time the configuration is changed, the system checks whether yellow is valid. If yes, this is set if the parameter has not yet been set otherwise.
			
			The default is a parameter
			
			If the default value is a parameter, it is always reset if something is changed before the parameter.
			Example:
			
			`WheelSize`
			`defcolor (set object):`
			`case when[WheelSize] <30 then 'red' else 'blue' end`
			`Color (Default=[defcolor])`
			
			If `WheelSize` is changed, the content of Color is also reset because `WheelSize` is BEFORE `Color`. If values are changed

Icon	Boyum Style	Object type	Description

Field	Description

	after `Color`, `Color` is not set again.
	
	Manual changes have priority:
	
	If `Color` is changed manually, the manual change takes precedence, i.e. even if `WheelSize` is changed, the default value of `Color` is not reset.
	Exception: the manually selected value loses its validity.
	
	Example:
	
	`Color is a radio box`
	`// Red only available, if WheelSize < 30`
	`// Blue only available, if WheelSize>24`
	`Red = case when [WheelSize] <30 then 1 else 0 end`
	`Blue= case when [WheelSize] >24 then 1 else 0 end`
	
	If you now manually select Blue and then set `WheelSize` to 22, Blue becomes invalid, so that manual entry loses its priority and the default value is set, in this case red and the

Field	Description
Price determination	Define the price

Icon	Boyum Style	Object type	Description

Field	Description

Value	Description
Formula	Create a formula to calculate the price
Manually	Insert the price manually in the Price field
Price List	Use price from a Price List. - Use default price list, defined in Calculation Header. - Use a special price list of a customer if it is selected from "Default price list" drop-down in the Calculation Header. (previously "Use BP price list" radio box). Supports all price list rules, but unit groups are not supported. If you insert [cprice] in a formula, you see the price determination result by Price List in this parameter.
No	Price determination is not activated for this entry.

Field	Description
Price	Use the entered price if price determination is set to Manually. The logo of the actual currency (for example "$" or "€") is displayed right of the field. Prices are rounded according to the value defined in **SAP Business One > General Settings**

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description

Field	Description
	> Display > Decimal Places (0..6) > Prices. Up to 6 decimals can be defined.
Item	Define the item to determine the price from a price list Choose the item directly or insert a parameter. For example for the following sofa cushions, there are two parameters: - Cushions Yes/No: whether cushions are needed - Number of quantity: how many cushions are needed In Cushion the price determination is set to No, so it does not affect the price. In Number of Quantity we define the price by a price list. Price comes from price list from "SofaCushion" item that was added to the Item field. Quantity comes from the current "Number of Cushions" parameter (nrcushion), so the [nrcushion] parameter is chosen in the Quantity field. 
© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description

Field	Description
	Result: Beas searches in the price list for the sofa cushion item. Total Quantity = Quantity from Sales Order / Quotation * Quantity from [nrcushion] Result = Price from Price List * Quantity from [nrcushion] Use the Test button in the product configurator definition list to test the setup. Note: **Volume discount** can be applied for the item (parameter), but not the parent item. **Limitation:** The price value CurrentEntry is not supported in WebApp Terminal 2.1
Quantity	Define the quantity for calculation Insert a number manually or use a parameter. Two quantities are calculated: Required quantity for 1 product (cquantity) Required total quantity (calculated quantity * quantity from sales order = ctotalquantity) For an example, ***see*** Item. *beas 9.3 PL 2*
Script /	Calculate the price using a formula

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description

Field	Description
Formula	If the price is calculated by a formula (Price determination is set to Formula), insert the formula. The Parameter Insert field provides a shortcut to all available parameters. If the "[price]" field is in the formula, Beas determines the price using the price list. ***See*** Script Syntax The following standard parameters are available. Note: Not supported in WEB Configurator.

Parameter Name	Description
`cprice`	Price from a price list (only for the Price calculation field)
`cpriceq`	Calculated quantity for this item (tab Price - field Quantity) `cpricet`	Calculated quantity (= tab Price - field Quantity) * Quantity from sales order or quotation

</table>

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description

Field	Description
Parameter	Object name
Parameter Type	Type of Parameter (String/Number)

The type of parameter

Auto	Beas determines whether the parameter is a number or a string depending on the value. • If the value is a number or "0", Beas interprets this parameter as a number. • If the value is empty or not a number, Beas interprets this parameter as a string. ***Example 1:*** Parameter: `"color"` is `"red"` Formula: `'the color is ' || [color]` HANA SQL: `select 'the color is' || 'red'` -> all ok Formula: `10 + [color]` SQL: `10 + 'red'` -> produce error ***Example 2:*** Parameter: `"color"` is `"5.3"` Formula: `'the color is ' || [color]` HANA SQL: `select 'the color is' || 5.3` -> produce error Formula: `10 + [color]` SQL: `10 + 5.3` -> all ok

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description

	The evaluation of a formula is always dependent on the contents of the parameter. All configurations created with *beas 9.2 PL 5 Build 32 or older*, use parameter type "Auto" as standard. Working with Beas system variables or custom defined variables starting with "**e_**", the parameter can be interpreted as a string or number. With the following BeasScript setup the type can be permanently defined as string type, if the value is a Beas variable. This must be executed only once per database or client. `setsetup=config_default_e_type=c`
String	This parameter type allows a string. If working with formulas, Beas inserts a ' (single quotation mark) at the left and right side of the parameter. If you create a new parameter, the string type is the default option. ***Example 1:*** Parameter: `"color"` is `"red"` Formula: `'the color is ' || [color] (HANA SQL)` MS SQL: `select 'the color is' + N'red'` HANA SQL: `select 'the color is ' || ' red'`

© 2026 Boyum IT Solutions A/S

Icon	Boyum Style	Object type	Description

	Example 2: Parameter: `"color_number"` is `"5,3"` Formula: `'10' + [color_number]` MS SQL: `'10' + '5,3'` -> all ok Formula: `'the color is ' + [color]` DataWindow Syntax: `'the color is' + 'red'`
Number	This parameter type allows numbers only. If the content is not a number, Beas replaces it with “0”. The decimal delimiter is based on what it is defined in the system, but Beas internally replaces it with a decimal point. ***Example:*** Parameter: `"color_number"` is `"5,3"` (Regional setting is Germany) Formula: `[color_number] * 3` SQL: `5.3 * 3`

If you use a parameter both as a string or numeric value, then it is advantageous to specify this directly in the formula.

String formula: `'color is ' || [color,dbstring]`
Number formula: `if [color_number,dbnum] > 10 then 1 else 100 end`

Insert Parameter	Display all already defined parameters and set-objects. Makes easier to generate the description text for field below.

Script Syntax

© 2026 Boyum IT Solutions A/S

Different programming languages can be used in configurator Scripts.
All existing parameter, which has been defined in the configurator can be accessed via placeholder.

SQL Formula is set by default!

Please note:
Using the SQL formula, database access may reduce processing speed in the Configurator window.

SQL Formula

Simplified use of SQL syntax only specifies what should be returned.
The system creates the following syntax:

```
select <your script> from "BEAS_DUMMY"
```

Example: Input: `3.5 * 4`
It is executed: `select 3.5 * 4 from "BEAS_DUMMY"`

If an information from the product configurator is needed (from a parameter), these are enclosed in square brackets.

Example: `[sofa_width] * 4`
If the length is 300, following will be executed: `select 300 * 4 from "BEAS_DUMMY"`

Please note:
Since there are problems with different country settings (Database and/or Windows system)
with decimal numbers and date definitions, should be used here with the formatting of parameters/set-objects (similar to Beas-Script) *beas 9.2 PL: 05 (5.13)*

SQL conversions:
For numeric values [value,**num**] or date [date,**dbdate**] or string [stringparameter,dbstring]

© 2026 Boyum IT Solutions A/S

Example:

```
[sofa_length,num] * 4
```
(with **sofa_length**: 200,5)

The whole SQL-instruction can be set in squared brackets if an extended SQL-instruction is necessary:

```
[select your command]
```

Example: Return UDF-Field: U_MaterialColor

```
[select "U_MaterialColor" from "OITM" where
"ItemCode"=[my_itemcode,dbstring]]
```

Important: Do not forget the quotation marks at placeholder if it is about a reference

Example: Return of a price of a price list

```
[select "ITM1"."Price"
from "ITM1"
 LEFT OUTER JOIN "OPLN" on "ITM1"."PriceList"="OPLN"."ListNum"
 where "ITM1"."PriceList"="OPLN"."ListNum"
 and "OPLN"."ListName"=[cpricelist,dbstring]
 and "ITM1"."ItemCode"='stoff_blau']
```

Example: Visibility Rule

A selection element of a list should only be displayed if the parameter "cushions" has the content "Y":

```
[cushions] = 'Y'
```

Example: Assign a value (or text) to a Set object

If the content of the parameter "headrest" has the content "Y" then assign "Y", otherwise "N":

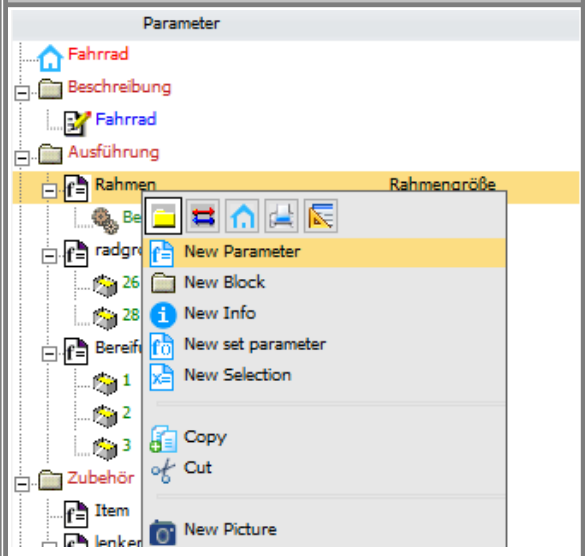
© 2026 Boyum IT Solutions A/S

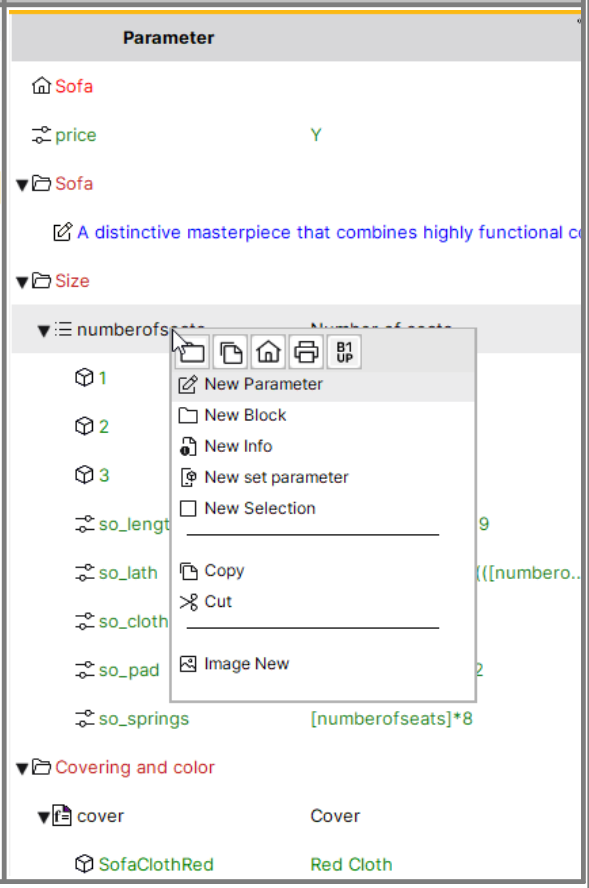
```
case when [headrest]='Y' then 'Y' else 'N' end
```

Product configuration process:

The procedure for creating a configurator for a product (item) is as follows:

Right-click on an existing object (or the empty configurator structure) to open a pop-up menu containing the objects to be added.

Traditional Style	Boyum Style
	




Picture: Pop-up menu

Only the objects that can be added to the selected object are displayed. You can now select which object should be added; a new window opens in which you can define the properties of the object.

The system can access the "Set objects" and "Parameter" from Bill of materials positions and routing positions.

The Bill of materials and routings can thus be customized independently of variants.

© 2026 Boyum IT Solutions A/S

Note:

The names of the parameter and set-objects must be unique in the configuration structure. Not case sensitive.

The system can access the *set-objects* and *Parameters* from Bill of materials positions and routing positions
The Bill of materials and routings can thus be customized independently of variants.

Please note that for Parameters and Set-Objects, the following
reserved names cannot be used:

- cpreis
- cprice
- currentuser
- cpreisliste
- cpricelist
- crabatt
- cdiscount

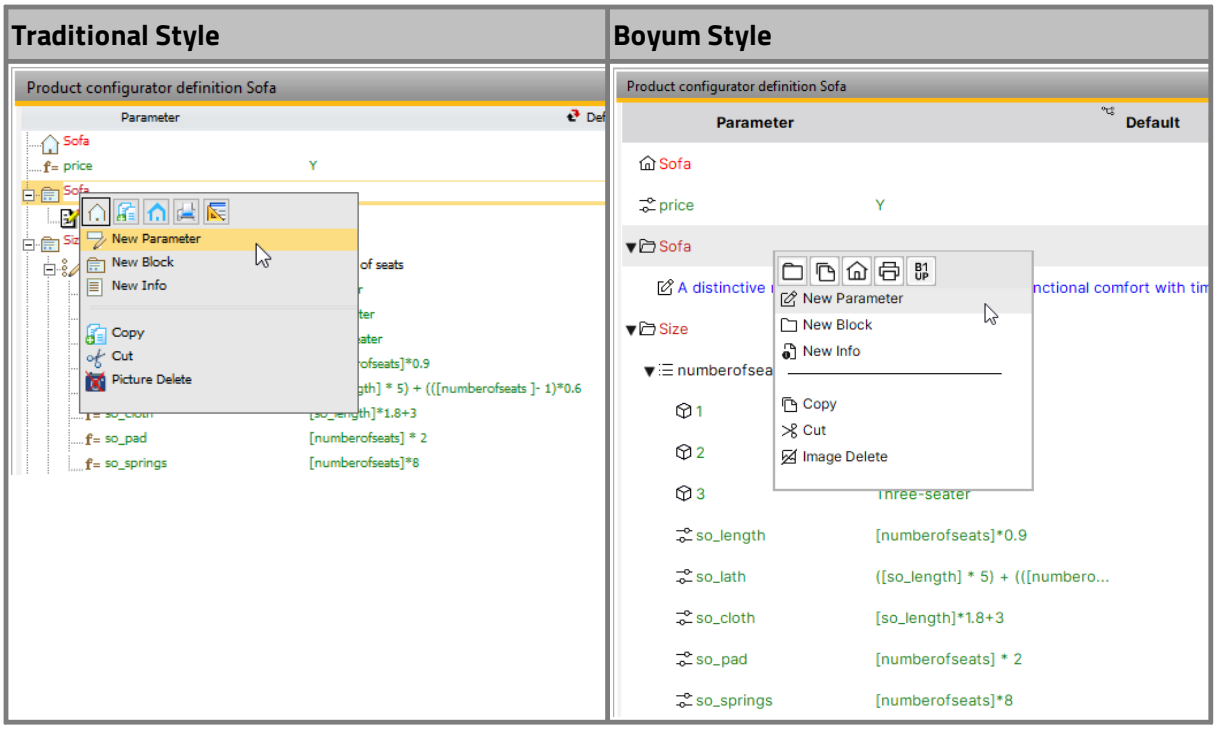
It is similarly not allowed to use "**e_**" at the beginning of a Parameters or Set-Objects, because external variables start with it.

8.14.2.1.7 Copying objects

In the Configuration Structure window, it is also possible e.g. to copy, cut or insert objects.

These functions can be accessed via the "right-click" menu. (/ : 1. Option in menu line. Default).

© 2026 Boyum IT Solutions A/S



/ **Copy**:

Copying of selected parameter or selection into clipboard.

/ **Cut** :

Transfer/cut of selected parameter or selection into clipboard.

/ **Insert**:

Insert of selected parameter or selection from clipboard to actual position.

8.14.2.1.7.1 Copying within the configuration structure

The "right-click" menu of the configuration structure under / includes the options **Copy**, **Cut** and **Insert:**

Icons

© 2026 Boyum IT Solutions A/S

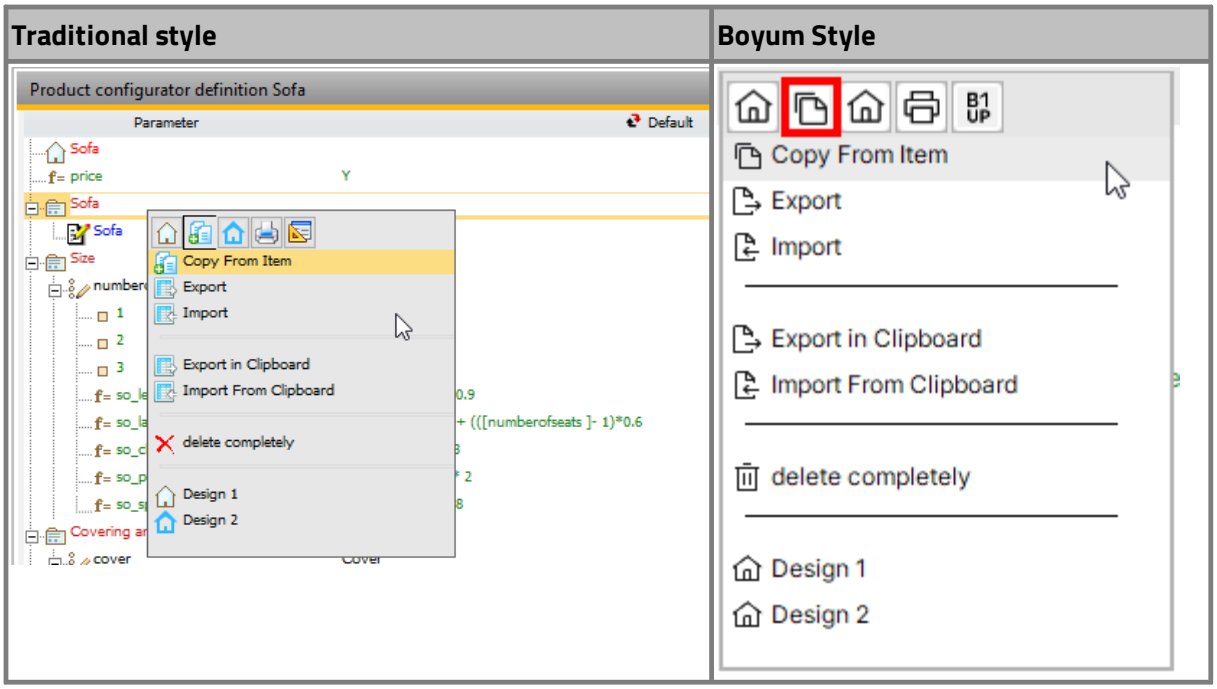
Function	Traditional style	Boyum Style	Description	
Copy			Copies the current block or line (e.g. set object, selection) to the clipboard.	
Cut			Removes the current block or line (e.g. set object, selection) and places it in the clipboard.	
Insert			Re-inserts the clipboard contents below the current line.	

8.14.2.1.7.2 Copy objects of other items

The "right-click" menu of the configuration structure under / includes the options **Copy from item.**

This gives you the option of copying any objects or all definitions from configurations of other items.

© 2026 Boyum IT Solutions A/S



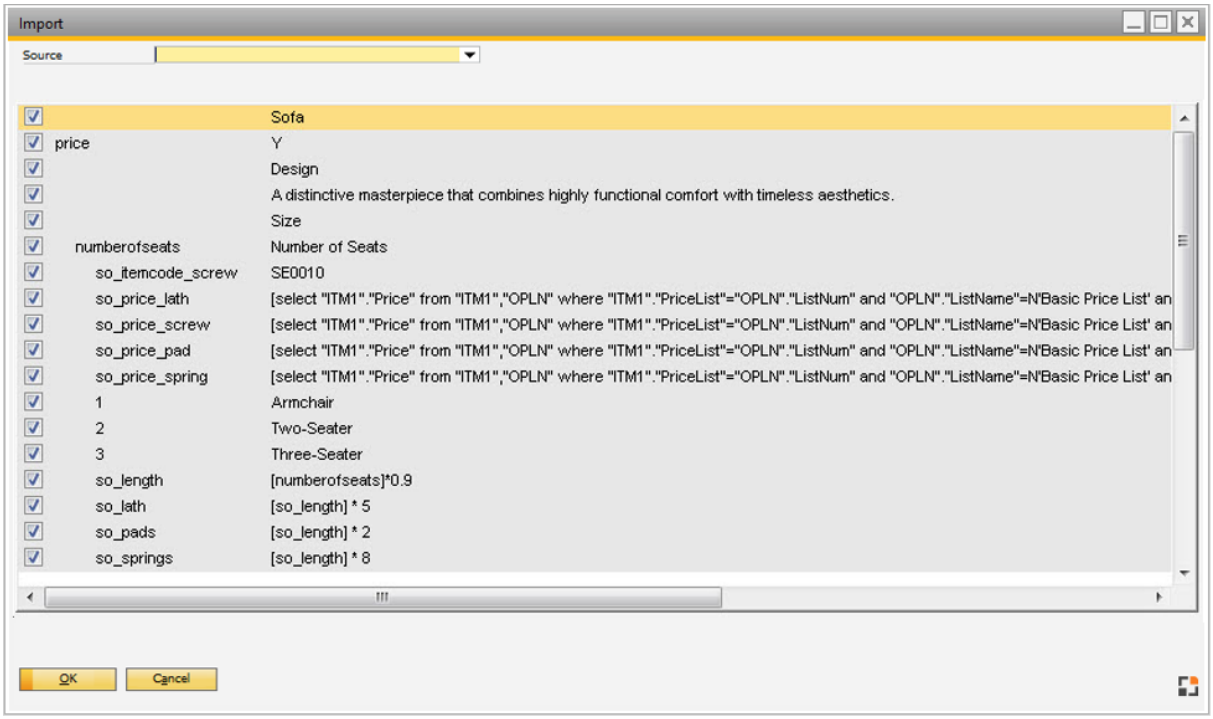
/ : **Copy from Item**

Copies the coding from this item.

To do this, a new window opens to allow you to select a possible item from a list. Only items that have configurations are displayed.

After selection, all objects of the selected configuration are displayed in another window. You can now select the required objects for transfer. Click on the **OK** button to transfer these objects.

© 2026 Boyum IT Solutions A/S



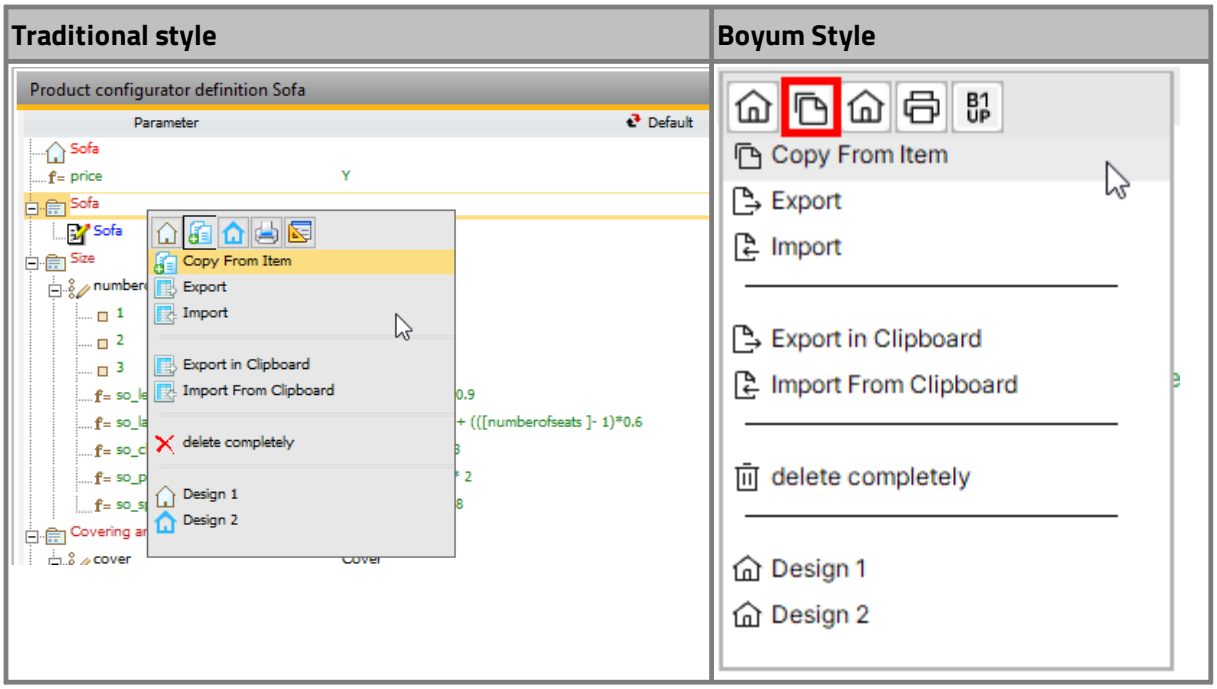
Window artikel_produktkonfigurator_export.psr

8.14.2.1.7.3 Exporting and importing objects

The "right-click" menu of the configuration structure under / includes the options **Export** and **Import.**

This allows you to export selected objects and e.g. insert these in other configurations.

© 2026 Boyum IT Solutions A/S



/ : **Export**

Exports all objects of the current item as a file to the project directory.

/ **: Import**

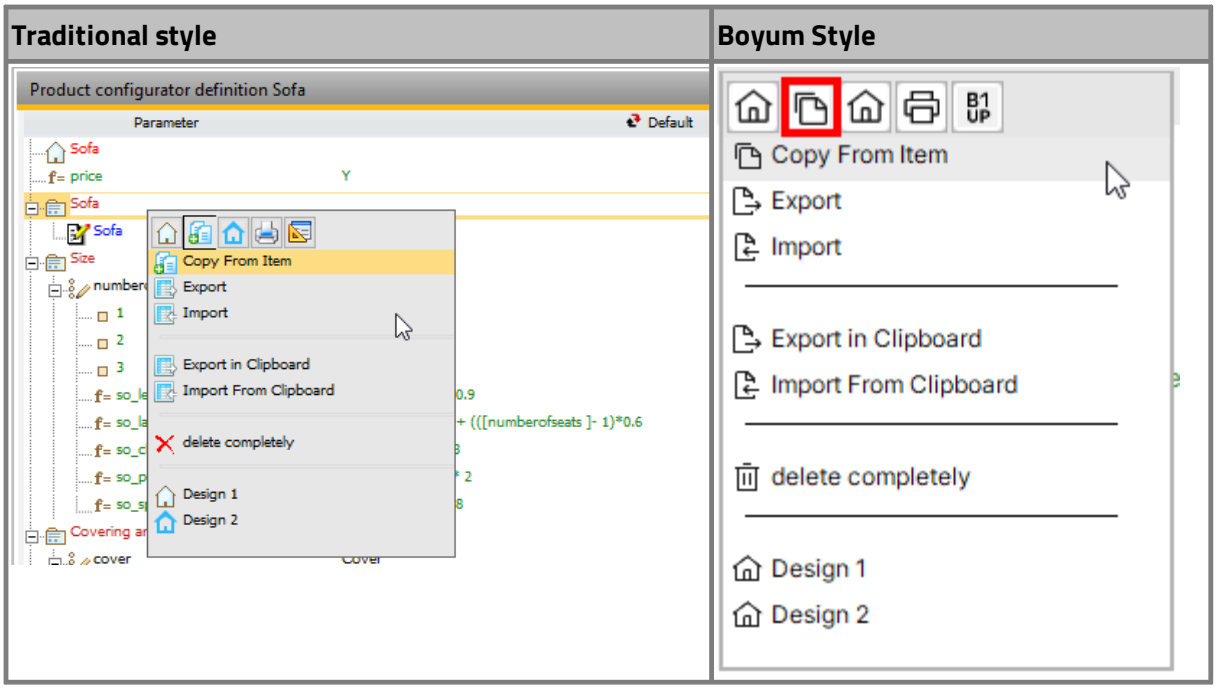
Possibility of importing individual items or all items from a selectable export file into the current configuration. A selection window opens in which you can select the required objects.

8.14.2.1.7.4 Exporting and importing object via clipboard

The "right-click" menu of the configuration structure under / includes the options **Export** and **Import in clipboard.**

This allows you to export selected objects and e.g. insert these in other configurations.

© 2026 Boyum IT Solutions A/S



: Export in Clipboard

Exports all objects of the current item as a file to the project directory.

: Import From Clipboard

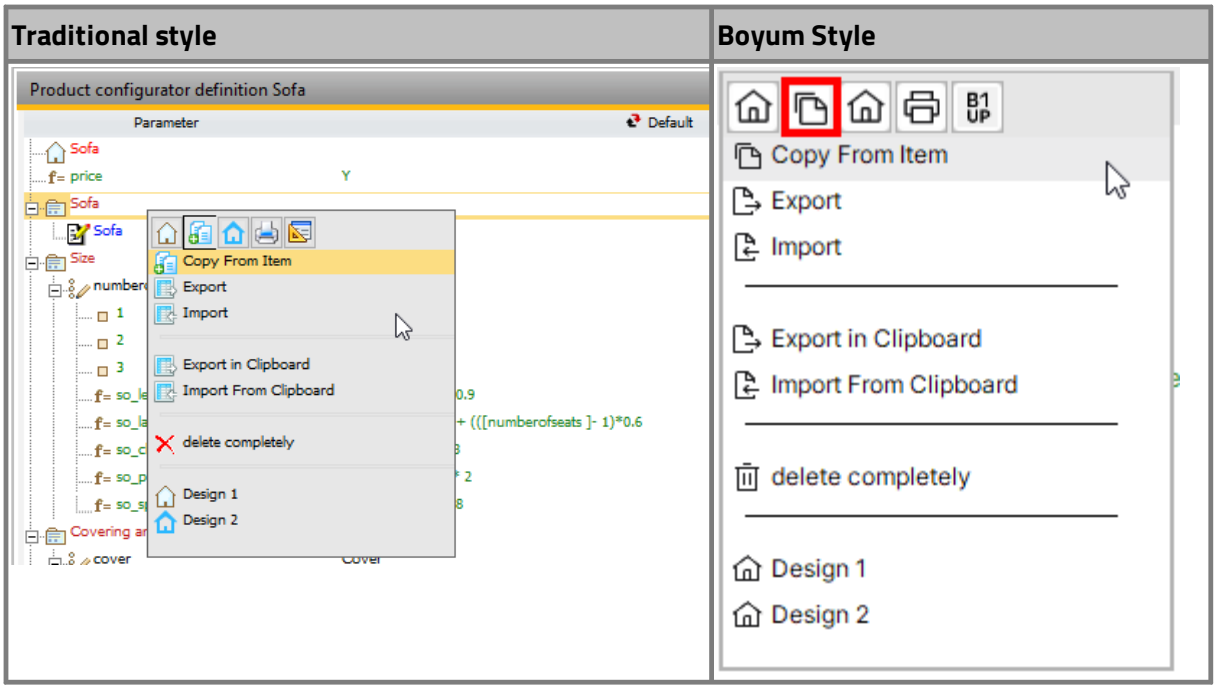
Possibility of importing individual items or all items from a selectable export file into the current configuration. A selection window opens in which you select the required objects.

8.14.2.1.7.5 Deletion of all objects

The "right-click" menu of the configuration structure under / includes the options **Delete completely.**

This allows you to export selected objects and e.g. insert these in other configurations.

© 2026 Boyum IT Solutions A/S



: Delete completely

Deletes the configuration coding of this item.

8.14.2.1.8 Script Syntax

Several programming languages can be used in the Product Configurator script fields.
Existing parameter, which have already been defined in the configurator, can be easily accessed using a placeholder.

The SQL formula syntax is set by default.

Note: When using the SQL formula, database accesses may reduce the performance of the configurator window.

SQL Formula

This simplified use of the SQL syntax only specifies what should be returned.
The system then creates the following syntax:

```
select <your script> from "BEAS_DUMMY"
```

© 2026 Boyum IT Solutions A/S

Example: Input: `3.5 * 4`

It is executed: `select 3.5 * 4 from "BEAS_DUMMY"`

If information of a product configurator parameter is required, enclose the parameter in square brackets.

Example: `[sofa_width] * 4`

If the width is 300, following is executed: `select 300 * 4 from "BEAS_DUMMY"`

> Note:
>
> Since different country settings of the database or Windows system can cause issues with decimal numbers and date definitions, these must be used with the parameters/set-objects (similar to BeasScript) formatting Beas 9.2 PL: 05 (5.13).

SQL conversions can be used for:

numeric values [value,**num**] or date [date,**dbdate**] or string [stringparameter,dbstring]

Example:

`[sofa_length,num] * 4` (with **sofa_length**: 200,5)

You can insert complete sql statements

Example: Return UDF-Field: `U_MaterialColor`

```
select "U_MaterialColor" from "OITM" where "ItemCode"=[my_itemcode,dbstring]
```

Important: Do not forget the quotation marks at placeholder if it is about a reference.

Example: Visibility Rule

A selection element of a list should only be displayed if the parameter "cushions" has the content "Y":

```
[cushions] = 'Y'
```

Example: Assign a value (or text) to a Set object

If the content of the parameter "headrest" has the content "Y" then assign "Y", otherwise "N":

```
case when [headrest]='Y' then 'Y' else 'N' end
```

HANA

You must always define a table in HANA.

Without defining a table, the system automatically inserts the keyword ' `from "BEAS_DUMMY"` '

© 2026 Boyum IT Solutions A/S

If you work with complete SQL statements or with sub-select commands, you must define the Table.

Note: BeasScript placeholder (<placeholder>) is not supported.

Examples:

sofa_width=300, numeric value

Example	Executed SQL command
`[sofa_width] * 4`	`select 300 * 4 from "BEAS_DUMMY"`
`select [sofa_width] * 4`	`select 300 * 4 from "BEAS_DUMMY"`
`select "ItemName" from "OITM" where "ItemCode"='1111'`	`select "ItemName" from "OITM" where "ItemCode"='1111'` the system find the keyword "from" inside the sql statement and don't insert the "BEAS_DUMMY"
`(select "ItemName" from "OITM" where "ItemCode"='1111') || 'hello'`	`select (select "ItemName" from "OITM" where "ItemCode"='1111') || 'hello'` Open bracket without closing bracket creates a sub-select command. The system finds the keyword "from" inside the sql statement and does not insert the "BEAS_DUMMY" This is working in MSSQL, but not in HANA, because we miss table "BEAS_DUMMY" outside the sub-select command.
`select "ItemName" || 'hello' from "OITM" where "ItemCode"='1111'`	`select "ItemName" || 'hello' from "OITM" where "ItemCode"='1111'` It is working in Hana and MSSQL.

- JavaScript Formula

Example: Visibility Rule.

A selection element of a list should only be displayed if the parameter "cushions" has the content "Y":

```
[cushions] == 'Y'
```

© 2026 Boyum IT Solutions A/S

JavaScript

Example: Visibility Rule.

A selection element of a list should only be displayed if the parameter "cushions" has the content "Y":

```
result = [cushions] == 'Y'
```

Example: Check the contents of a parameter.

Checking if you need a headrest for an armchair (number of seats = 1):

```
if ([numberofseats] == "2" || [numberofseats] == "3")
    result=1
 else
    result=-1;
```

VBScript-Formel

Example: Visibility Rule.

A selection element of a list should only be displayed if the parameter "cushions" has the content "Y":

```
[cushions] = "Y"
```

VBScript

Example: Visibility Rule.

A selection element of a list should only be displayed if the parameter "cushions" has the content "Y":

```
if [cushions] = 'Y' then
    result=1
 else
    result=-1
end if
```

DW Syntax

Datawindow Syntax.

This is the most powerful scripting language to use in the visibility rules and set objects.

(from Beas 9.3-PL0)

Example: Visibility Rule.

A selection element of a list should only be displayed if the parameter "cushions" has the content "Y":

```
'[cushions]' = 'Y'
```

© 2026 Boyum IT Solutions A/S

See Datawindow-Syntax

The following standard parameters are available.

Note: Not supported in WEB Configurator.

Parameter Name	Description
`cprice`	Price from a price list (only for the Price calculation field)
`cpricequantity`	Calculated quantity for this item (tab Price - field Quantity) `cpricetotalquant`	Calculated quantity (= tab Price - field Quantity) * Quantity from sales order or quotation `cpricelist`	Price list defined in Configuration Header

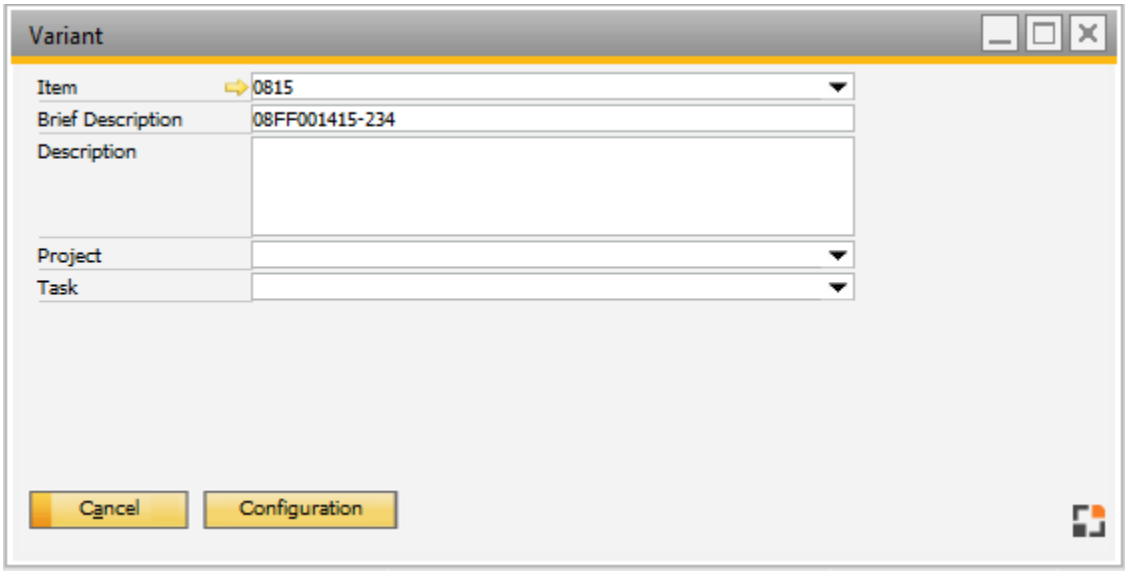
© 2026 Boyum IT Solutions A/S

Parameter Name	Description
	`currentuser`	Current user
`cardcode`	Business partner from the sales order or quotation
`cquantity`	Quantity from the sales order or quotation
`cdocdate`	Date from the sales order in "yyyymmdd" format, example 20220503 for the date 2022/05/03
`cshortvariant`	Short variant A-Z from sales order or quotation

8.14.2.2 Create a new configuration

An additional variant for the product configurator can be created and assigned to a project or a task. To save the variant, call the product configurator.

© 2026 Boyum IT Solutions A/S



Window caft_variante_kopf.psr

Field Descriptions

Field	Meaning
Item	Select items to configure.
Brief Description	Brief Description.
Description	Description.
Project	The created configuration is firmly assigned to a project. Note: In this case it is not checked whether the configuration exists already. The setting **Configuration wizard > Production > Product configurator > Recognize double entries** is ignored. ***see*** Settings - Product configurator
Task	Firm link to a task.

Button

Configuration: open the product configurator for this variant.

see

Configuration wizard - Production - Product configurator

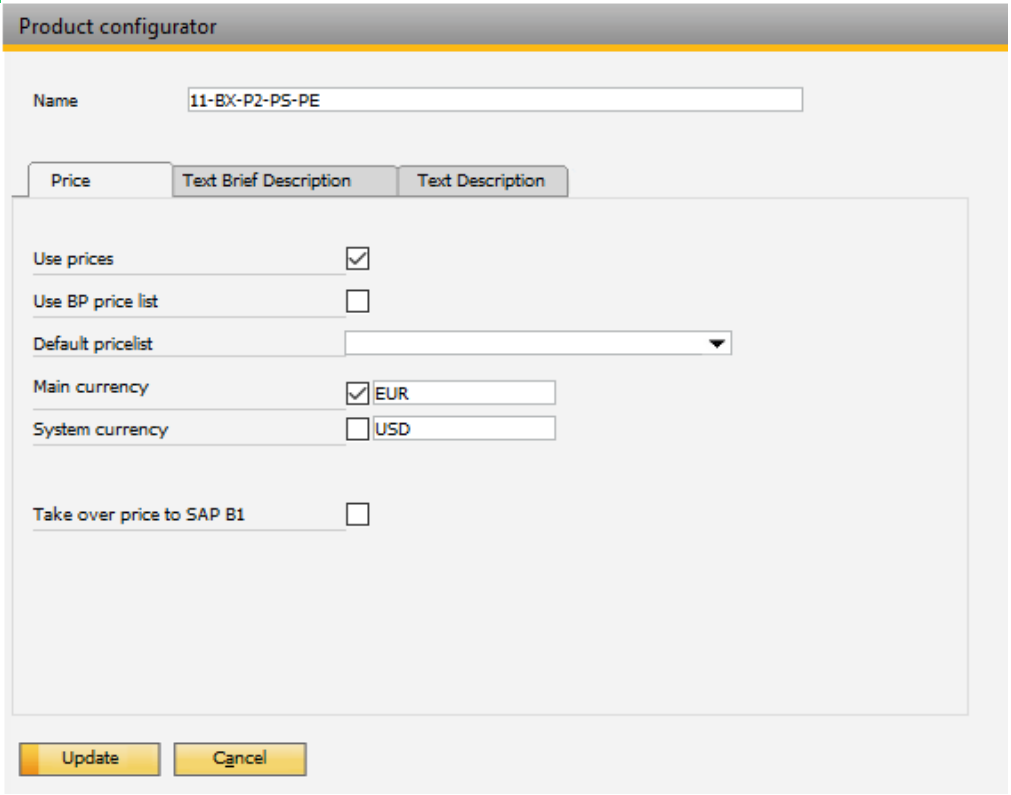
Price tab
Text Brief Description and Text Description tab

8.14.2.2.1 Price

In this tab you can provide price-related settings for the configuration.

PATH: Production > Product Configurator > Product Configurator Definition > double-click Header



Window artikel_produktkonfigurator_global.psr

How to link the Unit Price in a Sales Order:

Field descriptions

Field	Description
Activate Price Calculation	Check box that indicates to Beas that the prices need to be generated. In the product configuration prices are used and displayed in the configuration structure. When this option is checked, other fields in the tab appear.
Default price list	Select default price list for the configuration.

© 2026 Boyum IT Solutions A/S

Field	Description
	Business Partner - price list. This selection is used to generate prices based on the price list from the business partner defined in SAP. Prices can be chosen: (from sales order or quotation) - agreements - special price list - customer price list If no price is defined, the default price list is used. Support: - Multi currency price list - Period Discount - Volume Discount - Customer Price List, Special Price List - Agreements The date for Period discount is the delivery date from Sales Order or Quotation No support of unit groups The configurator does not support the global discount from the customer, because SAP inserts this discount in the Quotation or Sales Order at the end for the total sum. For more information ***see*** Parameteter – Tab Price
Use total BP discount	The defined total discount from business partner master data is included in the calculation. Only available if Use BP price list is enabled.
Default Price list	Define the price list for price determination

© 2026 Boyum IT Solutions A/S

Field	Description
	Select a price list as a default to calculate prices. If the field is empty, with no price list, Beas calculates the price regardless of a price list linked to a business partner. Support: - Multicurrency price list - Period Discount - Volume Discount The date for period discount is the delivery date from the Sales Order or Quotation. For more information ***see*** Parameteter – Tab Price.
Display currency	Define the currency to be used. This can be the defined main, system or business partner currency. Currency for manual Price	Select the currency for all the manually written prices.
Take over price to SAP Business One	☐ After finishing the configuration, the determined price of the current variant is transferred to the SAP Business One form. This filed enables Beas to calculate the price with the product configurator functionality and then transfer the calculated price into the sales document from SAP Business One. By enabling this field, the user creates a sales order. In the sales order the item to be configured is included. After the configuration is finished, the price calculated by the product configurator is transferred to the sales order.

8.14.3 External configurator

Beas allows to connect external configurators / configurators created with customized extensions. BOMs can be generated and tables can be created which will be considered by Beas.

Available tables:

© 2026 Boyum IT Solutions A/S

beas_config_header	Description of the configuration
beas_config_stl	BoM
beas_config_apl	Routing
beas_config_parameter	Parameter

key field is column "vri".
The external configurator works in parallel to the product configurator.
Link to the configuration to be used in sales order is established via column **rdr1.U_beas_vri**

Creating work orders or Precalculations, in the field "configuration" not only the configuration can be accessed but also the external configurations (beas_config_header).

To use the configurator, activate it in Configuration wizard – Production – Product configurator – External configurator

Configurations can be created manually via **Variant production > external configurator:**
1. Create a new configuration or edit an existing configuration (Table **beas_config_header**)
2. Create or edit existing BOMs and routings (**beas_config_stl**, **beas_config_apl**)

Multi-level BoMs
Multi-level BoMs can be created: In field "itemcode" the item number of the superordinated item is required. Connection via item number (**beas_config_stl.art1_id** and **beas_config_stl.itemcode**)
That is why assemblies may occur only once in a BoM.
In the view, there is a button **Structure** to register multi level BoMs.

Note:
This works in Precalculation and work order creation. Tools, alternative and parallel routings are not considered.

Field	Meaning
Configuration	Variant Number of the configuration.
Item	Item code.
Info	Description of Configuration.

Button	Meaning
Edit	The selected configuration opens the Edit Window.

Parameters

Name	Description
Documents	
Allow to create Sales orders	Define if the Web Product Configurator can create Sales orders. If "Yes" is set, the **Create the order** button appears in the Cart view. - Yes - No Note: If the parameter selection in "Allow to create Sales quotations" is "No", this setting is activated.
Allow to create Sales quotations	Define if the Web Product Configurator can create Sales quotations. If "Yes" is set, the **Create the quotation** button appears in the Cart view. - Yes - No
Display WEB orders only	List sales orders and quotations created with the Web Product Configurator: - Yes - No
Sales employee can select customer list of	Define the customer list that can be selected. - All customers: Sales employee can select all customers - Only linked customers: Sales employee can only select customers lists where customers are linked to Sales employees. ***See*** SAP documentation. Note: This parameter only affects operation when logged in as an employee.
Sales Employee can see sales Documents	- All Sales documents: Sales employee can see all documents. - Own sales documents: Display orders where the "Owner" is the same as the Sales employee. Note: This parameter only affects operation when logged in as an employee.
Allow to cancel a document	Define if the user can cancel a sales document in the Web Product Configurator: - Yes - No

© 2026 Boyum IT Solutions A/S

Name	Description
Write Description to UDF	Add linked UDF name from the Sales document: This setting adds the description in the previously created UDF of the Sales document.
Write Variant Digest to UDF	Add linked UDF name from the Sales document: This setting adds the parameter string (parameters with prices) in the previously created UDF of the Sales document.
Allow to modify the Requirement date	Define if the user can modify the requirement date in sales documents in the Web Product Configurator. - Yes - No Note: In Sales orders, this setting is reflected "Delivery date" field, and in Sales quotations, this is indicated in the "Valid until".
Display currency	Display currency according to one of these settings: - **Local**: the main, locally defined currency. - **System**: the currency used by the system. (default) - **Business Partner**: the currency set in the SAP Business Partner data.

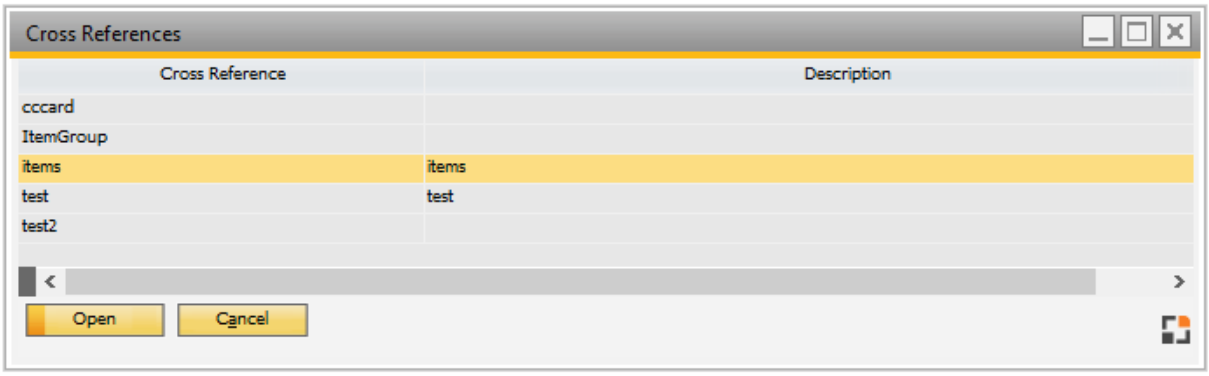
See List of Products

8.14.5 Cross-references

As described in the properties of objects, you can assign selection options to a parameter using a cross-reference. This way of defining selection options is particularly useful if you want to access the same selection options in the configurators of multiple items.

For ***example***, there could be several sofa types for which the same fabric types can be selected. In order not to have to store the different material types in each configuration structure of each sofa, you can enter these once within a cross-reference. If you then allocate this cross-reference to a parameter, the selection options stored there are available for this parameter.

© 2026 Boyum IT Solutions A/S



caft_verweis_browse.psr

Cross-reference could be used in the product configurator dropdown- or button lists.
A cross-reference is organized as a table with the columns Item, Name and Value. You can also add an image.
If an existing reference is selected or a new one is created, a new window opens.

If the configuration structure contains a *Material* parameter to which the reference *Fabric type* is allocated, the configurator contains the selections *Blue material* and *Red material* . If *Blue Material* is selected, the value *MatBlue* would be assigned to the parameter. The Item no. sets the default order for the values.

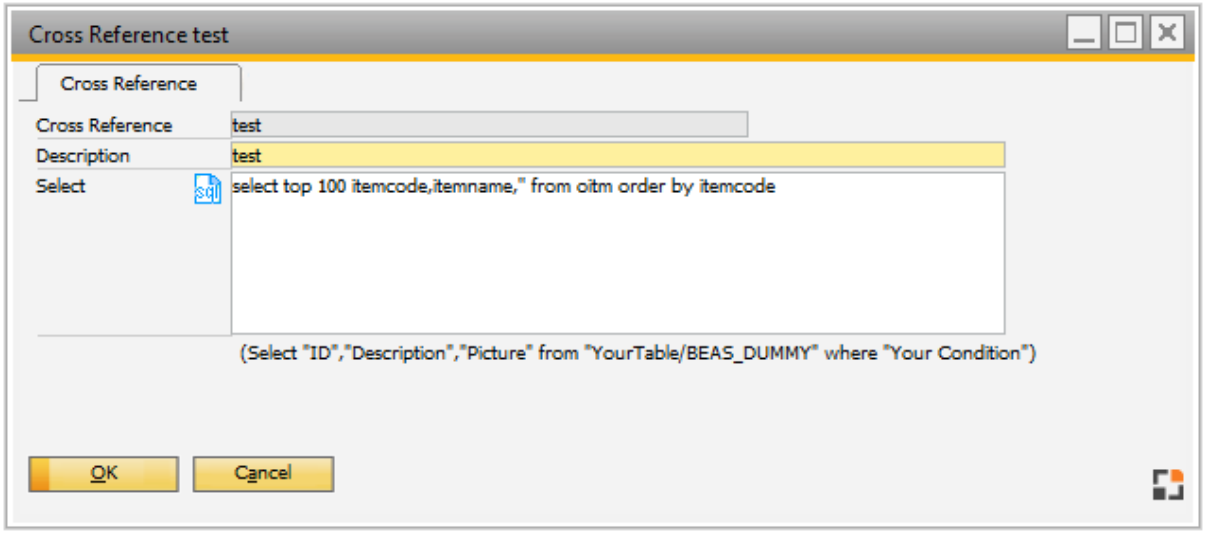
You can also generate a cross-reference table from a SQL-statement. For example, only material types could be displayed that correspond to a specific material group selected in the configurator (*Group* parameter from variant).

Generally defined parameters and set-objects can be used. Therefor, however, is to ensure that at the time of use in the product configurator, the values are already assigned.

8.14.5.1 Cross Reference

Here you can define a new Reference entry.

© 2026 Boyum IT Solutions A/S



caft_verweis_edit.psr

Tab "Reference"

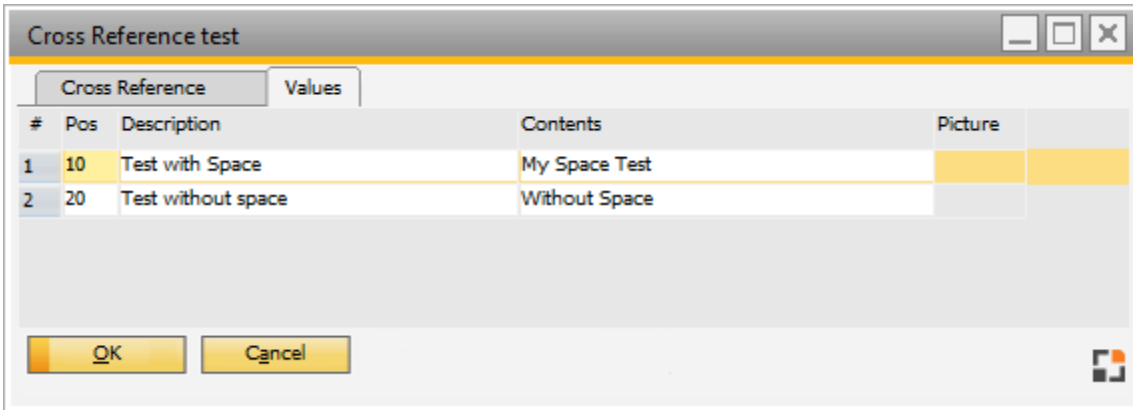
Field	Description
Cross Reference	Reference name
Description	Description of Reference
Select	Enter a data base query (Select-Statement). The SQL statement must return 3 columns: a) the ID b) the Description c) optional a picture reference or empty string Parameters can be inserted in [...] If no SQL statement is defined, you can insert manual values. ***See*** tab Values. ***Example:*** `select "ItemCode", "ItemName",'' from "OITM" where "U_gruppe" = '[group]'` Note: When using dropdown lists, it may possibly be useful to suppress the return value from the displayed list.

