Origin Type	Define the object type: • Tool • Resource • Serial number • Customer equipment Selecting the group in the Origin Type field determines the drop-down content of the entry field to the right which then lists the entries of the group.

Master data tab

Field	Description
Item	Item linked to origin type.
Description	Description of the origin object.
Serial number	(If determinable). If not, the serial number can also be entered manually.
Customer reference	Reference number of the customer.
Classification	The classification. No further functionality.

© 2026 Boyum IT Solutions A/S

Drawing number	Drawing number of the maintenance object.
WO	Linked work order. Here it is possible to define the Work Order via which the maintenance object was produced. Load the work order under the components tab. For this a copy will be created. Part changes can be run and a history can be created then via "Components"
Counter reading	Date of the last meter reading.
Counter value	Current count.
Blocked	Maintenance is blocked. No view in list "Maintenance orders"
Blocked reason	Blocking reason.
UDF1 ...4	Free available fields.

Contact tab

Field	Meaning
Business partner	Maintenance provided for the indicated business partner. Only with a business partner indicated, you can create activities or maintenance orders. If not, these options are hidden. If it is necessary for internal maintenance activities, set up a business partner representing your own company.
Contact	Contact person.
Supplier	Supplier of the object, for resources: the supplier of the resource.
Supplier information	Additional information about the supplier.
Location contact address telephone	At external maintenance: Location, contact, telephone and address of the object.

Extended tab

Field	Meaning

Header

Field	Meaning
Plan	Unique ID of the maintenance plan.
Remark	Remark, designation for the maintenance plan.
Description	Description of the maintenance plan.
Active	Maintenance plan active? No more maintenance orders will be created if the maintenance plan is inactive.

***See* Functions** above.

Tabs:

- **Master data**

Field	Meaning

© 2026 Boyum IT Solutions A/S

BoM	Define the material, which is required for the maintenance. This is used for the material requirement planning and also for the WO creation. The BoM be can be defined without a connection to an assembly and can be linked here.
Routing	The routing to be used.
Order recommendation	When active, the BoM is considered for every existing maintenance order in the order recommendation report if the maintenance orders must be considered according to the scenario settings. Once the work order has been created for the maintenance order, the requirement is determined from the created work order.
Work order Before date (Days) Assembly Production type	Define whether or not to create a work order. Expenses (Material, work hours and other costs) can be registered via work orders. This option is to manage the creation of work orders. **Automatic:** X days before the given date a work order will be created automatically depending on the maintenance order. The number of calendar days is defined in the field "Before date". Note: You need a running service for this. ***See*** Maintenance > Service. **Manual:** It is possible to create the work order manually in the maintenance order. **No:** No work order can be created. To create the work order, the assembly defined in the field "Assembly" is used with the BoM and routing which were defined in the respective fields.

© 2026 Boyum IT Solutions A/S

	The Production type is set according to the respective field, as well.
Service call Before date (Days) Remark	Define if a service call must be created. Note: Visible only if in business partner was stored in Maintenance master data. A service call can be created with a maintenance order. There is also the possibility to register all expenses. **Automatic:** X days before the date a service call will be created automatically depending on the maintenance order. The number of calendar days is defined in the field "Before date". Note: You need a running service for this. ***See*** Maintenance > Service **Manual:** It is possible to create the service manually in the maintenance order. **No:** No service call can be defined. The remark defined in the field "Remark" is inserted in the service call.
Activity Before date (Days) Remark	Define if an activity must be created. Note: Visible only if a business partner was stored in Maintenance master data. An SAP activity can be created with a maintenance order. Then, further actions can be triggered and/or an integration with Outlook can be realized. **Automatic:** X days before the date a SAP activity is created automatically depending on the maintenance

© 2026 Boyum IT Solutions A/S

	order. The number of calendar days is defined in the field "Before date". Note: You need a running service for this. ***See*** Maintenance > Service. **Manual:** There is a possibility to create the service manually in the maintenance order. **No:** No activities can be created. The remark defined in the field "Remark" is inserted in the activity.
Interruption Before date (Days) Interruption reason Remark From / to	Generate an interruption for the respective resource. A planned interruption can be entered here. The resource defined in maintenance master data is used and reserved for the given time area. An interruption is generated and a time reservation. Existing work order are not automatically re-scheduled. This happens at next calculation. **- Automatic:** X days before the date a planned interruption and a time reservation is created automatically depending on the maintenance order. The number of calendar days is defined in the field "Before date".. Note: You need a running service for this. ***See*** Maintenance > Service. **- Manual:** You can create one or multiple interruptions. **- No:** No interruptions can be created. **Interruption reasons:**

© 2026 Boyum IT Solutions A/S

	Filters can be stored in the interruption reasons. These are not considered here and will also not be checked further at creation. These filters are only considered at manual input of interruptions. You can set a maintenance order to be created upon the entry of an interruption reason in the Interruption reason master data. **Note**: WebApp Start Interruption does not support this.
Selectable at interruption	Selectable at interruption message. If active, this maintenance plan can be selected when an interruption occurs. This function is used if a maintenance order has to be created directly from an interruption message.
Image / color	Icon and color to display the entry.
UDF1..4	Up to 4 UDF's can be defined in the Configuration wizard.

Scheduling

Maintenance orders can be planned, edited or deleted here. The existing maintenance plans can be displayed with different colors in the calendar
Red entry: Maintenance order for this maintenance plan
Green entry: Maintenance order for another maintenance plan

Window maintenance_plan_edit.psr

Function	Meaning
Order: new	Creation of one or multiple dates: Single or multiple maintenance orders can be created here. A "New appointment" screen is opened for the definition:

Field	Meaning
Remark	Description / Remark for the maintenance order. Will be transferred to the maintenance order.
Plan start	Date, for which a maintenance is to be created. If you activate "Repeat", the date for the time area will be defined, for which maintenance orders have to be created.
Repeat	More fields are available, via which multiple dates can be created, if this option will be activated

© 2026 Boyum IT Solutions A/S

	Plan end: Define the period end, for which recurring maintenance orders are created. Repeat Type: Define the maintenance type: **Day:** In the field "Repeat day" you define the interval in days a maintenance order should be created. **Week:** In the field "Repeat week" you define the interval in weeks a maintenance order should be created. "Monday" to "Friday" will be shown to select the day of the week. **Month**: In the field "Repeat month" you define the interval in months a maintenance order should be created. In the field "Day" you can indicated, on which day the maintenance order has to be created. **Year:** The day in the month, the month itself and the repetition interval in years is indicated.
Date: delete	Delete selected date .
Order: Edit	This button opens the Maintenance order editing window.

Counter

In this tab you can define if the maintenance plan has to be created in dependence of counter readings.
This is only available for resources and tools and together with Beas – factory data capture.

Field	Meaning
Per finished items	All reported yield / scrap quantities are considered which are registered via order time capture. Starting from the count of the last maintenance order. If there is no value, the counter reading is determined from the item master data.

© 2026 Boyum IT Solutions A/S

	If the entered value was exceeded since the last capture date, a maintenance order is created.
Per hours	All order times are considered which are registered via order time capture. Starting from the count of the last maintenance order. If there is no value, the counter reading is determined from the item master data. If the entered value was exceeded since the last capture date, a maintenance order is created.
After max. days	It may be necessary to create a maintenance order before a certain counter reading has been reached. Here you can define, after how many day max. a new maintenance order has to be created. The creation date of the maintenance date is used as reference if no maintenance order was created before.

History

A history of all activities relating to the maintenance plan is displayed in this tab.

11 Human Resources

Human resources, attendance and absence, as well as the work hours, can be administered here.

Note: The recording of attendance requires the license "Beas App; Time recording, clock in out, Absence"

The administration itself is part of the basic license.

Note: SAP Business One has added an own personnel recording additionally, but which does not include an attendance recording or absence recording. Thus Beas cannot use the SAP Business One. But both of systems are synchronized automatically.

11.1 Process information

Presence recording can be set in a very flexible manner. However, this flexibility also implies that handling may get complicated if you are not familiar with the basic possibilities of shift times and period rules. Thus, this section describes some processes separately.

see

Structure of a shift
Shift scheduling
Calculating a working time
Flexible lunch break
Plan time calculation
Actual time determination
Flextime accounts
Personnel
Time Analysis

© 2026 Boyum IT Solutions A/S

11.1.1 Structure of a shift

A shift defines

- Clock in
- Flextime
- Fixed break times (up to 3 breaks per shift)
- Clock out
- Flextime

as well as
- Flexible lunch break
- Hours for the automatic shift detection

A shift may depend on the weekday. For ***example***, there may be a different clock out on Friday than during the period from Monday till Thursday. So-called day templates can be set up for this purpose and assigned in the factory calendar. The following day templates are created by default

Monday till Thursday
Friday
Saturday+Sunday

These are assigned to the corresponding weekdays in the factory calendar.
This means that for each day template, the times (clock in, clock out) must be entered separately.

Tolerances can be defined in addition. These determine how many minutes before working hours the employee may log in.

Entering the day templates:	Daily Schedule
Assignment in the factory calendar:	Factory Calendar
Entering the shift definition:	Shift Definition
Entering tolerances:	Period Rule
Assignment of the shifts and period rules to be used:	Personnel

A shift has the following structure:

```
      Clock in                Core time            Clock out
| Tolerance | Flextime |   Break1 Break2 Break3      | Flextime | Tolerance |
```

© 2026 Boyum IT Solutions A/S

|----------|----------|------||-----||-----||----|----------|----------|

Times outside of these shifts are not considered, i.e. they are cut off.

Flextime

Flextime only has an information function.

Under period rule, there is the additional option to define that the employee can only log on or off during flextime. Flextime is defined in the shift.

Example:

The employees should report for work between 6 and 9 o'clock.

Flextime is defined from 6 to 9 o'clock. 6 o'clock is the earliest clock in.

see

Period Rule

Flexible lunch break

Calculating a working time

11.1.2 Shift determination

Beas supports the following shift systems:

- Fixed allocated shift
- Rotating shift with 2 or 3 shifts
- Automatic shift control
- Automatic shift control with default shifts
- Week-day specific shift allocation
- Manual selection
- Master shift schedule

By default, the shift to be used is stored in the Personnel master.

More settings can be defined in the regular hours.

These are defined in the personnel master under "Regular hours" and can be used for a period to be determined there.

© 2026 Boyum IT Solutions A/S

When checking the shift to be used (takes place during logon when clocking), the following procedure applies:

1. Is a shift schedule available under Personnel – Shift schedule for this day?
   If yes, use it, otherwise:
2. Is a shift definition available under Personnel – Shift model?
   If yes, use it according to the rules defined there
3. Is a shift definition available under Personnel?
   If yes, use it, otherwise issue an error message.

see

Personnel

Shift Definition

11.1.3 Automatic shift determination

Because of the login time, Beas can schedule the shift automatically. The shift definition must therefore determine for which login period is to be used.

Example:

Morning shift: 7-15 h, Detection 4-10 h
Evening shift: 15-20 h, Detection 10-18 h
Night shift: 20-7 h, Detection 18-4 h

It is important that 24 hours are always covered with the detection. If someone logs on at 10:15 h, it is assumed that he wants to log on to the evening shift.
If a person logs on and off for a break, shift detection always refers to the first clock in. This prevents a person from accidentally slipping into a wrong shift. Special scenario:

Different shift models:

In case of different shift models, a definition in personnel is required specifying which shifts should be considered for automatic detection. This is done under Personnel / Shift model where up to 6 shift types can be entered.

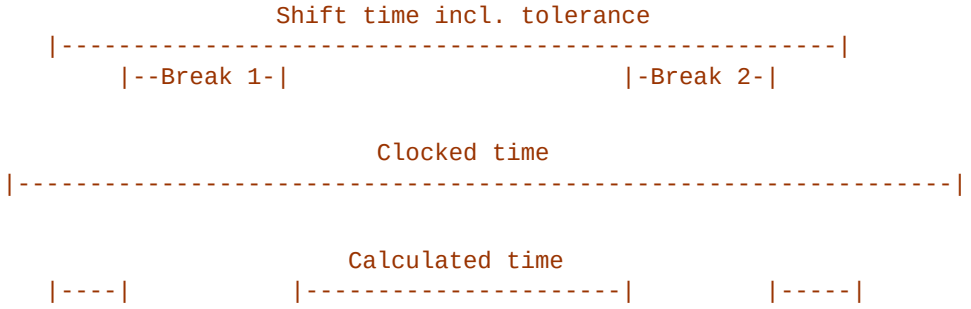
© 2026 Boyum IT Solutions A/S

11.1.4 Calculating a working time

There are two working times:
The clocked working time and the calculated working time

The calculated working time depends on many factors now described here

Structure of a working time



This structure shows that only the time is calculated that lies within the defined shift time and outside of the defined break times.

Example:

Shift time: 7am - 3pm, break from 9:00 to 9:30
Clocked: 6am - 2pm = 8 hours
Calculated from 7am-9am and 9:30am to 2pm
Calculated time: 6:30 hours

see

Shift definition
Structure of a shift

11.1.5 Flexible lunch break

Flexible lunch breaks are used when employees must take a lunch break of a certain length during a certain time range and if they must clock this break manually.

© 2026 Boyum IT Solutions A/S

If employees do not clock a break or if the break is too short, then the difference to the plan lunch break is automatically deducted.

Examples:

Flexible lunch break from 11 to 14 h, length of 30 minutes

Employee logs off at 11:30 and logs on again at 11:45 h.
15 minutes is subtracted for him on this day

Employee does not log off during this time
He gets a deduction of 30 minutes

Employee arrives at 11:30 h and works until 17 h
No break is deducted since he did not arrive until lunch time

Employee logs off from 10:45 until 11:15 and leaves at 16 h
He does not get a deduction since the lunch break is only verified if he is also present during lunch time

Employee logs off from 11:30 until 12:30
He does not get a deduction since his clocked break lasted longer than 30 minutes

Employee arrives at 9 and leaves at 13 h
He does not get a deduction since he leaves during lunch time.

The flexible lunch break is calculated at the moment of time evaluation first. It is not displayed at manual time registration or correction for the current day.

Setup

Flexible lunch breaks are defined in the Shift Definition .
The shift allocation does not depend on an employee's logon/logoff

© 2026 Boyum IT Solutions A/S

To determine the break, the shift that applies to the person on this day is used. If the automatic shift control is activated, the first clocking on this day is used that occurred after 0:01 h.

Example:

Employee logs on and off. Shift allocation "shift1". This shift allocation is changed manually by the office in this time clocking to "shift2". The flexible lunch break verification nonetheless accesses shift1 since this check is done independently of any clockings made.

Notes:
Order clocking does not consider flexible lunch breaks since a "flexible lunch break" is nothing but a subsequent temporary time deduction, meaning that the orders continue to run during the unclocked lunch break.
It should be examined if a fixed break time does not present the better alternative.

see
Shift Definition

11.1.6 Plan time calculation

In a time analysis, planned and actual time are compared.

The actual time is described in the chapter Actual time.

Actual time is in contrast with the plan time.
The difference between the two is allocated to the overtime account.

The plan time per day is stored in the shift that was used (Shift Definition - Working times - Day1).
The shift to be used is determined by Shift scheduling.

The number of hours stored there is multiplied by the percentage specification "Working day" defined for this day in the factory calendar, e.g. 50% on Christmas Eve (24.12.).

This calculation results in the plan time for this day.

© 2026 Boyum IT Solutions A/S

11.1.7 Actual time determination

The actual time is the sum of the calculated working times on the basis of clocking, the manually added presences, and the putility absences.

Actual time of a clocking activity

The actual time of a clocking activity is calculated from the calculated time. Further Information under: Calculating a working time

Special case: If an absence has been entered on the same day and a definition was made to the effect that absences should not be considered, then this actual time is not considered.

Actual time of manual additions

Time additions can be defined manually. The number of minutes is specified.

Actual time of absences

Certain absences count as actual time, e.g. vacation, sickness, etc.
The actual time is defined by the switch "Payment" in the absence type. A percentage statement can be made here again as to how much of the plan time is counted as actual time.

The planned time of an absence type is calculated as follows:

1. Determine the current shift according to Shift scheduling.
2. Determine the plan time according to shift definition taking the day template and factor calendar.
   The first day-hour entry is normally used.
   A definition can be made in absence type under number of hours specifying that the number of hours.
   Number 2 or 3 (defined in the Shift Definition) should be used.
3. This number of hours is multiplied with the work day according to calendar.
   (Normally 100%, but on 24.12., e.g. only 50%)
4. This number of hours is multiplied with the % value specified in absence time under Payment.

© 2026 Boyum IT Solutions A/S

The result is the actual time for this presence.

Special case: If the employee is present on this day and if "Observe presence hours" has been activated in absence type, the actual time is the sum of the presence and absence.

ALTERNATIVE:
A fixed number of hours can also be entered directly. This is not advisable, however. Alternatively, presences can also be entered manually in minutes.

For other settings as well as examples of absence types, ***see*** Absence Types.

11.1.8 Flextime accounts

Beas supports a variety of flextime account systems.

The following rules apply to the calculation of flextime accounts:

Planned Time – Actual Time = Overtime

Overtime (or minus hours) are added to or subtracted from the flextime account.
The sum of overtime is written to the monthly account of the person using time analysis In the following month, the overtime account then refers to the calculated flextime account in the previous month.

In the time analysis, the flextime accounts are shown in detail.

The behavior of the flextime account is set in Period Rule
Two independent accounts as well as an Overflow account .

Disable flextime account
If no flextime account is to be maintained, "-1" must be entered in "Maximum number of hours" in the period rules defined for the person.

Overtime pay
If a certain number of hours is to be paid they may not be included any more in the following month.
Follow this procedure:

© 2026 Boyum IT Solutions A/S

1. Create monthly analysis for the previous month and calculate the monthly numbers accordingly
2. Personnel – Monthly numbers
3. Enter the number of hours considered for the following month for account 1 and 2, respectively, in the column Flextime Account Balance/Current.

Overtime reduction through vacation/time off

If the person is not present, his account is automatically reduced.

If a respective entry should be made preventing the person from being absent without excuse, then an Absence Type can be created in this case and entered for the person and the corresponding area:

Pay: 0%

Sickness, vacation, training: 0%

Number of hours, standard; the remainder is also standard. Observe presence hours.

see

Overflow account

Plan time calculation

Actual time determination

Period Rule

Personnel

Absence Types

11.1.8.1 Overflow account

Overflow accounts are used when a person is allowed to accumulate only a certain number of overtime. If the account is full, the hours above are moved to the overflow account.

Overflow accounts are usually putility out or they expire. They are no longer included in the time analysis of the following month.

The limit of the account is defined in the Period Rule (maximum number of hours).

The max. flextime account limit can be set separately for each flextime account. However, there is only one overflow account.

The accounts are displayed through the time analysis or after the monthly analysis through Personnel – Monthly Quota.

There are 2 types of overflow accounts:

Daily computation

If the maximum account is exceeded on a particular day, a transfer to the overflow account is made immediately, even if the sum at the end of the month does not match the maximum.

Monthly computation

It is only verified at the end of the month if the maximum account is exceeded. An overflow is permitted during the month.

The behavior is configured under EXTRA – OPTIONS – FDC.

see

Flextime accounts

Period Rule

11.1.8.2 Second flextime account

Two flextime accounts are administered. This can be useful for accounting purposes, for ***example*** if, for a certain period, overtime should be posted differently for business reasons.

Determining the flextime account to which time should be posted is done under Personnel – Regular hours – Account planning. This can be defined with a from-to period, including specification of a reason for the change.

Calculation as well as output are done through the time analysis. The result of the last analysis can be viewed under Personnel – Monthly quota.

Both flextime accounts behave identically and the number of hours of the previous month is considered in the following month.

11.1.9 Overtime Accounts

Overtime accounts can be defined in addition to hourly accounts.
Above a certain number of overtime hours on a day, the hours over this limit are moved to an overtime account.

This is set up in the period rule in the Hourly Surcharge tab
Two accounts each can be defined separately for Saturday, Sunday and Weekdays and the surcharge entered as information.
The accumulated accounts can be output in the time analysis or stored in the month view.

© 2026 Boyum IT Solutions A/S

The hours are totaled if

a) a value > 0 is entered in the second overtime field for both accounts

b) a value > 0 is entered for only one account and 0 entered in the second account

Example:

Entry in period rule:

1. Sunday overtime From 1st hour and from 4th hour

If you work 6 hours on a Sunday and you have a planned work time of 0 hours, 2 hours are added to Sunday overtime account 2 (= number above the 4th hour) and 3 hours are added to Sunday overtime account 1 (= number above the 1st hour minus the hours written to account 2).

2. Sunday overtime Above the 1st hour, no entry in the second account field

If you are present for 6 hours and have a planned work time of 6 hours, 5 hours are written to the first account.

3. Sunday overtime Both accounts 0 hours

No hours are written to an overtime account

4. Sunday overtime First account 0, second account from 4th hour

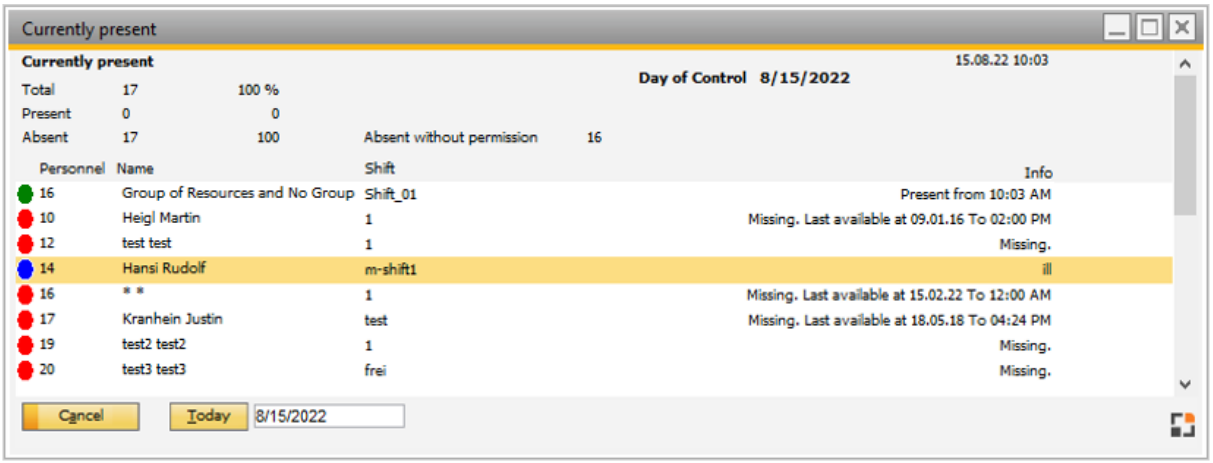
Present 6 hours, planned work time 0 hours: 2 hours to account 2 and 4 hours to account 1, as an account calculation is also calculated from 0 hours if something is entered in the second account.

11.2 Currently present

In this list, the currently present employees are displayed. Furthermore, statistics on the total number of the persons present are available. A presence list can also be displayed for any other day.

PATH: Human Resources > Currently Present.

© 2026 Boyum IT Solutions A/S



Window bde_ anwesenheit_ aktuell.psr

Field	Meaning
Status (colored dot)	Indication of the current status: Green: Present or was present. Blue: Permitted absence (e.g. vacation, sick-leave, etc.). Red: Missing or forgot to clock in.
Personnel	Personnel number.
Name	Name.
Shift	If the person is attendant: the current shift. If absent: the reason.
Info	Last login or logout.

Today: Function sets the date to the current day.
Refresh window: Update the list according to the latest changes.

Time is displayed according to the SAP Business One Client.

Field descriptions

Field	Description
...	Displays error status. Red halt signal: an error occurred, for example in login (attendance). Use the protocol to ***see*** more details. Measures if the error status cannot be removed. Normally, the error status is reset if all entries have been confirmed. If this is not the case, use the following SQL statement to resolve the problem. `update "BEAS_PERS" set "FLAGERROR"=0 where "PERS_ID"='<personal nummer>'`

© 2026 Boyum IT Solutions A/S

	Example: Personnel number 200 affected: `update "BEAS_PERS" set "FLAGERROR"=0 where "PERS_ID"='200'`
Personnel	Personnel number Unique personnel number. **Note:** sorted alphanumeric, not by number. ***See*** Personnel master data . Configuration wizard - Attendance - Personnel.
SAP-Id	The internal SAP Id Number for this Personnel Entry.
Name	Name. Displayed in gray if the employee is inactive.
Present	Since when has the personnel been present ? If the last login is from the previous day, time and date are displayed in red.
Attendance	Attendance type.
Attendance designation	Designation of attendance type.
Current shift	If present: currently assigned shift.
Cost center	Cost center of this employee.
Personnel group	Personnel group of this employee.

Additional fields (activate via window settings)

Field	Description
Active	Employee active? By default, all inactive employees are hidden and only displayed if searching for them. Names are displayed in gray.
Birth date	Date of birth.
Language	Menu language of this employee for terminal and WEB apps.
Entry date	Date of Hiring.
Leaving date	Date of Leaving.
Annual leave	Total annual leave.
Standard Shift	Standard shift, if no other shift determination applies
Hour rule	Standard hour rule, if no other applies
Employment status	Text field.
Location	Optional information.

© 2026 Boyum IT Solutions A/S

SAP-Id	Personnel number SAP Business One master data ***See*** Personnel – Connection to SAP B1 – personnel master.
UDF1..UDF4	Free definable fields.

11.3.1 Personnel Master data

The personnel master data are entered here. These data are needed for presence recording and FDC; they are completely detached from user administration.

Personnel List

Monthly quota

Personnel master data

Edit master data

Shift model Define specific information of the shifts for a certain period.

Account planning for a certain period

Special shift Define special shifts for manual shift determination.

Attendance Register and edit attendance times.

Absence Register and edit absences, vacation and sickness times.

Work orders Register and edit work orders time receipts.

Monthly quota Evaluate monthly values and wage types.

Documents Attach documents.

The visibility of the tabs depends on authorization. ***See*** Editing rights.

- Connection to SAP Personnel master.

SAP Business One – Personnel master was introduced subsequently. Beas has been connected to SAP Business One which means that an employee created in SAP Business One will be automatically inserted in Beas and vice versa.

© 2026 Boyum IT Solutions A/S

Due to downward compatibility, personnel numbers cannot be synchronized, because Beas allows alphanumeric personnel ID, in contrast to SAP Business One. For this reason the Beas – personnel entry consist of two personnel numbers. One manually entered number and one automatically generated SAP Business One – personnel number.

The following fields are synchronized:
First name
Second First name
Surname

- Customization

Example: Insert new fields

back to Personnel

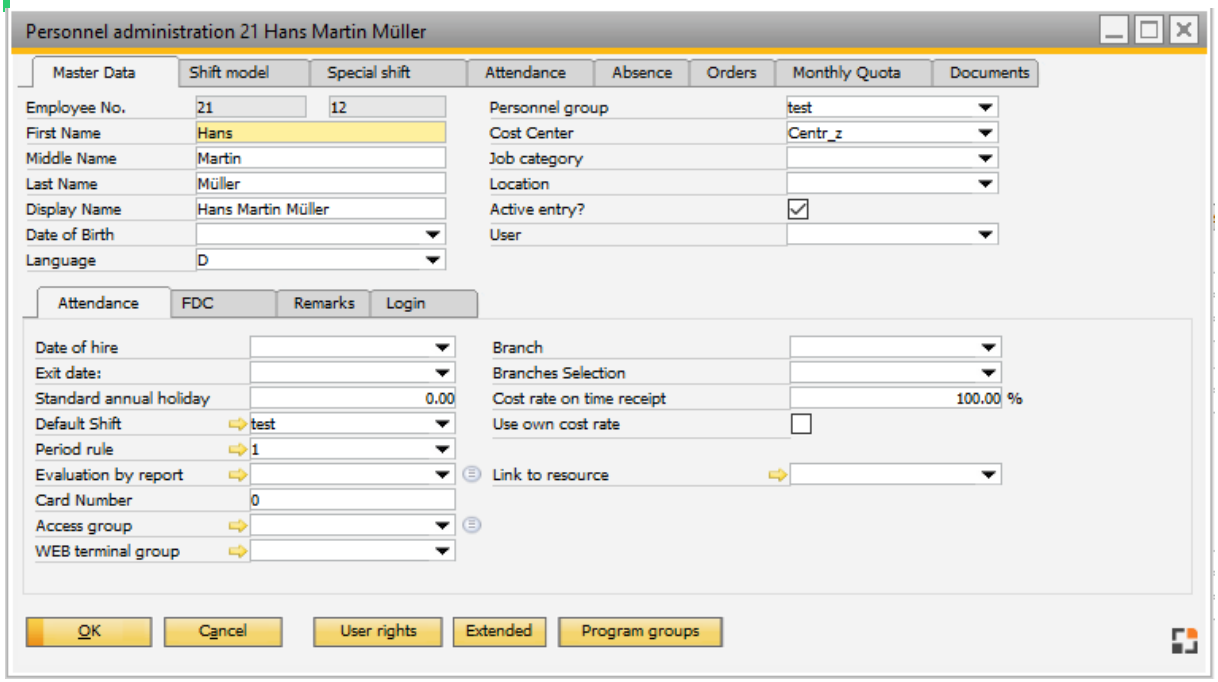
Documents

This Personnel window is the equivalent of the Employee window in SAP Business One. In this window you can edit personnel master data.
It is possible to synchronize Beas- and SAP Personnel Data (SAP: Employee Master Data). We are working on a solution to migrate both functions.

© 2026 Boyum IT Solutions A/S

PATH: Human Resources > Personnel > **Open** an entry.



Window bde_personal_edit.psr

Note: All fields with "x" in column "Sync" are synchronized automatically with SAP Business One Employee Master Data.

Currently only possible if you change the information in Beas window.

Master data tab – Header

Field	sync	Meaning
Personnel	x	Unique employee number There are two number fields: a) Beas Internal employee number (*beas_pers.pers_id*) b) Employee number linked to SAP Business One The second number is either linked to an existing SAP Business One entry or it is assigned automatically at new creation of the employee record. Note: Personnel number is alphanumeric and is sorted accordingly; it is not sorted by numbers.

© 2026 Boyum IT Solutions A/S

		Example: For personnel numbers 1–11 sorting is: 1,10,11,2,3,4,5,7,8,9,0 To avoid this, use initial 0, such as 001, 002, ... 011 If automatic personnel numbering was enabled in the Configuration wizard, the displayed list is sorted by numbers. ***See*** Configuration wizard – Personnel. Connection to SAP B1 personnel master data.
First Name	x	First Name.
Middle name	x	Middle name.
Last Name	x	Last Name.
Display name		The name displayed in several lists. Created automatically, if you change first, middle or last name Consist of First name, second First name, Last name. **Note**: If you change the name, the new name is shown in all lists and archives. Beas does not save the name in any other document (according to GDPR Rules).
Date of Birth	x	For information only.
Language		Important for language sensitive menus (like WEB Apps) which are displayed in the language of the logged in employee.
User	x	Link to SAP B1 user name and personnel number Certain kinds of data registrations as Quality control or Material posting require a linkage between SAP Business One - User and the personnel entry, if not started via Terminal. **Note:** Link can be established also in User administration – Extended.

© 2026 Boyum IT Solutions A/S

		See Quality control User management
Personnel Group		Belongs to Personnel Group.
Cost Center	x	Can be used for additional analysis, if applicable.
Bonus Group		More information according to bonus documentation.
Job category		Selection from SAP Business One.
Location		Selection from WEB Apps device administration.
Active Entry	x	If this option is disabled, the employee can no longer login or logout in presence recording.

Functions

Button	Meaning
Delete	Delete HR entry. With existing attendance entries the person will not be deleted, but set to "inactive". Note: The system asks separately if you wish to delete the entry in SAP Business One Employee Master Data.
User rights	Determination of extended editing rights and access for this user. Button is only visible, with authorization Personnel editing rights. ***See*** Editing rights.
Program group	Open the authorization window for access on program groups. Access can be defined per program group. This is only required when more than one program group had been activated. ***See*** Program group Administration.
Extended	Time evaluation for selected personnel entry. Button only visible with the respective authorization. ***See*** Time evaluation.
Reset SAP link	The system tries to link the SAP Business One Employee Master Data with Beas Personnel entry automatically. If the system is linked incorrectly, it will be possible to delete the link and to define a new link. For this you can choose the correct Employee entry. If not available: Do not fill the field. The system will create a new entry automatically. *Beas 2020.02*

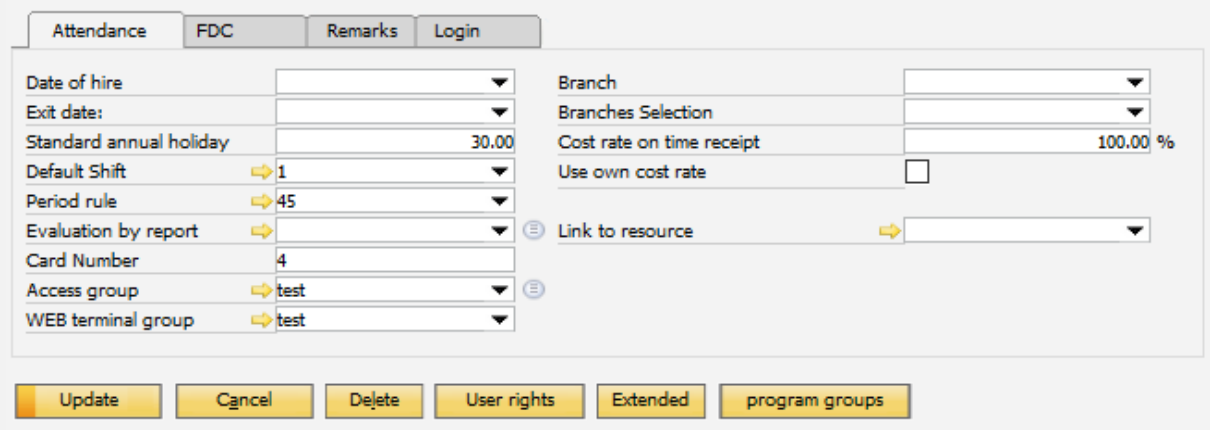
11.3.1.1.1 Attendance

Personnel List
Monthly quote
Personnel master data
Edit master data
Attendance
FDC
Logon
Editing rights

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Master Data tab > Attendance tab.



Window bde_personal_edit.psr

Field	Sync	Meaning
Date of Hire	x	The date the employee starts working for the company. **Note**: Login is not possible before the date of hire.
Exit Date:	x	The date the employee finishes working for the company. **Note**: Login is not possible after the exit date.
Standard annual holiday		Annual vacation entitlement of the employee The days entered here are used every year in January in the "vacation – surcharge" column for the Monthly Quota automatically. **Note**: With the customized extension fdc.src the behavior can be changed.

© 2026 Boyum IT Solutions A/S

		See Monthly quota.
Default Shift		Shift valid for employee if nothing else has been defined in regular hours and shift schedule.
Period rule		Period rule used for employee if no other period rule has been defined in regular hours.
Evaluation by report		Under time analysis, you can specify the information that should be output on the time analysis. You can store the report definition to be used here. ***See*** Time evaluation.
Card Number		To login to attendance recording and work order recording a unique number is required (e.g. RFID, Barcode, Magnetic strip, Chip, etc.). This number can be entered here. PC-Terminal: Only supported if in **Configuration wizard > Personnel > Terminal login** "Card number" was selected. WebApp: only supported if in **Attendance master data > Terminal-Functions > Setup > Basis settings > Login** "Card number" was selected.
Access group		Authorization group for PC-Terminal. In Authorization groups it is possible to define which apps an employee may access in PC Terminal of the program group "Terminal". As long as no authorization group was defined, all default apps are available. After an authorization was defined, an employee can access only the apps which had been assigned to their group.
WEB Terminal group		Authorization group to define which features are available in WEB Apps for this employee. If this field is left empty, the setting from above "authorization group" applies.
Branch		Set the branch from SAP Business One. This is only for filtering and sorting, no function.
Branches Selection		In this field you can set up from which branches the employee may select work orders or operations. Only for information purposes; no function.
Cost rate on time receipt		Modify the cost rate of a resource depending on the personnel who is reporting. In this case, it can be represented if the cost of the resource is more or less associated to the personnel reporting. This value is a percentage factor. By default, the value is 100%. In time receipt, the costs stored in the resource are multiplied by this cost factor: resource costs rate * cost factor.
Use own cost rate		Enable a cost rate per hour when the operator reports time. Once this field is active, a new field is available.

© 2026 Boyum IT Solutions A/S

		Cost Rate per Minute: Include the cost amount to be used. This option works together with labor cost defined in the resource. For this, labor cost must be evaluated separately. ***For example***, there is a labor cost rate per hour of 20€. This cost applies to any personnel. However, there can be differences depending on the personnel role, like specialist or supervisor, where the cost rate can be higher. In this example the own cost rate is 30€. Only the personnel who has this field active and have labor cost separate in the resource applies the cost rate assigned in the personnel master data.
Link to resource		The personnel entry can be linked to a resource. **Possibilities: select a resource**: In resource the field "number machines/employees" is set to the number of employees, linked to that resource. Thus, a 1:1-relation between resource and person can be represented. **Enter a new resource**: The entered resource is created and linked to the person. Note: This is only for information. The link has no effect on the capacity to the linked resource.

Functions:

Uncleared Time Records: this function opens the Attendance clock in screen to edit Shift and Clock in information.

Change log: Opens the Change log for employees (right-click function).

For further buttons ***see*** Edit Personnel Master data.

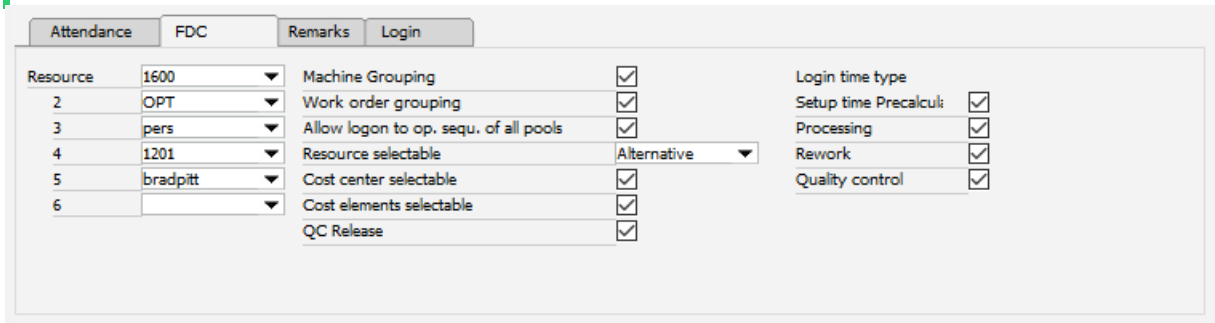
Logon

Editing rights

© 2026 Boyum IT Solutions A/S

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Master Data tab > FDC tab.



Window bde_personal_edit.psr

Field	Meaning
Resource	Determines which resource the employee may log in. Up to 6 Resources can be entered. Logon via Pool list to view all operations which are assigned to one of these 6 resources. A valid resource ID needs to be entered. From "Resource 2" placeholders can be used "%" or 010%: for all resource IDs starting with 010. ***Reference:*** The % character needs to be at the end. Additional %-characters are not allowed. ***Example*** Resource 1: % or _ not allowed. Resource 2-6: % or _ allowed. Beas checks this rule in - Work list - personnel filter - Login and logout - Pool list - Time receipt Important: This resource rule is not checked in Quick input app and functions linked with it.

© 2026 Boyum IT Solutions A/S

	See Resources Pool Report
Machine Grouping	If active, the employee can work on multiple machines in parallel (beas_pers.machine grouping 1/0). **Terminal > work order login**.
Work order grouping	If active, the employee can log on to multiple orders at once (beas_pers.work order grouping 1/0). **Terminal > work order login**.
Allow logon to op. sequ. of all pools	if active, the employee can also log on via bar code to positions which are not in the active pool. Only affects **Terminal > work order login**. Affects only the Terminal – Order login.
Resource selectable	Work oder login. Determine whether the employee may change the resource at login and logout to work order **Yes** = Any resource may be selected. **No** = Resource is predetermined; it may not be changed: only the resource in the position (or the resources belong to the group in the position) are allowed. **Alternative** = Employee may choose between the default resource ("No" option) and alternative resource. *(beas9.0-004-000-001)* Note: If the default resource is a resource group, you may choose between the resources of the group. This has a higher priority than the setting "alternative". With the setting "Yes" only the resources set up in **Personnel > FDC** (Resource 1–6) or stored in station settings are displayed. *Column: ressourcenwechsel 0=No, 1=Yes, 2=alternativ, Standard=1 (Yes)*
Cost center selectable	Determines whether the “Charge to Cost Center” field is displayed and can be changed for Time Receipt Logoff window
Cost Elements selectable	Determines whether the “Charge to Element” field is displayed and can be changed for Time Receipt Logoff window
Login time type	Determines which time types may be selected.

© 2026 Boyum IT Solutions A/S

	Time types (setup, processing, quality control, rework, etc.) the employee may select for at work order login and logout. The names of the fields can be defined in **Configuration wizard > Master data > Resources** and are selected here using the applicable check box.
QC Release	Activate if the employee is allowed to release goods in QC. When **inactive**, the "Release" flag is hidden in the QC Measurement sample window. When **active**, the "Release" check box is visible in the QC Measurement sample window.

Note: When editing a time receipt, these rules do not apply. Type type, resources, cost centers etc. are always selectable. The pool is not taken into account. No consideration in case of login via MDE, as in this case an offline-solution is working.

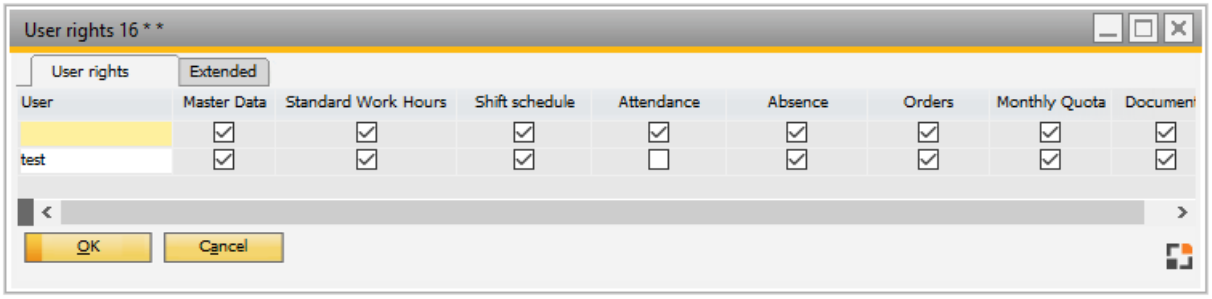
In this window extended editing rights are managed. Accessible via **Edit Personnel > Button "User rights"**

Here you can define by which user this employee can be viewed or edited and which data are included.



Window bde_personal_edit.psr

Settings are stored per user:

Area	Description
Master data	Editing rights for master data tab.

© 2026 Boyum IT Solutions A/S

	Important: Minimum requirement: reading rights are necessary to get access to additional tabs and functions.
Standard work hours	Editing rights for standard work hours tab.
Special shift	Editing rights for special shift tab.
Attendance	Editing rights for attendance. Right to calculate or view time evaluations ***See*** time evaluation.
Absences	Editing rights for absences tab. Right to calculate or view time evaluations ***See*** time evaluation.
Work orders	Editing rights for work orders tab. Affects not only the personnel master, but also work order structure, post-calculation and all other views on FDC reporting. If a user has no rights to administrate FDC clocking, these will be charged but always hidden, except the entries that the user is allowed to see according to their personnel editing rights.
Monthly quota	Editing rights for Monthly quota tab. Currently no effect on reports and monthly quota.
Documents	Editing rights for documents tab.

If nothing is set up, the employee has access to all data.

Functions:
Add/Remove: Create new / delete selected user right.

The user is stored with their editing rights:

Check box	Meaning
empty	No authorization.
gray	Reading authorization.
black	Editing rights.

Reading rights are always required. ***See*** Rights administration
Without personnel authorization, a user cannot open the personnel screen.
If full personnel editing rights were granted, this has a higher priority than the extended editing rights.

Shift Times tab – Available shift models

Field	Meaning
Employee no.	Personnel number.
For Date from ... to	⊟ Period for which the rule applies. Define the period in which the definition applies. If no "Date to" was entered, the rule applies until the next rule takes effect. Entries with overlapping dates: the entry with the highest "from date" is applied. ***Example:*** 1. Entry valid from May 1st 2015 until December 1st .2015 2. Entey valid from July 1st.2015 until - no entry - on June 1st 2015 the first entry is used. On August 1st, the second entry is used. Special shifts always have higher priority. *Note: from beas9.1 PL 6*
Shift model	According to week plan - tab: Shift determination by week Shift work 1 shifts: ⊟ One fixed shift.

© 2026 Boyum IT Solutions A/S

		You can define the shift that will be valid for the employee for the entered time period. Note: This can also be defined in the Special Shift.
	Rotation tab Shift work 2..4 shifts	Shift determination with weekly rotation
	Automatic Shift	Automatic shift determination
	Automatic on default	Automatic shift determination with stored shift definitions
	Manual selection tab	Manual shift definition
Evaluation by report	In time evaluation you can set up which information is to be printed in a report. You can store the report to be used. ***See*** Report definition.	
Max overtime	In period rules accounts can be defined including the maximum amount of hours. Here, you define the limit for an overtime account to be transferred to the next month. It is automatically truncated if the limit is exceeded (to delete overtime at the beginning of the following month.)	

Tab Extended

Optional period rule	Optional Period rule to be used.
Evaluation by report	You can define which information should be issued in the time evaluation. Here it is possible to deposit the report definition to be used.
Max overtime	⊟ Define max. allowed overtime. Accounts can be set up in the period rule: enter the max. hours of the account. This is the maximum reading for the following month. All hours exceeding this limit, be cut off automatically. (Example of use: if generally, overtime is expiring at the beginning of the month).
Plan hours / month	⊟ The number of working hours per month can be defined here. Hours according to shift are not longer considered. The program calculates the hours per day the person has to be present.

11.3.1.2.3 Shift Model

According to week plan
Rotation
Automatic shift
Automatic on default
Manual
Extended

11.3.1.2.3.1 According to week plan

Personnel List
Monthly quota
Personnel master data
Master data
Shift model
Edit standard working hours

According to week plan - tab

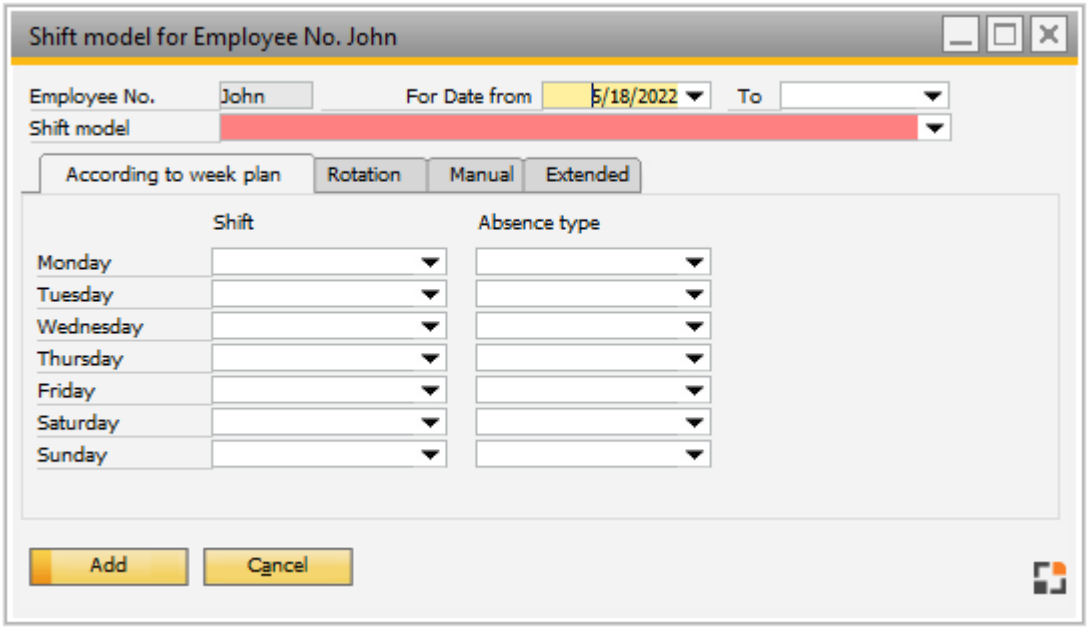
A separate shift of absence reason can be stored for each weekday. Therefore, the rule type "according to weekly plan" must be used.

Here can you define (for every day of the week):
- Shift selection
- Absence type

That means (depending on the day of the week you can determine) if the employee is present and which shift is assigned to them.

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Shift model tab > button **Open/Add** > "According to week plan" tab.

© 2026 Boyum IT Solutions A/S



Window bde_personal_rglarbzeitendetail.psr

Example:

An intern attends school on Thursday and for the remaining time, he works in the "Default" shift. A shift "Std" = Default as well as an Absence Type "School" (Schul) are created.

In the weekly plan, the shift "Std" is now entered from Monday till Wednesday, on Thursday the absence reason "School" and from Friday till Saturday the shift "Std" is entered again. Thus, the employee has – without further entries of absence times – the absence type "School" active for Thursday.

back to standard working hours

11.3.1.2.3.2 Rotation

Personnel List
Monthly quota
Personnel master data
Master data
Shift model
Edit standard working hours

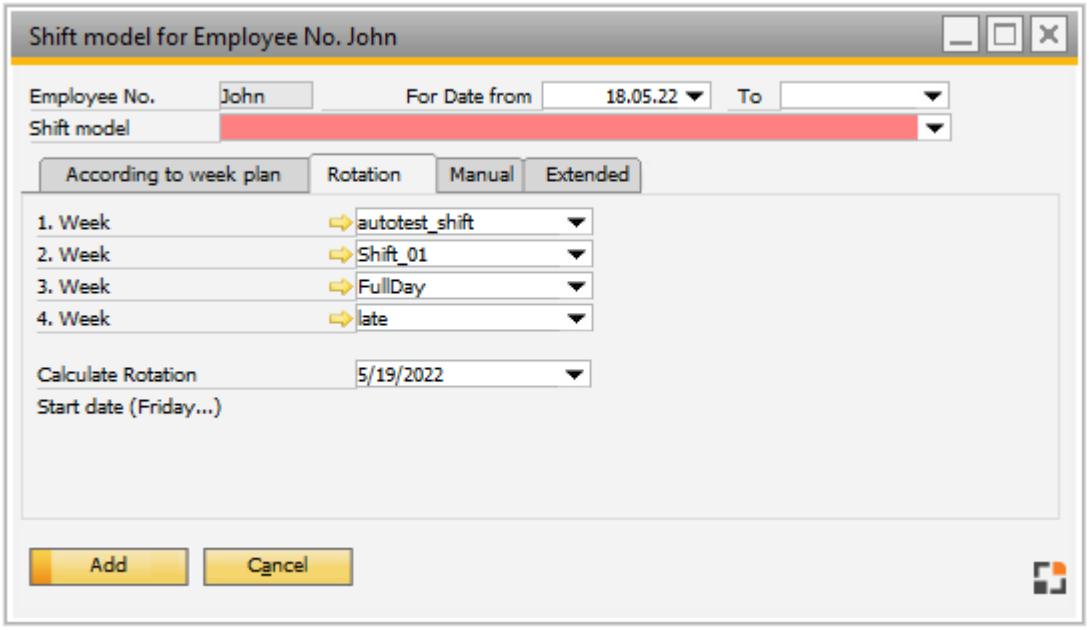
Shift Times 1-4 schedule

The input of the shift schedule depends on the rule type:

© 2026 Boyum IT Solutions A/S

Rotation tab (Shift times rotate weekly)	Manually tab (Select shift manually)
Shift work 1-4 Shifts For shift work 1-3 shifts for the 1., 2., 3. or 4. week, te respective week is entered. For the 1. shift it is enough to enter in 1. week.	Selection 1-6 Available shifts are entered to the lines 1-6. Select Rule type "Automatic per default" or "manual selection"
Rotation calculation from date (Friday): In case of rotation, the count begins with the date entered for the rotation calculation. The count starts from the following Friday.	Plan hours Plan hours are entered when the plan time should not be automatically calculated based on the factory calendar and the shift schedules but are to be firmly specified. This is usually done with annual accounting procedures.

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Shift model tab > button **Open/Add** > "Rotation" tab.



Window bde_personal_rglarbzeitendetail.psr

Example 1:

3-shift operation with morning (FS), evening (SS) and night shift (NS)

The entry first week "FS", second week "SS" and third week "NS" is made as well as a date from which rotation calculation should begin (e.g. from the previous Saturday)

© 2026 Boyum IT Solutions A/S

Example 2:

3-Shift Model

There is an early shift (shift1), late shift (shift2) and night shift (shift3)

The employee starts with the early shift from December and then changes weekly

Shift 1: shift1, Shift 2: shift2, Shift 3: shift3

Calculate rotation. 1st December

back to standard working hours

11.3.1.2.3.3 Automatic shift

Personnel List

Monthly quota

Personnel master data

Master data

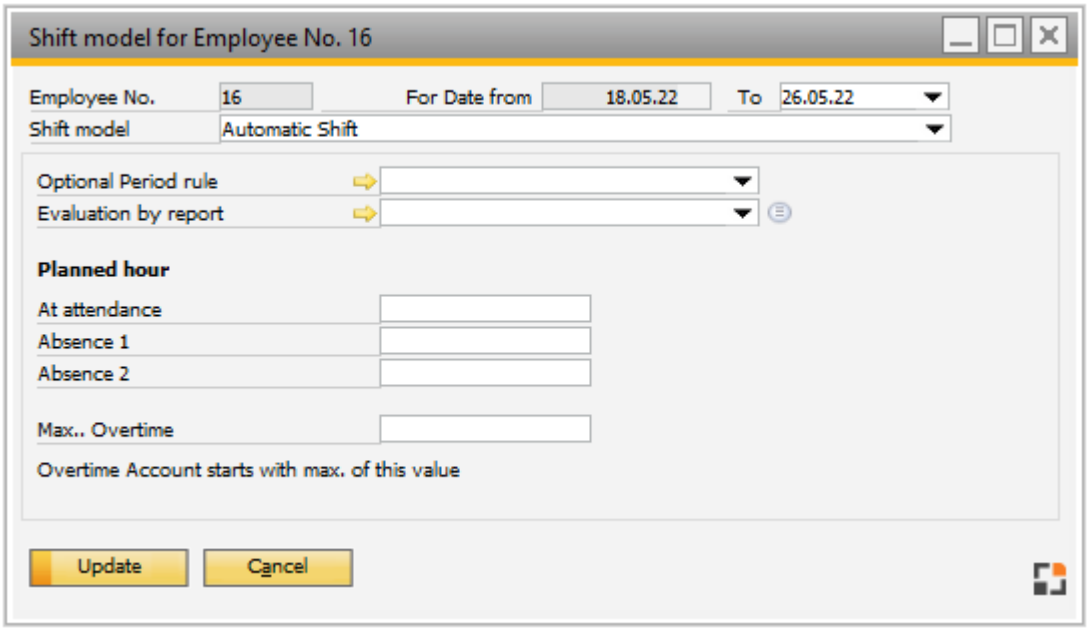
Shift model

Edit standard working hours

In Automatic shift there is no definition to set.

The system takes the first shift which is registered for the defined time.

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Shift model tab > button **Open/Add** > select "Shift model": Automatic Shift.



Window bde_personal_rglarbzeitendetail.psr

© 2026 Boyum IT Solutions A/S

The shift is determined automatically based on the first login time.
The shift definition the shift detection (Time) has to be deposited for this.

***Example*:**
Automatic shift detection
Shift 1: 5 am - 10 am
Shift 2: 8 am - 2 pm

Login is at 9 am: shift 1 and shift 2 are available
Login is at 11 am: Only shift 2 is available

Field descriptions

Field	Description
Optional Period rule	Select an optional period rule from the drop down list. The yellow arrow opens the definition window of the selected Period rule.
Evaluation by report	Select a report for evaluation from the drop down list. The yellow arrow opens the editing window of the selected Report definition.
Planned Hours	
At attendance	Planned hours for attendance for the automatic default setting.
Absence 1	Define planned hours for Absence type 1.
Absence 2	Define planned hours for Absence type 2.
Max.. Overtime	Define maximum planned overtime (in hours).

See Automatic Shift detection
In the shifts, a time for automatic shift control can be stored. The shift to be used is determined based on the first login of the day.

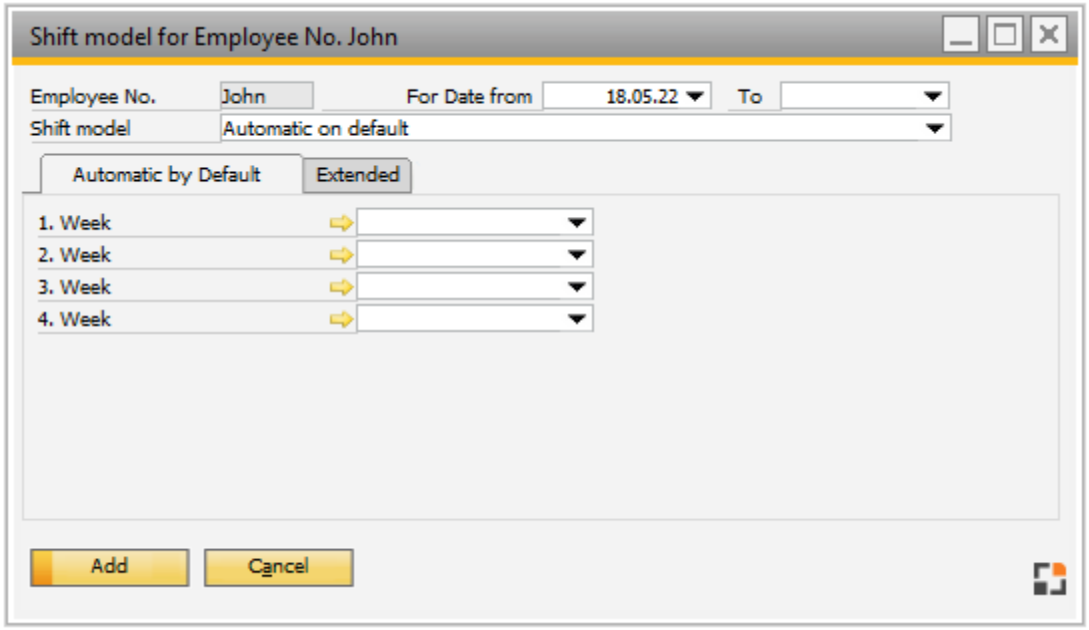
11.3.1.2.3.4 Automatic on default

Personnel List
Monthly quota
Personnel master data
Master data
Shift model
Edit standard working hours

© 2026 Boyum IT Solutions A/S

Automatic determination of the shift to be used from a shift selection.

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Shift model tab > button **Open/Add** > "Shift model" drop-down > select "Automatic on default".



Window bde_personal_rglarbzeitendetail.psr

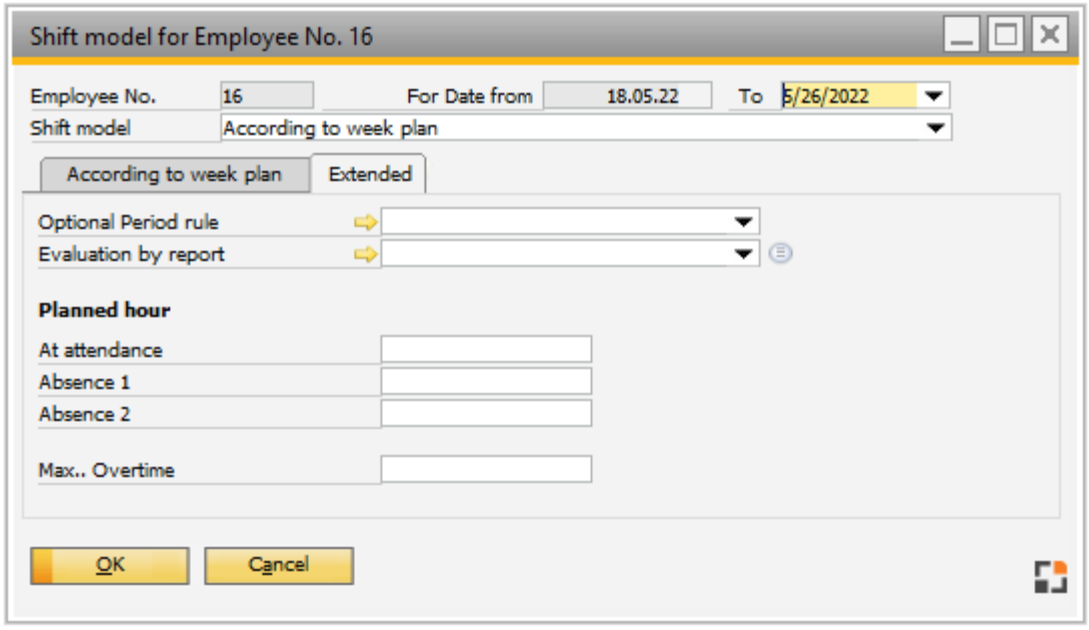
Same as automatic shift control, but only the shifts stored in the tab "Shift schedule" are available. The shift is determined automatically based on the first login time.
In Shift definition, the shift detection (Time) has to be deposited for this.

"Automatic on default" is selected automatically if there are different shift areas. The relevant tab is shown, in which up to 4 shifts can be defined, which is considered at the automatic determination.

Extended tab

In the extended tab you can perform the following, additional settings:

© 2026 Boyum IT Solutions A/S



Window bde_personal_rglarbzeitendetail.psr

Field descriptions

Field	Description
Optional Period rule	Select an optional period rule from the drop down list. The yellow arrow opens the definition window of the selected Period rule.
Evaluation by report	Select a report for evaluation from the drop down list. The yellow arrow opens the editing window of the selected Report definition.
Planned Hours	
At attendance	Planned hours for attendance for the automatic default setting.
Absence 1	Define planned hours for Absence type 1.
Absence 2	Define planned hours for Absence type 2.
Max.. Overtime	Define maximum planned overtime (in hours).

See Automatic Shift determination.

11.3.1.2.3.5 Manual

Personnel List

Monthly quota

Personnel master data

Master data

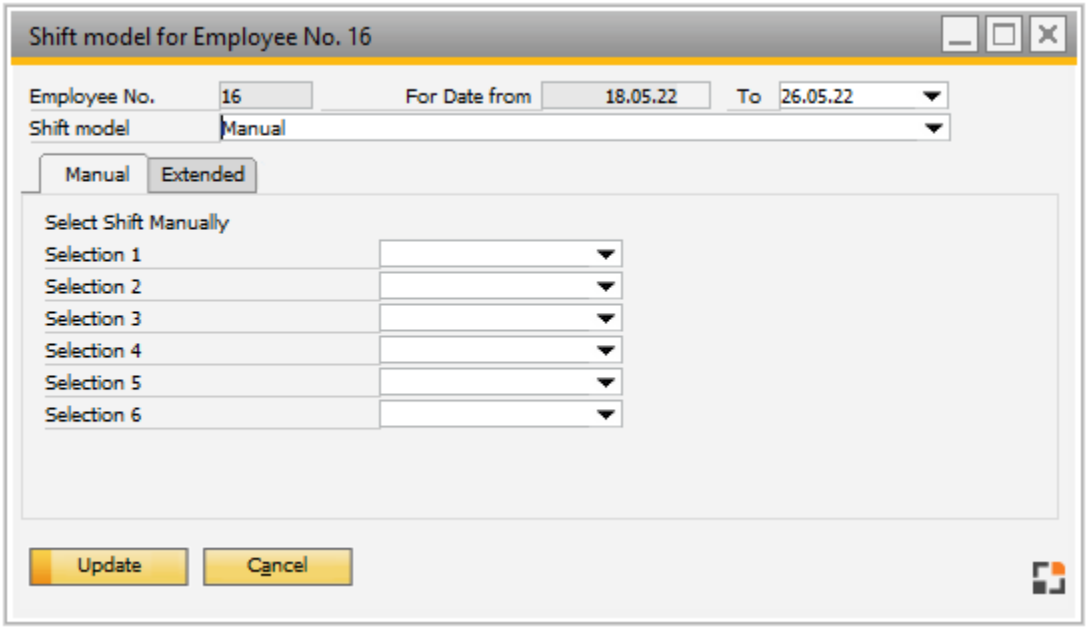
© 2026 Boyum IT Solutions A/S

Shift model

Edit standard working hours

With the Manual shift model, you can allow to choose the shift manually in the Login process.

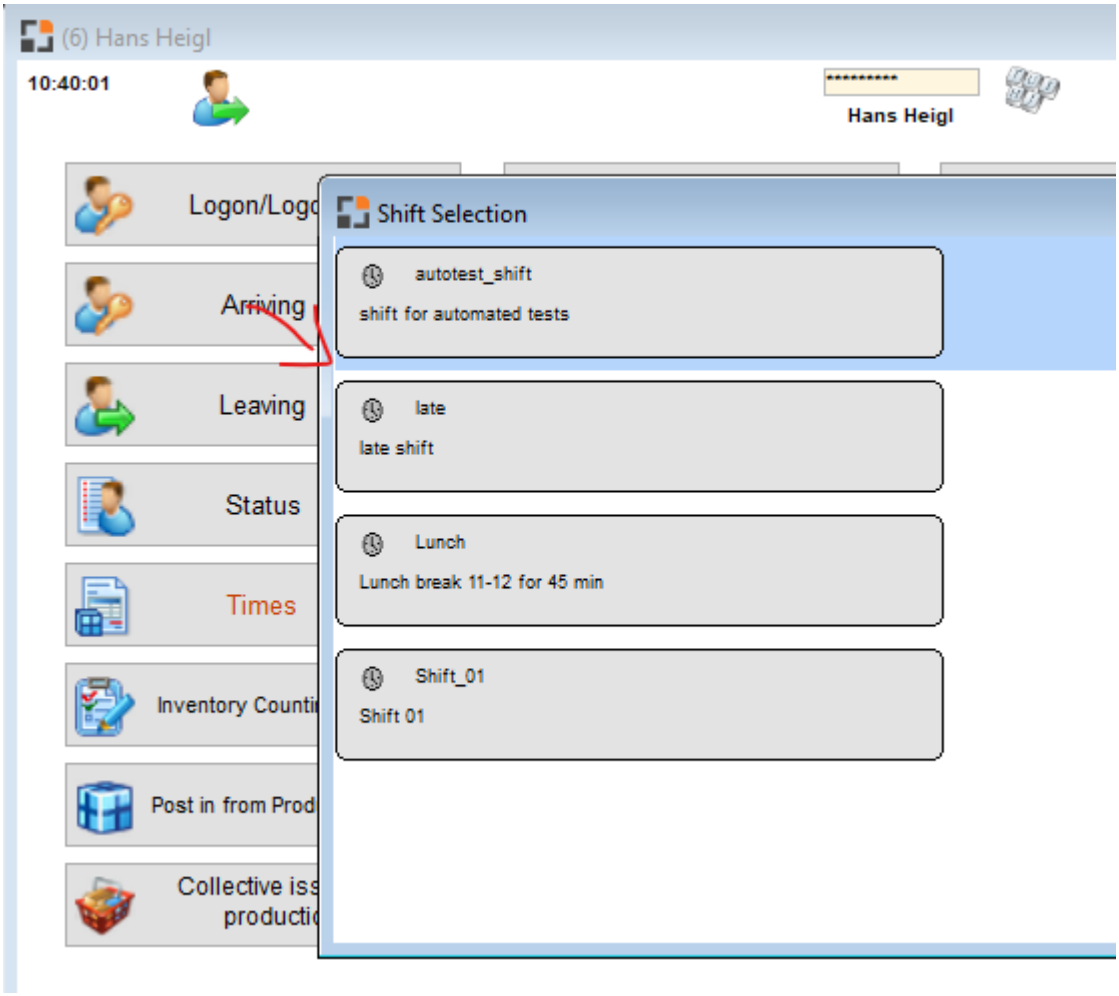
PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Shift model tab > button **Open/Add** > "Shift model" drop-down > select "Manual".



Window bde_personal_rglarbzeitendetail.psr

You can define up to 6 shifts, which the user can choose in the desktop terminal:

© 2026 Boyum IT Solutions A/S



If no shift is defined, the user can choose a shift from among all defined shifts.

It only displays shifts without definition of an "automatic shift" or the current time inside the "automatic shift".

Example:

Shift1: automatic shift 9-13

Shift2: automatic shift 13-17

ShiftM: no definition

Shift1, Schift2 and ShiftM defined in this tab "Manual"

User logs in at 9:00.

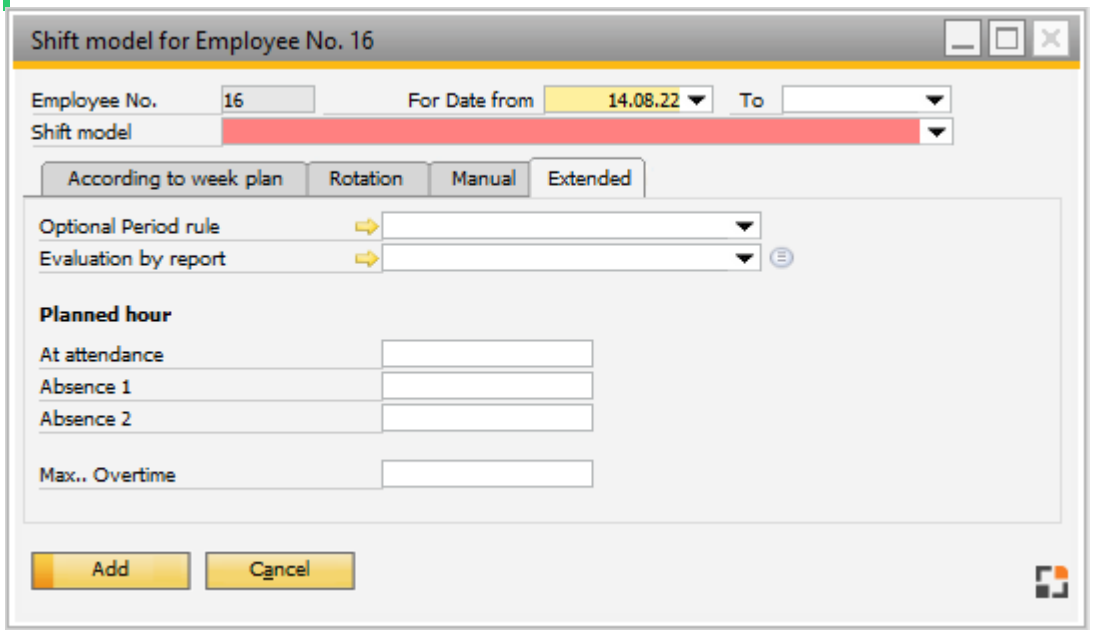
Now he can choose between Shift1 and ShiftM, but not Shift2

11.3.1.2.3.6 Extended

In this tab you can edit extended settings for the opened shift model.

© 2026 Boyum IT Solutions A/S

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Shift model tab > button **Open/Add** > "Extended" tab



Window bde_personal_rglarbzeitendetail.psr

Field descriptions

Field	Description
Optional period rule	Optional Period rule to be used.
Evaluation by report	You can define which information should be issued in the time evaluation. Here it is possible to deposit the report definition to be used.
Max overtime	Define max. allowed overtime. Accounts can be set up in the period rule: enter the max. hours of the account. This is the maximum reading for the following month. All hours exceeding this limit, be cut off automatically. (Example of use: if generally, overtime is expiring at the beginning of the month).
Plan hours / month	The number of working hours per month can be defined here. Hours according to shift are not longer considered. The program calculates the hours per day the person has to be present.

11.3.1.3 Special Shift

Personnel List

Monthly quote

Field	Description
Date from/to	Period, for which this special shift is valid. (from *beas9.0-000-001-008* the period can be entered).
Shift	Sets this special shift for the given period.
Description	Shift description.
Information	Enter a note or information for this entry (from *beas9.0-000-001-008*).

Remove: Right-click function to delete the opened special shift.

back to Personnel

11.3.1.4 Attendance

Personnel List
- Monthly quote
- Personnel master data
- Shift model
- Special shift
  - **Attendance**
    - Enter attendance
- Absence
- Work orders
- Monthly quota
- Documents

© 2026 Boyum IT Solutions A/S

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Attendance tab.

In the Attendance tab all presence times of the employee are displayed. Times can be deleted, changed and also added. The window can be adjusted dynamically. Templates are supported.

Field	Meaning
From Date	Starting date of the entry.
From time	Entered begin (registered time).
Until time	Entered end (registered time).
Duration	Duration between entered start end and entered end .
Duration (Min)	Entered duration.
From time	Calculated start.
Until time	Calculated duration.
Duration	Duration between calculated start end and calculated end including consideration of breaks and rounding rules.
Manually	Check mark if the entry was entered manually.
Changed	Check mark if the entry was changed manually.
Original time	Type of the original entry.
Info	Text field.
Shift	Determined shift.
Hour rule	Determined hour rule.
Shift	Entered shift.
Hour rule	Entered hour rule.

Functions

Open	Edit entry.
Add	Create new entry.
Remove	Delete entry.
Time evaluation	Time evaluation for the current entry. Verifies the attendance and absence of a person. This time analysis also records the vacations and flextime accounts for the following month into the personnel master data.

© 2026 Boyum IT Solutions A/S

Open	Edit entry.
Recalculation	Recalculate attendance after changes were saved.

11.3.1.4.1 Enter attendance time

Personnel List
- Monthly quote
- Personnel master data
- Shift model
- Special shift
  - Attendance
    - **Enter attendance**
- Absence
- Work orders
- Monthly quota
- Documents

The window is split in two: enter attendance on the left, and the determined shift according to the entry is displayed on the right. This display can be used to test whether the determination work correct, before values are saved.

A time can always only be entered for 1 day. If work continues through the night, temporary logoff takes place at 23:59:59 h and logon at 0 h. The same procedure must be followed for manual entries.
If no shift has been entered yet, the shift is determined automatically according to master data, regular hours and shift schedule and shown at the right. This is also a good test of shift determination.

PATH: Human Resources > Personnel > **Open** an entry. > Personnel administration XXX > Attendance tab > **Open/New**.

Time evaluation

© 2026 Boyum IT Solutions A/S

11.4 Time Evaluation

The time analysis is used to verify the presence and absence of a person. The time analysis also records the vacation and flextime accounts for the following month into the personnel data.
Call up via:

Human Resources > Time evaluation (for any number of persons, print or calculate monthly quota)
HR > Personnel list > Time evaluation
HR > Personnel > Edit personnel > Attendance > Time evaluation
Terminal – via various apps

See
Configuration Time evaluation
Report Definition

- Authorization

  The authorization "Time evaluation" is required.
  If extended Personnel – Editing rights are used, reading or writing rights for the attendance record of this employee are required.
  See Authorization, Personnel – Editing rights.

- The evaluation accesses always the results of the previous month

  Values from monthly quota are used

  Remaining leave + surcharge
  Flextime account 1 - pay-out
  Flextime account 2

  If there is no result from last month quota, the following values are used:

  Remaining leave = Annual leave
  Flextime account 1 = 0
  Flextime account 2 = 0

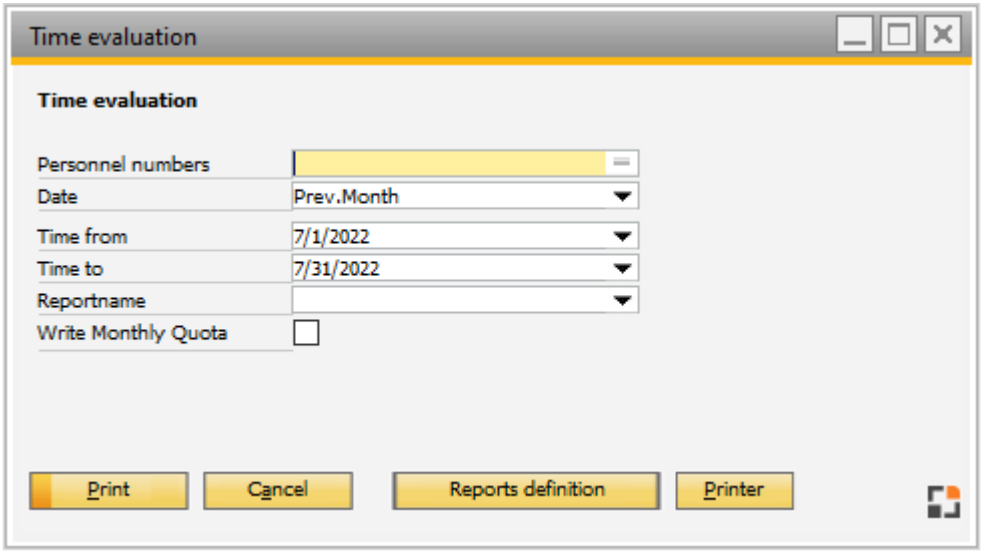
  Monthly values can be entered manually (Personnel Master data – Monthly quota) or calculated using time evaluation (***see*** Write monthly quota

© 2026 Boyum IT Solutions A/S

Example

manually entered for January: Remaining leave 25, Flextime account 1: 15 hours

Time evaluation for February: Basis for February will be remaining leave and 15 on flextime account.



Window bde_auswertung_zeit.psr

Attendance –Time evaluation

Function	Description
Personnel numbers	Use drop down to select personnel numbers
Date	Selection: previous month, current month
Time from – to	Period for evaluation Note: Overtime hours, remaining leave are always subtracted from the result of the previous month. Evaluations not starting from the first day of month, are calculated from that day, but hours are calculated and displayed only starting with the given date.

© 2026 Boyum IT Solutions A/S

	For calculations including more than one month, the monthly results within the selected period are not considered. A dot behind the duration is displayed if the time was automatically registered and manually changed afterwards. For evaluations of a longer period including several month, it is recommended to use Monthly quota. With templates own reports can be created.
Report name	The attendance report can be customized. Enter the name of the customized report. If nothing is stored, the default report stored in Personnel master is applied. ***See*** Report Definition
Write monthly quota	If active, the calculation result is written to monthly quota. This evaluation needs to be carried out monthly, as otherwise the calculation for the following month would have no basic data. Results can be viewed in - Monthly quota - Wage types ***See*** Define wage types

Function

Function	Description
Only calculate	No printout, only calculation of monthly values.
Print	Time evaluation is printed for all selected employees.
Reports Definition	Adjust the evaluation report.

Plan hours	#soll_std		Plan hours
Calculated hours	#ist_std		Calculated actual hours
Difference	#differenz		Difference Plan-Actual
Account 1 Previous month	#kto_vormonat		Account 1 balance for previous month
Account 1 current	#kto_akt		Account 1 current balance
Konto 1 Überlauf	#kto_ueberl		Account balance for overflow account 1
Konto 1 Änderung	#kontoaenderung		Change at account 1
Account 2 Previous month	#kto_vormonat2		Account 2 balance for previous month
Account 2 current	#kto_akt2		Account 1 current balance
Account 2 overflow	#kto_ueberl2		Account balance for overflow account 1
Account 2 change	#kontoaenderung2		Change at account 1
Surcharge 1	#nachtarbeit	nachtarbeit_std	Sum of hours, accrued in a certain domain. Here: night work. Defined in Period rule – time domain
Surcharge 2	#nachtarbeit2	nachtarbeit2_std	Sum of night work hours on account 2
Surcharge 3	#nachtarbeit3	spaetzuschlag_str	Sum of night work hours on account 3
Saturday hrs	#st_samstag	samstag_std	Sum of hours worked on a Saturday
Sunday hrs	#st_sonntag	sonntag_std	Sum of hours worked on a Saturday
Holiday hrs	#ist_feiertag	feiertag_std	Sum of hours worked on a Holiday
Pay off hrs	#auszahlung	konto_auszahlung	Number of hours, subtracted from account 1. Enter in Edit monthly quota – Pay out
Attendant total	#ist_anwesend		Sum of all attendant hours since las month closing

© 2026 Boyum IT Solutions A/S

Attendant days	#ist_tage		
Planned days	#soll_tage		Sum of all work days in period less absences (vacation, sick days)
Missing hrs	#fehlstd		Plan-Actual in hrs
Overtime 1			Sum of overtime account 1 as per Period rule – hourly surcharge
Overtime 2			Sum of overtime on account 2
Overtime 3			Sum of overtime on account 3
Overtime 1 saturday	#sa_uberstd1		Sum of overtime on saturday on account 1
Overtime 2 saturday	#sa_uberstd2		Sum of overtime on saturday on account 2
Overtime 3 saturday	#sa_uberstd3		Sum of overtime on saturday on account 3
Overtime 1 sunday	#so_uberstd1		Sum of overtime on sunday on account 1
Overtime 2 sunday	#so_uberstd2		Sum of overtime on sunday on account 2
Overtime 3 sunday	#so_uberstd3		Sum of overtime on sunday on account 3
Overtime 1 total	#uberstdtotal1		Sum of all overtime on account 1
Overtime 2 total	#uberstdtotal2		Sum of all overtime on account 2
Overtime 3 total	#uberstdtotal3		Sum of all overtime on account 3

11.4.2 Configuration time evaluation

Time evaluation (print out or display) has a fix configuration, only small adaptations are possible. In personnel master and in time evaluation you can set up, which report settings are to be used.

see Report Definition

Configuration

Weekly sum

Active by default, set up in report definition

Wage types

If working with wage types, results are displayed here

Wage type designation	Designation
Wage type ID	ID
Hours	Number of hours accrued on this wage type.
Days	Only when registered manually.
Value	Only when registered manually.
Cost center	Only when registered manually.
Cost object	Only when registered manually.
Attendance type	Only when registered manually.

Customized results table

In Report Definition a table of results can be defined, which will be displayed here

Standard results table

By default, this results are presented in this table.

In Report Definition it can be disabled.

Vac.Hrs	Sum of taken vacation hours in given period All absence types with "vacation" active are considered
Vac.Days	Sum of taken vacation days in given period
Vac.last Mo	Sum of taken vacation in previous month
Vac.Remain	Remaining leave
Vac./Year	Annual leave
Sick Hrs	Sick hours
Sick days	Sick days

© 2026 Boyum IT Solutions A/S

Vac.Hrs	Sum of taken vacation hours in given period All absence types with "vacation" active are considered
Holiday Hrs	Time worked on holidays (in hours)
Holiday	Time worked on holidays (in days)
Saturday	Work on Saturday
Sunday	Work on Sunday
Plan Hrs	Sum of monthly planned hours
Act. Hrs	Sum monthly actual hours
Difference	Difference between Plan and Actual
Act1 Prev.Month/Current/Overflow/Payed	Account balance Previous month/Current Overflow hours/hours payed out
Act1 Prev.Month/Current/Overflow/Payed	Account balance Previous month/Current Overflow hours/hours out hours
1,2,3	Surcharges depending on report definition (***see above***)

Additional fields are displayed depending on settings.

Report Definition

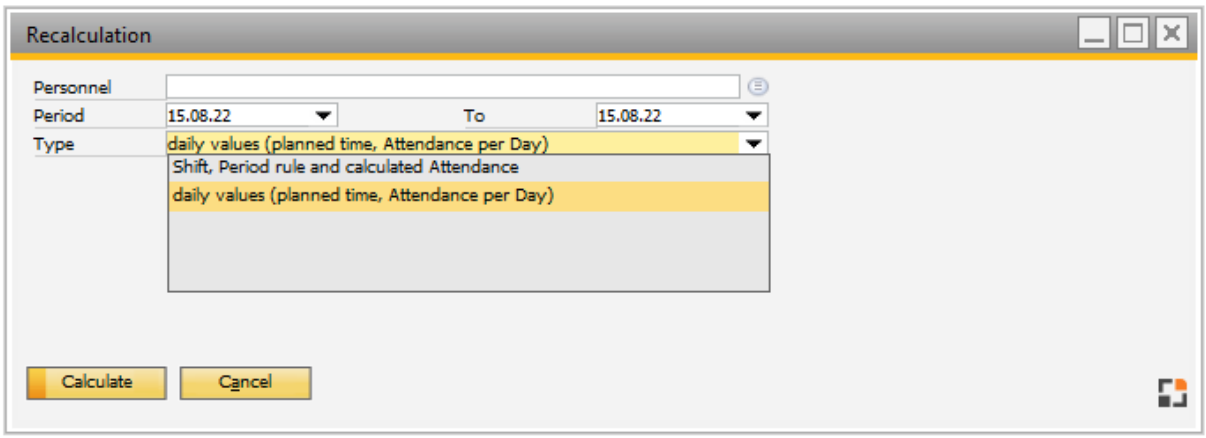
Period rule

11.5 Recalculation

In revaluation you can recalculate the following attendance values:

PATH: Human Resources > Recalculation.

© 2026 Boyum IT Solutions A/S



Window bde_personal_anwzeit_reparatur.psr

- Daily values (Planned time, attendance per day)

Calculates absence, availability per day.

These values are important for daily reports and views in the personnel administration and necessary for a personnel planning.

This calculation can also run using the Beas Service.

The generated table can also be used for own purposes

- Setup table BEAS_PERS_TIMES

Column	Description
PERS_ID	Personnel number
DATEID	Calculated date
PlanMinutes	Planned availability of this person on this day in minutes
AvailableMinutes	Payed time (also from absence times, in which "payed" was activated and the actual calculated attendance)
AttendanceMinutes	Actual attendance + absence, in which "Availability" was activated
AttendanceFrom	First login on this day. The valuation date will be considered and not login date.
AttendanceTo	Last logoff on this day
ABWGRND_ID	Absence type for this day

© 2026 Boyum IT Solutions A/S

Difference	Difference in minutes between planned availability and payed availability
VacHour	Holidays in hours
VacDay	Holidays in days
IllHour	Sick in hours
IllDay	Sick in days
TrainingHour	Training in hours
TrainingDay	Training in days
SCHICHT_ID	Valid shift for this day
STDRGL_ID	Valid period rule for this day
OverTime1 ..3	Overtime 1..3 according to period rule
TimeArea1...3	Work hours in defined time area

Script for subsequent calculation

```
object=ue_api_time=recalculatefdc=<parameter>
```

Parameter	Description

fromdate	Calculation start
	Calculation end will be set on fromdate + 180 automatically, if this will not be set manually.
	
	Example: From yesterday for personnel number 15
	
	`setvar=ld_start=<today -1>`
	`object=ue_api_time=recalculatefdc=pers_id=15<tab>fromdate=<ld_start,yyyy/mm/dd>`

todate	Calculation end
month	Set this on current month ***Example***: calculate current month for all persons `object=ue_api_time=recalculatefdc=month`
pers_id	Define, for which person the calculation has to be performed

© 2026 Boyum IT Solutions A/S

	Example: for personnel number 15 from today, the next 15 days `object=ue_api_time=recalculatefdc=pers_id=15<tab>fromdate=<today,yyyy/mm/dd>`
pers_list	Define the personnel list, for which the calculation has to be performed ***Example***: for this month personnel number 10,11 and 15 `object=ue_api_time=recalculatefdc=month<tab>pers_list='10','11','15'`

See

Report per Day

Beas Service Examples

beas 9.2 PL: 1

- Shift, period rule and calculated attendance

Existing attendance data can be recalculated via this subsequent calculation, if this is necessary because of master data changes.

This can become necessary at changes of
- Factory calendar (in the past)
- Shift- and period rule settings
- Change of the standard shift, period rule, shift model or special shift in the personnel master data

Note:
The time evaluation or calculation of the monthly values has to be re-performed afterward.

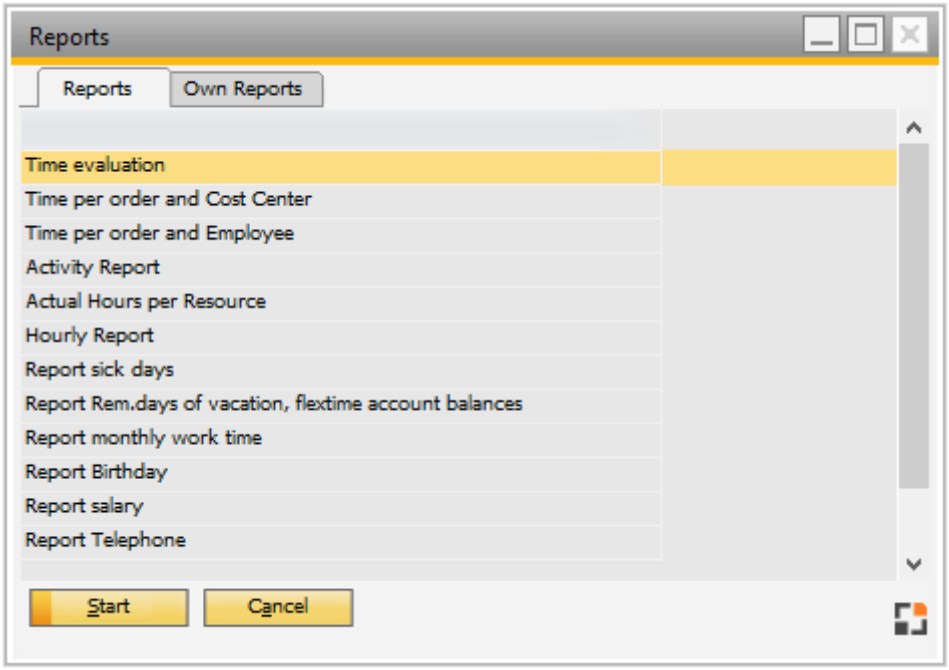
The following are calculated here:
- Shift
- Period rule
- Calculated attendance

© 2026 Boyum IT Solutions A/S

11.6 Report Attendance

Access reports related to personnel attendance in the following window:

PATH: Human Resources > Report Attendance



Window report_makro_start.psr

The following standard HR reports are available:

Report name	Description
Actual Hours by resource	Actual hours (reported order times) for every employee for a certain period and resource The total time per resource is displayed in hours and as diagram for the selected period. The resource entry can be expanded to - hours per day (level 2) - single order time receipts (level 3) *Window: bde_report_arbzeit_monat*
Hourly report (time sheet)	The hourly report provides a detailed overview of the activities of a person. This report is created monthly. In column format, it displays on which project the

© 2026 Boyum IT Solutions A/S

	person has worked for how long each day. In addition, the presence hours are compared allowing verification of the presence at the reported time.
Activity report	In the activity report, the order confirmation reports are shown for a person for a specific period. Entries are sorted by: Date/time - document number - assembly - position
Times by Project and Cost Center	This list shows the number of hours clocked for a specific period from which order to which cost center. The analysis is divided into - Order reporting - Overhead messages (messages to work orders of type Overhead). In addition, the sum is displayed per order, per cost center and total sum order/overhead costs. ***see*** Overhead costs
Times by Project and Employee	A clearly arranged column is displayed with the reported times per order grouped according to personnel numbers is shown. - Order reporting - Overhead messages (messages to work orders of type Overhead). ***see*** **Finished > Work Order > Work Order** One sum is shown per order, per personnel number and total sum order/overhead costs. ***see*** Overhead costs
Report per day	Daily report for personnel list A daily report can be created for all or certain employees for a time period of 31 days (one column per day) The following reports are possible: Attendance: Time presence period and the number of the attendance hours per employee and day Holiday: Display the holiday planning or absence planning in a clear form Shift: Display the shift planning Planning: Display the planned availability *beas 9.2 PL: 01*

11.7 Master data

This chapter contains all master data for:

Terminal functions
Absence Types
Wage types
Period rule
Shift definition
Personnel groups
Attendance recalculation
Day template

11.7.1 Terminal Functions

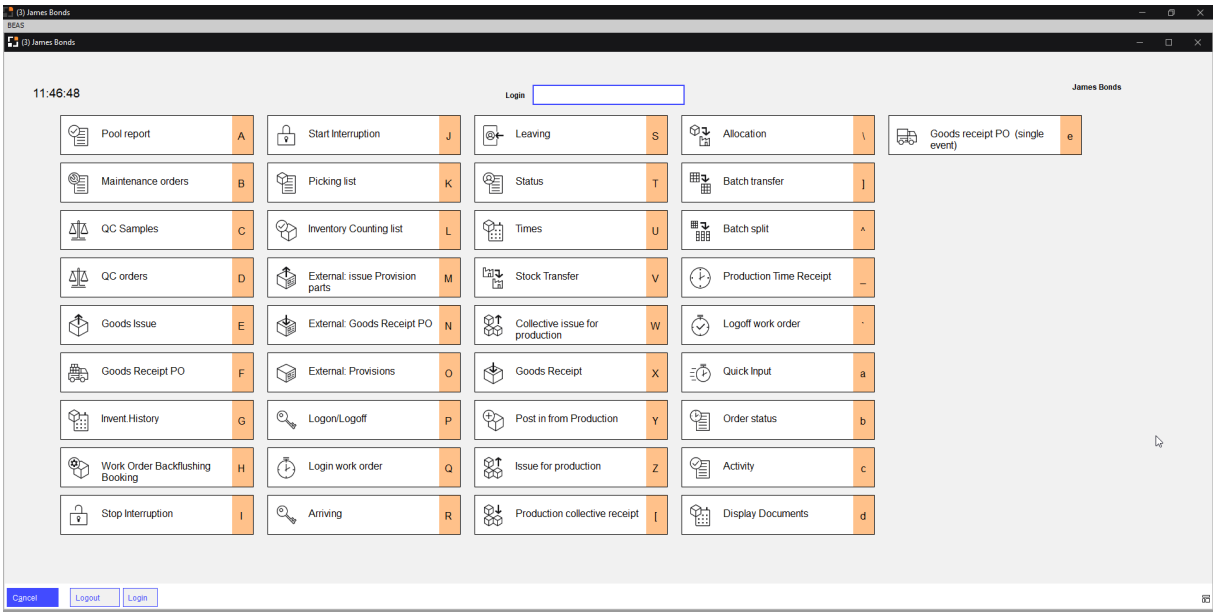
Via Terminal Functions you can edit the Apps of the default Program group "Terminal".
Here you can define, which functions (apps) the user can use
See Desktop Terminal, WEB APPS Version 1.0 and WEB APPS Version 2.1

Alternatively, call up from **Administration > Utilities > Program group Administration > Terminal**

© 2026 Boyum IT Solutions A/S

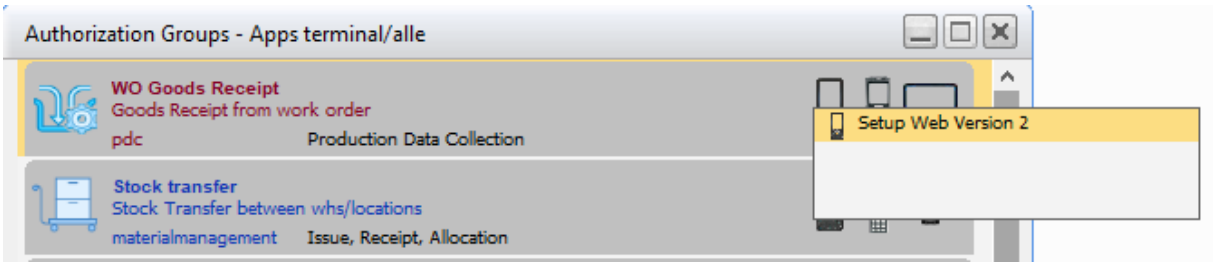
Open Configuration Wizard > Terminal and WEB APP for definition of basic settings and authorization.
Call up apps via PC Terminal or via WEB – solution. ***See*** Terminal.

In the Authorization groups you can set up which apps are available for which authorization groups.
See Terminal Apps Catalog, Personnel master data – Authorization group



Window menu_ entry_ to.psr

By clicking on the WEB / Desktop Symbol you can open the App settings:



The order of the apps in the list can be changed by drag-and-drop.

In the new WEB APP (Version 2) you can only see Apps with this Symbol

In the old WEB APP (Version 1) you can only see Apps with this Symbol

Apps available only for the Desktop Terminal appear with this icon:

© 2026 Boyum IT Solutions A/S

See

Personnel – Basic data – Terminal Functions

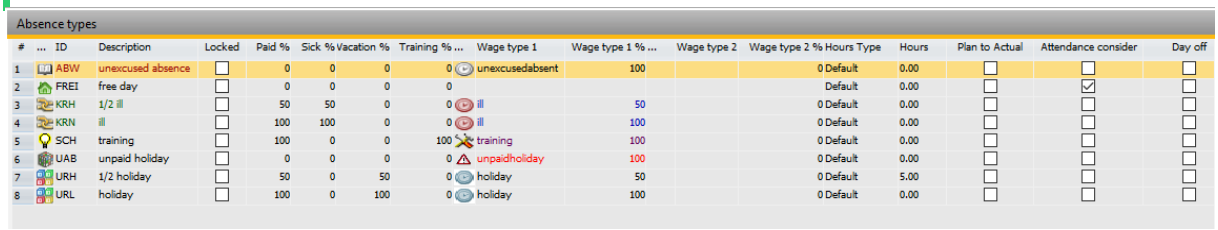
Program group Administration

11.7.2 Absence Types

Any absence types such as vacation, sickness, etc. can be defined in this window.
Its characteristics can be defined here.

For the personnel, the absences are entered under personnel / absences. Only one absence per day is possible.

PATH: Human Resources > Master data > Absence types.



Window bde_abwesenzeitart_browse.psr

Field	Description
ID	ID for the absence type.
Description	Detailed description of the absence type.
Paid %	Determines if the number of hours calculated here should be counted in the ACTUAL hours.
Sick %	Credit number of hours to the sickness account? How many percent of the hours determined if applicable.
Vacation %	⊟ Absence is subtracted from vacation account. If you enter a %-value, this value will be subtracted from vacation account. ***Example***: **Definition**: **1 Day vacation**: Entry 100%, Pay Yes, consider presence hours: No. **Definition**: **1/2 Day vacation:** Entry 50%, Pay Yes, consider presence hours: Yes.

© 2026 Boyum IT Solutions A/S

	Definition: **Unpaid vacation:** Entry 0%, Pay No, consider presence hours: Yes.
Training %	Book number of hours to the training account? If yes, how many percent of the hours.
Wage type	Hours can be booked to two wage types. The next column displays the %-value of the total number of hours. ***See*** wage types. beas9.0-004-000-000, wagetype1 wagetype1pc, wagetype2, wagetype2pc
Number of Hours	Type of hour determination An entry can be made in the shift definition specifying the number of hours the employee should work in a day. Up to 3 times can be stored. This is useful if a certain quota of hours should be built up while present which can be depleted again through free days but this account should not be controlled through the flextime account and should also not be built up again in case of vacation and sickness. For this purpose, the actual plan number in addition to the buildup time is entered in the shift definition in the first plan number of hours and for the second plan number of hours, only the actual plan number is entered. The "Number of hours 2" is then selected for the absence type. 
© 2026 Boyum IT Solutions A/S

or enter Number of Hours:	A definition can be made here to the effect that the plan number of hours should not be determined but predefined. **Warning**: This type of hour determination should not be used since it does not take holidays, period rule, shift definitions, factory calendar and day templates into account.
Add the time to Plan-/Actual Time	The time determined is credited to the actual and plan time account. This is useful when holidays should be entered as plan and actual hours. However, each holiday must then be entered for each person as absence. This option must be disabled for vacation and sick calls.
Add Attendance	A person can still be present in case of an absence, e.g. if the person only has half a vacation day. Define in this case that the person's presence is to be added. If the person takes a whole day of vacation, then, in the normal case, his or her actually illegal presence should not be added because the actual hours would then be rated twice - once through the presence and once through the vacation.
Day off	If enabled, this day is considered as leisure time, independent of the factory calendar. If activated, this day is leisure time. In column "plan" of the time evaluation independent of the factory calendar, always 0 will be displayed and calculated. The following ***examples*** are to explain the possible outcome of the new option: Regular working time is 8 hours. Vacation: payment 100%, vacation 100%, day off: No => Plan: 8 hrs, actual: 8 hrs, difference: 0 hrs, vacation: 8 hrs. Vacation: payment 0%, vacation 100%, day off: Yes

© 2026 Boyum IT Solutions A/S

	=> Plan: 0 hrs, actual: 0 hrs, difference: 0 hrs, vacation: 8 hrs. Vacation: payment 100%, vacation 100%, day off: Yes => Plan: 0 hrs, actual: 8 hrs, difference: -8 hrs, vacation: 8 hrs. Note: with more than one absence a day it is enough to enable this option for one entry.

Special case: Two absences per day

Only one absence can be entered per day and person.

If the person is sick for half a day and on vacation for half a day, another absence type must be created:

Vacation: 50%

Sick: 50%

Pay: 100%

Thus, any feasible combination is possible.

Example: 50% paid vacation, 50% unpaid vacation:

Vacation 50%

Pay 50%

11.7.3 Wage types

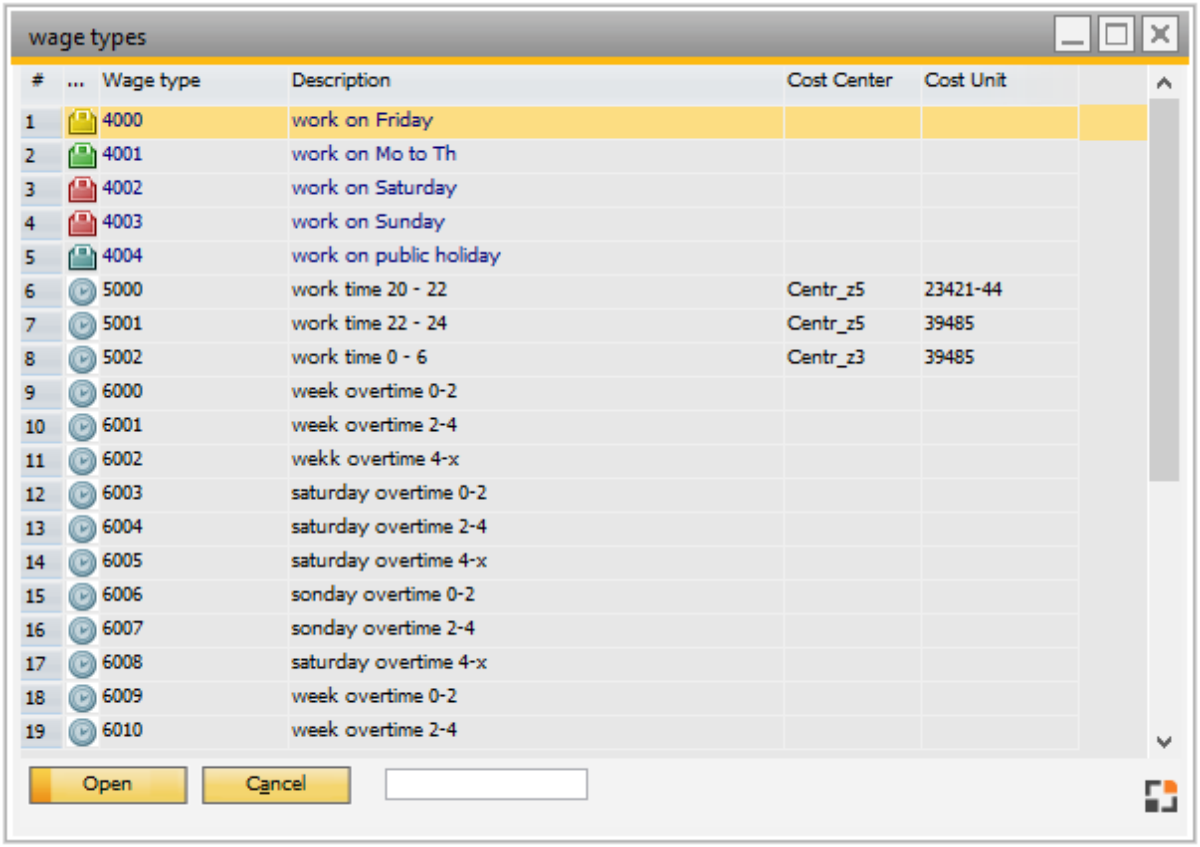
Store wage types in this window. Defined wage types can be evaluated using function time evaluation.

The editing list supports window settings. You can create, edit and delete entries.

Wage types can be stored in absence types, shift definition and period rule.

PATH: Human Resources > Master data > Wage types.

© 2026 Boyum IT Solutions A/S



Window wagetype_browse.psr

Field	Description
Wage type	Unique wage type ID. No subsequent change possible. *Field: wagetype*
Description	Description of wage type.
Cost center	Optional: cost center. Own reports can be created. *Field: kstst_id*
Cost unit	Optional: cost unit. Own reports can be created. *Field: costcarrier*
UDF1..4	Additional freely definable fields.
Bitmap, Color	Image and color to make the entry more visible.

Table: beas_wagetype

11.7.4.1.1 Rounding rule

Period rule

Edit period rule

Rounding rule

Hourly surcharge

Time domain

Extended

Rounding rule

Times can be rounded with the rounding rule. If a rounding time of 5 minutes is entered, then rounding takes place at a 5 minute interval to the employee's disadvantage. The calculation begins from the start of the flexitime according to the regular working hours. If the latter is 7 o'clock, the interval starts from 7 o'clock in 5 minute increments, that is 7:00, 7:05, 7:10, etc. If the employee begins at 6:56, his time starts counting from 7 o'clock._
At logoff, it is the other way around:
The calculation starts again at the begin of the shift, that is, 7 o'clock. If the employee leaves at 16:04, logoff actually takes place at 16:00 h.

Since rounding is not to apply during lunch and/or during the breaks, the shifts are divided into several zones: Before the shift, during flextime begin, flextime end and after the shift. In between is the core time. There is no rounding during this time but it can be set.

A special scenario is the setting for "rounding up .. minutes before next cycle"
You can set that rounding to the next but one interval is made - to the employee's disadvantage - but not at the full hour. This setting can be used to achieve that not all employees access the terminal all at the same time, and that they begin at the full hour.