© 2026 Boyum IT Solutions A/S

Field	Description
	This could be realized via the output formatting of the return value (***see*** BeasScript manual). `select "ItemCode" as itemcode__1, "ItemName",'' from "OITM" where "U_gruppe" = '[group]'`

8.14.5.2 Cross Reference Values

(Only visible if no database query was defined).



caft_verweis_pos.psr

Field	Description
Pos	Position no.
Description	Designation of value
Contents	Value
Picture	Assigned image for current position (Selection via Button "Picture")

The following is an example for a cross-reference for selecting material for a sofa.

Reference: Fabric type

Name: Selection of fabric type

Item	Description	Contents
10	Blue material	MatBlue

© 2026 Boyum IT Solutions A/S

Item	Description	Contents
20	Red material	MatRed

8.14.6 Formulas

All types of formulas are managed here, e.g.:
- Planned time calculation formulas
- Output calculation formulas

The formula number enables assignment of a formula to time components, operations, BoM positions, thus facilitating the calculation of:
- Default times
- Material requirements
- Other technical data

The result calculated from a formula can also be allocated to a variable.

- Elements of a formula

- Formula flag:	Unique flag used to identify the calculation (e.g. F4711)
- Description:	Describes the function or the use of the formula (comment)
- Formula string:	Any mathematical and logical formula can be entered here. All numbers and characters are permitted.
- Type	Output type of formula (as text or numeric)

- Structure of a formula

The following must be observed when using variable designations:

- Maximum length of 20 characters
- Blanks, spaces or mathematical symbols must not be used (+ - period, comma etc.)
- Variable names may not consist of reserved names (function names).
- Variables must begin with a letter
- Mutated vowel and "ß" must not be used.
- Unlike in the product configurator, variables do not have to be delimited by [..].
- Formel syntax corresponds the Syntax of Datawindow (R) - Interpreter of Sybase (R)
- The number of variables is not limited

© 2026 Boyum IT Solutions A/S

If a formula is selected or created new, a new window opens:

Tab "Formula"

Field	Description
Formula	Formula name
Match code	Match code
Description	Formula description
Formula string	Definition of formula
Type	Output of formula ("numeric", "string" or "yes|no")
Dec	Number of decimals (for numeric type)

Tab "Variables"

(Definition variables of used in formula)

The syntax is the same as the DataWindow syntax.

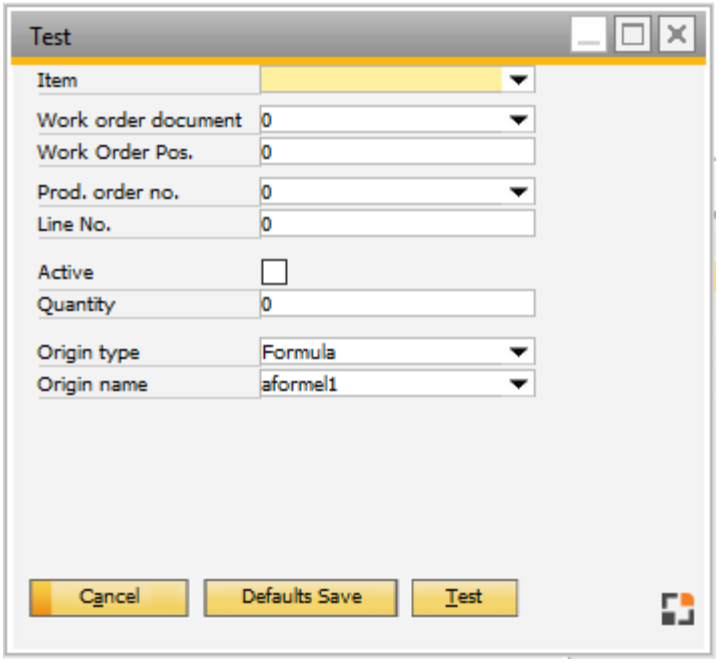
See: Datawindow-Syntax

Field	Description
Variable	Variable name
Description	Description of variables
Type	Output of formula (numeric or string)
Dec	Quantity of decimals, necessary by type "Number" (numeric)
UoM	Unit of measurement
Origin type	Origin of variable: - Formula - Table - Variant (from product configuration) - Field from Item - Order (Sales Order) - Order line - Manually (enter manually at run time) - Beas-Script For details ***see*** Formula Types
Origin name	Object name from origin type

© 2026 Boyum IT Solutions A/S

Field	Description
Change	Allow changes at run time
Validity	Validity of variable: - **local** (only within the formula and all formulas and tables called by it) - **shared** (within the assembly and for all following items, but not sub-assemblies) - **global** (in complete structure from the moment of calculation)
Operation	Mark, to save the variable globally with prefix "agbez_". Then it can be accessed in a description of an operation. ***see*** Operation Variables
Cross reference	Enter a link (Only useful with origin type "manually" or "Change")
Sorting	Order of processing variables

Test button: Press this button to test the formula in the the window that opens:



Window caft_testeval.psr

Field Descriptions

Field	Description
Item	Select an item from the drop-down.

© 2026 Boyum IT Solutions A/S

Field	Description
Work order document	Select a Work order from the list.
Work Order Pos.	Insert work order position
Prod. Order no.	Select Production Order number
Line No.	Insert Prod. order line number
Active	
Quantity	Insert quantity
Origin type	Select origin type: - Formula - Variant - Field from item - order - order line - Manually - Script
Origin name	Select value from the drop-down list. The values in the list correspond with the selected value in Origin type.

Defaults Save button: Save selected values as default for Test

8.14.7 Tables

In addition to formulas, you can also store decision tables. This means that you can store values or even other formulas for specific occurrences (or areas) of parameters. The number of parameters stored in a table is referred to as the dimension of the table.

For ***example***, you can store processing times for obtaining the sofa depending on the sofa length. Tables are particularly useful if parameters have a limited number of input options, or if there is a limited set of results.

Example: If sofa length < 150cm then produced on machine x.
If sofa length >= 150cm then produced on machine y.

Table tab
Dimensions tab

© 2026 Boyum IT Solutions A/S

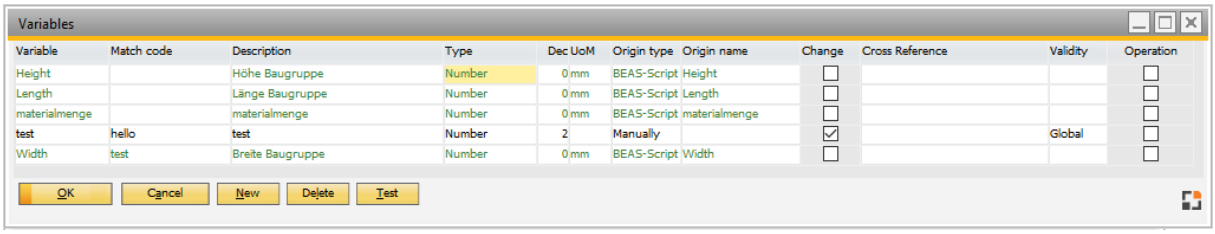
Values tab

8.14.8 Variables

Variables are pre-definitions (templates) of a time calculation through formulas and tables. The numeric or alphabetic assignment of variables can be:

- calculated in a formula
- read in a parameter list
- read in a table
- read from item, order line or order header
- determined from a freely definable origin type

Define the formulas and tables you want to use under the Variables menu option. The texts for description and unit of quantity are adopted when entering a variable name. However, you can also choose to describe the variables later in the actual formula or table.



Window caft_var_browse.psr

Field descriptions

Field	Meaning
Variable	Master name or key used to access the variable. Note the following here: - Variable names can be up to 20 digits long - Variables must begin with at least one letter - only the underscore '_' may be used as separator symbol - The number of variables is not limited - math symbols may not be used in variable names
Description	Arbitrary
Matchco	Free text

© 2026 Boyum IT Solutions A/S

de	
Type	Output of formula ("numeric", "string" or "yes/no")
Dec	For numeric: Number of decimal places. Number formats or number of decimal places are now adopted from the SAP Business One settings. Note: In Beas numbers are always formatted according to the Windows settings (Control Panel – Regional Settings), since all Beas fields are input fields conforming to Windows.
Unit	Unit of quantity as information such as piece, mm, etc.
Type of origin	Origin of the variable (How is the variable calculated?) – ***see*** Types of origin/Types.
Origin name	Details about the type of origin (e.g. for table -> name of table).
Change	Should the variable be entered or changed after calculation?
Selection	Should a selection list be available? If so, it can be defined here.
Link	Make available a selection list? Select link.
Validity	Validity and visibility: **local**: only within the formula and sub-tables and formulas called by it. **shared**: within the assembly for all following positions, but not for sub-assemblies. **global**: from the moment of computation visible in complete structure.
Operation	Mark to save the variable globally with prefix "agbez_". Then it can be accessed in a description of an operation. ***Example***: Local variable duration, "Operation" enabled Is saved al grlobal variable "agbez_duration" and can be added to the description <v:agbez_duration>

© 2026 Boyum IT Solutions A/S

	see Customzie BoMs and routings

Test button: ***See*** Test window.

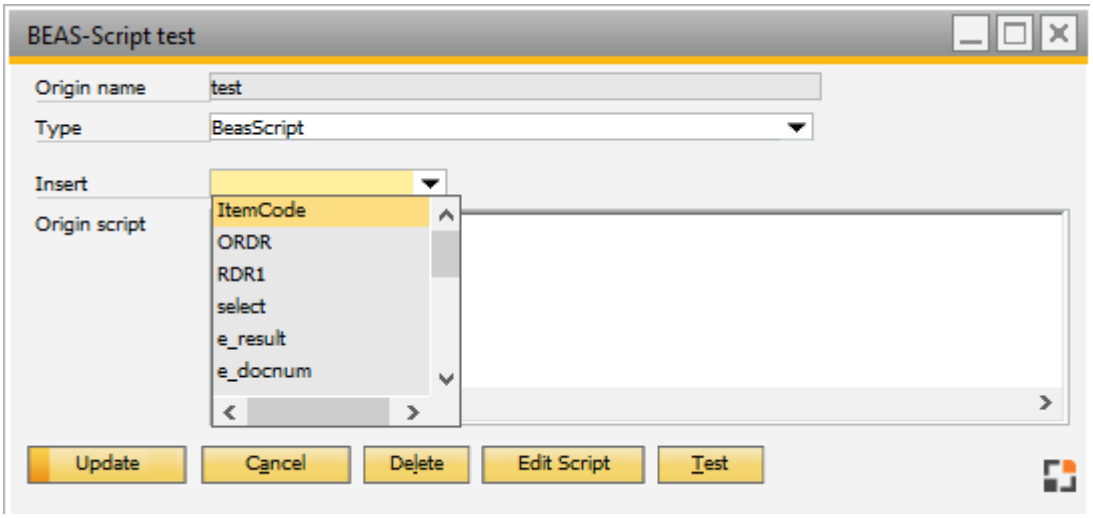
8.14.9 Beas Script

This defines how a variable should receive its value, unless determining the value takes place through the default types of origin.

This can be

- a field from item or sales order table
- result of SQL statement
- a Beas or JBScript

With the Test-Button you can test the formula directly.



caft_herkunft_edit.psr

If the Type is BeasScript and the Origin Script is empty, you can choose "ItemCode","ORDR" "RDR1" or "BoMItemCode"

This allows you to create an SQL statement or insert the placeholder.

- Details:

© 2026 Boyum IT Solutions A/S

select	The result of the select statement is returned. Only one result may be returned. Placeholders can be inserted. example : return the assembly `select <e_itemcode,dbstring> from "BEAS_DUMMY"`
ORDR RDR1	Information from Sales Order or Sales Order line. Only if linked at creation time to a Sales order.
itemcode.	Information from the assembly: e.g. itemcode.u_beas_znr (= drawing number)
bomItemCode	Bill of Material item code e.g. `bomItemCode.usertext` *Beas 2020.06*
e_	Access to a Beas variable. All master data information in the current BOM position or routing position is available as Beas variables: ***See*** Pre-defined Beas variables

BeasScript

You can insert a complete BeasScript function. Return the result with
`setvar=e_result="your result"`
You have access to all Pre-defined Beas variables.

Example

```
if <e_quantity> n> 5 then
  setvar=e_result="ABC"
else
  setvar=e_result="DEF"
end if
```

JBScript

You can insert JBScript. Define result in the return command

return "your result";

Example

```
if (e_quantity > 5 )
  return "ABC";
else
  return "DEF";
```

Pre-defined Beas variables

The following additional Beas variables are set:

Note: All variables are BeasScript variables (strings).

© 2026 Boyum IT Solutions A/S

e_docnum	Order number (if a reference exists) – only available when creating a work order
e_docentry	Internal order number – table order – only available when creating a work order Note: Pre Invoice not supported
e_linenum	Internal order line – table rdr1 – beginning with 0 - only available when creating a work order
e_belnr_id	Work order number
e_belpos_id	Work order position
e_itemcode	Item number of the assembly
e_quantity	Quantity of the assembly (only work order and calculation)
e_info1	Assembly/BoM that is currently being broken down (only Work order and Pre calculation)
e_bomitemcod	Material number of the BoM position (identical with e_art1_id)
e_aktiv	Y/N: Should BoM/operation position be added?
e_BoMId	Bill of Material Id (e_pos_id on Bill of Materials Level))
e_RoutingId	RoutingId (e_pos_id on Routing Level)

8.15 Variant production

In Beas a product configurator is available, which allows a variant production.

Variant
Product configurator
Variant generator

Productconfigurator (Webinar)

Beas can handle various configuration methods, which can be combined as well.

Item	Description
Variants A-Z	The simplest form is variants. 26 variants can be specified per item. The variants run from A to Z. Details:

© 2026 Boyum IT Solutions A/S

	In the BoM and in the routing, you simply specify the variant with which this is used. An extra activation switch is available for each variant. This simple type of variant production is used if no other calculations are needed. This procedure is inflexible but very easy to use. **Advantage:** ▪ Very simple operation ▪ Very quick setup ▪ Very transparent **Disadvantage:** • Limited possibilities I-Version	⊟ Use item versions as variants Item version control can serve as variant management tool. Every version will be a variant in this case. Control by setting up the visibility of single routing or BoM positions or define a separate BoM position per variant (= in this case the version) *beas 9.1 PL: 08*
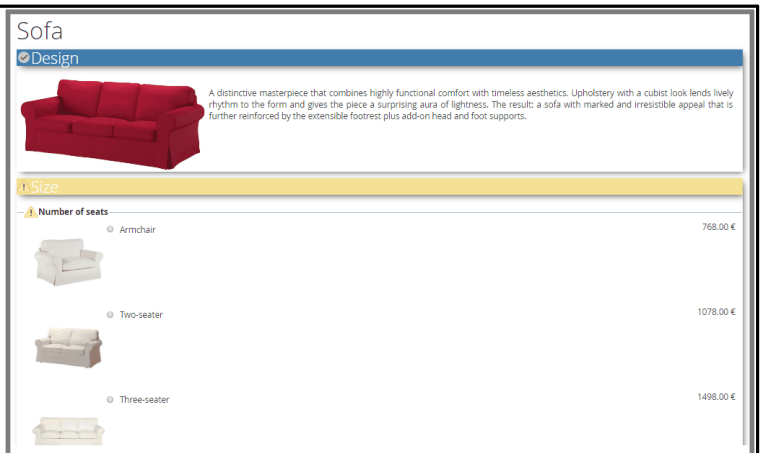
Variant generator	In the variant generator, any formulas or tables can be stored with every definition in the BoM or routing (item, quantity, active, size, resource, etc.). ⊟ Details: The formulas or tables obtain their values via source types, which can in turn be assigned any kind of information. This could be information on the product configurator, on the item, on the customer order or simply a manual input. The variant generator is active when creating a calculation or work order.

© 2026 Boyum IT Solutions A/S

	The manually input data is not saved. The product configurator can be used for this. **Advantage:** - Theoretically unlimited calculation possibilities **Disadvantage:** - If the product configurator is not used, there is no proper user interface - Not considered in material requirement planning - unless you create a calculation which the MRP run can reference.
Product configurator	The product configurator includes a graphical configuration. An endless number of configurations can be created, including item number generation and a price calculation. With this tool you can generate a small configurator in simple way, which is complete integrated in SAP Business One. Details: **Use this for** - generate order related sales order or quotation with price calculation - Business to Business: Business partner can use the WEB front end to generate orders **Don't use it** - For End user, if you need more then 50 parallel sessions - if you need very complex configurator The product configurator requires the variant generator if you want to create Items or Work orders. The configuration is created at the time of the quotation/order and transferred to the precalculation or production document using the variant generator.

© 2026 Boyum IT Solutions A/S



Advantage:

- Good and simple interface
- Many calculation possibilities

Disadvantage:

- High training requirement for setup
- High setup costs
- Not considered in material requirement planning - unless you create a calculation which the MRP run can reference

Limitations:

If you change a property in Front end, the system calculate at real time the complete configurations
All formulas must be executed. beas use in memory technology and check, which formula must be calculate again
If you need more than 400 formulas (WEB: 200) inside or if the configuration have more then 2000 (WEB: 1000) lines, the Frond end can be slow.

- Split configurations. Define more then one configuration definition
- Try to use less formulas as possible
- Use DataWindow Syntax for formulas, if you have a fast client
- Use SQL Syntax, if clients slow, but SQL server fast
- Only calculate information, which you need for the Configuration. Don't calculate information which you need for the work order.

Third configurator	⊟ Interface to external configurator

© 2026 Boyum IT Solutions A/S

	It is possible to work with the external configurator It is useful in case of better graphical interfaces or end user web pages. The external configurator must save the result in some tables in current SQL Database For more information contact our support.

Each of the procedures can be used separately or in combination.
Each procedure is active once information has been stored for it. Therefore separate activation is not required.

8.15.1 Variant

Beas includes proprietary variant management. It is possible to store up to 26 variants for an item.
The descriptions of the variants are stored directly with the item.
A variant is a fixed occurrence of the parameters defined in the item.

Define which BoM positions and routing position must be used for this variant (A-Z).
The variants (Variantenmatrix) can be inserted in the BoM or in the routing via window settings.

The following rule applies:
This position will be inserted if no variant – check box is enabled.
If at least one variant is active – check box, the position will only be inserted if the resulting check box has been selected.

Master Data | Bill of Materials

#	...	Position	UoM	Item	I-Version	Description	Quantity	Manually	Active	V-A	V-B	V-C	V-D	V-E	V-F	V-G	V-H	V-I	V-J	V-K	V-L	V-M	V-N

Windows artikel_stlpos_browse.psr

- Define variant description

  Variants A-Z can be named in the item or in the configuration wizard. ***See*** Configuration wizard, Item master data

  Note: At a variant definition Variants are always sorted by A-Z in lists instead by the names which are stored in the article master.

© 2026 Boyum IT Solutions A/S

- Field definition in database and data import

The variant definition is stored in the tables `BEAS_STL.SHORTVARIANTDEF` (for BOM) and `BEAS_APL.SHORTVARIANTDEF` (for routing) as a "character string".

It consists of 26 characters with J (Active) and N (Not active)

Example: `JJNNNNNNNNNNNNNNNNNNNNNNNN` = Active for variant A and B

Please note:

If there is something else in this database field or the "string" is not exactly 26 characters long, the variant will not be checked!

- Variants in sales order

To create a customer order using a specific variant, create the customer order, then select the item, and select it via the right-click-menu "variant". In the new window all variants are displayed. Select the variant which you will have for the item in the actual line of the customer order. You can select from existing variants, copy a variant, or generate a new variant by entering parameter values for this item.

Calculation: You can perform a calculation for a line, according to its variant, from a quote or order in SAP Business One. The Precalculation can be called up via right-click-menu "calculation". Parameters not defined in the variant are queried explicitly during the BoM breakdown. A calculation structure modified according to the parameters is created. The result is usually displayed in the calculation window. You can also convert it into a work order.

The resulting variant is transferred automatically to the customer order or quote line. You can then generate a work order from the customer order. The BoM and routing from the work order are then customized accordingly.

- Variants in Order recommendation list

If a work order is to be created for a sales order, the variant stored in the sales order is displayed when you switch to the "Production" tab in the bottom left window. If no variant is stored, this can be selected here if variants are stored in the item.

Requirement calculation: If no work order exists for a sales order yet, and it is an order-based item, the variant stored in the sales order is considered for the requirement calculation. In case of an assembly (warehouse-managed item), the BoM and routing positions active by default are used, i.e. you must define which default scenario should be used for requirement calculation. It is generally unreasonable to produce variant items in the warehouse.

- Variants in pre-calculation

© 2026 Boyum IT Solutions A/S

All variants are loaded in a Precalculation at all times. In the header of the calculation, the variant to be calculated currently can be selected. All BoM positions and routing positions not belonging to the currently selected variant are grayed out and not evaluated.
It is not possible to change Variant settings in the Precalculation.

- Variants in work order

When manually creating work orders, the variant can also be selected for the assembly position if variants are stored in the item.
This only works when creating a new work order. This cannot be changed subsequently.

- Variants per warehouse

In extended warehouse master data a default variant can be created. Different variants of a product can be produced depending on the production warehouse. If a work order is created (manually or via MRP) the respective variant is inserted. *(beas9.0-000-000-006)*.
See Edit extended warehouse data

- Variants with version control

If Version control is set to "Variants", an item version corresponds to a variant. Use this if a BOM and routing needs to be defined separately for each variant. This can be performed without formulas and scripts.

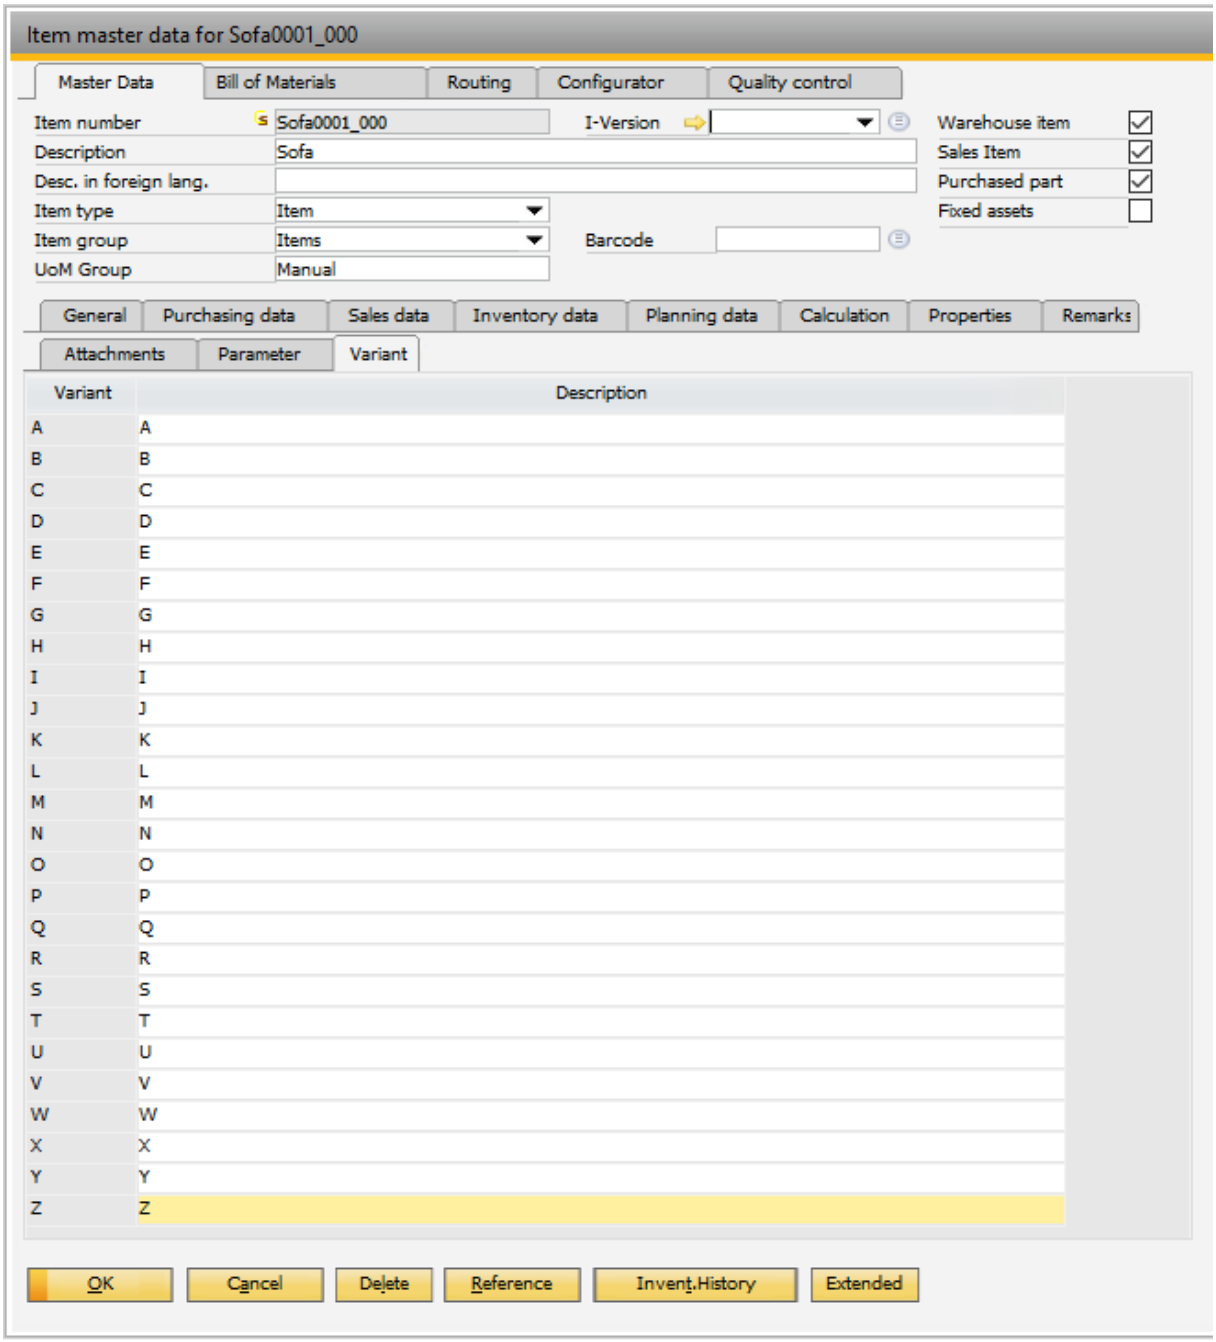
8.15.1.1 Creating Variants

In this window you can define up to 26 variants. It is accessible from the Item Master for XXX window.

Example:

PATH: Inventory > Item report > Item Master Data > "Master Data" tab > "Variant" sub-tab.

© 2026 Boyum IT Solutions A/S



Window artikel_edit.psr

Tab "Variant"

Field	Description
Variant	Possible variants (A–Z).
Description	Description of the variant.

© 2026 Boyum IT Solutions A/S

Before you can select variants for BoM and Routing, you must enable them in the view: **right-click > Window settings.** Scroll down in the new window and select the variants you want to have displayed. These settings apply globally and not per item- Therefore, even if you only have 5 variants of an item, you must always enable the maximum number of options.

Select the BoM or Routing tab, to create the different BoMs or Routing positions for each variant. Using check boxes you can assign each BoM item or operation to the variants. All BoM items can be added or removed to any variant.

Tab "BOM" and "Routing"

(only visible when enabled in window settings).

Field	Description
V-A	Variant assignment (BoM for "A").
V-B	Variant assignment (BoM for "B").
.....	
V-Z	Variant assignment (BoM for "Z").

back to Item Master

8.15.2 Product configurator

8.15.2.1 Bills of materials and operations

As a rule, configuring an item in the product configurator affects the bill of materials and the routing, respectively. In the sofa ***example***, a three-seater will require more cover fabric than a two-seater.

For this purpose, any routing or Bill of materials characteristic can store a formula, table, or the contents of a parameter.

Note:

When using the product configurator, the parameter will usually be accessed directly. However, you can also create formulas and tables by accessing the parameters of the product configurator.

Warning:

© 2026 Boyum IT Solutions A/S

The formula syntax of the product configurator is the same as that of the installed SQL server. The variant generator uses the DataWindow syntax.
In variant syntax, variables are delimited using [and]. In the variant generator, delimiters are not necessary.

see Formulas

8.15.2.2 Syntax

The product configurator uses various **syntax**. Parameters are used in square brackets ("[","]").
A Syntax verification of formulas is only possible for SQL syntax via the "Check"-Button.

For **visibility rules** only the condition is checked.

Example with SQL syntax:
[numberofseats]=2 or [numberofseats]=3

In this case, the statement is:
select case when [numberofseats]=2 or [numberofseats]=3 then 1 else 0 end

Note:
For more information on the possible mathematical and logical functions with SQL please consult the SQL database documentation.

Warning:
The product configurator uses SQL syntax, parameter are enclosed in square brackets ("[","]").
Conversely, the variant generator in the formula area uses the Sybase DataWindow syntax. Variables do not have to be enclosed within brackets.

Note:
If you use decimal numbers (numeric values with decimal places) in formulas, you must also tell the system that the decimal places are to be counted. Otherwise, only integers are expected.
Some MS systems, as well as MS SQL servers, must be informed of this explicitly.

Example:

© 2026 Boyum IT Solutions A/S

2 variables: value1=10, value2=20

-> [value1] / 1000 * [value2] brings up a "wrong" result: 0

-> [value1] / 1000.0 * [value2] calculates the "correct" result: 0,2

- Example of the product configurator syntax for visible rules

SQL formula:

[cushions] = 'Y'

or

```
case when [headrest]='Y' then 'Y' else 'N' end
```

DataWindow:

```
if([a]=5,1,-1)
if([a]="Y",1,-1)
```

JavaScript formula:

[cushions] == 'Y'

JavaScript:

result = [cushions] == 'Y';

or calculation of the headrest

```
if ([numberofseats] == "2" || [numberofseats] == "3")
    result=1
 else
    result=-1;
```

VBScript formula:

[cushions] = "Y"

VBScript:

```
if [cushions] = 'Y' then
   result=1
 else
   result=-1
end if
```

8.15.3 Variant generator

It is very easy to create BoMs and routings dynamically with Beas script.

© 2026 Boyum IT Solutions A/S

Customizing bills of materials and routings
Formulas
Tables
Variables
Beas-Script
Datawindow-Syntax

You can use the Variant generator to create BoMs and routings to be used as the basis for formulas, tables, etc.
You can store a formula, table, variable or script defined in any way behind each BoM and routing parameter. Very dynamic processes can be calculated using scripts.
When creating work orders or calculations, the existing formulas and tables, etc. are broken down behind the individual parameters/fields and included in the calculation.

You can use the product configurator to include the formulas, tables, etc. defined here for the different phases of the business processes.
Item, routing and BoM variants can be easily generated in this way.
see Variants with BeasScript

8.15.3.1 Customizing bills of materials and routings

In the master data form in the Bill of Materials or Routing area, the properties of the discrete positions can be processed
by Formulas. Tables, Variables and Beas-Script according to the variant definitions.

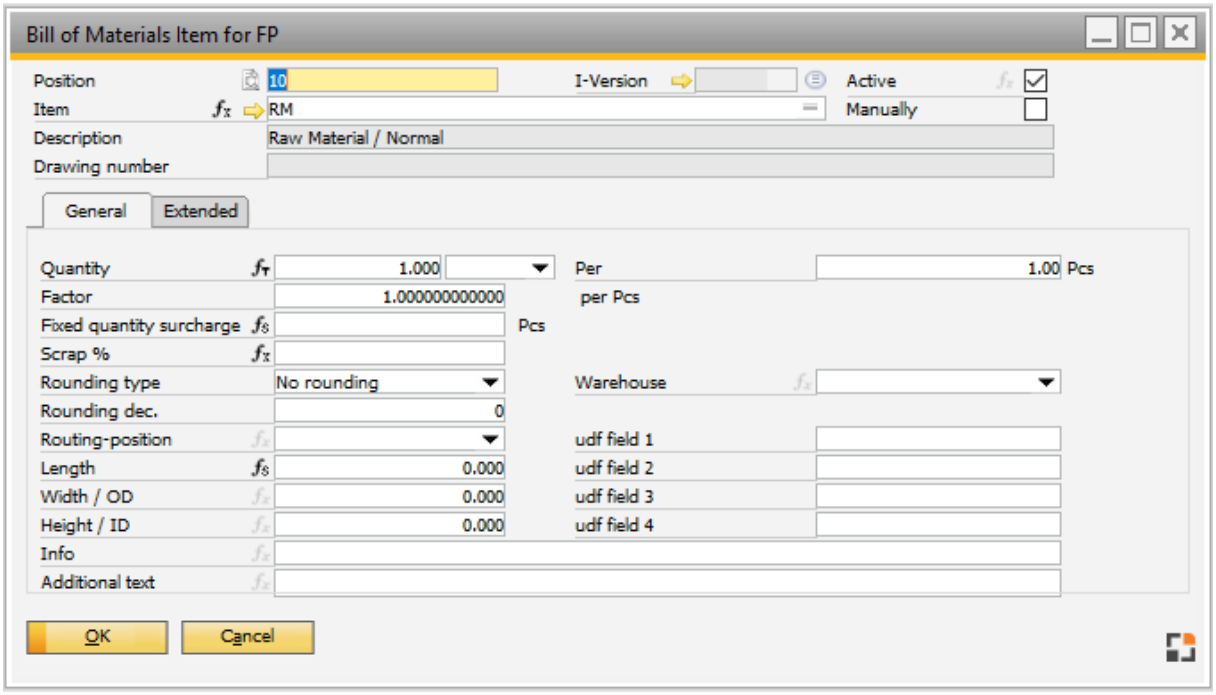
8.15.3.1.1 Formulas, Tables, Variables and Beas-Script

Bill of materials / Routing positions:
If you double-click on a BoM position in the Bill of Materials area in the item master data sheet, a processing window for that BoM position opens.
A formula or product configurator variable (variant) etc. can be stored for all properties of the BoM position /Routing position (except field "Position") identified by the f_x symbol to the left of the input fields.

Important: The Variant generator must be activated first.

© 2026 Boyum IT Solutions A/S

Note: The f_x symbol can be displayed by right-clicking in a free area of the processing window. Activate formula fields by **right-click > "Display formula fields"**.



Window artikel_stlpos_edit.psr

Formula icons

Icon	Boyum Style icon	Description
f_x	f_x	Function
f_T	f_T	Table
f_S	f_S	Script and other Variants
f_x	f_x	Empty formula
		Text edit disabled. Double-click to open the script editor. Located left of Item number in Item Master data.
		Text edit - script is inside. Double-click to open the script editor. Located left of Item number in Item Master data.

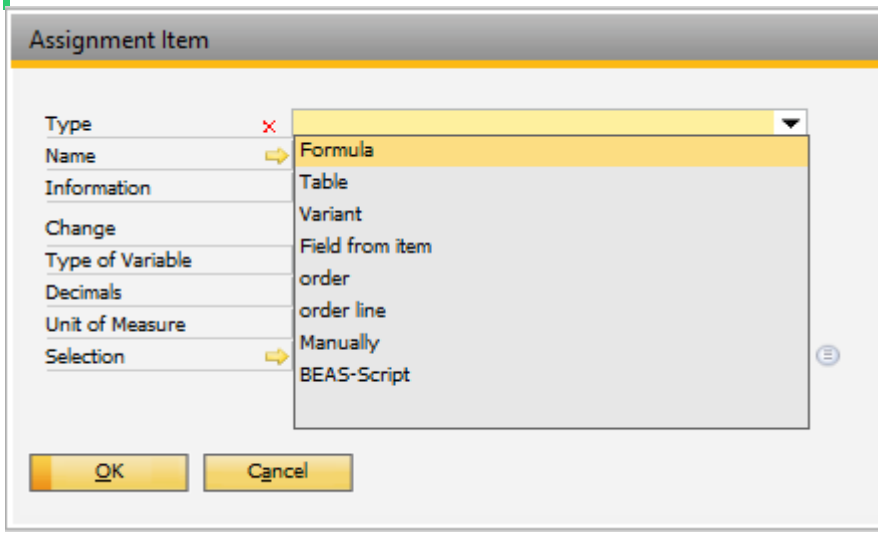
Double-click the f_x symbol left of the input field to open a window containing the type and name (value) of the allocation:

PATH: Item master data for XXX > Bill of Materials tab > **Open** a BoM position > double-click f_x symbol > right-click "Type" field.



Window artikel_ caft_ zuordnung.psr

Field	Meaning
Type	Type of formula

Type	Meaning
Formula f_x	Reference to a formula from the Variant Generator area. ***see*** Formulas.
Table f_T	Reference to a table from the Variant Generator area. ***see*** Tables.
Variant	Reference to a parameter or "set"-object from the variant of a product configuration. If there is a parameter in the configuration structure that calculates the quantity of screws required for a sofa, the value of the parameter can be accessed here.
Field from item	Reference to an item property, i.e. information stored in the item master, e.g. length, width, drawing no., etc. (for current item).

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Meaning</th></tr>
<tr><td></td><td>
<table>
<tr><td>Order
OrderLine</td><td>Reference to information stored in the customer order
Read fields direct from linked sales order
Example: Read color information from document line field U_color
<pre>Type: OrderLine
Field: U_color</pre>Note:
The system read information directly from table
The sales order must be saved
This is not working, if you want to create a PreCalculation inside a sales order, before you saved the sales order.</td></tr>
<tr><td>Manually</td><td>Manual input is required for this field (e.g. quantity) during evaluation of the Bill of materials.</td></tr>
<tr><td>Beas-Script</td><td>Reference to a BeasScript or Variable stored in the variant generator (e.g. for evaluation the order position, material quantity, etc.). see BeasScript.</td></tr>
<tr><td>JBScript</td><td>Reference to a JBScript stored in the variant generator.</td></tr>
</table>
</td></tr>
<tr><td>Name</td><td>ID of formula or table</td></tr>
<tr><td>Information</td><td>Free text, displayed at calculation or when formula is solved</td></tr>
<tr><td>Change</td><td>May the calculated value be changed by the user?</td></tr>
<tr><td>Unit of M.</td><td>Only visible if "change" was enabled.
Displayed or entered unit of measurement during calculation</td></tr>
<tr><td>Type of Variable</td><td>Only visible if "change" was enabled.
Type "Character" or "Number". Determines the format of input/output</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Meaning
Decimals	**Only visible if "change" was enabled.** If variable type was set to "Number": number of decimals
Selection	**Only visible if "change" was enabled.** The user gets options to select from.

Available formula (source) types:

For each BoM position you can input, for example, the quantity depending on the specifications entered in the variant using the references described in the above table. For ***example***, if the quantity of the cover fabric is calculated in the product configurator depending on the size of the sofa - e.g. using a “set” object *material_quantity*, that contains the corresponding value, a reference to this “set” object can be defined for the quantity field of the BoM position. This value is, then, copied to the BoM position field when calculating the Bill of materials.

The same procedure is possible for the item field of a BoM position - items on a bill of materials can be exchanged in this way. For ***example***, if there is a parameter *cover fabric*, in the configuration structure that can accept the values MatRed and MatBlue from a reference for the item field of the BoM position (where MatRed and Matgreen is replaced by MatBlue must be existing item numbers).

- Table/Column information (Data integration hub)

The information are saved in field CAFTINFO with format
(BEAS_STL.CAFTINFO, BEAS_APL.CAFTINFO)

```
Type=Name=Information=ColumnType=ColumnLength=Changeable=Unit=ChooseList=Formula
[CR-LF] .. next line
```

All "=" inside the parameter replaced with "³"

Type:

Type	Description
F	Formula
T	Table
P	Parameter from Configurator
V	Variable
K	No relation

		Text edit - script is inside. Double-click to open the script editor. Located left of Item number in Item Master data.

8.15.3.1.2 List of formulas

Overview list of all stored formulas in current BoM, routing and master data items. Use drag&drop to change the order of processing. This may be necessary if calculations depend on other results. Formulas can also be deleted here. New entries are not possible.

For field descriptions ***see*** Assignment of formulas

8.15.3.1.3 Routing Description

Customizing the routing description, Item name or additional BoM text

© 2026 Boyum IT Solutions A/S

In addition, in the operation description, additional information on the BoM, or item, information from a formula or variant can also be stored in the description of a routing.
Placeholders can be inserted into routing descriptions for this purpose. These placeholders begin with < and end with >. All variables as well as separate formulas, tables, types of origin, etc. can be inserted.

The origin itself is defined in the placeholder using **origin type** and "**:**".
The type "Script" is used if the type of origin is not specified.

TYPE	Description
f:	Origin is a formula, e.g. <f:MyFormula>
t:	Origin is a table, e.g.. <t:tab4711>
i:	From assembly – item master: e.g. <i:itemname> = Item name
v:	Variable which can be defined as necessary: e.g. <v:var0815>
c:	Beas-script. Can be defined as a type of origin definition, e.g.: <c:e_belnr_id> Document number from work order, <c:e_aplatz_id> = resource ID of the routing position
p:	Parameter from a variant. <p:so_sofa_length>

- Example of an operation description.

```
<c:e_quantity> * Cutting to size according to drawing number <i:u_dnr>
Color: <v:u_color>, length: <v:length>, width: <v:width>
```

with:

e_quantity:	e.g. from beas Script the value "5" gives
u_dnr:	Drawing number, e.g. "ZN 078 12345"
u_color:	e.g. red
length:	e.g. 20
width:	e.g. 10

the following information results in the field "Description":

© 2026 Boyum IT Solutions A/S

```
5 * Cutting to size according to drawing number ZN 078 12345
Color: red, length: 20, width: 10
```

8.15.3.1.4 with BeasScript (on position level)

For more complex processes and calculations related to variant configuration, it is also possible to change properties of field positions using Beas-script.

Proposal Picking is pending to be processed for work order.

You can also append BoM or routing items. There is no need to start from a maximum list and turning items inactive at runtime.

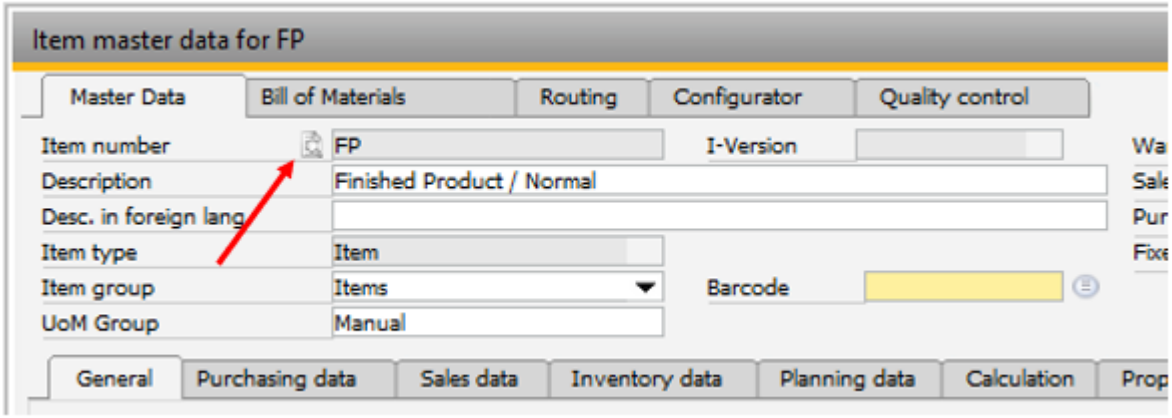
This function is useful in cases where decisions are made to add BoM items or routing positions.

Clicking on the / icon left of the input field "position", the Beas editor window opens, to enter Beas-script.

Important: The Variant generator must be activated first.

Note: The / symbol can be displayed by right-clicking in a free area of the processing window.

(right-click > "Display formula fields").



- Available variables:

Variable	Description	Example
`<itemcode.[fieldname]>`	Field from assembly item master data, table "OITM" HANA: Field Name must be added correctly.	`<oitm.ItemName>`

© 2026 Boyum IT Solutions A/S

	Example: Wrong: `itemname`, Correct `ItemName`	
`<bom_itemcode.[fieldname|>`	Field from material item master data, table "OITM". You can use this only in a Bill of materials – script HANA: Field Name must be added correctly. ***Example***: Wrong: `itemname`, Correct `ItemName`	`<bom_itemcode.ItemName>`
`<ordr.[fieldname]>` `<rdr1.[fieldname]>`	Field from sales order if a link exists. HANA: Field Name must be added correctly. ***Example***: Wrong: docnum, Correct DocNum Note: This is only working, if the document is saved Example: If you create a Calculation from Sales order, then the system can read the information only, if the order is added/updated.	`<ordr.DocNum>` `<rdr1.U_myduf>`
`<parameter.[parametername]>`	Field from configurator if a link to a configuration exists. If no entry found: – the link to a work order parameter if work order exists. If no entry found: – item parameter (Item master data – parameters)	`<parameter.length>`
`<productconfiguration>`	The Id of current product configuration.	`<productconfiguration>`
`<variant>`	The Id of current variant (A ...Z).	`<variant>`

- Adding of BoM and routing and positions and also parallel resources (Objects)

Only for scripts which will be deposited directly behind an item.

Functions are part of the object "variant". This identification has to be indicated accordingly.

Example: variant.addbom=itemcode=A1001<tab>pos_id=40<tab>sortid=40<tab>pos_text=40<tab>quantity=1

Function	Description	Example
`addbom`	Add a BoM position, properties	`variant=addbom=itemcode<tab>quantity=4`
`addrouting`	Add a routing position	`variant=addrouting=aplatz_id=A001`

© 2026 Boyum IT Solutions A/S

addparallelressource	Add a parallel resource or tool	variant=addparallelressource=wkz_id=T001

BoM attributes (with "addbom")

Nearly all attributes of a routing position with the object "variant" can be accessed via the BeasScript:

Parameter	Field / Attribute
pos_id	BoM position
pos_text	BoM sequence (Text for Routing position)
sortid	Sorting ID for BoM position
itemcode, art1_id	Item
itemname	Description
quantity, menge_lager, menge_verbrauch	Quantity
quantity_by, menge_je	Quantity per
roundingtype, round_type	Rounding-Type
roundingdec, round_dec	Mach+Labor Time/unit / Processing time
routingposition, aplanpos_id	Routing position
length, abm1	Length
width, abm2	Width /OD
height, abm3	Height /ID
additionaltext, usertext	Additional Text
warehouse, whscode	Warehouse
aktiv	Active flag
udf1 .... udf15	User defined field 1 - 15

Routing attributes (with "addrouting")

Nearly all attributes of a routing position with the object "variant" can be accessed via the Beas Script:

Parameter	Field / Attribute
resource_id, ressource, aplatz_id, resource	Resource
operation, ag_id	Operation

© 2026 Boyum IT Solutions A/S

pos_id	Routing position
pos_text	Operation sequence (Text for Routing position)
sortid	Sorting ID for Routing position
agtyp, agtype, type	Type
description, bez	Description
clockmandatory	Clock Mandatory
setup_calculation, traplatz	setting up time
setup_scheduling, tr2aplatz	Setup time capacity
time, teaplatz	Mach+Labor Time/unit / Processing time
costelement, timetype_id	Cost Element
timefor, menge_je	Time for .. finished part
timein, menge_zeitje	Time in .. (min=1, hour=60)
usefaktor, nutzen, usefactor	Use factor
worksteps, anzahl	Work steps
idletime, tl	Idle time
overlapptime, ueblgrz	Overlap limit
scrapfactor, ausschussfaktor	Scrap factor
qcinspectionplan, qs_id	QC inspection plan
payslips, lohnscheine, anzls	Number of payslips
activ, aktiv, active, aktivformel	Operation active
udf1 ... udf15	User defined field 1 - 15
feedback_unit, rm_me_id	Confirm in units
feedback_factor, rm_faktor	Factor for Assembly
external_itemcode, external_price	For external Routing position: The non warehouse item for Purchase order and the price *beas 9.3 PL2 HF1*

Parallel ressource attributes (with "addparallelressource")

The following attributes can be accessed with the object "variant" via the BeasScript:

© 2026 Boyum IT Solutions A/S

Parameter	Field / Attribute
ressource, ressource_id, resource, aplatz_id, wkz_id	Resource
activ, aktiv, active	Parallel resource active
alternativ, alternatively, alternative	Set Alternative resource
zusatzinfo, description	Description
costelement, timetype_id, kostenart	Cost element
anteil, zeitreservierung, timereservation	Time reservation

- Change of BOM attributes and routing attributes

All attributes of the object "variant" can be accessed via the script if the script is deposited directly in the BOM position or routing position.

English is supported, but it is recommended to use the field names.

Example for BoM – Additional information:
variant.description=this is my description

The most important characteristics are listed in the script-Editor right and can be changed here.

To access on existing values, use the field name "e_", e.g.
Routing – Resource: <e_aplatz_id>

- Examples

Using the simple variant configuration (Variants from A to Z) using Beas-script simple decision can be programmed:

Example 1:

In case that variant "A" was selected, a BoM item with item number "test003" is added.

```
if <variant> = A then
  variant.addbom=itemcode=test003,pos_id=40,sortid=40,pos_text=40,quantity=1,quantity_by=1,
end if
```

Example 2:

In case that variant "B" was selected, a routing position with defined resource "1102" and with times is added.

```
if <variant> = B then
  variant.addrouting=resource=1102,pos_id=20,sortid=20,pos_text=20,description=2.Position,t
end if
```

© 2026 Boyum IT Solutions A/S

If variables from Product configurator are needed, use them as in the following example

Examples:

In parameter "length" of the product configuration the length of a part was defined. Depending no the length a BoM item is to be added:

```
if <parameter.length> n> 1000 then
  variant.addbom=itemcode=material001,pos_id=60,sortid=60,pos_text=60,quantity=2
end if
```

The field contents can be set directly on the position level of a BoM position.

```
setvar=v_itemcode=printer_08
setvar=v_quantity=4
...
variant.art1_id=<v_itemcode>
variant.quantity=<v_quantity>
// set position of BOM to inactive
variant.aktiv=N
```

This is also possible for the operations on position level.

```
variant.bez=Carton Type A
// set position of operation inactive. Note: Routings must be set active/inactive via "set

// set direct inactive
setvar=e_aktivformel=N

or

// set with parameter (e.g. "pos_active") from corresponding configuration
setvar=e_aktivformel=<parameter.pos_active>
```

- Usable in the following areas

The scripts will be considered at:

- Create Work Order
- Create Precalculation

No consideration at:

- MRP / Order Recommendation
- Item structure view, Structure reports.

- Special fields

You can set all fields which are available in the BoM.

The following fields (not definable in the BoM item master) are additionally available:

price
itemname

- Working with decimal numbers

© 2026 Boyum IT Solutions A/S

Decimal numbers are transferred in the national system (Windows Regional settings).
The following problems may occur:

Decimal separator = Comma: Comma is also a parameter separator. The variable must be defined before.

```
setvar=lc_price=5,5
variant.addbom=itemcode=material001,quantity=<lc_price>
```

Different regional settings: If working with different regional settings, do the following: Enter a decimal variable in a string variable and then transfer the string variable. Thus the correct regional format will be defined at the conversion.

```
decimal lc_quantity
lc_quantity=2.34
setvar=ls_quantity=<lc_quantity,#0.000000>
variant.addbom=itemcode=AB123T,pos_id=11, pos_id=11,sortid=11,pos_text=11,quantity=<ls_quan
```

8.15.3.2 Formulas

All types of formulas are managed here, e.g.:

- *Planned time calculation formulas*
- *Output calculation formulas*

The formula number enables assignment of a formula to time components, operations, BoM positions, thus facilitating the calculation of:

- *Default times*
- *Material requirements*
- *Other technical data*

The result calculated from a formula can also be allocated to a variable.

- Elements of a formula

- Formula flag:	Unique flag used to identify the calculation (e.g. F4711)
- Description:	Describes the function or the use of the formula (comment)
- Formula string:	Any mathematical and logical formula can be entered here. All numbers and characters are permitted.
- Type	Output type of formula (as text or numeric)

- Structure of a formula

The following must be observed when using variable designations:

© 2026 Boyum IT Solutions A/S

- Maximum length of 20 characters
- Blanks, spaces or mathematical symbols must not be used (+ - period, comma etc.)
- Variable names may not consist of reserved names (function names).
- Variables must begin with a letter
- Mutated vowel and "ß" must not be used.
- Unlike in the product configurator, variables do not have to be delimited by [..].
- Formel syntax corresponds the Syntax of Datawindow (R) - Interpreter of Sybase (R)
- The number of variables is not limited

If a formula is selected or created new, a new window opens:

Tab "Formula"

Field	Description
Formula	Formula name
Match code	Match code
Description	Formula description
Formula string	Definition of formula
Type	Output of formula ("numeric", "string" or "yes|no")
Dec	Number of decimals (for numeric type)

Tab "Variables"

(Definition variables of used in formula)

The syntax is the same as the DataWindow syntax.