Example:

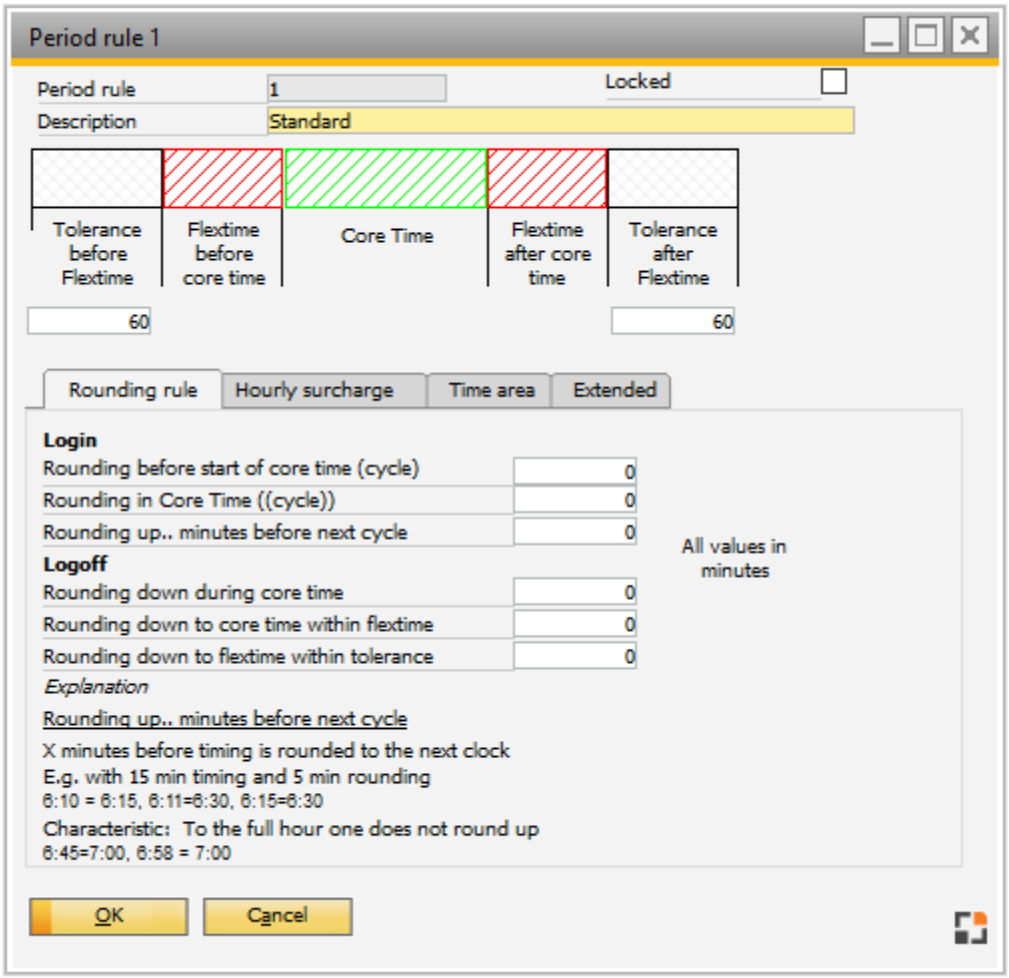
15 minute interval, rounding up 5 minutes

Clock in	Calculated from
6:10	6:15
6:11	6:30

© 2026 Boyum IT Solutions A/S

Clock in	Calculated from
6:15	6:30
6:20	6:30
6:26	6:45
6:45	7:00 (full hour)
6:59	7:00 (full hour)

PATH: Human Resources > Master data > Period rule > "Edit"/"New" > Period rule XXX > "Rounding rule" tab.



Window bde_stdrgl_edit.psr

Field description

Field	Description
Tolerance before Flextime	Time to be included in minutes before flextime begin. A separate rounding rule can also be stored here. Presences and order clocking

© 2026 Boyum IT Solutions A/S

	are computed during this time.
Tolerance after Flextime	Time to be included after end of flextime. Again, a separate rounding rule can also be stored here.
Rounding up within Tolerance	Number of minutes for rounding up during the defined tolerance.
Rounding up after Tolerance	Is used when a logon occurs after the tolerance – then applies to all subsequent times .
Rounding up .. Minutes Before Next Cycle	Rounding up to the next full hour or the next interval but one if logon xxx minutes before end of next interval.
Rounding down During Core Time	Rounding rule for logon in core time.
Rounding down to Core Time within Flextime	Rounding rule for logoff after core time before tolerance.
Rounding down after flextime within tolerance	Rounding rule during tolerance.

11.7.4.1.2 Hourly surcharge

Period rule

Edit period rule

Rounding rule

Hourly surcharge

Time domain

Extended

Overtime hours can be displayed separately and added on wage types. Per work day, Saturday and Sunday as well as per week three surcharge areas are available.

- Surcharge areas

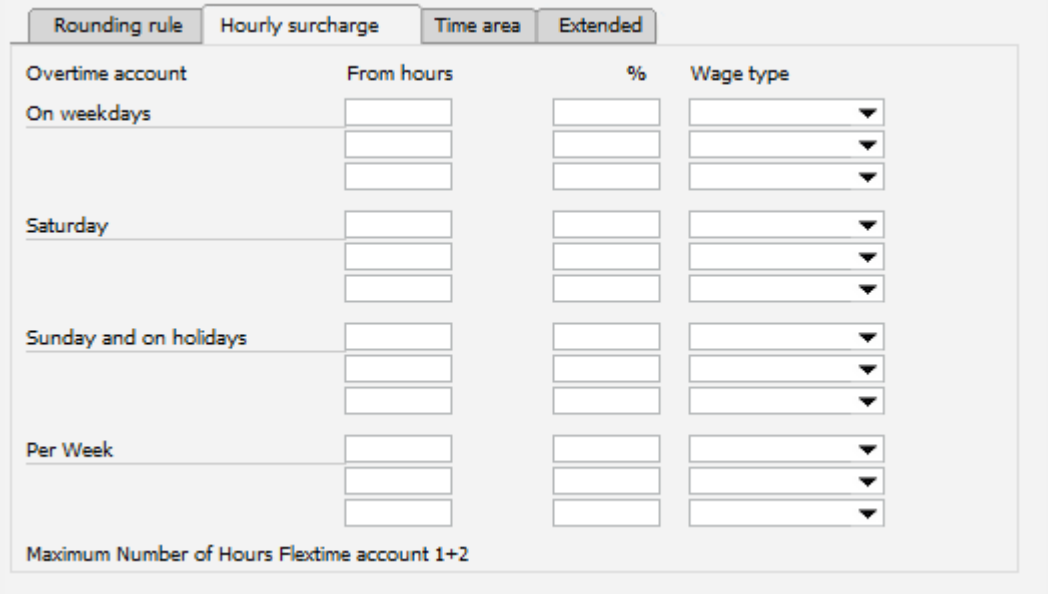
Work days	Monday to Friday except holidays
Saturday	Saturday except holidays
Sunday	Sunday except holidays
Weekly sum	Result of a weekly sum

NOTE:

© 2026 Boyum IT Solutions A/S

For weekly sums the period rule is used, which is stored in personnel master. For all other surcharge areas the period rule is determined from Personnel – Standard work hours or depending on the first attendance report of the day.

PATH: Human Resources > Master data > Period rule > **Open / Add** > Period rule XXX > "Hourly surcharge" tab.



Window bde_stdrgl_edit.psr

Field	Description
From hours	3 fields "from hours" are available An empty field means, the value is ignored. Values need to be entered in correct order: first, second, third. Example: ***Example 1:*** Work day surcharge 1. Entry: 0, wage type 6000 2. Entry: 2, wage type 6001 3. Entry: 4, wage type 6002 If the employee has 5 overtime hours, he will receive:

© 2026 Boyum IT Solutions A/S

	wage type 6000 = 2 hours wage type 6001 = 2 hours wage type 6002 = 1 hour ***Example2:*** Work day surcharge 1. Entry: 1, wage type 6000 2. Entry: 2, wage type 6001 3. Entry: 4, wage type 6002 If the employee has 5 overtime hours, he will receive: wage type 6000 = 1 hours wage type 6001 = 2 hours wage type 6002 = 1 hour
%	Percentage of overtime hours saved to the wage type. In time evaluation the %-values are not considered, only in sum values of the wage types. Default value / empty field = 100% Example: Work day surcharge 1. Entry: 0, wage type 6000, 100% 2. Entry: 2, wage type 6001, 120% 3. Entry: 4, wage type 6002, 150% If the employee has 5 overtime hours, he will receive: wage type 6000 = 2 hours wage type 6001 = 2,4 hours wage type 6002 = 1,5 hours
Wage type	Specify a wage type to which times are saved.

Accounts

Two flextime accounts are available In **Personnel > Standard work hours > account planning** you can define, to book overtime hours to which account.

© 2026 Boyum IT Solutions A/S

Overtime is defined in period rules, stored in personnel master.

Account 1/ 2	Max. hours permitted for two flextime accounts Each employee has two time accounts. In the Personnel – Standard work hours – Account planning can be defined, on which account his planned time and actual time for a specific day has to be saved. All reported times will then be booked to the according account. The value entered here, corresponds to the max. number of overtime hours, which may be booked to this account. Anything beyond that will be transferred to the overflow account. ***Example***: An employee is allowed to work max. 30 hours overtime. All hours above this are booked to the overflow accounts. Deactivate the overflow account Enter "-1" here to deactivate the function. This will be used if there is no planned time for the employee and only his pure attendance has to be counted. For further information ***see*** Flextime account The time accumulated here can be booked to a wage type. The wage type and the %-value can be stored for this purpose.
Rollover account	Enter the wage type to which the hours from the rollover account will be added. Value is multiplied with the given %-value.

11.7.4.1.3 Time domain

Period rule

Edit period rule

Rounding rule

Hourly surcharge

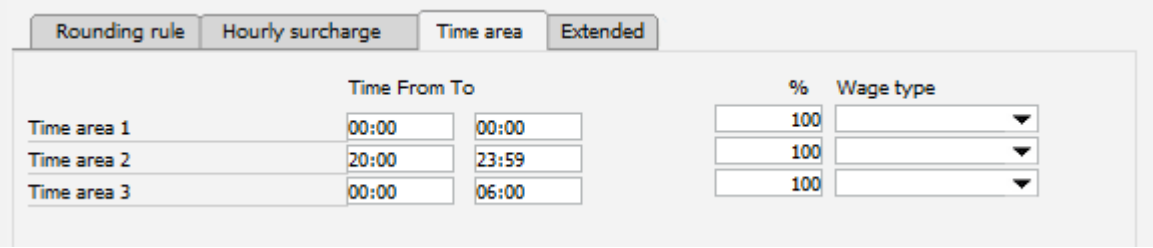
Time domain

Extended

© 2026 Boyum IT Solutions A/S

In **Period rule > Time domain** you can set hours for specific time domain as night can be identified separately and wage types can be assigned.

PATH: Human Resources > Master data > Period rule > Open / Add > Period rule XXX > "Time area" tab



Window bde_stdrgl_edit.psr

Up to 3 time areas can be defined. A time domain beyond midnight is allowed. *(beas 9.2 PL: 01)*
The time areas are displayed rightmost in time evaluation in columns 1, 2, 3 and in final sum. In Time evaluation – Report definition the header can be set up.

- Example:

Consecutive times
Time area 1: 20 – 22
Time area 2: 22 – 24

Employee works from 18 to 23
2 hours are saved to time domain 1
1 hour i saved to time domain 2

Overlapping times
Time area 1: 20 – 22
Time area 2: 20 – 24

Employee works from 18 to 23
2 hours are saved to time area 1
3 hours are saved to time area 2

Work over midnight
A time over midnight can also be indicated in the area e.g. 22:00 - 03:00 *(beas 9.2 PL: 01)*

© 2026 Boyum IT Solutions A/S

To be considered at beas Version before 9.2 PL: 0.1

A time area beyond midnight is not allowed. In this case do the following:

Time area 1: 22:00 - 23:59
Time area 2: 00:00 - 03:00

Although 23:59 was indicated, is actually calculated to 24 hours.
Means employee works from 21 - 2, it is calculated as follows:
Time area 1: 2 hrs.
Time area 2: 2 hrs.

For time domains you can define

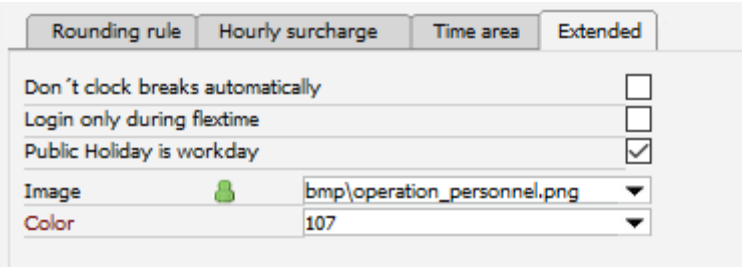
Field	Description
Time from	Time area. Time TO needs to be greater than time FROM.
%	Percentage value, considered as surcharge for a wage type. Default = 100% Example Time area 1: 20 – 22 o'clock, 50% on wage type 500 Employee works from 18 – 22 Result: 2 hours for time area 1 but only 1 hour on wage type 500
Wage type	Wage type to which times are saved.

11.7.4.1.4 Extended

Period rule
Edit period rule
Rounding rule
Hourly surcharge
Time domain
Extended

PATH: Human Resources > Master data > Period rule > **Open / Add** > Period rule XXX > "Extended" tab.

© 2026 Boyum IT Solutions A/S



Window bde_stdrgl_edit.psr

Field	Description
Don't clock breaks automatically	Breaks can be defined in the regular working hours. Normally, they are automatically deducted from the presence. This switch can be activated if this is not desired.
Login only during flextime	If this switch is active, the employee can only logon and logoff during the flextime defined in the regular work hours. Logon/logoff is not possible outside of these times. The employee must then report to the supervisor. In case of logoff, the following error message appears: "(bde:abmeldng4): You logged off outside of flextime (...)" or as short message. "Outside flextime". ***See*** App "Leaving".
Public holiday is workday	Define the behavior of holidays If active, a public holiday will be treated as a normal workday, as long as it is not Saturday or Sunday. A public holiday in the factory calendar will be defined by setting availability to < 100%. *beas 9.2 PL: 01 BEAS_STUNDENREGEL.HolidayWorkDay (1/0)*
Image	Image for that entry.
Color	Color for that entry.

11.7.5 Shift Definition

The working time for a shift is defined in this window. This can be entered separately for each Day Template.

For detailed documentation, ***see*** chapter Structure of a shift, Shift scheduling.

Window bde_schicht_browse.psr

Any number of shift definitions can be made. The allocation to Personnel is done via Personnel – regular hours or Personnel – shift schedule. For more information ***see*** Shift scheduling.

Configuration

Shift definition list

- Edit shift definitions
- Working time

List shift definition

All available shift definitions are displayed in the overview list. You can create, edit, and delete definitions using this. Window settings are supported.

Sorting

The list can be sorted in by right-click on column header or by drag & drop (click on "group" field). For drag&drop an authorization is required ***See*** Authorizations
After changing the sorting, a button "save sorting" is displayed. Click it to save the change.

11.7.5.1 Edit shift definition

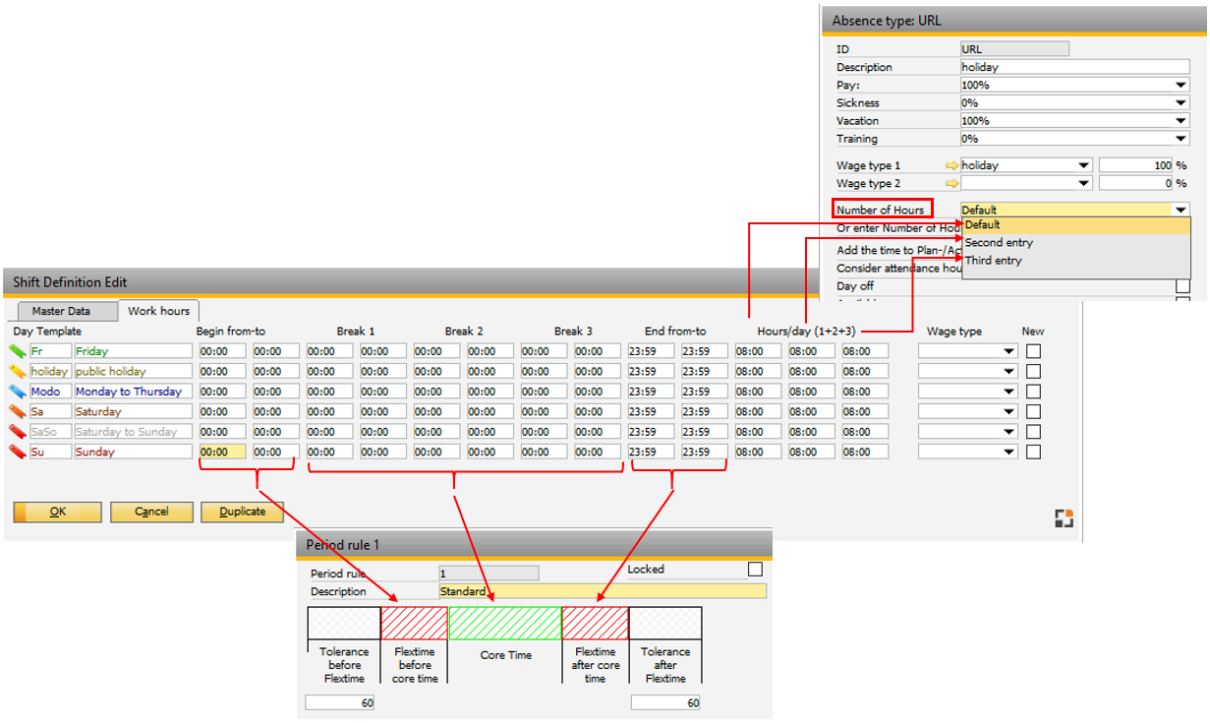
Shift definition list

Edit shift definitions

Working time

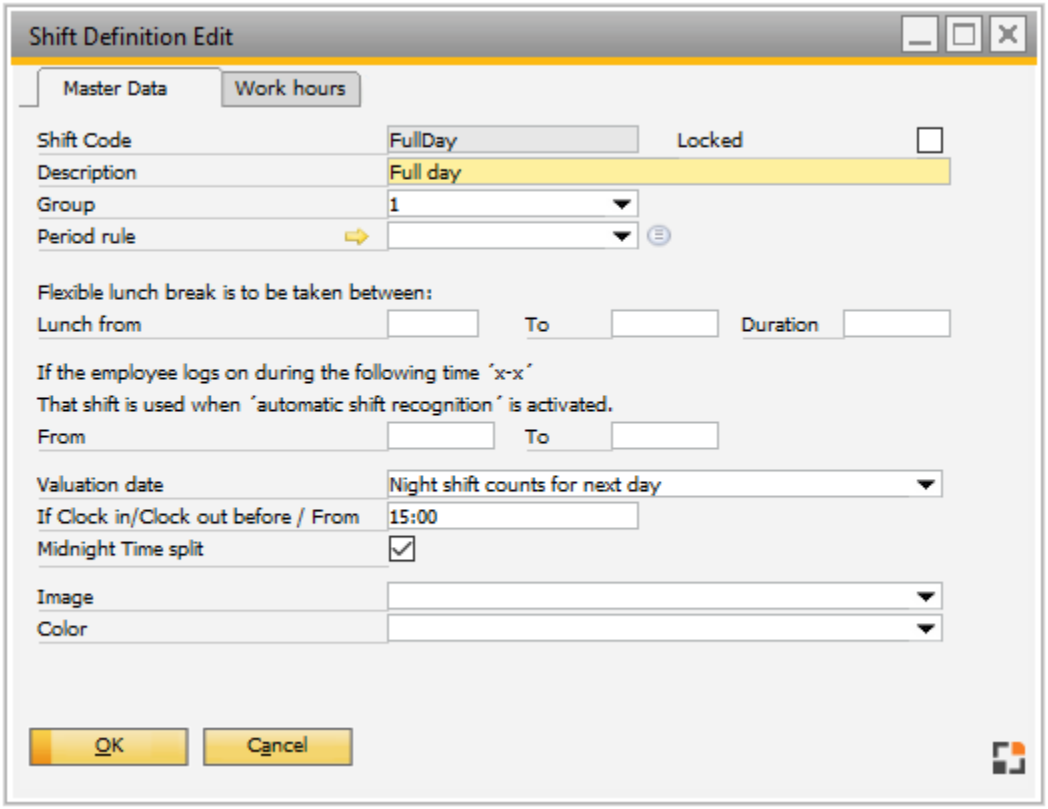
In this window you can edit shift definitions.

PATH: Human Resources > Master data > Shift Definition > **Open/Add**.



Master data tab

© 2026 Boyum IT Solutions A/S



Window bde_schicht_edit1.psr

Function	Description
Shift Code	Identification of the shift definition.
Description	Description of the shift.
Locked	If the entry was blocked it is no longer available for selection.
Group	The Group field allows subdivision into groups for better management or display without added functionality.
Period rule	Set a period rule to the shift. The period rule entered here has a higher priority than the one entered in the personnel master data. ***See*** Period rule.
Lunch from, To, Duration	Set a time range for a lunch break for a flexible lunch break. For more information ***see*** Flexible lunch break.
Shift detection from to	If the automatic shift detection was activated under Personnel / Regular hours, the time range defined there is taken into account. For more information ***see*** Automatic shift scheduling.

© 2026 Boyum IT Solutions A/S

	If "manual shift selection" is set, this time range is also considered. ***See*** Edit shift model – Manual selection.
Valuation date	Defines the day on which this shift is calculated: • Night shift included in next day: If there is a login after the time specified here, the time-related message relates to the next day. This allows you to keep the times of a shift together in the time analysis. • Early shift included in previous day: If there is a login before the time specified here, the login belongs to the previous day. It is possible to perform a Midnight Time split by activating the corresponding field. **IMPORTANT**: The "Midnight split" function is ONLY available for logging time in the terminal solution!
Image	Assign an image for the shift.
Color	Assign a color for the shift.

11.7.5.2 Working time

Shift definition list

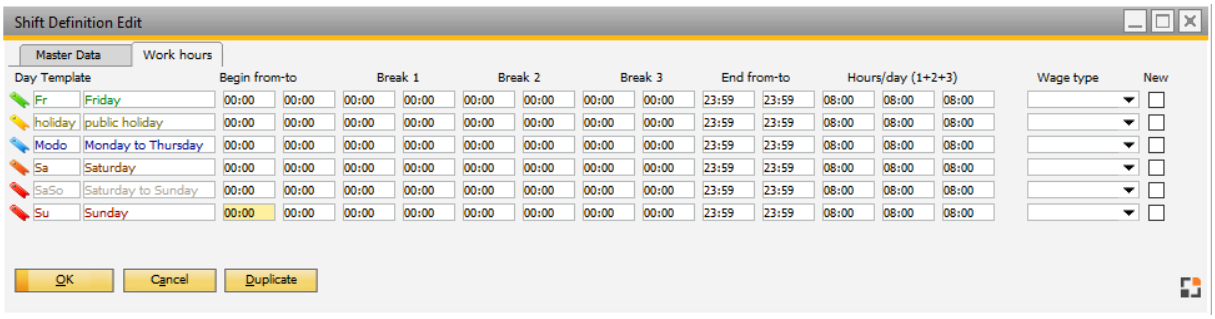
Edit shift definitions

Working time

Tab Work hours

For detailed information, ***see*** Structure of a shift

Begin from-to



Window bde_ schicht_ edit1.psr

Function	Description

© 2026 Boyum IT Solutions A/S

Day Template	For every Day Template the working hours must be defined separately. New day templates (not stored in shift definition previously) are marked red.
Begin from-to	The beginning of the shift. It is a range for defining flextime. This is for information only. This information comes automatically from the Time before Core Time from the period rule.
Break 1-3	A break in the shift. It is a range for defining flextime. Up to 3 breaks are available per day in the template. This information comes automatically from the Core Time from the period rule. ***See*** break definition in period rules.
End from-to	The end of the shift. It is a range for defining flextime. This is for information only. This information comes automatically from the Time After Core Time from the period rule.
Day/hours 1-3	Define a time for this shift. If a different number of hours is to be used as reference for certain Absence Types, two additional times can be specified.
Wage type	To this wage type the accumulated times of this line (day template) are posted.
New	A check mark designates a new day template, which was not stored in shift definition before.

Simplified input:
It is sufficient to determine the first line. Subsequently, the input can be DUPLICATED to the remaining Daily Schedule .

see

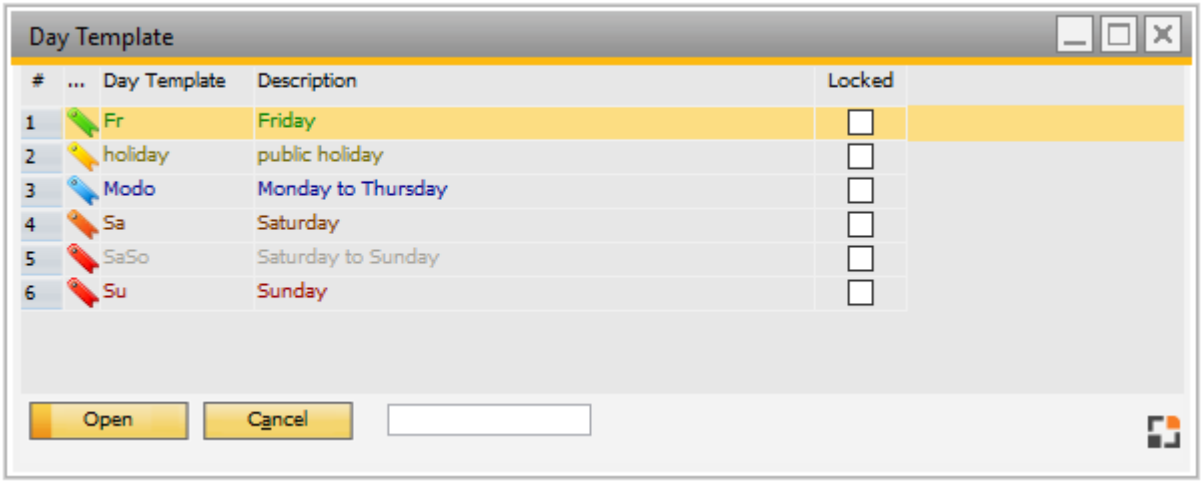
Structure of a shift
Automatic shift scheduling
Daily Schedule
Period rule
Absence Types

11.7.6 Day template

Regular work hours (shifts) may depend on the weekday. These can be stored as a day template which is available as a row in Shift definition. A day template, in turn, is stored to a specific day in the factory calendar.
In this window you can manage day templates. Setup an ID, description and a color.

PATH: Human Resources > Master data > Day Template.

© 2026 Boyum IT Solutions A/S



Window bde_tagmuster_browse.psr

Example:

Work is done from Monday to Thursday from 8-17h, on Friday only from 8-15h and on Saturday/Sunday no work is performed. 3 Day templates can best be created here: Mon–Thu Monday–Thursday Fri Friday Sat-Sun Saturday and Sunday

In the factory calendar, the day template Mon–Thu is now assigned to the days Monday to Thursday, Fr to Friday and Sa-Su Saturday+Sunday.
In the Shift definition, the day template entries defined here are now available as rows and the working time can be defined separately for each row.

Note:

If a day template is inserted as new, all shift definitions need to be reviewed. Open Shift definition, select every definition, edit work times add the new row and click on "update".

See

Shift definition

Factory Calendar

Structure of a shift

Special case half day work on December 24th and 31st

© 2026 Boyum IT Solutions A/S

If the 24th and 31st of December are to be counted as half work day, set the day to 50% in factory calendar.

In case of vacations on 24th or 31th of December a whole day needs to be entered. According to factory calendar only a half day will be subtracted. The Time evaluation provides a possibility to check.

11.7.7 Personnel Groups

The available personnel groups are administrated here. Only stored personnel groups can be entered in the personnel master that are stored here.

© 2026 Boyum IT Solutions A/S

12 Reports

From all modules reports can be created. All reports can be launched using the standard SAP Business One printing options

The following Crystal Reports are offered by Beas

Master data Report
QC Reports
Business performance Reports
Calculation Reports
Marketing Documents
Complaints Reports
Material Management Reports
Human Resource Reports

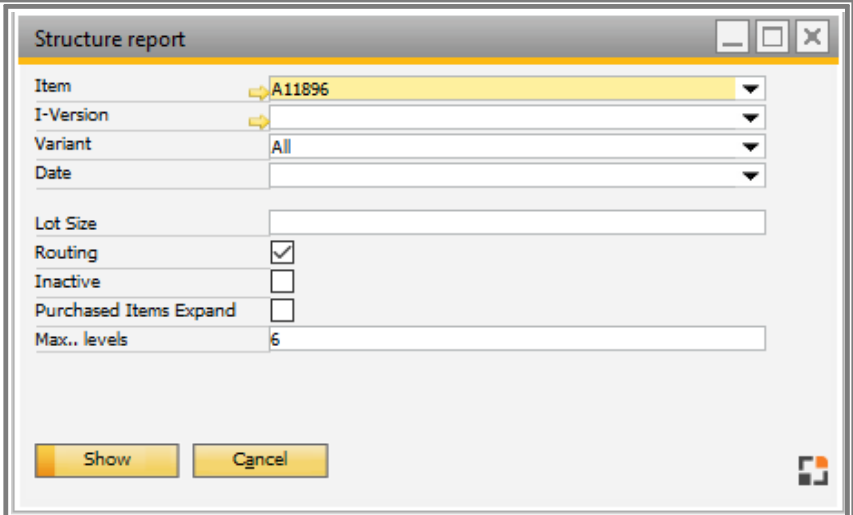
12.1 Reports Master Data

Any number of lists can be stored here for the "Master Data" area. In addition to the default reports, reports can be inserted using the "Window Settings" function (toolbar – gearwheel). For information about this question, please read the following documents: ***see*** Communication module. This window is also accessible via **item list, item processing, etc. > right-click > Report** .

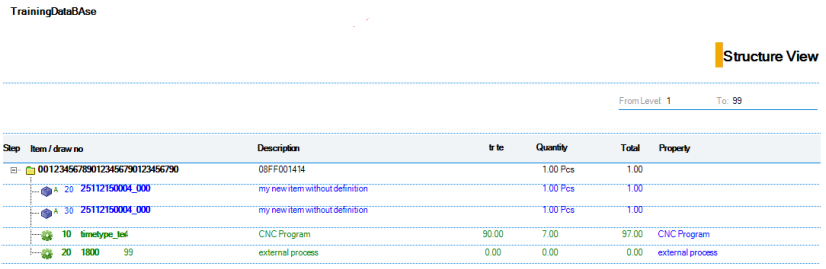
All reports are designed with Crystal reports and displayed with Beas report viewer.

Report	Meaning
Item structure	Detailed item structure data is displayed as crystal report: Parameter: ***See*** Structure report.

© 2026 Boyum IT Solutions A/S



The difference is only the output as **crystal report.**



Note:

The report support max. 6 Levels

Item Bill of Materials Single Level

Item Bill of materials are displayed as crystal report:

It displays all Bill of Materials entries of an Item.
It is a simple example for own crystal reports.

Bill of Materials not linked to Item will be ignored (for example Item Version control)

All visibility rules or version control are ignored.
Quantity is the "Quantity per consume unit".
All other Quantity information are ignored.

12.2 QC Reports

Quality Control reports provides details of the selected QC Order from the QC Orders screen. In addition to the default reports, reports can be inserted using the "Window Settings" function

© 2026 Boyum IT Solutions A/S

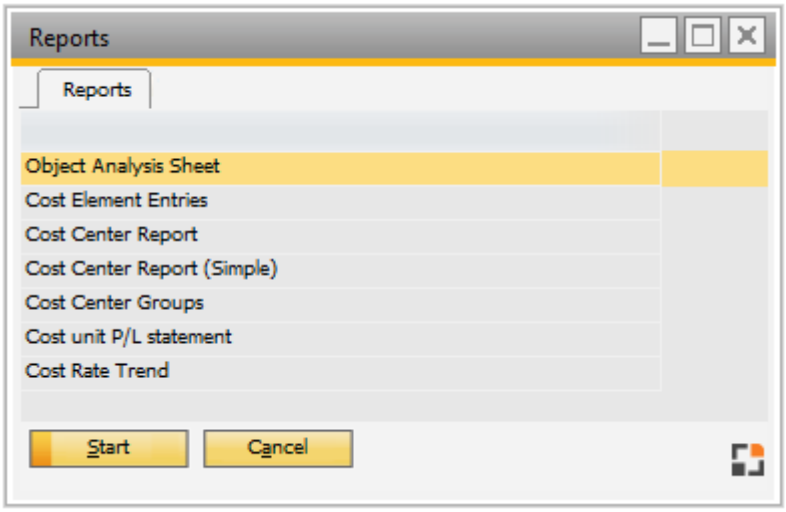
(toolbar – gearwheel). For information about this question, please read the following documents: ***see*** Communication module.
This window is also accessible via **QC Order > right-click > Report** .

All reports are designed with Crystal reports and displayed with Beas report viewer.

12.3 Cost Accounting Reports

The provided Business performance reports gives a detailed summary of Business performance data stored in the system .

The window is also accessible via **Financials > Business performance > Results > Reports** .



Window report_makro_start.psr

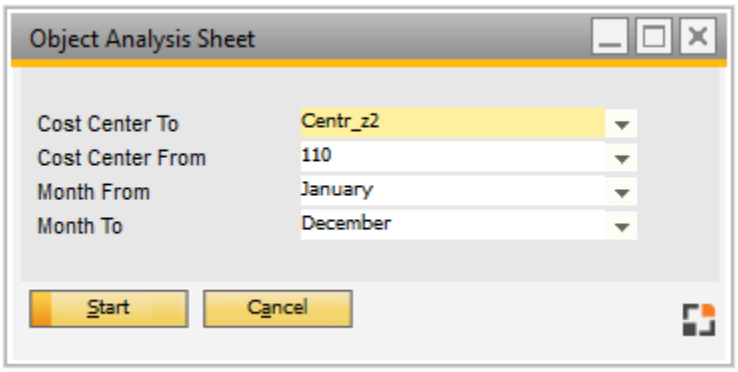
All reports are designed with Crystal reports and displayed with Beas report viewer.

Report	Meaning
Business performance	Provides Business performance details for the selected cost centers for the selected period.
Cost Element Entries	Provides Business performance details for the selected cost centers within the selected period.
Cost Center Report	A detail center report is presented for the selected cost centers for a selected period.
Cost Center Report simple	A summary center report is presented for the selected cost centers for a selected period.

© 2026 Boyum IT Solutions A/S

Cost Center Groups	Provides Business performance information for the selected cost types for the selected period.

Start: Click button to open the "Object Analysis Sheet":

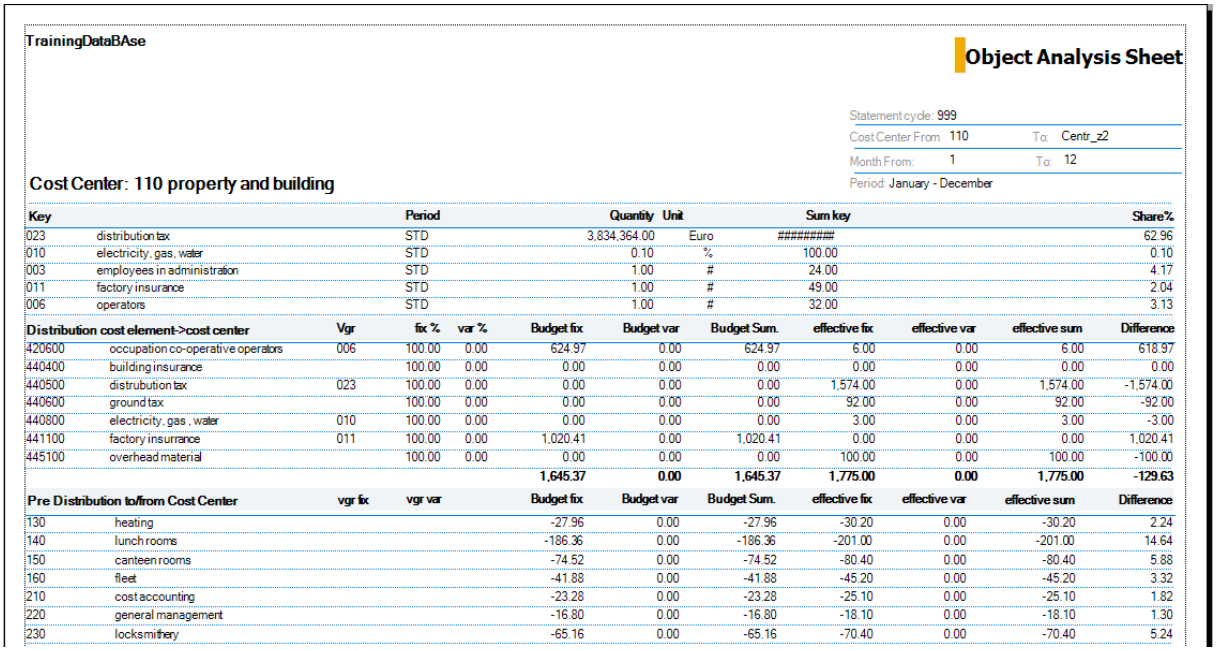


Window system_ auswahl.psr

Field Descriptions

Field	Meaning
Cost Center To	Select the end value of the cost center range for the analysis.
Cost Center From	Select the start value of the cost center range for the analysis.
Month From	Select the month to start from.
Month To	Select the month to end with.

Start: Click button to create Crystal report:



TrainingDataBAse

12.4 Calculation reports

Calculation reports (both pre- and post-calculation) are a mirror image of the pre and post calculation windows in Beas.
This window is also accessible via **Calculation > Precalculation > Right-click > Report** and **Work Order > Right-click > Postcalculation > Start > Report** respectively.

All reports are designed with Crystal reports and displayed with Beas report viewer.

Report	Meaning
Precalculation	Selected Precalculation entry is displayed.
Post-calculation	Post-calculation data from the selected work order is displayed.

12.5 Marketing Documents

Beas provide reports for all SAP Business One marketing (Sales and Purchasing) documents.
The reports are accessible in all SAP Business One Sales and Purchasing windows.

Report	Meaning
All sales and purchasing documents	Like the SAP marketing documents, Beas supplies a report for all your marketing documents.

12.6 Complaint Reports

Complaint reports provide a detailed view on complaints data. This window is also accessible via **Material Management > Complaint > Reports complaint**.

All reports are designed with Crystal reports and displayed with Beas report viewer.

Report	Meaning
Reclamation by origin	Complaints data originating from internal, Sales and Purchase is displayed.
Reclamation by employee	Complaints data originating from employee is displayed.
Reclamation by item, supplier and project	Complaints data originating from projects is displayed.

12.7 Material Management Reports

An inventory count-list is provided to record the number of counted stock for the selected annual inventory count.

© 2026 Boyum IT Solutions A/S

This window is also accessible via **Materials management > Inventory > Annual Inventory Count > Inventory list button (at the bottom of the window) > Right-click > Report**

All reports are designed with Crystal reports and displayed with Beas report viewer.

Report	Meaning
Inventory count list	Inventory counting sheet is provided for items within the selected annual inventory count.

13 SBO Menu View

SAP Business One Menu View

System information window

13.1 System information

You can call the system information with

The Debug-window has the following functions:
- Display table and column name of current column
- Display form name / window name
- Display executed Beas - scripts
- Display local and global initialized Beas - variables
- Display SAP Business One events
- Execute Beas - scripts

Overview Debug Functions

Send Debug Log to Support

Display field names

The system information is displayed in the first row of the debug window if a Beas-window is currently opened.
Information on the current field is displayed (where the mouse cursor is)
1. Form-Number (dw_1, dw_2, .. dw_6)
2. "item" - as note, if it is an item of a form
3. Field name
4. Field type
5. "Table:" + Table name, linked to the field
6. Form name. Generally a PSR-File + folder name

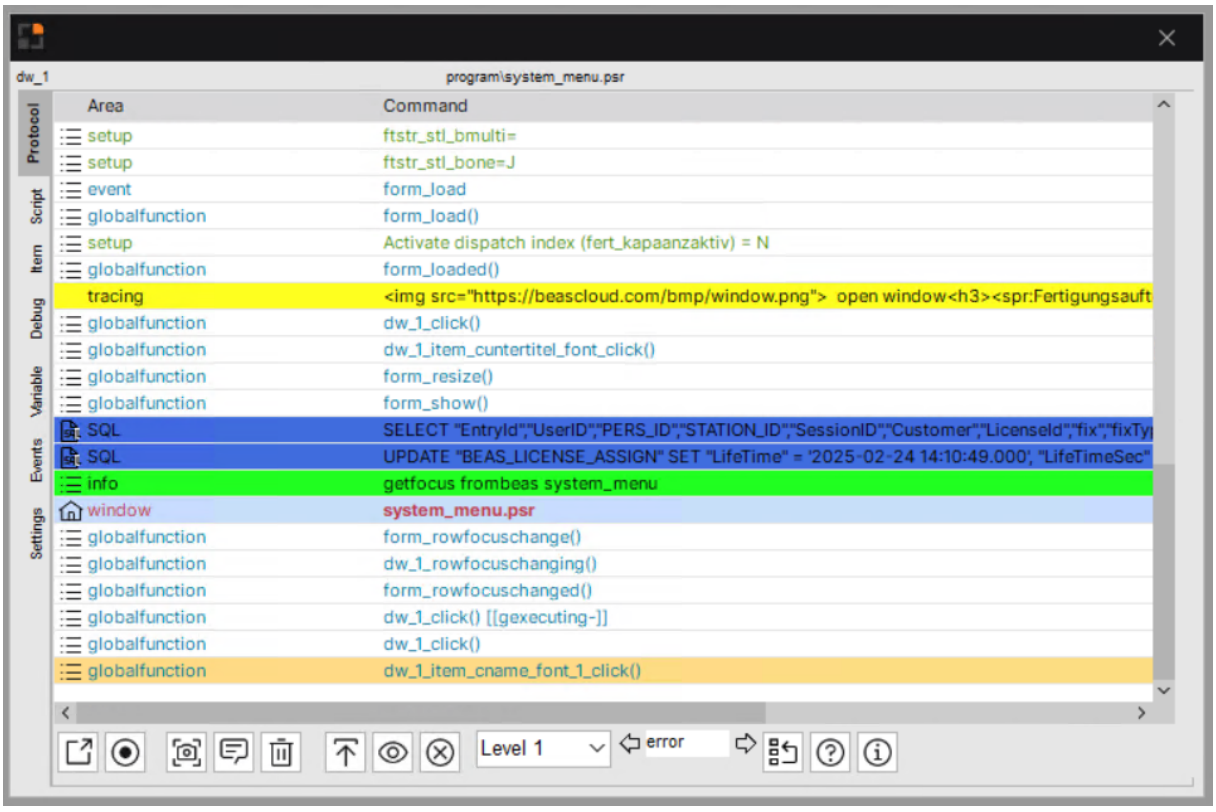
© 2026 Boyum IT Solutions A/S

In the Debug window you can view and edit all current events, SQL statements or scripts. Events are displayed in separate rows and in different colors.
Events on Level 1 are displayed with a yellow border around the window (***see*** image below) which changes to red once having switched to Level 2 and 3.

The color codes of the events are as follows:
Green: reading settings
Violet: calling functions
Orange: customized function
Red: error
Grey: window-specific event

PATH: View > System information **or** Ctrl+Shift+i

Click open a row to view the source code in an editor:



Window beasgui_sbo.psr

The tabs of the System Information window

The tabs of the Debug Information are located vertically on the left side of the window.

© 2026 Boyum IT Solutions A/S

Vertical tabs on the left	Meaning
Protocol	Protocol of all events
Script	Enter scripts
Item	Press Ctrl and move mouse on the object to see more details
Debug	Debug a script line by line
Variable	Display global and local variables
Events	Enter events
Settings	Settings for Debug-window

Columns	Meaning
Area	Area of the event: window event, SAP-event, SQL statement ...
Command	Executed statement
CPU	Duration in milliseconds between this and the preceding entry
Windowname	Displays the name of the latest opened window

- Protocol

The debug log can log every executed SQL command, Script line, Setting Read/Changes etc.
The line of buttons located on the bottom of the window in the Protocol tab + their meaning:

Buttons

Traditional style	Boyum Style	Description
		Show details for current line
		Start / Stop debug log
		Capture a screenshot of the current window
		Insert comment in debug log
		Delete current row

		Upload and create URL string to clipboard. You can insert This URL string in your ticket or send it as a link in email and other messaging systems. ***See*** Debug log HTML string
		Show as formatted HTML string. ***See*** Debug log HTML string
		Reset Protocol
Level 1/2/3... drop-down	Level 1/2/3... drop-down	Filters which events to be displayed: Level 1 – only events, SQL-Statements and other colored rows Level 2 – additionally, BeasScript without Resizing, Timer and various system scripts. Level 3 – everything
Search field with two blue arrows	Search field with two blue arrows	Enter search term and use the arrows to search in both directions.
		Open Beas Product news and general info.
		Submit your Questions and answers in the Boyum Helpcenter.
		Open Beas feature request and share your ideas in the Boyum Helpcenter.

Script

Create small scripts and execute this directly in the current window

In Tab Settings you can define the font size

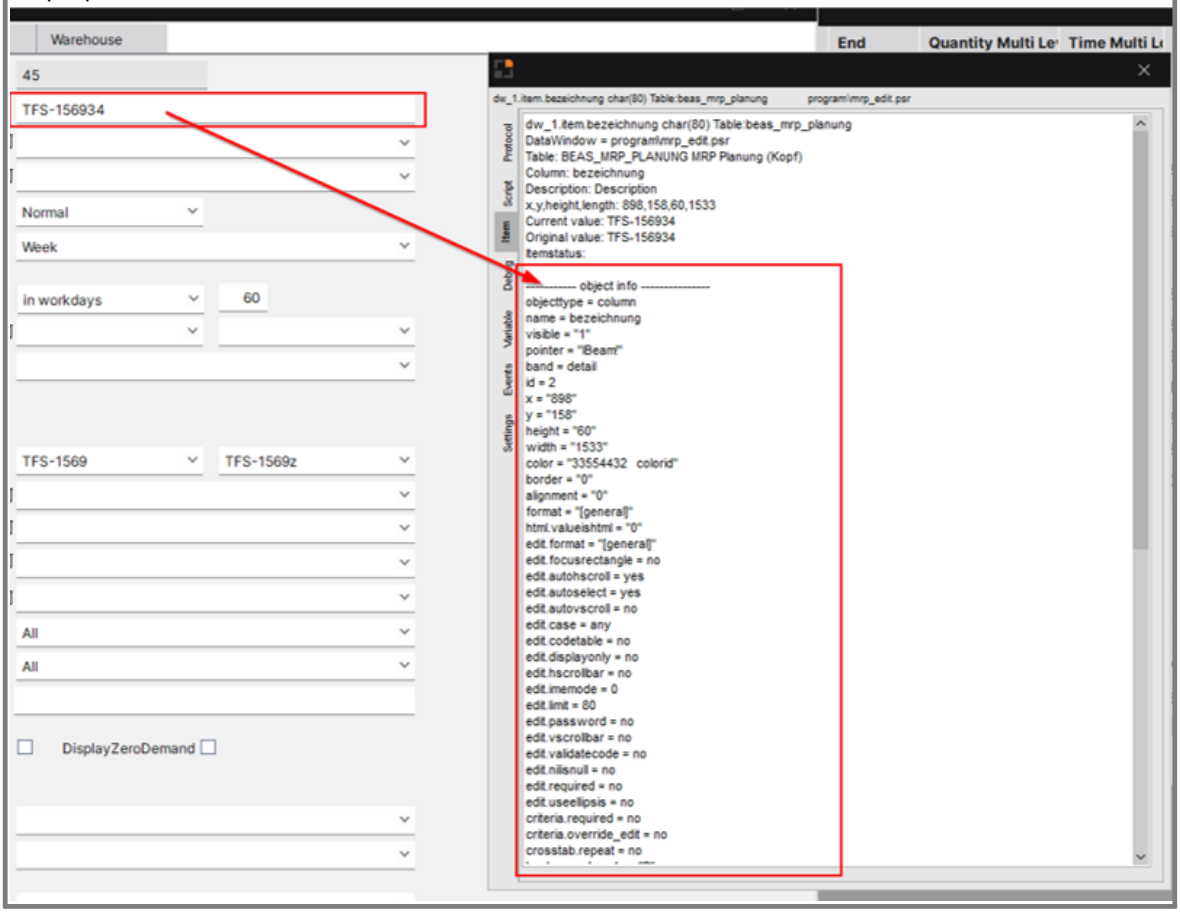
Button below	Meaning
Execute in system window	The currently entered script is executed in displayed window
Exec SQL	Marked section is transferred to SQL window and executed there. The system checks if the user has the right to execute SQL.

© 2026 Boyum IT Solutions A/S

Button below	Meaning
Editor	Open extended editor. The system checks if the user has the right to access the editor.
Blue question mark	Link to BeasScript Documentation.
Arrows	Switch between up to 10 different sources. These sources are saved by station.
Drop-down BeasScript / Macro	Execute the script as "BeasScript" (empty / default = BeasScript) or Macro script.

Item

Press Ctrl and move mouse over the object for more details. All properties of an object are displayed in the screen.



Debug

Debug a script step by step.

© 2026 Boyum IT Solutions A/S

Button	Description
	Activate debugging.
	Move on to the next step.
	Skip next step.
	Move on to the next step.
	Stop debugging.

Variable

Display all variables from current window:

Button below	Meaning
Local	All active variables in the current window
Global	All global variables
Timer on / off	Activate timer to update the list of local variables continuously
Gui-Window	Only in SAP B1 environment: all active windows are displayed

Events

Display all declared functions and events:

Button below	Meaning
Refresh	Update the list
Log other event	Check box option if you need the log of other events

Settings

<tr><td>sqlinfo</td><td>current SQL info</td></tr>
<tr><td>modulobject</td><td>function</td></tr>
</table>
To view the log, execute SQL-statement:
<pre>select * from "BEAS_SYS_DEBUG"</pre>
Note: Open transactions are closed after each entry . This can change the program behavior.
</td></tr>
<tr><td>Only current window</td><td>Log only current window</td></tr>
<tr><td>Show Window events, SQL, Window focus, Setup</td><td>Here you can select filters which type of information are to be displayed in the protocol: Window events, SQL, Window focus and Setup information.</td></tr>
<tr><td>DB Reset</td><td>Delete protocol.</td></tr>
<tr><td>View</td><td>View protocol.</td></tr>
<tr><td>Transparent Protocol %</td><td>Window is displayed transparently, if it loses the focus. Enter percentage for active tab "protocol".</td></tr>
<tr><td>Transparent Script %</td><td>Window is displayed transparently, if it loses the focus. Enter percentage for active tab "protocol".</td></tr>
<tr><td>Font Size</td><td>Define the font size for scripting in tab "Script".</td></tr>
<tr><td>Stop beasgui</td><td>If Beas is started in terminal mode, it can be stopped here.</td></tr>
<tr><td>Start Record Macro</td><td>Generate a macro script in background.</td></tr>
<tr><td>Stop Macro (save into clipboard)</td><td>Stop the macro recorder and save the script in debug window.</td></tr>
<tr><td>Debug to File</td><td>Activate the Debug to File function
When active, the right point is red and you can close the debug window.
If this option is activated, the information is saved in a file with the following structure:</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Buttons / Fields	Meaning
	`beasDebug_Database_Date.log` Note: If active, performance is decreased, and the user receives notification of this in the bottom, notification bar. *Beas 2020.05*
Load Debug File	Load from Debug file You can choose a BeasDebug.log file. The default location is the current temp folder. If you want to load the log file of a service, you must choose the protocol directory of this service. This function loads the debug log in the debug window (tab Protocol). You can select the Level (1-3) which you want to load. You can load the debug log more than once. After loading, you can export it to HTML or upload it to Boyum Support. *Beas 2020.05*
Delete Debug File	Delete the debug file selected in "Load Debug File" *2020.05*

Using the Debug window outside SAP B1

It is possible to use the debug window when Beas entries are collected within a separate menu point in the Modules tab of the SAP B1 Main menu.

In this way you can get an HTML view of the debug log with images and get a clear understanding of the process.

To access debug information of a window, proceed as follows:

1. Click on the Print Screen button / in the Protocol tab.
2. Mark a line and Shift + double-click on certain information you wish to edit.
3. A red rectangle appears (***see*** image below) which can be moved and re-sized with the

© 2026 Boyum IT Solutions A/S

mouse.

4. Click the "Clapperboard" / "Eye" button to access the HTML view.

Window fert_fthaupt_browse.psr

Example:

1. Open work orders and follow the procedure above.
2. Double-click on a work order, change some of the information in the WO window, then click on the Print Screen button.
3. Repeat changing information in the WO data and click Print Screen after each change.
4. Click on / to see the formatted HTML string of the process.

In this way you get a clearly understandable picture or description of an entire process in an HTML view.

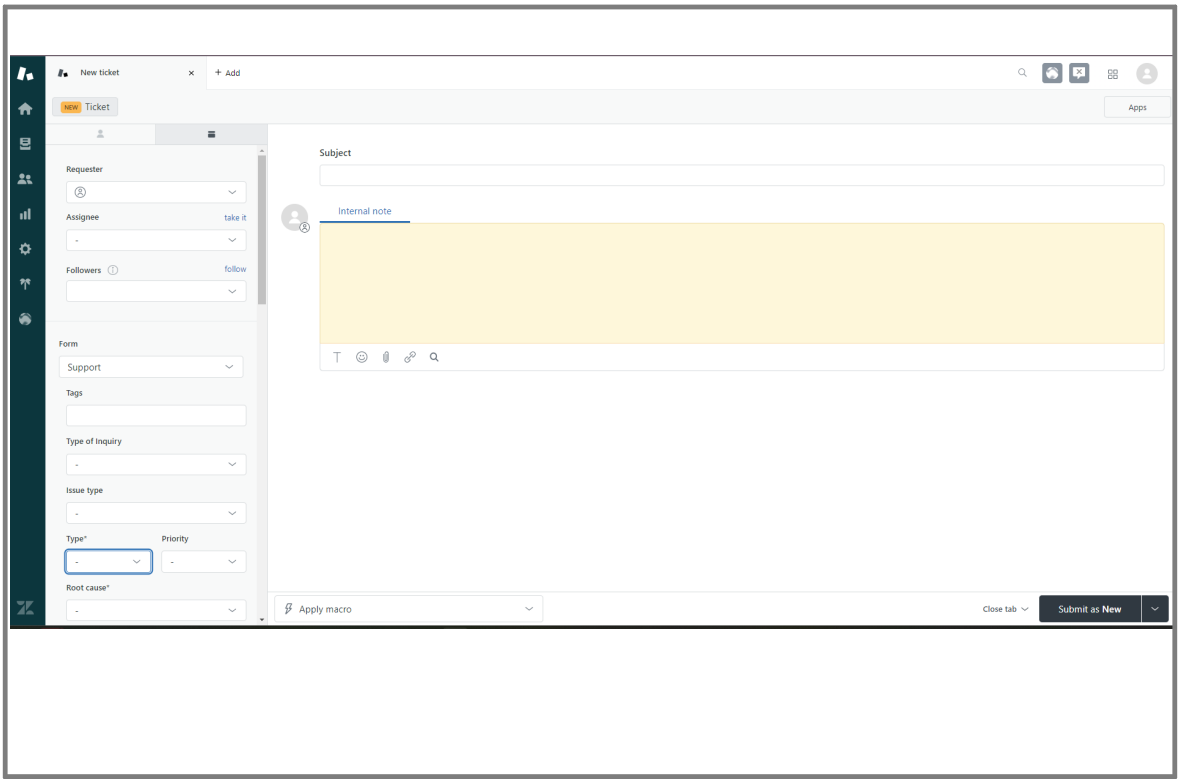
33	setup	Cost per (arbplatz_kstje) = (1) Minute Defines the time unit for which the costs are stored. see documentation

The different colors help support agents to quickly analyze every click and setting performed in a chronological order in the log.

In case you need support, you can simply copy the URL address of the Debug log to the clipboard and paste it in the Boyum help page to submit a request.
First, paste the URL string of the Debug log and describe the issue in a simple way. Then, fill all mandatory fields and send your request to support.

© 2026 Boyum IT Solutions A/S



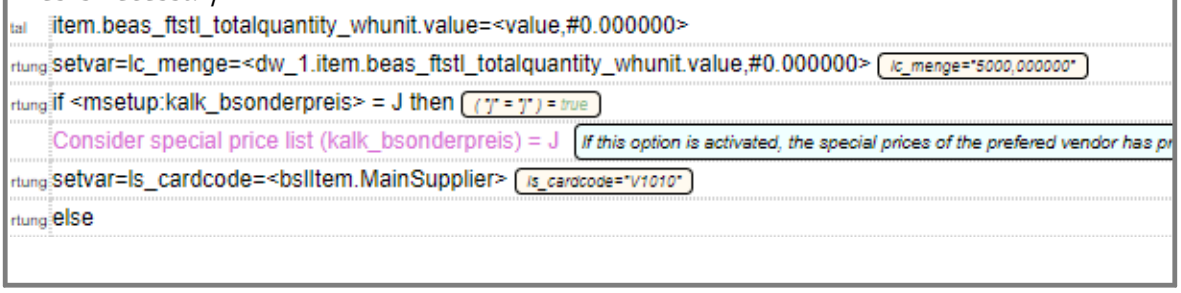
13.1.1 Debug to HTML

In the System information - debug window you can export the log to HTML

The HTML Debug log provides proper overview on all commands, settings, variable definitions and SQL commands.

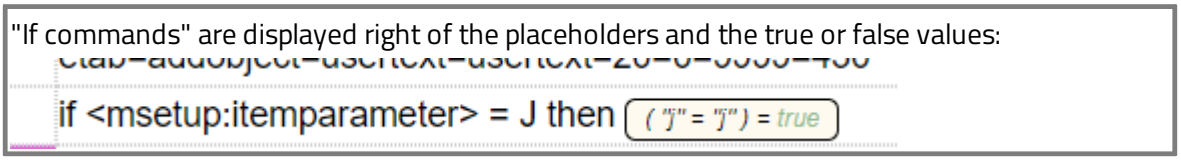
- setvar commands

The setting is displayed right of the command itself and no further analysis of the following lines is necessary.



- if commands

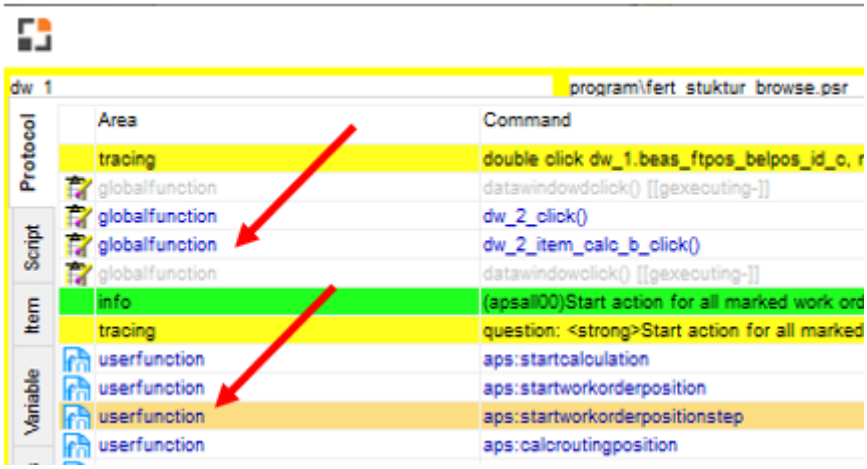
"If commands" are displayed right of the placeholders and the true or false values:



- use functions

© 2026 Boyum IT Solutions A/S

In the debug window you can double-click on a user function or global function:



The double-click opens the customizing Script editor, where you can insert a function (if it does not exist) and set cursors inside this function.

The debug log displays detailed information on User functions along with the source code.
Example: APS information:

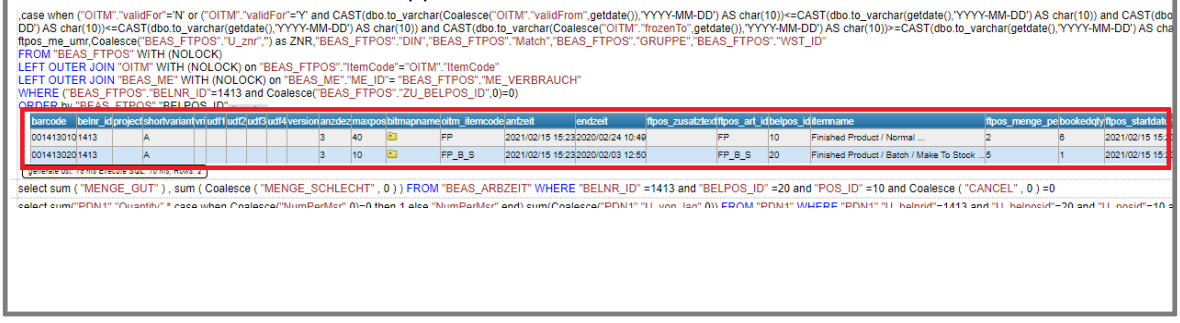
SQL commands

SQL commands are clearly highlighted, and real values are displayed. You can expand SQL commands, which then also appear in a table view, as well:



Different SQL Variants exist:

simple selection command via Script: All values are displayed.

multi-row selection command via Script: The first 10 lines with all columns are displayed as an HTML Table.

SQL Commands executed by the application itself: Only the SQL Statement is displayed, not the result.

14 SBO Menu Tools

Beas functions under TOOLS are marked with the Beas icon. These functions generally do not need to be modified, as they are not related to basic and master data.

Form settings
WEB Server
Protocol, Notes, Warnings
Preview window
Customization tools
Queries: SQL Editor, SQL HANA Converter, Active User
System Programming
Extensions for clients

14.1 Form settings

SAP Business One advanced window settings are defined here. Accessible in Beas **> right-click > Window settings**

Main menu – Form Settings

Subject only for theSAP Business One – environment

This determines which functions in the main menu the user has access to. Here, the menu items are not only hidden, but completely eliminated. This is only for SAP Business One windows, as Beas windows are called up differently.

Notes on authorization control

The SAP-user requires a lot of SAP Business One rights to be able to use the Beas Add-on. Therefore the user should get all permissions. Using the form settings you can take them away again. ***See*** Required SAP-Rights.

Notes: **Beas functions**

The "hide" of functions is controlled by Menu-ID. Unfortunately, the AddOn must assign a separate Menu-Id per language as the menu text and the ID are firmly connected to each other. (Restrictions from SAP Business One) Therefore, the settings apply only for the selected language.

Furthermore, the setting only applies to the menu, but not on the call option by clicking on the orange arrows, as it is available, for example, in SAP windows. These settings are not relevant when Beas is started outside the SAP Business One environment.

© 2026 Boyum IT Solutions A/S

14.2 WEB Server

This window is an efficient solution of the WEB function provided by Beas.
System authorization and administration authorization are required to open this window.

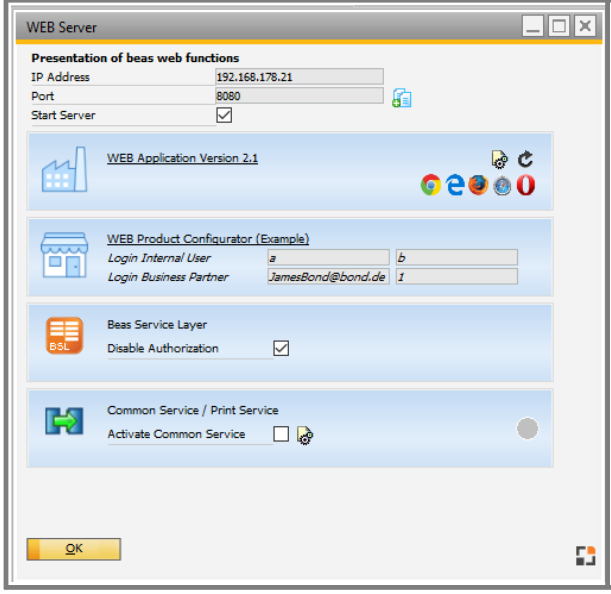
The WEB-Server is immediately available after the window is opened.
The window consists of a HTTP-Server and an application-server.
No additional components or services are required.

For more information ***see*** detailed description of the Web Application server and the Beas Keep Alive system.

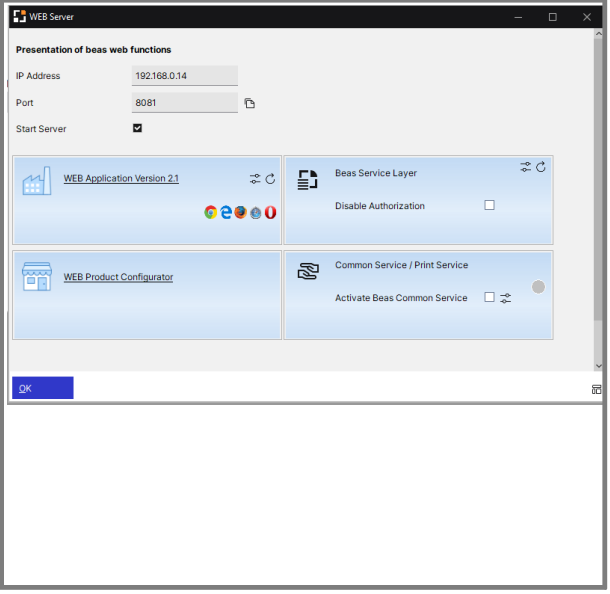
The IP-address and the Port are displayed, which you can use to establish the connection with any browser.
Beas suggests Port 8080. Enter another Port (e.g. 50020) if it is occupied and enable the service with the check box behind it.
The system does an automatic search for the next free port. This can only be changed manually if the check box at "Start Server" is disabled.

PATH: Tools > Web Server.

Traditional Style



Boyum Style



© 2026 Boyum IT Solutions A/S

Window httpserver_status.psr

Multiple links are available for the program by default.

- WEB Application Version 2.1

  For presentation or testing WEB Application 2.1
  For login you must define a Employee in Human Resources. Log in via the card number defined in Personnel administration.

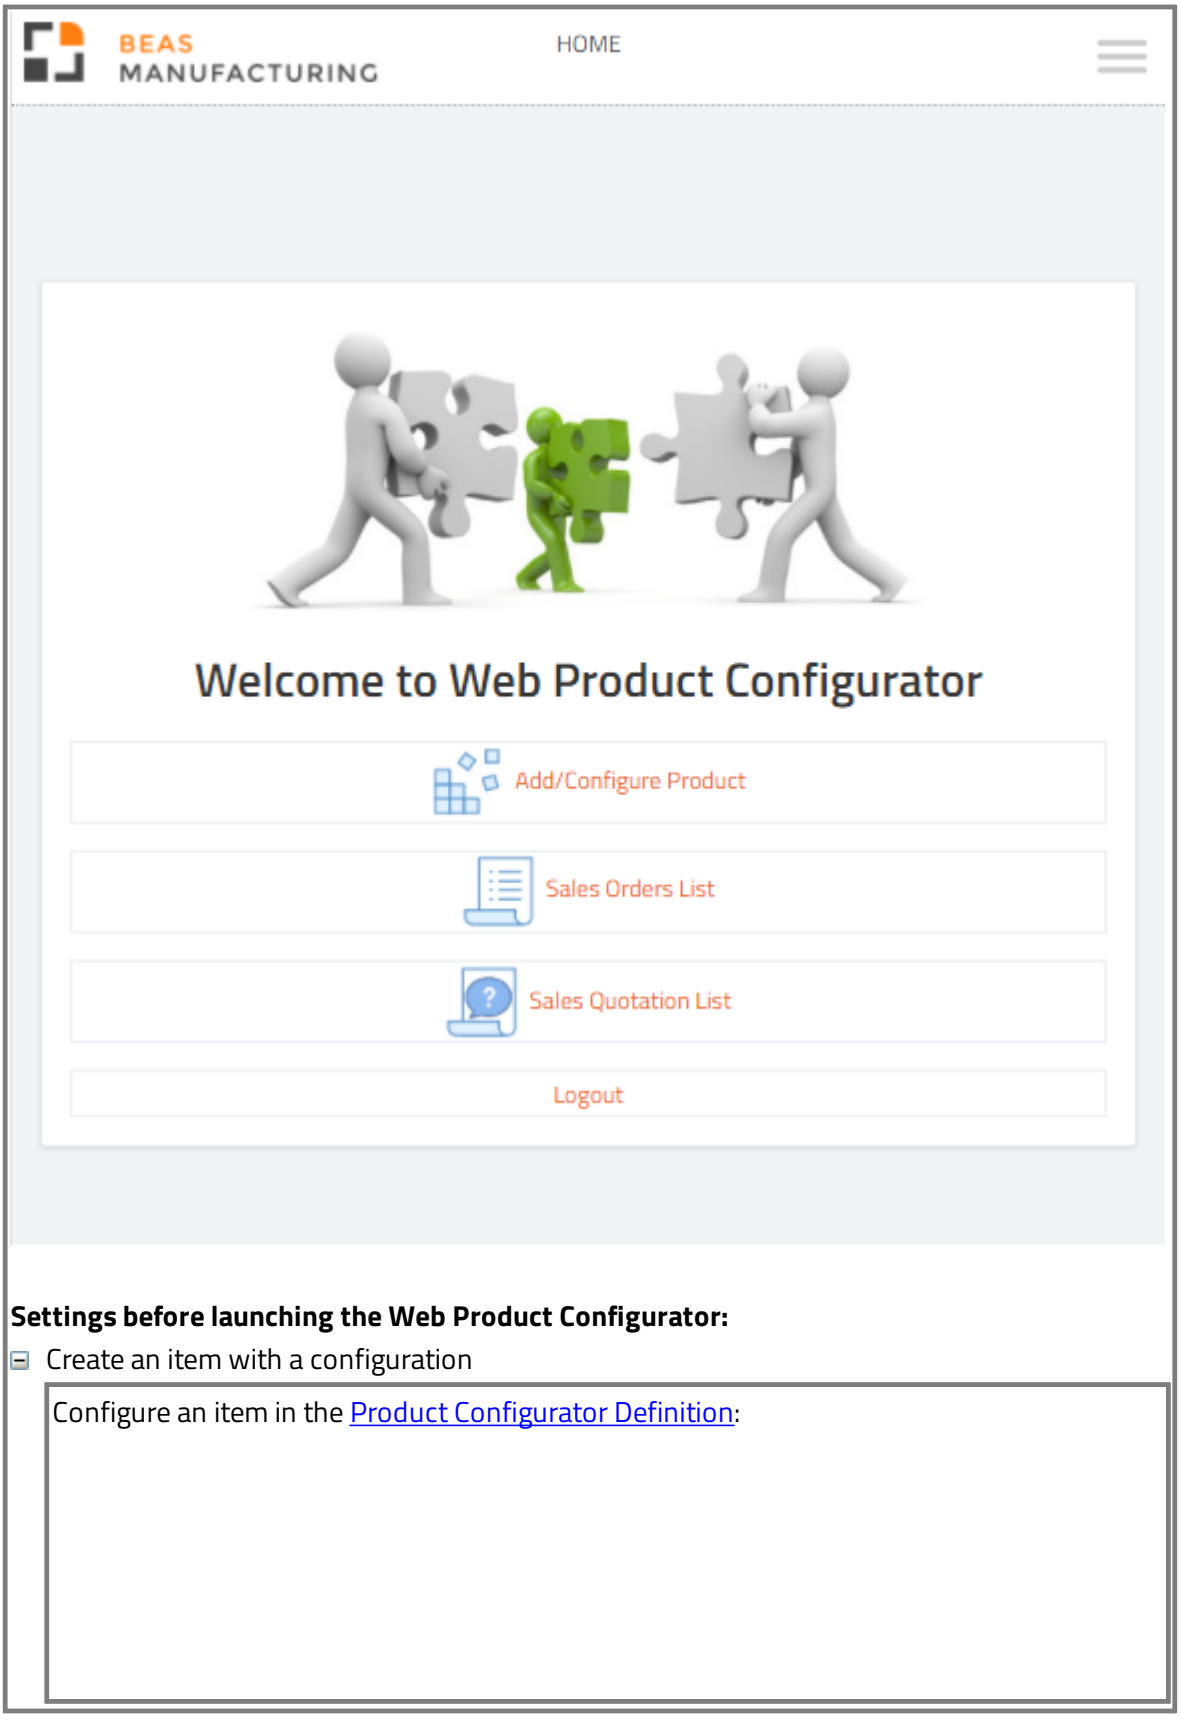
  For more information ***see*** WebApps - General information

- WEB Product Configurator

  If an item has a configuration stored in the system, it can be further configured in the Web solution.
  It is possible to create and cancel Sales documents, login as a customer or a sales employee, and depending on the various settings, the user can view and manage Sales orders/quotations lists.
  See the different basic settings in the Web Product Configurator Setup.

  LICENSE CONSIDERATIONS:
  Concurrence of users (User, Customer, Employee). Every Session takes one license.
  WebApps: The user must choose "Logout", otherwise it can take up to 10 minutes before the License is free for other sessions.

© 2026 Boyum IT Solutions A/S

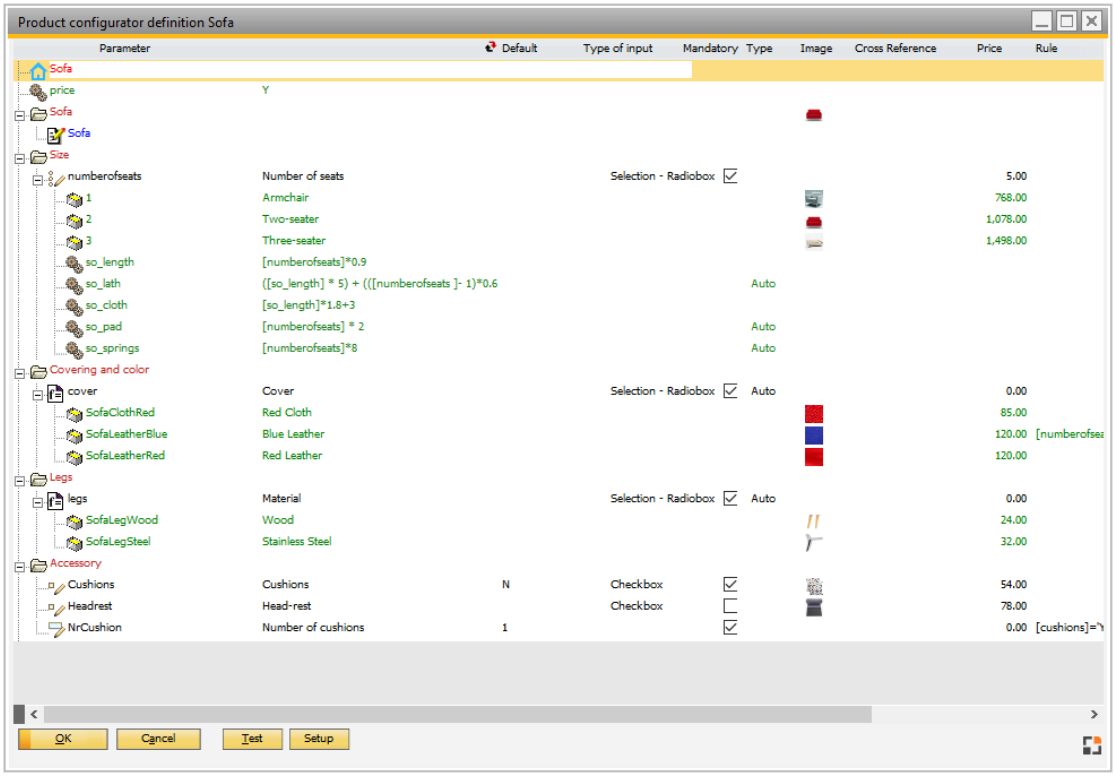


Settings before launching the Web Product Configurator:

- Create an item with a configuration

  Configure an item in the Product Configurator Definition:

© 2026 Boyum IT Solutions A/S



See Configuration

- Create a Beas service

  Create a Beas service in the Beas Manage Server, and enable the Web Application Server.

  Enter port number and activate "Start Server" in the WEB Server window.

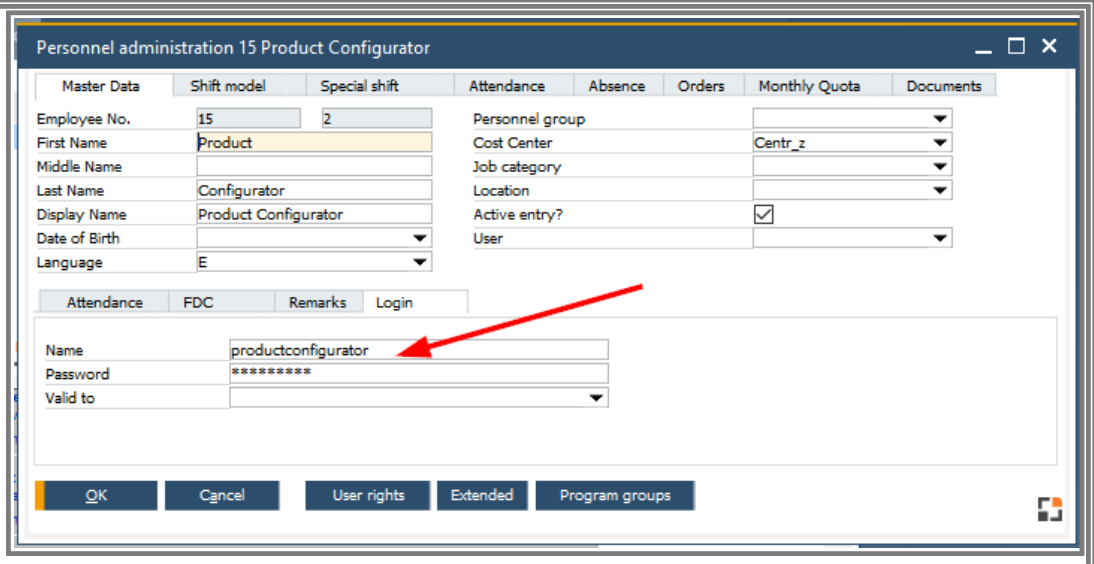
- Login

  - Login as Sales employee

    Go to user and password set up in **HR > Personnel > Login tab**.

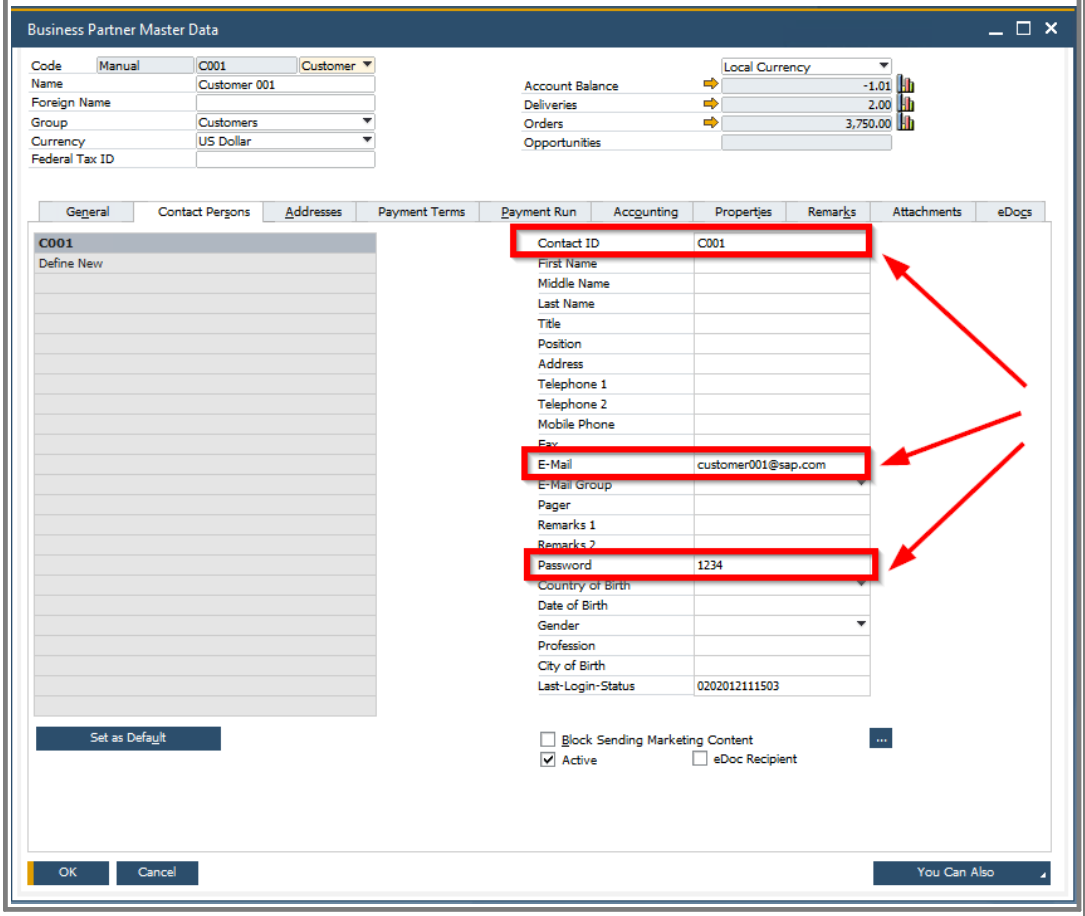
    The function searches for the first user with login information inside.

© 2026 Boyum IT Solutions A/S



Login as Customer

A customer must be stored for the login. A contact person, an email address and a password are stored in this customer entry in **SAP Business One > Business Partners > Business Partner Master Data > Contact Persons tab:**



© 2026 Boyum IT Solutions A/S

Login protection:
If the user tries to login 3 times with a wrong password, the system locks the user for 2 hours.
This prevents a bot attempting a brute force attack based on a dictionary.

See Logon and Edit Personnel Master data.

See functions and field descriptions in Web Product Configurator User interface.

- Beas Service Layer

The Beas Service Layer is available.
For more information on this new service ***see*** Beas script documentation – Beas service layer
Use Postman or other Service test tools to experiment its usage.
Option "Disable Authorization" allows you to use the Service without password protection.

- Common Service

Activate Common if you need WEB APP Print Solution or if you want to create all documents asynchronously.
See Common Service

Note:
Usually a Beas service is set up in the productive system.
For additional notes ***see*** Server management.

14.3 Protocol, Notes, Warnings

All actions are logged and can be viewed here in the protocol. The window is split in two parts.
Detailed information on the current entry is displayed below.
There, all error messages are displayed, including the current user, employee, station name etc. The window saves the original document which caused the error.
The error needs to be checked and confirmed. Click on "OK" in the lower area to do so.

Archive:

© 2026 Boyum IT Solutions A/S

It only logs significant errors which could lead to problems in financial accounting or in inventory. To prevent the protocol from growing too large, it is cleaned up daily. All "red" messages are deleted after one year, all other messages after 3 months.
An entry can be marked as "edited"; you can enter personal information. Multiple selection is possible.

Field	Meaning
Priority	0=process message 1=note 2=error, program cancellation
OK	An entry can be marked as "edited"; this is done in the lower area.
Area	Program part that the entry refers to.
Information	The protocol. In the list the first line of the message is displayed. In the lower part of the window the complete message is displayed. Click on this field to scroll down. The text is not changeable. Next to the message the following information is logged into the current window: a) window title b) form name (PSR-file name) c) content of transfer parameter (structure variable)
Remark	Below a remark can be entered for the protocol entry. The fields "by" and "at" are set automatically.
Date	Date and time of the creation of the protocol.
User	Current user at the moment the protocol was created.
Empl. name	Currently logged on employee user at the moment the protocol was created.
Work station	Work station logged on, if WEB-operation: Name of the client if station name was queried.
Remote station	Station name, on which the program runs, Remote access: name of the terminal server.
SAP code	Message code in SAP Business One.
Beas code	Message code in Beas.

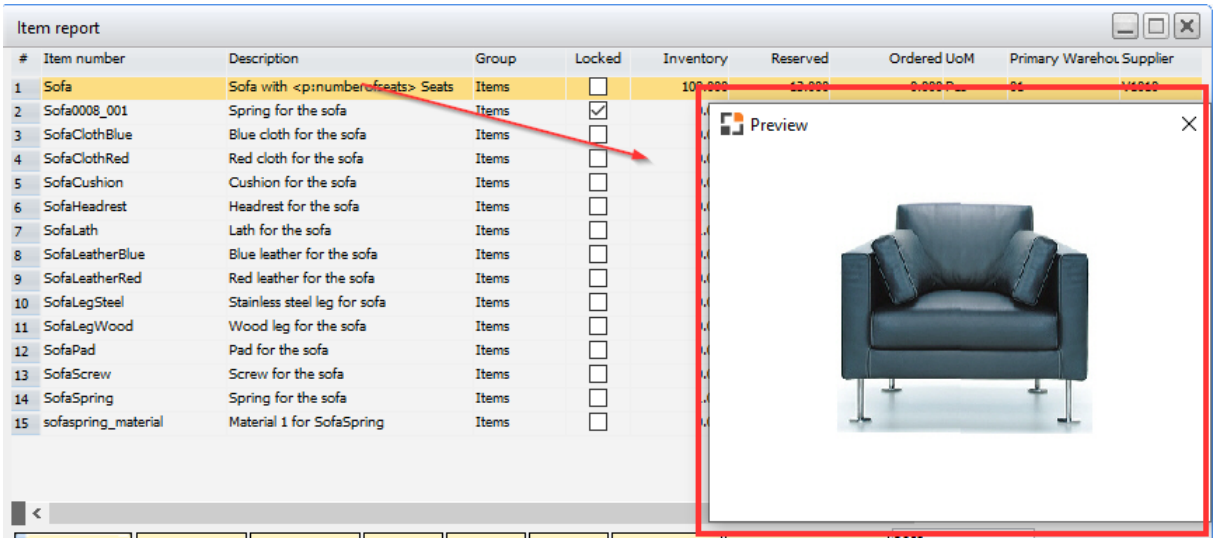
The link to the original document (currently work order document or Precalculation) is checked when deleting. If an entry is deleted, and there is no second entry for the same document, the error mark in the original document is removed.

© 2026 Boyum IT Solutions A/S

14.4 Preview window

In preview window the first document of the currently selected item is displayed.

Selecting this menu item, a separate window opens presenting the first document of the currently selected item. This works for almost all windows (item list, item structure, work order structure, work order item, etc.)



All JPEG, BMP, GIF, TIFF and PNG - image files are displayed. Other formats are displayed with OLE. If an OLE-capable program has been installed, the document is opened (eg. Word, Excel, Powerpoint) If not, only the icon is displayed.

The window can be opened both synchronously and asynchronously. Images are opened directly, other files using the OLE-icon. Double-click on the icon to execute the linked program.

Set up behavior in Station settings.

Working with 2 terminals

You can move the preview window to a second monitor. Beas saves last position and size.

In this manner you can work with terminal / SAP in the left window and on the second monitor you can see the technical picture.

© 2026 Boyum IT Solutions A/S

Terminal Mode:

In Terminal – mode the preview can be opened automatically. To do so: Station settings – Preview set to "automatically synchronous" or "automatically asynchronous".

beas9.0-004-051-000

14.5 Customization Tools

All Beas customizing functions are accessible from this menu.

The following Beas functions are available:

BeasScript Editor

Macro Editor

Beas Customizing Properties

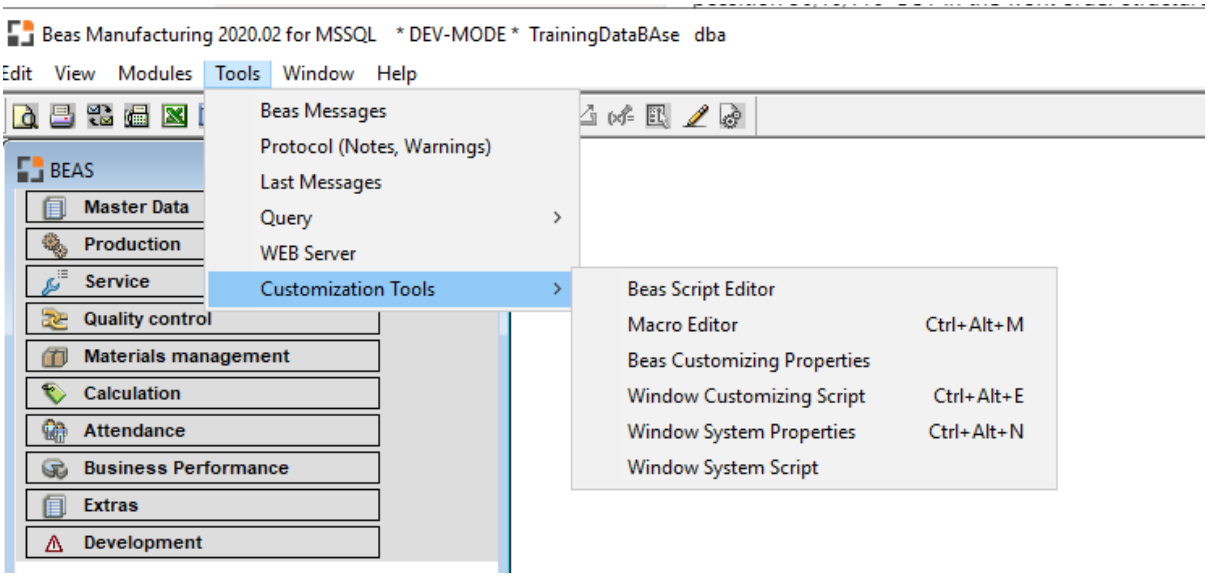
Window Customizing Script

Window System Properties

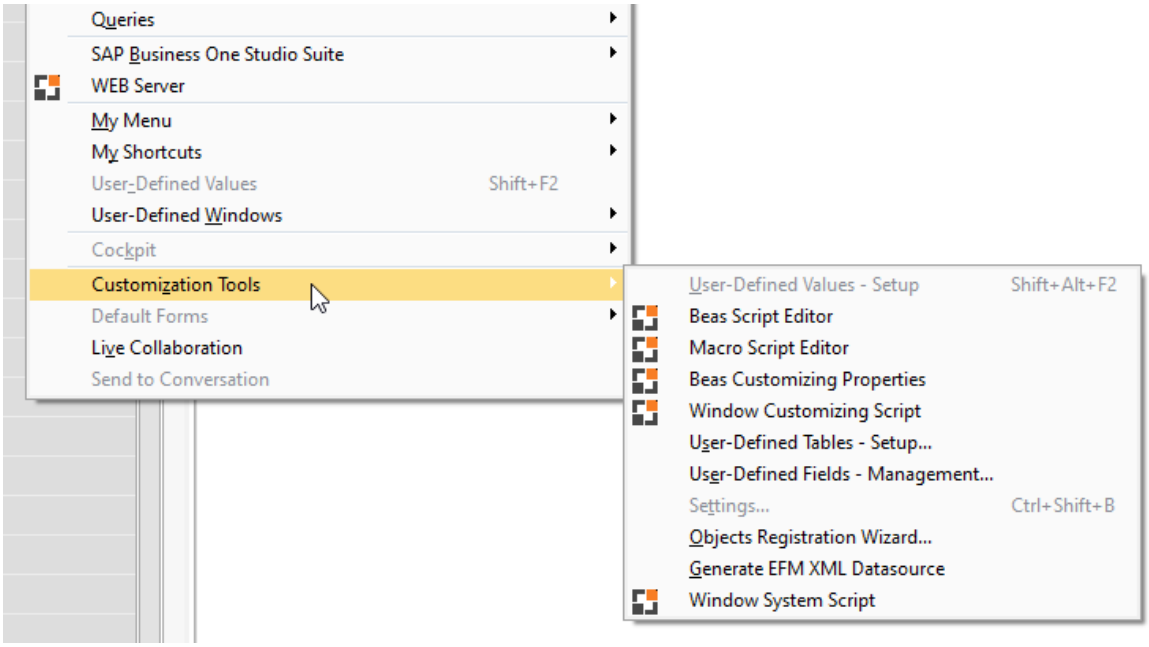
Window System Script

View in Beas standalone:

© 2026 Boyum IT Solutions A/S



View in SAP B1:



14.5.1 Beas Script Editor

You can use this editor to modify test scripts. It is identical to the the editor in the debug window, but with more functionality. There are additional properties.
It is possible to change between 20 different sources with the blue arrows.

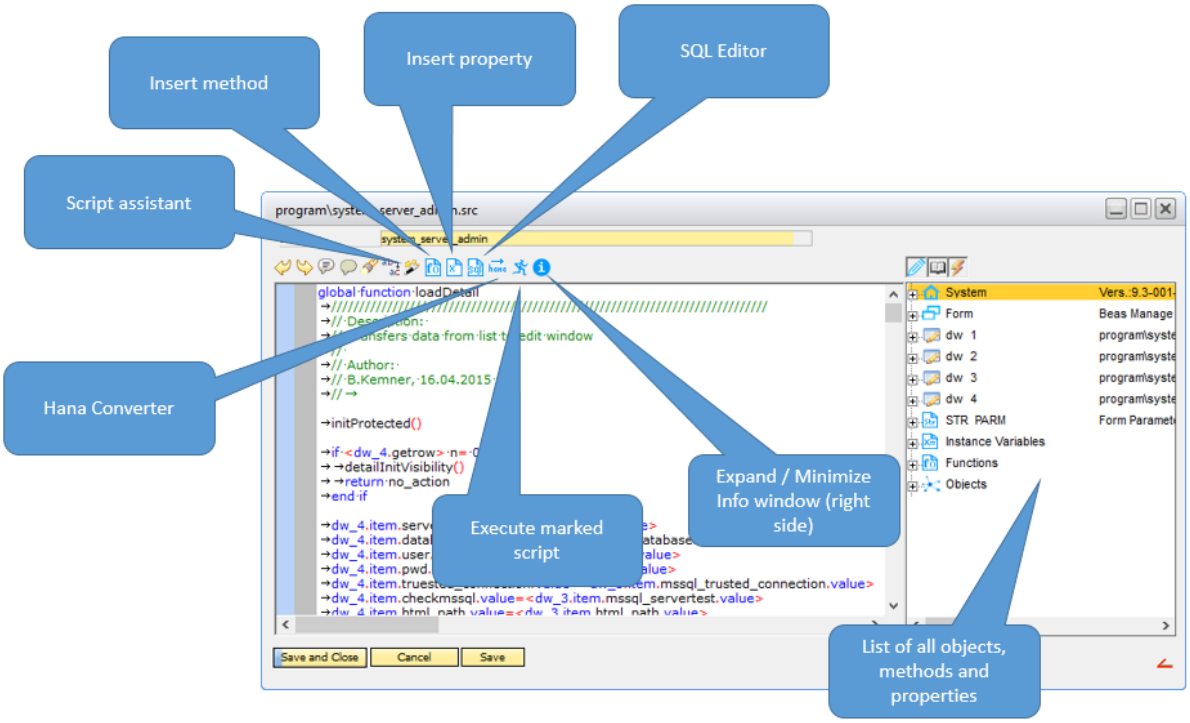
Beas can be customized easily and in different ways.
Beas has its own script language called BeasScript.

© 2026 Boyum IT Solutions A/S

With the integrated script editor it is simple to create customization with BeasScripts.

User rights:
Validate if the user has rights to open the SQL screen. ***See*** Right management SQL.

Examples for using Beas script editor:
- window-related – tools – extensions for clients
- Beas usability extensions – universal function – Beas script



The script assistant helps you to start with BeasScript. ***See*** BeasScript assistant.

Videos:
Display content of a datastore

See also Beas Service Layer.

14.5.2 Macro Recorder

This function allow to record the current session.
The macro recorder create directly a JBScript. With this script you can generate your own customizations.

© 2026 Boyum IT Solutions A/S

Current this window is in Work (BETA Version)

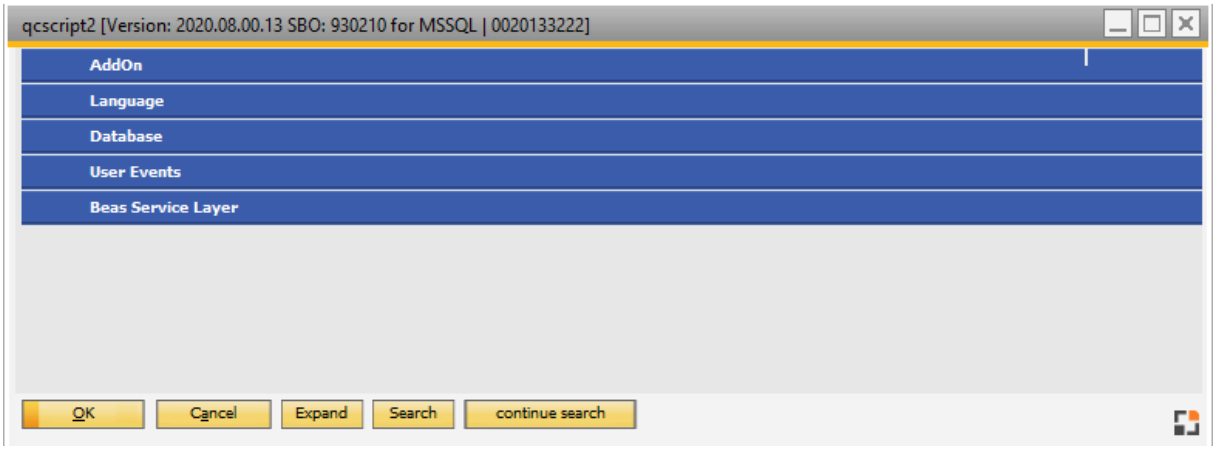
14.5.3 Beas Customization Properties

Open Add-On Extensions for the currently defined folder.

This menu option can also be called up from:

PATH: Administration > Add-Ons > Add-on-Manager (Beas) >

1. Select Addon >
2. Click **Open** button.



Window system_option_struktur.psr

Button	Description
Customized extension	Enter name and location of the Add-Ons.
Folder	Open the central project folder Only visible if working with a central project folder: Open the windows explorer in this folder.
Block client update on this station	Prevent an automatic update on the project folder Only visible if you do **NOT** work with a central project folder: Prevent adjustment of the local project folder. ***Use example:*** The extensions are developed at this station. This option can be activated for preventing an "overwriting" accidentally through an

	adjustment.
Request a client update	Request update of the project folder for all clients Only visible if **NOT** working with a central project folder: As soon as the clients restart Beas, the project folder is updated. The entry "version" is increased in the project folder on the server in the file "version.ini".
Distribute local changes	Distribute the local project folder to all clients Only visible if you do **NOT** work with a central project folder: All changes in the local folder are copied to the server > project folder and a distribution is requested to all clients. As soon as the clients restart Beas, the project folder is updated. The entry "version" is increased on the server in the project folder in the file "version.ini". Note: All files are copied but not deleted.
Local document	Open the local project folder Only visible if you do **NOT** work with a central project folder: Open the file explorer on the local client.
Server document	Open the project folder on the server Only visible if you do **NOT** work with a central project folder: Open the file explorer on the local client.
Language	Language settings

Language table	The translation in the project folder is saved in the file "lanuage.psr" and updated when: a) The addon is registered, b) The language is updated, c) Something is changed in this window.
Messages	Own messages for own extensions can be stored

© 2026 Boyum IT Solutions A/S

	Language table: The translation in the project folder is saved in the file "lanuage.psr" and updated when: a) The addon is registered, b) The language is updated, c) Something is changed in this window. here for all user languages. The translation in the project folder is saved in the file "message.psr" and is updated if: a) The addon is registered, b) The language is updated, c) Something is changed in this window.
Database	Database settings Define own Database Fields Edit table extensions: Edit database extensions. These are saved in db.ini. ***See*** "structure of the DB.INI" Edit rights: Edit further authorizations which are displayed in the user rights administration.
User events	Customer-specific functions Beas allow to insert additional functionality in the business logic. This is not window related and the scripts running complete in back end - in Beas Desktop / Terminal / WEB solution, Beas Service Layer and Data Integration hub. The following areas are available: Addon: Edit details with BeasScript editor. Menu: Edit details with BeasScript editor. MRP: Edit details with BeasScript editor. QC: Edit details with BeasScript editor. Calculation: Edit details with BeasScript editor.

© 2026 Boyum IT Solutions A/S

	<table><tr><td>Stock management</td><td>Edit details with BeasScript editor.</td></tr><tr><td>Work orders</td><td>Edit details with BeasScript editor.</td></tr><tr><td>APS</td><td>The **Details** button opens the script editor with the file APS.SRC and creates the function or jumps to the existing function.</td></tr></table> For more Information ***see*** BeasScript documentation – User events
Beas Service Layer	By clicking on the button "**Details**", you can insert the additional functionality for Beas Service Layer. For more information ***see*** Beas Service Layer documentation.

back to Customized Extensions

14.5.4 Window Customization Script

Here you can define the customization for the current window.

14.5.5 Window System Properties

Open the Window system property window.
Do not change anything, because these are system scripts .

Use this only if you created your own window with PowerBuilder, and it is saved in the project folder.

14.5.6 Window System Script

Open the System scripts window.
Do not change anything, because these are system scripts.
The program will overwrite all changes in the next program update.

For changing standard / system function, use Window Customization Script.
This scripts allow you to understand how the standard is working.

© 2026 Boyum IT Solutions A/S

14.5.7 User-Defined Fields

Beas for SAP Business One was created in 2001. At this time UDT's did not exist in SAP Business One.
We always strive to deliver a Beas version that is compatible with older versions because our partners invest a lot of time in Reports and Customization.
This is the reason why Beas does not use UDT's and why this cannot be changed.

On Beas tables it is not possible to create UDF's, because Beas does not use the SAP Business One UDT-System.
For more information ***see*** beas Addon settings

If you need your own fields on SAP Business One – Tables or if you want to create new tables: Use the SAP Business One UDT/UDF System.

You can create User-defined fields in 2 ways:

1. Use SAP Standard tools to create the UDF manually.
Upon creating the UDF, you can define all properties and must proceed similarly in every database.

2. Use db.ini in project folder to create SAP UDF's. ***See*** Beas Addon settings.
Beas creates the UDF's automatically. Here it is not possible to define all UDF Properties.

Attention:
If you create your own tables or udf: The prefix "Beas" is not allowed.

Example:
`u_beas_color` -> wrong
`u_mycompany_color` -> correct

14.6 Queries

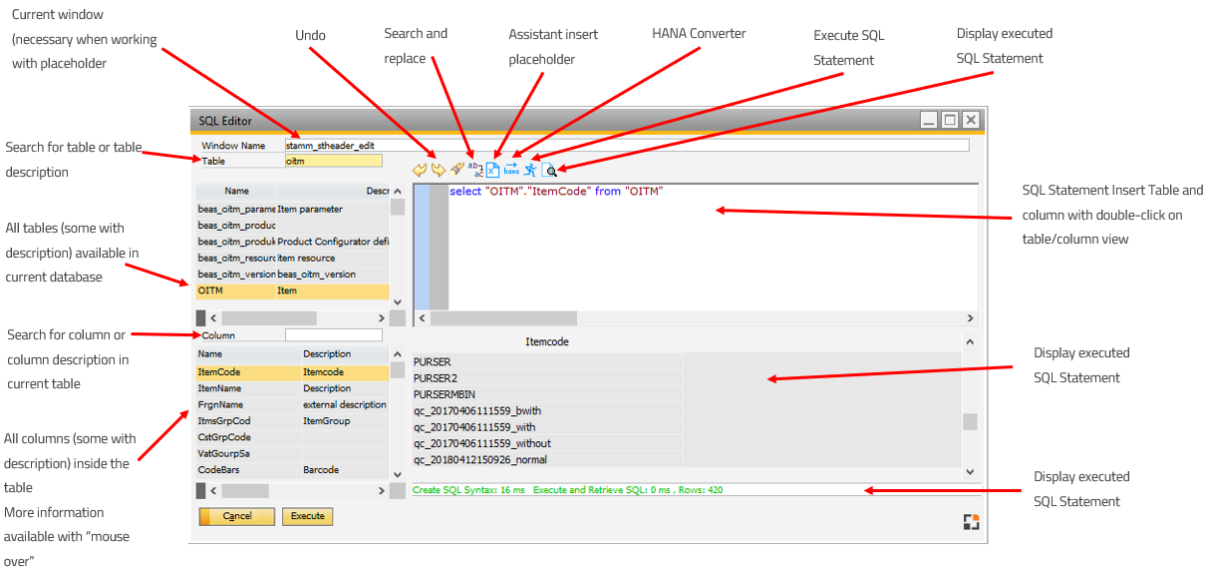
14.6.1 SQL Editor

With the SQL Editor it is easy to generate SQL statements.
The SQL Editor displays all SAP-Tables, all Beas Tables and Beas Views

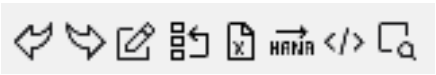
© 2026 Boyum IT Solutions A/S

When hovering the mouse over a Beas table column, Beas displays more information on the field (if available).

The integrated MSSQL→ HANA Converter makes it simple to convert the script in correct HANA Syntax.



Function buttons in Boyum Style design:



The SQL Editor has different modes.

Create own SQL Statements

Open SQL Editor from Debug window to test executed SQL Statement

Open SQL Editor to define Filter or Order

- Open SQL Editor to define UDF's or Templates

  In this mode Beas creates the correct syntax if you make a double click on a field.
  - convert NULL fields to string: COALESCE("TableName","FieldName",'')
  - convert all types to string: Cast(...)
  - allocate fields if you need more than one field (field1 || field2)

- Execute SQL Query

  Beas converts the string before executing.

© 2026 Boyum IT Solutions A/S

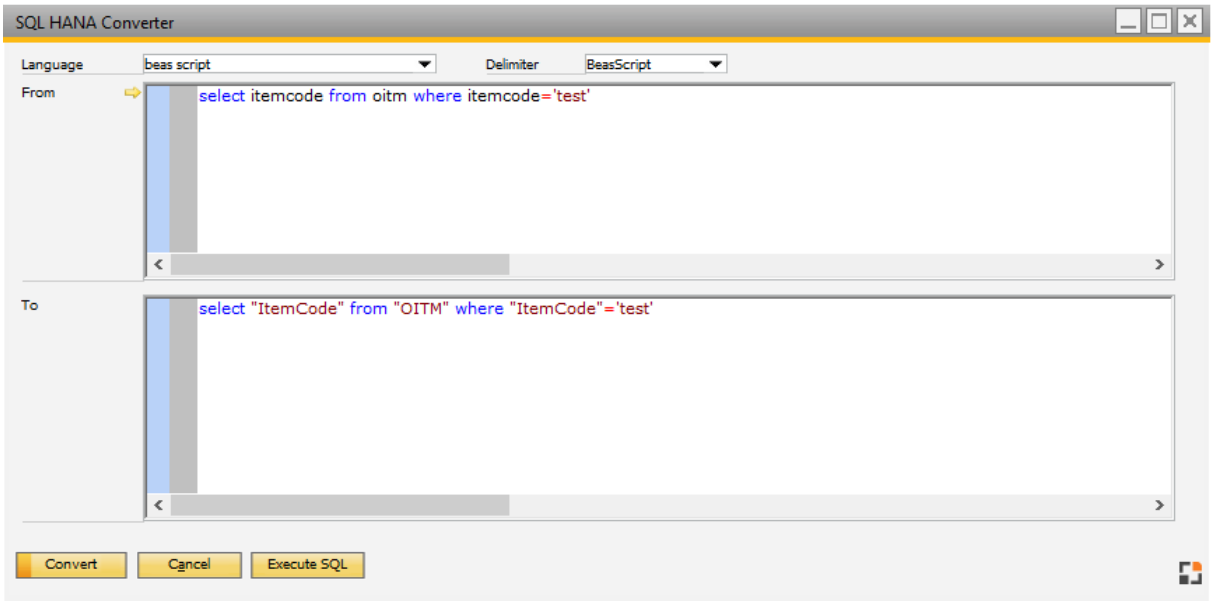
1. Replace all placeholders <...>, linked to window defined in the Window field in the top section
2. Delete & marks on right side
3. MSSQL: Convert HANA Syntax to MSSQL Syntax with internal MSSQL Online Converter
4. Display Result as Grid Table
5. Display count of rows and duration time from executing

Limitation:

SQL Statements executed from Beas can have questions marks in the arguments.
The SQL Editor cannot replace this.