See: Datawindow-Syntax

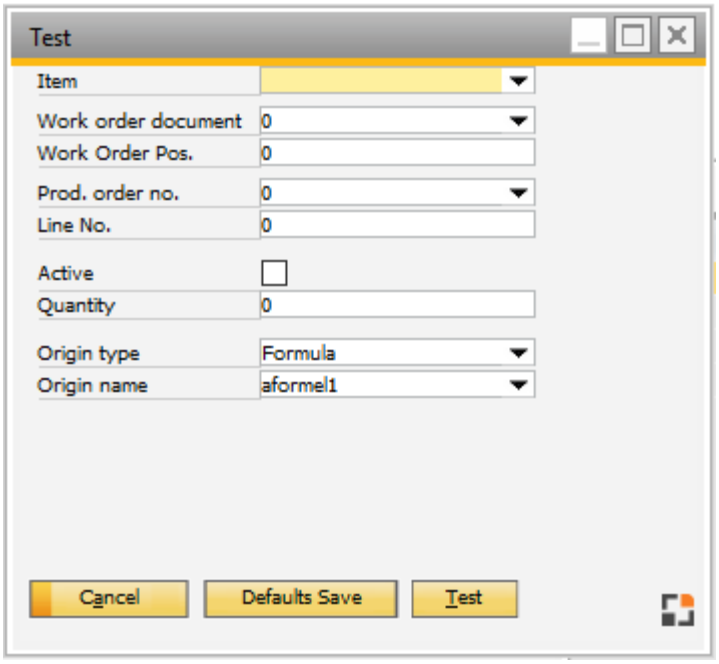
Field	Description
Variable	Variable name
Description	Description of variables
Type	Output of formula (numeric or string)
Dec	Quantity of decimals, necessary by type "Number" (numeric)
UoM	Unit of measurement
Origin type	Origin of variable: - Formula - Table

© 2026 Boyum IT Solutions A/S

Field	Description
	- Variant (from product configuration) - Field from Item - Order (Sales Order) - Order line - Manually (enter manually at run time) - Beas-Script For details ***see*** Formula Types
Origin name	Object name from origin type
Change	Allow changes at run time
Validity	Validity of variable: - **local** (only within the formula and all formulas and tables called by it) - **shared** (within the assembly and for all following items, but not sub-assemblies) - **global** (in complete structure from the moment of calculation)
Operation	Mark, to save the variable globally with prefix "agbez_". Then it can be accessed in a description of an operation. ***see*** Operation Variables
Cross reference	Enter a link (Only useful with origin type "manually" or "Change")
Sorting	Order of processing variables

Test button: Press this button to test the formula in the the window that opens:

© 2026 Boyum IT Solutions A/S



Window caft_testeval.psr

Field Descriptions

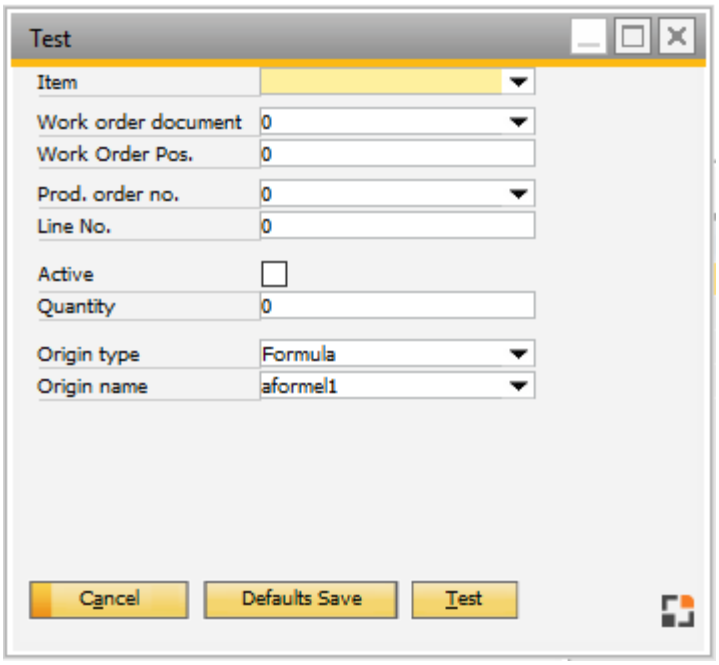
Field	Description
Item	Select an item from the drop-down.
Work order document	Select a Work order from the list.
Work Order Pos.	Insert work order position
Prod. Order no.	Select Production Order number
Line No.	Insert Prod. order line number
Active	
Quantity	Insert quantity
Origin type	Select origin type: - Formula - Variant - Field from item - order - order line - Manually - Script
Origin name	Select value from the drop-down list. The values in the list correspond with the selected value in Origin type.

© 2026 Boyum IT Solutions A/S

Defaults Save button: Save selected values as default for Test

8.15.3.2.1 Test

Test button: Press this button to test the formula in the the window that opens:



Window caft_testeval.psr

Field Descriptions

Field	Description
Item	Select an item from the drop-down.
Work order document	Select a Work order from the list.
Work Order Pos.	Insert work order position
Prod. Order no.	Select Production Order number
Line No.	Insert Prod. order line number
Active	
Quantity	Insert quantity
Origin type	Select origin type: - Formula - Variant - Field from item

© 2026 Boyum IT Solutions A/S

Field	Description
	- order - order line - Manually - Script
Origin name	Select value from the drop-down list. The values in the list correspond with the selected value in Origin type.

Defaults Save button: Save selected values as default for Test

8.15.3.3 Tables

In addition to formulas, you can also store decision tables. This means that you can store values or even other formulas for specific occurrences (or areas) of parameters. The number of parameters stored in a table is referred to as the dimension of the table.

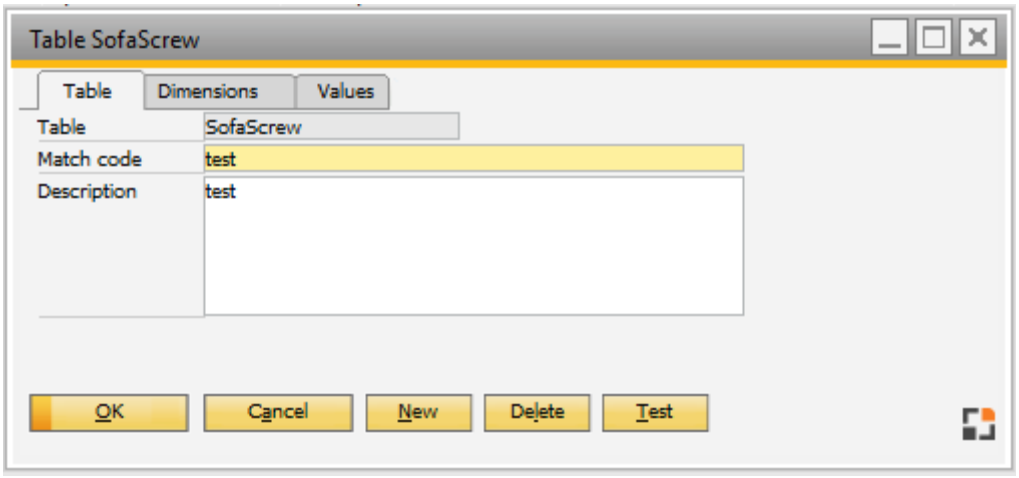
For ***example***, you can store processing times for obtaining the sofa depending on the sofa length. Tables are particularly useful if parameters have a limited number of input options, or if there is a limited set of results.

Example: If sofa length < 150cm then produced on machine x.
If sofa length >= 150cm then produced on machine y.

Table tab
Dimensions tab
Values tab

© 2026 Boyum IT Solutions A/S

8.15.3.3.1 Table tab



Window caft_tabelle_edit.psr

Field	Description
Table	Table name
Match code	Match code
Description	Table description

Test button: ***See*** Test window.

8.15.3.3.2 Dimensions tab

(Definition of used dimensions in table. Max. 6 dimensions)

Field	Description
Pos	Position
Varname	Name of the Variable
Designation	Designation of the Variable
UoM	Unit of measurement
Origin type	Origin of variable: - Formula - Table - Variant (from product configuration) - Item field - Order line - Manually (enter manually at run time)

© 2026 Boyum IT Solutions A/S

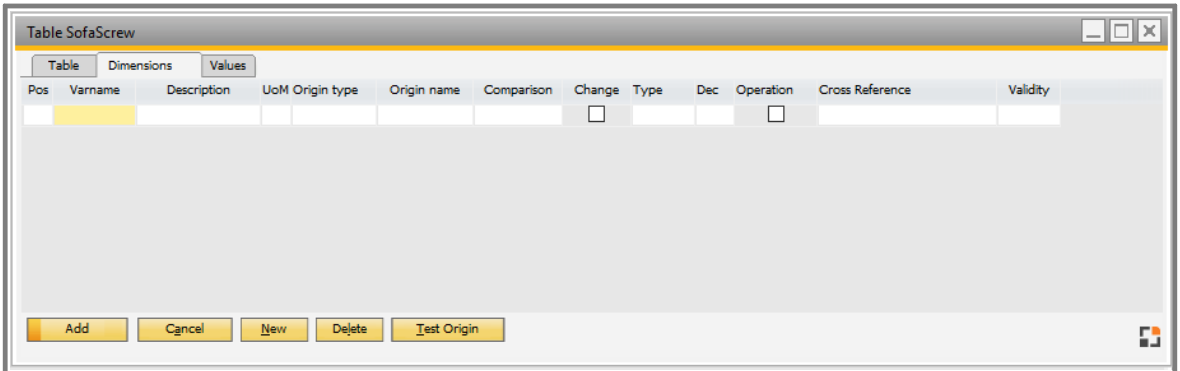
Field	Description
	- beas-Script
Origin name	Name of the object from origin type
Comparison	Desired logic for comparison - = (equal) - > (greater) - < (smaller) - => (greater or equal) - <= (smaller or equal)
Change	Allow changes at run time
Type	Output of formula ("numeric", "string" or "yes|no")
Dec	Number of decimals (if numeric)
Operation	Mark, to save the variable globally with prefix "agbez_". Then it can be accessed in a description of an operation. ***see*** Operation Variables
Cross reference	Enter a link (Only useful with origin type "manually" or "Change")
Validity	Validity of variable: - **local** (only within the formula and all formulas and tables called by it) - **shared** (within the assembly and for all following items, but not sub-assemblies) - **global** (in complete structure from the moment of calculation)

Test Origin button: ***See*** Test window.

Example for a two-dimensional table

The value depends on both the color and length. This could be the required time to upholster the sofas. Values can be stored for all combinations.

© 2026 Boyum IT Solutions A/S



Window caft_tabelle_dim_browse.psr

Procedure:

1) Create new table. Table name e.g. "**LaborTime**"

2) Select tab "Dimension" and insert table values

- Origin type: **Manually** (> This value will be asked at "Runtime" and is to be inserted via Keyboard by the User)

Pos	Varname	Description	UoM	Origin type	Origin name	Comparison	Change	Type	Dec
10	length	Cover length		Manually	B	=	x	Number	2
20	color	Cover color		Manually	B	=	x	Char.	

- Origin type: **Variant** (-> This value will be fetched at "Runtime" from the parameters (cover_len, cover_color) of the corresponding product configuration)

Pos	Varname	Description	UoM	Origin type	Origin name	Comparison	Change	Type	Dec
10	length	Cover length		Variant	cover_len	=		Number	2
20	color	Cover color		Variant	cover_color	=		Char.	

3) Select tab "Values" and insert table values

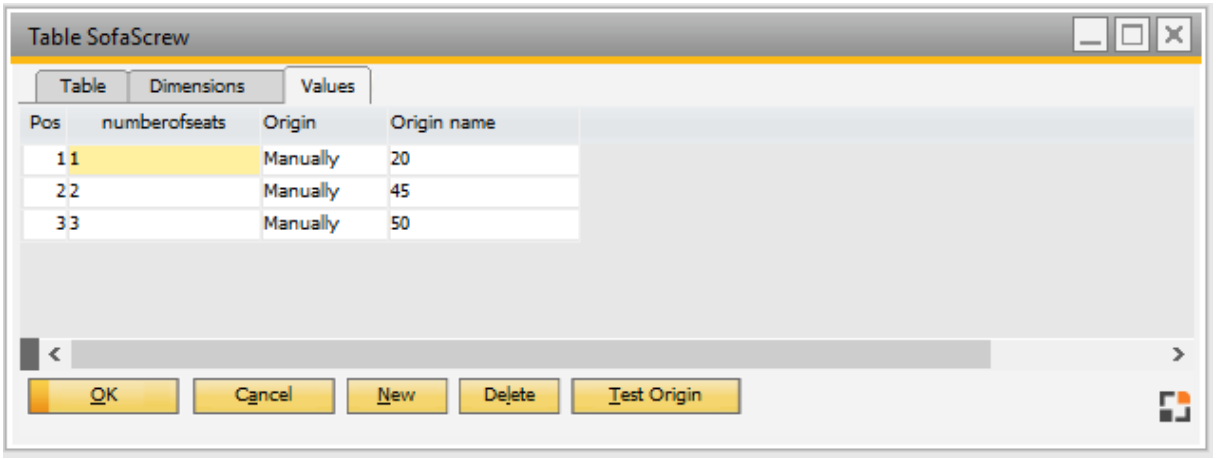
Pos	length	color	Value3	Value4	Value5	Value6	Origin	Origin Name
10	10	red					Manually	5
20	15	green					Manually	6
30	20	green					Manually	8

© 2026 Boyum IT Solutions A/S

if the length of the cover is "**10**" and the color is "**red**", then you'll get for table "**LaborTime**" at runtime the value "**5**" as result

8.15.3.3.3 Values tab

(Values for positions in dimensions tab)



Window caft_tabelle_werte_browse.psr

Field	Description
Pos	Position
<name of Variable 1>	Value for Variable 1
<name of Variable 2>	Value for Variable 2
<name of Variable 3>	Value for Variable 3
<name of Variable 4>	Value for Variable 4
<name of Variable 5>	Value for Variable 5
<name of Variable 6>	Value for Variable 6
Origin	Origin of variable: - Formula - Table - Variant (from product configuration) - Item field - Order line - Manually (enter manually at run time) - BeasScript
Origin name	Name of the object from origin type

© 2026 Boyum IT Solutions A/S

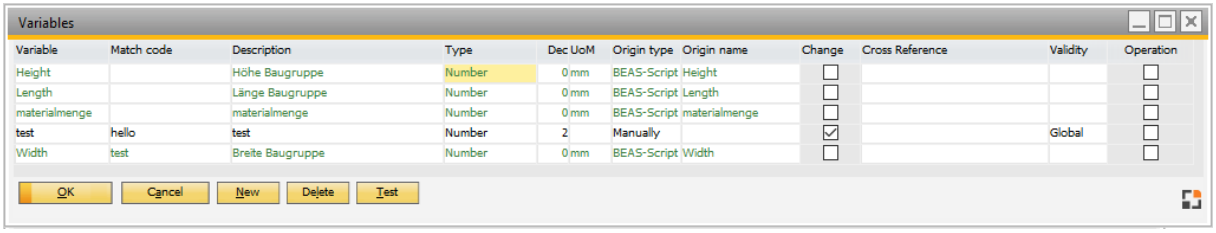
Test Origin button: ***See*** Test window.

8.15.3.4 Variables

Variables are pre-definitions (templates) of a time calculation through formulas and tables. The numeric or alphabetic assignment of variables can be:

- calculated in a formula
- read in a parameter list
- read in a table
- read from item, order line or order header
- determined from a freely definable origin type

Define the formulas and tables you want to use under the Variables menu option. The texts for description and unit of quantity are adopted when entering a variable name. However, you can also choose to describe the variables later in the actual formula or table.



Window caft_var_browse.psr

Field descriptions

Field	Meaning
Variable	Master name or key used to access the variable. Note the following here: - Variable names can be up to 20 digits long - Variables must begin with at least one letter - only the underscore '_' may be used as separator symbol - The number of variables is not limited - math symbols may not be used in variable names
Description	Arbitrary

© 2026 Boyum IT Solutions A/S

Matchcode	Free text
Type	Output of formula ("numeric", "string" or "yes/no")
Dec	For numeric: Number of decimal places. Number formats or number of decimal places are now adopted from the SAP Business One settings. Note: In Beas numbers are always formatted according to the Windows settings (Control Panel – Regional Settings), since all Beas fields are input fields conforming to Windows.
Unit	Unit of quantity as information such as piece, mm, etc.
Type of origin	Origin of the variable (How is the variable calculated?) – ***see*** Types of origin/Types.
Origin name	Details about the type of origin (e.g. for table -> name of table).
Change	Should the variable be entered or changed after calculation?
Selection	Should a selection list be available? If so, it can be defined here.
Link	Make available a selection list? Select link.
Validity	Validity and visibility: **local**: only within the formula and sub-tables and formulas called by it. **shared**: within the assembly for all following positions, but not for sub-assemblies. **global**: from the moment of computation visible in complete structure.
Operation	Mark to save the variable globally with prefix "agbez_". Then it can be accessed in a description of an operation. ***Example***: Local variable duration, "Operation" enabled

© 2026 Boyum IT Solutions A/S

	Is saved al grlobal variable "agbez_duration" and can be added to the description <v:agbez_duration> ***see*** Customzie BoMs and routings

Test button: ***See*** Test window.

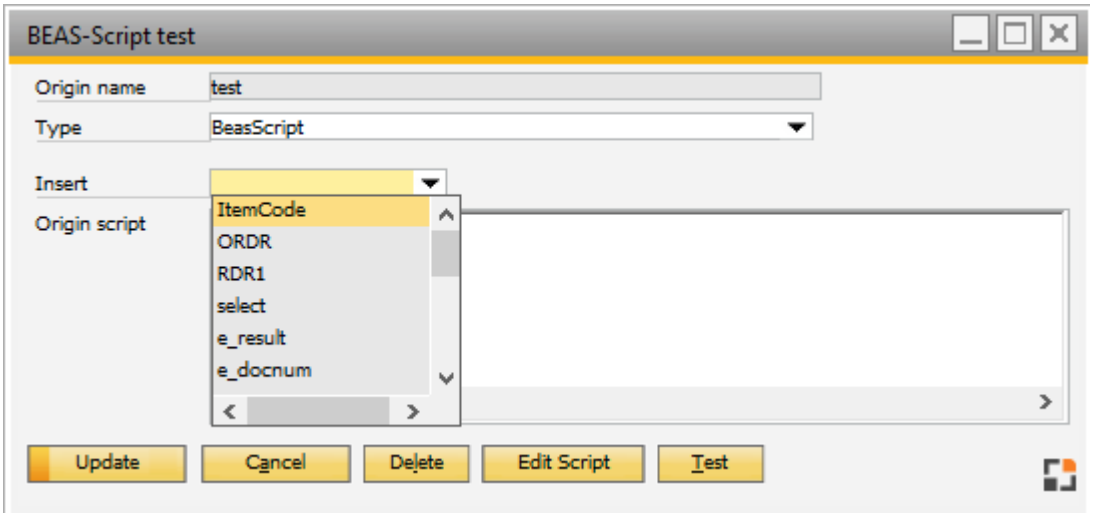
8.15.3.5 Beas-Script

This defines how a variable should receive its value, unless determining the value takes place through the default types of origin.

This can be

- a field from item or sales order table
- result of SQL statement
- a Beas or JBScript

With the Test-Button you can test the formula directly.



caft_herkunft_edit.psr

If the Type is BeasScript and the Origin Script is empty, you can choose "ItemCode","ORDR" "RDR1" or "BoMItemCode"

This allows you to create an SQL statement or insert the placeholder.

- Details:

© 2026 Boyum IT Solutions A/S

select	The result of the select statement is returned. Only one result may be returned. Placeholders can be inserted. example : return the assembly `select <e_itemcode,dbstring> from "BEAS_DUMMY"`
ORDR RDR1	Information from Sales Order or Sales Order line. Only if linked at creation time to a Sales order.
itemcode.	Information from the assembly: e.g. itemcode.u_beas_znr (= drawing number)
bomItemCode	Bill of Material item code e.g. `bomItemCode.usertext` *Beas 2020.06*
e_	Access to a Beas variable. All master data information in the current BOM position or routing position is available as Beas variables: ***See*** Pre-defined Beas variables

BeasScript

You can insert a complete BeasScript function. Return the result with
`setvar=e_result="your result"`
You have access to all Pre-defined Beas variables.

Example

```
if <e_quantity> n> 5 then
  setvar=e_result="ABC"
else
  setvar=e_result="DEF"
end if
```

JBScript

You can insert JBScript. Define result in the return command

return "your result";

Example

```
if (e_quantity > 5 )
  return "ABC";
else
  return "DEF";
```

Pre-defined Beas variables

The following additional Beas variables are set:

Note: All variables are BeasScript variables (strings).

© 2026 Boyum IT Solutions A/S

e_docnum	Order number (if a reference exists) – only available when creating a work order
e_docentry	Internal order number – table order – only available when creating a work order Note: Pre Invoice not supported
e_linenum	Internal order line – table rdr1 – beginning with 0 - only available when creating a work order
e_belnr_id	Work order number
e_belpos_id	Work order position
e_itemcode	Item number of the assembly
e_quantity	Quantity of the assembly (only work order and calculation)
e_info1	Assembly/BoM that is currently being broken down (only Work order and Pre calculation)
e_bomitemcod	Material number of the BoM position (identical with e_art1_id)
e_aktiv	Y/N: Should BoM/operation position be added?
e_BoMId	Bill of Material Id (e_pos_id on Bill of Materials Level))
e_RoutingId	RoutingId (e_pos_id on Routing Level)

8.15.3.6 Datawindow-Syntax

In Variant generator, unit of measurement calculation and in other areas for formulas DataWindow-Syntax is used. This is to give a short overview of available functions. Further details ***see*** online Powerbuilder-descriptions.

- Mathematical symbols (operators)

Mathematical symbols (operators)

+	Addition (numbers) or consolidation (characters)
-	Subtraction
*	Multiplication
/	Division
^	Power

Auxiliary symbols

(	Left parenthesis
)	Right parenthesis

© 2026 Boyum IT Solutions A/S

.	Decimal separators **(all nationalities !!!)**

- The formula must be logical, '('must be followed by')' etc.
- Any level of nesting is permitted.

Numeric functions

abs	Absolute – removes the sign	abs(-3) = 3 abs(3) = 3
ceiling	Return of the next higher integer	ceiling(-4.2) = 4 ceiling(-4.8) = 4
cos	The angle (in rad) for which the cosine should be calculated	cos(0) = 1 cos(1) = 0.540302
exp	The power for the exponential e (2.71828)	Exp(2) = 7.3890560989
fact	Value for the faculty	fact(4) = 24 fact(0) = 1
int	Rounds down to the next integer	int (3.8) = 3 int (-3.2) = 4
log	Calculates the natural logarithm of a number	log(10) = 2.302585092
logten	Calculates the logarithm to base 10	logten(10) = 1
mod	Calculates the remainder of a division	mod(20, 6) = 2 mod(25, 4.5) = 2.5
pi	Multiplies Pi by the specified number	Pi (1) = 3.14159265
Border	Random number between 1 and specified number	rand(20) = 1 ... 20
round	Rounds the number from the specified position	round(3.333,2) = 3.33 round(3.335,2) = 3.34 round(324,-2) = 300
sign	Calculates whether the number is negative, zero or positive. (by checking the sign)	sign(5) = 1
sin	Calculates the sine of an angle	sin(1)=0.84147098
sqrt	Calculates the square root of a number	sqrt(2) = 1.414213562
tan	Calculates the tangent of an angle	tan(1) = 1.55741
truncate	Reduces a number to the specified places	truncate(9.22, 1) = 9.2 truncate(9.28, 1) = 9.2

© 2026 Boyum IT Solutions A/S

Logical formulas

Beas also permits the use of logical formulas with the following structure:

```
if ( logic , value by true , value by false)
```

e.g.

```
if ( red = blue , 3.34 * x , 0 ) + (x * 2)
```

Logical characters and functions

=	Both values are identical	Price = 100
>	Left value greater than right value	Price > 100
<	Left value smaller than right value	Price **<** 100
<>	Left value is not right value	Price <> 100
>=	Left value greater than or equal to right value	Price >= 100
<=	Left value smaller than or equal to right value	price <= 100
NOT=	Left value is not right value	Price **not =** 100
LIKE	Left value is part of right value	Name **like** 'C%'
IN	Left value contained in right list	Price **in** (100,200,300)
BETWEEN	Left value is in the range of	Price **between** 1000 and 2000
NOT LIKE	Left value is not in right value	Price **not like** 'C%'
NOT IN	Left value is not in right list	Price **not in** (100,200,300)
NOT BETWEEN	Left value is not in range	Price **not between** 1000 **and** 2000

LIKE works with placeholders:

`%` Any number of characters

`_` Any single character

Example:

`'c%'` corresponds to any string beginning with c

`'c_'` corresponds to any string beginning with c and containing one additional arbitrary character

Logical links with "if"

Conditions can be linked with AND and OR as well as with NOT AND/OR:

© 2026 Boyum IT Solutions A/S

```
if ( x = y and x = z ,1,0)
if ( x = y or x = z,1,0)
if ( x = y and not x = z,1,0)
```

- Logical formulas with "case"

With **case** different results can be returned depending on a condition.

```
case ( column when value1 then result1 { when value2 then result2
   { ... } } { else resultelse } )

case (marriage_status when 'S' then 'Single' when 'M' then 'Married' else 'Unknown')
```

- Working with characters (strings)

Characters can be processed.

Characters are combined through +

```
a = "Adam"
b = "Eve"
a + " " + b = "Adam Eve"
```

The beginning and end of a string must be identified.

The following identifier fields are permitte:

```
"       "Hello World"
'       'Hello World'
[.]     [Hello World]
```

The use of identifier fields in string fields is permitted if the string begins with a different identifier field:

`"[Hello] 'World"'` Result: **[Hello] 'World'**

There are many character editing functions:

fill	Returns a filled string	fill("*"),3) = "***" fill("-+"),5) = "-+-+-"
left	String that is truncated at the right	left("hello world,6)="hello "
lefttrim	String that is truncated at the right and has blank spaces removed	leftright("hello world,6)="hello"
len	Return of number of characters in a string	len("hello") = 5
lower	Swaps uppercase letters in a string for lowercase letters	lower("Hello") = hello
match	Checks characters used (for more	match("A","^[A-Z]) = true

© 2026 Boyum IT Solutions A/S

	information, see Sybase Infomaker)	
mid	Returns the specified part of a string	mid("Hello",2,2)= "al"
Pos	Returns the position of a given string in the first string	pos("Hello","l") = 3
replace	Replaces a string in another string	replace("David", 4, 2, "e") = "Dave"
right	String which is truncated at the left	right("hello world",5)=" world"
righttrim	String which is truncated at the left and has blank spaces removed	righttrim("hello world",5)="world"
space	Returns specified number of spaces	space(5)=" "
string	Converts a number, date, character into a formatted string. Observes international settings in doing so.	string(5.2344,"#,#0.00") Germany: "5,23" USA: 5.23
trim	Removes the spaces left and right	trim(" hello ") = "hello"
upper	Swaps lowercase letters in a string for uppercase letters	upper("Hello ") = "HELLO"
wordcap	Converts first letter into a capital letter and the remainder into lowercase letters.	wordcap("boston, MASSACHUSETTS") = "Boston, Massachusetts"

8.16 Production Cockpit

The Production Cockpit window is a centralized interface that displays an overview of the current production status and allows users to quickly access key information, track the status of work orders, and efficiently manage their daily tasks. *(Beas 2025.06)*

What can you do with the Production Cockpit?

- View the current status of all your Work Orders (WOs): new, delayed, pending, or missing materials.
- Check which resources are in use, available, or interrupted.
- Monitor real-time production progress, with detailed information by operation.

© 2026 Boyum IT Solutions A/S

- Access the most up-to-date list of material requirements.

Immediate benefits:

- Instant Information: Quickly access real-time work order status, eliminating time-consuming searches.
- Efficient Planning: Easily identify and prioritize the latest orders, enhancing production scheduling.
- Timely Issue Resolution: Swiftly spot delays and material conflicts, enabling prompt decision-making.
- Streamlined Navigation: Directly access main tasks, reducing menu navigation for faster actions.

Initial setup:

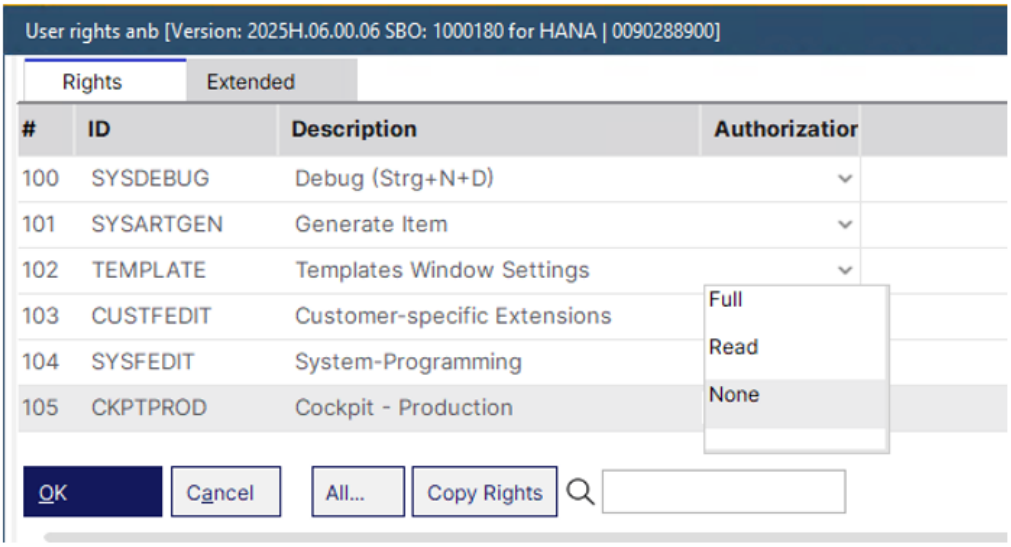
1. Run the Beas Service.

2. Activate "Calculate Material requirements for Cockpit" planned activity in the Beas Manage Server. **IMPORTANT:** Make sure that Beas Service is running; planned activities do not run without the Beas Service.

3. Edit and customize this planned activity to your needs: running the calculation on the selected days of the week, with the custom frequency (e.g. hourly).
Default setting: Daily, Monday to Sunday, from 8:00AM to 11:00PM on an hourly basis.

Rights activation for the Beas user:

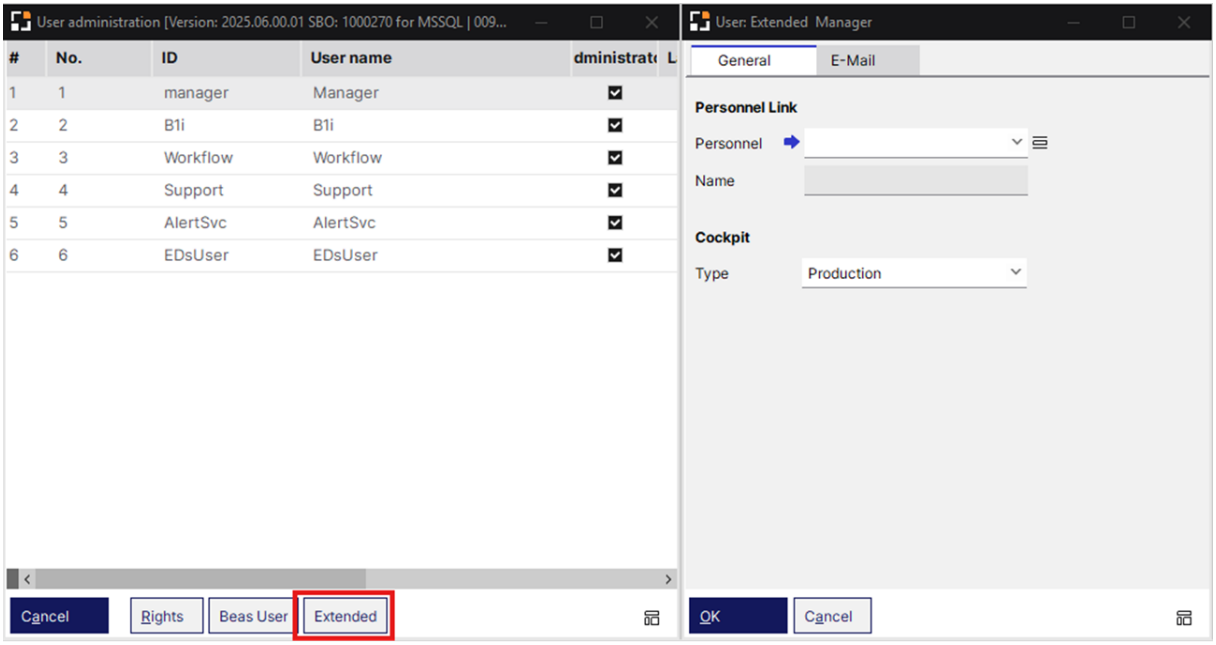
1. Rights for the Production Cockpit must be set up by the system administrator in the User administration rights extended option:



2. When user rights have been set up, the cockpit window can automatically be activated for the user when clicking the "Activate Cockpit" button in the "What's new window" upon Beas startup.

© 2026 Boyum IT Solutions A/S

Or the System administrator can change the Cockpit Type manually in the User administration extended setting:



Open the Production Cockpit:

PATH:

Beas: Tools > Cockpit > Production

OR

SAP B1: Tools > Cockpit > Production

Filter buttons

The total amount of WOs grouped in different statuses. You can open the WOs list filtered by one of these statuses.

Total: The number under the filter represents the count of all work orders. Click the filter to open the Work orders window displaying all WOs.	**New:** The number under the filter represents the count of new work orders. Click the filter to open the Work orders window displaying only the new WOs.	**Delayed:** The number under the filter represents the count of delayed work orders. Click the filter to open the Work orders window displaying only the delayed WOs.
Finished today: The number under the filter represents the count of work orders finished today. Click the filter to open the Work orders window displaying only the WOs finished today.	**To start:** The number under the filter represents the count of work orders that have not been started yet. Click the filter to open the Work orders window displaying the list of WOs that need to be started.	**Material shortage:** The number under the filter represents the count delayed work orders with material shortage. Click the filter to open the Work orders window displaying a list of WOs with material shortage.

Resources (X days)

© 2026 Boyum IT Solutions A/S

A table with all the resources. It shows a list of WO operations that are using these resources (in a predefined period of days) and if it is currently not in use, working or interrupted.

Resource	Name of the used resource. Sorting by this field is supported. Sorting by this field is supported.
Work order operations	The linked operation sequences listed, separated with a comma. Sorting by this field is supported.
Status	The status of the resource in the WO operation: • *Not in use* (gray) • *In progress* (green) • *Interrupted* (red) Sorting by this field is supported.
Capacity	Displays planned capacity in gray (according to resource scheduling) and currently dispatched capacity in green. The covered time period in utilization column is set up in: **Configuration wizard > Production > Display > Structure view > Dispatching index: number of days to be considered.**

In progress: XX

The table shows all the opened work orders that have at least one operation already started or done. When scrolling to the end of the first 30 entries of the list, the system loads the next 30 entries.

Work order	Linked work order. Sorting by this field is supported.
Item	Linked item. Sorting by this field is supported.
Start date	Start date of the work order. Sorting by this field is available.
Delivery date	Delivery date of the work order. Sorting by this field is available.
Quantity	Work order quantity
Production progress	Shows the status of production progress of each operational sequence with a colored dot: - GRAY: Not started - YELLOW: Already started - BLUE: In progress - GREEN: Completed Hovering over the colored dots (representing the individual operation sequences of a work order) opens a pop-up screen with information on

Work order	Linked work order. Sorting by this field is supported.
	the date, the Start date, the clocked-in employee and the quantity produced by that employee: 
Material requirements: (dd.mm.yyyy hh:mm)

A table with the last calculated material requirements list. The dd.mm.yyyy hh:mm information shows the exact time of the last calculation for material requirements.

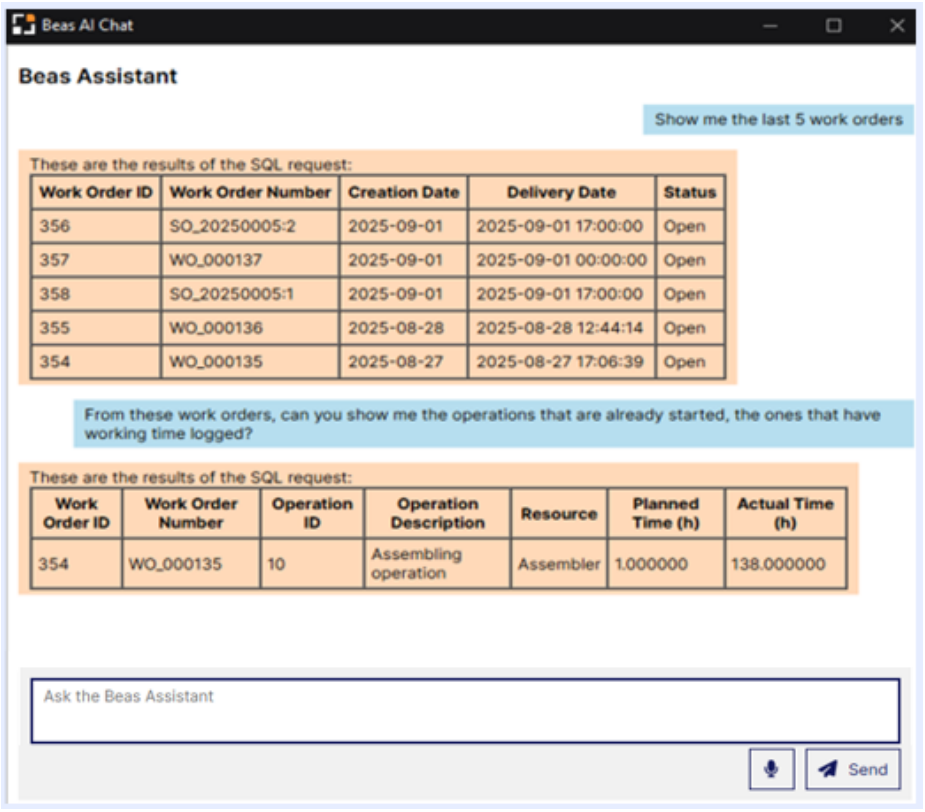
Item	Linked item. Sorting by this field is supported.
Balance	Total balance of stock for all work orders. Sorting by this field is supported.
Warehouse	Warehouse code. Sorting by this field is supported.
Version	Item Version number. Sorting by this field is supported.

8.17 AI Assistant

With the help of the Beas AI Assistant (*Beas 2025.09*) you can perform certain processes by using Artificial Intelligence.

IMPORTANT Prerequisite: Perform the required settings in the Configuration wizard.

© 2026 Boyum IT Solutions A/S



Window beas-ai-chat.psr

The ChatGPT-based AI Assistant can retrieve data from the database or create documents.

Available functionalities:

- Creating documents: Work orders, Time receipts and Goods receipts/issues.
- Retrieving data: from Beas Work orders or from any SAP B1 table. When retrieving data from the database, the result can be presented in formatted tables.

IMPORTANT: Data retrieval and document creation do **not** cover all fields!

- Supported fields:

Document creation:

- WORK ORDER
  - Card Code
  - Card Name
  - Start Date
  - Work Order Position
  - Item Code
  - Quantity to produce

© 2026 Boyum IT Solutions A/S

- Warehouse code
- UDF 1-4

TIME RECEIPT

- Document Entry

9 MRP

Beas is equipped with an extended integrated materials management feature, optimized for practical application in production.

MRP Wizard
Order recommendation: overview
Purchase request (Beas)
Production Request
Forecasts

Material Requirements Planning (MRP) enables you to plan material requirements for a manufacturing or procurement process. The requirement is calculated and it results from customer orders, work orders and forecasts.
MRP calculates gross requirements at the lowest BoM levels by carrying down net parent demands through the BoM structure. Dependent levels might have their own requirements, based on sales orders and forecasts. Planned receipts from production, scheduling and reservations are taken into account.
The results of the MRP run are recommendations that fulfill gross requirements by taking into consideration the existing inventory levels and existing Purchase Orders and Production Orders. The MRP run also takes into account defined planning rules for Multiple Order and Minimum Order Quantity.
MRP2: Beas provides the possibility, to calculate both, material requirement and resource utilization for a scenario.

MRP is a stock planning tool.
For order-related planning, use function Sales order to Production Order.
For complex scheduling you may use the MRP Wizard.

The MRP Process:

- The Scheduling process

1. **Create** an MRP scenario and customize all settings for scheduling.
2. **Calculation** Calculation methods are explained in separate chapters:

© 2026 Boyum IT Solutions A/S

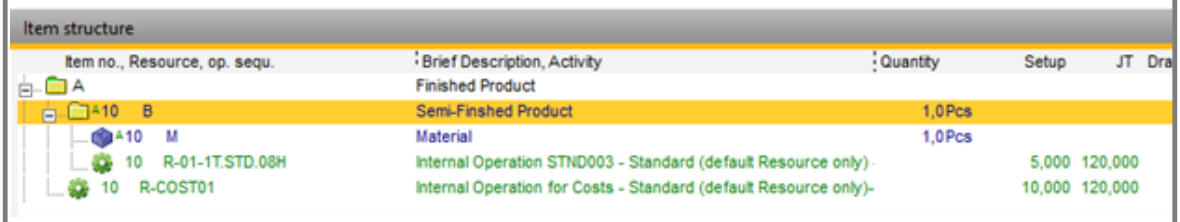
Calculation of order proposal date Calculation of material: Requirement coverage calculation For extensive planning you can schedule an automated calculation.
3. **Result** of the calculation: Order Recommendation.
4. From the order requirement, Purchase requests are created.

- MRP coverage calculation

The requirement coverage calculation checks which components are required for a sales order:

MRP always breaks down the assembly requirements (e.g. from customer orders). If the sub-requirement (BoM of an assembly) is again an assembly, the system first checks whether this can be covered by stock or by planned inflow. If not, this is broken down further. For this, the planned inflow is temporarily assigned to the planned outflow during calculation.

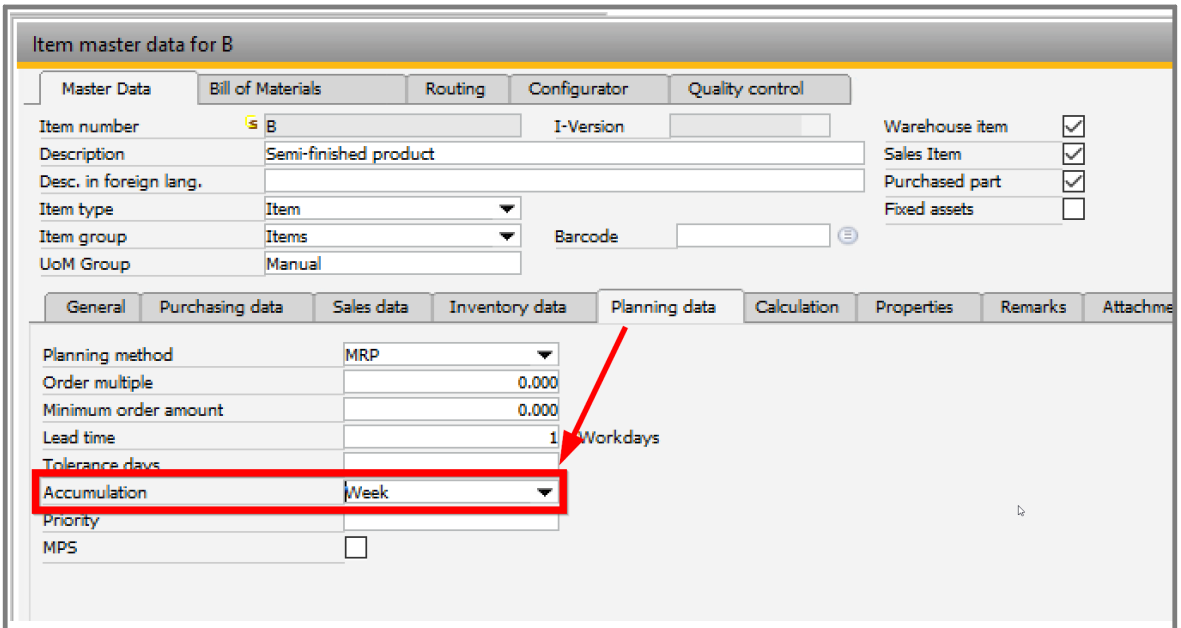
Example:
Sales order with Finished Product “A”
This product needs Semi-Finished Product “B” and “B” needs Material “M”



During the calculation of MRP, Beas considers “A” as necessary. As it is order-related, the system does not check stock. You must produce this. “B” is stock-related. The system must produce it only if no stock is available. Beas checks the stock. If available, the system reserves the requirement temporarily for this Sales order.
If no stock is available, the system simulates the production of “B” and creates a requirement for “M”.

Note:
“B” is stock-related. Beas calculates this related to the requirement of the sales order. But it uses it in view of a stock-related item. In the result you can see the Sales order which produced the requirement during calculation, but the result is always stock-related.
For stock-related items it is always better to receive the correct view in MRP. You can do this with the setting “Accumulation” = Day/Week/Month ...

© 2026 Boyum IT Solutions A/S



The reservations calculated during MRP processing are made at a time when it is not yet known which sub-finished goods or materials are actually needed. At the time of MRP calculation, the full balance calculation for each item is not yet known when processing a single document (work order, sales order etc.) Therefore, Beas uses the priorities described below for assigning the temporary reservation to different pegging originators.

1. Minimum inventory
   [+] Example: Item “A” stock-related, Stock: 6 Pcs, Minimum 10
   The system simulates a production order from 4 Pcs. This produces a requirement for 4 Pcs for semi-finished product “B”.
   The requirement date for the finished-product (in this case “A”) is always today.

2. Existing production outflow (BoM) of work orders and planned orders
   [+] Order by Delivery Date ascending, Document Number
   Example: Work order existing for Finish Product “A”, 10 Pcs
   This is Bill of Materials position “B”. If no stock is available, the system simulates a production order for semi-finished Product “B” and this produces the requirement for Material “M”.

3. Customer orders, advance invoices, forecasts with setting "like customer order"
   Order by Delivery Date ascending, Document Number

© 2026 Boyum IT Solutions A/S

4. Transfer Requests
   Order by Request Date ascending, Document Number

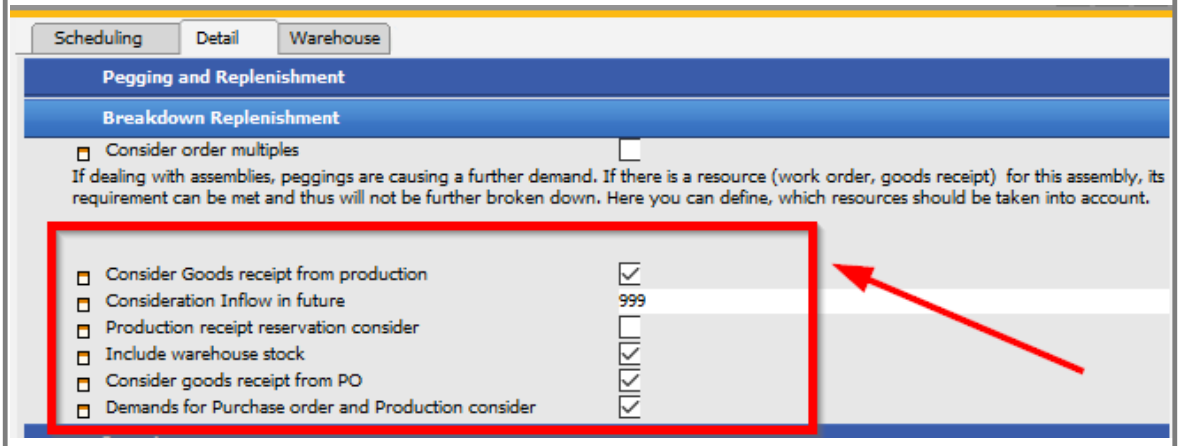
5. Forecasts (Default)
   Order by Plan Date ascending, Document Number

The System calculates all Minimum-Inventory requests first, then the Production order and so on. The system does not sort all requirements in one date line. The result can be a wrong order or temporal reservation for stock-related semi-finished products. But in general, this is not a problem, because it is a stock related item.

The system does not only consider stock. The following inflow is considered in order:

1. Remains from order multiples
2. Inventory
3. Production receipts, ascending by date of receipt
4. Purchase receipts, purchase and production requests, ascending by date of receipt

This behavior can be controlled with the respective options of an MRP calculation scenario:



The reservation criteria above are used by Beas in “real time” during the MRP calculation and should not be confused with a the fixed reservation that a user can do by linking stock quantities to a sales order line or the lines of a Work order BoM.

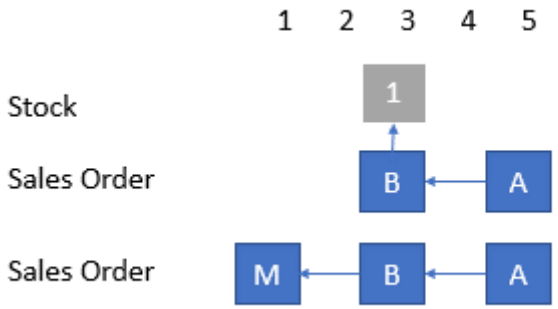
The temporary reservation determines whether sub-assemblies are broken down any further. In case of working with fixed reservations, the reserved material is always firmly linked to a pegging, and it may not be assigned to another pegging.

© 2026 Boyum IT Solutions A/S

Example: Item "A" has stock-related sub-assembly "B" with Material "M".
There are 2 sales orders for the same item "A", same quantity with the same delivery date and we currently have only 1 Pc in stock for assembly "B".

In this case, the first Sales (lowest Doc Number in SAP) order creates a requirement for "B" and the system covers this temporarily with stock.

For the second sales order, no stock for "B" is available, and the system checks which material you need in order to produce "B". In this case, it creates a requirement for Material "M".



Final balance result of the MRP calculation:

Saldo Item A: -2
Saldo Item B: -1
Saldo Item M: -1

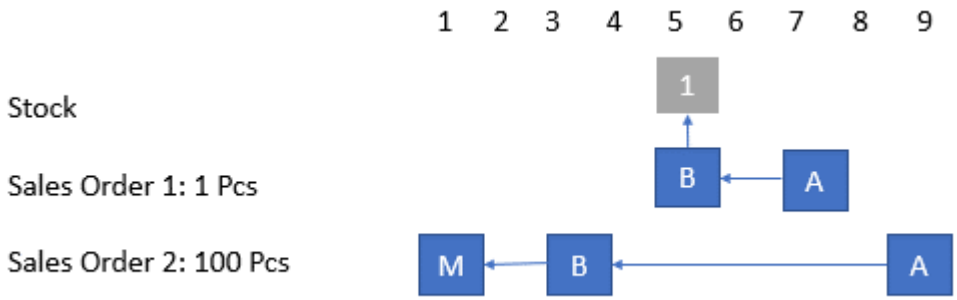
Here are some issues that might arise in reading the MRP calculation results in relation with the time-line of a stock-related sub-assembly:

Sales order 1: 1 Pcs, Delivery Date: 7th
Sales order 2: 100 Pcs, Delivery Date: 9th (later)
This produces different durations for the requirement of sub-assembly "B", because you need more time for the production of Sales order "2".

© 2026 Boyum IT Solutions A/S

The system calculates Sales order 1 and covers the stock for stock-related assembly "B".

Then, the system calculates Sales order 2 and no stock is available. The system simulates the production for “B” and creates the Material requirement for Sales order 2.



In the Saldo List for “B” you can see:

stock related item "B"	Date	Issue	Balance
Sales order 2	3th	100	-99
Sales order 1	5th	1	-100

and for the Material:

stock related item "M"	Date	Issue	Balance
Sales order 1	1th	100	-100

This means: when reading the MRP calculation results, you might see the requirements of an item at a lower level of a product structure in a different order than at the calculation time.

Note: If you use precalculation inside a sales order, the production time is always 0. This is because Beas does not support the calculation of the production time of a product structure in a calculation linked to a sales order line.

Example Sales order with Calculation:
Sales order 1 with Item “A” with calculation, 100 Pcs, Delivery Date: 10th March
Sales order 2 with Item “A” without calculation, 100 Pcs, Deliver date: 9th March
This produces a requirement for item “B”:
Sales order 1: 10th March (no calculated production time)
Sales order 2: 5th March
In MRP, first you can see Sales order 2 (sorted by requirement date), but the system calculates

© 2026 Boyum IT Solutions A/S

Sales order 1 first , and uses the existing stock for “B” for this sales order.
Note: Item “B” is stock-related. If you try to see order-related result for stock-related items, the system cannot deliver this.

Note:

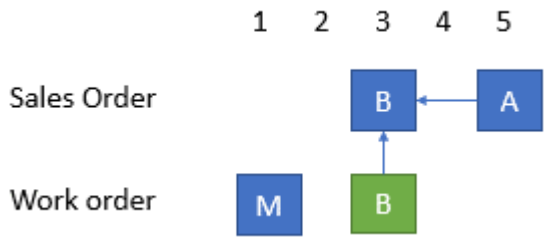
All production receipts are taken into consideration, regardless of the warehouse they are posted to. Warehouse settings defined in “MRP calculation scenarios – Warehouse” are **not** considered here.

The temporary reservation calculated by MRP can be displayed after the computation in **Order recommendation report > Origin**.

In this list, all temporary links are displayed in a structure view. See origin of requirement structure.

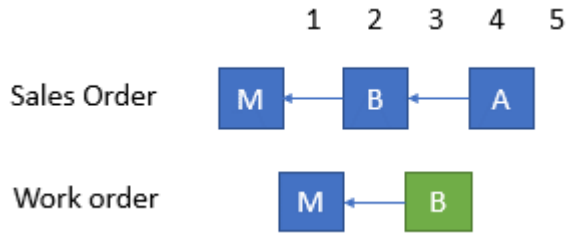
Consider inflow in future

If the date of delivery would be taken into consideration, the following problem could occur:
Assembly “A” contains assembly “B” with material M1.
Sales Order: assembly “A” on May 5th
Requirement of assembly “B” on May 3rd and material M1 on May 1st.
Work order is created for May 3rd, material is ordered for May 1st.
All requirements are covered.