14.6.2 SQL HANA Converter

The SQL HANA Converter converts SQL Syntax to HANA Syntax.



Window system_ convert_ sql.psr

Function	Description
SQL / BeasScript	Define if a Beas script with SQL statements or only a SQL statement must be converted.
Delimiter	**BeasScript**: Use "for field Names", for example select `"OITM"."ItemName"` **powerbuilder**: Use "for field Names", for example select `` `OITM`. `ItemCode` ``

© 2026 Boyum IT Solutions A/S

Function	Description
	the Beas internal Online HANA/MSSQL Converter replaces this at run time Use this if the SQL statement is inside ' ***Example*** in powerbuilder script: `sqlca.sqlcode("select `OITM`. `ItemCode` from `OITM`",lds)`

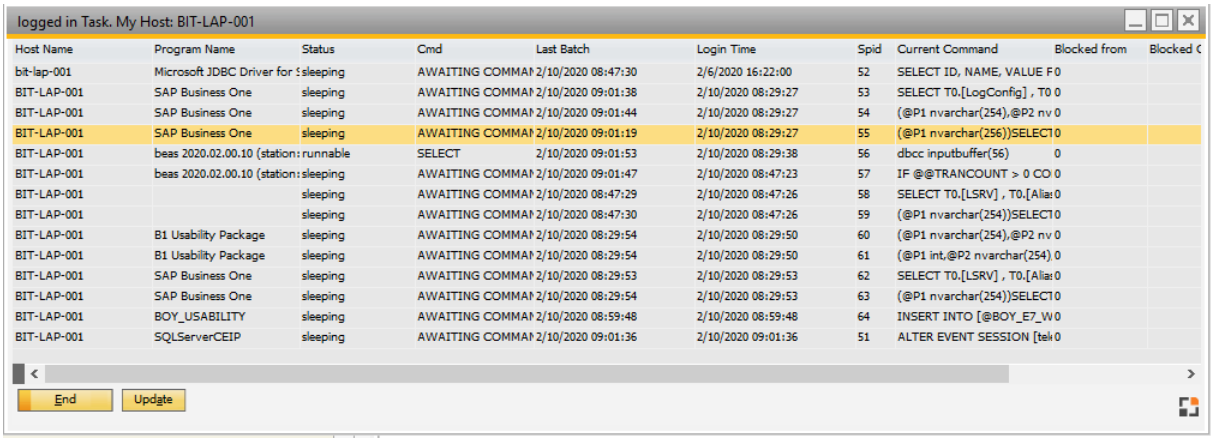
HANA Script	The translated SQL Script
	
	define corrent upper/lower case
	`itemcode -> "ItemCode"`
	this runs with all SAP- and Beas tables, UDF and UDT, not for own define fields outside the SAP System
	
	Insert "
	`itemcode -> "ItemCode"`
	
	replace convert, today and lot of other functions
	`getdate() -> now()`
	
	replace +
	`itemcode + itemname = "ItemCode" || "ItemName"`
	
	Replace MSSQL udf names to HANA udf names
	`select u_din from oitm -> select "U_besa_din" from "OITM"`

14.6.3 Active User

Lists all users including the application name, logged into the SQL server.

For Beas applications, the version number, the logged in user, command information, Login time and the current database are displayed here.

© 2026 Boyum IT Solutions A/S



Window system_ aktive_ user.psr

14.7 My Shortcuts

In my Shortcuts you can allocate Function keys to a Window.

Example: F3 open item master data

> NOTE:
>
> This ONLY works in SAP Environment and ONLY if an SAP Form has the focus.
>
> The function key does not work in Beas Standalone or if a Beas window has the focus.

14.8 System Programming

The system development window opens.

Beas allows to view the development tools, for analyzing features of Beas for customizations.

IMPORTANT: Do not change anything here, as all changes will be overwritten at the next program update.

Customizations are made only here: Customizations

14.9 Extensions for clients

Customized extensions can be added, created with Beas-script.

See

BeasScript Editor

Customized extensions

BeasScript

© 2026 Boyum IT Solutions A/S

14.9.1 beas script

With BeasScript you can modify and extend Beas and SAP Business One in various ways.
No other tools, cancellation or restart of the program is necessary.

BeasScript is a script language that is not compiled (as JavaScript) .
Beas was developed in this script language. The source code is available.

See Documentation: BeasScript

The main advantages of Beas script are the versatility and the direct access to different frameworks and API's:
SAP Business One - Data-Api and User-Interface-Api
Beas - Data-Api and User-Interface-Api
WEB-development
WEB-Service-development (SOAP)
Powerbuilder DataWindow-Object
Crystal-Report-Api

© 2026 Boyum IT Solutions A/S

15 SBO Menu Window

SAP Business One menu window:

Colors
Messages Activities

15.1 Colors

Up to 10 color settings can be made here.
This is necessary for example when using terminal servers that work with only 16 colors.

The currently selected color setup can be stored per station.

Generally, changing the color settings is not recommended.

15.2 Messages Activities

Beas includes a messages window which is easy to operate, similar to the activity management of SAP Business One

Advantages:
- very simple and quick operation
- different work flows can be represented
- easy adaptation with scripts

Used by following functions:
- Data check
- Events

There is an automatic check for new messages. The check interval can be set up in **SAP > System initialization > General settings > News update (minutes)**. Restart needed for changes to take effect.

The automatic notification can be turned on in Configuration wizard – System – Beas message check.

© 2026 Boyum IT Solutions A/S

16 SBO Menu Help

SAP Business One upper row : Menu item Help – Documentation

Beas offers many help resources, slides and videos.

Documentation
Last messages
Message IDs

See
Configuration wizard – Help

16.1 Documentation

For all References to Beas help ***see***

Beas Help Archive

16.2 Last messages

List of last error messages.

Field	Meaning
Clipboard	Copy selected error message to clipboard.

16.3 Message numbers

Warning messages issued by Beas are explained here in detail.

If the user selected "do not show anymore" for a recurring warning message, this selection can be reset in User administration.

© 2026 Boyum IT Solutions A/S

16.3.1 cantrollback

Note: Only BOM issue is aborted. All previous postings cannot be undone.
The following message appears:

"Aborted only the debiting of the BoM. All previous booking process cannot be undone!"

This message occurs in case of multiple transactions (for example, goods receipt, issue, etc.) are carried out in succession and one of these is aborted.

Possible reasons for cancellation:
- Cancel button pressed
- Error message (not enough inventory, blocked number range, no authorization, etc.)

Why the process is irreversible:

Example:
External production (last operation) - Goods receipt with provision parts and automatic posting
In this case, the following actions take place:
Goods receipt in SAP Business One
Material issue from external warehouse
Material issue from own warehouse
Post-calculation
Post in assembly

Each operation must be completed and the transaction will be closed to prevent subsequent manipulations(for ***example***, determining which batches to be selected). If a transaction is completed, it can not be undone because journal entries have been made. Journal entries may not be deleted.

If a transaction would not be closed, the database needs to would be locked (open transaction). A consequence would be the company-wide blockage of the complete program.

Measures
In certain cases, the document (e.g. production document) is marked as faulty. Details are shown in the log. In other cases, a message is generated (e.g. material not completely posted)

© 2026 Boyum IT Solutions A/S

16.3.2 primaryspace234

IMPORTANT: It is not advisable to insert a space into ID fields.

Beas as well as other programs can be accessed via command-line. As argument separators here mostly the space character is used.
If the value of an ID field, for example item number is transmitted which includes a space, then the item number is only transferred to the first blank space.

To keep the compatibility to command-line driven programs, you should not work with spaces in the identifier fields.

16.3.3 specialsigns1

In identifier fields (resource ID, product ID, etc.) The following characters are not allowed:
Tab, comma, quotation marks, apostrophe, underscore, ampersand (&), <>, (ß). For more information, see the documentation. These characters are replaced with replacement characters.

To ensure compatibility with WEB programs, with command-line programs and beas-script, various special characters are not allowed in ID fields:

, '"_ & <> ß and TAB character

because these are used as delimiters, as placeholders or as different identifier characters. Also @ should not be used as some programs use this as a wild card character.

16.3.4 stdpricek423984

Error message (stdpricek423984) Standard costs valuation:
Last item valuation is too old or not existing (Batch-calculation) or there was no calculation schema stored. Work order <belnr_id>, Item <itemcode> can not be created.

In this case the Standard cost method was enabled.
It is checked whether a batch-calculation was executed. The table "BEAS_OITM_CALCPRICE" is checked.

The reason for this error message may be :
- the last calculation was performed with an older version of beas than beas9.0 PL 0
- at batch-calculation you set up: "Save calculation". In this case, no entry is made to the table "BEAS_OITM_CALCPRICE"

© 2026 Boyum IT Solutions A/S

16.3.5 calendar3

Error message calendar3

Error while checking calendar yyyy/mm/dd + x work days: Calendar existing, but no work days found. Checked last y entries.

The other reason can be that more than 30 days without a work day were found in a time period. Please check beas company calendar (ue_kalender.add_arbeitstage(days))

Activities:

Check company calendar.

A time period > 30 days without work days is not allowed.

in Beas 9.3 PL 2 and older:

(<empty>)object ue_kalender.add_arbeitstage(day x) Max=4000 days. Calculate date yyyy/mm/dd to much days. Rest of days: 356

© 2026 Boyum IT Solutions A/S

17 Terminal and WEB APPS

Factory data capture provides an overview on all work orders which is always up to date, a simple reporting of work order times, statuses and quantities.

Data can be registered via WEB and PC. Functions are made available in "Apps" summarized in the program group "Terminal".
Apps can be grouped individually, extended and adjusted.

Apps basic settings
Program group Terminal
Terminal
WEB APPS Version 2.1
Web Product Configurator
Beas service layer

Terminal variants

Beas supports variable Terminal-Variants.

© 2026 Boyum IT Solutions A/S

Client-Server based (Desktop) Terminal	As separate application (Beas in Terminal mode) on PC-terminals (e.g. touch screen terminals)  ***see*** Client-Server-based The Terminal can be started from the SAP Business One-environment as a separate application and also as standalone. ***see*** call-up parameters No user account needed. Logon by using personnel card number. Each employee can be assigned to an authorization group, in which the functions available for him are defined. Authorizations groups are stored personnel master data The solution uses the application "Terminal" and displays apps, which have been released for the respective employee. Apps can be distributed simply via copy&paste. ***See*** Terminal License Concept, License types.
WEB-based	All Terminal features as WEB-applications are available on Touch-Screen-Terminals, Pad's or mobile devices. **Advantages:** - Simple connecting, low network load and high stability. - Very low hardware requirements - Low license costs - No installation required - Globally available The solution uses the application "Terminal" and displays apps which have been released for the respective employee.

Program group administration

Following additional licenses are required for these apps.

See

License management

17.1 Apps basic settings

There are basic settings for certain applications, for example the terminal.

PATH: Human Resources > Master data > Terminal Functions > select an entry > "**Basic Setting**" button.

The button opens the Terminal and WEB APP section of the Configuration wizard:
In this section you can configure settings for the Desktop Terminal and WebApps 2.1.

PATH: Administration > System Initialization > Configuration wizard.

Authorization Groups: The **Details** button opens the Administration terminal window.

17.2 Program group Terminal

The program group "Terminal" is delivered by default. It contains a number of apps and it is available in Terminal and WEB Application.

Additional licenses are required for these apps.

See

License management

© 2026 Boyum IT Solutions A/S

17.3 Terminal

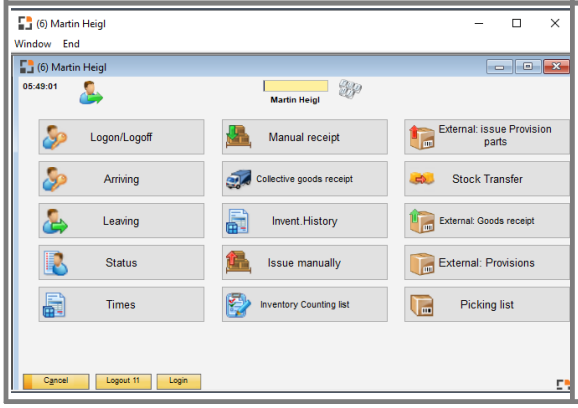
Certain functions which are optimized for the use in a workshop are available from the terminal window.

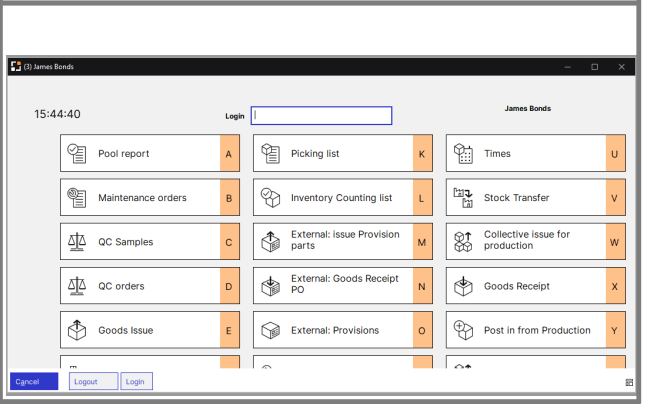
The terminal window is a platform in which any number of apps can be seen.

Login types:

1. Enter personnel-card number to log in.
2. Connect to the Terminal using the SSO (Single sign On) functionality.

To use this login type, send the following parameter in the command line: **sso=true**

Traditional style	Boyum Style
	




The terminal can be started via the terminal mode. This requires a windows link called "Beas Terminal".

- Installation

The installation of SAP Business One DI-API 32 Bit and Beas Standard is necessary.

A windows - link will be inserted on the station. The current "Beas" – link can be copied and can be renamed to "beas terminal" for this.
At "Target" will be inserted after "....\beas.exe" other parameters.

Terminal: ID for "Start in terminal mode"
User: The user ID (not user name!), e.g. Terminal1
PW: Password of the user
Database: name of the data base (according to SQL-server)

© 2026 Boyum IT Solutions A/S

Important: Blanks are not allowed at "user" and "pw". Blanks have to be replaced with "³", e.g. my³database.

Example:

"....beas\beas.exe\ terminal user=station1 pwd=abc database=trainingdb

License concept and installation

SAP License rule:

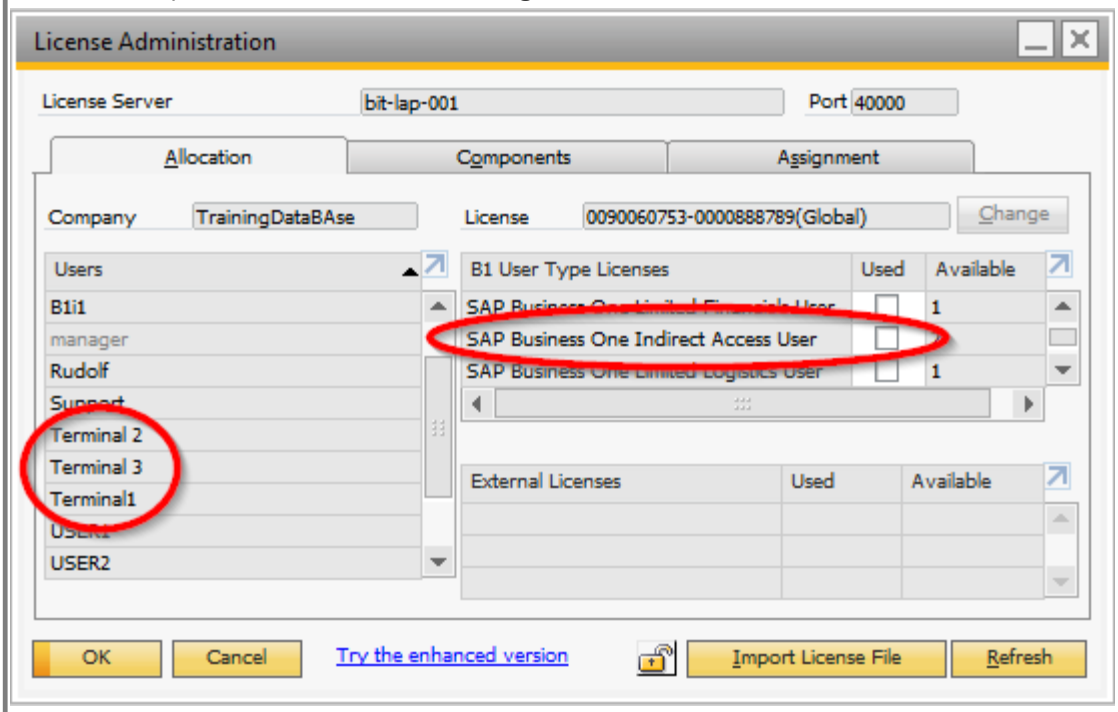
For using the functions of the Beas Terminal, you need a SAP Business One - indirect license.

Note: consult also the actual License rules of SAP Business One.

SAP B1 License for Terminal

For every station you need a separate SAP B1 User, e.c. Terminal1, Terminal2 etc.

For this user you must define the following SAP Authorizations:

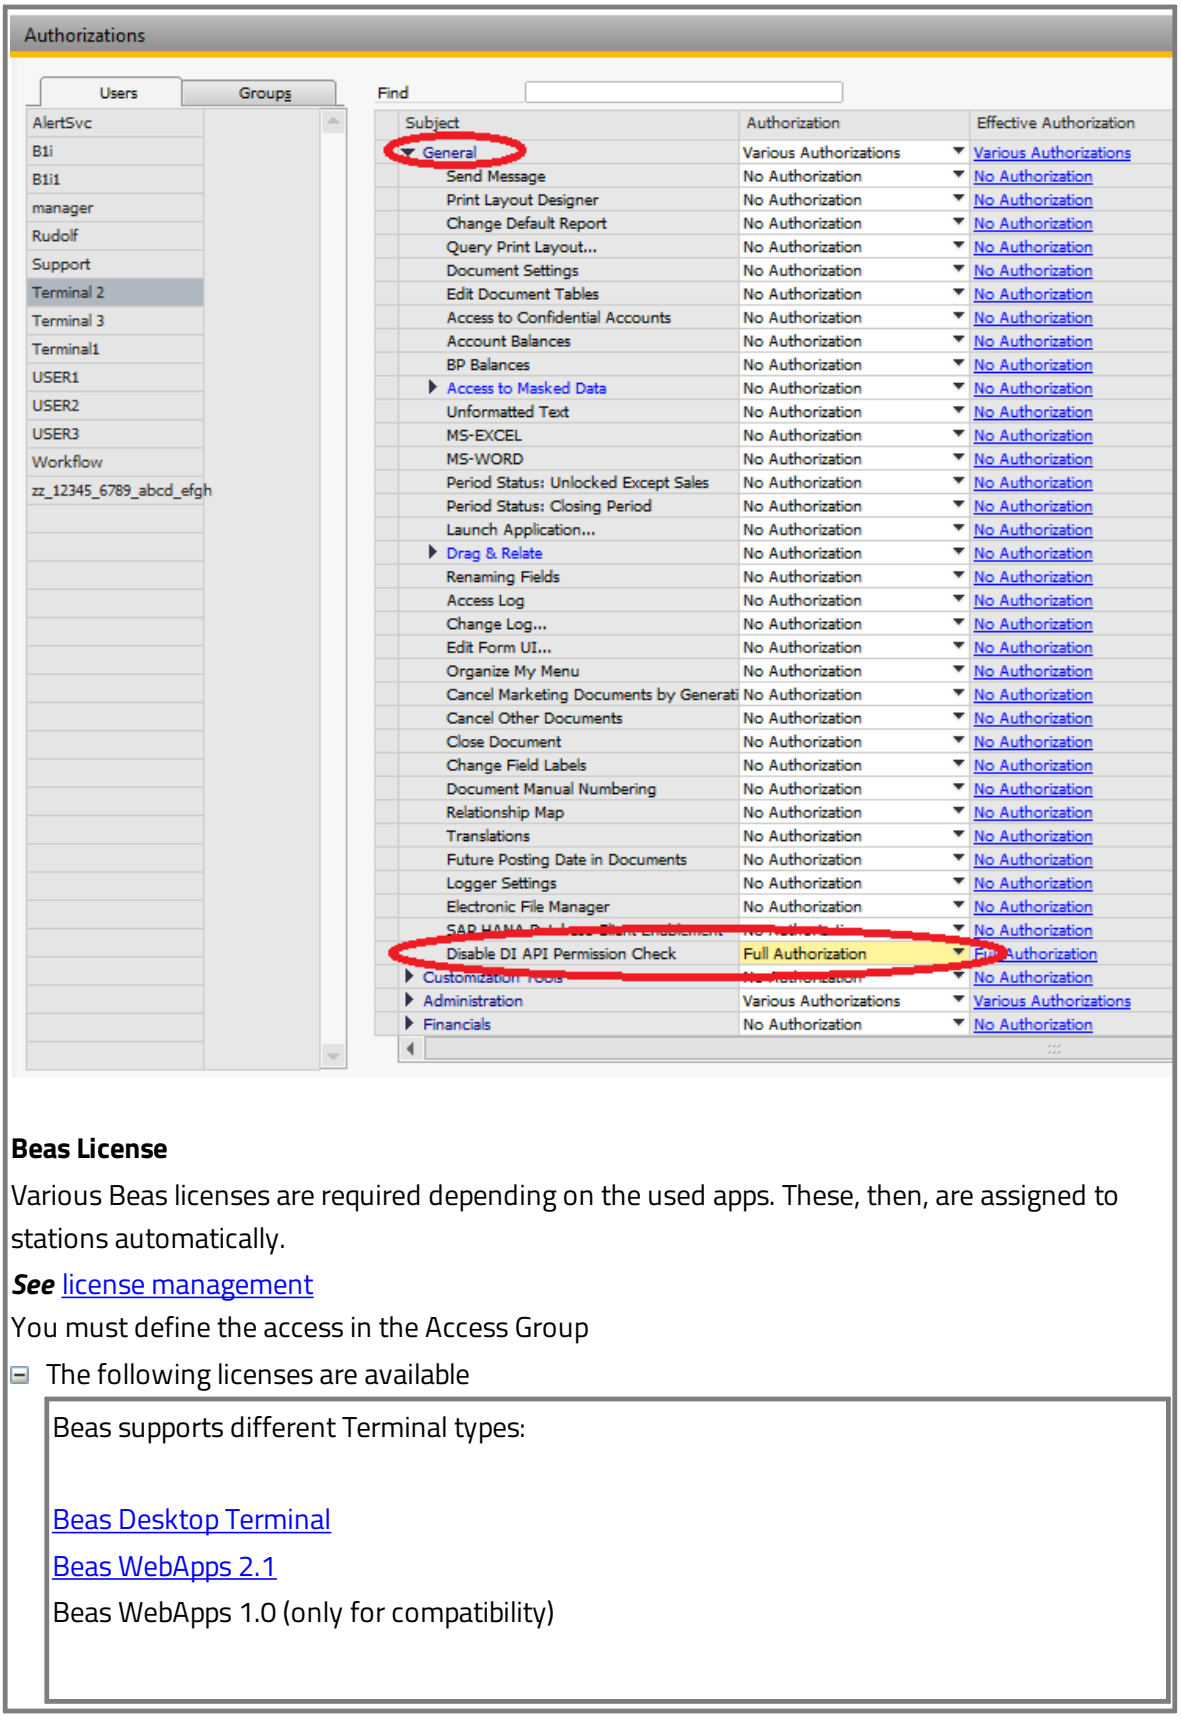


SAP B1 Authorizations

Administration - System initialization > Authorization > General Authorizations

General > Disable DI API PERMISSION CHECK on "Full authorization".

© 2026 Boyum IT Solutions A/S



Beas License

Various Beas licenses are required depending on the used apps. These, then, are assigned to stations automatically.

See license management

You must define the access in the Access Group

- The following licenses are available

Beas supports different Terminal types: Beas Desktop Terminal Beas WebApps 2.1 Beas WebApps 1.0 (only for compatibility)

© 2026 Boyum IT Solutions A/S

All use the same license pool with the same concept:

In **Terminal Functions > Edit Group > Choose apps** you can see the License needed for the apps.

Concurrence of users

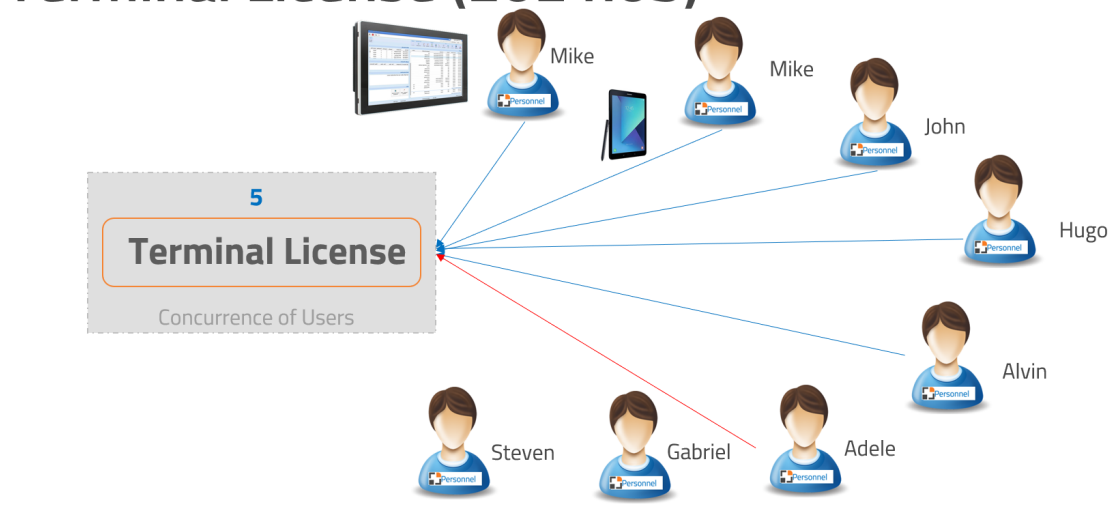
IMPORTANT: User login blocks all licenses that are assigned to the user! These licenses are released for use again once the user logs out.

Licenses can be reserved by user, machine or Beas operators.

See License Administration (Beas)

Article on License administration questions and answers

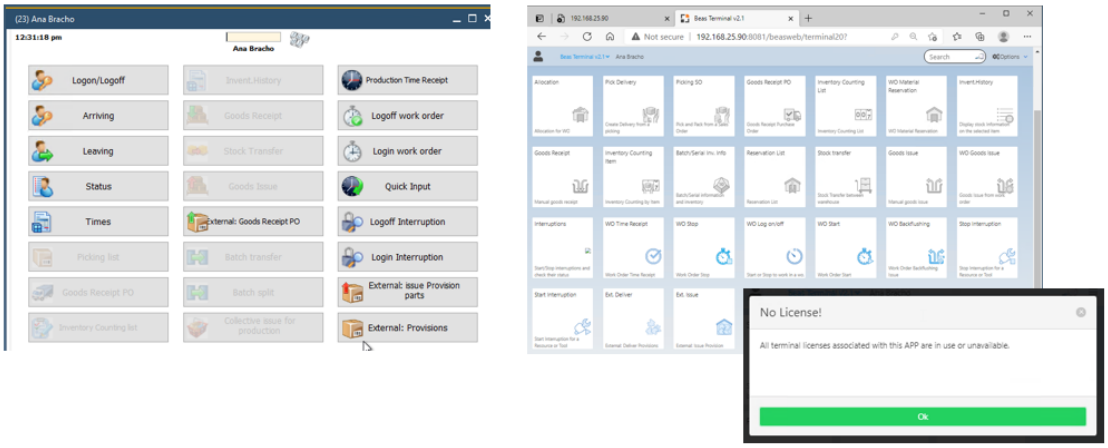
Example: A company has 5 Terminal licenses. Five users are using the 5 licenses each - therefore, the number of available licenses is 0.

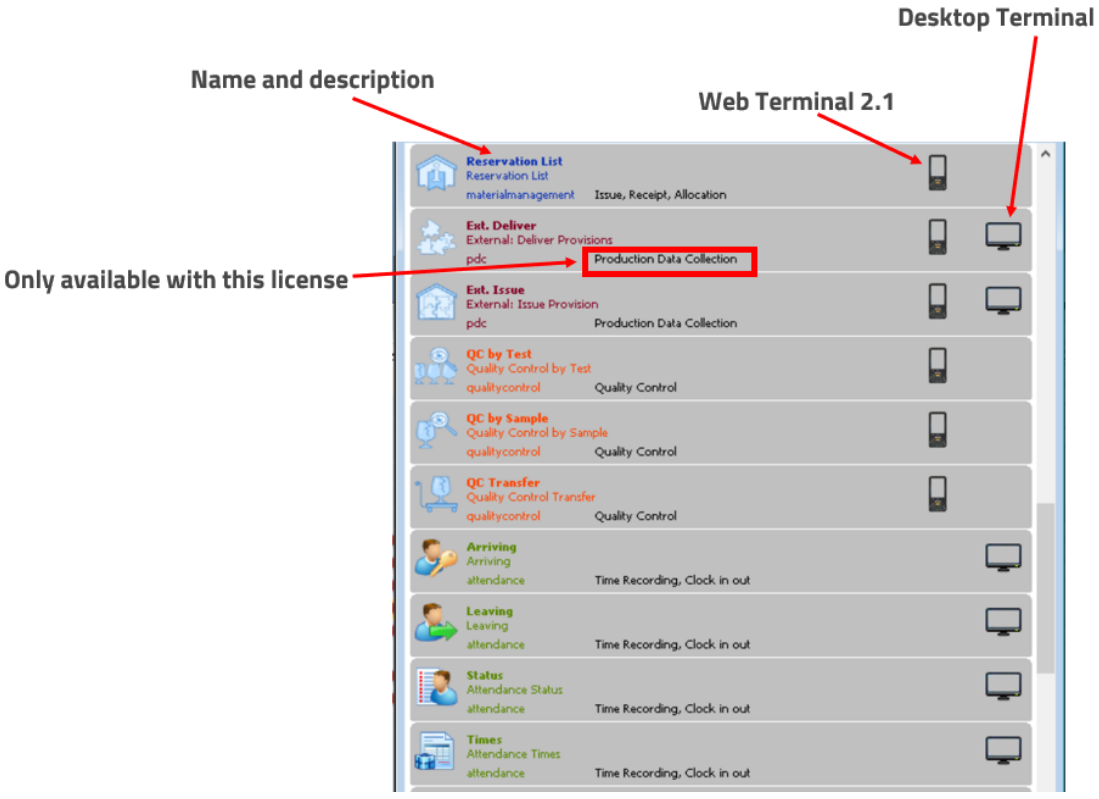


Apps that are not available for the user in lack of license are grayed out (disabled).

© 2026 Boyum IT Solutions A/S

License In Use: *when a license is not available*





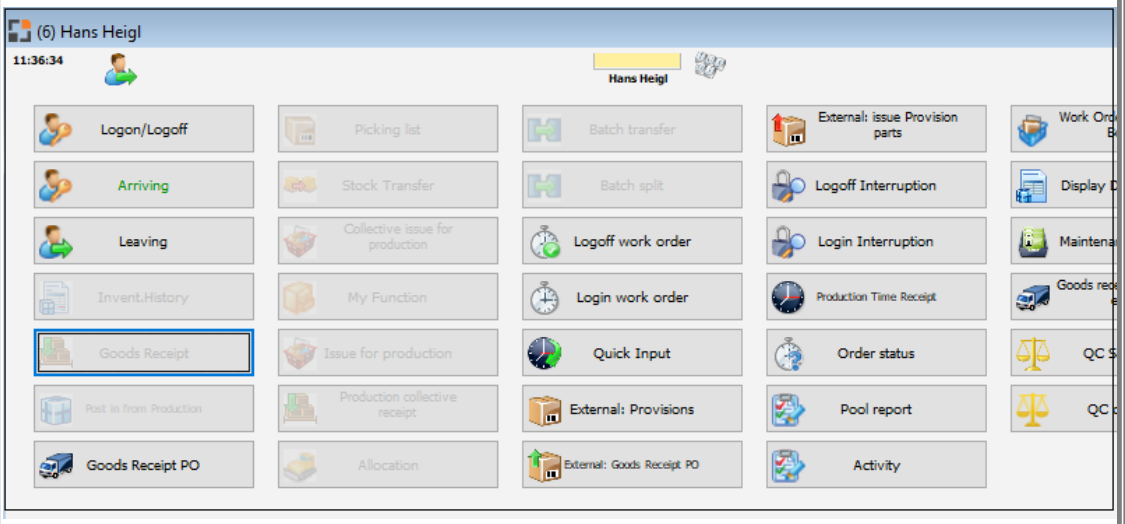
NOTE: Upon login all available licenses related to the authorization groups will be set as "In Use".

Desktop Terminal

If you start the Desktop Terminal, you do not need any license.

© 2026 Boyum IT Solutions A/S

If you login in Desktop Terminal, the system tries to use needed licenses. If available, the license will be reserved. If not, the app needing the license is grayed out. If you hover the mouse over or click on the button, you can see the info that the license is not available.



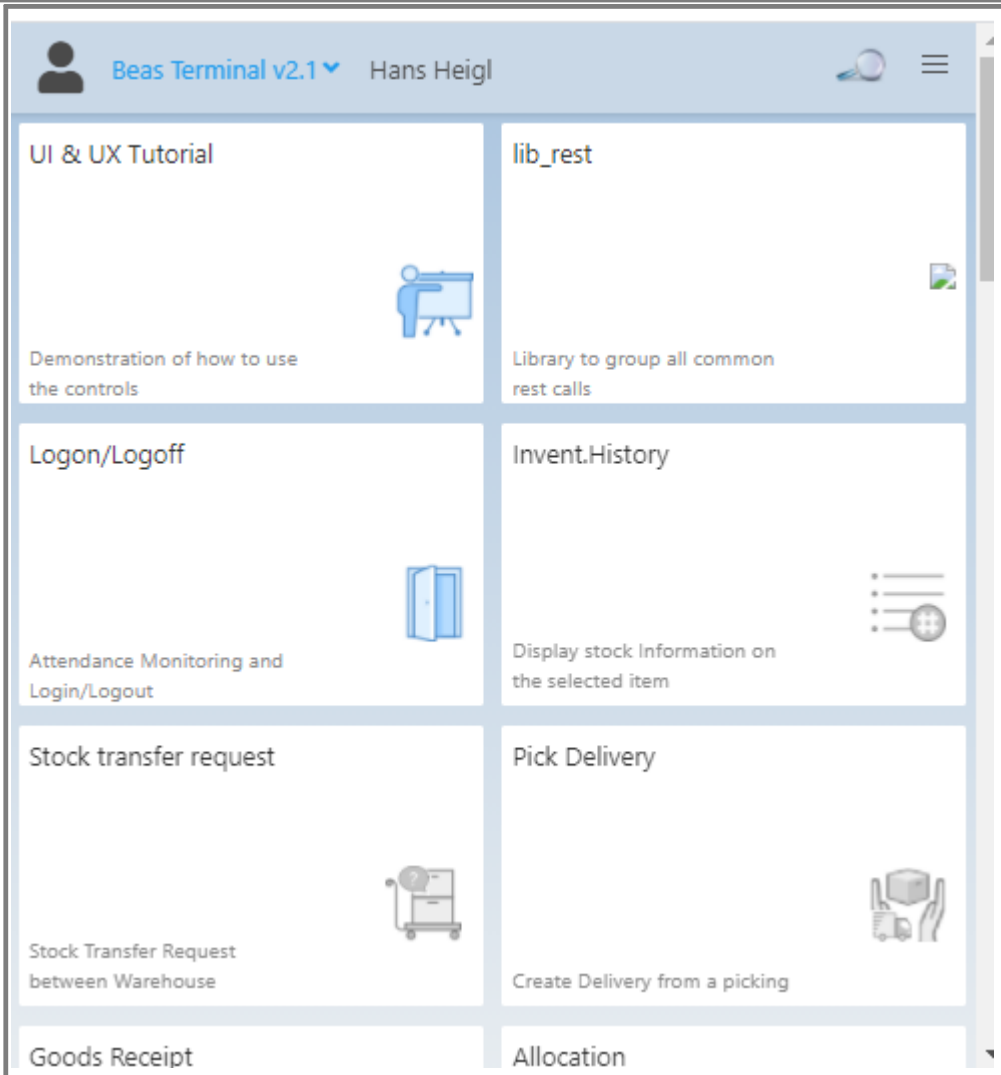
WEB APP

In WEB APP the license is reserved in the moment of Login.

Note: The user must choose "Logout", otherwise other users cannot use the license up to 10 Minutes.

If the license is not available, the system displays the APP in gray.

© 2026 Boyum IT Solutions A/S



Note:

Do not try to manipulate the system. If you delete the license information, the back-end will not work correctly.

ATTENTION: If you close WebApps without logging out, the system keeps the license in use for several minutes. After that the system automatically releases the license.

- Time Synchronisation

© 2026 Boyum IT Solutions A/S

The terminal does use the server time, not the time of the client. Time zone settings of Windows **System - Time zone** is taken into account.
For permission reasons Beas does not synchronize with the time of the operating system. It may be that on the client a time is displayed which is different from the terminal program.
The terminal program synchronizes with the server in 30 minute intervals. This way, a correct time is always guaranteed, as long as the time on the SQL server is set correctly.

Logon:

Enter card number to log in. All released apps are displayed. After 60 seconds of idle time, the user is logged off automatically. This timeout can be set up.
At logon it is checked, which applications are to be used. (set up in Station settings). If a person logs on, it is checked, whether a satin specific menu was set up. If there is none, the menu is used, set up in Personnel master.

Note:
As long no Authorization group was created, Standard-Apps are displayed. After an authorization group was created, you need to store on in Personnel master of an employee, otherwise they will not have access to the Terminal
In station settings, you can set up: Control (mouse/keyboard), Image (Logo), preview screen, menu.

Right-click menu:

Function	Meaning
Cancel	Terminal is closed. If started in terminal mode, the user needs to enter their card number before, to prevent an accidental logoff. Note: If the terminal is not started in terminal mode and another user logs in there than in the application, all postings and material movements outside the terminal screen are connected to the user who logged in to the terminal. This situation continues until a logoff in the terminal screen.
Logoff	Employee logs off immediately. The ESC-key can also be used. After 20 seconds of idle time, the user is logged off automatically if no other window is opened. This logoff time (timeout) can be changed in the Work station settings.

© 2026 Boyum IT Solutions A/S

Function	Meaning
	For attendance time registration, a shortened timeout can be activated in Configuration wizard - Attendance - Terminal.
Zoom	Only in Terminal-Mode: "Zoom"-Function accessible via right-click or Ctrl+Z. Enter a value between 90 and 170 to apply a zoom factor (in percent) All sub-screens are affected.
Mode: Keyboard	Switch to keyboard control. For each button a letter is displayed to call the function. This settings can also be set up globally for all work stations in Station settings wizard - Edit.
Mode: Mouse	Switch to mouse control, optimized for mouse or touchscreens. This settings can also be set up globally for all work stations in Station settings wizard - Edit

see

Program group Administration

17.3.1 Attendance apps

This chapter is dedicated to applications in the Attendance area in the Desktop Terminal.

Logon/Logoff

Arriving

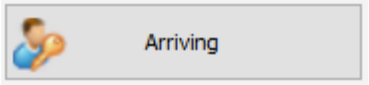
Activity

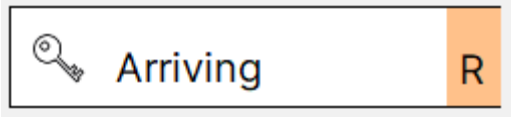
Leaving

Status

Times

17.3.1.1 Arriving





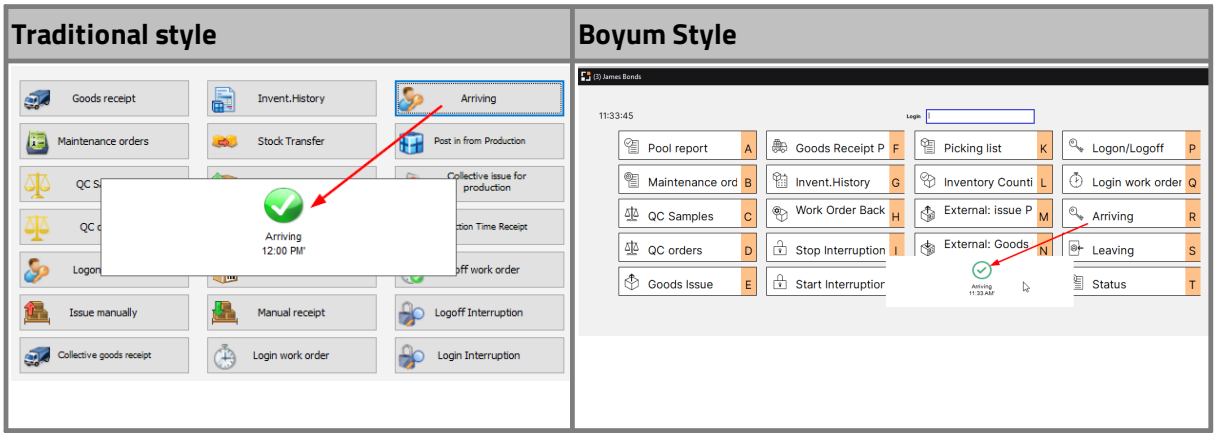
Available with the Time Recording, Clock In, Clock Out, Absences license.

See Terminal settings in Configuration wizard.

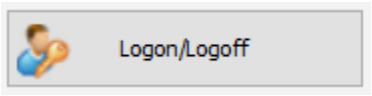
© 2026 Boyum IT Solutions A/S

With this app you can log in to start work. An informational message pops up showing arrival with the exact time (***see*** image below). The message pop-up screen disappears shortly after providing the information.

In case the user was already logged in, the system displays an error message.



17.3.1.2 Logon/Logoff



Available with the Time Recording, Clock In, Clock Out, Absences license.

See Terminal settings in Configuration wizard.

This app is serves as a short informational window on login information and also links to two other apps:

Arriving/Leaving

Status

The window closes automatically after a few seconds.

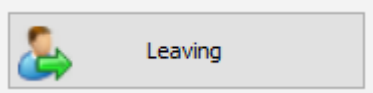
© 2026 Boyum IT Solutions A/S

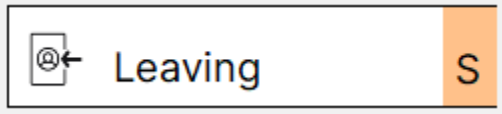
Traditional style	Boyum Style
 *Window terminal_attendance*	 *Window terminal_attendance*

Button	Description
Arriving/Leaving	The button caption depends on current login status and has the same function as the apps with the identical name.
Status	By clicking the button, three items of the report from the Status app appear under the button. - Status: present/absent - Rem.days of vacation: X.X days - Account  ***See*** Status.

© 2026 Boyum IT Solutions A/S

17.3.1.3 Leaving



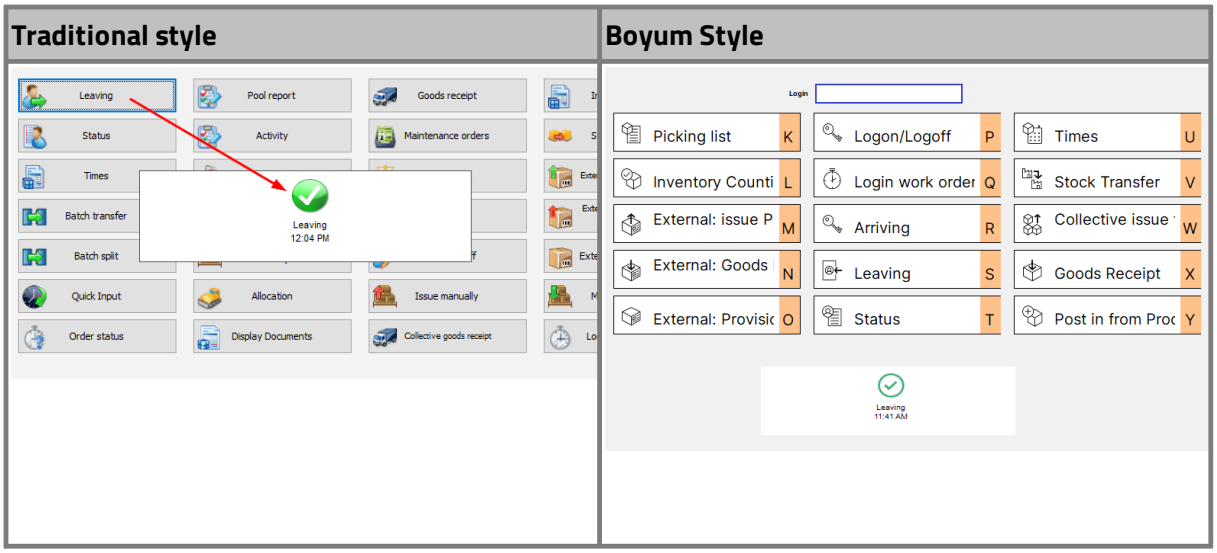


Available with the Time Recording, Clock In, Clock Out, Absences license.

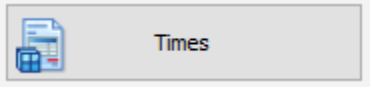
See Terminal settings in Configuration wizard.

With this app you can log off to finish work. An informational message pops up showing leaving with the exact time (***see*** image below). The message pop-up screen disappears shortly after providing the information.

In case the user was already logged in, the system displays an error message: "You are not logged in. Logoff not possible!"



17.3.1.4 Times



Available with the Time Recording, Clock In, Clock Out, Absences license.

See Terminal settings in Configuration wizard.

With this app you can retrieve the complete Time evaluation of the logged in user for a period. ***See*** Time evaluation.

When clicking on the app button, a window appears to define the period of the Attendance report:

© 2026 Boyum IT Solutions A/S

Traditional style	Boyum Style
 *Window system_von_bis_auswahl.psr*	 *Window system_von_bis_auswahl.psr*

Functions

Field	Description
From/To	Define a specific period for time evaluation by selecting the days from the calendar.
Prev.Month	With this button you can automatically select the full previous month.
Current month	With this button you can automatically select current month - naturally up to the actual day of evaluation

Time evaluation

Clicking on "OK" in the Period window, the Time evaluation attendance report opens.

See Personnel, Time evaluation, Time evaluation configuration, Report definition

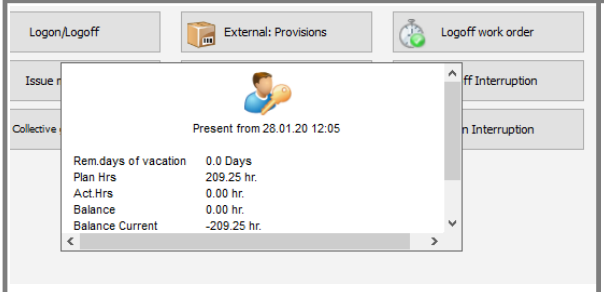
17.3.1.4.1 Status

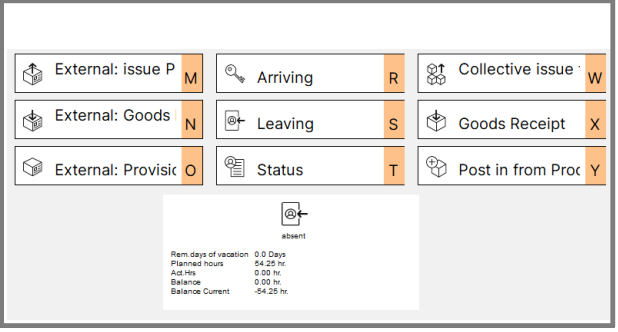
© 2026 Boyum IT Solutions A/S

Available with the Time Recording, Clock In, Clock Out, Absences license.

By clicking on this app you receive an informational message showing current status and records on working hours and vacation days.

The message pop-up screen disappears shortly after providing the information.

Traditional style	Boyum Style
	




Information	Description
Present from... / absent	Current status: - Present from + date + hh/mm - absent
Rem.days of vacation	The remaining days of vacation provided in days.
Plan Hrs	Planned hours, calculated based on the shift plan ***See*** Determination of planned time
Act.Hrs	Determined attendance hours.
Balance	Balance of working hours.
Balance Current	Current Balance of working hours.

See Personnel, Configuration of time evaluation

17.3.2 Material management apps

This chapter is dedicated to applications in the Material management area in the Desktop Terminal.

Goods Receipt

Batch transfer

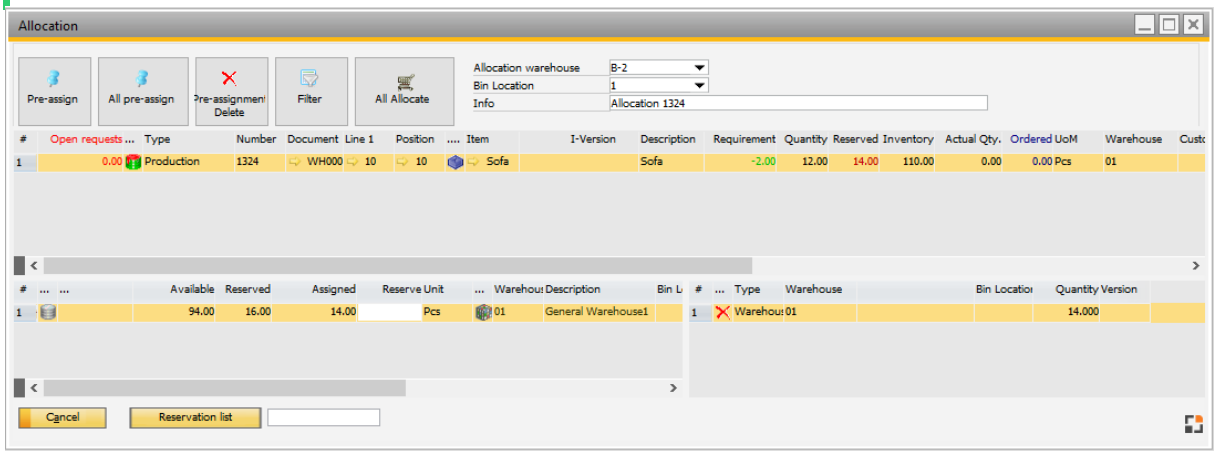
Collective goods receipt
Invent.History
External Goods receipt
External issue Provision parts
External provisions
Picking list
Inventory Counting list

17.3.2.1 Allocation

Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.
See Terminal settings in Configuration wizard.

This app opens the Allocation window.
The allocation/deliver function is used to transfer material needed for a work order from a default warehouse to an allocation warehouse. The material is also reserved for that work order. When doing an allocation, Beas creates a transfer document. Usually this is cost-neutral and not assigned to the work order.

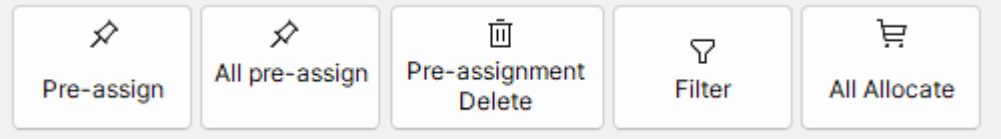
PATH: Production > Work Orders > right-click an allocation in the WO structure / right-click an item > "Allocation".



Window reservation_set_master.psr

Boyum Style top bar buttons design:

© 2026 Boyum IT Solutions A/S



- Prerequisites

Reservation system must be activated.
Allocation warehouse has been defined as type.

- Process of allocation

Transfer from standard item warehouse or from warehouse defined in BoM to the allocation warehouse. Goods are transferred via SAP Business One-transfer function to the allocation warehouse, a reservation is created. After finishing the product: manual or automatic backflushing of the material.

See: Reservation system
Backflushing

Charge off reserved material

Window structure

Header Functions in header	
Requirement list	
Inventory list	selected material

- Scanner support

The active field is always the entry field in the lowest line. This can be used for registration via scanner. There are two settings:
Production > Material posting > Backflushing > Material posting with scanner.

Active:
A matching batch or serial number is searched. If an entry is found, it is used and the required quantity is accepted. If no entry is found, an error message is issued: no entry found.
If the entry is blocked, (batch status, blocked bin location) the entry is not accepted, a message

© 2026 Boyum IT Solutions A/S

is issued.

Inactive:
Beas searches for the following entries: Batch number: field is selected, the cursor is set to quantity field.
Serial number: quantity is accepted immediately.
Item: entry selected, cursor is set to quantity field.

If no matching entry was found and the entry is numeric, the current entry is accepted including the quantity.
Error messages are issued in no case.

See
Configuration wizard – Material posting with scanner
Reservation
Material issue
Allocation
External operation Allocation
External operation issue

fert_scanbatchqty (J)

Fields right of the ribbon
Only some fields explained in the table below are displayed, depending on the work flow.

Field	Meaning
Posting date	**Postings**: select the posting date.
Allocation warehouse	**Allocation**: allocation warehouse. Setting is saved per work station. Note: this has no effect on the reservation and issue screen. ***See*** Reservation window, Material posting.
Bin location	Bin location of the external warehouse to which material is transferred (field is only displayed if the warehouse has bins). For reservation the definition of Bin Location is mandatory
Address	Address of the external warehouse.

Functions in upper ribbon:

© 2026 Boyum IT Solutions A/S

Button	Meaning

Pre-assign Quantity (manually)	Visible in WO Stock Transfer Request window.
	With this option the user can manually pre-assign quantities for each material line based on the equivalent amount of the parent product. In the quantity field you can specify the quantity of the parent product. Apply changes for the selected lines.
	Example:
	To manufacture 1 product A, you need:
	• 2 MA
	• 3 MB
	  • 20 MA
	  • 30 MB
	  • 2 * 2 = 4 MA
	  • 2 * 3 = 6 MB
	  • If Quantity is <= 0, the status bar message appears: "a quantity is required for pre-assigning"
	  • if Quantity is > 0, calculation is made for each Material in the list, considering part of the quantity of this BoM according to the Parent Quantity Field on the pre-assign button. Consider proportion of calculated scrap quantity. The result will be in the Column "Request" of the Material List.
	  • If you have reservations, the system will assign the reserved quantity to the right matrix.
	  • Beas create a transfer request document in background. This don't support any Bin management system. It is possible to choose item from bin managed warehouse, but the bin location information is not saved in the transfer request document
	Pre-assign Batches and Serials:
	Attention: In WO Stock Transfer Request, the pre-assign process does not select any batch/serial numbers, unless there is an existing

© 2026 Boyum IT Solutions A/S

	reservation. ***See*** WO Stock Transfer Request creation process.
Pre-assign	All entries selected in the upper list will be pre-allocated automatically Sorting 1. Reserved goods for this order line 2. Allocation warehouse 3. Default warehouse as per BoM or standard warehouse of the item Within this, batches and serial numbers are sorted by withdrawal rules according to the configuration wizard. ***See***: Configuration wizard. Normal items (not batch- or serial number related) will be pre-allocated only if the issue method was set to "automatic" in the Item master. ***See*** Item master – Issue method. Allocation rules **Batch and serial numbers** Within this, batches and serial numbers are sorted by withdrawal rules according to the Configuration wizard. ***See*** Configuration wizard – Backflushing **Warehouse** Only warehouses allowed to be used for the relevant process are considered (Reservation, issue etc.) ***See*** extended warehouse settings Available at **General settings > Warehouse > Warehouse master data > Extended**

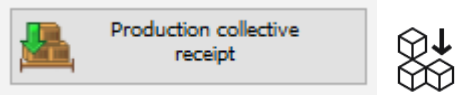
back to work order general

© 2026 Boyum IT Solutions A/S

17.3.2.2 Production collective receipt



Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.

See Terminal settings in Configuration wizard.

With this app you can create a collective receipt for production.

Clicking on it, a window pops up to enter the Bar code of the WO position:

Traditional style	Boyum Style

After entering the bar code, the collective receipt window appears.

The function collective post-in is available for merged work orders. All assembly items and **negative** BoM items can be posted at once. There is no material backflushing.

The function is accessible via:

PATH: Production > Work order structure > right-click on production order > Collective receipt.

or

PATH: Terminal > app "production collective receipt".

If called from work order structure, several work orders can be selected at once.

Batches, automatic batch determination, serial numbers, automatic serial number determination bin location management are supported.

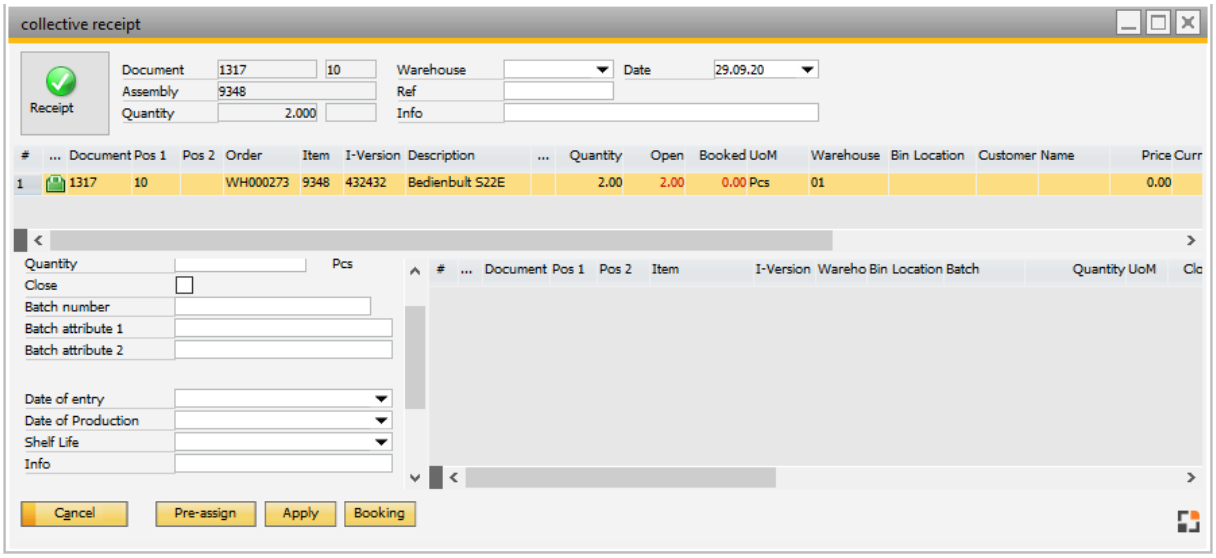
WMS Integration: Produmex WMS Batch attributes are supported.

Serial number reservation is not supported.

The window consists of three sections:

© 2026 Boyum IT Solutions A/S

Upper section	Planned receipt List is adjustable via **Right-click > Window settings.**
left below	Enter the quantity to post in for the currently selected (above) line Enter quantity, batch number, batch attributes, and price
right below	Displays already selected items



Window fert_postin_summary_header.psr

Workflow

1. With cursor up/down the next position from the upper list can be selected.
2. In the left window you can insert additional information such as Quantity, Batch number etc.
3. With the "**Apply**" button you can choose the position with the defined quantity,
4. With "**Booking**" you can create the receipt document.

For batches and serial numbers with automatic number generation, only the quantity can be entered, because the numbers are automatically generated when creating the accounting document.

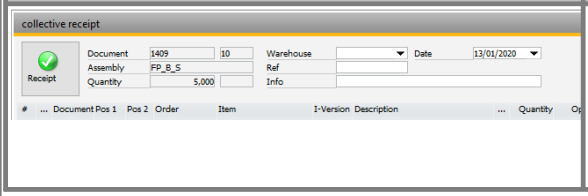
The expiration date is pre-assigned automatically. ***See*** Item - batch - shelf life

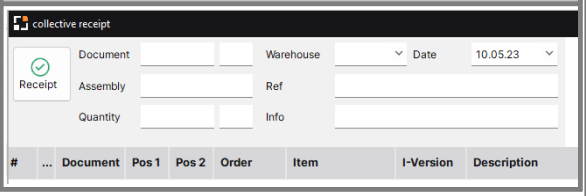
In production type you can set up whether batches or serial numbers are generally entered manually (enable manual batches). In this case batch numbers always need to be entered (e.g. for disassembly). ***see*** Production type - manual batches

Field descriptions

- Header

© 2026 Boyum IT Solutions A/S

Traditional style	Boyum Style
	




Display the current work order. If more than one work order is chosen, the system displays the first work order

The following additional fields define properties for the receipt document.

Field	Description
Warehouse	If empty, the system uses the warehouse defined in the work order. If you change the Warehouse, all positions are receipted on this warehouse. Note: If you change the Warehouse and work with different WIP Accounts, this can produce problems in accounting! If you choose a warehouse from another branch, the receipt returns an error. ***See*** Warehouse rules.
Ref	Reference displayed on the Receipt document. If empty, the Bar code of the Work order is displayed.
Info	Additional reference. If empty, the note on the current work order is shown.
Date	The posting date. You can define a posting date for the past.

Upper list

Planned receipt is displayed in the upper list. Use window settings to adjust.

Note on WMS Integration

If the receipt is made from Beas in a WMS warehouse, it applies the Quality status defined in

© 2026 Boyum IT Solutions A/S

Produmex WMS > Organizational Structure > Production tab.
It is not recommended to have more than 1 serial number per LUID, because the WMS Quality Status cannot be defined per serial number.

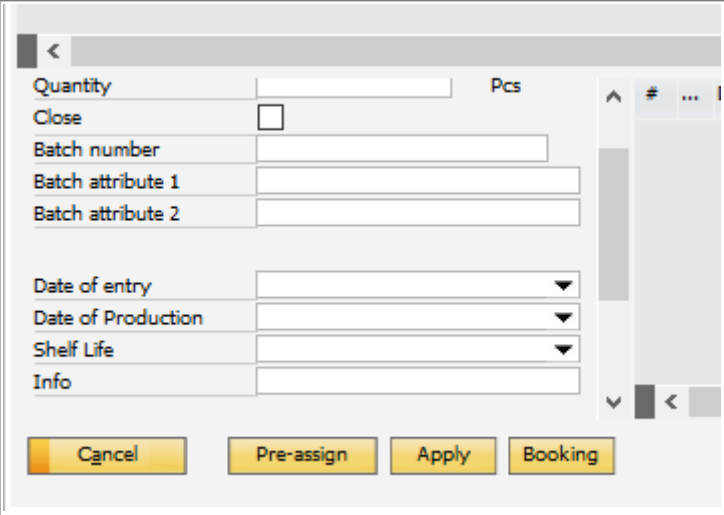
Field	Description
Document	Work order document
Pos 1	Document position (Assembly)
Pos 2	BoM item (for assembly always 0) otherwise the Pos-ID of the BoM with negative amount
Order	Order number of work order document
Item	Item number of the assembly
Designation	Designation of the assembly
Quantity icon	Visual display of registered quantity (empty) – no registration some quantity has been registered the correct quantity has been registered too much registered
Quantity	Planned total quantity as per work order (without scrap) in warehouse units
Open	Quantity still to post in: Planned quantity - posted qty + canceled qty - selected qty = open (in warehouse units) Column is display in colors: Red = open > 0 (still something to post) Green = open = 0 (everything completed correctly) Blue = open < 0 (too much was posted)

© 2026 Boyum IT Solutions A/S

Posted	Already posted quantity: posted qty - cancelled qty + selected qty = posted (in warehouse units) Column is display in colors: Red = open > 0 (still something to post) Green = open = 0 (everything completed correctly) Blue = open < 0 (too much was posted)
Unit	Unit (warehouse unit)
Warehouse	Warehouse to post to. Note: The warehouse stored in thew work order item is displayed. If no warehouse was entered, the default warehouse of the assembly is used.
Customer	Customer number from the work order
Name	Customer number from the work order
Quantity CU	Planned quantity without cut-off in consumption units
Unit CU	Unit in consumption units
Factor	Conversion factor between warehouse and consumption unit
Price	Manually entered price 0 = Price is determined automatically Price valuation ***see*** Configuration wizard – Calculation Entry of price only possible if enabled in production type. ***see*** Production type – manual price

Left window

© 2026 Boyum IT Solutions A/S



In this area you can insert details for the Assembly or Bill of materials for post in.

Field	Description
Bin Location	Define the Bin Location. Only visible in case of bin-managed warehouses. ***See*** Warehouse rules. Note / Limitation: If you book one work order position on a different bin location, the system creates one document line per Bin location.
LUID	Define LUID number. ***See*** LUID behavior settings.
Quantity	Define the post-in Quantity
Close	Define if the work order position or Bill of material position should be closed: If "close assembly automatically" in Configuration wizard is activated and the total receipt quantity is equal to or bigger than the planned quantity, the system activates this flag automatically. *Beas 2020.02* Note: The system cannot close the complete work order.

© 2026 Boyum IT Solutions A/S

Field	Description

Batch / Serial Number	Define the Batch or serial number:
	Items with automatic batch Generation:
	If you insert a batch/serial number, the manual input has higher priority.
	Otherwise, it generates the batch/serial number automatically.
	
	Working with Serial number reservation
	If Serial Number reservation is active, the system uses the next reserved serial numbers automatically.
	Alternatively you can choose one of the reserved serial numbers *beas 2020.08*
	 	
	Serial numbers with comma
	You can insert more than one serial number. Delimiter is comma:
	`serial-a,serial-b,serial-c ...`
	Limitation: max. field size is 1024 characters.
	
	Serial number with definition string
	The numbering must be inside brackets: { and }
	
	Example: `AB{0001}C` produce follow serial numbers:
	`AB0001C, AB0002C, AB0003C,AB004C,...AB012C ...`

Batch attribute 1	Define the Batch attribute 1 and 2

© 2026 Boyum IT Solutions A/S

Field	Description
Batch attribute 2	

Price	Define the price:
	Only visible for material positions, not for assemblies.
	
	If you prefer manual price entry, active this in production types (can be determined depending on production types) . ***see*** Production type – manual entry of price. Price entry is only allowed for negative BOM items. For assemblies (pos 2=0) are valued as default, which is set up in the Configuration wizard.
	
	Automatic pricing
	If no price is entered for negative BOM items they are valued as for negative material postions. ***see*** Material price list negative BOM
	
	Customizing:
	With beasscript the price can be manipulated: available functions:
	`workordermanagement:getprice_negativposition`
	The following variables are available:
	`e_type=receiptwo, e_belnr_id, e_belpos_id, e_pos_id, e_itemcode, e_towhscode, e_price`
	In variable `e_price` the price can be returned. This process cannot be cancelled.

Date of entry	Post-in date
Date of production	Production date
Shelf life	Shelf life for assembly positions: if not defined, the system calculates the shelf life automatically. ***See*** Item - Batch - Shelf Life in

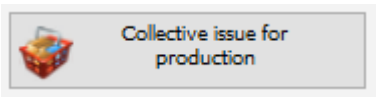
Booking	Create the receipt document

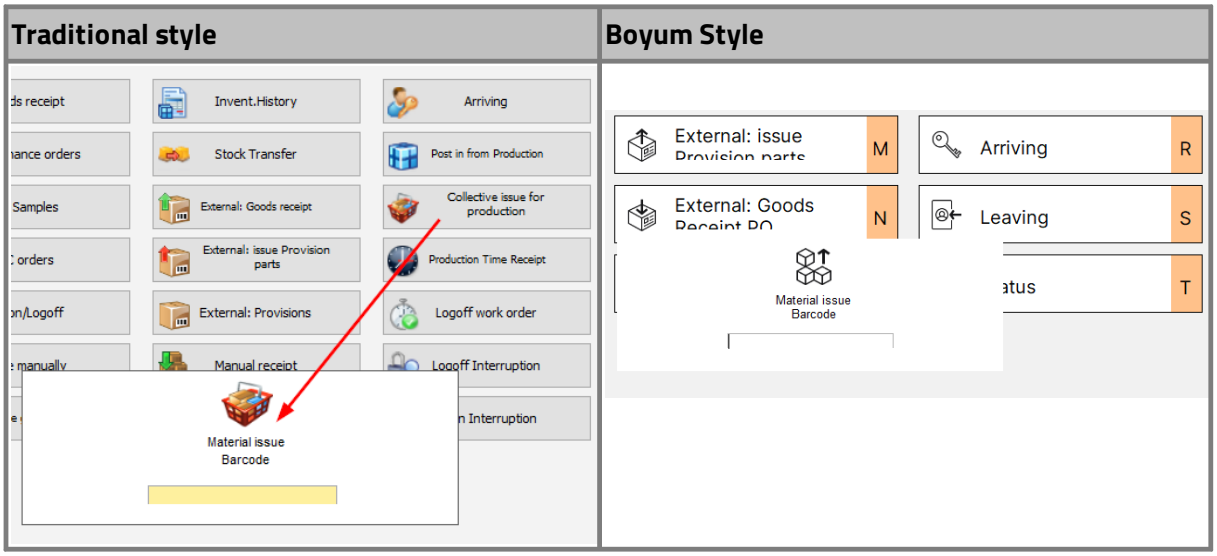
17.3.2.3 Collective issue for production



Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.

See Terminal settings in Configuration wizard.

With this app you can create a collective material issue for production after providing the Bar code of the work order position in the message box that pops up:



The issue window opens:

In this window the required material is issued for a manufacturing position.

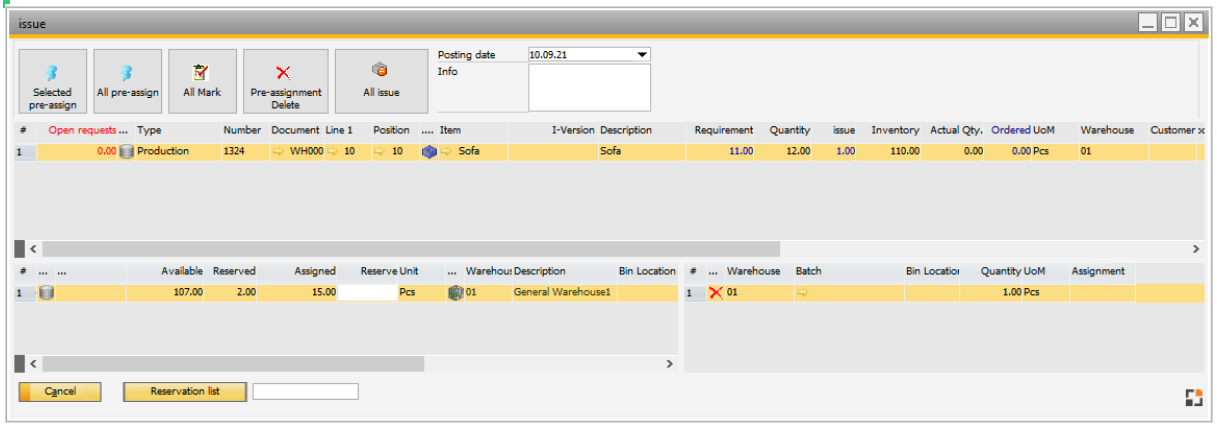
Note: For backflushing in Configuration wizard the option **Production > Material posting > Backflushing > "issue quantity changeable"** needs to be set to "Yes".

For allowing quantities to exceed planned quantities see **Production > Material posting > Backflushing > "Exceeding planned quantity allowed"**.

PATH: Production > Work Orders > right-click an issue in the WO structure / right-click an item >

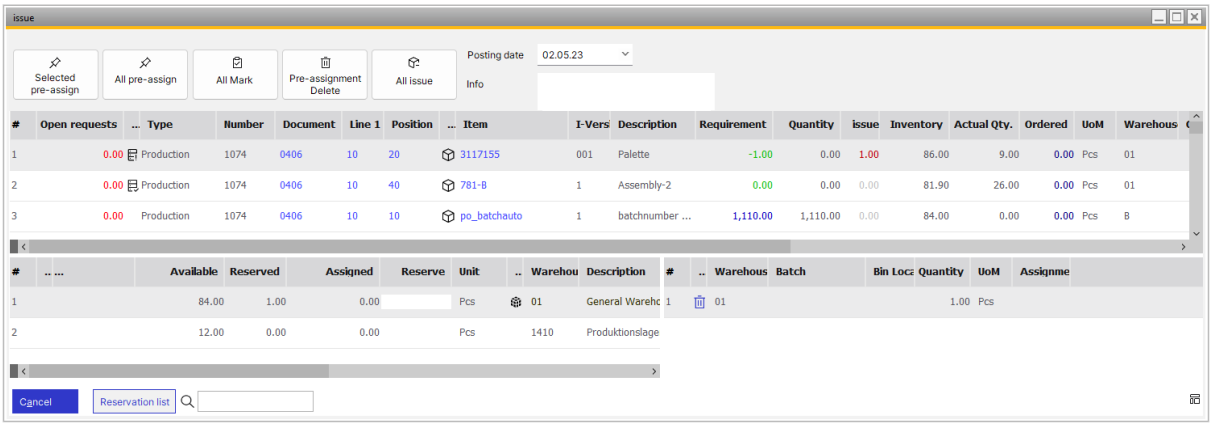
© 2026 Boyum IT Solutions A/S

"Material issue".



Window reservation_set_master.psr

Boyum Style design:



Window structure

Header	
[Functions in header]	
[Requirement list]	
[Inventory list]	[selected material]

Possible workflow variants

- **Work order structure > issue material**. Quantity refers to the full remaining planned quantity
- issue material via **routing-time receipt**. Quantity refers to time receipt screen. The material belonging to the operation is displayed. In case of the last operation to be reported, the

© 2026 Boyum IT Solutions A/S

assembly may be posted in afterwards.
- External operation **> Material issue**: to issue the planned material from an external warehouse (***see*** allocations). Quantity refers to external operation-goods receipt

- Scanner support

The active field is always the entry field in the lowest line. This can be used for registration via scanner. There are two settings:
Production > Material posting > Backflushing > Material posting with scanner.

Active:
A matching batch or serial number is searched. If an entry is found, it is used and the required quantity is accepted. If no entry is found, an error message is issued: no entry found.
If the entry is blocked, (batch status, blocked bin location) the entry is not accepted, a message is issued.

Inactive:
Beas searches for the following entries: Batch number: field is selected, the cursor is set to quantity field.
Serial number: quantity is accepted immediately.
Item: entry selected, cursor is set to quantity field.

If no matching entry was found and the entry is numeric, the current entry is accepted including the quantity.
Error messages are issued in no case.

fert_scanbatchqty (J)

Serial number linking, serial number reservation

- Default warehouse, warehouse selection

© 2026 Boyum IT Solutions A/S

In the warehouse you can set up, which warehouse is available for selection. Furthermore, the withdrawal sorting and the display can be defined using extended rules.

See

Inventory list

Extended rules

Edit warehouse master data - Production outflow

- Negative BoM items

Negative BoM items are displayed in the work order structure with the same icon and positive values. If selecting one, in the window left below not the warehouses are displayed but the entry values can be entered manually. Warehouse, bin location, batch / serial number and quantity can be entered. After entering the quantity, data is saved. Here, the same concepts apply for batch determination and pricing as used in Collective receipt *(beas9.0-000-003-014).*

- Exceeding planned quantity

The "Exceeding planned quantity allowed" parameter affects WO Material issue (Collective): the system checks the maximum allowed quantity based on total planned quantity.

Functions in upper ribbon

Button	Meaning
Pre-allocate marked entries	All entries, marked in the upper list, are pre-allocated automatically All priorities are considered: 1. Reserved goods for this order line (not in reservation window). 2. Allocation warehouse (***see*** Allocation window). 3. Warehouse and Bin Location defined in Bill of Material position 4. Default warehouse for backflushing as per Configuration wizard - backflushing - issue from allocation warehouse. Within this sorting, batches and serial numbers are sorted by withdrawal rule according to the Configuration wizard. ***See*** Backflushing - Automatic batch issue. Note: If a warehouse is stored in Configuration wizard > Backflushing > issue from allocation warehouse, only this warehouse is considered at automatic backflushing.

© 2026 Boyum IT Solutions A/S

Allocation rules

If the option "book only reservation" in the BoM position is active, only reserved entries are chosen even if they are insufficient.
See Edit Bill of Material - Book only reservations.

Non-batch/serial number related items are pre-allocated only if the issue method was set to "automatic" in the Item master data > Issue method.

Note: Allocation warehouse is set up per work station. ***see*** Allocation window.

Negative BoM items

Negative BoM items are also pre-allocated, if
a) Batches/Serial numbers are defined automatically
b) The warehouse is not a bin location warehouse

Batch and serial numbers

Within this, batches and serial numbers are sorted by withdrawal rules according to the Configuration wizard.
See Configuration wizard – Backflushing

Warehouse

Only warehouses allowed to be used for the relevant process are considered (Reservation, issue etc.)
See extended warehouse settings
Available at **General settings > Warehouse > Warehouse master data > Extended**

Window bin_whs_edit.psr

Attention

SAP Bin Management not supported.

Window bin_whs_edit.psr

Extended rules

Extended rules can be stored in the function `workordermanagement.setres_supply()`

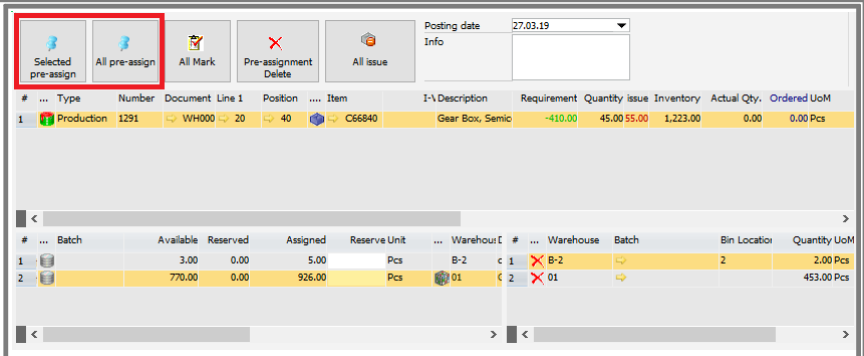
For further information ***see*** Extended rules.

In the reservation window, material issue window and in provision window you can apply customer-specific rules for automatic pre-assignment.

See Material booking > Automatic pre-assignment setting.

PATH: Production > Work orders structure > right-click an entry > "Reservation".

© 2026 Boyum IT Solutions A/S



Window resevation_set_master.psr

Boyum Style button design:

These extended rules can be stored in the function "`workordermanagement.src`". (In project folder)
Depending on the window a specific function is called, for example for reservations `setres_reservation()`

See Pre-Assign buttons description
For more information ***see***
UserEvents
UserEvents for PreAssign

Note: If working with **Report work order times > Scrap quantity**, the planned scrap and cut-off material may not be taken into account.

See
Configuration wizard – Backflushing
Requirement – Reservation window requirement – column requirement

Pre-allocate all	All entries are marked, and then pre-allocated.
Delete pre-allocations	All pre-allocations are deleted.
All issue	All marked material is charged off.

© 2026 Boyum IT Solutions A/S

Fields right of the buttons at the top

Only some fields explained in the table below are displayed, depending on the work flow.

Field	Meaning
Posting date	Select the posting date.
Info	Text field for comment.
Serial numbers	Display serial numbers to be posted in. This list is only displayed if a) the finished part is serial number related. b) the selected material is serial number or batch related. c) serial number reservation was set to automatic and serial numbers are generated automatically for the assembly or if serial number reservation was set to manually. Serial numbers to be posted in are displayed and new serial numbers to be posted in can be added. If an item is selected, it is assigned to the currently marked number. The Function "issue material" does not post immediately. Manually added serial numbers are reserved first and assigned to the work order - even if serial number reservation was disabled. Existing reservations are always displayed. ***See*** Configuration wizard - Assembly - Serial numbers The function "backflushing issue" for example via "last operation" displays only the serial numbers to post in. Additional serial numbers can be entered manually. To post in, select serial numbers by clicking the check mark. The number of selected numbers needs previously selected number. Otherwise a message is issued: (*issuewoserlnk)'Please select a serial number item and in the upper window the serial number to be posted in. Planned quantity xxx, selected yyy'*

© 2026 Boyum IT Solutions A/S

	At the assignment of serial numbers to serial numbers the material serial numbers may not be selected automatically. A manual selection is required. Therefore, it is recommended to set backflushing to of serial numbers to "manually" ***See*** Configuration wizard – Material – Backflushing – Serial numbers, Serial number reservation, Serial number tracing. *beas9.0-000-003-000*

Right-click menu

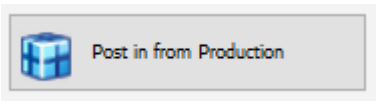
Item	Meaning
Reservation list	Open the reservation list.
Reservation delete	Delete existing reservations.
Filter: all	Lines which have been posted are also displayed.
Filter: only requirement	Standard view. Only lines which have not been posted are displayed.
New series	This button is active only if assembly and material position are serial number related. With "New series" a new serial number to be posted in later can be added and assigned to the serial number to be issued. ***See*** Serial number. *beas9.0-000-001-000*

Notes

- WMS, SAP and Beas Min management system supported.
- Beas RFID and WMS LUID supported.
- Not possible to create issue from same batch from different Bin locations or same Bin location but different RFID/LUID.

back to Work order general

17.3.2.4 Post in from Production



Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.

See Terminal settings in Configuration wizard.

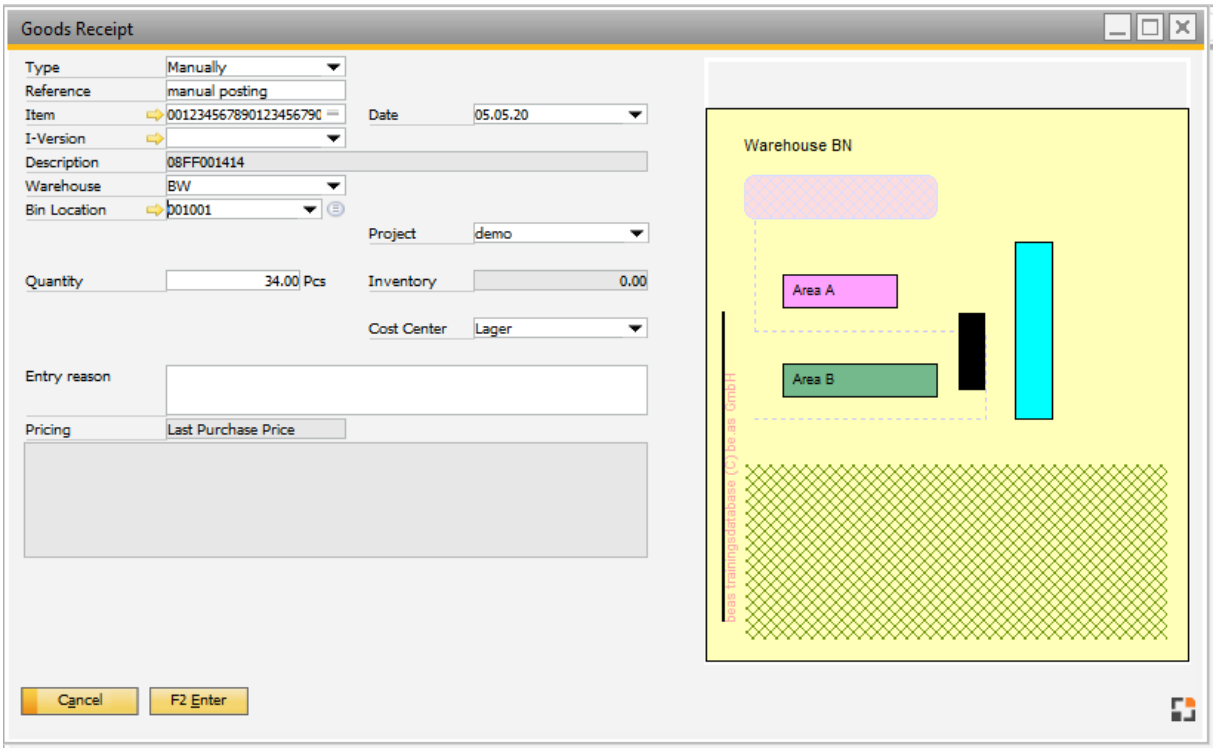
© 2026 Boyum IT Solutions A/S

This app opens the window for manual postings > Goods receipt. The Type is automatically set to "Production" and therefore Reference field appears as a Work order filter.
With manual postings the inventory can be adjusted without a document.
For example, after the stocktaking, part of the stock was not counted, the missed amount can then be manually posted.

The following manual posting options are available:

- Receipt
- Issue
- Transfer

Only one item can be added per manual posting procedure.
The posting is a simplified operation to be used in production and some information is omitted.



Window mw_manuell_buchen.psr

Posting types

There are different types of postings

Type	Description

© 2026 Boyum IT Solutions A/S

Manual	Used to report a manual posting. This option uses the accounts set in Beas general parameters. These accounts can be different from the correction option.
Production	Assigned to a production order. Entry of the production document and the position or BoM position is necessary. The process: After choosing the position, the item is inserted automatically. The posted quantity is displayed and evaluated in the production structure views. In the Production order field the following can be entered: • work order number • work order position bar code • BoM bar code The entry is processed according to its type. **Production posting type special case** **Receipt - Pricing** With the Type "Production" selected, the Pricing field becomes invisible as then the pricing Production valuation assembly is used. Postcalculation may be running in the background. **Receipt - order time receipt** is created automatically if enabled in Configuration wizard – Production – Work order backflushing – Book times automatically and "...to employee" is defined Correction	Used to report adjustment of remaining inventory (evaporation, scrap,

© 2026 Boyum IT Solutions A/S

	and so on). This option uses the accounts set in Beas general parameters.
Inventory	Uses the same accounts as the Manually option, but the inventory adjustment posting type is entered in the comment field in the goods issues document.

Window structure, field description

The input window structure changes, depending on the entered information. Related fields become available depending on whether receiving, issuing or transferring takes place, whether a batch or a serial number is entered or whether there are different inventories or Production UoMs. The same applies to bin locations. If the bin location has been created, they are displayed for selection.

Field	Meaning
Work order	Displayed only if Production type was selected. The Work order area has three fields: Document number, line and position. If new is selected from the position drop-down, "-1" is displayed in the field. A new work order position can be entered instead of the -1, the item and quantity can be selected. **1. Field - work order number** The work order can be selected from the drop-down list or scan: a) The work order document number (Data field: beas_fthaupt.belnr_id). b) The work order bar code (9 digits). It is used for posting in the assembly. The second and third field is filled automatically. (Data field: beas_ftpos.barcode) c) The material bar code. Used to post material. (Data field: beas_ftstl.nummer) (BoM - Extended - Bar code) **2. Field - work order line number** Select work order item to be issued or posted (Data field: beas_ftpos.belpos_id). Only items allowed to post are

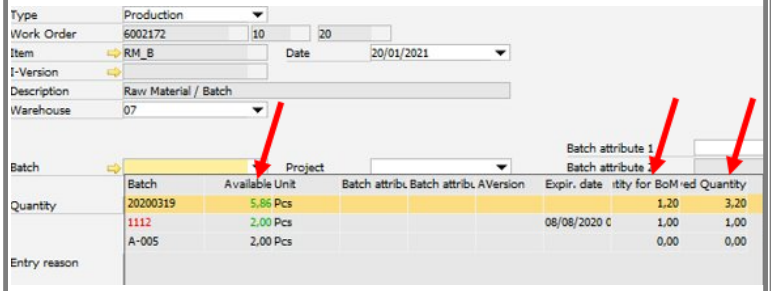
© 2026 Boyum IT Solutions A/S

	available (items not closed or blocked) **3. Field - work order position number** Select the BoM item to be posted (Data field: beas_ftstl.pos_id). Only BoM positions that are not closed been closed, with warehouse oriented items are allowed. Special case: 0 or empty = the assembly is posted. -1 = a new BoM item is generated. Blocked BoM positions Blocked BoM positions cannot be selected, but the position number can be manually entered or scanned via barcode. For postings, the respective authorizations are required. Post and create new BoM position It is possible, to issue material and to create a BoM position at the same time, if the position does not exist. Select the work order document and the assembly, and then select "new" in the third field.
Item	Item number. NOTE on WMS-related receipt: **WMS Integration:** If the receipt is made from BEAS in a WMS warehouse, it applies the Quality status defined in **Produmex WMS > Organizational Structure > Production tab**.
I-Version	Item version to be posted. *(beas 9.1 PL: 08)* Note: It is only possible to create a manual receipt of an item version with "Released" status.
Warehouse	Warehouse that item is posted to. ***See*** Warehouse rules. Note: As of Beas Manufacturing 9.3 PL03, Produmex WMS

© 2026 Boyum IT Solutions A/S

	warehouses are supported for Beas transactions.
Bin location	Bin location to be posted to Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3) The field has the following components: **Arrow icon** / List of all bins where the item is located. **Selection (Drop-down)** A list opens to select the desired bin location.  **The selected drop-down option displays the following information in receipt documents:** • Bin Location • Warehouse Area • First item in this bin location • Stock of the first item in this bin location The list can be modified in the Configuration wizard. **The selected drop-down option displays the following information in issue documents:** • All stock information of all bin locations with batch- and serial number information. • Reserved Batch quantities information 
© 2026 Boyum IT Solutions A/S

The drop-down contains information on reserved quantities in 3 columns:



The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

Select or List - Icon

By using the selection icon, an adjustable selection list opens. Window settings and templates are supported.

Notes: Beas Bin Warehouse

© 2026 Boyum IT Solutions A/S

The Definition of the bin location is mandatory.

Notes: SBO Bin Warehouse

If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type.
This is entirely managed by SAP Business One.

Drop-down for volume or weight is not supported. Columns are always 0.

beas 9.3 PL 2

Notes: WMS Bin Warehouse

Bin location is mandatory.
Drop-down for volume and weight not supported.

Customizing of the drop-down list in Beas 9.3 PL 2 or newer release

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent setbindropown`)
2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

In the `e_bindropdownbsl` variable, the ODATA command can be defined.
It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.

The standard functions for receipt and issue are as folows:

```
file stockmanagement.src

function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bsl>)?$mask=1
```

© 2026 Boyum IT Solutions A/S

```
end function

function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,
BatchAttribute2,ExpirationDate&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered by
OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$select=BinLocation/BinCode,BinLocation/BinColor
,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where OnHand >
0 of the selected ItemCode, ordered by OnHand
descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand
desc, BinLocation/BinCode asc
end function
```

- Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

© 2026 Boyum IT Solutions A/S

	The following priorities are considered:
	1. Window-related customization (`windowevent`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	Window-specific adjustments:
	Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.
	
	Example:
	`windowevent setbindropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end event`
	
	Note: This window event is supported in every window where the selection field is available.
	
	General adjustment
	Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.
	
	`file stockmanagement.src`
	`function binreceiptdropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end function`
	
	See Warehouse rules.

LUID	Define LUID number ***See*** LUID behavior settings. WMS Production receipt
Project	Link to an SAP Project code. The default value comes from the project linked to the work order. If continued stock is active in the database,

© 2026 Boyum IT Solutions A/S

	the project code is included in the journal entry.
Batch/Serial	Click the orange arrow to generate a new batch or serial number. After this batch or serial number is firmly assigned and the arrow is hidden. Information on Reserved Batches: The drop-down contains information on reserved quantities in 3 columns:  The batch entry in the list is displayed in RED color if the Batch is not free. **Quantity-related information:** **Field** / **Description** Available: Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail. Reserved for BoM: Reserved Quantity for this BoM Position Reserved Quantity: Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail. Inventory: Stock batch quantity in the bin location. ***See:***

© 2026 Boyum IT Solutions A/S

	Production – Batch administration Materials management – Batch administration
Date	Posting date of the document. The default value is the today variable.
Quantity	The quantity to be issued. **Serial numbers:** For serial numbers only a quantity of 1 can be entered. **Serial number reservation** Posting in a production assembly any quantity can be entered if the serial number determination is set to "automatic" for the respective item and the serial numbers have been reserved. In this case, a window opens where the serial numbers can be selected. ***See:*** Configuration wizard – Production – Serial numbers Concept Serial number reservation Item master – Series tab
Conv-Quantity	⊟ Enter posting quantity in consumption units Only displayed, if the consumption unit does not match the warehouse unit of the item. ***See*** consumption unit The entered quantity is converted to warehouse unit. Length, width and height are indicated. These parameters are considered, using the conversion formula. ***See*** Conversion
Close	⊟ Close WO position Only visible, if a production assembly is posted. Set automatically, as soon as the planned quantity is reached. Manual change is possible. The behavior can be defined in Configuration wizard - Close assembly automatically. If the option is active, the production position is closed after receipt.

<table>
<tr><td>Cost center</td><td>Select cost center

If no cost center is selected, the default settings apply.

Adaptation
Use the script in workordermanagement.src and materialmanagement.src to extend determining the cost center.

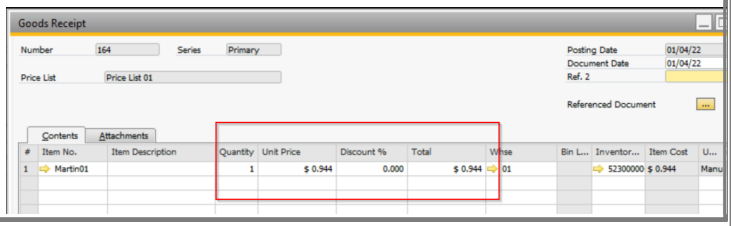
See
Configuration wizard - Production - Material - Account determination
Configuration wizard - Production - Assembly - Account determination
Item - General - Cost center</td></tr>
<tr><td>Entry reason</td><td>Free text to add information.</td></tr>
<tr><td>Pricing</td><td>Shows the method determining the price. Automatically filled.

<table><tr><td>Production Assembly</td><td>Settings apply from Production > Valuation and booking of the assembly > Valuation</td></tr><tr><td>Post in positive BoM item</td><td>Settings apply from Materials management > post in manually > Purchased items pricing booking</td></tr><tr><td>Post in negative BoM item</td><td>Settings apply from Calculation > Precalculation > Pricing negative BoM</td></tr><tr><td>Other posting</td><td>Settings apply from Materials management > Post in manually > Purchased items/In-house production pricing booking</td></tr></table>
SAP Limitation:

SAP Manual receipts: When Beas creates a receipt document, the system calculates the Unit price based on calculating the Total price of the booking.
The difference between the decimals of SAP and Beas can cause mismatch between the values: The "Total" price field</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

may be rounded as the Unit price is defined with a different
number of decimals.



Additional fields are available at transfer:

Field	Description
To	Define the warehouse to transfer to. The To warehouse can only have the same entry as Warehouse if it is a bin location inventoried warehouse. A pure bin location transfer is then possible. Note: A bin location move instead of a SAP Business One - Transaction runs at a bin location transfer. There is no account movement, no calculation of FIFO prices or average prices. The bin location entry is changed. An entry is created in the bin location-movement protocol.
Bin Location	Define the bin location to transfer to. For further information, ***see*** from bin location.

Functions and Buttons

Button	Description
Cancel	Cancel the process.
Batch list (F3)	Inventory list by batches This button is only visible if a batch related item is selected.
Book (F2)	Start the booking process.

Events

© 2026 Boyum IT Solutions A/S

Every posting process creates several events, which can be set as default or customized (***see*** customizing).
Posting finished products (assigned to a work order), calls the assignment program which controls closing, pricing, and batch administration. An external materials management system can also be connected and used in parallel.

- Account settings

Accounts that are used, depend on the posting type. If a posting is performed with reference to a work order, generally the WIP account of the work order is used. In other cases the default account of SAP Business One is used. Account settings can be changed in the Configuration Wizard.

See:
Materials management - manual postings
Production – posting
Production – Account determination

- Pricing

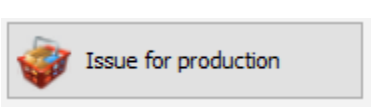
Pricing depends on the posting type. If an assembly is posted in for a work order, pricing is performed as set up in the work order, if there was nothing set up, the settings in **Configuration wizard > Materials management** apply.

See:
Materials management - Pricing
Production Valuation of assembly

- Batches and Serial numbers

See
Configuration wizard – Batch administration
Configuration wizard – Serial numbers

17.3.2.5 Issue for Production



Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.
See Terminal settings in Configuration wizard.

	3. Settings in the Configuration wizard
	
	Window-specific adjustments:
	Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.
	
	Example:
	`windowevent setbindropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end event`
	
	Note: This window event is supported in every window where the selection field is available.
	
	General adjustment
	Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.
	
	`file stockmanagement.src`
	`function binreceiptdropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end function`
	
	See Warehouse rules.

LUID	Define LUID number ***See*** LUID behavior settings. WMS Production receipt
Project	Link to an SAP Project code. The default value comes from the project linked to the work order. If continued stock is active in the database, the project code is included in the journal entry.

© 2026 Boyum IT Solutions A/S

Batch/Serial	Click the orange arrow to generate a new batch or serial number. After this batch or serial number is firmly assigned and the arrow is hidden. Information on Reserved Batches: The drop-down contains information on reserved quantities in 3 columns:  The batch entry in the list is displayed in RED color if the Batch is not free. **Quantity-related information:** **Field** / **Description** Available: Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail. Reserved for BoM: Reserved Quantity for this BoM Position Reserved Quantity: Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail. Inventory: Stock batch quantity in the bin location. ***See:*** Production – Batch administration

© 2026 Boyum IT Solutions A/S

	Materials management – Batch administration
Date	Posting date of the document. The default value is the today variable.
Quantity	The quantity to be issued. **Serial numbers:** For serial numbers only a quantity of 1 can be entered. **Serial number reservation** Posting in a production assembly any quantity can be entered if the serial number determination is set to "automatic" for the respective item and the serial numbers have been reserved. In this case, a window opens where the serial numbers can be selected. ***See:*** Configuration wizard – Production – Serial numbers Concept Serial number reservation Item master – Series tab
Conv-Quantity	☐ Enter posting quantity in consumption units Only displayed, if the consumption unit does not match the warehouse unit of the item. ***See*** consumption unit The entered quantity is converted to warehouse unit. Length, width and height are indicated. These parameters are considered, using the conversion formula. ***See*** Conversion
Close	☐ Close WO position Only visible, if a production assembly is posted. Set automatically, as soon as the planned quantity is reached. Manual change is possible. The behavior can be defined in Configuration wizard - Close assembly automatically. If the option is active, the production position is closed after receipt.
Cost center	☐ Select cost center

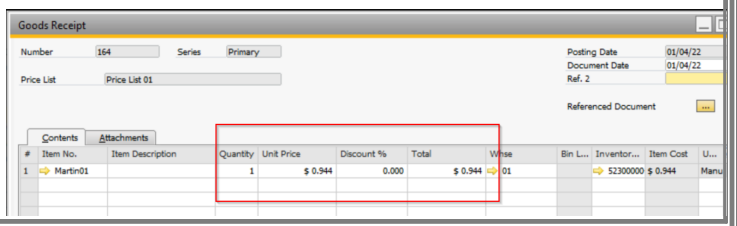
different
number of decimals.



Additional fields are available at transfer:

Field	Description
To	Define the warehouse to transfer to. The To warehouse can only have the same entry as Warehouse if it is a bin location inventoried warehouse. A pure bin location transfer is then possible. Note: A bin location move instead of a SAP Business One - Transaction runs at a bin location transfer. There is no account movement, no calculation of FIFO prices or average prices. The bin location entry is changed. An entry is created in the bin location-movement protocol.
Bin Location	Define the bin location to transfer to. For further information, ***see*** from bin location.

Functions and Buttons

Button	Description
Cancel	Cancel the process.
Batch list (F3)	Inventory list by batches This button is only visible if a batch related item is selected.
Book (F2)	Start the booking process.

Events

© 2026 Boyum IT Solutions A/S

Every posting process creates several events, which can be set as default or customized (***see*** customizing).
Posting finished products (assigned to a work order), calls the assignment program which controls closing, pricing, and batch administration. An external materials management system can also be connected and used in parallel.

- Account settings

Accounts that are used, depend on the posting type. If a posting is performed with reference to a work order, generally the WIP account of the work order is used. In other cases the default account of SAP Business One is used. Account settings can be changed in the Configuration Wizard.

See:
Materials management - manual postings
Production – posting
Production – Account determination

- Pricing

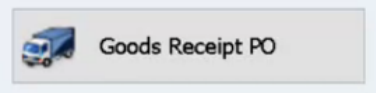
Pricing depends on the posting type. If an assembly is posted in for a work order, pricing is performed as set up in the work order, if there was nothing set up, the settings in **Configuration wizard > Materials management** apply.

See:
Materials management - Pricing
Production Valuation of assembly

- Batches and Serial numbers

See
Configuration wizard – Batch administration
Configuration wizard – Serial numbers

17.3.2.6 Goods receipt PO



Available with Goods Receipt for Purchase Orders, Labels, Stock Information license.
See Terminal settings in Configuration wizard.

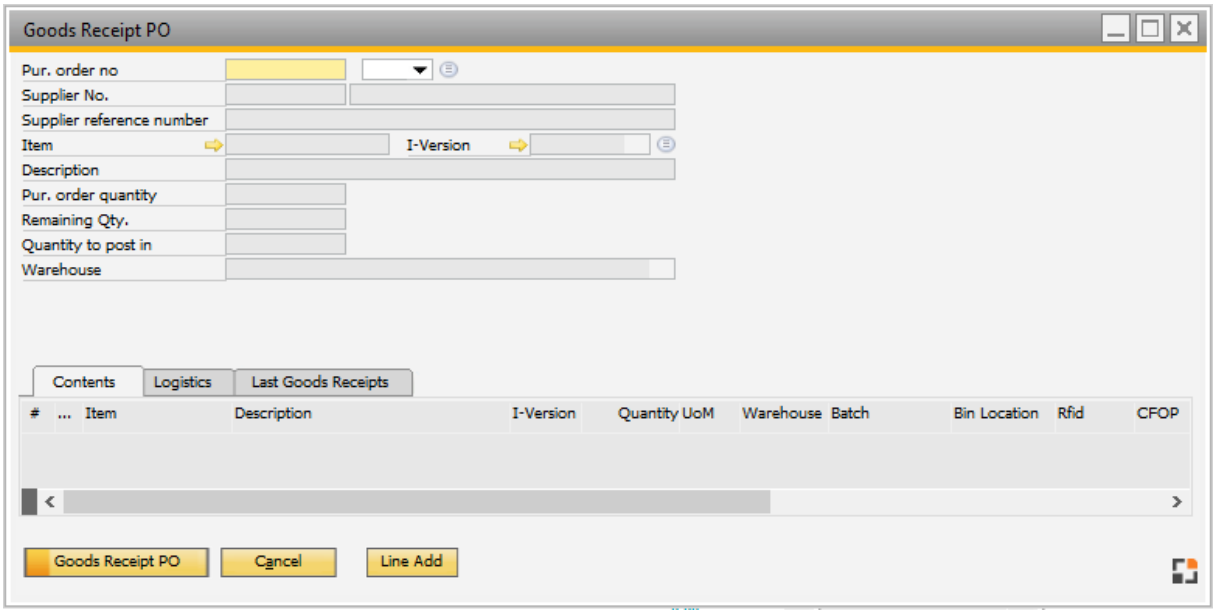
With this app you can create a single goods receipt for quantities based on a purchase order.

© 2026 Boyum IT Solutions A/S

Goods receipt is a replacement function for SAP Business One – **Purchase > Good receipt PO**.

This function is ideal to be employed directly at the goods receipt location and supports, apart from supplied parts lists, optimal batch support and serial numbers support, quality control, label printing and some other important functions. Goods receipt creates a regular goods receipt delivery note in SAP Business One.

Multiple Goods Receipt purchase window (default)



Window mw_goodsreceiptpo_edit.psr

Special Functions:

- Several purchase order rows can be posted in with one goods receipt document
- Posting in several batches, only one goods receipt row is created.
- Summary of different purchase orders is not possible
- All good receipts which has been created on this station via this window are displayed in tab "previous good receipts". Own good receipt function created via SAP B1 or good receipts, which has been created on other stations, are not be displayed here.
- Support Beas, SAP and WMS Bin Management

Single Variant

There are two functions: You can set up the one to be used in **Configuration wizard > Materials management > Goods receipt > Goods receipt type.**

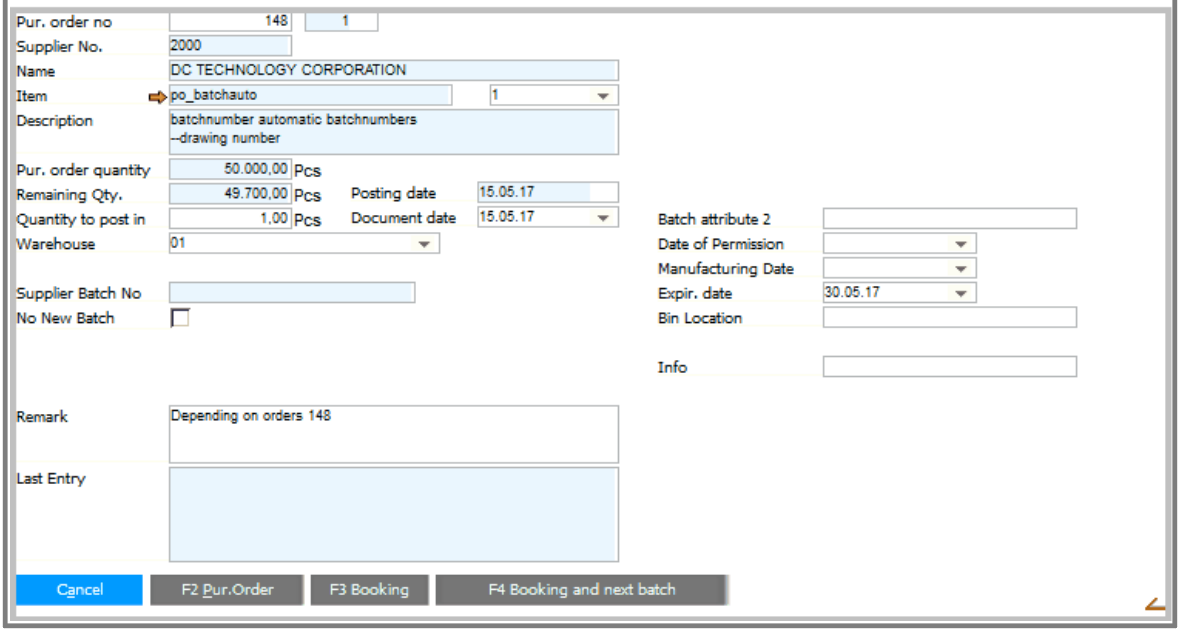
Attention:

© 2026 Boyum IT Solutions A/S

Do not use this Variant. This window is in maintenance and this will not be supported in the future.

This is still available only for reasons of compatibility and will be replaced by the "Multiple".

- Per purchase order row one goods receipt is created.
- For each batch a goods receipt is created.
- Several serial numbers can be posted in with one goods receipt.
- **SAP functionalities newer than SAP 9.0 are NOT supported.**



Field description

Apart from the order information, additional fields are shown – depending on the item type.
Window settings are available

Note: Localization in this window is not supported.