The customer asks for a delivery one day earlier, on May 4th:
If the requirement coverage calculation would take into account the delivery date, the work order would no longer cover the requirement.
In effect, assembly “B” would be broken down, although the balance is 0. From the work order and the sales order a requirement would arise for material M1, and thus it would be ordered twice.
To prevent this, the delivery date is not considered.

© 2026 Boyum IT Solutions A/S



The delivery date is taken into account, but it may be in the future. This is set up in **Configuration wizard > Detail > Breakdown replenishment > "Consideration of future receipt"**.
The delivery date is not taken into account - except for point 1 - since otherwise there would be a risk that the sub-material is dispatched twice. For this reason, **Configuration wizard > Detail > Breakdown replenishment > "Consideration of future receipt"** parameter is set to 99 days.

If "Consider inflow in future" is activated, the system covers the work order, which is 1 day in the future and you need in the example the Material "M" only e.

Filter *Only shortage*
This filter shows all items that need to be ordered or produced, or for which the planned inflow is too late.
In this case, assembly "B" would be shown as shortage, as the balance for 4th May is negative.
The inflow to be used can be specified in **MRP wizard > Detail > Breakdown of resources**.

Sales order: Hard stock reservation

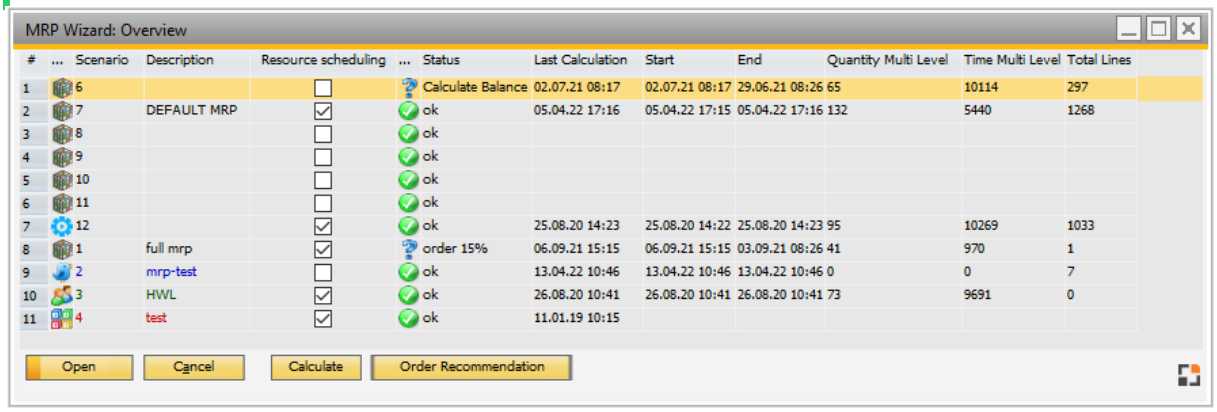
9.1 MRP Wizard

The MRP Wizard helps you plan required quantities for complex manufacturing processes, to define new planning scenarios and to analyze the MRP results. In order that the product is manufactured by the desired time and in the required quantity, the MRP Wizard creates recommendations for the purchase and production.

© 2026 Boyum IT Solutions A/S

When opening the MRP Wizard all created scenarios are shown in a list.

PATH: MRP > MRP Wizard.



Window mrp_browse.psr

Window settings are supported.

To edit a scenario you need the MRP wizard authorization and editing rights stored in the scheduling.

The result of the calculation can be seen in this window or, with lower authorization, in the Order recommendation – overview.

List

Field	Description
Icon	Status of the current scenario: • Green (OK) = Ready • Blue (Question mark) = in work • Red (Stop) = an error occurred during the computation
Scenario	ID of the plan For better overview, the display order can be changed by clicking and dragging a a line.
Description	Long description of the plan.
Last calculation	The date of the last calculation run.
Calculate automatically	The MRP is calculated automatically by the server at activation. For further information ***see*** Automatic calculation.
Status	The current status. In case a calculation is being carried out on another station, the order recommendations cannot be displayed as long as the plan is not in "OK" status.
Calculate resources	Indicates whether resource scheduling (MRP2) was activated. ⊟ The function opens the "Resources Calculate" window

Field Descriptions

© 2026 Boyum IT Solutions A/S

Field	Description
Scenario	ID of the plan.
Description	Long description of the plan.
Forecast	Includes a SAP Business One forecast in the MRP run. More than one forecast can be added to this scenario. A new screen is displayed when forecast is selected. NOTE: Past forecast are always ignored by the system. Only the forecast for the current month and for the future are taken in consideration. ***See*** Configuration wizard - Forecast Forecast (SAP) Planning scenarios - Detail - Forecast MPS
MPS	Select from one or more forecasts in which MPS planning is provided. What is MPS: **M**aster **P**roduction **S**cheduling is a rough production planning procedure and is used in Material Requirements Planning to develop a detailed production plan. The Master Production Schedule is compiled by a Master Scheduler and takes into account the requirements of the various departments, including sales (delivery times), finance (minimizing inventory) and manufacturing (minimizing set-up times). The program plans the production periods and the purchase of materials taking into account the capacities and resources available to the production system. Beas supports special forecasts, which are treated differently than usual forecasts. These can be used to integrate MPS features. MPS scheduling can be realized in Excel or other programs and then imported by DTW into SAP Business One. As an alternative, you can

© 2026 Boyum IT Solutions A/S

Field	Description
	use the forecast management of SAP Business One. Enter MPS-forecasts into the MRP-scenario under "MPS". For the requirement calculation of MPS-planned items, **outflows**, forecasts and SCM orders are ignored, and planned outflow from the MPS scheduling is used instead. MPS only takes place if the respective item was marked as an MPS item. This is indicated in item master (Beas) **> Master data > Planning Data > "MPS"** Resulting entries are marked with MPS. **Special forecasts** Special forecasts are entered in the MRP scenario under MPS. As opposed to MPS scheduling, the respective items are not marked as MPS items. All planned issues are ignored and not consumed. The peggings therein are marked with the *special forecast* term. Note: Planned inflow and outflow of work orders and purchase orders are not affected. Note: MPS is calculated only if **Details > Pegging > Sales > Sales order** is activated. The Summary field refers only to usual forecasts, not to MPS forecasts. Summary	The forecasts can be summarized by month, regardless of their definition. If possible, work with Summary. This reduces Data and increases performance. The Summary field refers only to forecasts, not MPS. 
© 2026 Boyum IT Solutions A/S

Field	Description
Order recommendation by	Display order recommendations by period (selection). Set a time period to display order recommendations for: • Week • 2 Weeks • Month • manually You can see this in the MRP: PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button  *Window mrp_browse.psr* The number of displayed columns are dynamic and depend on the total time period of the calculation, and the defined length for each period. The minimum is 2 columns, maximum is 18. The columns display the start- and end dates in a tool tip when moving the mouse to the column header. For more information on "Order recommendation – time areas" ***See*** Order recommendation report. You can define the area manually by choosing the "Manually" option. PATH: MRP > MRP Wizard > Select a scenario and click the **Open** button

© 2026 Boyum IT Solutions A/S

Field	Description
	 *Window mrp_edit_per.psr* By selecting manually the following can be specified: **Period based on:** This defines if the values for the time period represent days, weeks, or months. **Period length:** Field used to specify the length of the period. The value entered represents the length of each period. In the example above each period lasts 7 days. <u>Special periods:</u> 1. The **first period** is calculated from 1900/1/1 until the end of the first period. The end of the first period depends on "period based on" and is for - days: the number of days defined in the first period. The actual day is day one for the period - weeks: last day of week for the first period, based on today. the actual week is week 1. - month: last day of month for the first period, based on today. the actual month is month 1. 2. The **last period**: starts one day after the end of the second to last period. The end is set to the far future(2050/12/31) **Title**: Field used to indicate what is to be displayed in order recommendation report. Placeholders are allowed. The following

© 2026 Boyum IT Solutions A/S

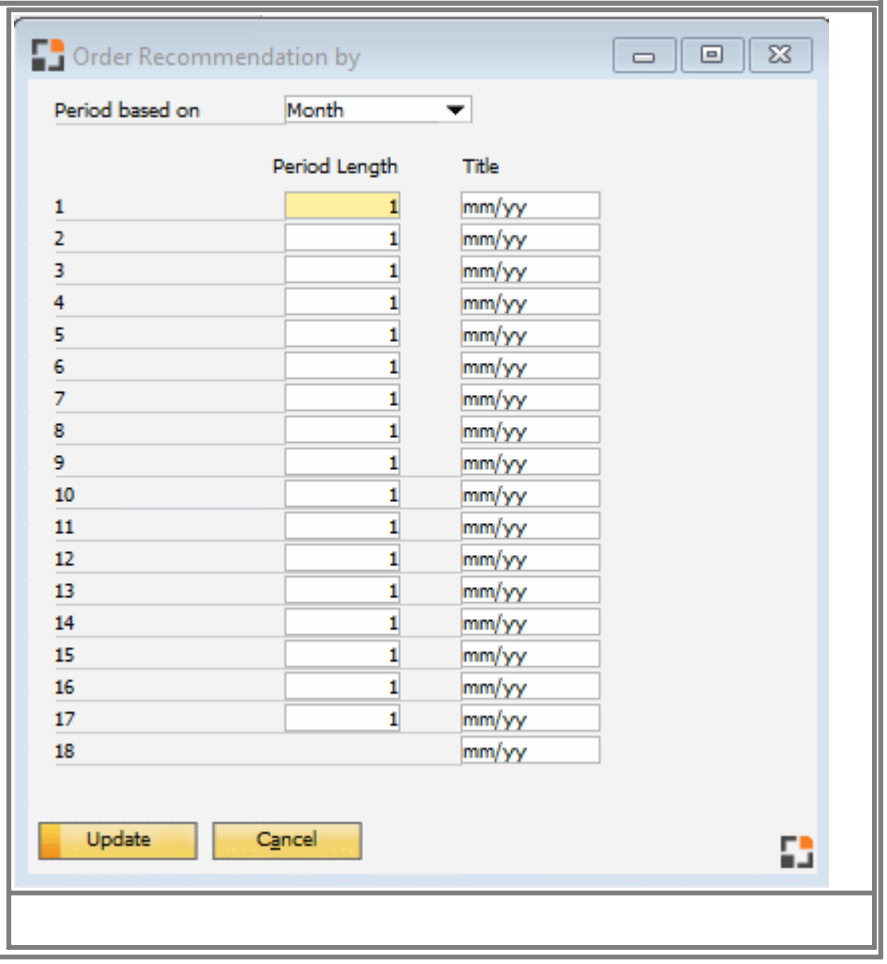
Field	Description
	letters represent: YY, year 2 digits; MM, month 2 digits; DD, day 2 digits; and, CC, calendar week 2 digits. For example, YY/CC 21/05 for calendar week 5 in year 2021 Note: upper case (YY) and lower case (yy) works similarly.

Character	Description
YY	Year 2 digits
YYYY	Year 4 digits
MM	Month 2 digits
DD	Day 2 digits
CC (also: ww)	Calendar week 2 digits

With the manual definition you have also the possibility to influence the count of periods that are displayed.
For example, if you want to show only 5 periods, regardless of the fact that the system has determined a higher number of time periods, you can just leave the period length and title for period 6 to 18 empty.

- if you insert value <=0, then the system deletes the entry
- if you delete the entry or insert <=0, the system deletes the entry too
- if you insert new value > 0, the system inserts standard title related to the period base setting
- not possible to insert value if value in line before <= 0
- if you delete an entry or insert <= 0, the system deletes the values from the current line and all lines after this

© 2026 Boyum IT Solutions A/S

Field	Description
	


In the order recommendation report items are displayed according to filter settings.

Field	Description
Delivery Date	Set the date limit to take into account orders and forecasts. From the drop-down you can select whether calculations should be based on a fixed delivery date or work days. Work days are defined as default.
Or. Workdays	Set the date limit to take into account orders and forecast This is used when the scenario has been created for multiple executions. This makes the date dynamic, for example the next 60 working days from the current date. **IMPORTANT**: If a main demand is not considered due to the date, the requisites dependent on it are not calculated even if the lead time,

© 2026 Boyum IT Solutions A/S

	the order date, or the need date of these requisites fall within the period of calculation.
Work order	Display only the item needed for the selected work order. ***See*** Containment for Display
Branch	Branch used of this scenario This automatically marks the correct warehouses in the "Warehouse" tab. If you choose a Branch, you can only see the Warehouses for this Branch in the "Warehouse" tab. ***See*** Tab Warehouse Detail – Inventory – Warehouse filter for transactions Requirement coverage calculation. *beas 9.3 PL 3*

Bottom section: Containment for Display

Limitation (affects only the display of the results)

With filter definition you can specify which items should be stored in the results. All peggings are calculated, because an item outside this definition may cause a requirement within this definition. Items outside the defined area will not be saved.

For large amounts of data, the calculation time can be reduced if the range is limited.

Attention: The MRP cannot display linked information if the linked item is outside the filter area.

Example

Assembly A → Material position with Item B

Sales order with Assembly A

No filter:

MRP checks A and finds B. In the result you can see A and B.

Right-click on planned outflow for B → Origin: MRP displays Sales Order A as source item.

Filter Only Item "B":

© 2026 Boyum IT Solutions A/S

MRP checks A and finds B, but saves only B. In the result you can see only B.
Right-click on planned outflow for B → MRP cannot display the relations because these are not saved.

Alternative:
Calculate all and define the filter in the view itself.

Performance:
If a filter is defined, the calculation can be little faster.

For calculation and view

The filters defined in this area are set for both the calculation and the results displayed in the Order recommendation.
The filter searches all documents related directly or indirectly to the defined items.

Field	Description
Item (from/to)	Narrow the range of items by item number
Item group	Narrow the range of items by item group
Material group	Narrow the range of items by material group
Item property	Narrow the range of items by item properties
Employee	Limit results to personnel
Sales item	Filter the results displayed by sales item. It can be a range of items, or selected sales items. Yes = only items, which are marked as sales items No = only items, which are not marked as sales items All = the ID "sales item" is ignored
Purchased part	Filter the results displayed by purchase part. It can be a range of items, or selected purchase parts. Yes = only items, which are marked as purchase items No = only items, which are not marked as purchase items All = purchase and non purchase items
Filter SQL	Add SQL filter to narrow down the number of items to be calculated. You can enter your SQL filter directly in this input field or edited in an SQL editor via the “SQL icon”.

© 2026 Boyum IT Solutions A/S

Field	Description
	The filter entered is checked immediately to see whether the condition is executable: A green or red dot/flag next to the input field indicates whether the condition is correct. A condition can also be deactivated by placing it in a comment /* */. NOTE: Sub-queries to link to other tables can be added but the filter is based on the OITM table.
Only with Pegging	If active, only items that have a pegging or a planned receipt are displayed. Default: disabled. All items according to settings are displayed in MRP. **Note**: If there are too many items in the database, it is recommended to disable this option. Otherwise the computation may take very long.
Display 0-Demand	When this check box is active, items without any material demands are also displayed in the list. With the help of this flag you can get a clear overview of e.g. which Sales order materials that have been completely covered by a Work order etc.
Image	Select an icon (image) to represent the scenario in the MRP Overview list.
Color	Define a color for the list view.

Server

Field	Description
Execute in	Select how to execute the calculation: **Setting** / **Description** Background: When starting the calculation, a separate task for the calculation is opened. While the calculation is running, it is possible to work with Beas, and the MRP Browser shows the status of the calculation. **Note:** Background execution does not support "Windows authentication" login mode. Use standard login to Beas for background operations.

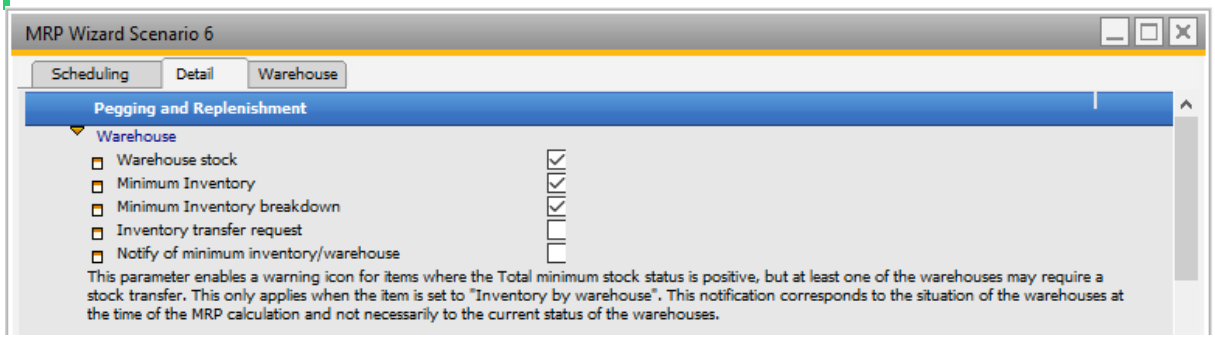
9.1.1.2.1.1 Warehouse (Pegging setting)

Detailed MRP scenario settings related to warehouse and inventory.

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.



Window system_ option_ struktur.psr

Field	Description
Warehouse stock	Enable Beas to take into account the inventory of the items in the MRP.
Minimum Inventory	⊟ Minimum stock is taken into account Enables Beas to take into account the minimum inventory that is defined in the item master data, in the MRP. The minimum stock request is always be shown as pegging, even if it causes no requirement. Only the actually occurring requirement is displayed in the "Outflow" field. ***Example: No underlining*** Warehouse 100 Minimum stock: 50 Info = "Min: 50" Outflow = 0 Balance = 50 ***Example: Partial underlining*** Warehouse 100 Minimum stock: 150

© 2026 Boyum IT Solutions A/S

	Info = "Min: 150" Outflow = 50 Balance = -50 For further information ***see*** "Breakdown minimum stock" **Note**: If the requirements are in the past, they are put into the present after minimum stock examination has been carried out. ***See*** Order Recommendation Note for beas 9.1 PL: 07 and older In older versions the minimum stock was only shown as the pegging, if this causes a direct requirement, so it is bigger than the considered warehouse stock. Calculation for the minimum stock There are some dependencies to determine the minimum stock: **Stock management by item:** If the minimum stock is bigger than the required stock, the minimum stock is always be used as the reference size, otherwise the required stock is used. The minimum stock is determined in warehouse units, the required stock is determined in purchase units ("OITM"."ReorderQTy" * "OITM"."NumInBuy"). **Stock management by warehouse** The sum of all minimum stock of all warehouses that are included in the calculation are considered.
Minimum inventory breakdown	Defines if the minimum stock must be broken down. Enable Beas to break down the minimum inventory requirements. There is only a breakdown if the warehouse inventory is smaller than the minimum inventory. Only the missing share is broken down.

© 2026 Boyum IT Solutions A/S

	If this option is activated, the minimum stock requirements are broken down. A storage related assembly is broken down into its components. In this case the requirements always date from the past. **Attention:** This function works only for storage-related items, not for order-related assemblies. ***See*** item master data **Example:** the warehouse inventory is 100 Pcs and the minimum inventory is 150. The program assumes that the missing 50 Pcs must be produced to fulfill the minimum inventory. In case the minimum inventory is underrun, the scrap quantity is not considered. It will be taken into account at breakdown. **Example:** the warehouse inventory is 100 Pcs, the minimum inventory is 101 and scrap quantity is 10 Pcs. A negative balance of 101 results, and a further breakdown occurs with 111. If a work order is created from this, it has a quantity of 101 + 10 from scrap. For items managed by batches, if the option locked batches are Disposable in the section Inventory from the Details tab is deactivated, only released (non-blocked) batches are used as a warehouse reference. **Example:** the warehouse inventory is 70 Pcs, the minimum inventory is 100 and the locked batch quantity is 10 Pcs. A negative balance of 40 arises.
Inventory transfer request	Enables Beas to manage inventory transfer request through MRP Each inventory transfer request generates 2 entries in the MRP; the first one is similar to a sales order in the source warehouse and the second entry is like a purchase order for the target warehouse. If this setting is activated, the system checks the transfer request document.
Notify of minimum inventory / warehouse	Activate this parameter to enable a warning icon for items The warning icon works only if - Item is set to "Inventory by warehouse" - MRP setting "Notify of minimum inventory" is activated

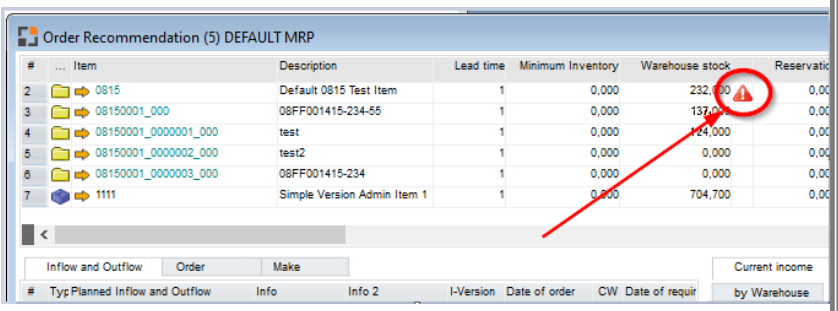
© 2026 Boyum IT Solutions A/S

- Warehouse Stock > Minimum Inventory

What the system checks

Activate this parameter to enable a warning icon for items where the Total minimum inventory status is positive, but at least one of the warehouses may require a stock transfer (Warehouse minimum inventory status is negative).

This notification corresponds to the situation of the warehouses at the time of MRP calculation and not necessarily to the current status of the warehouses.



Example:

Warehouse 01: Min. Inventory = 100, Current Inventory = 0

Warehouse 02: Min. Inventory = 0, Current Inventory = 200

Warehouse 03: Min. Inventory = 500, Current Inventory = 0

Total Min. Inventory = 600, Total Inventory = 200

In this case Balance is > 0,

The inventory in one warehouse is not enough to cover the Minimum Inventory of this warehouse and the Total Min. Inventory > Total Inventory

- the system shows the requirement and the actual item must be checked.

- the system displays no alert.

Example:

Warehouse 01: Min. Inventory = 100, Current Stock = 0

Warehouse 02: Min. Inventory = 0, Current Stock = 200

Warehouse 03: Min. Inventory = 0, Current Stock = 0

Total Min. Inventory = 100, Total Stock = 200

© 2026 Boyum IT Solutions A/S

	In this case Balance is > 0, but the inventory in one warehouse is not enough to cover the Minimum Inventory of this warehouse and Total Min. Inventory < Total Inventory - the system does not show requirement - the system displays the alert. **I-Versions** When working with I-Versions (Setting "Consider I-Version" is activated), minimum inventory by warehouse is indicated only in the active version. However, inventory information in the by Warehouse tab is not considered per I-Version. This means that it considers the complete inventory of the Item. ***See*** MRP Order recommendation by Warehouse. ***See*** Minimum inventory alert.

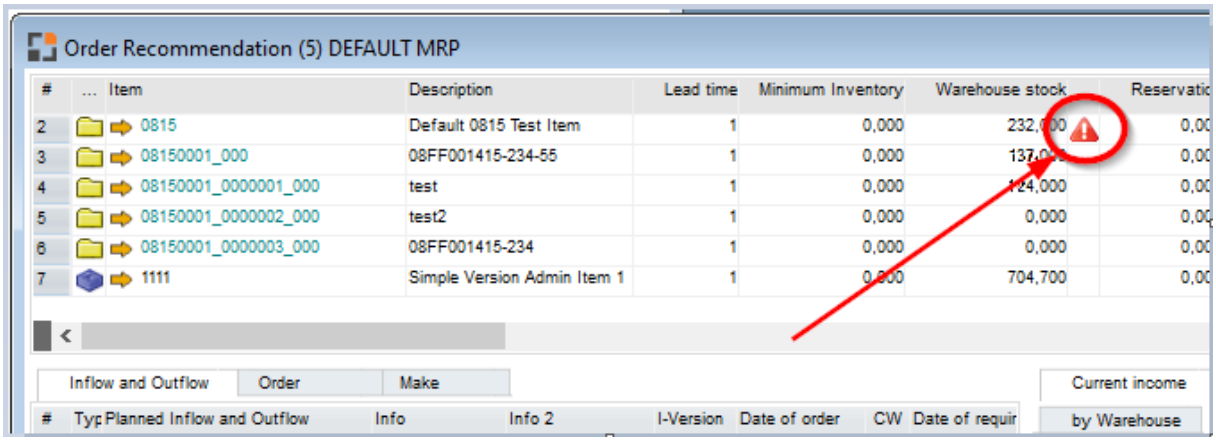
The warning icon works only if
- Item is set to "Inventory by warehouse"
- MRP setting "Notify of minimum inventory" is activated
- Warehouse Stock > Minimum Inventory

What the system checks

Activate this parameter to enable a warning icon for items where the Total minimum inventory status is positive, but at least one of the warehouses may require a stock transfer (Warehouse minimum inventory status is negative).

This notification corresponds to the situation of the warehouses at the time of MRP calculation and not necessarily to the current status of the warehouses.

© 2026 Boyum IT Solutions A/S



Example:

Warehouse 01: Min. Inventory = 100, Current Inventory = 0

Warehouse 02: Min. Inventory = 0, Current Inventory = 200

Warehouse 03: Min. Inventory = 500, Current Inventory = 0

Total Min. Inventory = 600, Total Inventory = 200

In this case Balance is > 0,

The inventory in one warehouse is not enough to cover the Minimum Inventory of this warehouse and the Total Min. Inventory > Total Inventory

- the system shows the requirement and the actual item must be checked.
- the system displays no alert.

Example:

Warehouse 01: Min. Inventory = 100, Current Stock = 0

Warehouse 02: Min. Inventory = 0, Current Stock = 200

Warehouse 03: Min. Inventory = 0, Current Stock = 0

Total Min. Inventory = 100, Total Stock = 200

In this case Balance is > 0, but the inventory in one warehouse is not enough to cover the Minimum Inventory of this warehouse and Total Min. Inventory < Total Inventory

- the system does not show requirement
- the system displays the alert.

I-Versions

When working with I-Versions (Setting "Consider I-Version" is activated), minimum inventory by warehouse is indicated only in the active version.

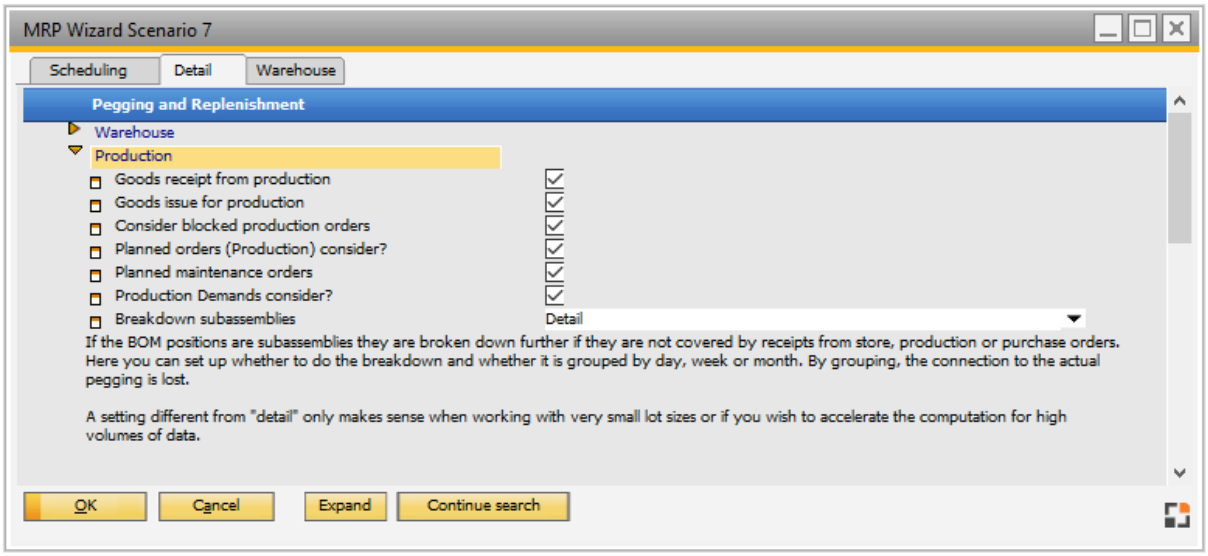
© 2026 Boyum IT Solutions A/S

However, inventory information in the by Warehouse tab is not considered per I-Version. This means that it considers the complete inventory of the Item. ***See*** MRP Order recommendation by Warehouse.

9.1.1.2.1.2 Production (Pegging setting)

Detailed MRP scenario settings related to Production.

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.



Window system_option_struktur.psr

Field	Description
Goods receipt from production	Consideration of planned receipt from production This option refers to balance calculation. If enabled (as default), includes planned goods receipts from production and negative BoM items in the MRP calculation. These are used as “Inflow” when calculating MRP inventory flow. The warehouse stored in the work order or in the negative BoM is used for receipt. If in the Configuration Wizard a receipt warehouse is stored, this is used as reference. This applies only if special warehouses must be considered. ***See*** Planning scenarios – warehouse

© 2026 Boyum IT Solutions A/S

	Plannings scenarios – detail – warehouse filter Configuration wizard – Posting
Goods issue for production	If this option is activated, planned production issues (BoM) are taken into account in the MRP calculation. Negative BoM items are not considered.
Consider blocked production orders	By default the blocked production orders are not taken into consideration in the MRP. Disabled by default.
Consider planned orders (production)	Planned Work orders are taken into consideration in the MRP, even if they are blocked. Enabled by default.
Consider planned maintenance orders	Consider demand from planned maintenance orders If active, MRP considers planned maintenance orders for which no work order has been created yet. For breakdown, the Bill of materials assigned in the maintenance plan are used. At the moment the work order is created for the maintenance order, the maintenance order is no longer considered. The requirement is, then, determined from the work order, but only if the Goods Issue for Production option is enabled.
Production Demands consider?	If this option is enabled, production requests that have been created by order recommendation are considered for the current MRP run. Enabled by default. Note: The system always makes a breakdown from the first level and from all order-related sub levels. Stock-related sub levels: use setting "Breakdown sub-assemblies" defined in sales order area. If you create a production request from a sales order with linked precalculation, the system ignores this in the production demands.
Breakdown subassemblies	How to breakdown sub-assemblies whose requirement is not covered Defines how to breakdown sub-assemblies. If sub-assemblies are not covered by inventory, production, or purchases, these are further broken down. Here, the user can select if pegging is grouped by day, week or month. Creating groups of pegging cut the link to the current pegging. ***Example:***

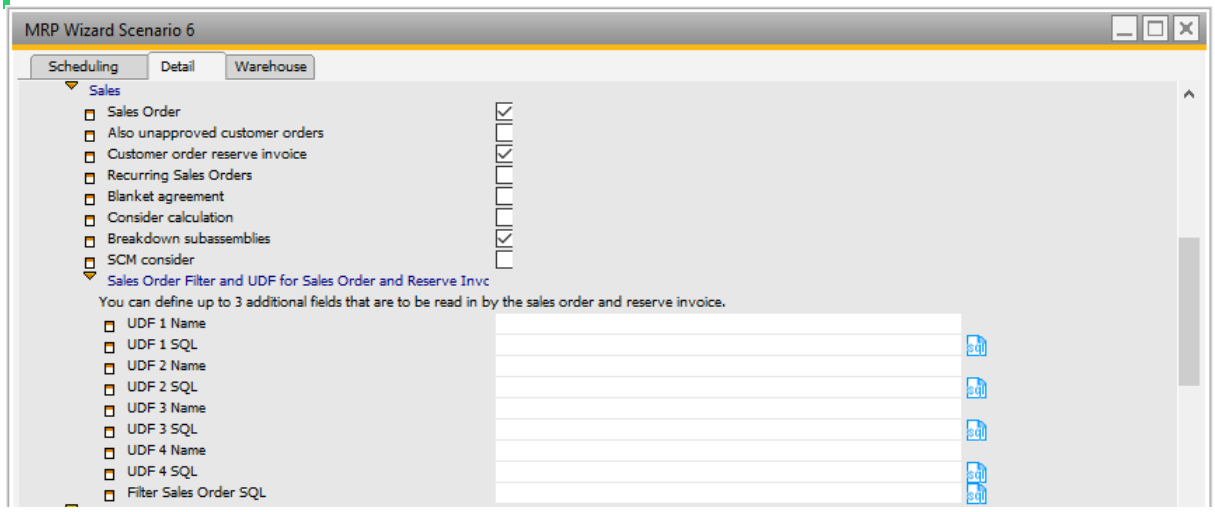
© 2026 Boyum IT Solutions A/S

	There is a work order for item “A” with the following structure: Finished Goods “A” Sub-assembly “B” Purchase Item “C” Beas checks if there is enough inventory for sub-assembly “B” or if there is a scheduled receipt (requirement coverage calculation). If nothing is found, assembly B is broken down, thereby determining the requirement for material C, though there is no production order. Here, material C is firmly linked to the pegging (production order, assembly A). Note: This setting is ignored at production demand consideration, and the system uses the breakdown definition from the Sales area.

9.1.1.2.1.3 Sales (Pegging setting)

Detailed MRP scenario settings related to Sales documents.

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.



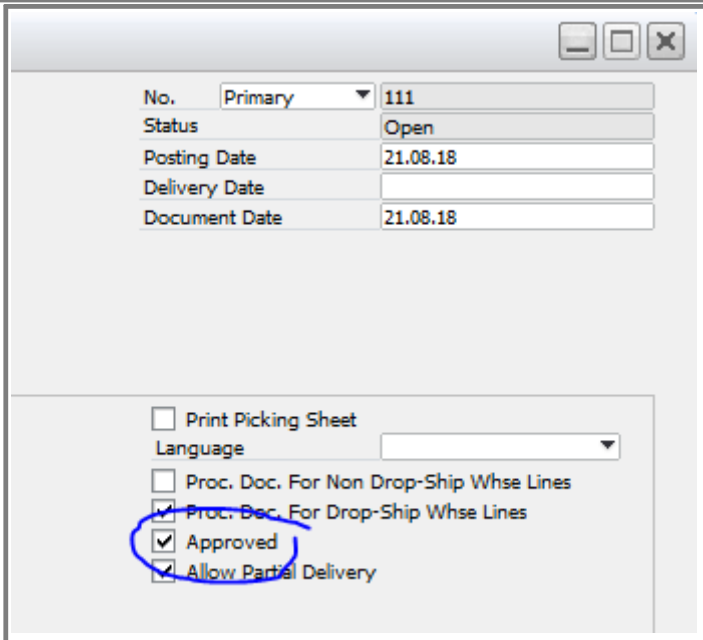
Window system_ option_ struktur.psr

Field	Description
Sales order	⊟ If this option is activated, sales orders are considered in MRP calculations under the following conditions:

© 2026 Boyum IT Solutions A/S

	• Order line has not been closed • Open quantity is greater than zero • **SBO Sales order > "Logistics" tab, "approved" enabled** or "Also unapproved customer orders" are enabled  • It is an assembly or the purchase part is included in item area, defined in „Item“ • Delivery date within the period to be computed • It falls in the Sales Order Filter If you disable this option, the following functions are disabled automatically: Also unapproved customer orders, Customer order reserve invoice, Blanket agreement, Consider calculation. Note: For MPS calculation the Sales order must be calculated too.
Also unapproved customer orders	If enabled, customer orders that are not approved are taken into account In the Sales Order an order can be approved. Beas only loads approved sales orders, unless this option is enabled.

© 2026 Boyum IT Solutions A/S

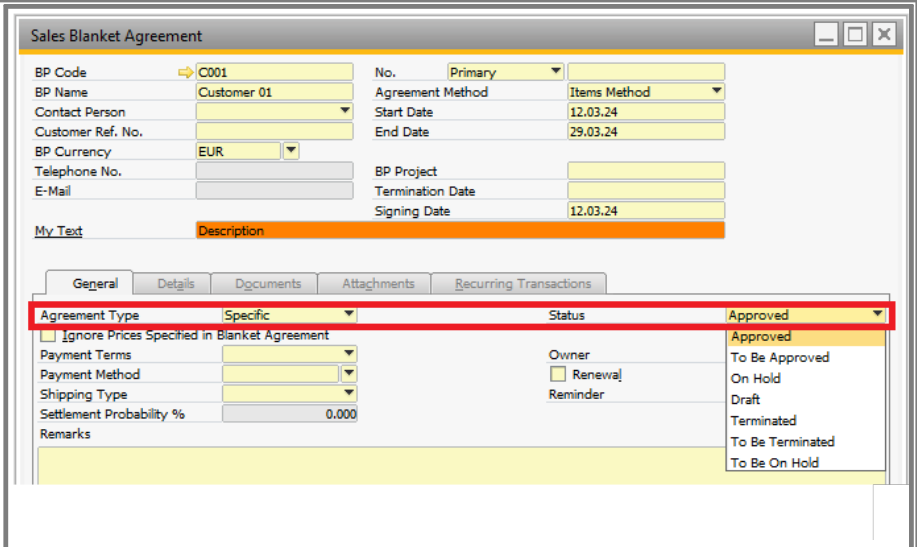


If you need another filter, you can define this in the Sales Order Filter.

(Field ORDR.Confirmed)

Customer order reserve invoice	If this option is activated, customer order reserve invoice are taken into consideration. When this parameter is enabled, the reserve order invoices are included in MRP calculation. If this option is disabled, the sales order for which a customer order reserve invoice was created is no longer considered because SAP closes the sales order. In this case, the requirement originator is now the customer order reserve invoice, not the sales order. In order for this to be included in the MRP as the requirement originator, this option must be enabled. The sequence therefore changes in SAP from **Sales order > Delivery note to sales order > Invoice > Delivery note**. This option is disabled by default.
Blanket agreement	Activate to consider Purchase Blanket Agreements Only Specific and Approved statuses are considered. PATH: Sales > Sales Blanket Agreement.

© 2026 Boyum IT Solutions A/S



If the sum of requirements of a sales order linked to a specific blanket agreement is lower than the quantity in the blanket agreement itself, Beas creates order recommendations for the quantity difference.

Formula to calculate pending quantity of one agreement is as follows:
Agreement Quantity `(OAT1.PlanQty) - (Quantity already sent (OAT1.CumQty) + Quantity Pending` from all open sales orders linked to the Agreement `(SUM (RDR1.OpenQty))`
Sales Order open quantity is affected by SAP parameter "Reopen Doc. by creating returns/Goods return/ Credit notes based on Doc."

Important: In the blanket agreement details, you need to define the date or the recurring period.

Consider calculation

- Considering pre-calculations in calculation.

  If this option is activated, precalculations are taken into consideration.
  If a precalculation is mapped to a customer order item, the material requirement for the customer order is not based on the master data but on the stored pre-calculations.

  Note: Lead time is not calculated. Requirement dates do not take into account any processing times included in the calculation.

- **Breakdown, order/stock-related sub-assemblies**

© 2026 Boyum IT Solutions A/S

- **Storage-related sub-assemblies**: The MRP performs the breakdown based on the information in Item Master data. This is indicated in the Type field of the Order recommendation and marked with the icon / .
- **Order-related sub-assemblies**: The MRP performs the breakdown based on the information in Precalculation. This is indicated in the Type field of the Order recommendation and marked with the icon / .

See more details on Breakdown, order/stock-related sub-assemblies in Activity Log.

Consider SCM

Determine if SCM is considered.

Option visible only, if the View "BEAS_SCM_MRP" exists. This is the case, if the View is installed for example when activating the SCM-solution.

Configuration of the View

Field	Type	Description
itemcode	nvarchar(30)	Item
cardcode	nvarchar(30)	Customer
scm_bo_project	nvarchar(20)	Project code
scm_numatcard	nvarchar(20)	Reference to sales order number or Purchase order number
scm_sal_pur	nvarchar(3)	Sales order (= "sal") or Purchase (="pur") Determines, dealing with a purchase or a sales order.
scm_date	nvarchar(20)	Delivery date. Configuration: yyyy/mm/dd
scm_quantity	decimal(19,8)	Quantity
scm_bo	nvarchar(25)	Sales order number or Purchase order number
scm_bo_pos	nvarchar(10)	Saler order or purchase order row

© 2026 Boyum IT Solutions A/S

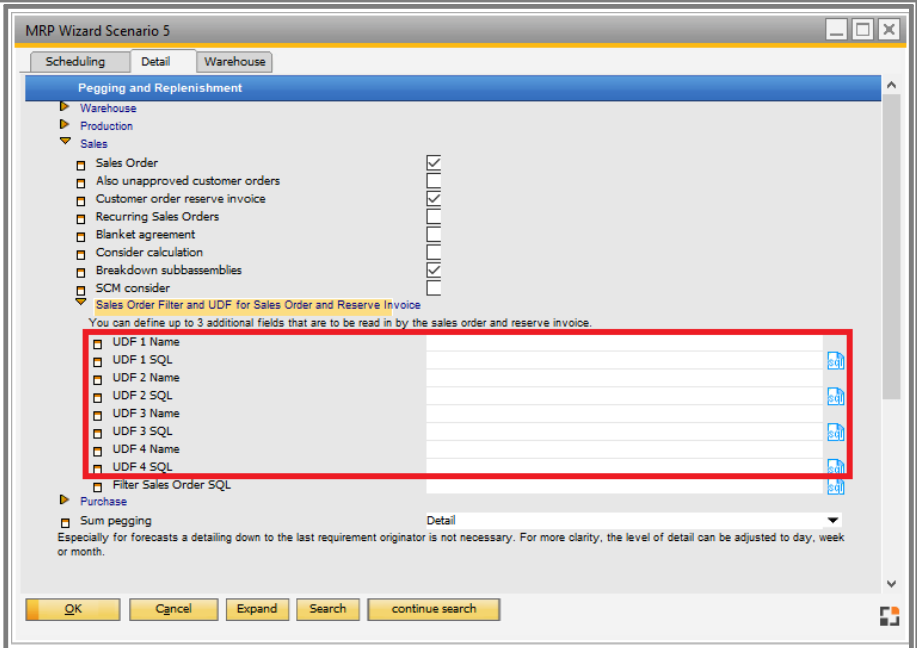
<table>
<tr><td></td><td>
<table>
<tr><td>scm_itemver</td><td>nvarchar(20)</td><td>Item version number.
Following values are considered:
Sale:
<table>
<tr><td>Space</td><td>No version number</td></tr>
<tr><td>NULL</td><td>Version number according to item master</td></tr>
<tr><td><version nr></td><td>Indicated version number (Will not be checked further)</td></tr>
</table>
Purchase:
Indicated item version number. No item version will be applied at NULL/Entry.</td></tr>
</table>
Stored entries are treated as sales orders. For further information please see the SCM documentation.
</td></tr>
<tr><td>Breakdown sub-assemblies</td><td>Determines whether sub-assemblies are broken down.
If this option is activated, sub-assemblies from sales area are broken down. Enabled by default.
Example: There is the following structure for item “A”:
Finished Goods “A”
Assembly “B”
Purchase Item “C”
If the switch is enabled, Beas displays requirement for all three items: “A”, “B” and “C”.
If the switch is disabled, Beas displays requirement only for item “A”. In this case, Assembly “B” is not further broken down. Purchase Item “C” is not displayed as a requirement.

Example of use: Disable the switch if you do not manufacture everything. Disabling this option allows you to decide at the time of scheduling to decide, whether to produce or to purchase.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

	Further information ***See:*** Requirement coverage calculation
Sales Order Filter and UDF for Sales Order and Reserve Invoice	Define up to 4 UDF fields for Sales Order and Reserve Invoice. You can create up to 4 user defined fields, which you can see in the inflow or outflow area. A UDF is a combination of a title and an SQL statement. Beas reads this information and displays this in the UDF field. If the order line is an assembly and a work order does not exist, Beas explodes the order line and inserts the information in all sub-level areas, as well. ***Example***: Assembly "A" has a bill of material position "A1". In the order line you defined a UDF called "Color".  In the Sales Order you can activate this column to be displayed.  In the MRP Wizard > Details tab > Sales > Sales Order Filter and UDF for Sales Order and Reserve Invoice can define up to 4 UDF fields. PATH: MRP > MRP Wizard > Select a scenario > click the **Edit** button > **Detail** tab.

© 2026 Boyum IT Solutions A/S



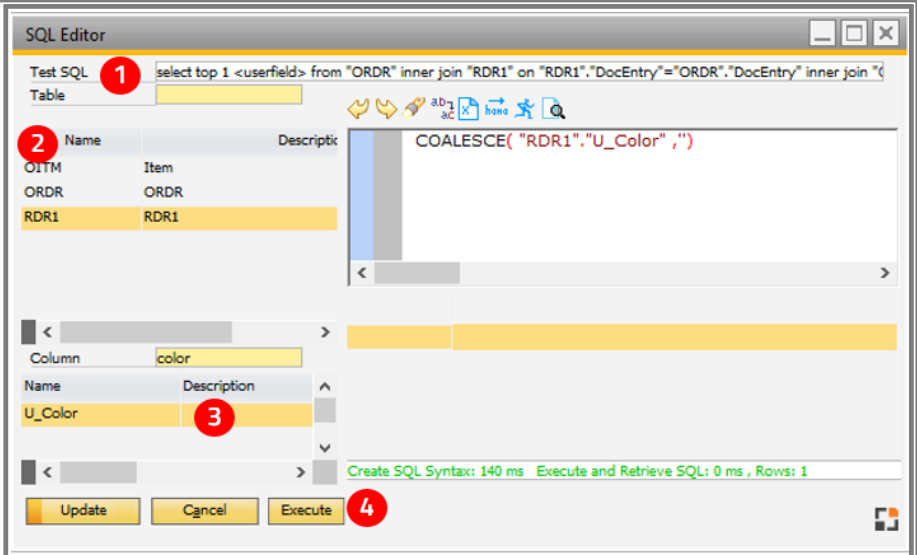
Window system_option_struktur.psr

When you click on the SQL icon, you can define the value of the UDF.

See SQL Editor.

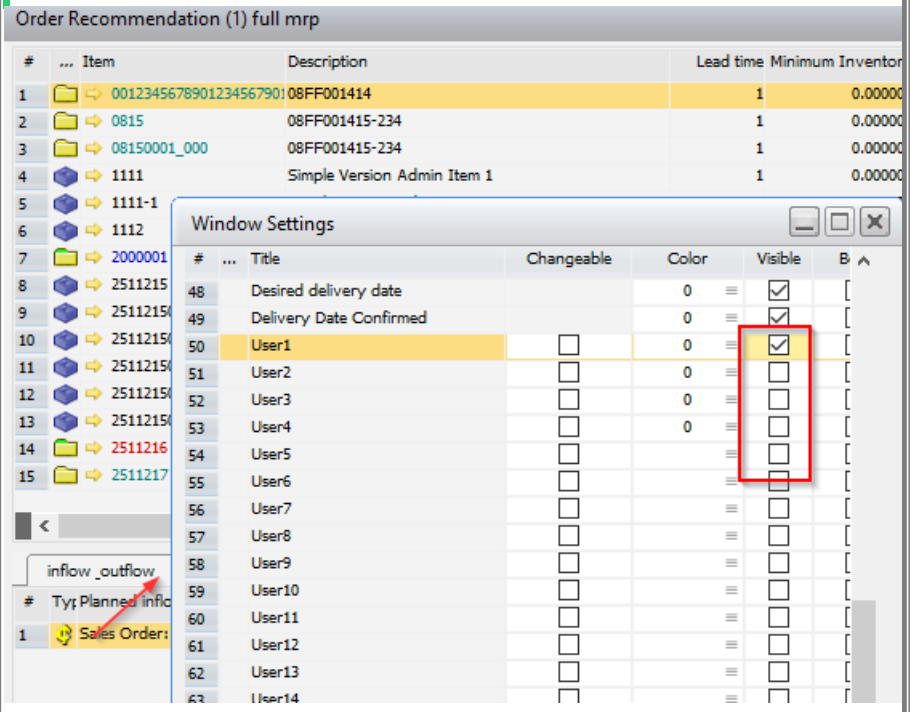
1. You can see a test SQL statement. The SQL that you define is inserted in the "<userfield>" area.
2. All available tables are displayed. In this example: OITM, RDR1 and ORDR. Beas will replace ORDR/RDR1 with OINV/INV1 for reading Invoices.
3. This area shows all fields of the selected table. Double-click on the element to insert into the editor. If this is a column that is a number or date type, Beas inserts the syntax to convert to string. The COALESCE command replace NULL values to an empty string. If you click on an additional column, Beas inserts || to allocate the string (HANA style). If you are working with MSSQL, Beas converts the string at runtime back to the MSSQL syntax.
4. Click the "**Execute**" button to test the command. The correct command is indicated with a message in green font below.

© 2026 Boyum IT Solutions A/S



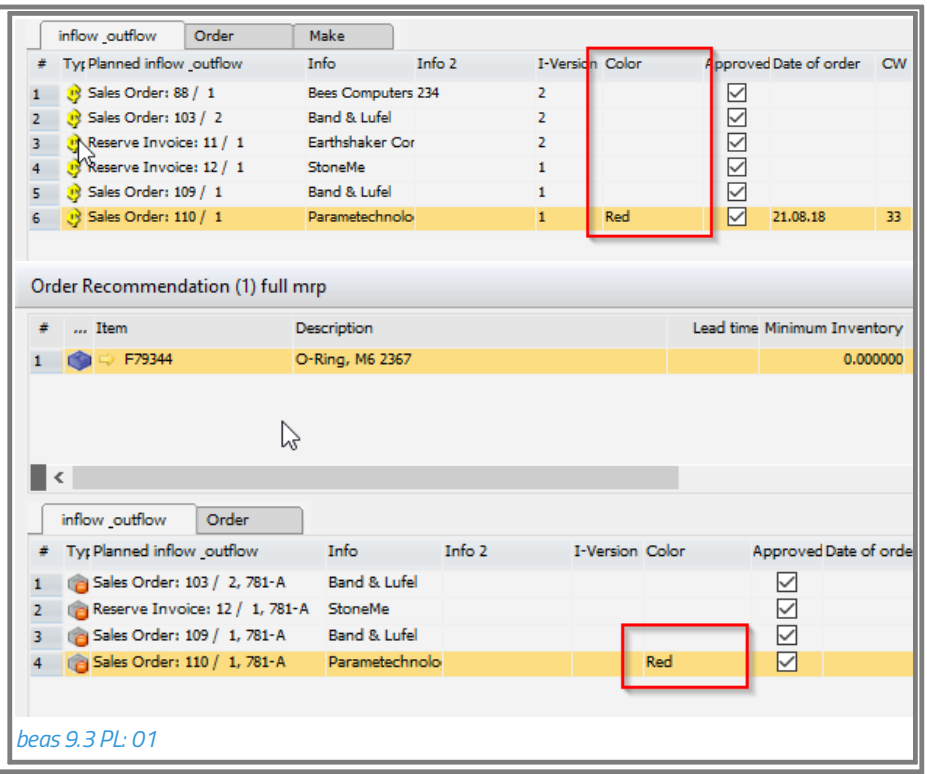
In the Order Recommendation - Inflow/Outflow Area - Window setting you can activate the UDFs to show.

PATH: MRP > MRP Wizard > Select a scenario and click the **Order Recommendation** button > Choose Window settings from the right-click menu.



After recalculating of the MRP, you can see the result (the color in this example) in the assembly and material position and in the Bill of materials.

© 2026 Boyum IT Solutions A/S



beas 9.3 PL: 01

Sales Order Filter

Define which Sales orders are calculated in current MRP Scenario

Additional filters can be defined for the sales order.

Example: Read only sales orders for one project, for one customer, only for one item code.

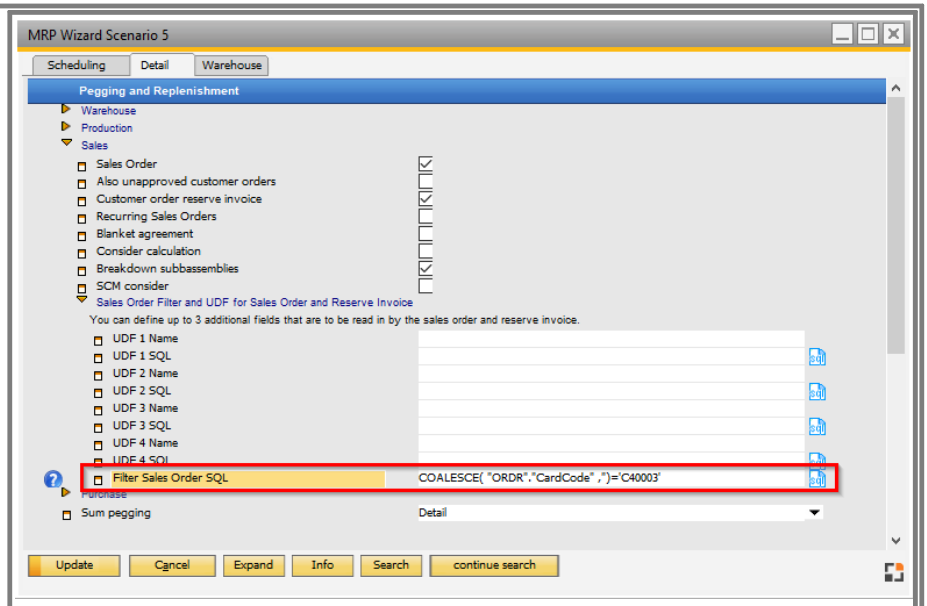
You can define a SQL statement. ***See*** SQL Editor.

The following tables available: ORDR, RDR1 and OITM.

This is working for sales orders only and not for pre-invoices.

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.