Field	Meaning
Purchase order number	Select from open purchase orders or purchase requests (switch on the right to open the window open purchases) You can insert the number manually or you can choose this from a list. If you insert the number manually, you can insert only a Purchase order, not Pre-Invoice or Quotation number.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	If a Document number exists more than once, Beas uses the last document.
Supplier number	Supplier number
Supplier reference number (only for GO type multiple)	Free text
Name	Supplier name
Item	Item
Item description	Item description
Pur. order quantity	Purchases quantity
Remaining quantity	Remaining quantity
Quantity to post in	Quantity to be posted in now. **Warning:** All quantities are shown in the purchasing UoM. The number of decimal places depends on Master data – Units of measure. If per line serial numbers are entered, this field displays the current total quantity according to the sum of all quantities from entries below. Notes on serial numbers: In item master series tab you can set up whether serial numbers are generated automatically or not. Serial numbers are generated manually. If serial numbers are entered per line, these fields show the current total quantity. Automatically generated serial numbers.

© 2026 Boyum IT Solutions A/S

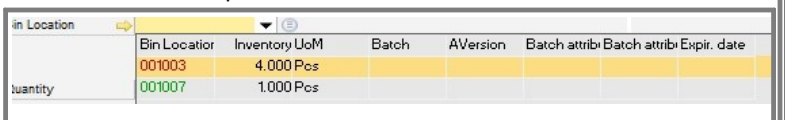
Field	Meaning
	The quantity can be specified. Serial numbers are generated only at the moment of goods receipt. Number generation is set up in Configuration wizard – Materials management - Goods receipt – Serial numbers.
Date of entry (Only type "single")	The date for the entry. It is normally the current day. Depending on the settings (goods receipt type simple or multiple) this field is to be found under logistics tab.
Reference date	Corresponds to Tax date in SAP document.
Warehouse	Target warehouse Warehouse stored in purchase order. Representing the primary inventory. Depending on the setting, the quality control warehouse is set up automatically. If a goods receipt warehouse is defined, depending on the rules the associated goods receipt warehouse is entered. Limitations: - SAP Bin Warehouse supported. But it is not possible to make a receipt on different Serial- or Batch Numbers with the same base document line. - Beas Warehouses: The same base line purchase document cannot be received in 2 different bin locations. - WMS bin warehouses are supported, but the same base line purchase document cannot be received in 2 different bin locations. - WMS Warehouses: System creates separate lines for each entry, which means that only 1 entry can be assigned for each base line. ***See***: Configuration wizard – Quality control – Goods receipt

© 2026 Boyum IT Solutions A/S

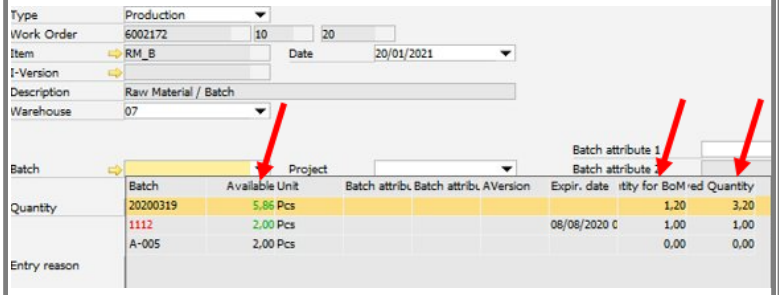
Field	Meaning
	Edit warehouse master data
Bin location	Determines to which bin location the goods are posted at receipt. Supported: Beas and SAP Bin Management ***See*** Receipt on bin location Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3) The field has the following components: **Arrow icon** / List of all bins where the item is located. **Selection (Drop-down)** A list opens to select the desired bin location.  **The selected drop-down option displays the following information in receipt documents:** • Bin Location • Warehouse Area • First item in this bin location • Stock of the first item in this bin location The list can be modified in the Configuration wizard. **The selected drop-down option displays the following information in issue documents:** • All stock information of all bin locations with batch- and serial number information.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	• ⊟ Reserved Batch quantities information



The drop-down contains information on reserved quantities in 3 columns:



The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	Select or List - Icon By using the selection icon, an adjustable selection list opens. Window settings and templates are supported. Notes: Beas Bin Warehouse The Definition of the bin location is mandatory. Notes: SBO Bin Warehouse If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type. This is entirely managed by SAP Business One. Drop-down for volume or weight is not supported. Columns are always 0. *beas 9.3 PL 2* Notes: WMS Bin Warehouse Bin location is mandatory. Drop-down for volume and weight not supported. Customizing of the drop-down list in Beas 9.3 PL 2 or newer release This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`. The following priorities are considered: 1. Window-related customization (`windowevent setbindropown`) 2. General changes (`stockmanagement.src`) 3. Settings in the Configuration wizard In the `e_bindropdownbsl` variable, the ODATA command can be defined. It is beneficial to use the Beas service layer, because Beas

© 2026 Boyum IT Solutions A/S

Field	Meaning

supports different warehouse systems that use different tables and logic.

The standard functions for receipt and issue are as folows:

```
file stockmanagement.src

function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$mask=1
end function

function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,
BatchAttribute2,ExpirationDate&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered by
OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$select=BinLocation/BinCode,BinLocation/BinColor
,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where OnHand >
0 of the selected ItemCode, ordered by OnHand
descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand
desc, BinLocation/BinCode asc
end function
```

Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in

© 2026 Boyum IT Solutions A/S

Field	Meaning

	maintenance.
	
	This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.
	
	The following priorities are considered:
	1. Window-related customization (`windowevent`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	Window-specific adjustments:
	Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.
	
	Example:
	`windowevent setbindropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end event`
	
	Note: This window event is supported in every window where the selection field is available.
	
	General adjustment
	Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.
	
	`file stockmanagement.src`
	`function binreceiptdropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end function`

© 2026 Boyum IT Solutions A/S

Field	Meaning
	LIMITATION: The receipt process linked with a purchase order is not able to create receipt for the same line into 2 different bin locations at the same time. As a workaround for this, the user can generate the receipt document in 2 steps or receipt full quantity in one bin location and move the required quantity to a different location after the receipt is created.
Expiry date	Only possible for batch or serial number items. Determines the expiration or end of warranty date. This date is calculated automatically. Setup in Item master > batch tab or Serial number tab
Supplier Batch No	Only possible for batch or serial number items. A supplier batch number can be specified here. At batch: Entered in the field Supplier batch of the batch. If the field "No new batch" is active, the batch entered here is also used as internal batch number. For serial number: Next to the serial number, the batch is entered in the field "Batch".
Serial number	Different depending on selected "Type "in Configuration wizard. ⊞ Goods receipt type single There are three options: 1. Automatic generation If there is no entry, the numbers are generated automatically. Automatic number generation is set up in Configuration > Materials Management. 2. Manual entry The numbers can be separated with commas, e.g. 10004,100023,100Z3 etc. 3. Manual determination of the automatic generation A template is defined which determines the structure of the serial numbers. *The counter is enclosed by { and } . Example of piece count 3: {0010} results in 0010, 0011, 0012 A5-3{002}X results in A5-3002X,A5-3003X,A5-3004X

© 2026 Boyum IT Solutions A/S

Field	Meaning
	Goods receipt type multiple **1. Automatic generation** No serial number can be entered. Quantities > 1 not possible. Serial numbers are generated with the document. **2. manual determination** Serial numbers are entered or scanned and confirmed with TAB/ENTER. Jump to next entry. Quick entry If a lot of serial numbers are to be entered, numbers can be added one by one: after one click the next serial number is added as a new line. Using bar code scanners, the scanner can be configured for adding a key after each read. Then, the user only needs to read all bar codes – no more action is necessary. After the reading has been finished, click on the "**goods receipt**" button to create the document. This function is only allowed with the following parameters: poincomingtyp set to "M". It works with manual serial items only, because for automatic serial items the window does not show a message with the complete serial number information.
Batch	Entry of the batch This field is only visible if "Manual batch entry" or "Batch according to material" has been set in the Batch tab of the item master. The batch number for the item to be posted can be defined here. The quantity and the batch are indicated on "Add row" and then the next batch is captured if multiple batches are posted.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	Capture of more batch attributes 1. Right-click on the list. 2. Select Window settings. 3. Fields "Batch attribute 1" as well as all other fields, which are required are set to "Visible" and "Changeable" . 4. These fields can now be edited directly in the list.
No new batch (Only type "single")	Only for batch items. No automatic generation of the batch number takes place if this is activated. Instead, the batch number entered in delivery batch No. is used. Otherwise the next number is automatically generated. For more on the batch number ***see*** Batch Management.
CFOP	CFOP Tax code Affects only Brazilian localization. The field is displayed only if a code was stored (table OCFP).
Remarks	Input field for remarks.
Last entry	Last posting entry.
UDF 1–15	User-defined fields Note: The information entered in these fields is saved in the table "BEAS_PLANDOCUMENT_LINE", but not in any other UDFs in Beas. Modification is available by customization.

Only displayed for Goods receipt type "multiple"

Lower tabs

Content: Previously entered items which are to be posted in with the same document.

Archive: Previous goods receipts created on this work station.

Logistics:

Field	Meaning
Posting date	The date for the entry. It is normally the current day.
Document date	Creation date of the selected document.

© 2026 Boyum IT Solutions A/S

Field	Meaning
Remark	Free text.
Label	Only for compatibility reasons. Can be used for own Macros.

In the lower list items selected for posting are displayed. With a click on the deletion icon they can be removed. Click the goods receipt button to perform the posting.

Functions

Function	Meaning
Line Add	To post in a second item. Previously entered values are displayed below, the upper fields are emptied for new entries. If for a document row more than one inflow was added (e.g. a second batch) the second entry is locked and the selected stock of the first row is used, because for a goods receipt only one warehouse may be selected per document line.
Goods receipt PO	Execute the posting.
Cancel	Close window without saving changes.
Post and new batch	Only for Goods receipt Type "single" and batch-managed items. If an item was entered after posting, the screen not reset. You can easily record the next batch for the same order.

Process

1. Select the order with F2.
2. Enter posting quantity.
3. Execute the order by pressing F3.

(Note: In SAP Business One-environment F-keys cannot be used. These are available only when Beas is started outside SAP Business One)

If a provision parts list exists, it is queried afterwards.

See Provision parts.

Quality control

If a quality control order is stored in the item, it is created immediately after completing the goods

© 2026 Boyum IT Solutions A/S

receipt. Depending on the settings in Configuration wizard - Quality control - Goods receipt the quality control order is opened immediately.

Automated document printing

Right-click menu > Layout

Field	Meaning
Preview	Via preview the last printed document can be viewed and printed.
Layout	Opens the Macro window. If in this window a Macro named "default" is stored, it is printed automatically after the goods receipt has been finished. Usually, API "B1DocumentGenerate" is used to access the table "beas_document_header/beas_document_line". If you do not want to use this API, read the internal document number from variable "e_docentry".

Additional Macro parameters for document printing

e_cardcode	Business partner
e_docentry	Internal goods receipt document number (docentry)
e_itemcode	Item number
e_batchnum	Generated batch number
e_whscode	Warehouse
e_quantity	Quantity
e_remark	Note
e_qcorder	Quality control order

Manual document printing

For document printing a corresponding document must be deposited in the Macro settings. The name can be freely assigned.

After creating the goods receipt document, via preview or print icon the last created document can be printed.

Extended fields in purchase

The following fields are filled in SAP Business One – delivery note

© 2026 Boyum IT Solutions A/S

Field	Description
Personnel	Personnel number (currently logged on in Terminal, WEB Apps or linked Personnel-SAP-User
Beas Version	Beas Versions used for the posting
Origin	Origin type. For goods receipt via beas always "B"

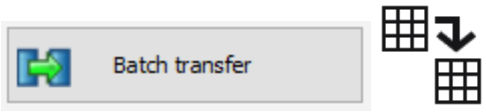
See

Provision parts

Configuration wizard - Quality control - Goods receipt

Configuration wizard - Materials management - Goods receipt

17.3.2.7 Batch transfer



Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.

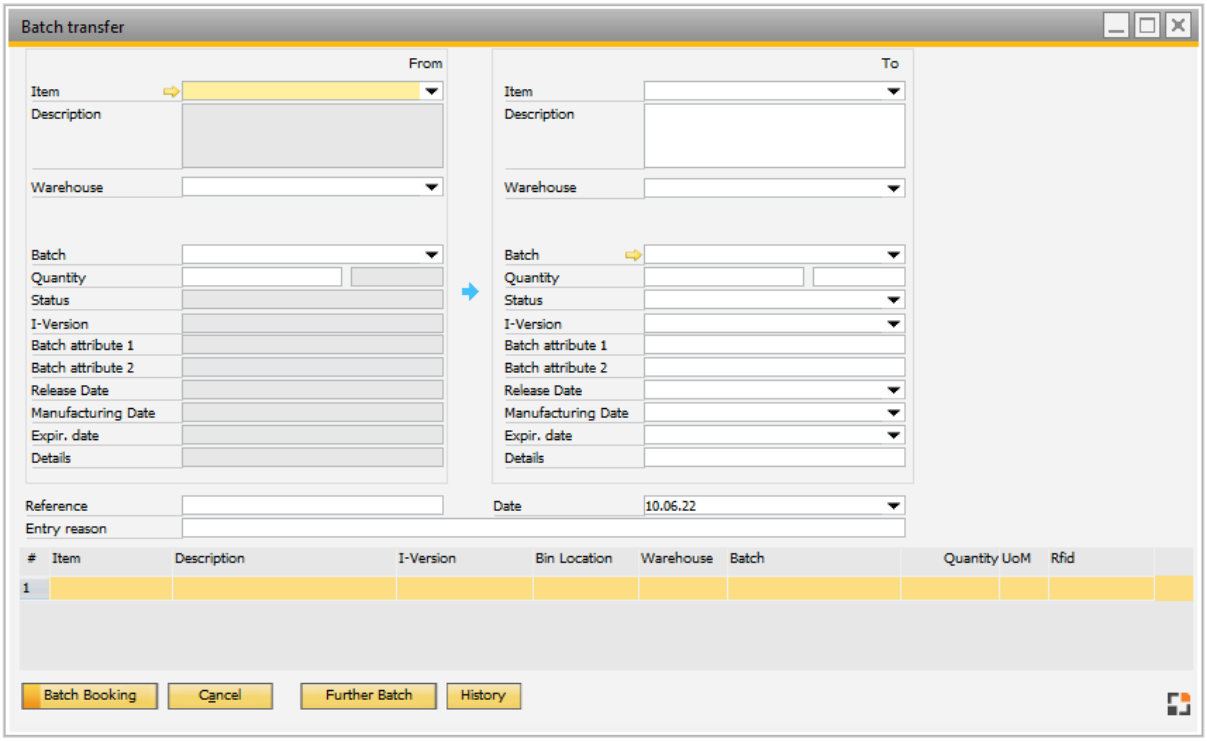
See Terminal settings in Configuration wizard.

With this app you can register a batch transfer from one warehouse to another.
This module offers the following possibilities:

- Transfer batches or a part of a batch to an existing or a new batch.
- Mix several batches into one.
- Combine several batches of different items with another item or batch.

PATH: Inventory > Inventory transactions > Batch transfer.

© 2026 Boyum IT Solutions A/S



Window mw_batchnum_transfer.psr

Items with different batches and different quantities from same warehouse can be summarized to new batches. The total quantity is proposed by the program and can be changed later. The active batch, marked for editing, is highlighted.

A table with two columns is displayed, the batch is transferred from left to right. See image above and field descriptions below.

Behavior is defined in the Configuration wizard – Batch transfer.

	from	to
Field	**Description**	**Description**
Item From/To	Select item from whose batch to transfer to an existing or new batch.	Choose item to which the batch selected in the "From" field should be transferred.
Description	Description of the item.	Description of the item.
Warehouse	Select source warehouse of the batch to transfer.	Add target warehouse of the batch to transfer.
Bin Location	Select source bin location of the batch to transfer. SAP, Beas and WMS Bin Manage	Add target bin location of the batch to transfer. SAP, Beas and WMS Bin Manage supported

© 2026 Boyum IT Solutions A/S

Field	Description	Description
	supported *(beas 2020.02)* Here you choose the Bin location and Batch number. In Bin managed warehouses you can't choose Batch number in Batch number field	*(beas 2020.02)*
Batch	Number of original batch Only selectable, if not Bin managed warehouse	Number of new batch A new batch will be created by single-clicking the yellow arrow. Up until *beas 9.2*: The batch according to the goods receipt definition is used in all cases. From *beas 9.2*: The behavior can be defined in the Configuration wizard.
Quantity	Quantity of current Batch, which you want to transfer to new batch number on right side	Quantity of new Batch
Status	Status of Batch	New Batch status. Define the Status of this Batch after the transaction. Only editable if you create a new Batch. For existing Batches it is not possible to define new status in this window. **Attention:** The system does not check any rules. You can release the Batch without any quality control, and you can transfer a locked batch to a released batch.
Batch attribute 1+2 I-Version Release date Details Manufacturing Date	Batch number information. Only for information. Not changeable	Various, Batch number-related pieces of information. Only editable if you create a new batch number

© 2026 Boyum IT Solutions A/S

Field	Description	Description
Expir. date		
Reference Date Entry reason	Reference information, Post date and Notes for transfer (issue/receipt) document	

Functions

Function	Description
Batch booking	Click Batch booking to issue the total amount of the batches to be split and to post in the batches to be created (in the background an issue and a receipt document are generated.
Further batch	Insert the next batch into the line.
History	Open the History log window.

- Pricing

The batch on the right side receives the total price of all batches selected on the left side.
Use Perpetual Inventory active: The price which is stored in the journal of the charge-off document is used here.
Use Perpetual Inventory disabled: The total price which is stored in the charge-off document is used here.

Example:
left side (Issue document): Batch 1: `1x3€ + Batch 2: 2*4€ = total 11€`
right side (Receipt document): The new Batch is posted in with `11€`

Additionally, a booking reason and reference to this process can be entered.
Batch control: original and target batch may not be equal.
A pure bin to bin transfer is not possible if there is an assignment to a sales order or if the batch is reserved. After editing by pressing "post batches" the batch is transferred. The button "History" shows all previously performed transfers, and a separate document is created for each batch.

Note:
Batch transfer creates 2 documents: Issue and Receipt.
In the issue document created by the Batch transfer you can see the *Info price.*, which is not the

© 2026 Boyum IT Solutions A/S

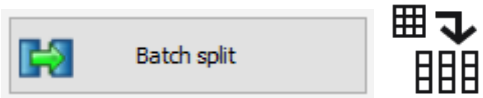
same as *Stock price*.
You can see the correct price in the column "item cost"
Example:
Info price is 1715€ and Item Cost is 863,41€
For the Receipt document Beas is using the Item cost price, because this is the price, which you can see in the journal entry.

Batch Transfer Pricing

Rounding problem:
If the price only saved with 2 decimal places (SAP Definition - count of decimal places for prices) and you work with high quantity, then this can produce a rounding problem and different prices between Issue and Receipt
Workaround: increase count of decimal places for prices.

See Batch transfer.

17.3.2.8 Batch Split



Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.
See Terminal settings in Configuration wizard.

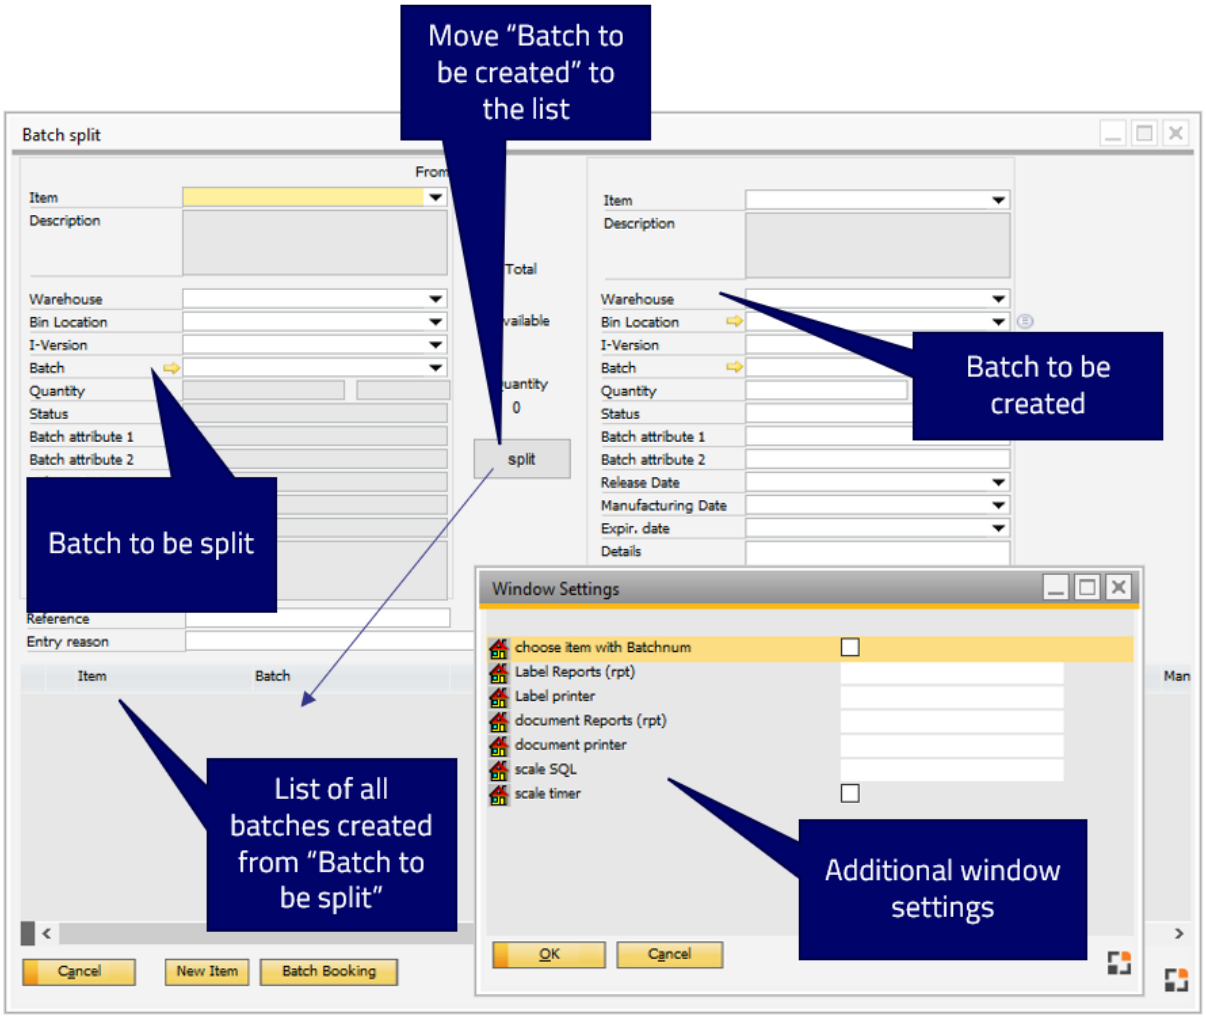
This app is the terminal solution for the identical function integrated in SAP B1.
In this window an item batch can be divided into several item batches. In this case, neither the item number nor the batch lot number needs to match. The quantities of source and target batch may differ, only the current stock is considered as limit.

PATH: Inventory > Inventory transactions > Batch split.

The window is divided into three areas:

Area	Description
Top left	Batch to be split.
Top	Batch to be created.
Below	Already selected batch to be created.

© 2026 Boyum IT Solutions A/S



Window mw_batchnum_splitt.psr

Process description:

Indicate the batch to split (left) and the batch to be created (right). The amount of the batches to be created may not exceed the amount of batches to be divided. Different units of measurement are not considered.

Clicking on **Split** the batch on the list below is accepted and the "available" value is reduced accordingly.

Click **Batch booking** to issue the total amount of the batches to be split and to post in the batches to be created (in the background an issue and a receipt document are generated)

In parallel, a transfer document is created with its own document number. There the numbers of the related documents for receipt and issue are stored. Documents are accessible via **right-click - archive.**

© 2026 Boyum IT Solutions A/S

- Window settings

The behavior of the batch split function can be adapted using **right-click – window settings**. These are saved as workstation-specific.

Window setting	Description
Choose item with batchnum	If enabled, batch numbers and bin locations are displayed in item selection list. Thus all information is displayed in a list. Note: This list can get very long. If disabled: Only batch-related items with stock are displayed.
Label Reports	A report can be stored which is generated when clicking "divide". Parameters for the report: `itemcode, distnumber, quantity, unit, whscode, bincode, mnfserial, lotnumber`
Label Printer	If another printer than the default printer shall be used for printing the label report, enter the printer name here.
Document Report	A Crystal-Report can be stored. It is printed when clicking on "post batch" . Parameters for the report: `docentry` This refers to the table `beas_batchnumtrans.docentry` where all additional information is stored.
Scale SQL	A SQL-statement can be stored returning the quantity. ***Example***: `select top 1 weight from my_scale_table order by nr desc` ***Example*** of use: scales are entering the weight to an SQL table. The entered value is transferred clicking the button "scale".
Scale timer	If enabled, scale SQL is executed every 2 seconds and the last weight is used.

Note:

SAP and WMS Bin Management are not supported in this window.

© 2026 Boyum IT Solutions A/S

Pricing

The system creates 2 documents
- Issue document for the item which you want to split
- receipt document for all entries

The system uses standard pricing for issue / receipt

Issue document

Basic Initialization - Use Perpetual Inventory is disabled:

Beas uses price from the Configuration wizard - Purchased Items Pricing Booking or In-house Production Pricing Booking

The system converts the price to home currency, saves this in field "Price per Unit" and does not use any rounding.

Basic Initialization - Use Perpetual Inventory is enabled.

The system uses SAP Standard; the item valuation method.

Receipt document

Beas uses price from the Configuration wizard - Purchased Items Pricing Booking or In-house Production Pricing Booking

The system converts the price to home currency, save this in field "Price per Unit" and does not use any rounding.

Note:

The system writes the Price and Unit price, not the total price.

The total price of the Issue document is not the price of receipt document.

Beas does not manage the rounding as it is completely managed by SAP.

When applying Batch split with serial/batch valuation method, consider that Goods issues will be created according to the SAP serial/batch valuation method. However, Goods receipts are generated according to average price valuation.

Example:

An Item has 2 batches

BN001 - 10 units x 10€ = 100€
BN002 - 10 units x 5€ = 50€

© 2026 Boyum IT Solutions A/S

Using the Batch split function:
Split 5 units of BN001 to BN002 (the system issues 5 units of BN001, then receipts 5 units of BN002)

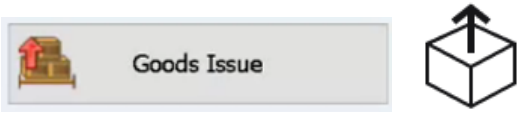
Cost of the goods issues of BN001 is calculated by SAP (using batch/serial valuation) as 5 units x 10€ = 50€

Cost of the goods receipt of BN002 is calculated as average price of all batches in stock at the moment the goods receipt is going to be created.

BN001 5 units x 10€ = 50€
BN002 10 units x 5€ = 50€

Cost average at the goods receipt is = (50 + 50) / 15 = 6.66666666€

17.3.2.9 Goods Issue



Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.
See Terminal settings in Configuration wizard.

This app opens the window for manual postings.
With manual postings the inventory can be adjusted without a document.
For example, after the stocktaking, part of the stock was not counted, the missed amount can then be manually posted.

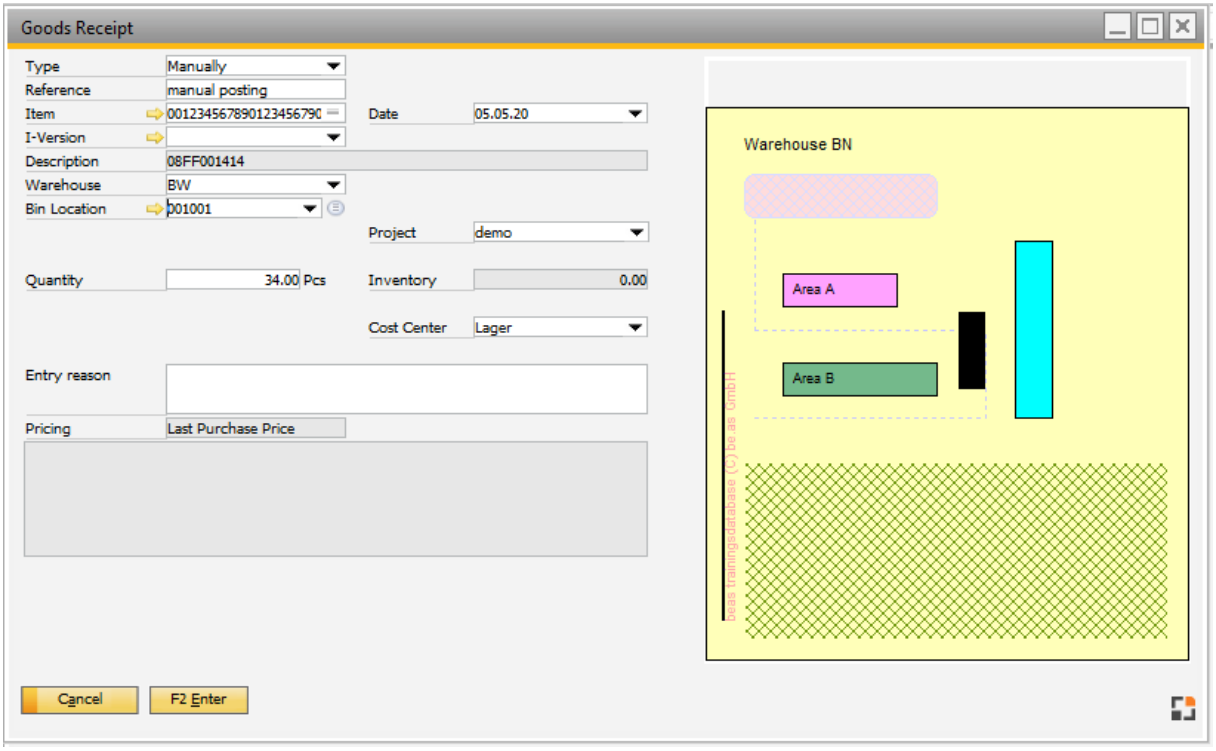
The following manual posting options are available:

- Receipt
- Issue
- Transfer

Only one item can be added per manual posting procedure.

© 2026 Boyum IT Solutions A/S

The posting is a simplified operation to be used in production and some information is omitted.



Window mw_manuell_buchen.psr

Posting types

There are different types of postings

Type	Description
Manual	Used to report a manual posting. This option uses the accounts set in Beas general parameters. These accounts can be different from the correction option.
Production	Assigned to a production order. Entry of the production document and the position or BoM position is necessary. The process: After choosing the position, the item is inserted automatically. The posted quantity is displayed and evaluated in the production structure views. In the Production order field the following can be entered: • work order number • work order position bar code • BoM bar code

© 2026 Boyum IT Solutions A/S

	The entry is processed according to its type. **Production posting type special case** **Receipt - Pricing** With the Type "Production" selected, the Pricing field becomes invisible as then the pricing Production valuation assembly is used. Postcalculation may be running in the background. **Receipt - order time receipt** is created automatically if enabled in Configuration wizard – Production – Work order backflushing – Book times automatically and "...to employee" is defined Correction	Used to report adjustment of remaining inventory (evaporation, scrap, and so on). This option uses the accounts set in Beas general parameters.
Inventory	Uses the same accounts as the Manually option, but the inventory adjustment posting type is entered in the comment field in the goods issues document.

Window structure, field description

The input window structure changes, depending on the entered information. Related fields become available depending on whether receiving, issuing or transferring takes place, whether a batch or a serial number is entered or whether there are different inventories or Production UoMs. The same applies to bin locations. If the bin location has been created, they are displayed for selection.

Field	Meaning

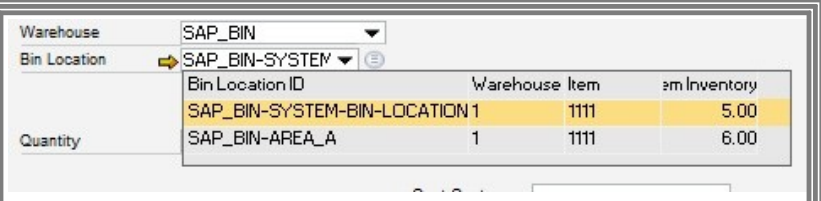
© 2026 Boyum IT Solutions A/S

Work order	Displayed only if Production type was selected. The Work order area has three fields: Document number, line and position. If new is selected from the position drop-down, "-1" is displayed in the field. A new work order position can be entered instead of the -1, the item and quantity can be selected. **1. Field - work order number** The work order can be selected from the drop-down list or scan: a) The work order document number (Data field: beas_fthaupt.belnr_id). b) The work order bar code (9 digits). It is used for posting in the assembly. The second and third field is filled automatically. (Data field: beas_ftpos.barcode) c) The material bar code. Used to post material. (Data field: beas_ftstl.nummer) (BoM - Extended - Bar code) **2. Field - work order line number** Select work order item to be issued or posted (Data field: beas_ftpos.belpos_id). Only items allowed to post are available (items not closed or blocked) **3. Field - work order position number** Select the BoM item to be posted (Data field: beas_ftstl.pos_id). Only BoM positions that are not closed been closed, with warehouse oriented items are allowed. Special case: 0 or empty = the assembly is posted. -1 = a new BoM item is generated. Blocked BoM positions Blocked BoM positions cannot be selected, but the position number can be manually entered or scanned via

© 2026 Boyum IT Solutions A/S

	barcode. For postings, the respective authorizations are required. Post and create new BoM position It is possible, to issue material and to create a BoM position at the same time, if the position does not exist. Select the work order document and the assembly, and then select "new" in the third field.
Item	Item number. NOTE on WMS-related receipt: **WMS Integration:** If the receipt is made from BEAS in a WMS warehouse, it applies the Quality status defined in **Produmex WMS > Organizational Structure > Production tab**.
I-Version	Item version to be posted. *(beas 9.1 PL: 08)* Note: It is only possible to create a manual receipt of an item version with "Released" status.
Warehouse	Warehouse that item is posted to. ***See*** Warehouse rules. Note: As of Beas Manufacturing 9.3 PL03, Produmex WMS warehouses are supported for Beas transactions.
Bin location	Bin location to be posted to Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3) The field has the following components: **Arrow icon** / List of all bins where the item is located. **Selection (Drop-down)** A list opens to select the desired bin location.

© 2026 Boyum IT Solutions A/S



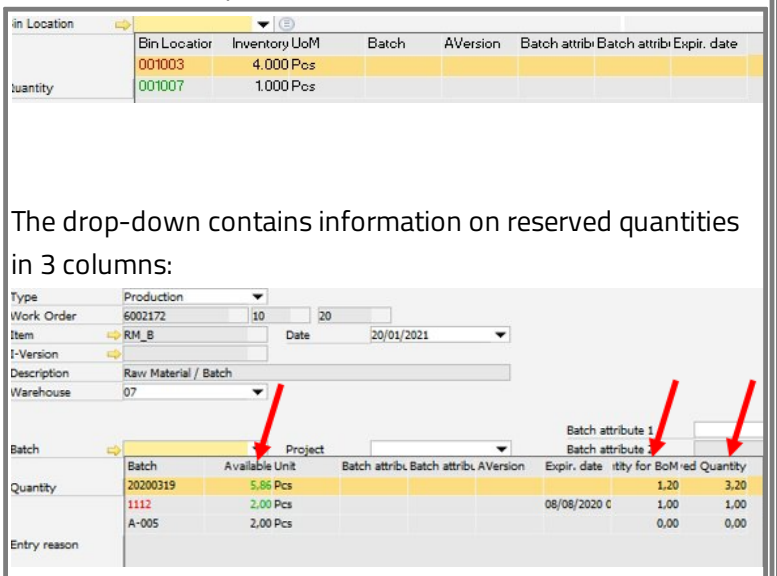
The selected drop-down option displays the following information in receipt documents:

- Bin Location
- Warehouse Area
- First item in this bin location
- Stock of the first item in this bin location

The list can be modified in the Configuration wizard.

The selected drop-down option displays the following information in issue documents:

- All stock information of all bin locations with batch- and serial number information.
- Reserved Batch quantities information



The drop-down contains information on reserved quantities in 3 columns:

The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

© 2026 Boyum IT Solutions A/S

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

Select or List - Icon

By using the selection icon, an adjustable selection list opens. Window settings and templates are supported.

- Notes: Beas Bin Warehouse

  The Definition of the bin location is mandatory.

- Notes: SBO Bin Warehouse

  If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type.
  This is entirely managed by SAP Business One.

  Drop-down for volume or weight is not supported. Columns are always 0.
  beas 9.3 PL 2

- Notes: WMS Bin Warehouse

  Bin location is mandatory.

© 2026 Boyum IT Solutions A/S

Drop-down for volume and weight not supported.

Customizing of the drop-down list in Beas 9.3 PL 2 or newer release

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent setbindropown`)
2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

In the `e_bindropdownbsl` variable, the ODATA command can be defined.
It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.

The standard functions for receipt and issue are as folows:

```
file stockmanagement.src

function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$mask=1
end function

function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,
BatchAttribute2,ExpirationDate&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

© 2026 Boyum IT Solutions A/S

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered by
OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$select=BinLocation/BinCode,BinLocation/BinColor
,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where OnHand >
0 of the selected ItemCode, ordered by OnHand
descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand
desc, BinLocation/BinCode asc
end function
```

- Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent`)
2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

Window-specific adjustments:

Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.

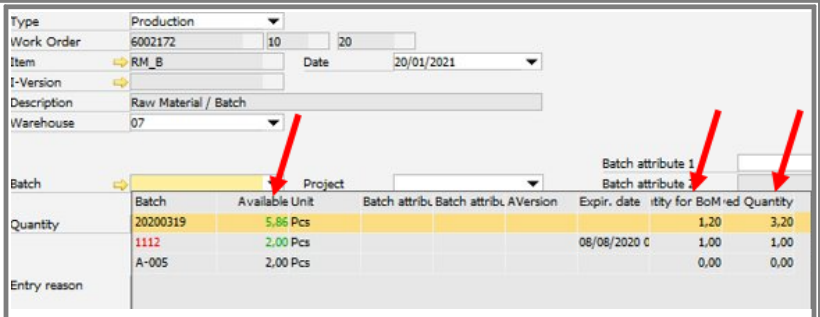
Example:

```
windowevent setbindropdown
setvar=e_bindropdown=ddsql=select "BINCODE" from
"BEAS_WHSBIN" where
```

© 2026 Boyum IT Solutions A/S

	"WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT" end event Note: This window event is supported in every window where the selection field is available. **General adjustment** Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration. file stockmanagement.src function binreceiptdropdown setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT" end function ***See*** Warehouse rules.
LUID	Define LUID number ***See*** LUID behavior settings. WMS Production receipt
Project	Link to an SAP Project code. The default value comes from the project linked to the work order. If continued stock is active in the database, the project code is included in the journal entry.
Batch/Serial	Click the orange arrow to generate a new batch or serial number. After this batch or serial number is firmly assigned and the arrow is hidden. Information on Reserved Batches: The drop-down contains information on reserved quantities in 3 columns:

© 2026 Boyum IT Solutions A/S



The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

See:

Production – Batch administration

Materials management – Batch administration

Date	Posting date of the document. The default value is the today variable.
Quantity	The quantity to be issued. **Serial numbers:** For serial numbers only a quantity of 1 can be entered.

© 2026 Boyum IT Solutions A/S

	Serial number reservation Posting in a production assembly any quantity can be entered if the serial number determination is set to "automatic" for the respective item and the serial numbers have been reserved. In this case, a window opens where the serial numbers can be selected. ***See:*** Configuration wizard – Production – Serial numbers Concept Serial number reservation Item master – Series tab
Conv-Quantity	Enter posting quantity in consumption units Only displayed, if the consumption unit does not match the warehouse unit of the item. ***See*** consumption unit The entered quantity is converted to warehouse unit. Length, width and height are indicated. These parameters are considered, using the conversion formula. ***See*** Conversion
Close	Close WO position Only visible, if a production assembly is posted. Set automatically, as soon as the planned quantity is reached. Manual change is possible. The behavior can be defined in Configuration wizard - Close assembly automatically. If the option is active, the production position is closed after receipt.
Cost center	Select cost center If no cost center is selected, the default settings apply. **Adaptation** Use the script in workordermanagement.src and materialmanagement.src to extend determining the cost center.

© 2026 Boyum IT Solutions A/S

	See Configuration wizard - Production - Material - Account determination Configuration wizard - Production - Assembly - Account determination Item - General - Cost center
Entry reason	Free text to add information.
Pricing	Shows the method determining the price. Automatically filled.

Production Assembly	Settings apply from **Production > Valuation and booking of the assembly > Valuation**
Post in positive BoM item	Settings apply from **Materials management > post in manually > Purchased items pricing booking**
Post in negative BoM item	Settings apply from **Calculation > Precalculation > Pricing negative BoM**
Other posting	Settings apply from **Materials management > Post in manually > Purchased items/In-house production pricing booking**

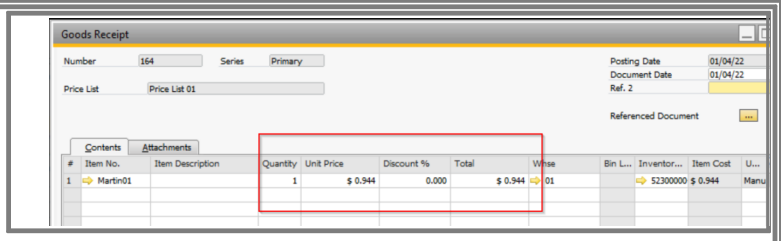
SAP Limitation:

SAP Manual receipts: When Beas creates a receipt document, the system calculates the Unit price based on calculating the Total price of the booking.

The difference between the decimals of SAP and Beas can cause mismatch between the values: The "Total" price field may be rounded as the Unit price is defined with a different

number of decimals.

© 2026 Boyum IT Solutions A/S



Additional fields are available at transfer:

Field	Description
To	Define the warehouse to transfer to. The To warehouse can only have the same entry as Warehouse if it is a bin location inventoried warehouse. A pure bin location transfer is then possible. Note: A bin location move instead of a SAP Business One - Transaction runs at a bin location transfer. There is no account movement, no calculation of FIFO prices or average prices. The bin location entry is changed. An entry is created in the bin location-movement protocol.
Bin Location	Define the bin location to transfer to. For further information, ***see*** from bin location.

Functions and Buttons

Button	Description
Cancel	Cancel the process.
Batch list (F3)	Inventory list by batches This button is only visible if a batch related item is selected.
Book (F2)	Start the booking process.

Events

Every posting process creates several events, which can be set as default or customized (***see*** customizing).

© 2026 Boyum IT Solutions A/S

Posting finished products (assigned to a work order), calls the assignment program which controls closing, pricing, and batch administration. An external materials management system can also be connected and used in parallel.

- Account settings

Accounts that are used, depend on the posting type. If a posting is performed with reference to a work order, generally the WIP account of the work order is used. In other cases the default account of SAP Business One is used. Account settings can be changed in the Configuration Wizard.

See:

Materials management - manual postings

Production – posting

Production – Account determination

- Pricing

Pricing depends on the posting type. If an assembly is posted in for a work order, pricing is performed as set up in the work order, if there was nothing set up, the settings in **Configuration wizard > Materials management** apply.

See:

Materials management - Pricing

Production Valuation of assembly

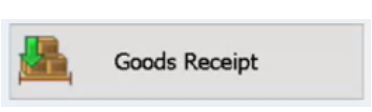
- Batches and Serial numbers

See

Configuration wizard – Batch administration

Configuration wizard – Serial numbers

17.3.2.10 Goods receipt



Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.

See Terminal settings in Configuration wizard.

Customizing of the drop-down list in Beas 9.3 PL 2 or newer release

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent setbindropown`)
2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

In the `e_bindropdownbsl` variable, the ODATA command can be defined.
It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.

The standard functions for receipt and issue are as folows:

```
file stockmanagement.src

function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bsl>)?$mask=1
end function
```

© 2026 Boyum IT Solutions A/S

```
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,
BatchAttribute2,ExpirationDate&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered by
OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$select=BinLocation/BinCode,BinLocation/BinColor
,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where OnHand >
0 of the selected ItemCode, ordered by OnHand
descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand
desc, BinLocation/BinCode asc
end function
```

- Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

The following priorities are considered:

1. Window-related customization (`windowevent`)

© 2026 Boyum IT Solutions A/S

2. General changes (`stockmanagement.src`)
3. Settings in the Configuration wizard

Window-specific adjustments:

Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.

Example:

```
windowevent setbindropdown
setvar=e_bindropdown=ddsql=select "BINCODE" from
"BEAS_WHSBIN" where
"WhsCode"=<e_binwhscode,dbstring> order by
"STORAGESORT"
end event
```

Note: This window event is supported in every window where the selection field is available.

General adjustment

Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.

```
file stockmanagement.src
function binreceiptdropdown
setvar=e_bindropdown=ddsql=select "BINCODE" from
"BEAS_WHSBIN" where
"WhsCode"=<e_binwhscode,dbstring> order by
"STORAGESORT"
end function
```

See Warehouse rules.

LUID	Define LUID number ***See*** LUID behavior settings. WMS Production receipt
Project	Link to an SAP Project code. The default value comes from the project linked to the work order. If continued stock is active in the database, the project code is included in the journal entry.

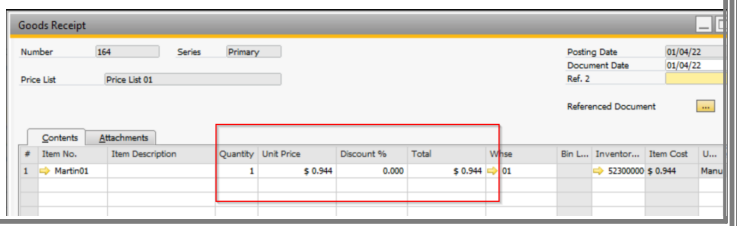
</table>
SAP Limitation:
SAP Manual receipts: When Beas creates a receipt document, the system calculates the Unit price based on calculating the Total price of the booking.
The difference between the decimals of SAP and Beas can cause mismatch between the values: The "Total" price field may be rounded as the Unit price is defined with a</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

different
number of decimals.



Additional fields are available at transfer:

Field	Description
To	Define the warehouse to transfer to. The To warehouse can only have the same entry as Warehouse if it is a bin location inventoried warehouse. A pure bin location transfer is then possible. Note: A bin location move instead of a SAP Business One - Transaction runs at a bin location transfer. There is no account movement, no calculation of FIFO prices or average prices. The bin location entry is changed. An entry is created in the bin location-movement protocol.
Bin Location	Define the bin location to transfer to. For further information, ***see*** from bin location.

Functions and Buttons

Button	Description
Cancel	Cancel the process.
Batch list (F3)	Inventory list by batches This button is only visible if a batch related item is selected.
Book (F2)	Start the booking process.

Events

© 2026 Boyum IT Solutions A/S

Every posting process creates several events, which can be set as default or customized (***see*** customizing).
Posting finished products (assigned to a work order), calls the assignment program which controls closing, pricing, and batch administration. An external materials management system can also be connected and used in parallel.

- Account settings

Accounts that are used, depend on the posting type. If a posting is performed with reference to a work order, generally the WIP account of the work order is used. In other cases the default account of SAP Business One is used. Account settings can be changed in the Configuration Wizard.

See:
Materials management - manual postings
Production – posting
Production – Account determination

- Pricing

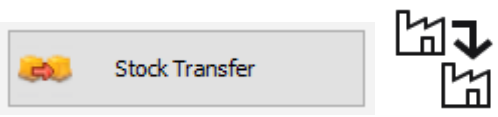
Pricing depends on the posting type. If an assembly is posted in for a work order, pricing is performed as set up in the work order, if there was nothing set up, the settings in **Configuration wizard > Materials management** apply.

See:
Materials management - Pricing
Production Valuation of assembly

- Batches and Serial numbers

See
Configuration wizard – Batch administration
Configuration wizard – Serial numbers

17.3.2.11 Stock Transfer



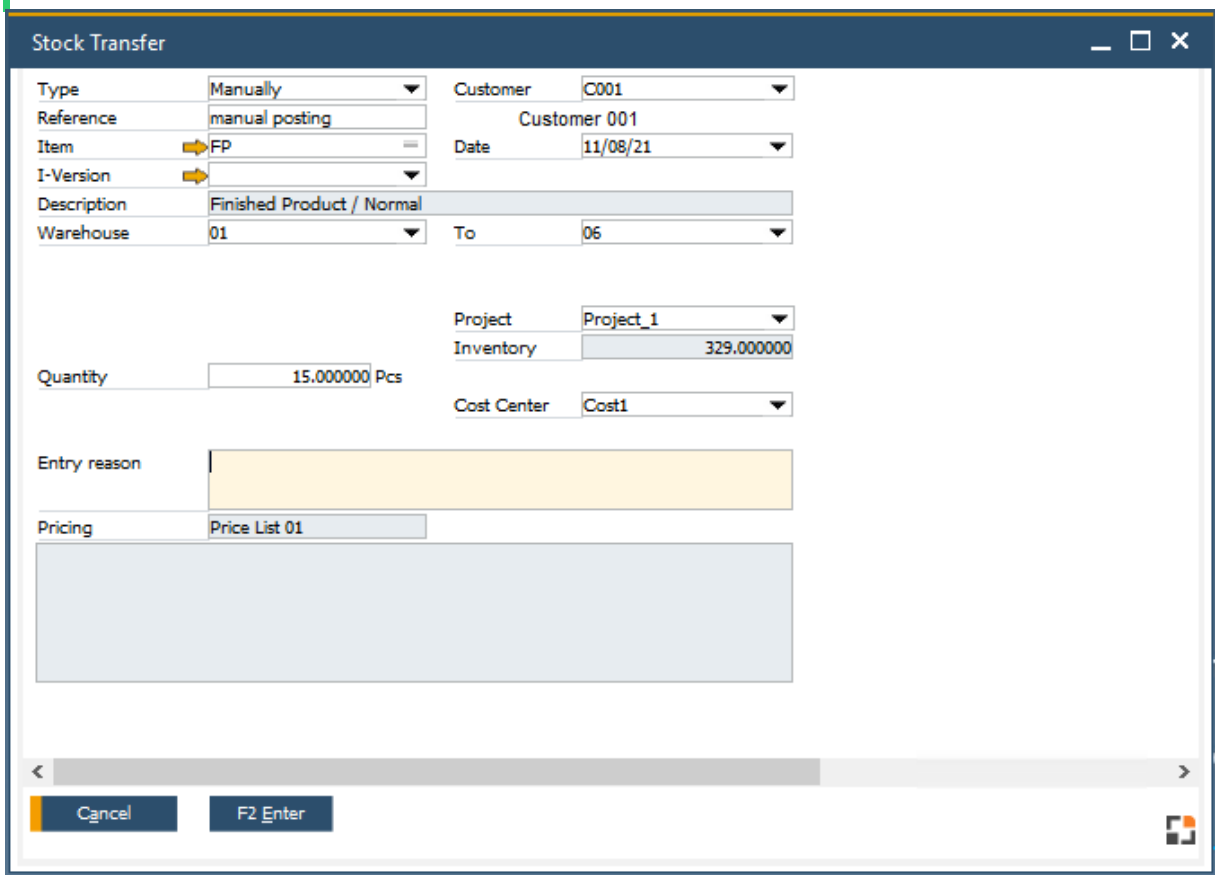
Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.
See Terminal settings in Configuration wizard.

This app opens the window for manual postings.
Stock transfer can be used for transferring one item from one warehouse to another. A bin to bin

© 2026 Boyum IT Solutions A/S

transfer in one warehouse is also possible.

PATH: Inventory > Inventory transactions > Stock transfer (single event)



Window mw_manuell_buchen.psr

Transfer and Reservation

You can transfer reserved material only if you define the linked document.

Example: You reserve material for work order 1000, Pos 10/20.

In Stock transfer you must define Type = Production and Position 10/20 and then it is possible to transfer the material.

The System deletes the reservation from the old warehouse/bin location, but it does not create a new reservation on the new place. You lose the reservation information.

Note:

POI (Folio Numbering) is not supported.

It is not possible to transfer material reserved for a Sales order or Pre-invoice.

© 2026 Boyum IT Solutions A/S

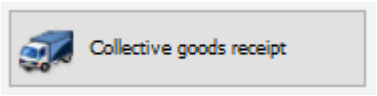
SAP Transfer (Standard):

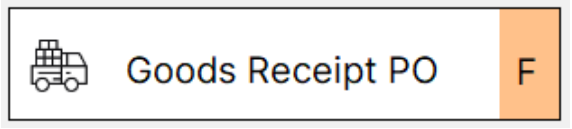
From transfer request, created by Beas (linked to work order): Reservation supported.

For all other: You can't transfer reserved material.

For detailed field descriptions and function buttons ***see***: manual postings.

17.3.2.12 Collective goods receipt





Available with Goods Receipt for Purchase Orders, Labels, Stock Information license.

See Terminal settings in Configuration wizard.