© 2026 Boyum IT Solutions A/S



Examples:

Only Items starting with A and C	substring("OITM"."ItemCode",1,1) between 'A' and 'C'
Only Customer with Id C003	"ORDR"."CardCode"='C003'
Only if Line UDF "Color" is red or blue	"RDR1"."U_color" in ('red','blue')

Compatibility information: This replace the Variable mrp.src.of_start Variable "mrp_auftragfreigabe". If you have defined this variable in the file mrp.src: Delete it!

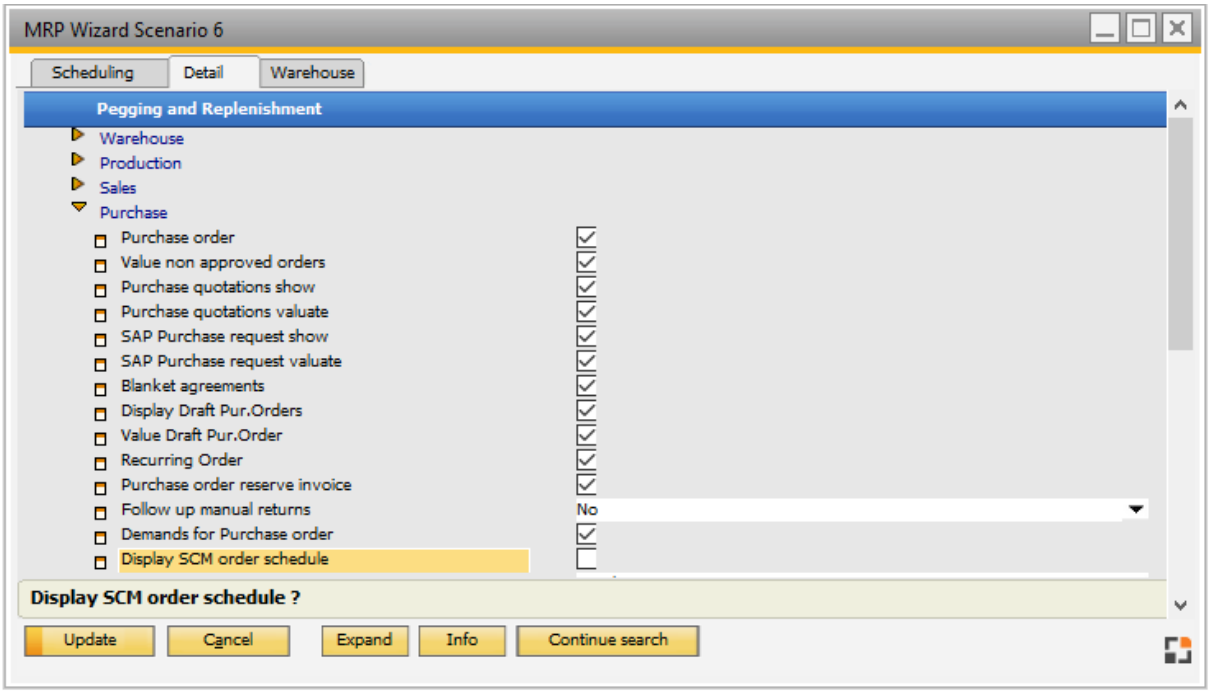
beas 9.3 PL 1

9.1.1.2.1.4 Purchase (Pegging setting)

Detailed MRP scenario settings related to Purchase documents.

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.

© 2026 Boyum IT Solutions A/S



Window system_option_struktur.psr

Field descriptions

Field	Description
Purchase order	If activated, purchase orders are taken into consideration in MRP calculations. This makes consistent balance calculations possible. When disabled, purchase orders are completely ignored.
Value non approved orders	If activated non-approved orders are included in the MRP balance calculation. When disabled, the non-approved purchase orders are completely ignored.
Purchase quotations show	If enabled, purchase quotations are only displayed . Usually, this is not needed, because purchase quotations are also displayed in the window on the right (currently planned receipts).
Purchase quotations valuate	Can only be selected, if the "Purchase quotations show" option is enabled. Activate this option to use purchase quotations in balance calculations. This is used if purchase quotations are used for other purposes, for example for planned receipts.
SAP Purchase request show	If activated, Beas displays the purchase requests created by the SAP Business one purchase request module.
SAP Purchase request valuate	If activated, Beas include purchase request created by SAP the Business one purchase request module in the calculation. Can only be selected, if the *SAP Purchase request show* option is enabled.

© 2026 Boyum IT Solutions A/S

	Attention: A request is not an order document. Please check your desired work flow, before activating the option.
Blanket agreement	Activate to consider Purchase Blanket Agreements Only Specific and Approved statuses are considered. PATH: Purchasing > Purchase Blanket Agreement.  If the sum of requirements of sales order linked to a specific blanket agreement is lower than quantity in the blanket agreement itself, Beas creates order recommendations for the quantity difference. Formula to calculate pending quantity of one agreement is as follows: Agreement Quantity `(OAT1.PlanQty) - (Quantity already sent (OAT1.CumQty) + Quantity Pending` from all open sales orders linked to the Agreement `(SUM (RDR1.OpenQty))` **Important**: In the blanket agreement details, you need to define the date or the recurring period. If you do not define the weekly/monthly creation in the Blanket Agreement, MRP is not going to display the Blanket Agreement in the order recommendation.
Display Draft Pur.Order	If activated, the draft purchase orders are displayed in the MRP run.
Value Draft Pur.Order	Can only be selected, if the "Display Draft Pur.Order" option is enabled. If this option is activated, buffered purchase orders are included in the balance calculation. Use this, if drafted purchase orders are used for planned receipts.

© 2026 Boyum IT Solutions A/S

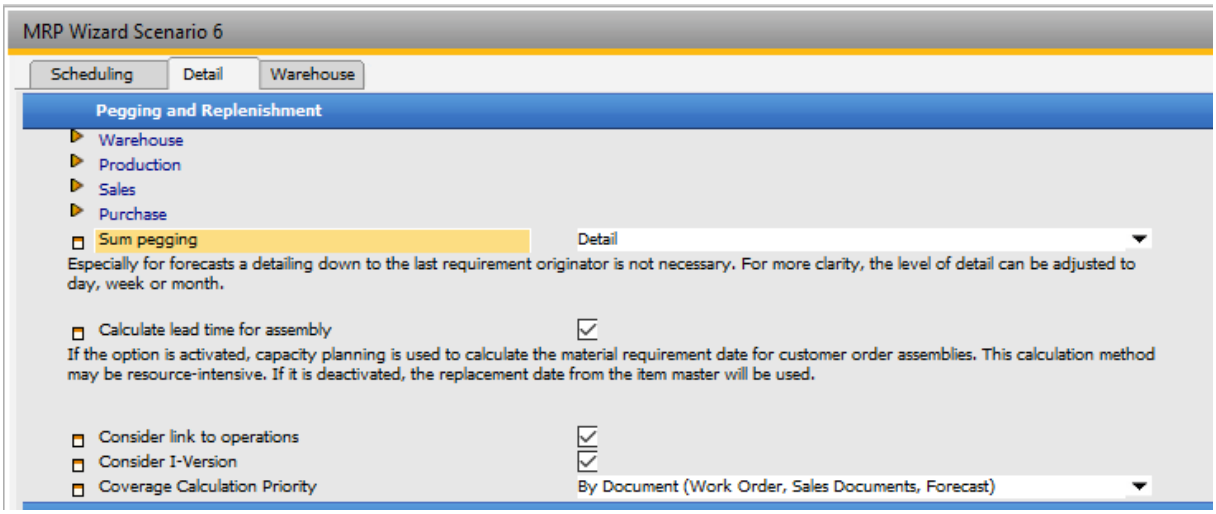
Recurring orders	Enable this option to support the "recurring transactions" SAP Business One function in MRP.
Purchase order reserve invoice	If activated, reserve order invoices are taken into consideration. This option is activated by default. Reserve invoices are displayed in MRP as long as they are not delivered or closed.
Follow up manual returns	If activated, purchasing returns created without a reference to a goods receipt are displayed as a negative or positive inflow (selection). If goods are returned and a replacement delivery is expected without a new purchase order being created, a manual return can be created without a reference to the goods receipt. As soon as the delivery takes place, the return is closed. **Important**: Manual returns are considered in the requirement coverage calculation.
Demands for Purchase Order	If activated, purchase requests from Beas, created from order recommendation are used in the calculation.
Display SCM order schedule	Only available if an SCM Module is installed. If only this option is selected, order schedule is displayed in gray, the calculated balance is not affected. If option is enabled, order schedule is displayed in gray, the calculated balance is not affected. ***See*** consider SCM
Valuate SCM order schedule	Only available if an SCM Module is installed. If this option is enabled, the planning run behaves just like forSAP Business One orders. Balance calculation takes into account the order schedule. ***See*** consider SCM

9.1.1.2.1.5 Computation type (Pegging setting)

Detailed MRP scenario computation settings.

PATH: MRP > MRP Wizard > Select a scenario > click the Open button > Detail tab.

© 2026 Boyum IT Solutions A/S



Window system_option_struktur.psr

Field	Description
Sum peggings	Allows the summary of peggings. Set the summary requirement based on time: day, week, month. This function allows compression of the data and reduction in the calculation effort. ***See*** Calculation time **Detail** All peggings (forecast, order, customer order, etc.) are displayed separately. This setting makes sense if purchases are issued as order-related or it has goods of high value. Purchase order for several instances of the same Item with different delivery dates is supported. The items therefore appear in several lines in Order recommendation. **Day/week/month/sum** The peggings are summarized corresponding to chosen the time period. This is recommended, if no detailed declaration of the pegging or resource is necessary and one has to deal with high amounts of data. The calculation time is shortened, and the view is clearer. This setting can also be defined in the item master data.

© 2026 Boyum IT Solutions A/S

	In Item master this setting can be applied. Higher summary level always has priority. ***See*** Item master - Planning.
Calculate lead time for assembly	When active, lead time is calculated. Resource scheduling (MRP2) is based on lead time calculation. Therefore "**Calculate lead time for assembly**" must be activated if resource scheduling is required. If **enabled**, lead time is calculated using the integrated capacity planning tool based on the defined routing production times. The calculation is carried out by means of backward scheduling simulation. Existing capacities are not taken into account. If a material is assigned to an operation sequence directly, then the start date of the operation sequence is assigned (time: start of processing). Depending on the depth of the production structure and the accuracy of the forecast, the computation can by time consuming. If **disabled** the item lead time and the lead time defined in the Configuration Wizard serves as a reference. The calculation time is significantly shortened. The "Resources - Activate resource planning function is disabled. **Note**: Lead time means production time of the assembly without consideration of sub-assemblies lead times. **ATTENTION:** In case of sub-assemblies, the parameter **only** affects lead time calculation of order-related sub-assemblies used as WO BoM! For storage-related sub-assemblies, the system uses fix lead time defined in Item master data. ***Example - Assembly with order-related sub-assembly:*** Example: Here is the item structure: Assembly A (Lead time = 10 work days) Assembly B (Lead time = 5 work days) The date of finished production A and B is the requirement date

© 2026 Boyum IT Solutions A/S

	Start date A: Requirement date – Lead time A (10 days) Start date B: Start date A – Lead time B (5 days) ***See:*** calculate resources
Consider link to operations	Consider links to routings **Sales documents** If this feature is enabled, calculate the requirement date for sales documents. Links between operation sequence and bill of material are considered. It is enabled by default. If disabled, the links are not considered, which means that the calculated manufacturing start date is always used as the requirement date for the Bill of materials items. By disabling this option, the calculation takes less time. **Production** If this option is enabled, the start date of the operation is used for calculating the requirement date of the Bill of materials items. Otherwise, the start date of the work order position is used. If this option is disabled, the delivery date is used. ***See*** Calculation of order recommendation date
Calculate resources	This gives direct access to the "calculate resources" function. Only visible if "Calculate lead time for assemblies" has been deactivated. This computes e.g. the complete material requirements and complete resource requirement in advance. The necessary resources (material and tools) are calculated based on the the production lot size and stored accumulated. This calculation type is gradually faster than the "Calculate lead time for assemblies" option and it provides a good estimate.
Consider I-version	Group requirements by Item version / ignoring Item version. • Check box **active**: Group requirements by versions (all batches/serials item managed by versions are then split to display

© 2026 Boyum IT Solutions A/S

	the real requirement for each version). • Check box **empty**: Display the the whole item requirement ignoring any version. By default, this parameter is disabled (i.e. not grouping the requirements by version). NOTE: If a batch/serial-managed Item has information in the I-Version field, but there is no existing I-Version, this field is used as information, and the MRP is going to consider this item as a non-version managed item. Therefore, if the flag "Consider I-Version" is enabled in the MRP Scenario, this MRP Scenario is not going to be able to display any requirement for this Item. To see the requirements, you should execute an MRP Scenario with this flag disabled. Non-batch/serial managed items with item version are not supported. If this type of item has item version with separate Bill of Materials, the MRP calculation result will be incorrect. For more information ***see*** DataCheck.
Coverage calculation priority	Select the type and priority of coverage calculation: - **By Documents:** Cover the demand of the coverage calculation by documents. Priority for coverage calculation is defined in requirement coverage calculation. Priority of documents: 1. WO, 2. Sales Documents, 3. Forecast. - **By Date:** Cover the demand of coverage calculation by date. Documents affected for this parameter in coverage calculation: 1. WO, 2. Sales orders and Precalculations, 3. User table, 4. Forecasts. ***See*** Requirement coverage calculation.

© 2026 Boyum IT Solutions A/S

9.1.1.2.2 Breakdown replenishment

Breakdown replenishment

Peggings cause another requirement in the case of assemblies. If there is a resource (work order, goods issue by order, etc.) for this assembly, its requirement can be covered and therefore it is not broken down further. You can configure which resources should be considered. If you activate all possibilities, the net breakdown is performed; if nothing is activated, the gross breakdown is performed.

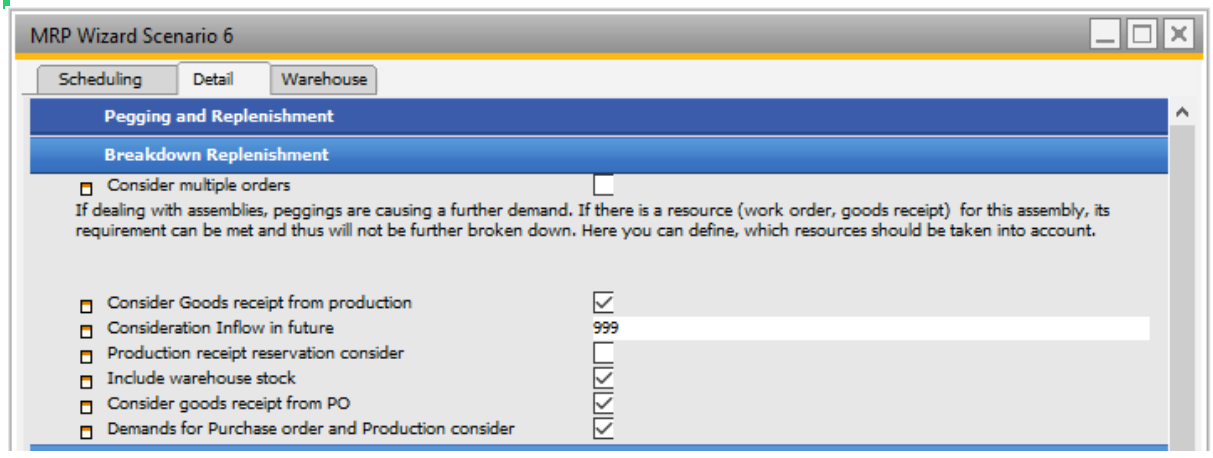
See: Requirement coverage calculation

Example:

For net breakdown:
Order A consists of 100 item B
Inventory in warehouse 50 item B
Each item B consists of 5 item C
Requirement for item B: 100, but balance only 50
Requirement for item C: 250

For gross breakdown:
Order A consists of 100 item B
Inventory in warehouse 50 item B
Each item B consists of 5 item C
Requirement for item B: 100, but balance only 50
Requirement for item C: 500

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.



Window system_option_struktur.psr

© 2026 Boyum IT Solutions A/S

Field	Description
Consider multiple orders	Determines whether multiple orders are to be considered at the breakdown of assemblies. Affects the minimum purchase quantity and the order multiple of an assembly. ***See*** Item master – Planning data Minimum order quantity is always considered. Affects the function requirement coverage calculation only. Only material and the sub-assemblies of the assembly which has multiples orders are affected. If a subsequent requirement originator is covered by the multiple order of the predecessor, the subsequent pegging gets the same order proposal date. ***See*** Example 3. **Note**: Sub-assemblies and material requirement are combined in this case. In the Origin of requirement function the requirement coverage is displayed in a note. ***See*** Requirement coverage calculation ***Example 1:*** Assembly A (order multiple = 50) Assembly B (= BoM of Assembly A, not order-related) Sales order 1 for "Assembly A" 30 pcs Arising requirement: "Assembly A" from sales order 1 = 50 pcs "Assembly B" from sales order 1 = 30 pcs ***Example 2:*** Sales order 1 for "Assembly A" 30 pcs Sales order 2 for "Assembly A" 5 pcs Arising requirement: "Assembly A" from sales order 1 = 30 pcs "Assembly A" from sales order 2 = 5 pcs "Assembly B" **Total** 50 pcs

© 2026 Boyum IT Solutions A/S

"Assembly B" can cover 2 sales orders because of this setting in the parent item.

Example 3: Order proposal date

Assembly A, Minimum order quantity is10, no stock, cycle time is 1 day.

Forecast 7. January: 4 pieces, order proposal: 6. January

Forecast 8. January: 4 pieces, order proposal: 6. January

Forecast 9. January: 4 pieces, order proposal: 8. January

Forecast 7: temporary 10 pieces are produced until January 6th. Forecast 8 is completely covered and Forecast 9 partly. From Forecasts 9, 2 pieces remain. More needs to be produced, accordingly a new date is calculated and displayed.

Note: refers to versions from beas9.1-004-058

Example 4:

With minimum order quantity and without multiple order:

`Assembly A` (Minimum order quantity = 50)

`Assembly B` (= BoM of Assembly A, not order related)

Sales order 1 for "Assembly A" 30 pcs

Sales order 2 for "Assembly A" 5 pcs

Arising requirement:

"Assembly A" from sales order 1 = 30 pcs

"Assembly A" from sales order 2 = 5 pcs

"Assembly B" **Total** 50 pcs

Example 5:

With minimum order quantity and without multiple order:

Sales order 1 for "Assembly A" 30 pcs

Sales order 2 for "Assembly A" 5 pcs

Arising requirement:

"Assembly A" from sales order 1 = 50 pcs

"Assembly A" from sales order 2 = 5 pcs

© 2026 Boyum IT Solutions A/S

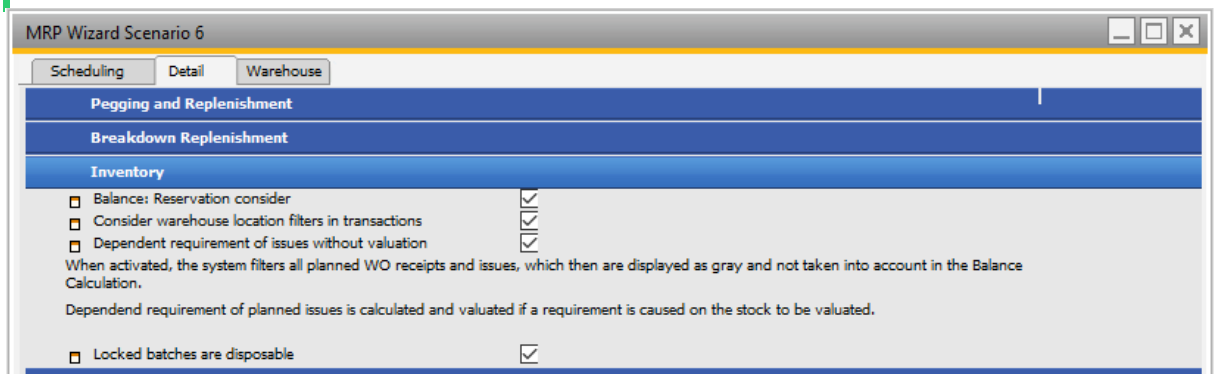
	"Assembly B" from sales order 1= 50 pcs "Assembly B" from sales order 2 = 5 pcs No summary, because Assembly "B" is produced with minimum order quantity of 50 and covers sales order 1. The date is also considered. For additional information, ***see*** Requirement coverage calculation **Attention**: MRP2 - Resource planning: Summarized values are displayed as a forecast. **NOTE:** If there is a lower level item that has requirements from different parent items and these parent items have Multiple orders or minimum order quantity, it is recommended to enable this parameter.
Consider goods receipt from production	Production receipts are taken into account if they are available at the requirement date. ***See*** Requirement coverage calculation.
Consideration of inflow in future	Number of days between the planned outflow and the planned receipt. Default setting is 999, which means that if the planned receipt is within 999 calendar days after the requirement day, it is taken into account. **Important**: This flag only applies to items where "Breakdown" is different from "Order-related" items. Item breakdown. ***See*** Requirement coverage calculation.
Production receipt reservation consider	Only order-related items are affected. Disabled: There is a 1 to 1 link between customer order and work order; reservations are ignored. Enabled: Order assignments are ignored, only receipt reservations are considered.
Include warehouse stock	Inventory is considered for sub-assemblies.
Consider goods receipt from PO	Planned purchase receipts are taken into account, if they are available at the requirement date. Buffered and blocked purchase orders are not considered.
Demands for Purchase order and Production	☐ Consider purchase and production requests. If active, requests for purchase and production are considered. This option is displayed only, if **Pegging and replenishment > Purchase**

© 2026 Boyum IT Solutions A/S

	> Purchase order and **Details > Purchase > Request** are activated.

9.1.1.2.3 Inventory

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.



Window system_option_struktur.psr

Inventory

Field	Description
Balance: Reservations consider	**Disabled:** Reservations are ignored in the calculation. **Enabled:** Reservations are subtracted from stock. From outflow reservations are subtracted, leading to a neutralization of reservations in balance calculation. The balance does not change, the switch determines only the time at which a reservation is subtracted. This only works if the reservation system is enabled. ***See*** Order recommendation view – requirement – balance
Consider warehouse location filters at transactions	☐ Consider warehouse area filters at transactions. In MRP Wizard > Planning scenarios > warehouses you can define warehouses to be included in the calculation. This is used to define consideration for planned inflow and outflow. Enabled: Warehouse tab filter is considered at the calculation. Planned inflow and outflow is grayed out, balance is not affected.

© 2026 Boyum IT Solutions A/S

	Disabled: Warehouse tab filter is not considered at at the calculation. Planned inflow and outflow is always displayed, regardless of the warehouse where the item is stored. ***Parameter enabled example*:** If in a calculation you only want to see documents on transactions, but not the current stock, deselect the warehouse in the Warehouse tab. ***Parameter disabled example*:** Consider parameters only from the master data, like minimum inventory, but not the planned transactions. The balance is affected according to the transaction made (sales order, purchase order, work order). The following is affected by this parameter: • All types of sales documents (sales order, advance invoice etc.) • Production inflow • Production outflow • Purchase documents (PO, quotations etc.) Documents, which do not have a stored warehouse (e.g. blanket agreements) forecasts and SCM-entries are always displayed.
Dependent requirement of issues without valuation	Include planned issues without valuation in the calculation. Displayed if "Consider warehouse location filters at transactions" is enabled. If active, the dependent requirements of non-valued, planned transactions are calculated. Not affected: work orders, because their BoM requirement is already planned.

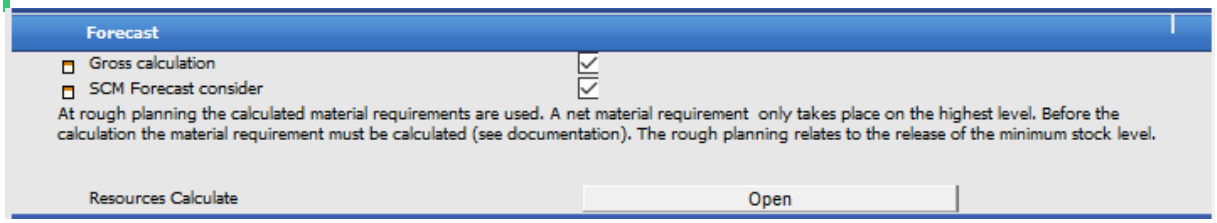
© 2026 Boyum IT Solutions A/S

	***Example*:** Sales order is for a bicycle in the warehouse, which consists of two wheels from warehouse 01. MRP is run for warehouse 01 Warehouse filter for transactions is enabled. If this option is enabled, the requirement of 2 wheels is calculated and valued because the goods are stored in Warehouse 01.
Locked batches are disposable	If this option is activated, blocked batches are valued as available stock at inventory calculation. This option is activated by default.
Filter by WMS Quality Status	Filter MRP results by Produmex WMS Quality Statuses - Only available with WMS databases Select the WMS Quality Status(es) to be considered in viewing MRP calculation results. Unchecked statuses will be ignored, and if the parameter is left empty (that is: no status is selected), all quality statuses will be considered by the filter. After the calculation process is finished, the system displays the available stock in the column "Warehouse Stock", considering the selected quality statuses. The following WMS Quality Statuses are available for filtering: BLOCKED, QUARANTINE, REJECTED, RELEASED, RETURNED, SHIPPING UNDER QUARANTINE ***See*** more details about WMS Quality Statuses on the Produmex WMS help page.

9.1.1.2.4 Forecast

Forecast

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.



Window system_option_struktur.psr

© 2026 Boyum IT Solutions A/S

Field	Description
Gross calculation	If long-term forecasts must be calculated with complex assembly structures, the calculation can be time and resource consuming. Details As for long-period calculations, results exact to the minute are not necessary. A fast mode of calculation is provided here: gross calculation. The material requirements are determined using the function "calculate resources" and must not be broken down at the time of the calculation of the purchase recommendation any more. **Important:** If this method is activated, the material requirements must be calculated first for all assemblies concerned, or after greater changes. Requirement coverage calculation is not available, but balance calculation is. ***Example*** Finished part "A" - semi-finished part (storage related) "W" - purchase part "P" stock "W" = 2 pieces requirement "A" = 5 pieces Net requirement calculation results: A = 5 pieces, W = 5 pieces, purchase part "P" = 3 pieces, because W is covered from stock (requirement coverage calculation) Gross calculation A = 5 pieces, W = 5 pieces, purchase part "P" = 5 pieces, because no requirement coverage calculation is performed.

© 2026 Boyum IT Solutions A/S

	Resource scheduling (MRP2) is based on lead time calculation. Therefore "gross calculation" must be deactivated if resource scheduling is required. Item setting "multiple order" is not considered. Order-related assemblies are not displayed (they have no effect on balance calculation) ***See***: Calculate resources The function should be activated only for extensive long period forecasts. The function per default is deactivated.
Calculate Resources	Only active if "Gross calculation" is enabled. The material requirement can be calculated in advance for assemblies with this option. ***See***: Calculate resources
SCM Forecasts consider	Only visible if SCM is activated in this database. If enabled, order recommendation considers forecasts from SCM. **Note**: setting in **Configuration wizard > Materials Management > MRP Wizard > Forecasts > Forecast consider > like planned customer orders** is not taken into account. SCM forecasts are always considered based on the SAP Business One Standard.

See

Configuration Wizard – Forecast

Forecast (SAP)

Planning scenarios – Planning

MPS

9.1.1.2.5 Resources

Resources

Field	Description
Enable resource scheduling	Option is only visible if **lead time for assemblies** is enabled in calculation types.

© 2026 Boyum IT Solutions A/S

	Forecast – Gross calculation must be deactivated. If it is enabled, it will be disabled automatically when activating the resource scheduling. When using this option, required resources for a scenario are also calculated on top of material requirements. The calculation time is increased with this option. Results can be viewed in the Order recommendation window using the resources button.

Note:

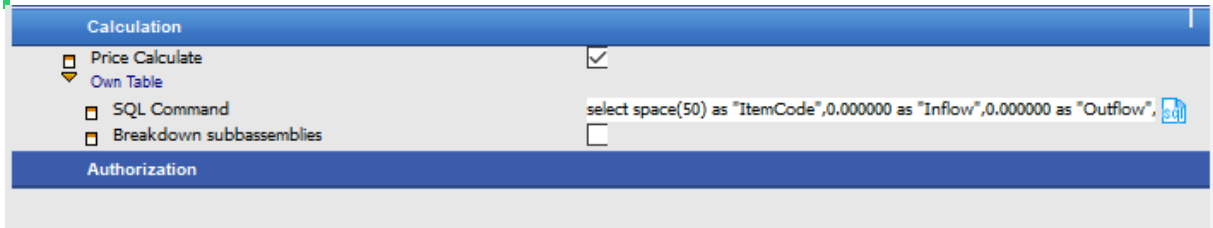
Parameter	Status	Status of resource scheduling
Calculate lead time for assemblies	Disabled	Deactivated and hidden.
Forecast > Gross calculation	Enabled	Deactivated. If Resource scheduling is activated, then Forecast > Gross calculation is deactivated in return.

If Consider order multiples is activated, sales order are displayed as Forecast.

For further details on Resource calculation and MRP2 ***see*** Requirement of resources MRP2.

9.1.1.2.6 Calculation

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Detail** tab.



Window system_option_struktur.psr

Calculation

Field	Description
Price calculation	If active, the purchase price is calculated during the MRP run and displayed in the results list. If this option is disabled, it is calculated only if a purchase is created or

© 2026 Boyum IT Solutions A/S

	the amount or the supplier is changed. This option can be disabled to shorten calculation time and if no purchase orders are to be created.
Own Table - SQL Command	It is possible to read inflow and outflow from other tables. Define the SQL table to read information from

You can define the SQL statement to read the information.

Example: You have a third-party system and you want to read the material requirement from this system into the Beas MRP or to an additional external work order program.

You can work with Views or Tables. Procedures are not supported.

The following columns are supported:

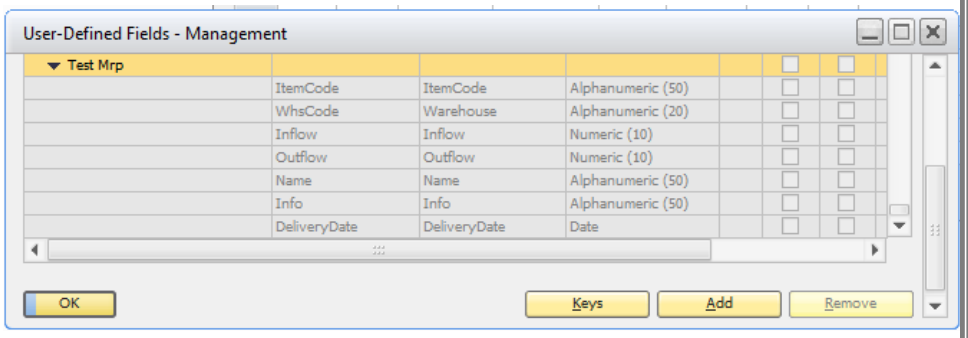
Field name	Field typ	Mandatory	Description
Itemcode	varchar(50)	yes	The itemcode
WhsCode	varchar(50)	no	Warehouse. If it is not defined or empty, the MRP uses the default warehouse of the item.
Version	varchar(20)	no	The Item Version. If it is not defined, the MRP uses the default version number of the item.
DrawingNumber	varchar(50)	no	The Drawing Number. If it is not defined, the MRP uses the default drawing number of the item.
Confirmed	char(1) or integer	no	Confirmed prompt. Allowed: 1/0, Y/N, J/N, True/False etc.
Project	varchar(20)	no	Project Code. Attention: The MRP system does not validate the value.
Inflow	decimal	yes	Inflow quantity.
outflow	decimal	yes	Outflow quantity.
Inflow_wo	decimal	no	Inflow quantity for production.
Outflow_wo	decimal	no	Outflow quantity for production.

© 2026 Boyum IT Solutions A/S

Field name	Field typ	Mandatory	Description
Name	varchar(50)	yes	Name of requirement.
Info	varchar(50)	no	Information for requirement.
Info2, Info3	Varchar(50)	no	Additional information for requirement.
udf1 ... udf4	varchar(50)	no	Userfields 1-4.
DeliveryDate	DateTime	yes	Delivery date.
Color	Number	no	Color for view.
BmpName	varchar(50)	no	Bitmap File name, e.g. "bmp\active.png". **Attention**: The picture must exist on the client. Do not use a network folder.

Example

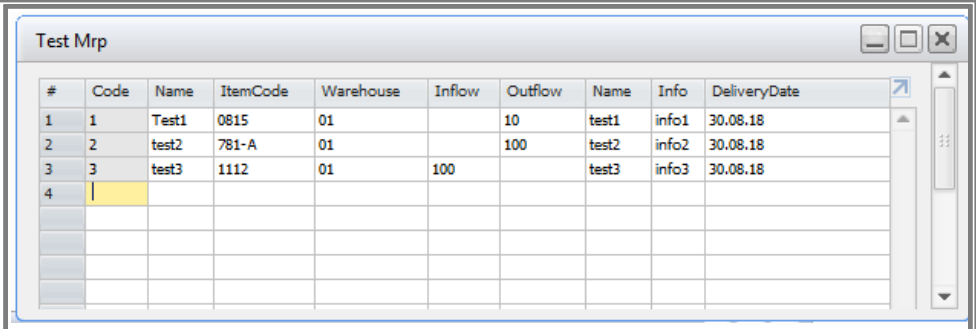
A user defined table.



Window beasgui_sbo.psr

PATH: Tools > User Defined Windows > Insert example data.

© 2026 Boyum IT Solutions A/S

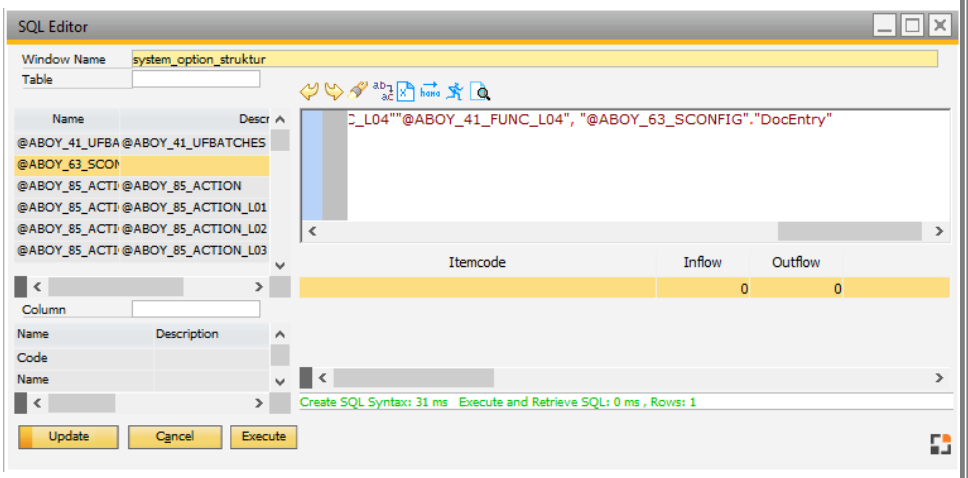


PATH: MRP Wizard > Calculation > Own Table > SQL Command.

1. Define the SQL command.
2. Click on the SQL icon to insert a sample SQL statement that you can modify according to the requirements.

With the `as` command you can define the correct name.

3. Click on **Execute** to test the result. The field name must be correct.



Window sys_ sqleditor.psr

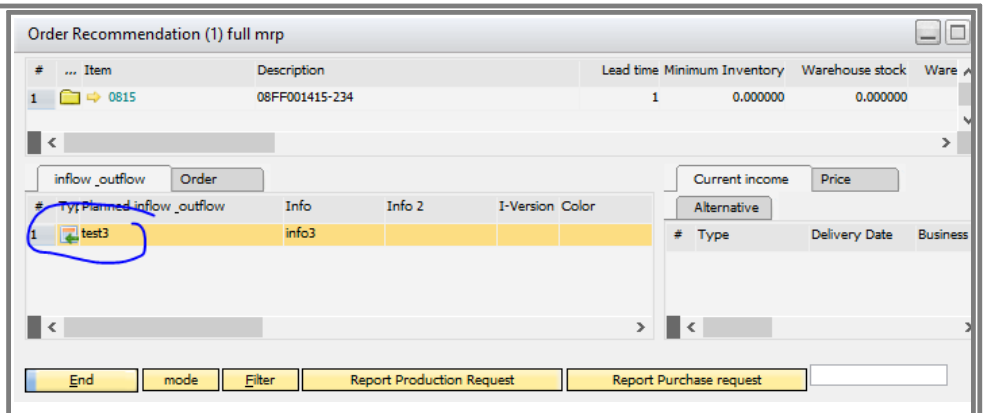
Attention:

If the field name is not correct, for example `"Test_mrp_ItemCode"` and not `"ItemCode"`, it must be renamed with the `as` command:

```
coalesce("@TEST_MRP"."U_ItemCode",'') as itemcode
```

In MRP, user-definded entries are marked with type "U" and with an icon:

© 2026 Boyum IT Solutions A/S



Window mrp_view_masterrahmen.psr

Attention:

- Requirement coverage calculation is ignored.
- Forecasts are ignored.
- Refreshing after creating the documents is not working.

Own Table - Breakdown subassemblies	If this option is enabled, Beas MRP breaks down the material and subassemblies for the user-defined SQL table.

9.1.1.2.7 Authorization

In addition to the standard rights administration, access rights for each schedule can be adjusted individually.

Both access management systems are used. Therefore, to get access to the planning, one needs the standard right for purchase order recommendation lists, as well as the right defined in this authorization.

If the Authorization section is left empty, this authorization control is not activated.

Field	Meaning
Setup	Authorization for changing planning settings.
View	Authorization for opening order recommendations.
Calculation	Authorization for calculating planning.

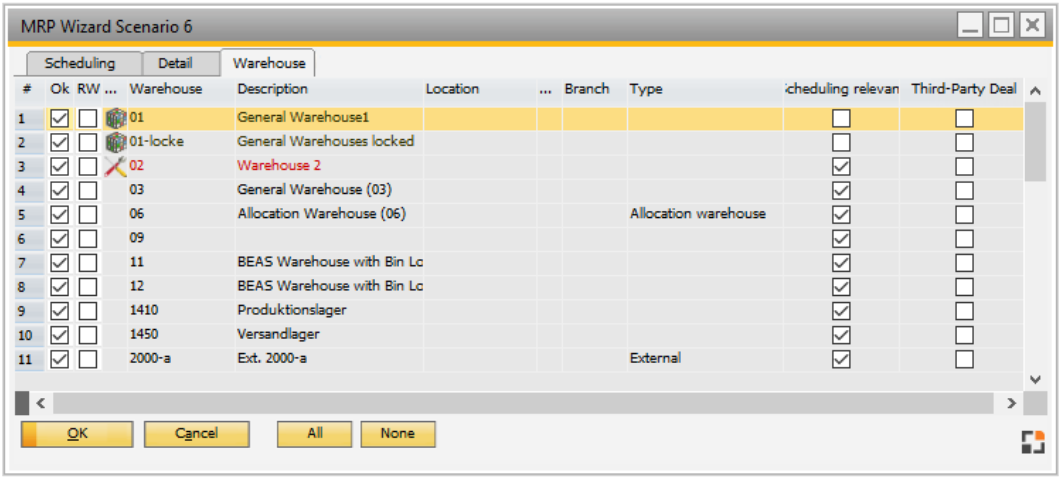
back to planning scenarios

© 2026 Boyum IT Solutions A/S

9.1.1.3 Warehouse

Warehouses to be included in the calculation can be selected in this tab.

PATH: MRP > MRP Wizard > Select a scenario > click the **Open** button > **Warehouse** tab.



Editable fields:

OK: Include the selected warehouse in the calculation - calculate all requirements in the selected warehouses.

RW: Mark selected warehouse as Replenishment warehouse. When marked, the OK flag is unchecked as this flag indicates that this warehouse is to supply materials to all other warehouses in the list.

See Transfer tab for MRP Inventory Transfer Request. ***See*** also MRP Replenishment Warehouse tab.

Other fields are not editable and are linked from the Warehouse master data window.

Buttons:

All: Select all warehouses in the list.

None: Deselect all warehouses in the list.

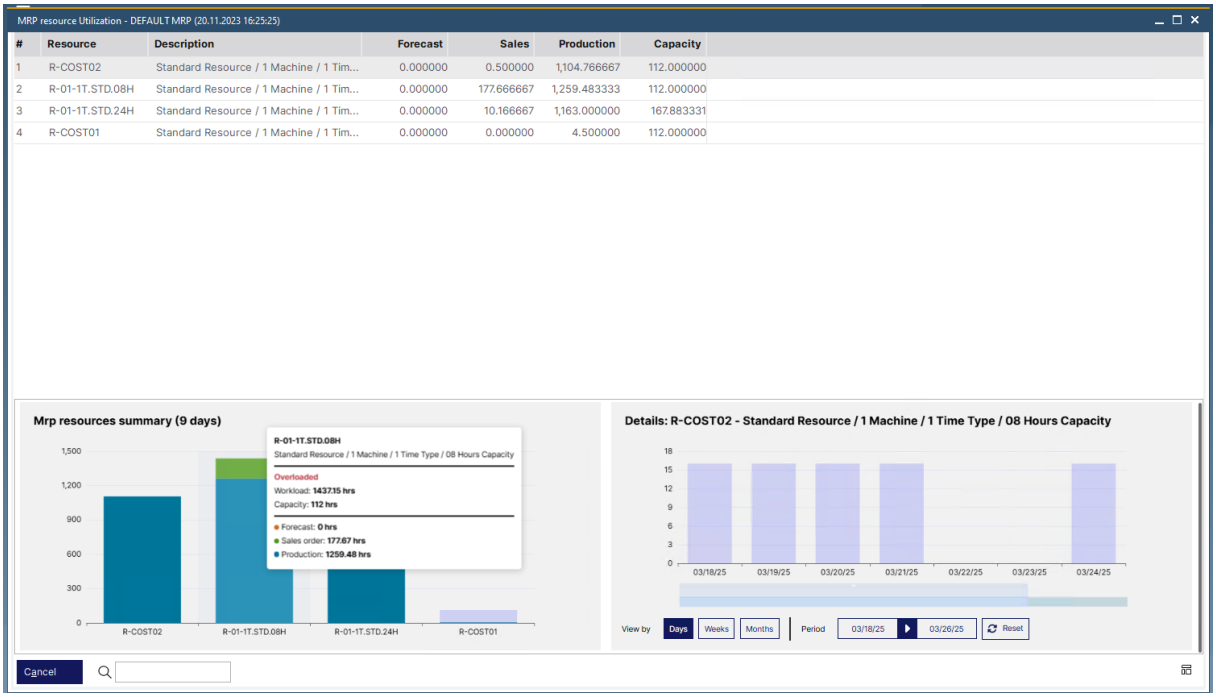
For impacts, ***see*** Detail – Inventory – Warehouse filter for transactions and Requirement coverage calculation.

9.1.1.4 Requirement of resources MRP2

PATH: MRP > MRP Wizard > Select a scenario > click the **Resources** button.

PATH: MRP > MRP Wizard > **Order recommendation** button > **Resources** button.

© 2026 Boyum IT Solutions A/S



Window: mrp_view_resource_web.psr

Planned resources dispatching for this scenario contains the following:

Resource	Name of resource
Description	Description of the resource
Forecasts	Forecasts, multiple orders, Planned work orders without customer reference, Minimum inventory, Sums

Type	Description
Forecast	Forecasts selected in MRP Wizard.
Multiple orders	If multiple orders are enabled in the MRP wizard and a multiple order is defined in the item, the lower assembly structure is not summed up. The lower structure has no relation to sales orders, forecasts, minimum inventory and is displayed under Forecasts.
Planned work orders	Planned work orders without a customer.
Summaries	If you work with summaries (per day, week, month), the reference to peggings is lost (pegging to work order, sales order etc). For this reason these summaries are displayed under forecasts.
Minimum	Requirement from minimum stock.

© 2026 Boyum IT Solutions A/S

	inventory
Sales order	Sales orders, Advance invoices, planned work orders with customer reference Sales order: Sales order or advance invoices. Planned work orders: Planned work orders without a customer.
Production	Work order (except planned work orders).
Capacity	The available capacity of each resource.

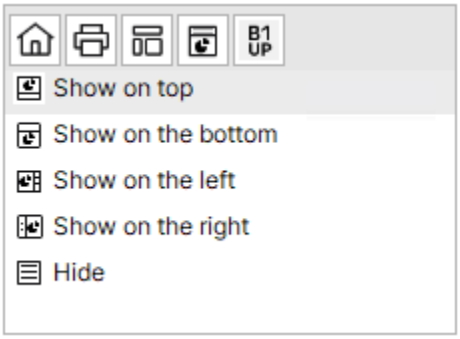
Graphical display

The graphical display provides a summary of all Resource utilization and the relevant details of a selected resource in a chart view.

You can dynamically set the window structure of your preference by selecting the placement of the graphical display in the contextual menu. The appearance is user-dependent and can be set in each screen individually.

Adjust display size by Ctrl + Scroll up/down.

Graphical Contextual menu



Menu entry	Description
Show on top	Places the graphical display on the top of the window.

Planned outflow	Planned outflow.

9.1.2 Calculation

This chapter details the calculation processes in MRP.

MRP Calculation
Calculation time
Calculation order proposal date
Requirement coverage calculation
Automatic calculation

9.1.2.1 MRP calculation

Material requirements for a production process can be planned in the order recommendation. Material requirements are determined by the MRP calculation and are based on the current stock and forecasts. The requirement or planned requirement is compared to the stock and inflow and the recommendation is prepared.
An accurate calculation requires correct data and settings. Therefore, a data check is provided by MRP. The most important items in master data are checked. If any errors are found, a note is issued before starting the calculation.

© 2026 Boyum IT Solutions A/S

Peggings made in the past are taken into account. If there are peggings in the past, a correct balance calculation is not possible. Correct the delivery dates, that are in the past or cannot be met anymore.

Negative amounts:

A correct requirement computation is not possible, if there is negative stock. We strongly recommend our users to deactivate negative stock in SAP Business One.

Requirements include:

- Customer Orders
- Calculations which are associated with the customer orders
- Projections
- Manufacturing Disposals (BOM)
- Forecasts
- Minimum stock
- If necessary, third-party systems

Inflow can be:

- Goods receipt from production orders
- Production requirements
- Requisitions
- If necessary, third-party systems

The **current inventory** is the sum of all the stocks:

- Without taking into account blocked items
- Excluding storage are for blocked stock

Receiving storage locations, storage for provisions and other stores are taken into account.

Note: Only valid, not blocked items, and non-phantom items are are taken into account. Additionally, the "stock item" and "planning system" parameters must be activated. The item must be a "Purchased part" item or "Breakdown" must be defined as "Make".

In the results only items with a requirement are displayed. If all items are to be displayed, regardless of the requirement, set the filter to "show all" in the result window to display all selected items in the scenario.

Note: Regardless of the settings, all items are computed. For more information, ***see*** Planning scenarios – Detail – Item.

© 2026 Boyum IT Solutions A/S

Multi-level - Calculation of delivery date

On the breakdown of the assembly BoM, the stored routing is taken into account and the demand is scheduled accordingly, as long as goods are not reserved. ***See*** Configuration wizard – Production – Reservation and Requirement coverage calculation.

The Delivery date is calculated using standard capacity planning with forward simulation. Existing dispatching is not considered and no resources are assigned.
The following factors affect the calculation:

- the routing stored in the item
- the resource stored in the routing
- the day capacity defined in the company calendar

For more information on the calculation function: ***see*** capacity planning.

Exception:

If a calculation is stored in a customer order, the dissolution is subject to the parameters of the associated calculation. If a production order has already been created, the requirements from the production order are used and the calculation and master data are ignored.

Warning: If the calculation contains assemblies, which are produced as order-oriented, these are not automatically established at the creation of the production order. In this case, a gap arises in the requirements calculation. Therefore, only order-related assemblies may be used for order-related calculations. The assembly MRP indicator in the calculation is used and not the one from master data.

NOTE on lead time calculation of sub-assemblies:

ATTENTION: In case of sub-assemblies, the parameter **only** affects lead time calculation of order-related sub-assemblies used as WO BoM! For storage-related sub-assemblies, the system uses fix lead time defined in Item master data.

Forecasts

With forecasts the requirement can be scheduled before the actual receipt of customer orders. Any projections can be defined and taken into consideration in the order proposal list.
Forecasts can be scheduled daily, weekly or monthly. Forecasts are defined in **SBO > MRP > Forecasts**.

Forecasts are taken into account if:

- They are in the future

© 2026 Boyum IT Solutions A/S

- Requirements are not covered by customer orders

  Example: There is a forecast of 20 and customer orders of 10, the prognosis for the requirements calculation is reduced to 10.

Monthly forecast: In the current month only the remaining percentage of the requirements are taken into account. Requirements for this month: Daily requirements for the month * remaining days of the month.

Example: It is 10th January and for this month there is a forecast for 100 units. Requirement is calculated: (100/31 days) * 21 days remaining = demand of 67.7 for the remainder of January.

Multistage: Forecasts are always broken down. Existing stock is not included.

Note: The **SBO > Administration > System Initialization > General Settings > Planning** setting has no influence on the Beas – Order proposal calculation.

Priorities

Priorities are considered.

Minimum / Maximum stock

Minimum stock: From the desired inventory or minimum stock, the higher value is taken into account.

***Example**:* Desired inventory = 10, minimum stock = 5, desired inventory of 10 is used.

Phantom assemblies

A phantom assembly itself is not displayed, but its BoM is (at multi-level calculation).

9.1.2.2 Computation time

The calculation of material requirements planning is done mostly with in-memory technology and is highly optimized. However, calculation can get complex and can become time-consuming for large data sets .

To analyze the performance of the calculation process use the MRP Scenario Planning > Analysis function.

If the process crashes, try to increase the memory allocated to the process. ***See*** 32Bit with 4GB Memory

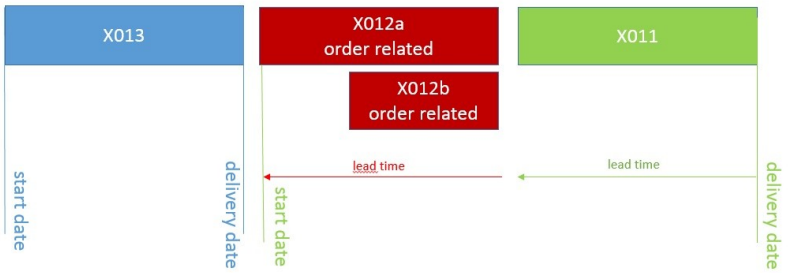
Depending on the data load, various measures can be taken. ***See*** Suggestions for improvement.

© 2026 Boyum IT Solutions A/S

9.1.2.3 Calculation of order proposal date

Field	Description
Delivery date customer order	Delivery date stored in the customer order, prognosis, or another requirement originator.
Average delivery time	Average delivery time in work days, defined in the Configuration Wizard.
Lead time according to item master	Lead time in working days according to the item master, given lead time for planning.
Calculated lead time	⊟ For an assembly (storage-related production): Using a backward scheduling simulation (routing of the assembly) the latest possible start date is calculated. Lot size is the requirement quantity. Multiple orders are not taken into account here. ⊟ For order-related production: Using a backward scheduling simulation (routing of the assembly) the latest possible start date is calculated for the complete order-related item structure. This corresponds to the start date of the sub-assembly which must be produced first. Lot size is the requirement quantity. **Important**: The multiple orders, lot size, existing time reservations on resources are not taken into account during calculation. **ATTENTION:** In case of sub-assemblies, the parameter **only** affects lead time calculation of order-related sub-assemblies used as WO BoM! For storage-related sub-assemblies, the system uses fix lead time defined in Item master data. If calculation of the lead time was disabled, the item lead time is used as reference. The lead time is the sum of a single lead times of the order related sub-assemblies.

© 2026 Boyum IT Solutions A/S



Example 1: Lot size and setup time.
Assembly A with operation sequence A1, 10 days setup time, lot size is 10.
Company calendar: Every day is a working day.

Customer order, delivery date 30.12.
Pos 1 100 pieces: Calculated: 10 days, start 20.12.
Pos 2 100 pieces: Calculated: 10 days, start 20.12.
Pos 3 200 pieces: Calculated: 10 days, start 20.12.

Example 2: Lot size and time for processing.
Assembly A with operation sequence A1, time for processing 1 hr/piece, lot size is 10.
Company calendar: Every day is a working day.
Resource has 1x10 hrs/day.
100 pieces = 10 days

Customer order, delivery date 30.12.
Pos 1 100 pieces: Calculated: 10 days, start 20.12.
Pos 2 100 pieces: Calculated: 10 days, start 20.12.
Pos 3 200 pieces: Calculated: 20 days, start 10.12

Apparently, there is a problem, there is only one single resource, capacity limits and time reservations are not taken into consideration. This problem can only be avoided by the production orders being created as planned orders. Using APS, planned orders can be correctly scheduled and necessary resource times can be reserved.

© 2026 Boyum IT Solutions A/S

Requirement date according to the forecast	The planned requirement date that is defined in the forecast. In a monthly forecast, it is the beginning of a month, in weekly forecasts, the Monday of the respective week. In case of an assembly, the required date of the sub-assembly is earlier.
Pre call time for prognoses	In the **Configuration Wizard MRP > Calculation > Forecast > Pre call time for prognoses** in calendar days.

Determining the date, depending on pegging

Field	Description
Customer order purchase part	Delivery date according to the customer order, average delivery time. Lead time according to the item master, period needed for replacement.
Customer order anonymous and order related production	Delivery date according to the customer order, average delivery time. Lead time according to the item master, period needed for replacement.
Forecast purchase part	Requirement date pre-call time for prognoses, lead time according to the item master, period needed for replacement.
Production BoM position	If the BoM is assigned to a routing position, its Processing time – Start time is as follows: Details: • With the Issue material with first operation setting the Processing time – Start time is the first reportable, active routing position. • With the Issue material later setting, the Processing time – Start time is the last reportable, active routing position. • If there is no reportable routing position, the delivery date is used as reference. If the Consideration of link to routing parameter in the MRP Wizard was disabled, the start time of the work order position is used. If this was not set, the delivery date is used. From the date calculated this way, the first working day is determined according to the factory calendar. Then, the Item – lead time is subtracted in calendar days, and the lead time – safety days as per configuration wizard is subtracted in work days.

© 2026 Boyum IT Solutions A/S

	If dealing with a purchase part, the Goods receipt – Idle time is also subtracted. If the resulting date is in the past, the order recommendation date is the next work day starting from the current day. ***See*** Order recommendation – Requirement.

9.1.2.4 Requirement coverage calculation

MRP always breaks down the assembly requirements (e.g. from customer orders). If the sub-requirement (BoM of an assembly) is again an assembly, the system first checks whether this can be covered by stock or by planned inflow (= temporally stock reservation). If not, this is broken down further. For this, during the calculation, the planned inflow is temporarily assigned to the planned outflow.

See Coverage Calculation priority settings.

Example:
Sales order with Finished Product A
This product needs Semi-Finished Product B and B needs Material M

Item structure

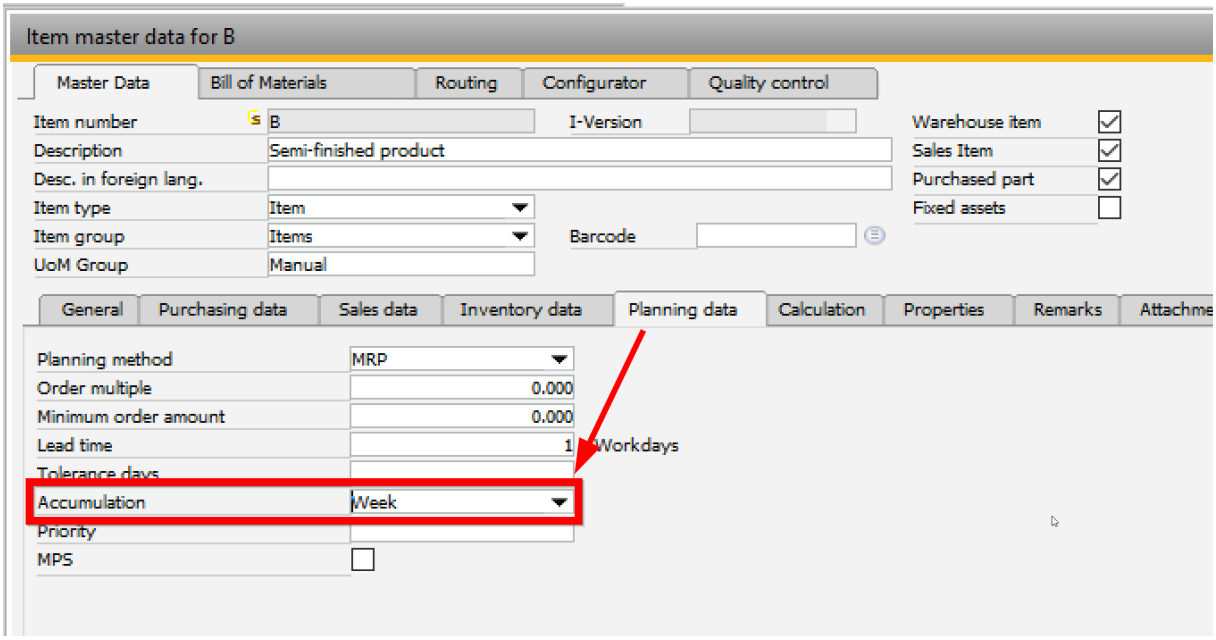
Item no., Resource, op. sequ.	Brief Description, Activity	Quantity	Setup	JT	Dra
A	Finished Product				
A 10 B	Semi-Finshed Product	1,0 Pcs			
A 10 M	Material	1,0 Pcs			
10 R-01-1T.STD.08H	Internal Operation STND003 - Standard (default Resource only)		5,000	120,000	
10 R-COST01	Internal Operation for Costs - Standard (default Resource only)		10,000	120,000	

During the calculation of MRP, Beas considers: A is required. If order-related, Beas does not check the stock. It must be produced. B is stock-related. The system must produce it only if no stock is available. It checks the stock. If available, Beas reserves the requirement temporarily for this Sales order.
If no Stock is available, the system simulates the production of B and creates a requirement for M.

Note:
B is Stock-related. Beas calculates this related to the requirement of the sales order. But it is used in view of a stock-related item. In the result you see the Sales order, which produced the requirement during the MRP calculation, but the result is always stock-related.

© 2026 Boyum IT Solutions A/S

For stock-related items it is always better to set the correct view in MRP. You can do this with the setting “Accumulation” = Day/Week/Month



The reservations calculated during the MRP processing are made at a time when it is not yet known which sub-finished goods or material is actually required. At the time of MRP computation, the full balance calculation for each item is not yet known when processing a single document (work order, sales order etc.) Therefore, Beas uses the priorities described below for assigning the temporary reservation to different pegging originators.

- Priority steps for assigning temporary reservation to different pegging originators

1. Minimum inventory
   [+] Example: Item A stock related, Stock 6 Pcs, Minimum 10
   The system simulates a production order for 4 Pcs. This produces a requirement for 4 Pcs for Semi-Finished product B
   The requirement date for the Finished-Product (in this case A) is always today.

2. Existing production outflow (BoM) of work orders and planned orders
   [+] Order by Delivery Date ascending, Document Number
   Example: Work order existing for Finish Product “A”, 10 Pcs
   This has a Bill of Materials position “B”. If no stock is available, the system simulates a production order for Semi-Finished Product “B” and this produces the requirement for Material “M”.

© 2026 Boyum IT Solutions A/S

3. Customer orders, advance invoices, forecasts with setting "like customer order"

Order by Delivery Date ascending, Document Number

4. Transfer Requests
   Order by Request Date ascending, Document Number

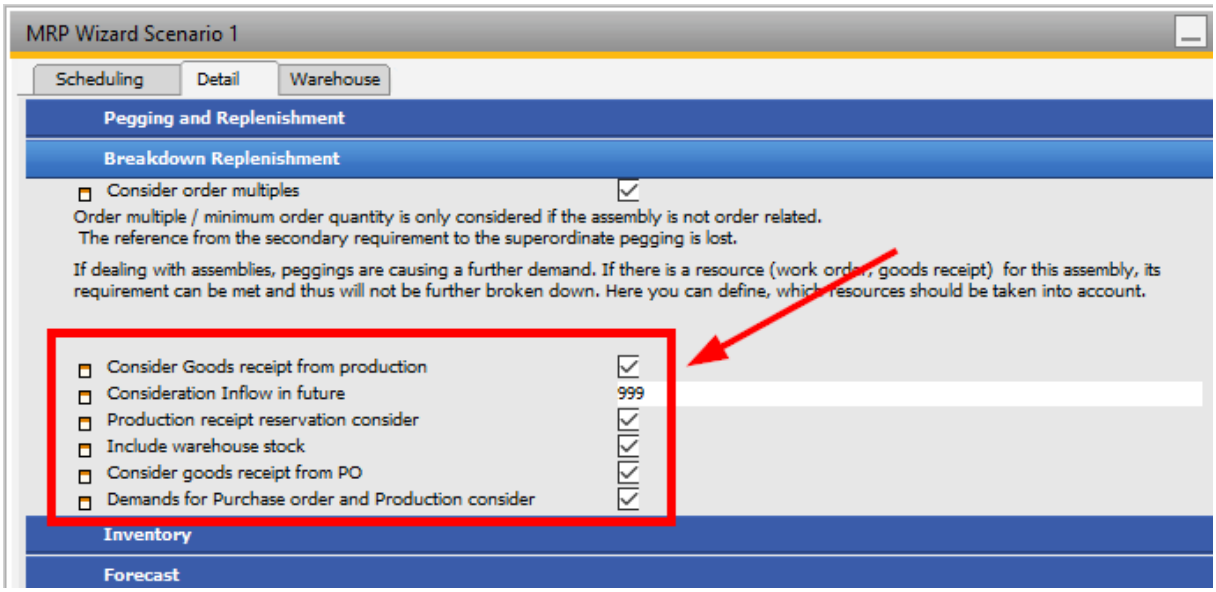
5. Forecasts (Default)
   Order by Plan Date ascending, Document Number

Beas first calculates all Minimum-Inventory requests, then the work order and so on. The system does not sort all requirements in one date line. The result can be a wrong order or temporary reservation for stock-related, semi-finished products. However, this should not generate problems, as this is a stock-related item.

Beas does not only consider stock. The following inflow is considered in order:

1. Remains from order multiples
2. Inventory
1. Production receipts, ascending by date of receipt
2. Purchase receipts, purchase and production requests, ascending by date of receipt

This behavior can be controlled with the respective options of an MRP calculation scenario:



© 2026 Boyum IT Solutions A/S

The reservation criteria above are used by Beas in "real time" during the MRP calculation and should not be confused with a the fixed reservation that a user can do by linking stock quantities to a sales order line or the lines on a Work order BoM.

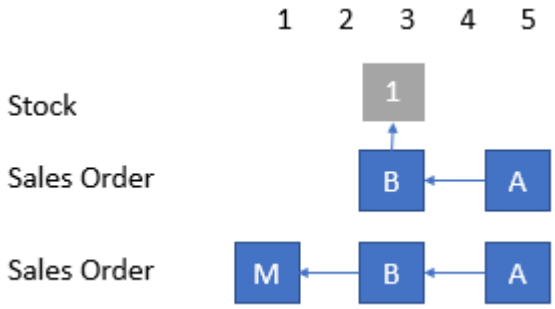
The temporary reservation determines whether sub-assemblies are broken down any further.
In case of working with fixed reservations, the reserved material is always firmly linked to a pegging and it may not be assigned to another pegging.

Example:

Item "A" has stock-related Sub-Assembly "B" with Material "M"
There are 2 sales orders for the same item A, same quantity with the same delivery date and we currently have only 1 Pcs in stock for assembly "B"

In this case, the first Sales (lowest Doc Number in SAP) order creates a requirement for "B" and the system covers this temporarily with stock.

For the second sales order no stock for "B" is available, and the system checks which material you need in order to produce "B". In this case, it creates a requirement for Material "M".



Final balance result of the MRP calculation:

Balance Item A: -2
Balance Item B: -1
Balance Item M: -1

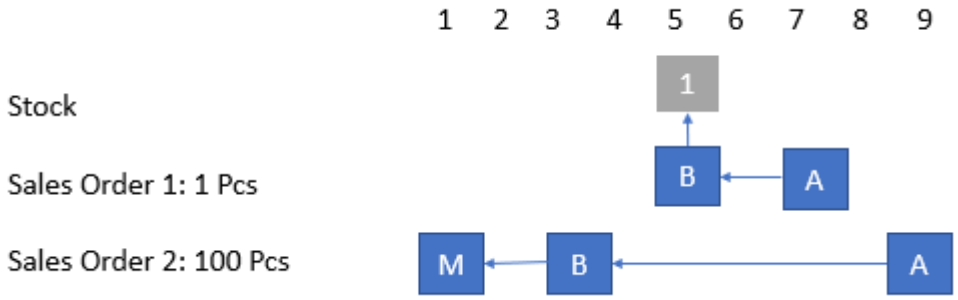
Here are some issues that might arise in reading the MRP calculation results in relation with the time-line of a stock related sub-assembly:

© 2026 Boyum IT Solutions A/S

Sales order 1: 1 Pcs, Delivery Date: 7th
Sales order 2: 100 Pcs, Delivery Date: 9th (later)
This produces different durations for the requirement of sub-assembly “B”, because you need more time for the production of Sales order “2”.

The system calculates Sales order 1 and covers the stock for stock-related assembly "B".

Then, the system calculates Sales order 2 and no stock is available. The system simulates the production for “B” and creates the Material requirement for Sales order 2.



In Balance List for B you see

Stock-related item "B"	Date	Issue	Balance
Sales order 2	3th	100	-99
Sales order 1	5th	1	-100

and for Material

Stock-related item "B"	Date	Issue	Balance
Sales order 1	1th	100	-100

This means that, when reading the MRP calculation results, you might see the requirements of an item at a lower level of a product structure in a different order than at calculation time.

© 2026 Boyum IT Solutions A/S

Note: If you use a precalculation inside a sales order, the production time for the order-related structure inside the precalculation is always the lead time of the item.

Example Sales order with Calculation:

Sales order 1 with Item "A" with calculation, 100 Pcs, Delivery Date: March 10th
Sales order 2 with Item "A" without calculation, 100 Pcs, Delivery date: March 9th
This produce a requirement for item B:
Sales order 1: March 10th (no calculated production time)
Sales order 2: March 5th
In MRP you see first Sales order 2 (sorted by requirement date), but the system calculate first Sales order 1 and use the existing stock for B for this sales order.

Note: Item B is stock-related. It is not possible to see order related result in stock-related items.

Note:

All production receipts are taken into consideration, regardless of the warehouse they are posted to. Warehouse settings defined in the **MRP calculation scenarios > Warehouse** are **not** considered here.

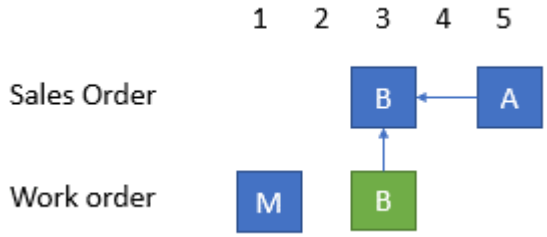
The temporary reservation calculated by MRP can be displayed after the calculation in **Order recommendation report > Origin**.

In this list, all temporary links are displayed in a structure view. ***See*** origin of requirement structure.

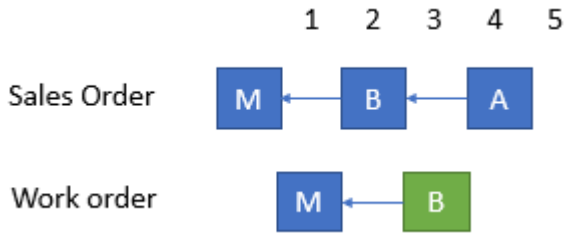
Consider inflow in future

If the date of delivery would be taken into consideration, the following problem could occur:
Assembly "A" contains assembly "B" with material M1.
Sales Order: assembly "A" on May 5th
Requirement of assembly "B" on May 3rd and material M1 on May 1st.
Work order is created for May 3rd, material is ordered for May 1st.
All requirements are covered.

© 2026 Boyum IT Solutions A/S



The customer asks for a delivery one day earlier, on May 4th:
If the requirement coverage calculation would consider the delivery date, the work order would no longer cover the requirement.
In effect, assembly "B" would be broken down, although the balance is 0. From the work order and the sales order a requirement would arise for material M1 - and thus it would be ordered twice.
To prevent this, the delivery date is not considered.



The delivery date is taken into account, but it may be in the future. This is set up in **Configuration wizard > Detail > Breakdown replenishment > "Consideration of future receipt".**
The delivery date is not taken into account - except for point 1 - since otherwise there would be a risk that the sub-material is dispatched twice. For this reason, **Configuration wizard > Detail > Breakdown replenishment > "Consideration of future receipt"** parameter is set to 99 days.

If "Consider inflow in future" is activated, the system covers the work order, which is 1 day in the future and you need in the example the Material "M" only.

Example:

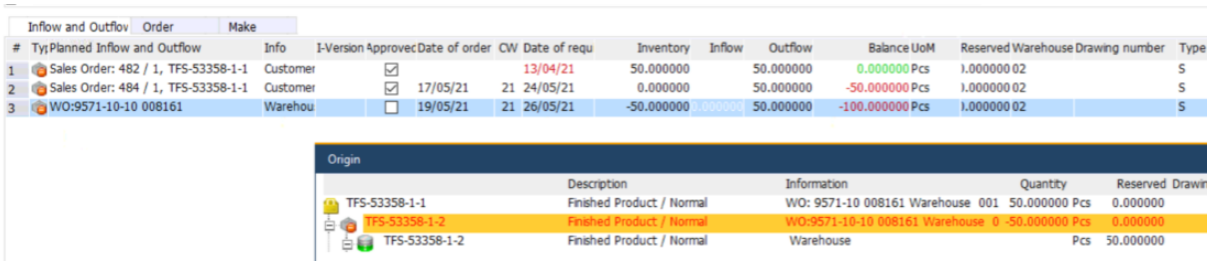
This item is a stock-related sub-assembly. The order in this list is by Date of requirement.
Before the system checks which material is needed for the assembly, it checks if stock is available for this assembly.
If yes, Beas reserves the stock for this assembly and you do not need to produce it. The system does not check the required material.

© 2026 Boyum IT Solutions A/S

The temporary reservation uses the defined priority: Minimum Stock, Work order, Sales order and so on.

What this means: Beas reserves the material for the work order (line 3) and **not for** the sales order (line 1 or line 2).

Right mouse click on line 3 - Origin you can see the defined reserved quantity.



Filter *Only shortage*

This filter shows all items that need to be ordered or produced, or for which the planned inflow is too late.

In this case, assembly “B” would be shown as shortage, as the balance for 4th May is negative.

The inflow to be used can be specified in **MRP wizard > Detail > Breakdown of resources**.

9.1.2.5 Scheduled MRP calculation

The calculation may be time consuming. For this reason, you can have the calculation performed automatically overnight.

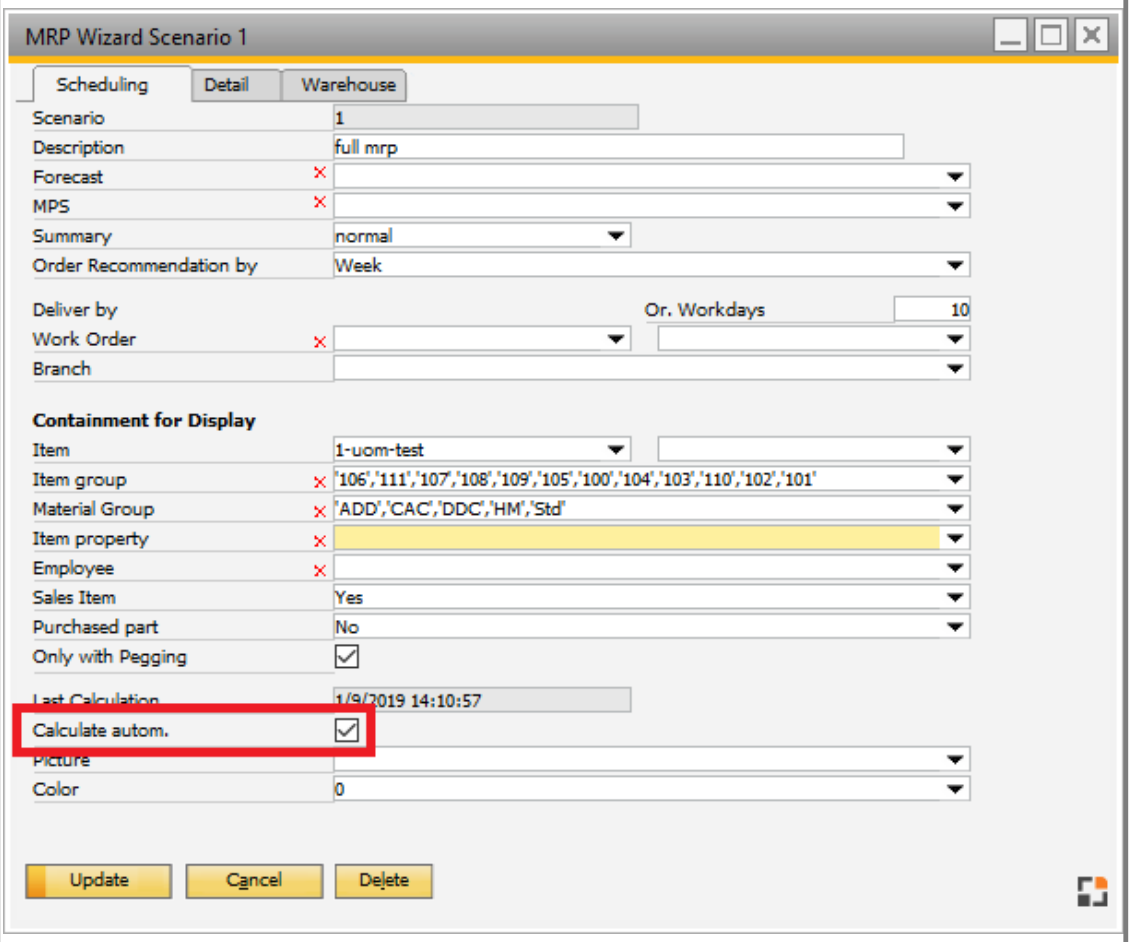
The following examples provide details on how to schedule MRP calculation in different ways:

Examples for planned MRP execution

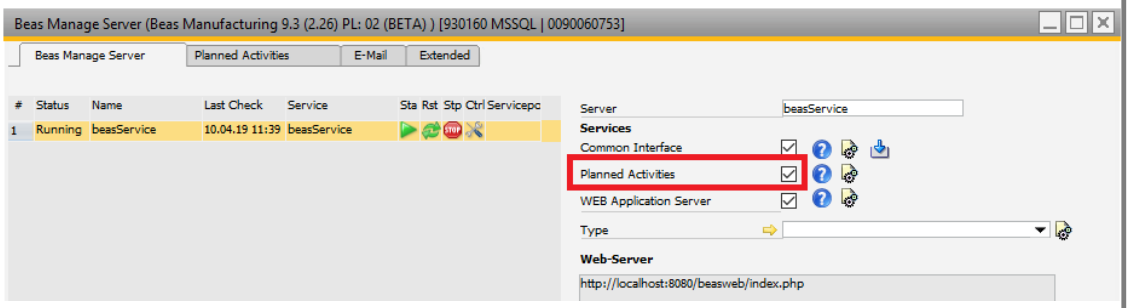
Example 1:

You can execute automatic MRP run over Beas service planned activity.
This depends on the "Automatic calculation" parameter in the MRP Scenario: With the execution of this event, ALL MRP runs that have the option "Automatic calculation" set are automatically executed.

© 2026 Boyum IT Solutions A/S



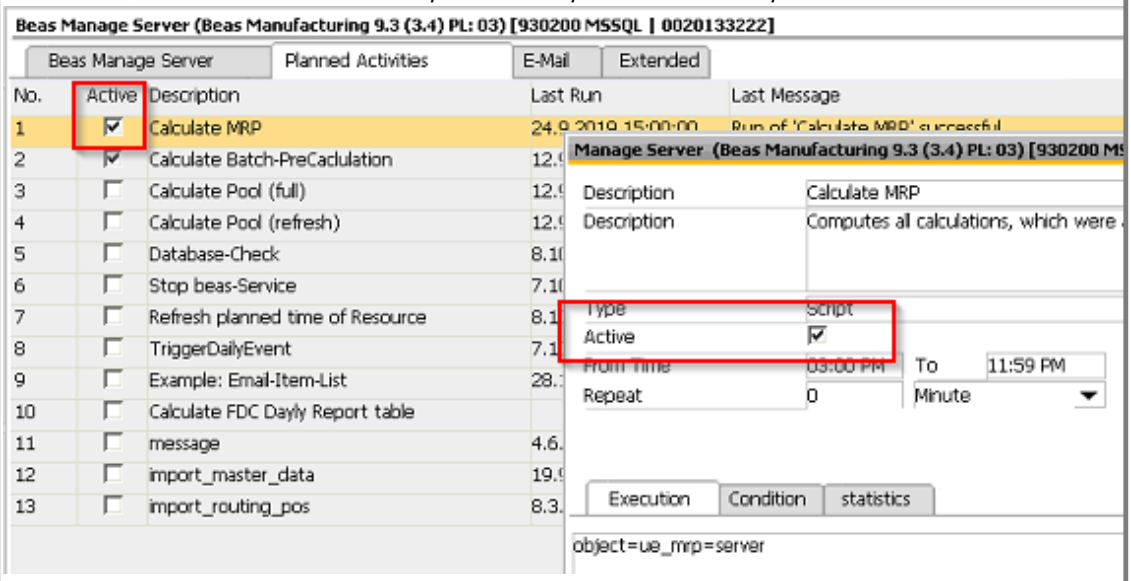
The "Planned Activities" check box is linked with the



By default the system defines the "Calculate MRP" task in the planned activity list.
The task must contain the script `object=ue_mrp=server` in the Execution tab. ***See*** image below.

© 2026 Boyum IT Solutions A/S

If the task does not exist (deleted by the user), you can manually define it:



Example 2:

Execute 1 specific MRP Scenario.

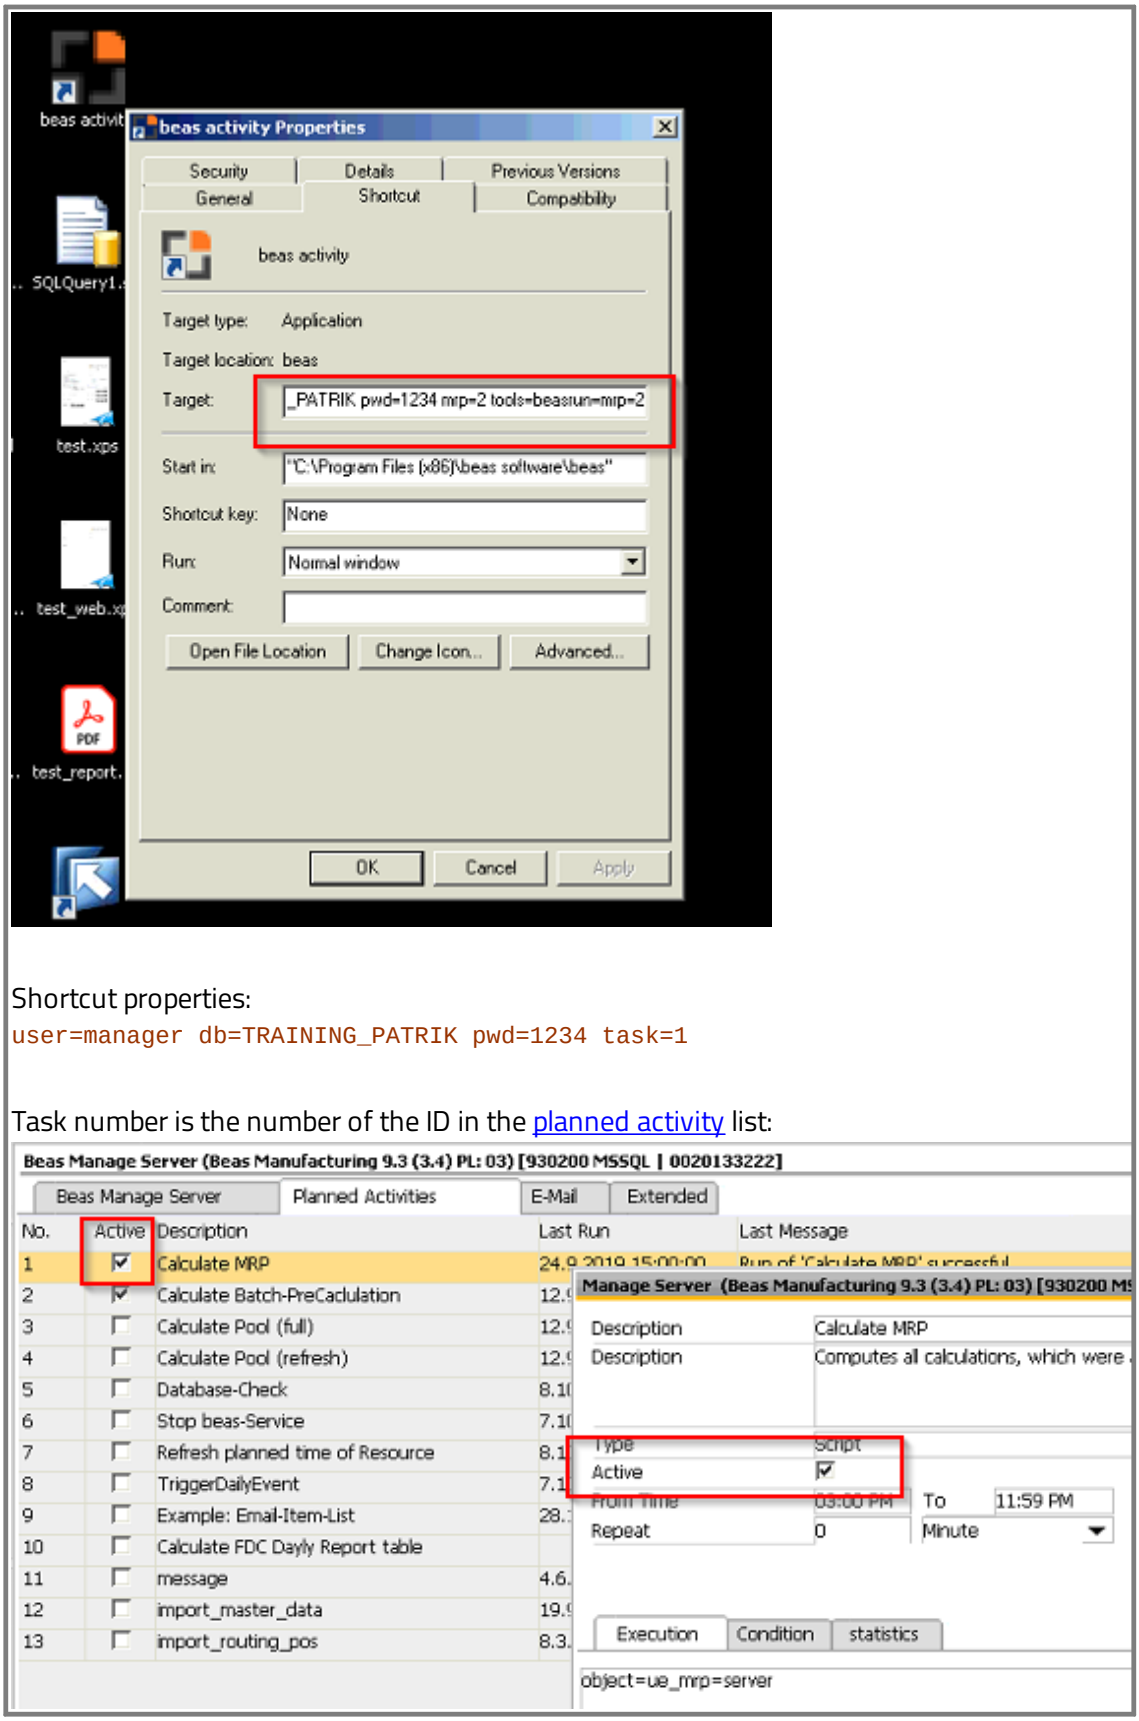
If you want to execute only one scenario, create a planned task with the following BeasScript, containing the number of the scenario:

```
object=ue_mrp=calc=1
```

Example 3:

You can execute MRP over shortcut properties to call a specific task e.g. Automatic calculation:

© 2026 Boyum IT Solutions A/S



Shortcut properties:

```
user=manager db=TRAINING_PATRIK pwd=1234 task=1
```

Task number is the number of the ID in the planned activity list:

© 2026 Boyum IT Solutions A/S

Example 4:

You can execute MRP by BeasScript for all scenarios marked as "Automatic calculation":

Script:

```
object=ue_mrp=server
```

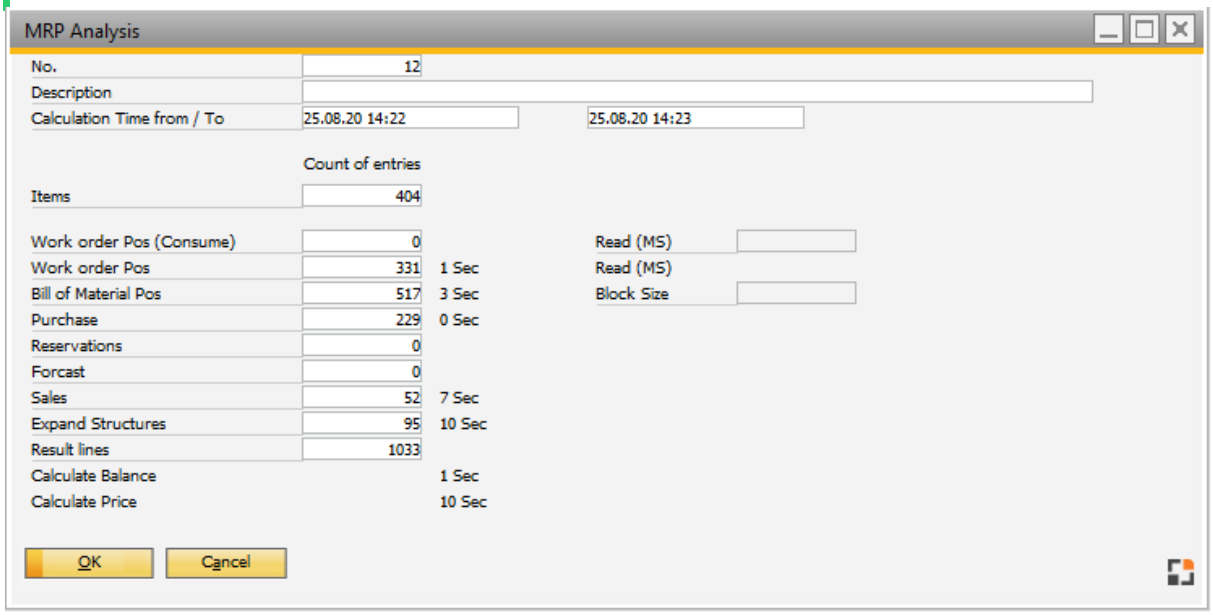
Execute 1 specific MRP Scenario: ***See*** Example 2 above.

See Manage Server

9.1.3 Analysis

The MRP Analysis displays information about the performance statistics of the calculation. It shows the number of calculated table records and the time it takes to run the calculation.

PATH: MRP > MRP Wizard > right-click a scenario.



mrp_ view_ analysis beas 9.3 PL 2 HF 2

If the MRP runs slowly, you can analyze the calculation with this tool. You can see count of records and time used for calculation and can start activities, which you help to make the running the MRP faster.

See

Performance recommendations

Calculation of order prosal date

© 2026 Boyum IT Solutions A/S

Field	Description
Calculation time from / to	Displays the start and end time of the last calculation process.
Items	Number of items included in the calculation.
Work order Pos (Consume)	Number of work order position entries for breakdown replenishment calculation (only the read process). *(beas 9.3 PL 3: always 0)*
Wor order Pos	Number of work order positions included in the calculation. **Pegging and Replenishment > Production > Goods receipt from production**
Bill of Material Pos	Number of Bill of material positions included in the calculation. **Pegging and Replenishment > Production > Goods issue for production** Block size: If you have to calculate more than 100 000 BoM positions in one scenario, it is reasonable to make the calculation in blocks. In this case, contact BoyumIT support.
Purchase	Number of purchase orders included in the calculation **Pegging and Replenishment > Purchase > Purchase order**
Reservations	Checked reservations in the calculation. **Breakdown > Replenishment > Consider order multiples and other in this area**
Forcast	Forecast and MPS included in the calculation. **Scheduling > Forecast / MPS**
Sales	Sales order, Pre Invoice, Recurring Sales Orders, Blanked agreement (...) **Pegging and Replenishment > Sales**
Expand Structures	Number of expanded assemblies included in the calculation. ***Example:*** Sales order with Assembly, Stock and Work order not existing. In this case, the system calculates the material requirements and duration time. This number displays the count of items and the time for the process.
Result lines	The number of result lines in the calculation. - The number reflects the count of items in the requirement area (inflow and outflow).

© 2026 Boyum IT Solutions A/S

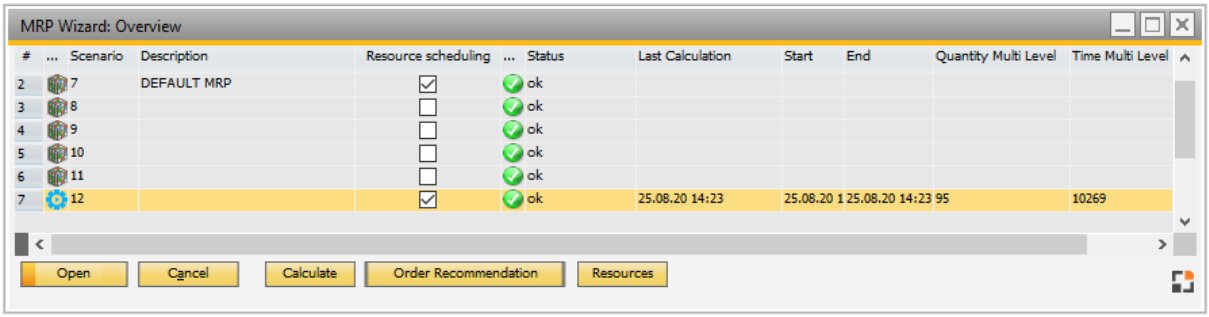
Field	Description
	Calculate Balance	Time spent to calculate the balance in Inflow/Outflow area (also in per week/month and so on).
Calculate Price	Time spent to read prices from price list. If this takes too long, it can be disabled in the MRP scenario settings **MRP Scenario > Details tab > Calculation > Price Calculate**. ***See*** MRP Scenario

9.2 Order recommendation: overview

In the order recommendation overview all scenarios are displayed, can be edited or calculated.

The order recommendation can also be viewed in the Planning scenarios.

PATH: MRP > MRP Wizard



Window mrp_browse.psr

Column

Field	Description
Scenario	MRP planning number.

© 2026 Boyum IT Solutions A/S

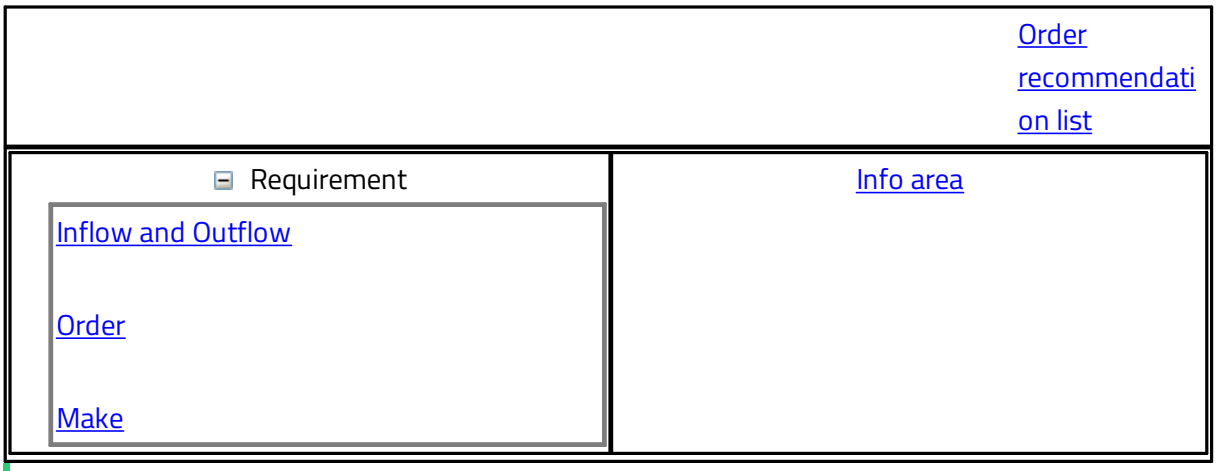
Description	Long description of the plan.
Last calculation	Date of the last calculation.
Status	Current status of the calculation. If it is currently calculated on an other station, as long as status is not OK, no order proposals can be displayed.
Resource scheduling	Shows, whether resource scheduling is enabled. Set in Resources.

Functions

Field	Description
Calculate	Execute the selected MRP scenario.
Order recommendation	Show computation results.
Resources	View planned resource utilization (MRP2). ***See*** Resource utilization MRP2.

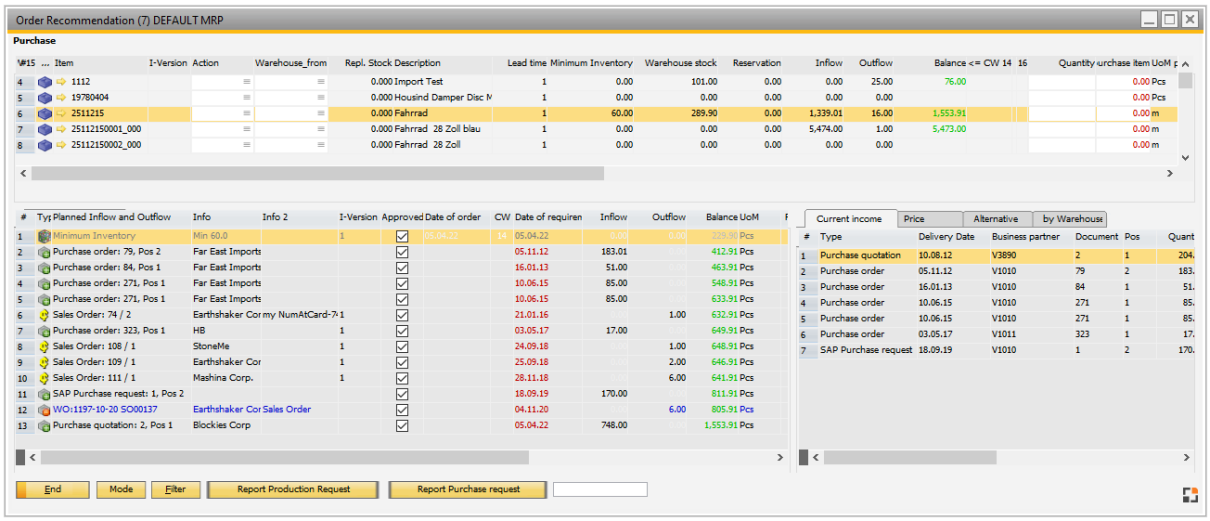
9.2.1 Order recommendation view

This is the central view of the MRP calculation which also enables to create purchase orders and work orders. There are three main areas:



PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button.

© 2026 Boyum IT Solutions A/S



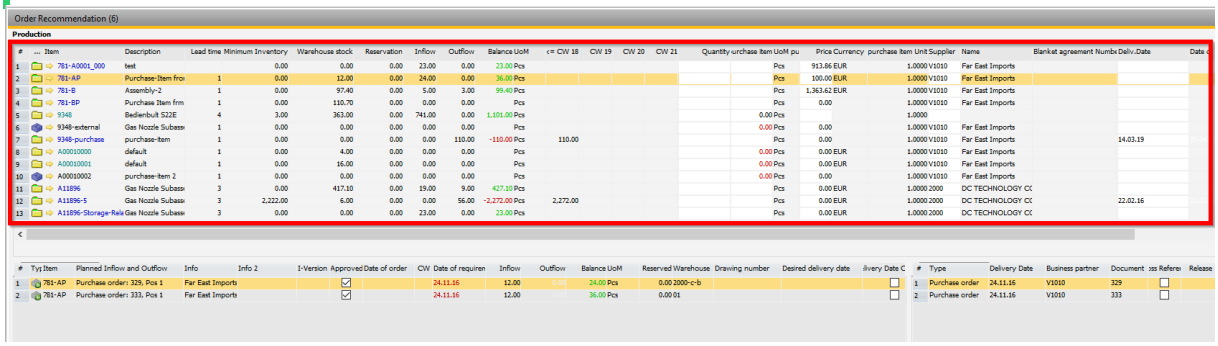
Window: mrp_view_masterrahmen

The buttons have the same function as the right-click – context menu. In the search field to the right of the buttons you can search for item number, item name, drawing number, supplier, material group, match code.

9.2.1.1 Order recommendation List

This window section of the Order recommendation displays the requirements on item level for planning purchase orders or production orders.

PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button.



Window: mrp_view_masterrahmen

Templates and window settings are supported.

The window settings are saved in the currently selected template automatically if a template is active.

Note: Only the item list is affected (Order recommendation list).

See Youtube

© 2026 Boyum IT Solutions A/S

Only the flowing items are displayed:

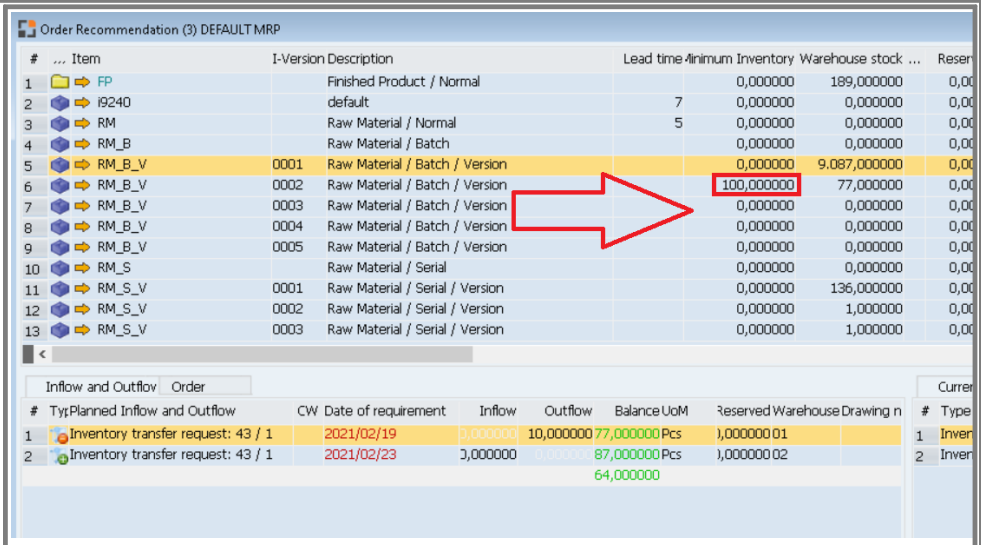
- Items according to filter settings in the planning scenario. ***See*** Planning.
- Items according to filter settings. ***See*** window filters.

Field descriptions

All values provided are true at the moment of computation.

Field	Description
Item	Item number.
I-Version	Item version number. MRP can calculate version-managed items based on the available stock of the item. Each Item version is treated as an individual item. ATTENTION: This only applies to batch/serial-managed items. **IMPORTANT:** if you have an item that is controlled by versions, it is calculated by each version. If the item is marked as version-controlled, but not managed by batches/serials, the item is calculated as one line. Documents* that have empty version field take the default version. Such documents are forecasts, sales orders, sales quotations, reverse invoices, stock transfer requests, Purchase orders, Purchase quotations, Beas PO requests. **Minimum stock for version:** If minimum stock is set, the calculation applies the minimum stock only for the version that was set as default. ***See*** image below.

© 2026 Boyum IT Solutions A/S

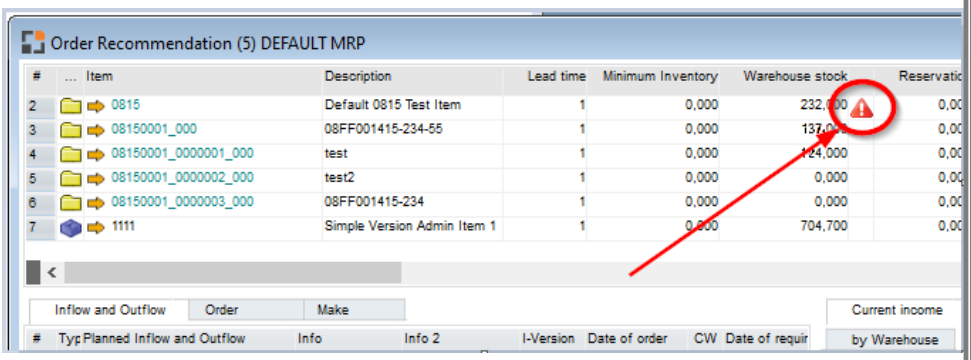


Note: Inventory information is not displayed by I-Version in the "By Warehouse" tab.

Description	Item description.
Lead time	Lead time or replenishment time according to the item master in working days.
Minimum inventory	Minimum item stock in warehouse units Required stock is displayed in case that it is higher than minimum stock. If Inventory management by warehouse was enabled, the sum of minimum stock per warehouse is displayed. Only the warehouses that have been selected in Planning scenario - Warehouse are considered.
.../ *Inventory ALERT	Indicate a stock overflow on a warehouse The warning icon works only if - Item is set to "Inventory by warehouse" - MRP setting "Notify of minimum inventory" is activated - Warehouse Stock > Minimum Inventory **What the system checks** Activate this parameter to enable a warning icon for items where the Total minimum inventory status is positive, but at least one of the warehouses may require a stock transfer (Warehouse minimum inventory status is negative).

© 2026 Boyum IT Solutions A/S

This notification corresponds to the situation of the warehouses at the time of MRP calculation and not necessarily to the current status of the warehouses.



Example:

Warehouse 01: Min. Inventory = 100, Current Inventory = 0

Warehouse 02: Min. Inventory = 0, Current Inventory = 200

Warehouse 03: Min. Inventory = 500, Current Inventory = 0

Total Min. Inventory = 600, Total Inventory = 200

In this case Balance is > 0,

The inventory in one warehouse is not enough to cover the Minimum Inventory of this warehouse and the Total Min. Inventory > Total Inventory

- the system shows the requirement and the actual item must be checked.
- the system displays no alert.

Example:

Warehouse 01: Min. Inventory = 100, Current Stock = 0

Warehouse 02: Min. Inventory = 0, Current Stock = 200

Warehouse 03: Min. Inventory = 0, Current Stock = 0

Total Min. Inventory = 100, Total Stock = 200

In this case Balance is > 0, but the inventory in one warehouse is not enough to cover the Minimum Inventory of this warehouse and Total Min. Inventory < Total Inventory

- the system does not show requirement
- the system displays the alert.

I-Versions

When working with I-Versions (Setting "Consider I-Version" is activated),

© 2026 Boyum IT Solutions A/S

	minimum inventory by warehouse is indicated only in the active version. However, inventory information in the by Warehouse tab is not considered per I-Version. This means that it considers the complete inventory of the Item. ***See*** MRP Order recommendation by Warehouse. ***See*** MRP Scenario settings
Required	Required stock in warehouse units If Inventory management by warehouse was enabled, the sum of required stock per warehouse is displayed. Only the warehouses which have been selected in Planning scenario - Warehouse are considered.
Warehouse stock	Warehouse stock of the item Displays current item stock at the moment of calculation. If Inventory management by warehouse was enabled, the sum of required stock is displayed. Only the warehouses that have been selected in Planning scenario - Warehouse are considered. If you disable in Planning scenario - Details - Inventory - Blocked batches are available as stock, only free or unavailable batches are considered, but blocked batches are not. **WMS Integration:** If the **MRP Wizard > Detail > Inventory > Filter WMS Quality Status** parameter is set, the system will display the available stock considering the selected quality statuses.
Warehouse stock available	Available stock Displays the warehouse stock minus the reserved goods. ***See*** Warehouse stock. **Note**: If blocked batches are reserved and not considered, this may lead to incorrect values. Because in this case, blocked batches will be subtracted from the displayed stock.
Inflow	Sum of all planned inflow in Inventory UoM (according to current filter settings), excluding order related quantities (e.g. bill of materials with order related item) and pegged requirements that were covered by reservations.

© 2026 Boyum IT Solutions A/S

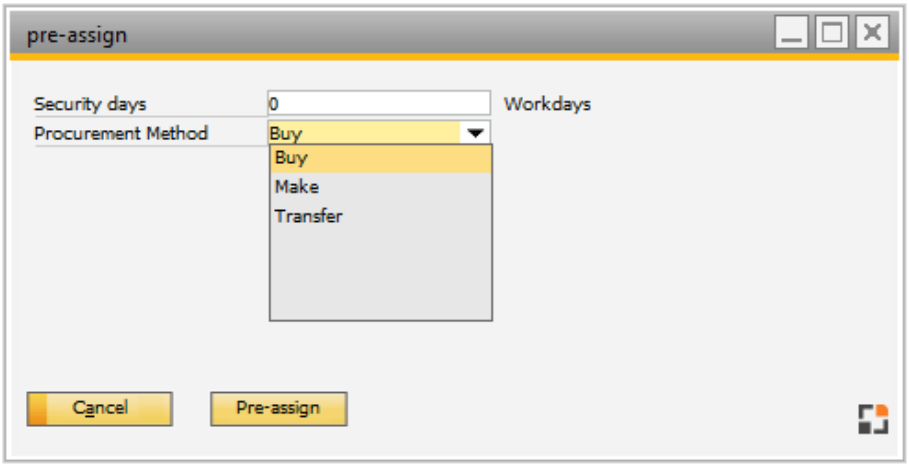
Outflow	Sum of all planned issues in Inventory UoM (according to current filter settings) plus sum of all planned inflow in Inventory UoM (according to current filter settings), excluding order-related quantities (e.g. bill of materials with order related item).
Balance	Balance of stock level-minimum stock-planned issue+planned inflow in the period of computation displayed in Inventory UoM.
Reservation	Total reserved quantity. **WMS Integration:** From Beas Manufacturing 2024.04 on, this field considers WMS Batch/LUID and Detail level locks. **Important:** The "Balance: Reservation Consider" parameter must be activated for this.
EH	Inventory UoM.
Warehouse	Default warehouse of the item Note: If you create a work order, the system uses the Production warehouse related to all Warehouse rules and Configuration settings. It does not use the Default warehouse.
Action	Action to be taken by MRP. In Massive mode, this column is automatically filled with the selected procurement method: - Buy - Make - Transfer: Transfer between Replenishment warehouse and the current warehouse. Note: When the quantity in each line is entered manually (manual mode), the system only fills this field with values "Buy" or "Make". You must select "Transfer" manually.
Warehouse from	Replenishment warehouse. Select the supplier warehouse to transfer items from - mandatory field only for "Transfer" action.
Repl. Stock	Replenishment stock quantity in Inventory UoM. The sum indicated in this columns reflects all the stock in different Replenishment warehouses.
Direct item	The column shows direct (check box active) and indirect items (check box inactive) Direct item: the material is directly related to the filter. Indirect item: the material is indirectly related to the filter. You can make the column visible in Window settings.

© 2026 Boyum IT Solutions A/S

Order recommendation by: CW x Month x or user defined	Order recommendation for next calendar weeks, months or other time units, that can be defined manually. Detailed information PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button First slot (e.g. <= CW5) : week at the moment of the MRP run. second to second to last slot: slots of defined duration (e.g. one week) last slot: all requirements from the beginning of the last slot until the far future.  *Window maintenance_ order_ browse.psr* Depending on the defined time period for the calculation and the type of time period representation, the system calculates the count of columns. 2–18 periods are displayed then. In Planning Scenario > Scheduling you can define other time units, for example monthly, bi-weekly or in customized time unit definitions. **Attention! Order proposal date is not the requirement date!** An order proposal corresponds to the requirement date minus the average delivery time, lead time and some buffer days. More Information In the order recommendation list it is possible to determine the quantity to be ordered automatically, even if the last possible date has not yet been reached. Select the number of buffer days, as well as the desired procurement method. Then, the test starts determining what quantity should be ordered, taking into account the lead time + buffer days (working days):

© 2026 Boyum IT Solutions A/S

PATH: MRP > MRP Wizard/Order recommendations > Select a scenario > **Order recommendation** button > **mode** button > **Pre-assign** button.



WIndow mrp_strukturansicht_vorbelegen.psr

Calculation

The **requirement date** (list of peggings) is less or equal to the current date + lead time + buffer days given in working days. The sum of the affected peggings, taking into account the already planned receipts in this period, is the quantity to be ordered or to be produced. The calculated **delivery date** is, at earliest, the current day (today) + replenishment lead time + buffer days (work days). The determined date is at least one day after current date + replenishment lead time. If the determined day is not a working day, the next working day is identified and proposed. The determined values are entered in the order recommendation item list (upper part) in columns "quantity" and "requirement date".

Click the **Create request** button to complete the process.

Note: This pre-allocation function considers only storage-related assemblies.

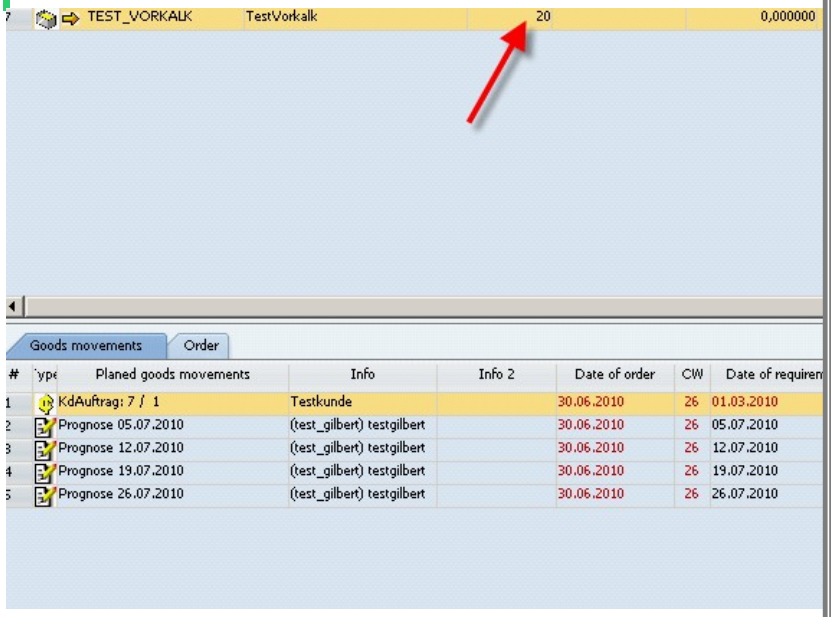
Attention: Supplier and price need to be entered prior to the creation of purchase documents. Items without this information are ignored.

Examples for the calculation of the order proposal date with help of the pre-allocation function:

© 2026 Boyum IT Solutions A/S

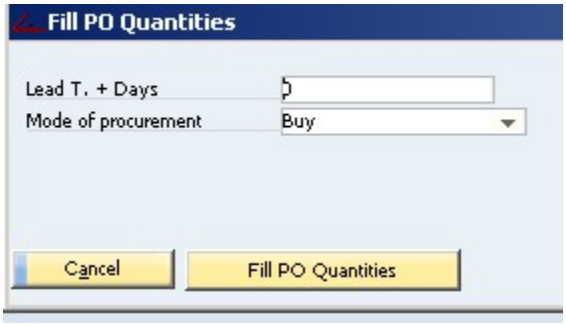
1. Lead time from the item master appears in the calculation is 20 days.

   PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button

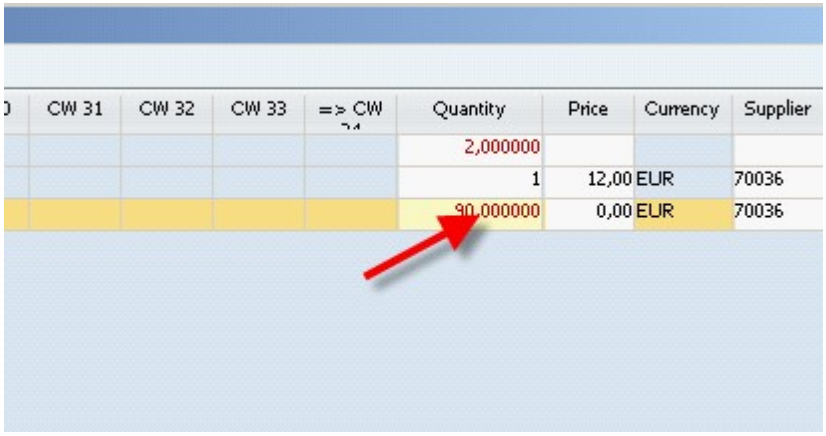


Window: mrp_view_masterrahmen

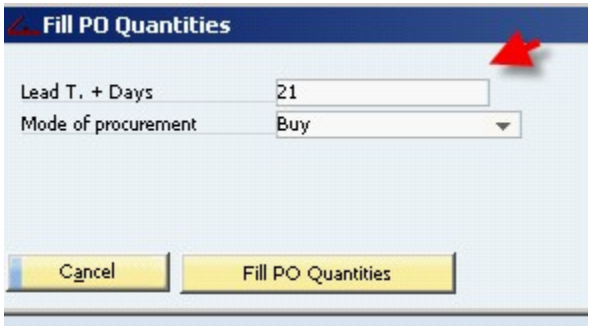
2. Fill PO quantities. Additional days can be entered.

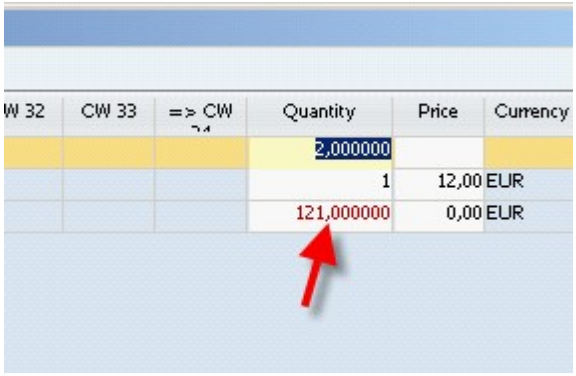


© 2026 Boyum IT Solutions A/S



Period = Current day + Lead time (item master) + work days
End of the period = 24.07.2010
The last requirement of 31 pieces from 26.07.2010 is outside the period.





Period = Current day + Lead time (item master) + work days
End of the period = 23.08.2010
The last requirement of 31 pieces from 26.07.2010 is now inside the period.

© 2026 Boyum IT Solutions A/S

	If by right-clicking on a calendar week the purchase order quantity (field "quantity“) is pre-allocated, the delivery date is also pre-allocated according to the selected calendar week. It is also possible to enter the desired delivery date of the purchase order to be created. **Order multiples** Order multiples (item master) is taken into account. ***Example***: Order multiple 10 Purchase order recommendation CW of 10: 6 pcs, CW 11: 4 Pcs Displayed: CW 10: 10 Pcs, CW 11: 0 Pcs It is always rounded up to the next order multiple and the subsequent purchase is covered by it. Double requests are avoided. **Order possibility** **Collective purchase request/collective production request**: Right-click on the time heading (CW x), which uses the order quantities for CW x. The requirements are entered in the quantity column. Only entries with corresponding requirements are displayed. For purchase orders the price and the supplier must be entered, for production request only the quantity. Then, the process can be started via "production request" or "order request". **Take over single quantity**: If the quantity is to be used for one item, right-click in the CW x column on the corresponding item and choose "order request" or "production request". This is not possible in collective order mode. For activating the detailed view click on the **mode** button. Thereafter, data can be completed and the process can be started.
Quantity	Quantity to be purchased / produced in Inventory UoM (Column header "quantity"). **Color codes:** GRAY: For "Make" items RED: For "Buy" items
Quantity purchasin	Quantity to be purchased / produced in purchasing units (Column header "quantity").

© 2026 Boyum IT Solutions A/S

g item	**Color codes:** GRAY: For "Make" items RED: For "Buy" items
Purchasing UoM	Purchasing UoM according to item master data.
Factor Purchase UoM	Factor Purchasing UoM to Inventory UoM according to item master data.
Price	Purchase price, editable Beas reads the price automatically if you change the date, supplier or quantity. based on: - Purchase blanket agreement - special prices - price list (linked to the supplier) - standard price list Beas uses the same concept as SAP Business One – Purchase order If there are no supplier price lists and no special price lists, the last purchase price is used. Price is displayed in purchasing UoM. Price is for "today" (not delivery date) **Note for blanket agreements** Blanket Agreement is only checked if: - Agreement Type = "Specific" - Status is Approved - Today inside Start- and End Date - "Set as Default" is activated (NOTE: In SAP 10.0 this field is not available any more)

© 2026 Boyum IT Solutions A/S

	Currency	Currency for purchase. The system use the Currency from the defined price list, Blanked agreement and so on.
Supplier	Default supplier according to item master data (can be changed). Choose Supplier in dropdown list : Option is to be defined in the Configuration Wizard: ***See***: Configuration wizard - Materials management - MRP wizard - view - supplier selection
Name	Supplier name.
Blanked Agreement Number	Purchase Agreement Number for the current defined supplier and Item The system select the correct Purchase Agreement number automatically for current supplier, quantity and delivery date.
Blanked Agreement ID	Internal Purchase Agreement Number
Gross price	If a gross price list for the chosen supplier was stored, all price quotations are then carried out for gross prices (cannot be changed). If an order is prepared, the price is submitted as a gross price.
Deliv. date	Delivery date for the purchase order to be created. It is pre-allocated with the first outflow (e.g. requirement date from customer order or work order). The balance (inventory, other inflow) is not considered. If the first planned outflow is in the past, this date will be displayed in this field.
Date of order	Planned inflow of first purchase order. **Color codes:** RED: Date is today or before today. GRAY: Date is later than today.
First demand	First planned issue (delivery date of customer order, forecast). **Color codes:**

© 2026 Boyum IT Solutions A/S

	RED: Date is today or before today. GRAY: Date is later than today.
Sales Uom	Sales UoM.
Sales factor	Factor Inventory UoM to sales UoM.
MRP	Scheduling ID according to item master data.
Order related	Active for order related items.
Procurement Method	Purchase item or production item.
Produce	Active for production items.
Buy	Active for purchase items.
Sales item	Active for sales items.
Purchase item	Active for purchase items.
free	Clearance attribute according to item master.
free from	Clearance attribute "from" according to item master.
free to	Clearance attribute "to" according to item master.
blocked	Attribute blocked according to item master.
blocked from	Attribute blocked "from" according to item master.
blocked to	Attribute blocked "to" according to item master.
Item account	Default account as per item master. Note: The account is only correct if the account was set up per item.
raw material	Raw material according to item master.
Order multiple	Order multiple according to **item master data > Planning Data tab**.
Minimum order amount	Minimum order amount according to **item master data > Planning Data tab**.

© 2026 Boyum IT Solutions A/S

Maximum amount	Minimum order amount according to item master.
Goods issue for production	Total of planned production outflow.
Goods receipt from production	Total of planned production on hand.
Ordered	Total of incoming purchase orders.
Sales order	Total Sales order outflow.
Quantity for chosen PO	Total items for PO as selected in **Planning > Detail > Filter**.
Release for production	Release ID as per item master.
Drawing number	Drawing number according to item master.
DIN	DIN - according to item master.
Match code	Match code - according to item master.
Priority	Priority of the item If the demand for this item is caused by another item (assembly), which has a higher priority, the priority of the originator is displayed. It can be set in the Configuration Wizard, whether a high or a low number has higher priority. The priority is set in the **Item master data > Planning data > Priorities.** ***Also see:*** Configuration wizard - Planning data - Priority Sales order - Priority

© 2026 Boyum IT Solutions A/S

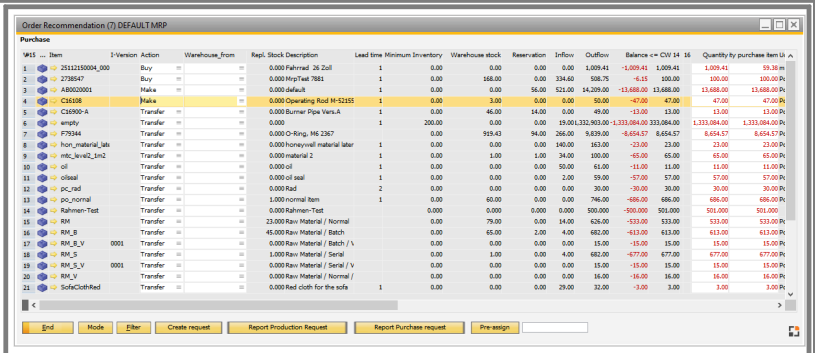
Material group	Material group according to item master.
UDF 1-3	Freely definable field (Only available via customization). Any change made is saved immediately. You can rename the fields with Beasscript using the „tabredraw lmaster“ event. Entered values are saved and stay available as long the order recommendation is not recomputed.
Stock underrun PO	Stock underrun for the PO selected in **Planning > Detail > Filter**.
Remark	Free text. Note: The content is not saved and stays available until the list is redrawn. This field may be used for customizations, as well as fields "UDF1 ... UDF3".
Project	Not supported.
First inflow	First inflow by purchase (P) or production order (W).

Right-click functions

ATTENTION: To create a Purchase request or a Production request, go to perform the command in the "Action" column in the top list for a single item.

Field	Description
Cancel	Closes order recommendation window
Mode	Change between Single and Massive mode You can manage requirements to plan production, purchase or inventory transfer documents by switching between two **modes**: **Single mode** (default view of the Order recommendation window) **Massive mode** By switching to Massive mode, you can work on item level for planning purchase requests, production requests or Inventory transfer requests. Click the mode button, and the complete bottom window area disappears to perform functions for all the lines:

© 2026 Boyum IT Solutions A/S

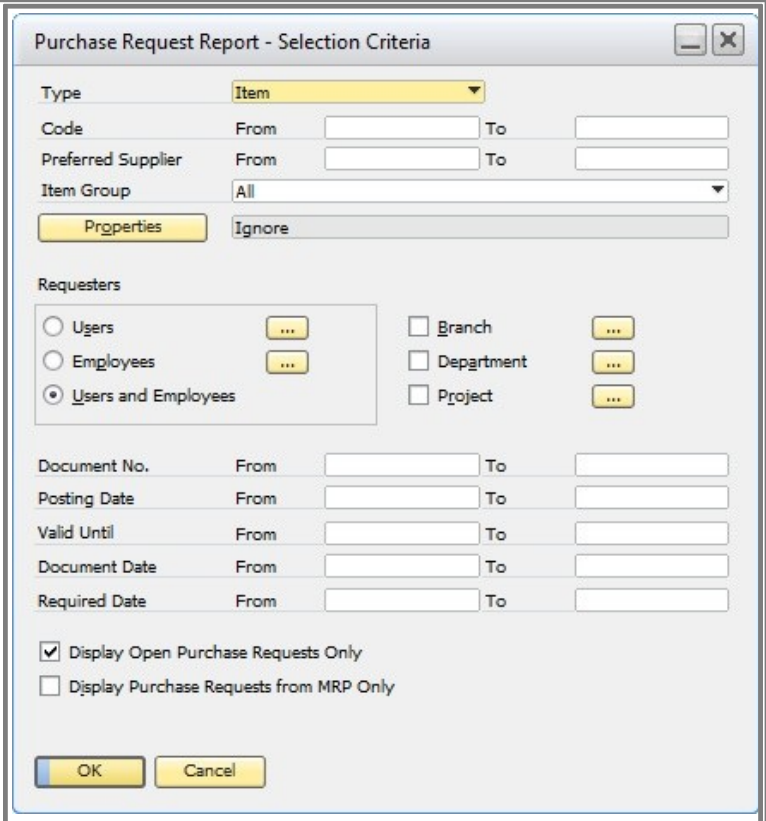


Button	Function
Create request	Generate documents for each line with one click according to what was defined in the Configuration wizard: - Buy actions: Purchase request - Make actions: Production request - Transfer actions: Inventory transfer request. Note: For Transfer actions you must define a Replenishment warehouse in the corresponding field of the Order recommendation list.
Pre-Assign	Opens a new window to calculate what quantities need to be produced or purchased for the next X days. Use this to make material requirement planning for a defined upcoming period.

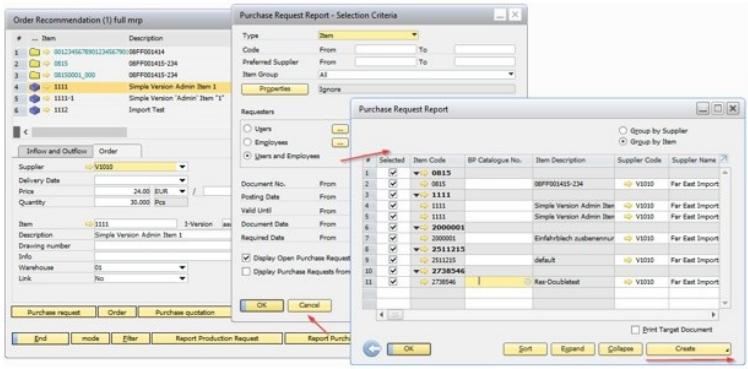
© 2026 Boyum IT Solutions A/S

	Button / **Function** ***See*** functionality description in Pre-Assign
Filter	Settings for fixed filters
Report production requests	Opens list of Production requests
Report purchase requests	Opens list of Purchase requests The button is only visible if the user has the authorization to create a purchase request. It uses a Beas or SAP variant for purchase request. ***See*** Configuration wizard – purchase request SAP Variant Opens the SAP Purchase request report window This is not possible if you start Beas in standalone mode. PATH: Purchasing - A/P > Purchasing Reports > Purchase Request Report

© 2026 Boyum IT Solutions A/S



From this window you can create a Purchase Order and Purchase Quotation from the Purchase request:



beas 9.3 PL 2

Beas Variant:

Opens the Beas Purchase request window
From this window you can manage all purchase requests, create purchase orders, purchase quotations or draft documents.

© 2026 Boyum IT Solutions A/S

	PATH: MRP > Purchase request  For more information ***see*** Beas purchase request.
Pre-assign	Only visible after switching to Massive mode with the **mode** button (***see*** above).

Fixed filters

Context menu and filters

Planning

9.2.1.1.1 Context menu and filters

PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button.

Right- click on column title: Various functions are available, depending on the column data. The sorting function is available in all columns.

Right-click on column supplier: Sort by supplier number (items without supplier number are filtered out), requirement date, order date and first demand into ascending or descending sorting.

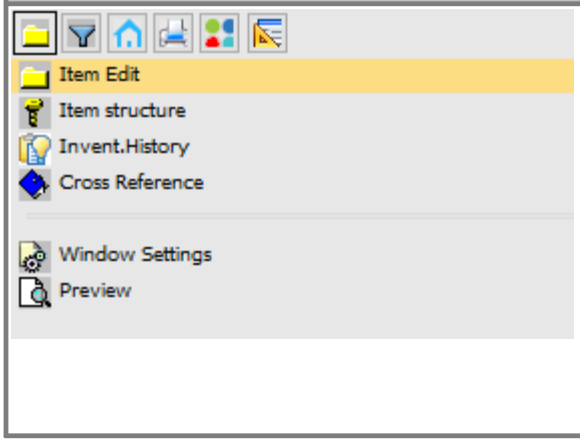
Right-click on column CW: Apply quantities for purchase order, production order (pre-allocate) or transfer request.

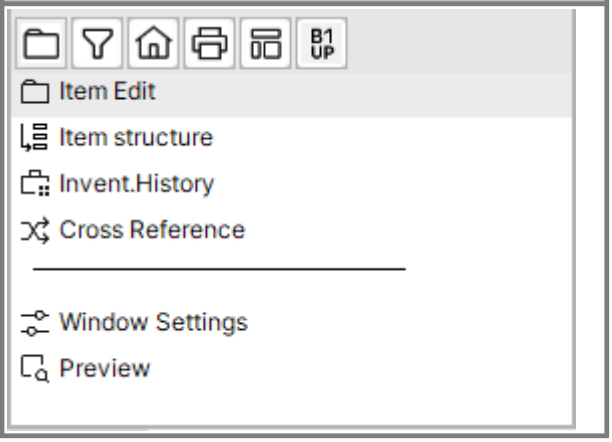
Note: By selecting "Inventory transfer for:", the window switches to Massive mode and only displays "Buy" and "Transfer" items.

Right-click menu on an item row

© 2026 Boyum IT Solutions A/S

Folder symbol

Traditional style	Boyum Style
	




Field	Description
Edit item	Open item master.
Item structure	Open item structure.
Inventory history	Open Inventory history of the item.
Cross reference	Open Item cross reference.
Window settings	Settings, which columns are displayed.
Preview	Preview for print.

Filter symbol

Enhanced filter	Open definition window for enhanced filter
Balance <0	Show only entries with balance <0
Balance >0	Show only entries with balance >0
Demand for CW ...	Show order requirements for selected CW

General, export and template menu options are generic for all Beas windows and are described in Right-click menu.

Right-click menu in the inflow/outflow area

Folder symbol

Field	Meaning
Work order for	Change to the Produce tan and open the window to create a production request or work order.
Customer order for	Open SAP Business One customer order.
Allocation	Over a work order, open the allocation windows for the selected item.
Stock Transfer	Open the manual stock transfer windows.
Reservation for	A hard reservation is made for the requirement of the customer order.
Total requirement	Set a filter in the item list (new tab).
Calculation update	Update the upper item list. Peggings and replenishments are read again without breakdown of peggings. **IMPORTANT:** ***See*** detailed Configuration wizard setting description. **Limitations:** 1. Summary values cannot be recalculated. 2. If changes affect other items, these are not recalculated. 3. Peggings, arising from other peggings, (e.g. breakdown of customer orders), are not updated.
Preview	Preview for print.
Window settings	Settings of column visibility.

Filters

© 2026 Boyum IT Solutions A/S

You can filter the order recommendation list by different criteria. Fixed or temporary filters can be set up.

Method	Meaning
Filter button	Using the Filter button a fixed filter can be set in advance, which can be stored per user and scenario. ***See*** Fixed Filters .
Right-click on the column header	Filter suggestions are provided depending on the column data. ***For example***: Right-click on lead time opens the following filter options: Without lead time, lead time greater than 0, lead time greater input field, lead-time equal to the input field. Sorting options are also available.
Right-click on pegging	By clicking on a pegging, (e.g. a line in the customer order in the lower area), this can be set as filter criteria: all items and dependent items, which are needed for this line of the customer order.

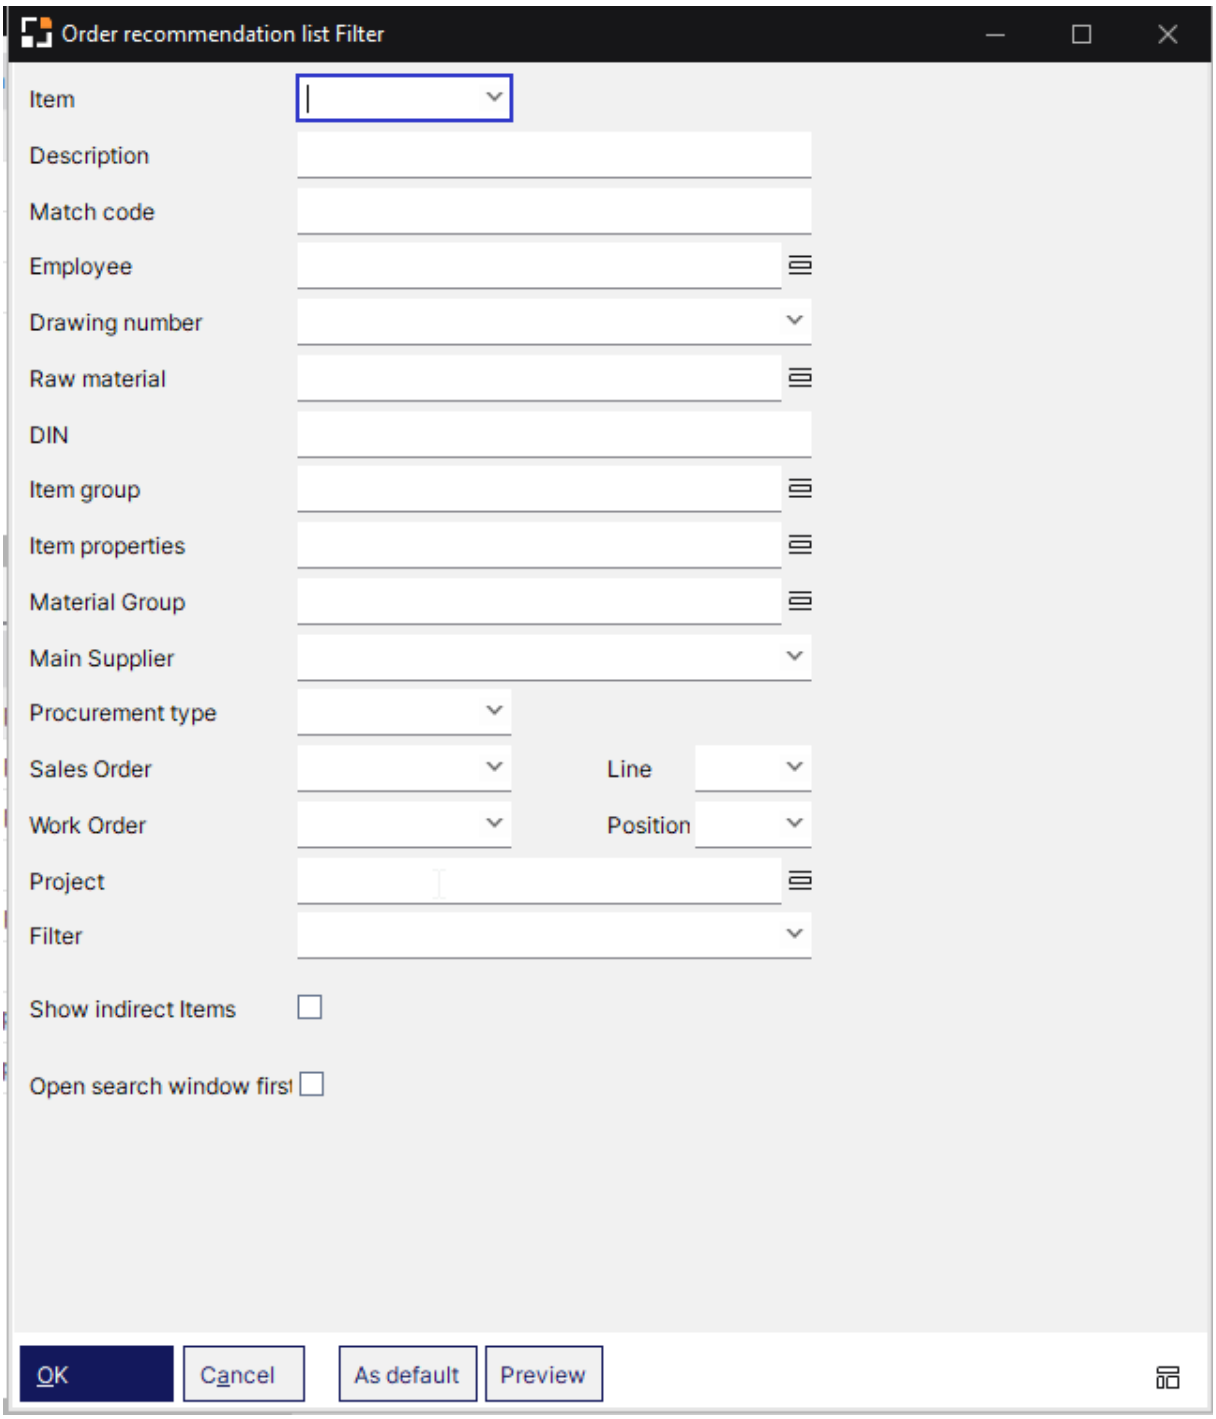
9.2.1.1.2 Fixed filters

PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button.

Via **Order recommendation > Filter > Function** a fixed filter can be stored, and saved per user and scenario.

Call up: use the **Filter** button in the order recommendation window.

© 2026 Boyum IT Solutions A/S



window: mrp_view_search

Note:

The upper item list is filtered. The filter has no influence on balance calculation or the display of peggings or planned inflow.

It is possible to create a filter per template.

© 2026 Boyum IT Solutions A/S

If a template is active, the filter definition is saved in the template.

In this way you can create different MRP scenarios per MRP Definition with templates.

Field description

Field	Meaning
Item	All items beginning with the search term.
Description	All items whose description begins with search term (placeholders are not allowed here).
Match code	Match code of the item (optional) .

Employee	Items assigned to this employee.
	The assignment is done in the item master under employee.
	Compatibility Notes:
	All items with no employee assignment have been displayed additionally.
	The following has to be added in the Open Event of the filter-window if the "old" behavior is expected:
	`setvar=ib_emptyemployee=true`
	Example as Script
	`windowevent open`
	`setvar=ib_emptyemployee=true`
	`end event`
	The effect appears at existing filter only when the filter will be changed.

Drawing number	Items with this drawing number stored in item master.
Raw material	Items with this raw material stored in item master.
Material group	Items with this material group stored in item master.
Main supplier	Items with this main supplier stored in item master.
Procurement type	Items with this procurement type Buy = All items with Procurement Method = "Buy" Make = All items with Procurement Method = "Make"

© 2026 Boyum IT Solutions A/S

<table>
<tr><td></td><td>Make or Buy = All items with Procurement Method = "Make" and "Purchased part" is activated
All = all items</td></tr>
<tr><td>Sales order</td><td>Items needed for the given sales order. Also a line from the sales order can be entered.</td></tr>
<tr><td>Work order</td><td>Items needed for the given work order. Also a order position can be entered.</td></tr>
<tr><td>Project</td><td>Item needed for the given project. (Project is taken from Sales order, Work order, etc.)</td></tr>
<tr><td>Filter</td><td>Predefined Filter
The following predefined filters are available:
<table>
<tr><th>Filter</th><th>Meaning</th></tr>
<tr><td>Only shortage</td><td>All item entries with negative balance at present or in the future.

Important:
The entire time-line is checked – not only the current balance or the balance at the end of planning horizon.

If the balance is under-run at any time (e.g. possibly because the planned inflow of an order is too late) with more than what is defined in Tolerance Days, this entry will be displayed.

The system ignores negative balance that is in the past.

Tolerance days
In Item Master Data > Planning Data tab you can define Tolerance days.</td></tr>
</table></td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Filter	Meaning
	 Related to order scheduling: If there is negative stock in the time line, the item will be shown as shortage in MRP. Here you can enter the number of days. Negative balance is tolerated. ***Example:*** Stock = 0 Sales order = 3rd May Purchase order delivery date = 6th May Material comes 3 days late  If the tolerance date for this item is defined with 3 days or more, the result is: OK If the tolerance date is < 2, MRP must display this piece of information. In MRP the filter "Only shortage" means: Display all entries which have a negative balance in the timeline.

© 2026 Boyum IT Solutions A/S

Filter	Meaning
	 **(MRP Filter - Predefined Filter)** In this example the item has a balance of 0, but a negative balance between 3rd and 6th May MRP displays this item if the item has "tolerance days" < 3 days. MRP does not display this item if the item has a "tolerance days" > 3 days. **Negative Balance in past** Negative Balance in the past is ignored entirely. The calculation for the time area starts from the current Date. ***Example:*** Today is 5th May Sales Order is 3rd May Delivery = 6th May The system calculates: Balance is negative from 5th – 6th May = 1 day.

© 2026 Boyum IT Solutions A/S

	<table><tr><th>Filter</th><th>Meaning</th></tr><tr><td>All calculated entries</td><td>All item entries.</td></tr><tr><td>Current balance < 0</td><td>All item entries with a negative balance at the end of the planning horizon.</td></tr><tr><td>Current balance > 0</td><td>All item entries with a positive balance at the end of the planning horizon.</td></tr><tr><td>Reaching inventory limit</td><td>All item entries reaching inventory limit at the end of the planning horizon.</td></tr><tr><td>Filter 1...3</td><td>Up to three additional fields can be set up. ***See*** Configuration wizard – Materials management – MRP wizard – View.</td></tr></table> Allowed maximum number of characters is 1000 chars.
Show indirect items	If this check box is active, the system adds further Items to the calculation if they are related to the item range defined in the filter.
Open search window first	If active, the search mask is opened first at call up of the order recommendation list.

Functions

Function	Meaning
as default	⊟ The filter defined here is saved No template saved: Filter is stored as default for this scenario and the current user. A Template is active: Filter is assigned to the current template. The filter defined here is active if this template was selected.
Preview	Show results of filtering without closing the window.

© 2026 Boyum IT Solutions A/S

OK	Use the current filter. It remains active until the window "Order recommendation" is closed. If saved as default, it remains active until changed.

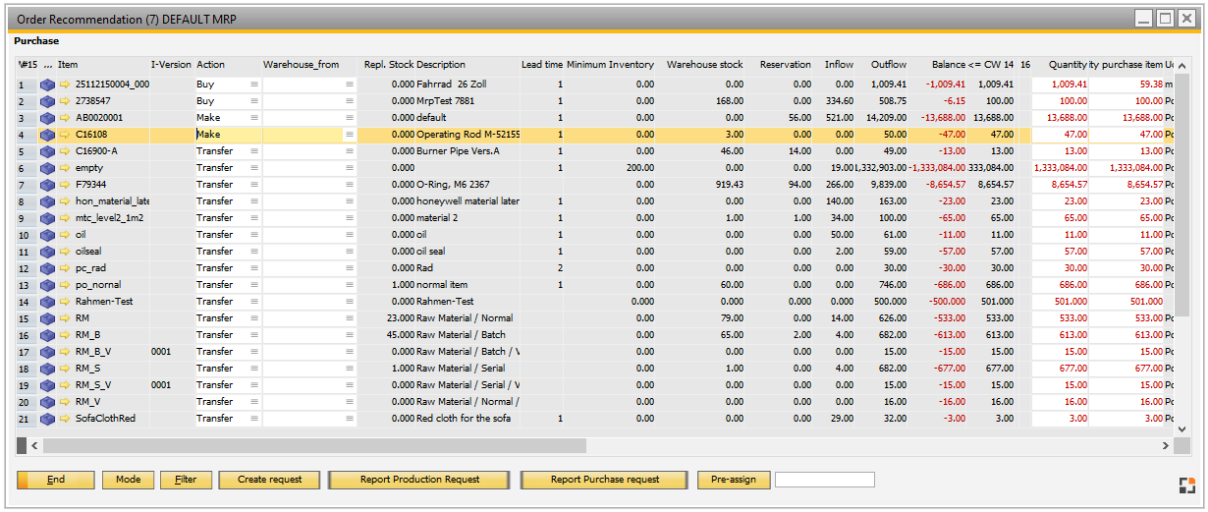
back to order recommendation view

9.2.1.1.3 Massive mode

You can manage requirements to plan production, purchase or inventory transfer documents by switching between two **modes**:

Single mode (default view of the Order recommendation window)
Massive mode

By switching to Massive mode, you can work on item level for planning purchase requests, production requests or Inventory transfer requests.
Click the mode button, and the complete bottom window area disappears to perform functions for all the lines:



Button	Function
Create request	Generate documents for each line with one click according to what was defined in the Configuration wizard: - Buy actions: Purchase request - Make actions: Production request - Transfer actions: Inventory transfer request.

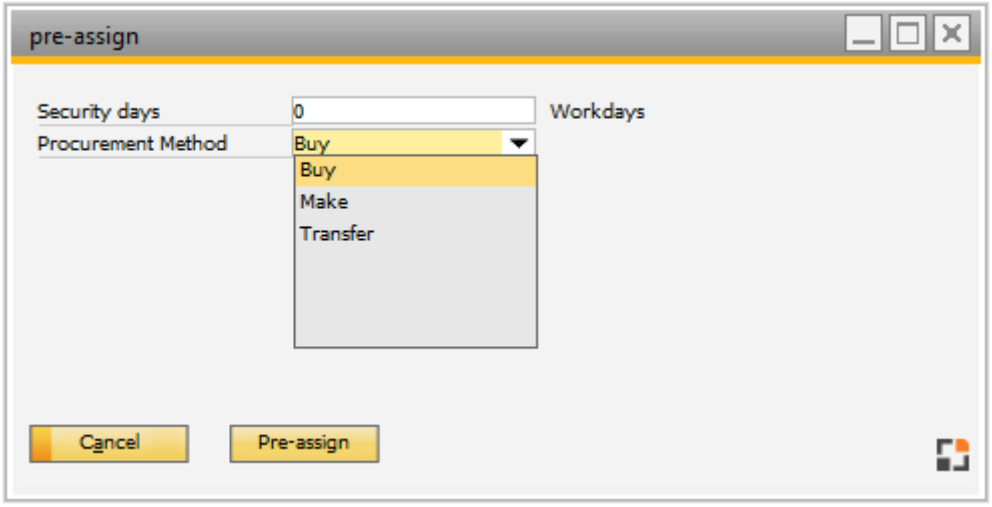
© 2026 Boyum IT Solutions A/S

Button	Function
	Note: For Transfer actions you must define a Replenishment warehouse in the corresponding field of the Order recommendation list.
Pre-Assign	Opens a new window to calculate what quantities need to be produced or purchased for the next X days. Use this to make material requirement planning for a defined upcoming period. ***See*** functionality description in Pre-Assign

9.2.1.1.3.1 Pre-Assign

In the order recommendation list it is possible to determine the quantity to be ordered automatically, even if the last possible date has not yet been reached. Select the number of buffer days, as well as the desired procurement method. Then, the test starts determining what quantity should be ordered, taking into account the lead time + buffer days (working days):

PATH: MRP > MRP Wizard/Order recommendations > Select a scenario > **Order recommendation** button > **mode** button > **Pre-assign** button.



WIndow mrp_strukturansicht_vorbelegen.psr

Calculation

The **requirement date** (list of peggings) is less or equal to the current date + lead time + buffer days given in working days. The sum of the affected peggings, taking into account the already planned receipts in this period, is the quantity to be ordered or to be produced. The calculated **delivery date**

© 2026 Boyum IT Solutions A/S

is, at earliest, the current day (today) + replenishment lead time + buffer days (work days). The determined date is at least one day after current date + replenishment lead time. If the determined day is not a working day, the next working day is identified and proposed. The determined values are entered in the order recommendation item list (upper part) in columns "quantity" and "requirement date".

Click the **Create request** button to complete the process.

Note: This pre-allocation function considers only storage-related assemblies.

Attention: Supplier and price need to be entered prior to the creation of purchase documents. Items without this information are ignored.

Examples for the calculation of the order proposal date with help of the pre-allocation function:

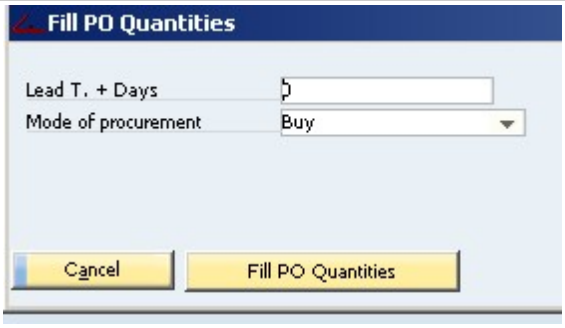
1. Lead time from the item master appears in the calculation is 20 days.

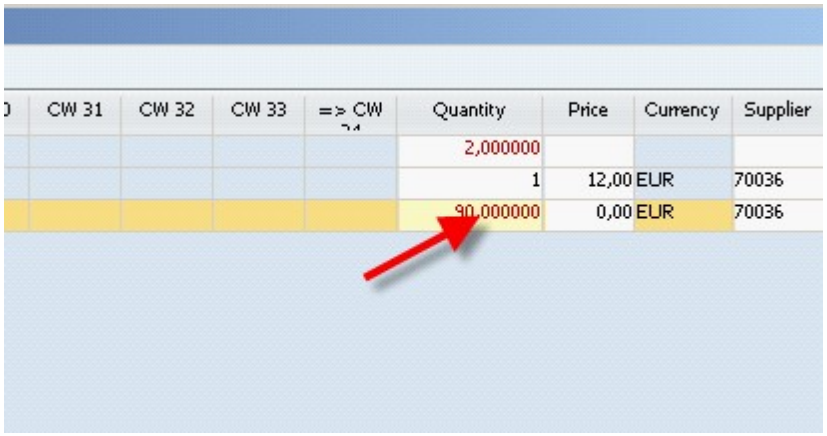
   PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button

   Window: mrp_view_masterrahmen

2. Fill PO quantities. Additional days can be entered.

© 2026 Boyum IT Solutions A/S

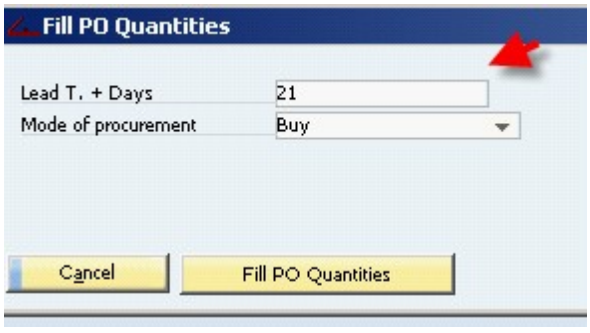




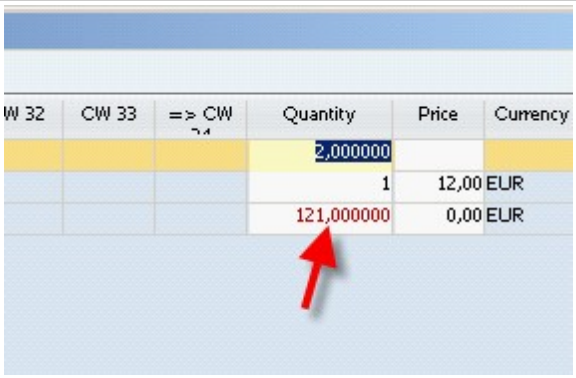
Period = Current day + Lead time (item master) + work days

End of the period = 24.07.2010

The last requirement of 31 pieces from 26.07.2010 is outside the period.



© 2026 Boyum IT Solutions A/S



Period = Current day + Lead time (item master) + work days
End of the period = 23.08.2010
The last requirement of 31 pieces from 26.07.2010 is now inside the period.

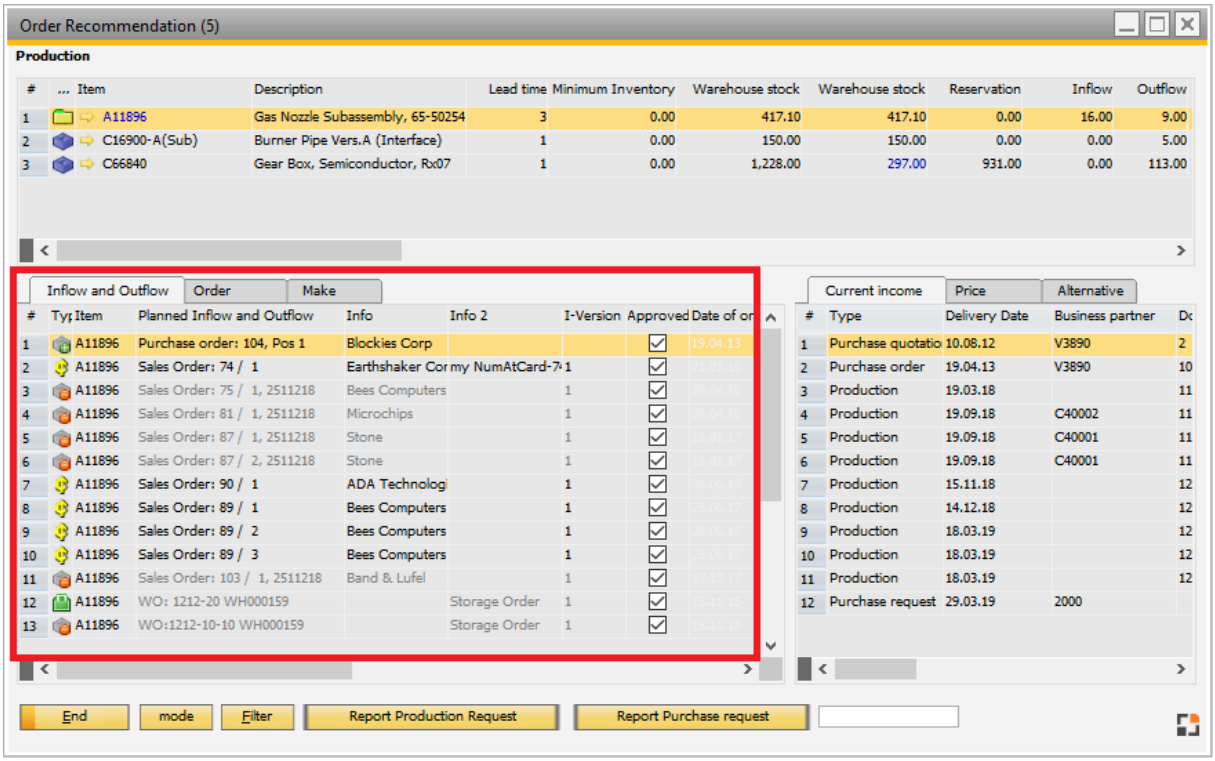
9.2.1.2 Requirement

Order recommendation list	
Inflow and Outflow	Info area
Order	
Make	

In this window section of the Order recommendation you can manage all requirements and can create an order related to the linked Sales order or Work order requirements .
To work on item level instead, switch to "Massive" mode and use the Order recommendation list.

PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button.

© 2026 Boyum IT Solutions A/S



Window: mrp_view_masterrahmen.psr

9.2.1.2.1 Inflow & Outflow

This tab lists all requirements for producing or purchasing an item selected in the upper order recommendation list.
The detailed, daily/weekly/monthly or summed view of the requirements can be set in **Item Master > Planning Data > Accumulation**.

Double-click an order in this tab, and either the Order tab opens where you can edit and create purchase documents, or the Make tab to edit and create Production requests or a work order.

Considering Warehouse rules

If you double-click over the sales order line, the system copies a lot of sales order information to the Make tab and defines the Warehouse based on the defined warehouse rules.
If you simply click on Make tab, Beas does not copy any value from the inflow/outflow information, and you can manually fill all information that you need. In this case, Beas searches for the warehouse rule when the tab is activated, and thus no "origin" document is taken into consideration to find the warehouse rule.
Important: If you manually modify the link and set a sales order or any order information, the Warehouse rule is not recalculated.

© 2026 Boyum IT Solutions A/S

- Inflow & Outflow tab

Field	Description
Type	Type of inflow / outflow (symbol).
Planned inflow_outflow	Number and description of pegging (order and item).
Info	Name of customer/supplier.
Info 2	Content of "Customer ref. Nr".
Approved	- Requirement approved This switch is dependent on the pegging. In sales area the switch **Sales document > Logistics > Approved** serves as reference. **Sales area:** • Forecast: always released • Sales order: approved from document *ORDR.Confirmed* • Advance invoice: approved from document *OINV.Confirmed* • Transfer request:"approved from document *OWTQ.Confirmed* • Blanket orders: always released • Recurring sales orders: always released • SCM: always released Originated material requirement receives the same status. **Production area:** • Assemblies and BoM: approved from work order position *beas_mrp_detail.released 1/0* This switch is enabled if customer order is approved.
Date of order	- Latest date to order the goods or to start the production Calculated from the requirement date minus replenishment time or calculated production time. The date is only displayed if the balance is negative. The date is set to the current date if it is in the past. **Colors:** RED: If the date is before today, the date is displayed in red. GRAY: If the line is not evaluated, the date is displayed in gray.

© 2026 Boyum IT Solutions A/S

	Calculation of the production time is done independent of any lot sizes. The required quantity is always used as lot size. Planned receipt of first purchase: At purchased items the number of workdays stored in the Configuration wizard is subtracted. Calculate order recommendation date
CW	Show the calendar week of the order date.
Date of requirement	Date of requirement of the material or assemblies. ***See*** Calculation of purchase recommendation date If a work order or a purchase order is created, this date is indicated as the delivery date. Purchase order for several instances of the same Item with different delivery dates is supported. The items, therefore, appear in several lines in the Order recommendation. **Colors:** RED: If the date is before today, the date is displayed in red. GRAY: If the line is not evaluated, the date is displayed in gray. ***See*** Purchase Create
Inventory	Stock before or after next inflow If minimum stock is considered, it is taken into account as follows: Minimum stock is calculated as a requirement at the moment of calculation. Peggings from the past have no effect. Minimum stock can become a pegging only if it has a negative balance at the moment of calculation. Balance by warehouse stock minus minimum stock is **positive**:

© 2026 Boyum IT Solutions A/S

	The minimum stock is subtracted directly from the warehouse. The minimum stock is not displayed as a requirement because it does not create a requirement. Balance by warehouse stock minus minimum stock is **negative**: The minimum stock is displayed as the pegged requirement (separate line). ***See*** Scenario > Details > Consider minimum stock Depending on setting in **MRP wizard > Details > Inventory > Balance: consider reservations.** If enabled, the reserved quantity is subtracted from stock. The field is inactive by default (***See*** window settings).
Inflow	Sum of all inflow Planned receipt quantity. Can be (example) - Work order positions - Negative Work order Bill of Materials positions If it is an order-related sub position of a work order, it only appears as neutral quantity (gray). If the quantity is higher than the quantity of the related Bill of materials position, only the quantity higher than the Bill of materials quantity is displayed. ***Example***: Special case for inflow or outflow work order sub-assemblies: work order with order-related sub-assembly (BoM position 10, item abc, covered by work order position 30, item abc) PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button 
© 2026 Boyum IT Solutions A/S

	Bill of materials: 1 Pcs Sub-assembly order related: 1 Pcs Balance is 0, inflow and outflow neutral. This is not visible in inflow or outflow, and in the requirement list it is gray. PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button  However, if you change the quantity from order-related sub-assembly, it changes. The quantity displayed is not for the main assembly but for the stock. PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button Outflow	Sum of all outflow. Sum of all planned outflow can be Sales order, Work order, Pre-Invoice etc. Work order Bill of Material Positions Total open Quantity of Work order Bill of Materials position `(Planned Quantity from BoM Position * Open quantity from Work order position)`

© 2026 Boyum IT Solutions A/S

	If this position is linked to a work order position (order-related item) then Beas checks if the planned open quantity is the same as the current one `open BoM Quantity - Reservation` Follow example  ***Example:*** Bill of materials = 1, but we produce 10 9 is for the stock In Beas only one inflow column is available, but in this case: 1 Pcs = neutrally, 9 = income Beas displays this in the following way: Item list Inflow: Include the quantity of the stock, in this case 9, and increase the inflow quantity from 5 to 14. Requirement list inflow: Do not display neutral quantities and display only the stock related quantity = 9
Outflow without reservations	Field is inactive by default (***see*** window settings). Sum of all outflow, minus the quantity reserved for the pegging.
Balance	⊟ Balance of planned stock movements Balance of stock - minimum inventory - planned outflow + planned inflow within the calculation period of this schedule. Settings in **MRP wizard > Details > Inventory > Balance: Consider reservations** affect this as follows: **If enabled**, balance is calculation as stock minus reservations:

© 2026 Boyum IT Solutions A/S

- (outflow minus reservations)
+ (inflow minus reservations)
In total, reservations are neutralized, but the time line of requirements can change.
If disabled, reservations are completely ignored in balance calculation.

Color codes:
GREEN: The balance is positive.
RED: The balance is less than zero = negative.

See Configuration wizard > Production > Reservation

Note: If reservation is disabled, no correct balance can be displayed for order-related items. ***See*** item breakdown. Order-related items are managed by the customer order to work order function.

Note: For temporary reservation (***see*** requirement coverage) Beas does not check the Balance or order of entries.

Example:

This item is a stock-related sub-assembly. The order in this list is by Date of requirement.
Before the system checks which material is needed for the assembly, it checks if stock is available for this assembly.
If yes, Beas reserves the stock for this assembly and you do not need to produce it. The system does not check the required material.

The temporary reservation uses the defined priority: Minimum Stock, Work order, Sales order and so on.
What this means: Beas reserves the material for the work order (line 3) and **not for** the sales order (line 1 or line 2).
Right mouse click on line 3 - Origin you can see the defined reserved quantity.

© 2026 Boyum IT Solutions A/S

	 **Filter *Only shortage*** This filter shows all items that need to be ordered or produced, or for which the planned inflow is too late. In this case, assembly “B” would be shown as shortage, as the balance for 4th May is negative. The inflow to be used can be specified in **MRP wizard > Detail > Breakdown of resources**.
UoM	Unit of measure.
Reserved	Shows the reserved quantity for this pegging This refers to the sales order, reserved invoices, production Bill of materials item. If something was reserved for the item in a warehouse or planned receipt, a quantity is displayed here.
I-Version	Requirement of inflow with item version number For planned inflow or outflow the item version number can be indicated.
Drawing number	Drawing number stored in planned inflow or outflow Can be transferred to subsequent document and changed. If working with item version control, this is usually the item version number.
Requirement Coverage (Covered, Covering, Demand)	Breakdown of the assembly was prevented because the requirement is covered by a temporary reservation Requirement coverage is further broken down to 3 columns including coverage for sub-assemblies when it comes from the parent: **Covered:** Amount that can be covered by stock or expected inflows.

© 2026 Boyum IT Solutions A/S

Covering: Expected inflows that can be used to cover demand, visible at incoming receipts.
Demand: Final quantity demanded after considering coverage. Real demand = Quantity - Covered.

ID Description

ID	Description
(S)	Covered by quantity from stock. The assigned quantity is displayed. (OM)	Covered by multiple order or minimum order quantity.  **Format:** OM:"ItemCode" Qty:"Assigned quantity in this line"/"Accumulated quantity" UID: "Unique Identification of the line in MRP where the Inflow quantity is referenced" **IMPORTANT:** Activate the Consider multiple orders parameter! ***Examples*** **A. Consider multiple orders parameter ACTIVE:** 1. Set up a multiple order for 50 units in Item Master Data > Planning tab. 2. Create a Work order with this quantity, and activate the parameter in an MRP Scenario. 3. Check MRP Order recommendation Coverage information:

© 2026 Boyum IT Solutions A/S

ID	Description
	 This means that for first line the user will create a work order for 50 Units, in the second and third line, the orders are for 10 units, and also the remaining quantity available from the created work order. B. **Consider multiple orders parameter DEACTIVATED:** 1. Set up a multiple order for 50 units in Item Master Data > Planning tab. 2. Create a Work order with this quantity, and deactivate the parameter in an MRP Scenario. 3. Check MRP Order recommendation Coverage information: (WO)	Covered by planned production receipt.  **Format:** WO: "Work Order/Work Order position" Qty: "Assigned quantity in this line" Res: "Already reserved quantity" UID: "Unique Identification of the line in MRP where the Inflow quantity is referenced" **Reservations**

© 2026 Boyum IT Solutions A/S

ID	Description
	The Balance: reservations consider MRP parameter affects coverage calculation. **1. Balance: reservations ACTIVATED:** You have an item with a Work order to cover a specific Sales order. The Coverage field here does not display Work order information as it is not considered in the coverage calculation, and also doesn't modify the balance, because the quantity has already been reserved:  **2. Balance: reservations DECTIVATED:** In this case, MRP takes into consideration the Work order in coverage calculation and in balance:  **IMPORTANT:** The Reservation > Receipt reservation only at parameter affects the overall result of MRP coverage calculation.
(PO)	Covered by planned goods receipt from a purchase order.  **Format:** PO: "Purchase Order Number/Purchase Order Line"

© 2026 Boyum IT Solutions A/S

ID	Description
	Qty: "Assigned quantity in this line" UID: "Unique Identification of the line in MRP where the Inflow quantity is referenced"

For more information, ***see*** Requirement coverage calculation.

The list is sorted by the following criteria:

1. Shortfall of minimum requirement
2. Date of inflow or outflow
3. If the same date: first inflow
4. Document number

Field descriptions

Field	Description
Supplier	Supplier, for which you want to create a purchase order,-quotation or -request
Delivery date	⊟ Delivery date of the order Determined from the ⊟ Requirement date

Field	Description
Delivery date customer order	Delivery date stored in the customer order, prognosis, or another requirement originator.
Average delivery time	Average delivery time in work days, defined in the Configuration Wizard.
Lead time according to item master	Lead time in working days according to the item master, given lead time for planning.
Calculated lead	⊟ For an assembly (storage-related

© 2026 Boyum IT Solutions A/S

time	production): Using a backward scheduling simulation (routing of the assembly) the latest possible start date is calculated. Lot size is the requirement quantity. Multiple orders are not taken into account here. For order-related production: Using a backward scheduling simulation (routing of the assembly) the latest possible start date is calculated for the complete order-related item structure. This corresponds to the start date of the sub-assembly which must be produced first. Lot size is the requirement quantity. **Important**: The multiple orders, lot size, existing time reservations on resources are not taken into account during calculation. **ATTENTION:** In case of sub-assemblies, the parameter **only** affects lead time calculation of order-related sub-assemblies used as WO BoM! For storage-related sub-assemblies, the system uses fix lead time defined in Item master data. If calculation of the lead time was disabled, the item lead time is used as reference. The lead time is the sum of a single lead times of the order related sub-assemblies. 
© 2026 Boyum IT Solutions A/S

Example 1: Lot size and setup time.
Assembly A with operation sequence A1, 10 days setup time, lot size is 10.
Company calendar: Every day is a working day.

Customer order, delivery date 30.12.
Pos 1 100 pieces: Calculated: 10 days, start 20.12.
Pos 2 100 pieces: Calculated: 10 days, start 20.12.
Pos 3 200 pieces: Calculated: 10 days, start 20.12.

Example 2: Lot size and time for processing.
Assembly A with operation sequence A1, time for processing 1 hr/piece, lot size is 10.
Company calendar: Every day is a working day.
Resource has 1x10 hrs/day.
100 pieces = 10 days

Customer order, delivery date 30.12.
Pos 1 100 pieces: Calculated: 10 days, start 20.12.
Pos 2 100 pieces: Calculated: 10 days, start 20.12.
Pos 3 200 pieces: Calculated: 20 days, start 10.12

Apparently, there is a problem, there is only one single resource, capacity limits

© 2026 Boyum IT Solutions A/S

	and time reservations are not taken into consideration. This problem can only be avoided by the production orders being created as planned orders. Using APS, planned orders can be correctly scheduled and necessary resource times can be reserved.
Requirement date according to the forecast	The planned requirement date that is defined in the forecast. In a monthly forecast, it is the beginning of a month, in weekly forecasts, the Monday of the respective week. In case of an assembly, the required date of the sub-assembly is earlier.
Pre call time for prognoses	In the **Configuration Wizard MRP > Calculation > Forecast > Pre call time for prognoses** in calendar days.

Determining the date, depending on pegging

Field	Description
Customer order purchase part	Delivery date according to the customer order, average delivery time. Lead time according to the item master, period needed for replacement.
Customer order anonymous and order related production	Delivery date according to the customer order, average delivery time. Lead time according to the item master, period needed for replacement.
Forecast purchase part	Requirement date pre-call time for prognoses, lead time according to the item master, period needed for replacement.
Production BoM position	If the BoM is assigned to a routing position, its Processing time – Start time is as follows: Details: • With the Issue material with first

© 2026 Boyum IT Solutions A/S

	operation setting the Processing time – Start time is the first reportable, active routing position. • With the Issue material later setting, the Processing time – Start time is the last reportable, active routing position. • If there is no reportable routing position, the delivery date is used as reference. If the Consideration of link to routing parameter in the MRP Wizard was disabled, the start time of the work order position is used. If this was not set, the delivery date is used. From the date calculated this way, the first working day is determined according to the factory calendar. Then, the Item – lead time is subtracted in calendar days, and the lead time – safety days as per configuration wizard is subtracted in work days. If dealing with a purchase part, the Goods receipt – Idle time is also subtracted. If the resulting date is in the past, the order recommendation date is the next work day starting from the current day. ***See*** Order recommendation – Requirement. and from the current selected row of the pegging.
Single / daily / weekly / monthly	Single or multiple delivery days Select "single" for single delivery, the order is created for one date. For multiple delivery enter the date and quantities.

© 2026 Boyum IT Solutions A/S

	Beas suggests the delivery date and the necessary purchase dates, depending on the selected view: daily weekly 2-week and monthly  This view refers to the required date and, unlike the top list, not the "latest possible date of order." Dates are proposed considering the factory calendar and the quantity is calculated with consideration of order multiples. Result: Even if a weekly order is selected according to the forecast, it is possible that other than a weekly request is presented. As the delivery date is suggested as the beginning of a time range, it takes account of the factory calendar. In the monthly view, this appears clearly.
Quantity	Quantity purchase UoM. Note: Unit groups are not supported!
Price	⊟ Purchase price according to standard pricing Beas reads the price automatically if you change the date, supplier or quantity. based on: - Purchase blanket agreement - special prices - price list (linked to the supplier) - standard price list

© 2026 Boyum IT Solutions A/S

	Beas uses the same concept as SAP Business One – Purchase order If there are no supplier price lists and no special price lists, the last purchase price is used. Price is displayed in purchasing UoM. Price is for "today" (not delivery date) **Note for blanket agreements** Blanket Agreement is only checked if: - Agreement Type = "Specific" - Status is Approved - Today inside Start- and End Date - "Set as Default" is activated (NOTE: In SAP 10.0 this field is not available any more) Quantity	Quantity warehouse units.
Item	Item ID.
I-Version	Item version number I-Version number used from item master. If in pegging (sales order, production – BoM position) an I-Version was stored, it is used.
Designation	Item designation.
Drawing number	Drawing number Drawing number from item master is used. If a version number was stored, the Drawing number according to item version is used. If in pegging a drawing number was stored, it is used.
Info	Free text.
Project	Link to project.

© 2026 Boyum IT Solutions A/S

Warehouse	Current item warehouse.
Link	Order can be linked to a pegging. Link is only possible to a pegging with same item number. **Note**: Receipt reservations for purchase orders are currently not supported. Link serves only as information
Contract	Number of the purchase blanket agreement You can see all entries - if today is between Start/End date of the purchase blanket agreement - if blanket agreement is approved and not closed or canceled - if defined Item Version number is same as in current entry or item Version Number is empty in current entry or blanket agreement if you choose a blanket agreement, the system inserts price, currency, item version (if defined) and supplier from blanket agreement. Note: This was designed for SAP B1 9.3 PL 3, which is not supported by Beas Manufacturing. Note: The Contract field always shows information related to the post-in date, that is the day of creating the Purchase order/ request, and NOT related to the Delivery date.
Gross price	Use price as Gross price Allow to define the price as gross price. Appears only if you have selected the check box "Enable Separate Net and Gross Price Mode" in **Administration > System Initialization > Company Details > Basic Initialization tab.** Determine whether it is a gross price list or net price list. • Gross: All prices defined in the window are base prices and gross prices. • Net: All prices defined in the window are base prices and net prices.
Distribution rule	The distribution rule can be used as reference to a cost center. It is transferred to the purchase order.
Length, width height	Item properties.

© 2026 Boyum IT Solutions A/S

Buttons

Field	Description
Purchase request	▣ Create a Purchase request The button is only visible if the user has the authorization to create a purchase request. It uses the Beas or the SAP variant to create a purchase request. ***See*** Configuration Wizard > Purchase request ▣ SAP variant Creates an SAP purchase request. If an active SAP purchase request for the currently used supplier exists, Beas adds the line to the current document. For more information on SAP Purchase request creation, ***see*** SAP documentation. *beas 9.3 PL 2* ▣ Beas variant PATH: MRP > Purchase request 
© 2026 Boyum IT Solutions A/S

	Creates a Beas purchase request.  *Window mrp_purchase_master.psr* For more information, ***see*** Beas purchase request.
Create purchase order	Create a purchase order The button is only visible if the user has the authorization to create a purchase. Beas creates a purchase request first and, from that a purchase order. If your authorization to create a purchase was blocked from SAP, an error message is displayed, but the purchase request is created.
Create purchase quotation	A purchase quotation is created for the selected entry. This creates a SAP Business One Purchase quotation document. Note: Function "Create online Quotation" is not supported. Note: The price is not transferred (as in SAP Business One) because it is to be queried.

9.2.1.2.3 Make

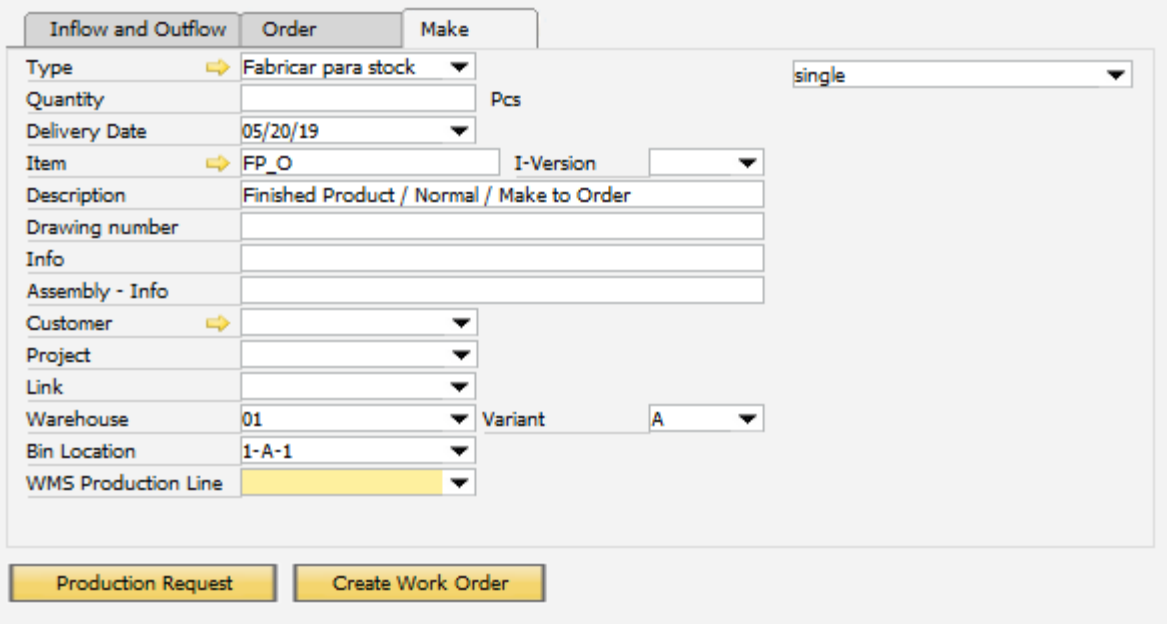
Order recommendation list

© 2026 Boyum IT Solutions A/S

Inflow and Outflow	Info area
Order	
Make	

This tab is only visible for assemblies. It can be used to create a production request or a work order for the selected item.

PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button.



Window mrp_view_masterrahmen.psr

Field descriptions

Field	Description
Type	Production type. Default: When assigned to a sales order "production type for customer order", otherwise "production type for storage order". This is set in the Configuration Wizard. ***Also see***: Production Types Configuration wizard > Production > Create > Production type for warehouse order / sales order
Single / daily / weekly / monthly	Select single for single production. For recurring production enter the frequency and quantities.

© 2026 Boyum IT Solutions A/S

Field	Description
Quantity	Quantity in consumption units.
Delivery date	Delivery date of the order. Determined from the requirement date and from the current selected row of the pegging.
Item	Item ID.
I-Version	Active in case of version-managed items.
Info	Text field.
Assembly - Info	Free text.
Customer	Customer of the work order.
Project	Link to project.
Link	Link to a pegging (sales order, advance invoice, production outflow). ***See*** Reservation

Warehouse	The Production Warehouse. ***See*** standard rules for the work order warehouse.
	Note: Sales order to work order: The system does not use the warehouse from the sales order.
	Important: In case of semi-finished products, the warehouse is defined in the BoM settings of the parent WO position.
	To use the behavior of versions before 2022.06 (that is to load the default Item warehouse), use the following script:
	`windowevent display_workorder`
	`post=post=post=sql=select "OITM"."DfltWH" FROM "OITM" WHERE "ItemCode" =<dw_3.item.itemcode.value,dbstring>`
	`post=post=post=dw_3.item.whscode.value=<wert1>`
	`end event`

Bin Location	Select bin location. In case of a Bin-managed warehouses, the Bin Location field is displayed. If a bin location is defined in a warehouse rule, Beas inserts the defined bin code.
WMS Production Line	Select WMS Production Line for the work order. If the warehouse is a WMS-managed warehouse, Beas also displays this field.
Variant	Item variants. ***See*** Variants.
Configuration	Item configuration. ***See*** Configurator for *Beas 9.2* and Product Configurator for *Beas 9.3*.

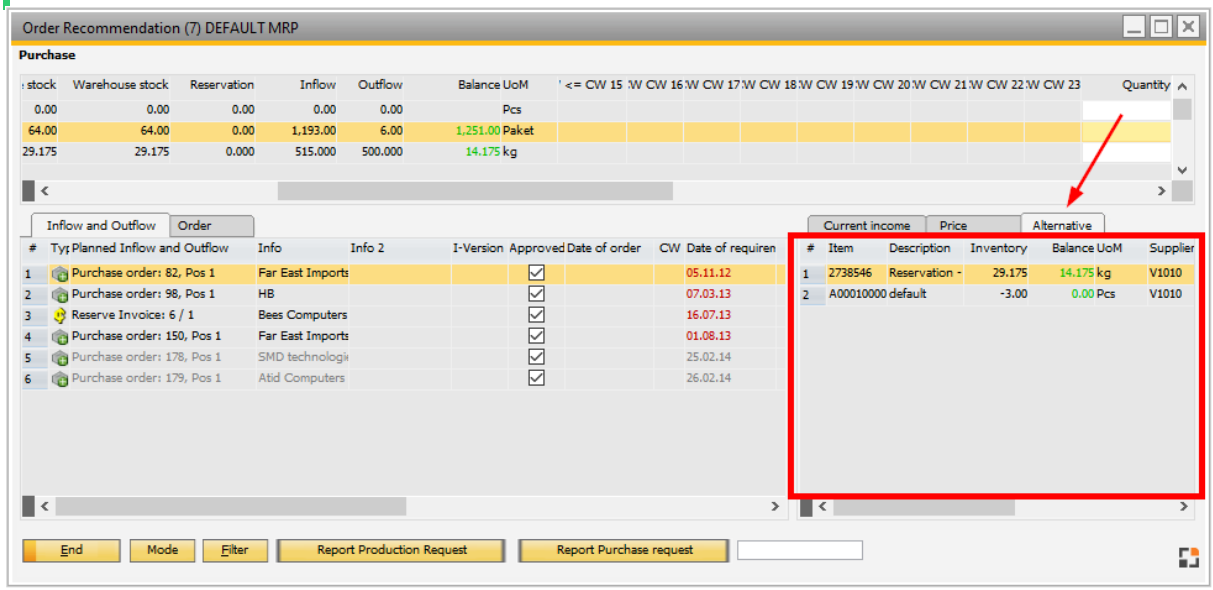
9.2.1.3.3 MRP Alternative

This tab lists the alternative items stored in the pegging and alternative items according to **SBO Inventory > item management > Alternative items** and in Bill of Materials positions.
All planned inflow and outflow and balance of current MRP run appear in the list.

If a work order is selected in the left window (multi-selection possible) with a right-click, an item can be exchanged in the work order.
If dealing with a BoM-related alternative, the stored quantity is transferred to the work order.
For alternative items, the new quantity is calculated and entered.
If it is lower than the requirement quantity, the quantity in the original item can be changed. For other peggings no item exchange is possible.

PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button > right bottom window section



Window mrp_view_masterrahmen.psr

Field descriptions

© 2026 Boyum IT Solutions A/S

Field	Description
Item	Item code
Description	Item description - serial-, batch-, version managed item, raw material etc.
Inventory	Stock before or after next inflow If minimum stock is considered, it is taken into account as follows: Minimum stock is calculated as a requirement at the moment of calculation. Peggings from the past have no effect. Minimum stock can become a pegging only if it has a negative balance at the moment of calculation. Balance by warehouse stock minus minimum stock is **positive**: The minimum stock is subtracted directly from the warehouse. The minimum stock is not displayed as a requirement because it does not create a requirement. Balance by warehouse stock minus minimum stock is **negative**: The minimum stock is displayed as the pegged requirement (separate line). ***See*** Scenario > Details > Consider minimum stock Depending on setting in **MRP Wizard > Details > Inventory > Balance: consider reservations.** If enabled, the reserved quantity is subtracted from stock. The field is inactive by default (***See*** window settings).
Balance	Balance of planned stock movements Balance of stock - minimum inventory - planned outflow + planned inflow within the calculation period of this schedule. Settings in **MRP wizard > Details > Inventory > Balance: Consider reservations** affect this as follows: **If enabled**, balance is calculation as stock minus reservations: - (outflow minus reservations) + (inflow minus reservations) In total, reservations are neutralized, but the time line of requirements can change.

© 2026 Boyum IT Solutions A/S

Field	Description
	If disabled, reservations are completely ignored in balance calculation. ***See*** Configuration wizard > Production > Reservation **Note**: If reservation is disabled, no correct balance can be displayed for order-related items. ***See*** item breakdown. Order-related items are managed by the customer order to work order function. Note: For temporary reservation (***see*** requirement coverage) Beas does not check the Balance or order of entries. ***Example:*** This item is a stock-related sub-assembly. The order in this list is by Date of requirement. Before the system checks which material is needed for the assembly, it checks if stock is available for this assembly. If yes, Beas reserves the stock for this assembly and you do not need to produce it. The system does not check the required material. The temporary reservation uses the defined priority: Minimum Stock, Work order, Sales order and so on. What this means: Beas reserves the material for the work order (line 3) and **not for** the sales order (line 1 or line 2). Right mouse click on line 3 - Origin you can see the defined reserved quantity.  **Filter *Only shortage*** This filter shows all items that need to be ordered or produced, or for which the planned inflow is too late. In this case, assembly “B” would be shown as shortage, as the balance for 4th May is negative.

© 2026 Boyum IT Solutions A/S

Field	Description
	The inflow to be used can be specified in **MRP wizard > Detail > Breakdown of resources**.
UoM	Unit of measure
Inflow	Sum of all inflow Planned receipt quantity. Can be (example) - Work order positions - Negative Work order Bill of Materials positions If it is an order-related sub position of a work order, it only appears as neutral quantity (gray). If the quantity is higher than the quantity of the related Bill of materials position, only the quantity higher than the Bill of materials quantity is displayed. ***Example***: Special case for inflow or outflow work order sub-assemblies: work order with order-related sub-assembly (BoM position 10, item abc, covered by work order position 30, item abc) PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button  Bill of materials: 1 Pcs Sub-assembly order related: 1 Pcs Balance is 0, inflow and outflow neutral. This is not visible in inflow or outflow, and in the requirement list it is gray. PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button

© 2026 Boyum IT Solutions A/S

Field	Description
	 However, if you change the quantity from order-related sub-assembly, it changes. The quantity displayed is not for the main assembly but for the stock. PATH: MRP > MRP Wizard > Select a scenario and click the **Order recommendation** button Outflow	Sum of all outflow. Sum of all planned outflow can be Sales order, Work order, Pre-Invoice etc. Work order Bill of Material Positions Total open Quantity of Work order Bill of Materials position `(Planned Quantity from BoM Position * Open quantity from Work order position)` If this position is linked to a work order position (order-related item) then Beas checks if the planned open quantity is the same as the current one `open BoM Quantity - Reservation` Follow example

© 2026 Boyum IT Solutions A/S

Field	Description
	 ***Example:*** Bill of materials = 1, but we produce 10 9 is for the stock In Beas only one inflow column is available, but in this case: 1 Pcs = neutrally, 9 = income Beas displays this in the following way: Item list Inflow: Include the quantity of the stock, in this case 9, and increase the inflow quantity from 5 to 14. Requirement list inflow: Do not display neutral quantities and display only the stock related quantity = 9
Supplier	Supplier code
Drawing number	Drawing number stored in planned inflow or outflow Can be transferred to subsequent document and changed. If working with item version control, this is usually the item version number.
New Quantity	Add new quantity. By default, the field loads the quantity defined in the Beas alternative BoM definition (***see*** Type "B" below).
Type	The type of alternative bill of materials: A = SAP type of alternative BoM. B = Beas alternative BoM.
Info	Information stored for the alternative material.

© 2026 Boyum IT Solutions A/S

Field	Description
	- for Type A: The field value is linked to the "Remarks" field of SAP Alternative materials. - for Type B: The field value is linked to the "Info" field of Beas alternative materials editing window.
Qty	It displays the defined quantity. - for Type "A": For SAP items, the quantity considers the SAP "Match factor" that is defined in % in the SAP alternative material definition. - for Type "B": The quantity defined in the Beas alternative BoM definition.

Functions:

Function	Description
Item substitute	Substitute the selected item in the current work order line. **Work flow:** 1. When selecting this option in the right-click menu, the system returns a query and the user can confirm the replacement of the item by answering "Yes". Click "No" to cancel the process. 2. After selecting "Yes", the system returns another query: *'Split BOM? Attention: the quantity per assembly will be replaced by a fixed quantity.'* The system executes two completely different functionalities depending on the answer to this question: • "Yes": The function "splits" the current BoM based on the quantity selected in the Alternative tab, and updates the current BoM line of the WO by reducing the selected quantity and creating a NEW BoM line in the WO with the selected quantity. **Important:** this process sets the "Quantity Per" field of these two lines to Fixed quantity. • "No": The system replaces the item in the BoM with the new Item and the new quantity selected in the Alternative tab. 3. The system displays an additional question to ask if the user wants to reserve quantities of the new material in the WO. To create a reservation, select "Yes".

Window settings are available.

Other Info area tabs:

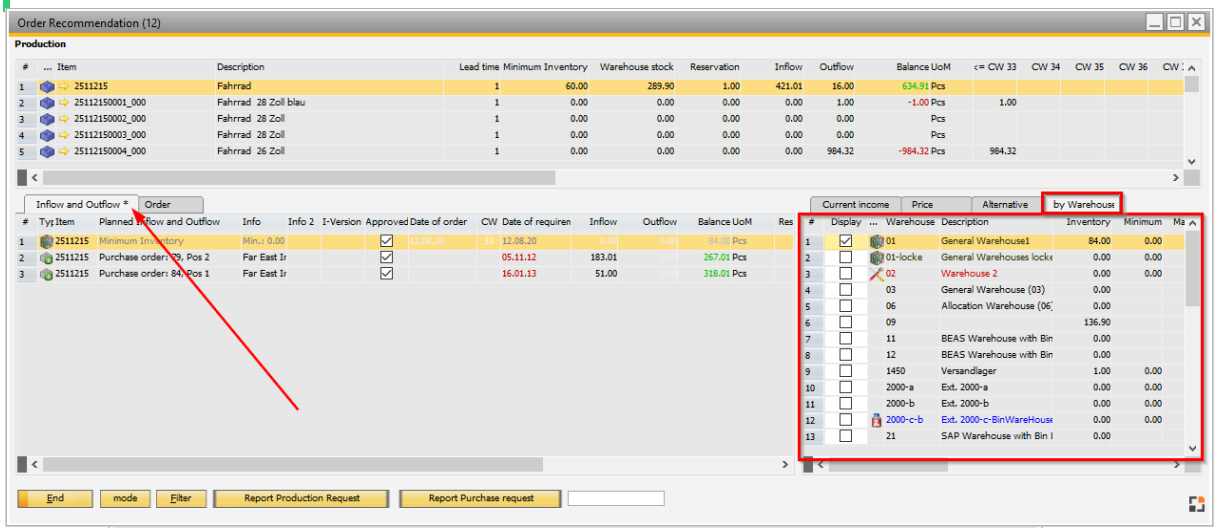
MRP Warehouse

9.2.1.3.4 MRP Warehouse

This tab is only visible for items set as Inventory by warehouse.

The purpose of the tab is to check status of each warehouse and see minimum stock levels. Information can be accessed also when Notify of minimum inventory / warehouse is not active. The displayed information is identical to Inventory data > By Warehouse in the Item master data.

PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button > right bottom window section



Window mrp_view_masterrahmen.psr

The information in the Inflow and Outflow tab is filtered according to the warehouse(s) selected in the By Warehouse tab.

Note: Beas does not recalculate any other information than the Inflow/Outflow in this tab.

The highlighted top row in the Inflow and Outflow shows the total "Minimum inventory" and the balance as well. Select a warehouse by clicking in the Display field, and an asterisk (*) appears right of the Inflow and Outflow tab name (***see*** image above), indicating that the filtering is done according to warehouses.

Changing the selection in the by Warehouse field automatically changes the balance in the Inflow and Outflow tab.

Attention: Once you select another tab of the window, the filter in this tab is reset.

See the complete function in the following video:

© 2026 Boyum IT Solutions A/S

Note: The information displayed in the Tab corresponds to the Real time (and not the MRP calculation).

Item Version: Inventory information is not displayed by I-Version in this tab.

Field descriptions

Field	Description
Display	When active, information in the Inflow and Outflow tab is filtered according to the currently selected warehouse(s).
...	The icon set in the Warehouse master data to represent the Warehouse.
Warehouse	Warehouse code.
Description	Description of the warehouse.
Inventory	Total stock of the item including blocked batches.
Minimum	Input of the minimum warehouse stock quantity for this warehouse.
Maximum	Input of the maximum warehouse stock quantity for this warehouse.
UoM	Unit of measure.
Confirmed	Planned issue for customer orders. No breakdown of sub-components. Calculation according to SAP rules.
Order	Planned receipt from purchase orders. Summation according to SAP rules.
WO Receipt	All planned receipts are displayed without consideration of any settings (blocked work orders etc).
WO Issue	All planned issues are displayed without consideration of any settings (blocked work orders etc). **Important:** all previous postings for this item are considered regardless of which warehouse they were posted from. This works only if the work order was created by Beas without any changes by external programs.
Minimum Purchase Order	Required Purchase Order stock levels. Input of the required inventory levels for this warehouse. Value deposited in purchasing unit, it is supported in order recommendation report, if no minimal stock was entered. The quantity required to reach to the minimum warehouse stock is displayed in the Required (purchasing UoM) field. If the release of warehouse stock under the minimum limit is selected in the document settings, the system issues warnings if the minimum warehouse stock is not reached. The system does not permit further input of inventory

© 2026 Boyum IT Solutions A/S

Field	Description
	documents if the warehouse stock has reached the maximum quantity.
Locked	Inventory is locked on item level. It is related to SAP Business One **> Item Master Data > Inventory Data > field Locked.** Locks the warehouse for the item and prevents you from adding the item from this warehouse to any A/R or A/P document. Warehouse Locked	The (non-editable) check box indicates that the warehouse is locked. Related to SAP Business One - Warehouse - Field "Inactive".
Warehouse Type	Type of warehouse (allocation, external, general warehouse etc.) ***See*** Warehouse administration.
User field 1-4	Freely definable user fields. Activate and define a value via customization. For more information visit our BeasScript documentation.

See Transfer tab

back to Order recommendation list

9.3 Purchase request (Beas)

Purchase requests can be created from the Order recommendation window, reservation list and other windows. This is the pre-stage to a purchase order or purchase offer.
In the purchase request window requirements are collected, for which no order has yet been created. These can still be changed before an order, a drafted order or an offer is generated.

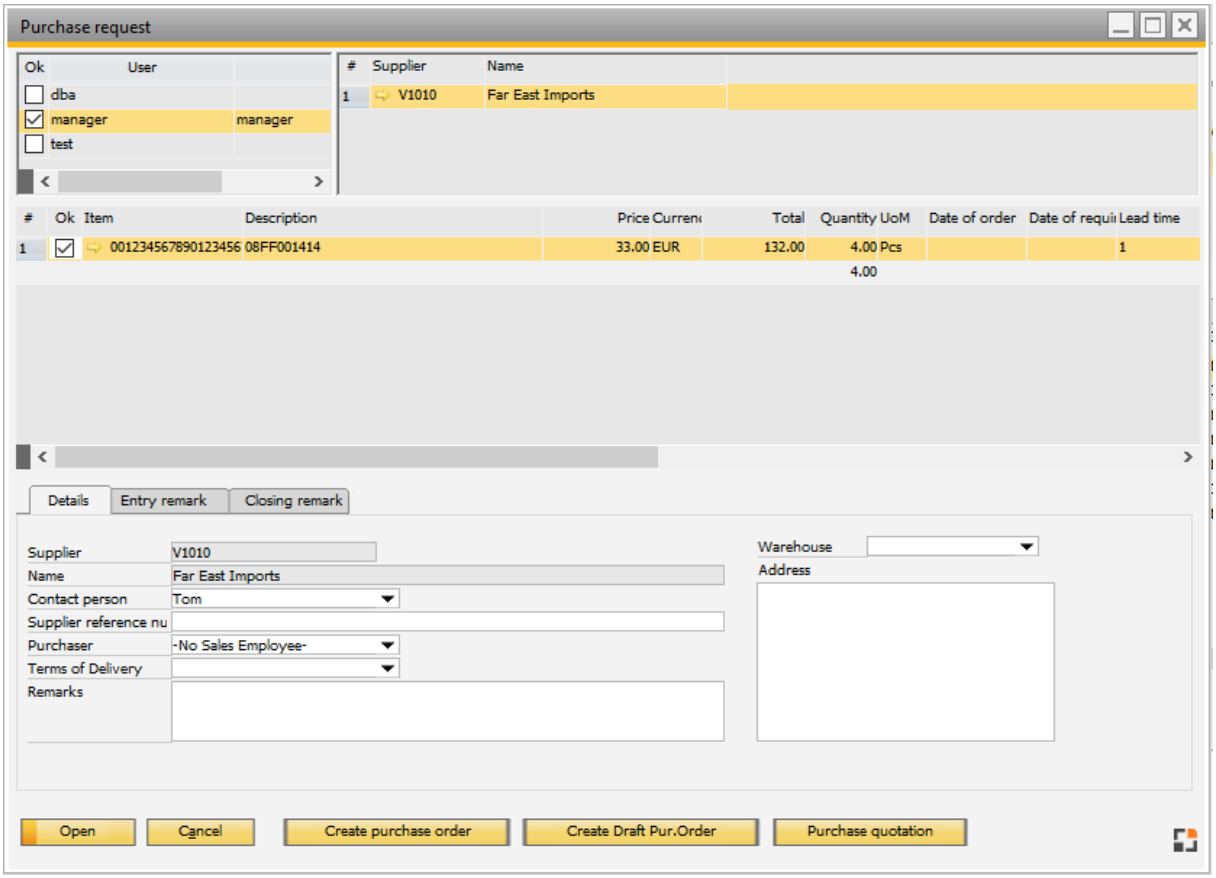
You can create a Beas purchase request or SAP purchase request. This can be defined in Configuration Wizard.
If you make a Purchase Order or Purchase Quotation from the MRP window, Beas creates a Beas purchase request, and the related SAP document automatically.

Call up from: **Materials management > purchase request**

The Beas purchase request variant:

PATH: MRP > Create request button (Buy items).

© 2026 Boyum IT Solutions A/S



Window: mrp_purchase_master

Authorizations

Required rights: Purchase request To create documents full access is required

The purchase request window is divided into three areas:

Up left: User In this area, all users who have created a purchase requests from the MRP run are displayed. If you only want to see purchase requests of specific users, remove the selection in "OK" column and all purchase requests of that user are hidden.

Up right: Supplier In this area, all suppliers are displayed for which there are purchase orders created by the selected user.

Below: mark suppliers to get items shown, for which a purchase request has been created.

Field	Meaning
Item	Item ID
Price	Purchase price

© 2026 Boyum IT Solutions A/S

Total	Total price (Price * Quantity)
Menge	Purchased quantity
Purchase date	Requirement date less lead time
Requirement date	Delivery date less lead time
Lead time	Lead time from item master
Warehouse	Standard item warehouse
Approved	Settings from origin document apply

Lower window section

Details tab

In the Details tab, you can add further information to the purchase request and then create a purchase order or create a drafted document. Click the relevant button to do this.

Field	Meaning
Supplier	Supplier ID
Name	Supplier name
Contact person	Contact person at supplier
Supplier reference number	Optional
Purchaser	Who created the purchase request
Terms of delivery	Select from terms of delivery
Remarks	Free text, remarks are transferred to the SAP Business One document. To enter in rich Text format, enable this feature in window settings.
Warehouse	Target warehouse for purchase
Address	Free text

Entry remarks tab: Enter comments.

Closing remarks tab: Enter comments.

Right-click menu

© 2026 Boyum IT Solutions A/S

Same functions as on buttons below. Additionally: window settings: there the RTF mode can be activated to enter formatted remarks.

Buttons:

Button	Meaning
New	Create a new purchase request.
Delete	Delete the selected purchase request.
Open	Open the selected request for editing, same function as double click on the entry in the list above.
Create purchase order	After a security query, whether to close the purchase request, for the selected entry a purchase order is created, and the SAP Business One document is opened.
Create Draft pur. order	For the selected entry a drafted order is created; in SAP Business One a drafted document is created.
Purchase quotation create	Create a purchase quotation the selected entry After creation, there is a query, to delete the purchase request. If no, you can use this for the next supplier. As in SAP Business One only the supplier, date, item and quantity are transferred, but not the price.
Invent.History	Opens the Inventory history for the selected item.

- Automatically open of created documents

  The program creates the documents but these are not displayed immediately.
  The created document is opened after creation automatically, by inserting the following script:

  Ctrl+N+U, insert script, save, reopen the window

```
windowevent open
setvar=ib_OpenDocument=true
end event
```

  beas 9.2 PL: 04

- Work with UDF, Adjust views

  In this window on row level up to 4 additional fields can be defined (***see*** Configuration wizard).

© 2026 Boyum IT Solutions A/S

Adjust supplier selection

In variable "`is_secondfilter`" an extended filter can be stored. Accessible is only the table "`BEAS_MRP_ORDER`"

Use the UserEvent "windowevent dw2inretrieve" to access variable "ls_sql". It can be modified, e.g. you can determine userfield1 to userfield4. Template fields should not be used here, because these can be set to invisible. Use window settings to rename or set UDF visible or invisible.

Example:

Display "hello world" in userfield 1. Therefore, userfield1-sequence will be replaced.

```
windowevent dw2inretrieve
setvar=ls_replace=cast('' as nvarchar(50)) as userfield1
tools=globalreplace=ls_sql=<ls_replace>='hello world'
end event
```

(*beas 9.1 PL: 07*)

Adjust item list

To adjust the item list, use event dw3initretrieve

Example:

Display "hello world" in userfield 1. Therefore, userfield1-sequence will be replaced.

```
windowevent dw2inretrieve
setvar=ls_replace=cast('' as nvarchar(50)) as userfield1
tools=globalreplace=ls_sql=<ls_replace>='hello world'
end event
```

(*beas 9.1 PL: 07*)

Create a purchase order with more fields

Transfer additional fields to a purchase order is possible only via script. ***See*** Customizations

Creating a PO row, the user-event "insertline" is called up. The object "porder" is available, to which the information can be transferred.

Example:

In rows-UDF U_myfirstfield and U_mysecondfield the content of udf1 and udf2 is to be saved.

Ctrl+N+U (opens the Script-window)

```
windowevent insertline
porder=line=U_myfirstfield=<dw_3.item.beas_mrp_order_udf1.value>
porder=line=U_mysecondfield=<dw_3.item.beas_mrp_order_udf2.value>
end event
```

Close the window and re-open it.

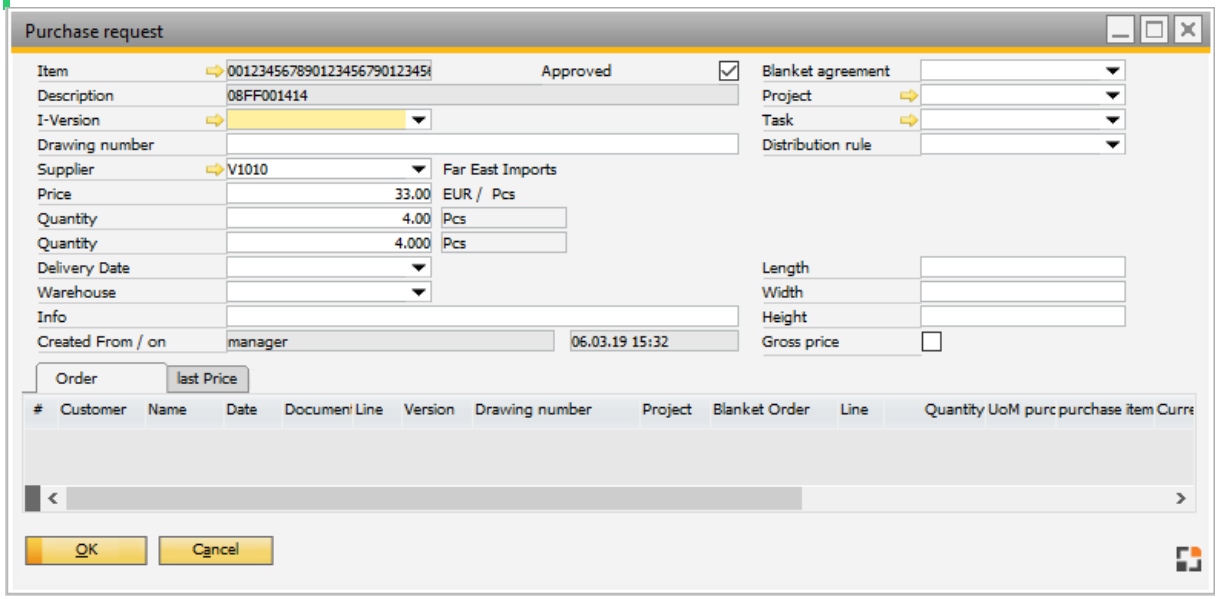
Window: mrp_purchase_master
beas9.0-000-001-004

© 2026 Boyum IT Solutions A/S

9.3.1 Edit purchase request

If a line was selected for editing in a Purchase request, this window opens.

PATH: MRP > MRP Wizard > Select a scenario > click the **Order recommendation** button.



Window mrp_purchase_details.psr

Available fields

Field	Meaning
Item	Select item from the drop-down, or enter item code manually.
Supplier	Supplier of the item for this purchase order. Only valid suppliers are available for selection. Set up selection type in Configuration wizard – Material requirement planning .
I-Version	⊟ Item version If version control was enabled, select item version here. This information is transferred to all documents until the goods receipt. Item version is also indicated for batches and serial numbers. *(beas9.0-000-004-015, beas_mrp_order.u_beas_version)*
Drawing number	⊟ Drawing number Drawing number is saved in purchase order and used in goods receipt.

© 2026 Boyum IT Solutions A/S

	(beas9.0-000-004-015, beas_mrp_order.u_beas_znr)
Blanket agreement	Link to the blanket agreement valid for this order.
Gross price	Gross price.
Quantity	Quantity in purchase units. Unit displayed on the right. NOTE: only the standard purchase unit is supported. Additional units, which may be stored in uom groups are converted to standard unit.
Quantity	Quantity in warehouse units. Unit displayed on the right.
Price	Price from MRP-Pricing. When the quantity or the supplier are modified, the price is recalculated. Note: If the item has no information stored in any SAP price list (special or standard price list), this field is empty, and the currency definition cannot be displayed. If the user sets a manual price in this window, the system applies the business partner currency stored in the SAP document. It is not possible to change the currency manually in this window.
Delivery date	Delivery date of the purchase order.
Warehouse	Desired goods receipt warehouse.
Project	Link to project.
Task	Link to a task.
Distribution rule	Distribution rule from Business Performance. Added to the purchase order in field "Free text" *(por1.FreeTxt)*
Info	Free text.
Length, Width, Height	Additional information on the item.
Created by / on	The creator and date of the document.

Available tabs

- Order

© 2026 Boyum IT Solutions A/S

All purchases created for this item are displayed. The list is dynamically adjustable. ***See*** window settings
List is sorted by document type descending.

- Last prices

All suppliers are shown, for whom a purchase order was created. Additionally:
red: Information from last purchase order for this supplier
green: Current price for this supplier, for this quantity and quantity unit of the last purchase order
blue: Current price for this supplier and for the currently requested quantity and quantity unit

Note: when using pricing per warehouse, always the current goods receipt warehouse is used.

The list is dynamically adjustable. ***See*** window settings
Sorted by supplier number.

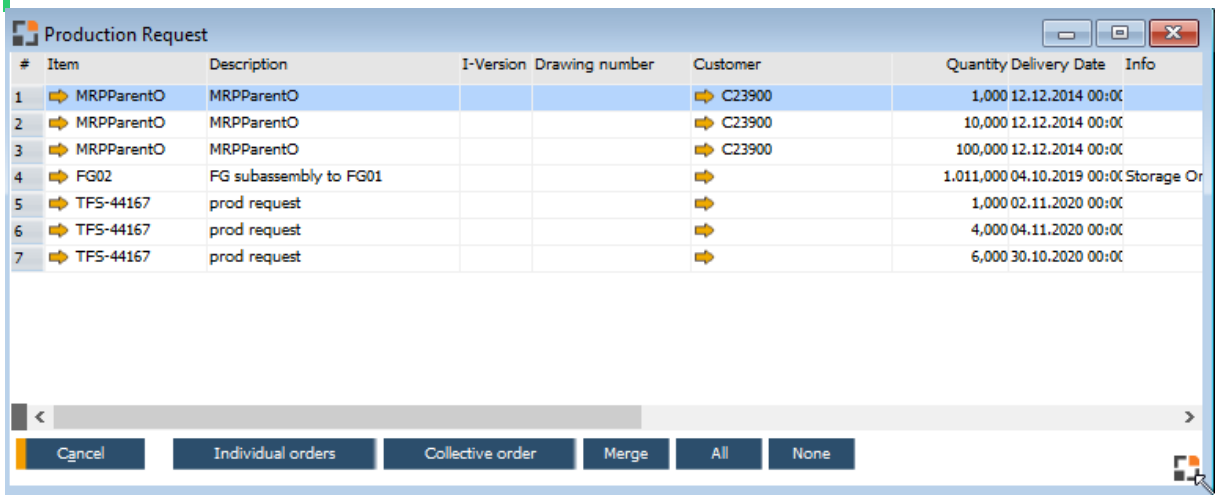
Window: mrp_purchase_details

9.4 Production Request

You can generate work orders from production requests created in the MRP run.
Window settings and Templates are supported.

PATH: MRP > **Create request** button (Make items)..



Window mrp_planed_workorder_browse.psr

© 2026 Boyum IT Solutions A/S

Field	Meaning
OK	Selected for creation or deletion.
Item	Item to be produced.
Designation	Standard item designation (not designation from selected item version).
Customer	For customer (if order-related).
Quantity	Quantity to be produced.
Delivery Date	Desired date of completion.
Info	Further information.
Additional Text	Further additional text.
Project	Project code.
Type	Type.
UDF1...4	User-defined fields.
Variant	Production variant (A..Z).
Configuration	Configuration to be used.

Function	Meaning
Remove	Delete production request.
Individual orders	Create a work order for all selected production requests.
Collective Order	⊟ Create a collective work order for all selected work orders. Create one work order for all marked lines, and for every marked line a separate work order position. In work order header, the system writes link information from the first position (example customer name), but the positions are linked to the correct sales order.
Merge	⊟ Combine all requirements into one work order For more information ***see*** Merge. **Attention:** Linking e.g. to sales order or reserved invoices disappears when merging. No receipt reservation or linking is generated. Use only for warehouse-related production.

© 2026 Boyum IT Solutions A/S

All	Select all work orders ("OK" column is set).
None	Deselect all work orders (selection in "OK" column is removed).

back to order recommendation view

9.4.1 Merge

With a collective production order several different assemblies can be combined into one work order. This simplifies and shortens the creation of work orders, and the cost analysis is restricted to the complete work order.

Conditions for merging

The structure of the work sequences must be the same, and the work sequence numbers with the appropriate resources must match. Job times may differ. These are summed as fixed times (time per=0) and entered. As setup time, the largest set-up time of all assemblies is used. Phantom assemblies can also be used.

Routing position numbers need to be unique, because they are not renumbered. Position numbers in operation sequences of sub-assemblies may not overlap with the position numbers of the superordinate assembly. If this happens, existing entries are overwritten and times are summed up.

The production order is created here as follows:

First position: In the first assembly position no assembly is stored, but all the accumulated work sequences and Bill of materials items. All time receipt and material reports are submitted to this position.

Following positions: Each item which was chosen for the collective work order is inserted as a separate item. These assemblies have no BoM items and no routing. To these position the postings of the assemblies are made.

Example:

Assembly 1:

Pos 10	1x C001	
Pos 20	2x C002	
Op. sequ. 10	Resource 1000	10 mins setup time, 5 mins job time
Op. sequ. 20	Resource 2000	5 mins setup time, 1 min job time

Assembly 2:

© 2026 Boyum IT Solutions A/S

Pos 10	1x C001	
Pos 20	1x C003	
Op.sequ. 10	Resource 1000	15 mins setup time, 10 mins job time

After merging there are the following positions:

Document-Pos 10:	Collective order with BoM and routing
Document-Pos 20:	Assembly 1 without BoM and routing
Document-Pos 30:	Assembly 2 without BoM and routing

Document-Pos 10 – Collective order – has the following BoM:

Pos 10	2x C001	
Pos 20	2x C002	
Pos 30	1x C003	
Op.sequ 10	Resource 1000	15 mins setup time, 15 mins job time (entered fix)
Op.sequ. 20	Resource 2000	5 mins setup time, 1 min job time

Restrictions

1. In retrospect, it is not possible to identify what costs are incurred for which assembly. A post-calculation is possible only for the complete work order. "Like manual posting" needs to be selected as valuation method.

see Tip

2. The collective production function is only available when evaluation is performed at standard price or price list. If, for evaluation some kind of "evaluation price" (post calculation price) is set, this function is hidden. The production lot size is not taken into account.

3. Batch or serial number tracing is possible only to a limited extent.

NOTE:

If in Configuration wizard > Production > Valuation and posting of assembly >Valuation anything else than "like manual posting" was set up, a special production type is required for this work order, as any other valuation method is not supported. ***See*** Administration > Definition > Production > Production type > Valuation

LIMITATION:

© 2026 Boyum IT Solutions A/S

With Tool administration > "Defines lead time" you can set the times to be inserted in the tool as the lead time for the operation.
This setting will be ignored when different items are merged to one Work Order. Consequently, it is always the times that are stored in the operation that are considered by the system, even if the "Defines lead time" parameter in the tool administration is set to active.

back to Order recommendation overview

9.5 Forecasts

In many cases, production companies receive sales orders on short notice. However, the production process might take long. As a result, it is common for these companies to plan their purchasing and production in advance, even before they receive actual sales orders. This is the goal of a forecast. A forecast is designed to serve as an additional requirement. Therefore, the goods are produced based on the forecast, and when the actual sales orders are received, the company is able to supply the order quickly.

For additional information, please refer to SAP Business One-documentation:

Beas provides additional features for forecasts.

- Any number of forecasts can be taken into account by MRP.
- Various computation methods are available.
- A warehouse can be stored in a forecast, which is useful if you have multiple locations.
- A requirement list can be stored (MPS).

Planning per variant or configuration

SAP Business One - warehouse management allows only management per item. Order scheduling works order related. That is why it is impossible to plan per variants or configurations.

A requirement of a variant or configuration is always order-related. To have a more detailed view in forecasts, please create variants as separate items.

© 2026 Boyum IT Solutions A/S

- Warehouse definitions

Attention: From SAP Business One 9.2 the warehouse definition of SAP Business One is used. A UDF Field "Warehouse" has been added for older versions. This has no function for the current versions.

For *Beas 9.1* and older:

In SAP-UDF-Field "warehouse" (accessible via **View > UDF**) the target warehouse can be stored. This can affect:

- Which forecast is considered,
- Price determination (in case of pricing per warehouse)
- Which variant is used (in case of variants stored per warehouse)

If you do not define a warehouse, the default warehouse according to the item master is used. If no warehouse was defined, the settings of **System initialization > General settings > Warehouse - Item** are used.

See:

Configuration wizard – Forecasts

Maintenance orders

Maintenance module for internal and external maintenance.

The following objects can be administrated:
- Resources
- Tool
- Serial number related items
- Customer equipment

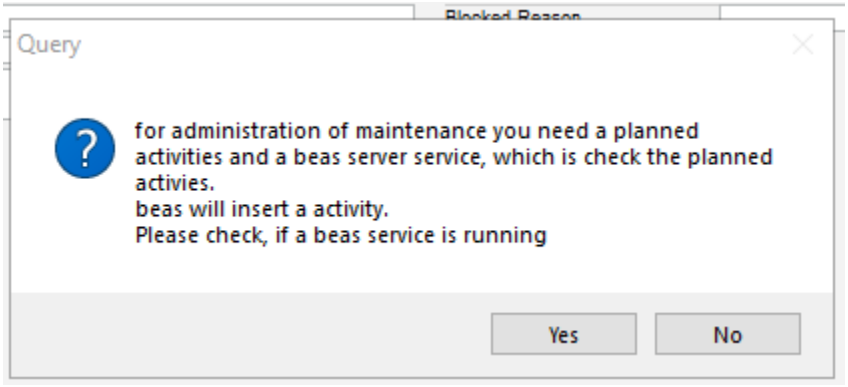
The maintenance module includes the following functions:
- Create a maintenance document
- Create a maintenance plan
- Edit maintenance orders
- Administrate components (e.g. Items of a machine)
- Document administration
- Create planned interruptions
- Create time reservations during the interruption, which affect the APS

© 2026 Boyum IT Solutions A/S

Available work-flows:
- Administration of internal / external maintenance, creating maintenance orders via defined maintenance cycles
- In Resource / Tool: direct administration of maintenance orders, direct creation of maintenance orders
- Interruption Messages (incidents): creating maintenance orders including production repair orders, activities etc.
- Creating maintenance orders automatically at the moment the lifetime of a component or tool expires (hours or pieces)

Needed Service:

The maintenance needs a service which creates all necessary documents in a defined time.
If you create the first maintenance plan, you will see the following message:



This creates a planned activity in Beas server management.
A service for planned activities must be active.