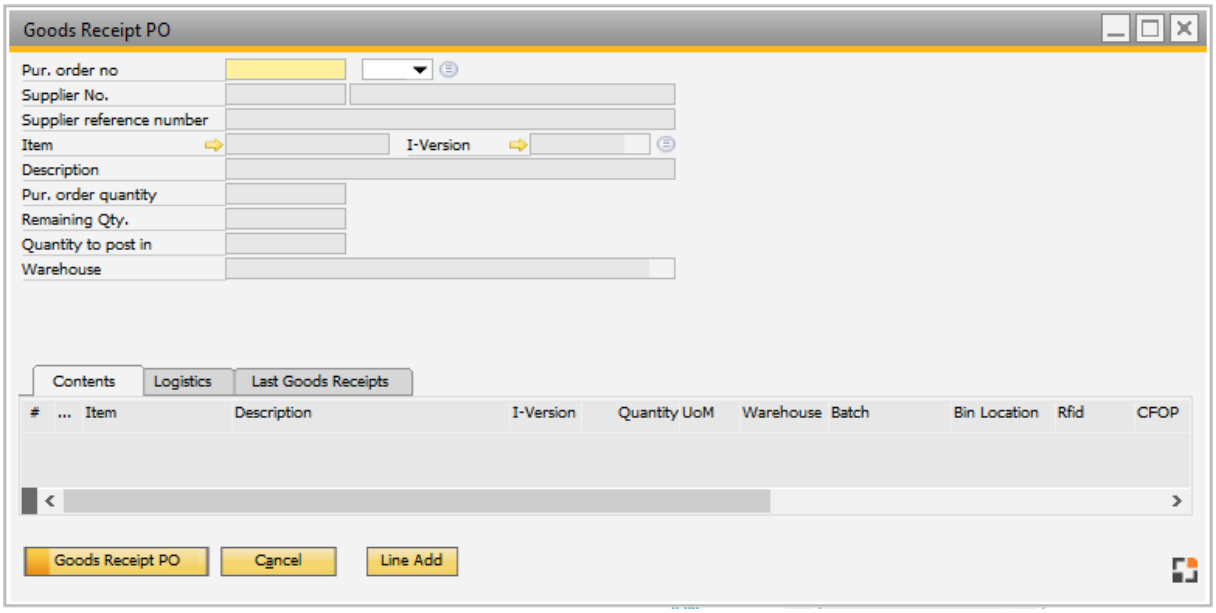
When launching this app, the Goods Receipt Purchase window appears.

Goods receipt is a replacement function for SAP Business One – **Purchase > Good receipt PO**.

This function is ideal to be employed directly at the goods receipt location and supports, apart from supplied parts lists, optimal batch support and serial numbers support, quality control, label printing and some other important functions. Goods receipt creates a regular goods receipt delivery note in SAP Business One.

Multiple Goods Receipt purchase window (default)

© 2026 Boyum IT Solutions A/S



Window mw_goodsreceiptpo_edit.psr

Special Functions:

- Several purchase order rows can be posted in with one goods receipt document
- Posting in several batches, only one goods receipt row is created.
- Summary of different purchase orders is not possible
- All good receipts which has been created on this station via this window are displayed in tab "previous good receipts". Own good receipt function created via SAP B1 or good receipts, which has been created on other stations, are not be displayed here.
- Support Beas, SAP and WMS Bin Management

Single Variant

There are two functions: You can set up the one to be used in **Configuration wizard > Materials management > Goods receipt > Goods receipt type.**

Attention:

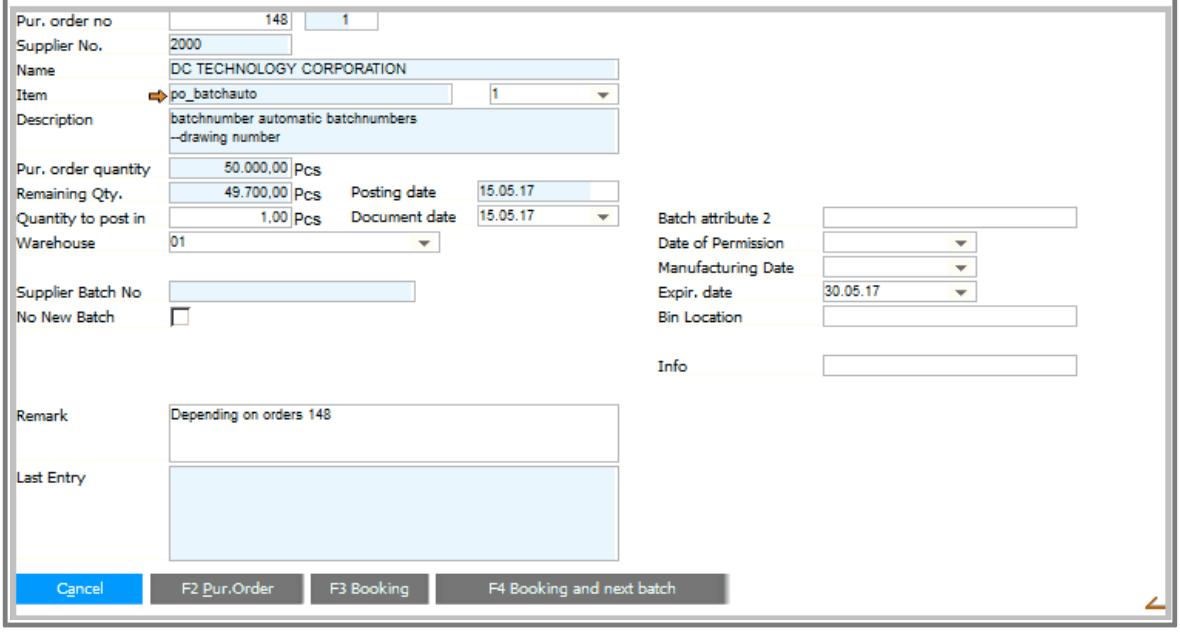
Do not use this Variant. This window is in maintenance and this will not be supported in the future.

This is still available only for reasons of compatibility and will be replaced by the "Multiple".

- Per purchase order row one goods receipt is created.
- For each batch a goods receipt is created.
- Several serial numbers can be posted in with one goods receipt.

© 2026 Boyum IT Solutions A/S

- **SAP functionalities newer than SAP 9.0 are NOT supported.**



Field description

Apart from the order information, additional fields are shown – depending on the item type.
Window settings are available

Note: Localization in this window is not supported.

Field	Meaning
Purchase order number	Select from open purchase orders or purchase requests (switch on the right to open the window open purchases) You can insert the number manually or you can choose this from a list. If you insert the number manually, you can insert only a Purchase order, not Pre-Invoice or Quotation number. If a Document number exists more than once, Beas uses the last document.
Supplier number	Supplier number
Supplier reference number (only for GO type multiple)	Free text

© 2026 Boyum IT Solutions A/S

Field	Meaning
Name	Supplier name
Item	Item
Item description	Item description
Pur. order quantity	Purchases quantity
Remaining quantity	Remaining quantity
Quantity to post in	Quantity to be posted in now. **Warning:** All quantities are shown in the purchasing UoM. The number of decimal places depends on Master data – Units of measure. If per line serial numbers are entered, this field displays the current total quantity according to the sum of all quantities from entries below. Notes on serial numbers: In item master series tab you can set up whether serial numbers are generated automatically or not. Serial numbers are generated manually. If serial numbers are entered per line, these fields show the current total quantity. Automatically generated serial numbers. The quantity can be specified. Serial numbers are generated only at the moment of goods receipt. Number generation is set up in Configuration wizard – Materials management - Goods receipt – Serial numbers.
Date of entry (Only type "single")	The date for the entry. It is normally the current day. Depending on the settings (goods receipt type simple or multiple) this field is to be found under logistics tab.
Reference date	Corresponds to Tax date in SAP document.
Warehouse	Target warehouse

© 2026 Boyum IT Solutions A/S

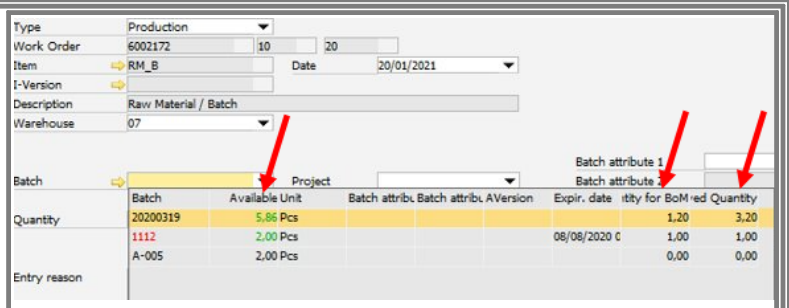
Field	Meaning
	Warehouse stored in purchase order. Representing the primary inventory. Depending on the setting, the quality control warehouse is set up automatically. If a goods receipt warehouse is defined, depending on the rules the associated goods receipt warehouse is entered. Limitations: - SAP Bin Warehouse supported. But it is not possible to make a receipt on different Serial- or Batch Numbers with the same base document line. - Beas Warehouses: The same base line purchase document cannot be received in 2 different bin locations. - WMS bin warehouses are supported, but the same base line purchase document cannot be received in 2 different bin locations. - WMS Warehouses: System creates separate lines for each entry, which means that only 1 entry can be assigned for each base line. ***See***: Configuration wizard – Quality control – Goods receipt Edit warehouse master data
Bin location	Determines to which bin location the goods are posted at receipt. Supported: Beas and SAP Bin Management ***See*** Receipt on bin location Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3) The field has the following components:

© 2026 Boyum IT Solutions A/S

Field	Meaning
	Arrow icon / List of all bins where the item is located. **Selection (Drop-down)** A list opens to select the desired bin location.  **The selected drop-down option displays the following information in receipt documents:** • Bin Location • Warehouse Area • First item in this bin location • Stock of the first item in this bin location The list can be modified in the Configuration wizard. **The selected drop-down option displays the following information in issue documents:** • All stock information of all bin locations with batch- and serial number information. • ⊟ Reserved Batch quantities information  The drop-down contains information on reserved quantities in 3 columns:

© 2026 Boyum IT Solutions A/S

Field	Meaning



The batch entry in the list is displayed in RED color if the Batch is not free.

Quantity-related information:

Field	Description
Available	Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.
Reserved for BoM	Reserved Quantity for this BoM Position
Reserved Quantity	Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Inventory	Stock batch quantity in the bin location.

Select or List - Icon

By using the selection icon, an adjustable selection list opens. Window settings and templates are supported.

- Notes: Beas Bin Warehouse

© 2026 Boyum IT Solutions A/S

Field	Meaning

	The Definition of the bin location is mandatory.
	Notes: SBO Bin Warehouse
	If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type.
	This is entirely managed by SAP Business One.
	
	Drop-down for volume or weight is not supported. Columns are always 0.
	beas 9.3 PL 2
	Notes: WMS Bin Warehouse
	Bin location is mandatory.
	Drop-down for volume and weight not supported.
	Customizing of the drop-down list in Beas 9.3 PL 2 or newer release
	This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.
	
	The following priorities are considered:
	1. Window-related customization (`windowevent setbindropown`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	In the `e_bindropdownbsl` variable, the ODATA command can be defined.
	It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.
	
	The standard functions for receipt and issue are as folows:
	`file stockmanagement.src`
	`function binreceiptdropdown`

© 2026 Boyum IT Solutions A/S

Field	Meaning

```
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$mask=1
end function

function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,
BatchAttribute2,ExpirationDate&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0
end function
```

For receipt, use BinLocation.

For issue, use WareHouseStock.

For more information, ***see*** Beas Service Layer documentation.

Example

-- file stockmanagement.src --

```
// BinReceipt: Show all Bin Locations, ordered by
OnHand descending, BinCode ascending:
function binreceiptdropdown
setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bs
l>)?$select=BinLocation/BinCode,BinLocation/BinColor
,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc
end function

// BinIssue: Show only Bin Locations where OnHand >
0 of the selected ItemCode, ordered by OnHand
descending, BinCode ascending:
function binissuedropdown
setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode
,bsl>)?$select=BinLocation/BinCode,BinLocation/BinCo
lor,OnHand,UoMCode,Batch&$filter=ItemCode eq
<e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand
desc, BinLocation/BinCode asc
end function
```

- Customization of the drop-down list in Beas 9.3 PL 1 or earlier release

Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.

This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.

© 2026 Boyum IT Solutions A/S

Field	Meaning

	The following priorities are considered:
	1. Window-related customization (`windowevent`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	Window-specific adjustments:
	Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.
	
	Example:
	`windowevent setbindropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end event`
	
	Note: This window event is supported in every window where the selection field is available.
	
	General adjustment
	Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.
	
	`file stockmanagement.src`
	`function binreceiptdropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE" from "BEAS_WHSBIN" where "WhsCode"=<e_binwhscode,dbstring> order by "STORAGESORT"`
	`end function`
	
	LIMITATION: The receipt process linked with a purchase order is not able to create receipt for the same line into 2 different bin locations at the same time. As a workaround for this, the user can generate the receipt document in 2 steps or receipt full quantity in one bin location and move the required quantity to a different location after the receipt is created.

© 2026 Boyum IT Solutions A/S

Field	Meaning
Expiry date	Only possible for batch or serial number items. Determines the expiration or end of warranty date. This date is calculated automatically. Setup in Item master > batch tab or Serial number tab
Supplier Batch No	Only possible for batch or serial number items. A supplier batch number can be specified here. At batch: Entered in the field Supplier batch of the batch. If the field "No new batch" is active, the batch entered here is also used as internal batch number. For serial number: Next to the serial number, the batch is entered in the field "Batch".
Serial number	Different depending on selected "Type "in Configuration wizard. ⊞ Goods receipt type single There are three options: 1. Automatic generation If there is no entry, the numbers are generated automatically. Automatic number generation is set up in Configuration > Materials Management. 2. Manual entry The numbers can be separated with commas, e.g. 10004,100023,100Z3 etc. 3. Manual determination of the automatic generation A template is defined which determines the structure of the serial numbers. *The counter is enclosed by { and } . Example of piece count 3: {0010} results in 0010, 0011, 0012 A5-3{002}X results in A5-3002X,A5-3003X,A5-3004X ⊞ Goods receipt type multiple **1. Automatic generation** No serial number can be entered. Quantities > 1 not possible. Serial numbers are generated with the document.

© 2026 Boyum IT Solutions A/S

Field	Meaning
	2. manual determination Serial numbers are entered or scanned and confirmed with TAB/ENTER. Jump to next entry. Quick entry If a lot of serial numbers are to be entered, numbers can be added one by one: after one click the next serial number is added as a new line. Using bar code scanners, the scanner can be configured for adding a key after each read. Then, the user only needs to read all bar codes – no more action is necessary. After the reading has been finished, click on the "**goods receipt**" button to create the document. This function is only allowed with the following parameters: poincomingtyp set to "M". It works with manual serial items only, because for automatic serial items the window does not show a message with the complete serial number information.
Batch	Entry of the batch This field is only visible if "Manual batch entry" or "Batch according to material" has been set in the Batch tab of the item master. The batch number for the item to be posted can be defined here. The quantity and the batch are indicated on "Add row" and then the next batch is captured if multiple batches are posted. Capture of more batch attributes 1. Right-click on the list. 2. Select Window settings. 3. Fields "Batch attribute 1" as well as all other fields, which are

© 2026 Boyum IT Solutions A/S

Field	Meaning
	required are set to "Visible" and "Changeable" . 4. These fields can now be edited directly in the list.
No new batch (Only type "single")	Only for batch items. No automatic generation of the batch number takes place if this is activated. Instead, the batch number entered in delivery batch No. is used. Otherwise the next number is automatically generated. For more on the batch number ***see*** Batch Management.
CFOP	CFOP Tax code Affects only Brazilian localization. The field is displayed only if a code was stored (table OCFP).
Remarks	Input field for remarks.
Last entry	Last posting entry.
UDF 1–15	User-defined fields Note: The information entered in these fields is saved in the table "BEAS_PLANDOCUMENT_LINE", but not in any other UDFs in Beas. Modification is available by customization.

Only displayed for Goods receipt type "multiple"

Lower tabs

Content: Previously entered items which are to be posted in with the same document.

Archive: Previous goods receipts created on this work station.

Logistics:

Field	Meaning
Posting date	The date for the entry. It is normally the current day.
Document date	Creation date of the selected document.
Remark	Free text.
Label	Only for compatibility reasons. Can be used for own Macros.

In the lower list items selected for posting are displayed. With a click on the deletion icon they

© 2026 Boyum IT Solutions A/S

can be removed. Click the goods receipt button to perform the posting.

Functions

Function	Meaning
Line Add	To post in a second item. Previously entered values are displayed below, the upper fields are emptied for new entries. If for a document row more than one inflow was added (e.g. a second batch) the second entry is locked and the selected stock of the first row is used, because for a goods receipt only one warehouse may be selected per document line.
Goods receipt PO	Execute the posting.
Cancel	Close window without saving changes.
Post and new batch	Only for Goods receipt Type "single" and batch-managed items. If an item was entered after posting, the screen not reset. You can easily record the next batch for the same order.

Process

1. Select the order with F2.
2. Enter posting quantity.
3. Execute the order by pressing F3.

(Note: In SAP Business One-environment F-keys cannot be used. These are available only when Beas is started outside SAP Business One)

If a provision parts list exists, it is queried afterwards.

See Provision parts.

Quality control

If a quality control order is stored in the item, it is created immediately after completing the goods receipt. Depending on the settings in Configuration wizard - Quality control - Goods receipt the quality control order is opened immediately.

Automated document printing

Right-click menu > Layout

© 2026 Boyum IT Solutions A/S

Field	Meaning
Preview	Via preview the last printed document can be viewed and printed.
Layout	Opens the Macro window. If in this window a Macro named "default" is stored, it is printed automatically after the goods receipt has been finished. Usually, API "B1DocumentGenerate" is used to access the table "beas_document_header/beas_document_line". If you do not want to use this API, read the internal document number from variable "e_docentry".

Additional Macro parameters for document printing

e_cardcode	Business partner
e_docentry	Internal goods receipt document number (docentry)
e_itemcode	Item number
e_batchnum	Generated batch number
e_whscode	Warehouse
e_quantity	Quantity
e_remark	Note
e_qcorder	Quality control order

Manual document printing

For document printing a corresponding document must be deposited in the Macro settings. The name can be freely assigned.

After creating the goods receipt document, via preview or print icon the last created document can be printed.

Extended fields in purchase

The following fields are filled in SAP Business One – delivery note

Field	Description
Personnel	Personnel number (currently logged on in Terminal, WEB Apps or linked Personnel-SAP-User
Beas Version	Beas Versions used for the posting

© 2026 Boyum IT Solutions A/S

Origin	Origin type. For goods receipt via beas always "B"

See

4 Notes on MRP scenario in area **5**

Note: MRP results with Item versions are not displayed in this area.

5 MRP scenario: (planning view) Result of last MRP run, which has been defined as standard MRP run.

Important: It shows the moment of the calculation. Following the rules, which have been defined in MRP wizard, customer orders are broken down, forecasts are taken into account and other parameters have effect. The result has nothing to do with the current stock and status displayed in the upper area (**1**).

View the upper area for current actual stock.

- Field description current report of stock and reservations **(1)**

All Quantities in Inventory UoM

Field	Description
Warehouse stock	Inventory across ALL storage locations except blocked storage locations.
Thereof	Reserved goods of type "warehouse reservation" (Beas reservation system)

© 2026 Boyum IT Solutions A/S

Field	Description
reserved	**WMS integration:** This field also considers all WMS reservations for locking types Batch, LUID and Detail.
Blocked stock	Total inventory of blocked batches or in blocked warehouses. If MRP wizard in stored Standard MRP run it was set up, that blocked batches are available, these will not be displayed here. If the option is disabled, blocked batches are displayed as usual blocked stock.
Sales order	Planned issue for customer orders and reserve invoices. Determined by SAP Business One *OITM.committed*
Thereof reserved	Reserved quantity for customer orders.
Goods issue for Production	Planned issue for production Planned quantity as per BoM, minus already posted quantity plus canceled quantity. Only work orders are considered which are visible, not completed and not blocked. Planned work orders are not considered. Note on post calculation: As reference serves the Total Quantity *BEAS_FTSTL.TOTALQUANTITY_WHSUNIT* less all already performed issues and receipts. For computation the SQL Procedure `beas_invhistory` is used. Blocked work orders *BEAS_FTHAUPT.SPERRUNG<>'I'* are considered if they are planned orders *BEAS_FTHAUPT.PLANNINGORDER=1* Planned quantity as per BOM, less already posted quantity plus canceled quantity. Only work orders are considered which are visible, not completed and not blocked. Planned work orders are not considered. Negative planned quantities are ignored. These are part of "goods receipt from production". If position is not closed and you post out more quantity than planned, it produces a negative quantity. ***Example***: Planned: 10, Post out 15 = -5

© 2026 Boyum IT Solutions A/S

Field	Description
Goods receipt from production	Planned receipt from production Summary of planned receipt from production minus already posted and manually reported quantities plus canceled postings. This is the sum of Production Positions and Bill of material positions with negative quantity. Only work orders are considered which are visible, not completed and not blocked. Planned work orders are not considered. If position is not closed and you post in more quantity than planned, it produces a negative quantity. ***Example***: Planned: 10, Post in 15 = -5
Goods receipt from PO	Planned receipt from purchase orders, determined by SAP Business One (Field "ordered". Use the MRP wizard to configure whether unreleased orders should be considered.
Available	Warehouse stock minus reservations plus planned receipt.

Functions

Function	Meaning
Print	Open printer selection to print the current view. Note: stock report (middle part) is not printed.
Inventory Movements List	Open Inventory Movements List.
Document open	Open the assigned document, which was marked in the lower list.

Window settings are available.

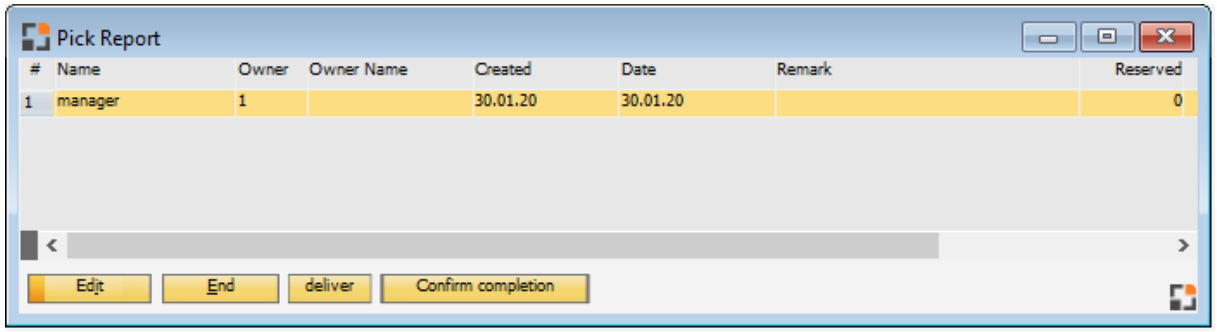
17.3.2.14 Picking List

Available with Issue, Receipt, Allocation for production, Pick and pack, Stock information license.

See Terminal settings in Configuration wizard.

With this app you can access released picking lists.

© 2026 Boyum IT Solutions A/S



Window pick_countchoose.psr

Attention: this app does not support serial-managed items.

Functions

Function	Description
Edit	Edit the picking list selected in the Pick Report.
Deliver	This button opens the delivery document linked from a sales order. In Sales order > right-click > "Deliver", you can deliver reserved items. Additional information for the delivery can be entered here, which will then be transferred to the subsequent document. PATH: Sales > Sales order > right-click on an item > "Deliver"  *Window shipping_delivery_header.psr* **Field** / **Description** Order: Order number From: Creation date Customer: Customer ID

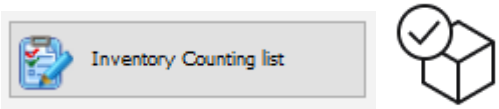
17.3.3 Inventory apps

This chapter includes apps to count inventory.

17.3.3.1 Inventory Counting list



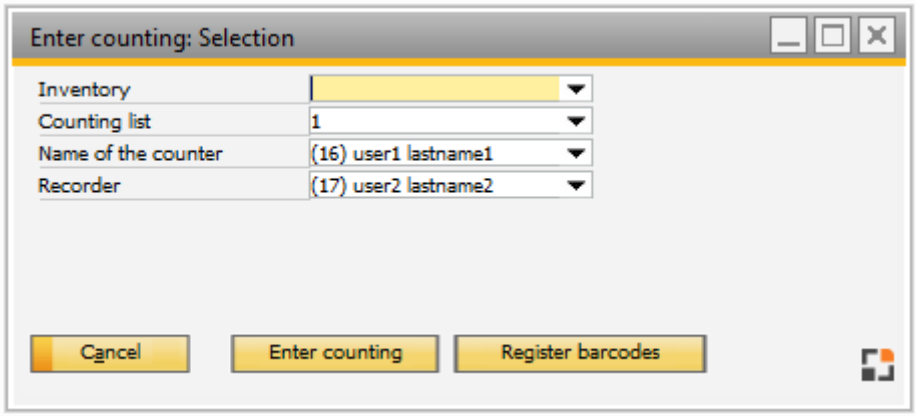
Available with Inventory license.

See Terminal settings in Configuration wizard.

This app opens the Enter counting: Selection window.
Selection window for counting lists entry. Via "Enter counting" inventory can be registered in a list. The entries are saved immediately, making possible a simultaneous registration by several employees. Next to stock other values as batch information or bin corrections can be registered. The count list is dynamically adjustable and supports templates. Depending on the kind of inventory, counting entry can be adjusted, for example "only counted" what means that the switch "counted"is activated, but no stock is entered.

© 2026 Boyum IT Solutions A/S

PATH: Inventory > Inventory transactions > Enter counting: selection.



Window mw_inventory_counting_choose.psr

Call up via Annual inventory, via Cycle Count Recommendations or via menu item "enter counting", it can also be included in the terminal screen. A reading access on inventory is required. When called up via the menu item "enter counting", the active inventory, the counter, typist and the count list need to be specified. If no count lists are defined, leave the "1".
If called directly from inventory, as user the person currently logged in will be used. All counting lists are displayed.

Button

Button	Meaning
Enter counting	Open Counting list.
Register barcodes	Open Bar code registration.

back to inventory.

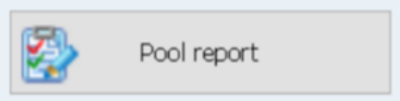
WO Logon
WO Logoff

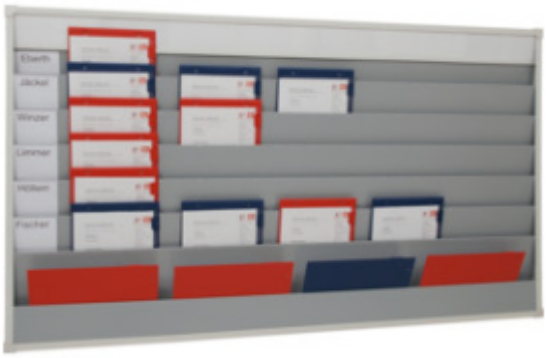
17.3.4.1 Pool Report



Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.
The pool report is only accessible via the Terminal application and WebApps Terminal 2.0.
See Terminal settings in Configuration wizard.

The idea and of the Pool report is to display the work for one worker for the next 1-2 days. The employee can easily see and check their work sequences for the upcoming short period. These tasks can also be logged in. The optional material availability check shows whether the required material is available, and only operations from the current pool are displayed (normal pool 1).

This is the same concept as a manual, paper-oriented planning board, but it is paperless and offers more functionality.

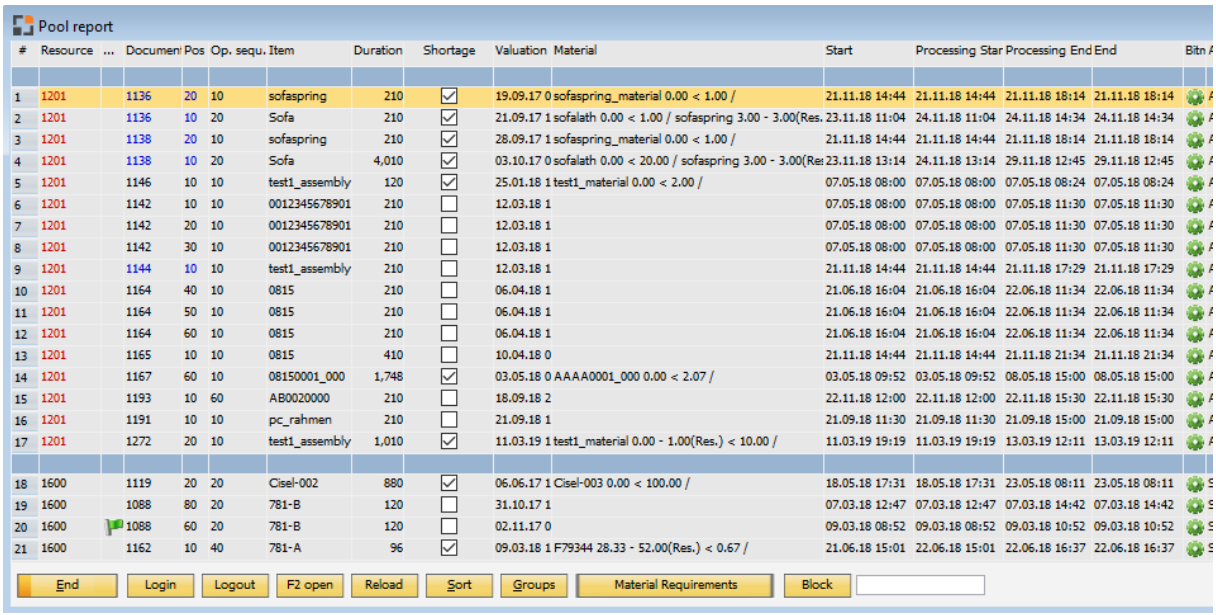


© 2026 Boyum IT Solutions A/S

NOTE:

Don't use the pool list for administration of the open routing position. For this the function Work list is available.

This window is dynamically adjustable; it displays order, size and the view of the fields can be changed. By using the lower input field or right-clicking in the title, you can filter and sort the list. Templates are supported. The list can be customized and saved per user.



Window bde_terminal_poolinfo

What can the Worker see?

- The list only shows resources which may be operated via terminal: Stations settings terminal .
- The employee may only log in to the resource stored in Personnel master **FDC tab > Resources**.
- Multiple log-on to several operations at once is possible if enabled in Configuration wizard (**direct logon / logoff**).
- Only the current Pool.
- Only if the Routing position is the first operation or if there is a time receipt for the preview routing position.

Default pool list sorting is done by resource and valuation date according to pool valuation. ***See*** Pool control.

IMPORTANT!

© 2026 Boyum IT Solutions A/S

The Pool list shows a section of the resources set in the Work Station Terminal and Personnel settings.

Examples:

Resources: A1, A2, B1 and all resources (%) or all resources starting with letter A and B (A%, B%)

- Work Station: A1 Personnel: A1 --> The Pool list is displayed.
- Work Station: A1 Personnel: A2 --> The Pool list is NOT displayed because the Station can only show A1 but the person is only allowed to see A2.
- Work Station: A% Personnel: A1 --> The Pool list is displayed because the station can show all (%) resources that start with the letter "A".
- Work Station: A, % Personnel: B1 --> The Pool list is displayed because the station allows all, as for second a resource "%" is defined.
- Work Station: B% Personnel: A1 --> The Pool list is NOT displayed because the station can only show show resources starting with B.
- Work Station: B% Personnel: A1, % --> The Pool list is displayed. Person has main resource A1 but with % in second Personnel resource setting is allowed to see all.

See VIDEO:

Performance ⚠

Using the pool list as an "administration list" to display the work of all workers – that is planning the entire work list of all workers – results in severe performance issues.

As displaying the pool list is highly CPU-intensive, this incorrect utilization of the list can slow down processing significantly.

In Beas 9.3 PL 3 we delivered a Work list for administration purposes.

What to do if Performance is not optimal.

Functions for the correct usage:

Duration: If the time to open the list takes more than 5 seconds, we display information on how to use the list correctly with Link to the documentation.

If opening the list takes too much time, you can see a warning message (***see*** below), recommending the deactivation of material check in the Configuration wizard.

If you do not want to see it again, click on "do not show anymore". If you want to see more information: Click on "** documentation **".

© 2026 Boyum IT Solutions A/S

beas 9.3 PL 2 HF 2

Optimize performance

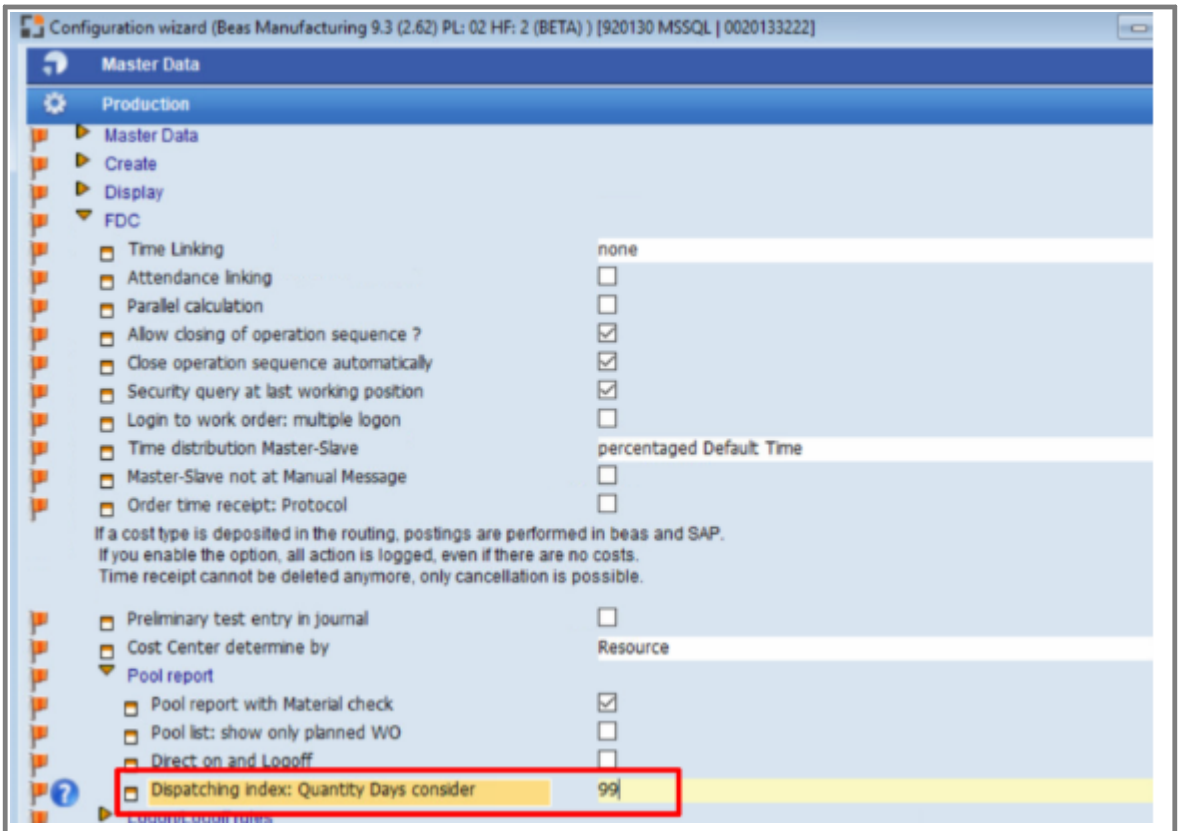
1. Disable Pool Report -> with Material check, because the online Material check takes too much time.
2. Reduce days of "Dispatching index: Quantity days consider".

If you reduce this to example 2, you can see only routing positions with Start date in the past or next 2 calendar days.

Important:

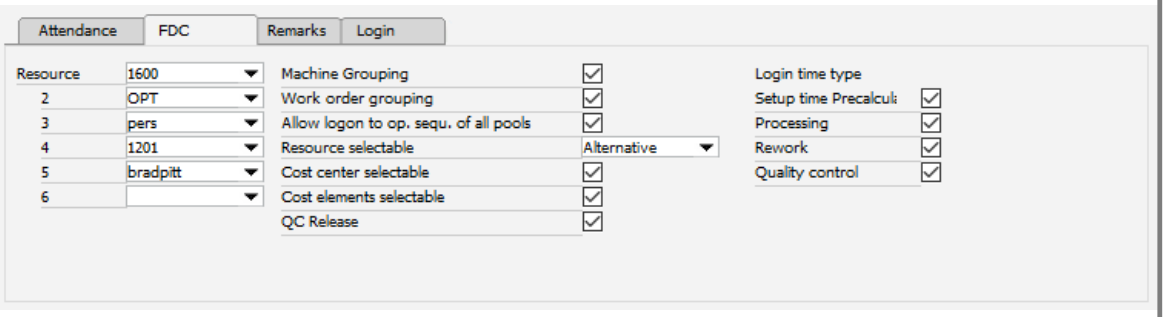
If you do not work with APS forward calculation (APS license required), changing the setting "Dispatching Index" can cause a risk, as the date/time may be wrong inside the start date field of the routing position.

© 2026 Boyum IT Solutions A/S



beas 9.3 PL 2 HF 2

3. Personnel – Master data



Only define the resource with which the worker has to work. Do not work with * or %.

Field descriptions

Field	Meaning
Resource	Resource.
...	Green flag: Order has been registered by the person currently logged on. Orange flag: Order has been registered by someone else.

© 2026 Boyum IT Solutions A/S

	No flag: Order not registered. Red hand: interruption has been reported for this resource.
Document	Work order document number.
Pos	Position in work order.
Operation	Operation number.
Pos2	Position of parallel resource.
Item	Item designation.
Duration	Total duration without consideration of already reported times.
Quantity	Total reported quantity in consumption units of the assembly (not time receipt unit).
Quantity already reported	Reported quantity in consumption units of the assembly (not time receipt unit).
Shortage	Check mark shows if there is a shortage of material.
Start	Start date/time of operation.
Processing start	Start date/time of processing.
Processing end	End date/time of processing.
End	End date/time of operation.
Valued start	Valued start time. Calculated by pool calculation function. The date determines the order in pool list. ***See*** Introduction Pool control.
Activity	Description of activity (operation).
Material	Used material.
Assembly – Match code	Match code of the assembly.
Assembly – Designation	Designation of assembly.
Assembly – Group	If assembly was assigned to a group .
Production – Delivery	Delivery address.

Button

Field	Meaning

© 2026 Boyum IT Solutions A/S

F2 open	Open operation to start work. There, you can log on or log off the operation post material. ***See*** Edit operation in pool list.
Login	Only displayed if you enable: **Configuration wizard > Production > FDC > Pool report > "Direct logon logoff"**. All marked operations can be logged on at once.
Logout	***See*** above.
Refresh Window	Update the list. If another employee has started or completed an order in the meantime, this will be displayed after refresh.
Sort	(Right-click in the respective field) A sorting is performed by: resource and work order start date, work order, item.
Group	Displays resources in groups.
Material requirement	Open material requirement list. Available only with the respective authorizations. ***See*** Personnel – Editing rights – Extended.
Block	The selected order is blocked, and removed from the pool list. Available only with the respective authorizations. ***See*** Personnel – Editing rights – Extended.

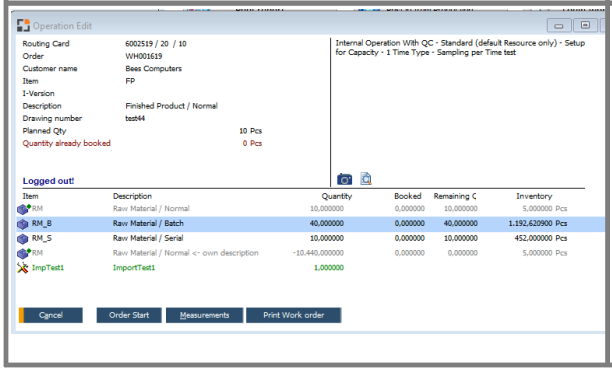
Priorities

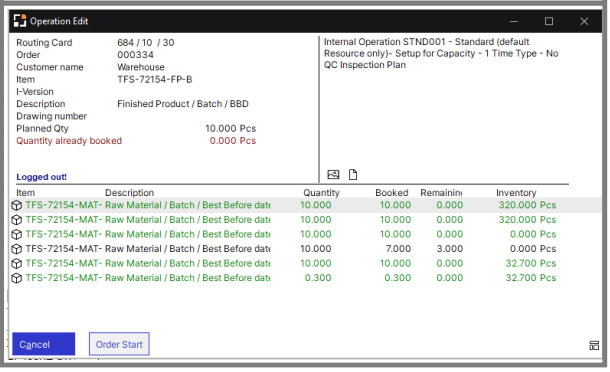
17.3.4.1.1 Edit operation in pool list

Using the Pool list the window "Edit operation in pool list" can be called up.

PATH: Production > Factory Data Capture > Terminal > "Pool Report" app > double-click an entry / **F2 open**.

© 2026 Boyum IT Solutions A/S

Traditional Style	Boyum Style
	




Window fert_afo_anmelden.psr

Here, you have the following possibilities:

- Logon/Logoff operation
- Issue material
- View activities and stored images

Activities / Images

Right above the activity is displayed (Operation - activity description). Click the photo icon / to display images stored in

a) Operation

b) Item master

c) Resource

d) Tool

Click on the / symbol and the Instructions dialog window opens. Add instructions to the work order here.

Material list

In the lower part, the material requirement list is displayed.

Field	Meaning
Item	Item ID
Description	Item description
Quantity	Planned quantity for the Work order

© 2026 Boyum IT Solutions A/S

Booked	Already posted for this work order
Remaining quantity	Remaining quantity yet to produce
Inventory	Total item inventory (from warehouse) defined in the BoM position. Batch managed items: only non-locked batches. Limitation: Item Versions and reservations are not supported.

All quantities are displayed in consumption units.

COLOR CODE	Meaning
Gray	Not belonging to the selected operation or posted automatically
Green	Booked
Black	Part of the selected operation
Green point top right of the icon	Material positions posted automatically or backflushed.

Button

Field	Meaning
F2 Issue	Issue the currently selected position. Only possible if the selected line is not grey. The "material issue screen" is called up.
F3 Confirm	Visible only if the operation is logged on. Then you can insert all relevant information to log off the operation in the Time receipt window which opens.
Order start	The order is started. Visible only if the order was not started before. The window "Order logon" is opened.
Measures	Visible only if behind the selected operation a QC-order was stored. Measurement position can be registered. The window "QC-order" is opened. NOTE: With more than 1 measurement position, only the first is opened with this button. If you wish to have a different system behavior for this function, implement BeasScript.
Print	Print the current view or Macro selection, if stored.

17.3.4.2 Activity

Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

The activity report provides a list of Time Receipts for the person that is logged in.

Edit existing and add new time receipts in this browse window.

For field descriptions ***see*** Time Receipts .

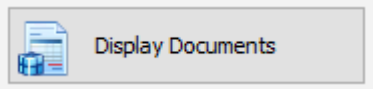
See Terminal settings in Configuration wizard.

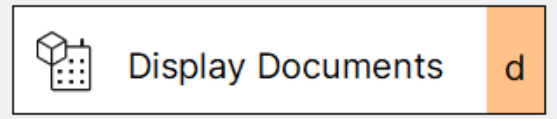
Buttons:

Button	Description
Search	This button opens a filtering pop-up window to search for activities of the logged in person by: - order - resource - reason - project - document
Edit	Edit the Time Receipts of the selected activity.
End	Closes the app.
New	Opens the Time Receipts window for a new activity.
Delete	Delete the selected Time Receipt.
Back	When clicking this button, the activity report list displays the activities for the previous day. The actual date is indicated in the top window bar.
Today	Displays the list of activities for the current date.
forward	When clicking this button, the activity report list displays the activities for the next day. The actual date is indicated in the top window bar.
Date	Opens the Query window to add a date of your choice. The activity report, then, lists the time receipts for the selected date.

© 2026 Boyum IT Solutions A/S

17.3.4.3 Display Documents



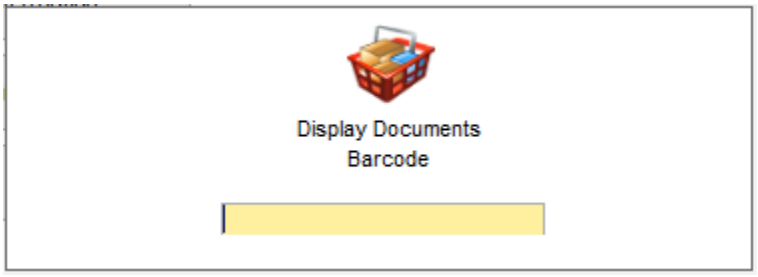


Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

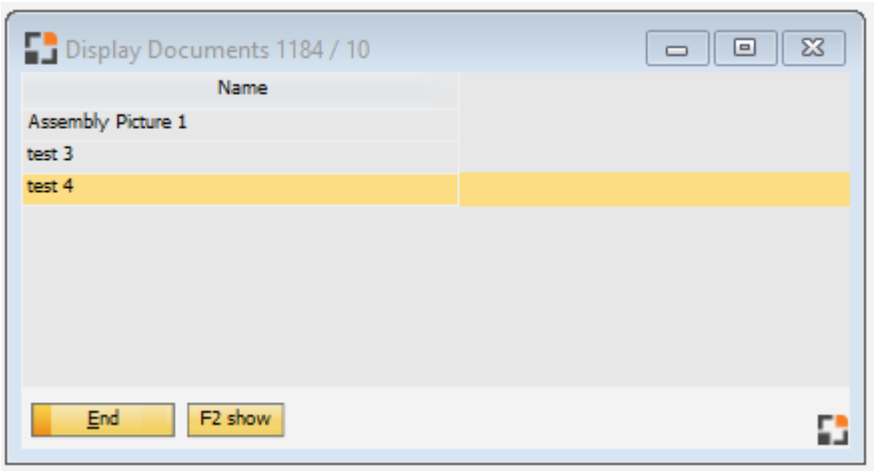
See Terminal settings in Configuration wizard.

With this app you can display attachments that were linked to a Work order position.

1. A window pops up to enter the Bar code of the WO position.



2. After entering the Bar code, you can see the number of the WO position in the top bar after the "Display Documents" caption.

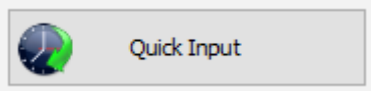


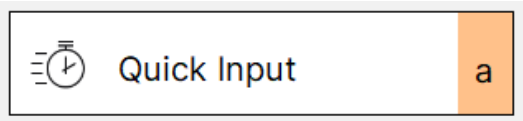
3. Click **F2 show** and the browse window for Documents opens.

See WO document attachments

© 2026 Boyum IT Solutions A/S

17.3.4.4 Quick Input





Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

See Terminal settings in Configuration wizard.

This app opens the Quick Input tab of the Production Time Administration window in a separate window.

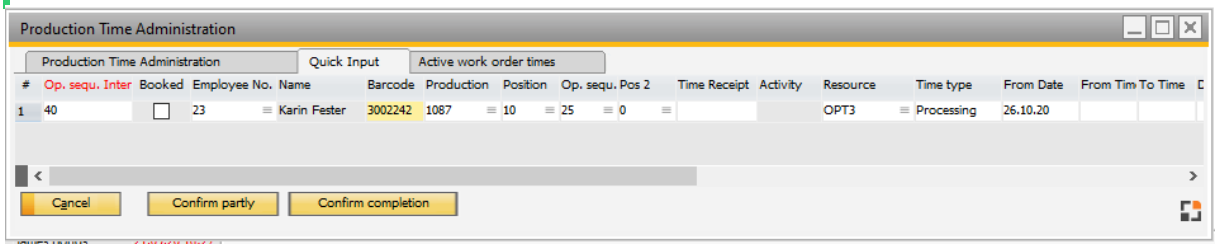
The Quick Input tab is used to report several time receipts in a list form.

All fields available at the time receipt are also available in quick input but in a grid format. Each row is a time receipt and the columns are the fields.

For field descriptions ***see*** Production Time Receipt.

Several lines can be added with the required information and then the information is added to the database when the confirmation buttons are used.

PATH: Production > Factory Data Capture > Production Time Administration > "Quick Input" tab.



Window fert_arbzeit_schnellerfassung.psr

Button	Description
Cancel	Closes the window without any action.
Add	Adds a new line.
Delete	Removes the selected line from the list.
Confirm partly	Part confirmation for all entered operations or complete confirmation if in the Close column a check mark was set.
Confirm completion	All operations on the provided list are posted and closed.

Important: Parallel calculations and the automatic division of the reported times to resources

© 2026 Boyum IT Solutions A/S

does not work from this window. The time receipt must be created in the terminal. This setting is available in **Configuration Wizard > Production > FDC > Parallel calculation**.

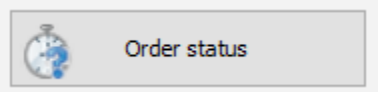
Field	Description
Booked	Check mark is displayed when booked.
Pers.No.	Employee number of person reporting the time receipt (setup in **Attendance > Personnel**).
Name	Name of the employee.
Default branch	Default branch of the item.
Barcode	Bar code printed on the work order document (***see*** **Routing > position > extended > Barcode**).
Production	Work order number.
Document	Work order of the previously selected document.
Position	Position of the work order document.
Op. sequ.	Operation to be reported.
Pos 2	Parallel resources of the operation (previously resource pos).
Activity	Reported activity.
Resource	Resource Pre-assign a resource stored in the operation. Use right-click to select resources available for this employee. Any resource can be entered manually, resource groups are not allowed and therefore not selectable. ***See*** Resource rule Personnel Resources Resources
Cost type	Cost type on which costs are to be booked.
Cost center	Cost center to be charged (Business performance).
Time type	Time type In the resource up to 4 time types can be stored. With right-click the time type can be selected.After selection, it is checked, whether the

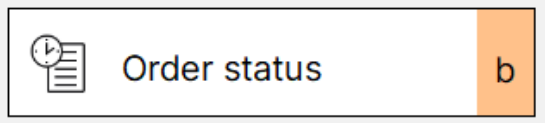
© 2026 Boyum IT Solutions A/S

	time type is allowed for the current resource. If not, the default type is inserted. For more information ***see*** Time type *beas9.0-004-000-000*
From Date	Start date.
To Date	Date of valuation.
From time	Start time.
To time	End time.
Duration	Duration of work order time. Can be changed after calculation.
External price	External price.
Valuation date	Valuate to the specified.
Closed	Shows if the operation closed.
Quantity yield	Produced quantity that is free from defects.
Quantity yield RE	Entry quantity in entry units, defined in operation. ***See*** Production – Routing – Extended – Time receipt unit.
Scrap	Scrap quantity in reporting units.
Unit	Quantity unit.
Item	Item number.
Information	Additional information.
Drawing number	Optional field.

back to production times administration

17.3.4.5 Order Status



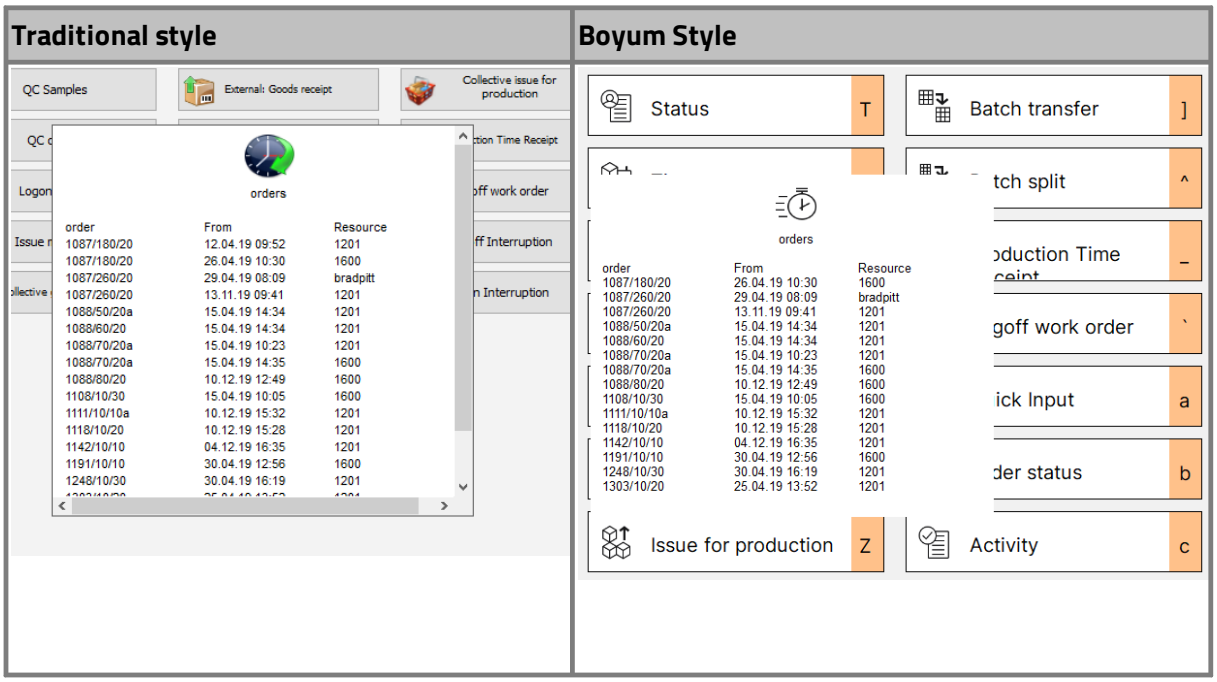


Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

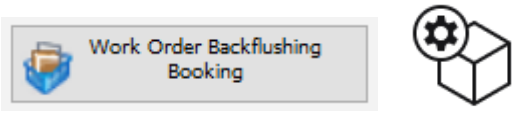
See Terminal settings in Configuration wizard.

© 2026 Boyum IT Solutions A/S

With this app you can display a brief status report on ongoing Work orders.
It lists the logged in Work order positions with the starting time and the Resource (***see*** image below).
The status report is displayed in a pop-up window that is not editable, and disappears after a few seconds.



17.3.4.6 Work Order Backflushing booking

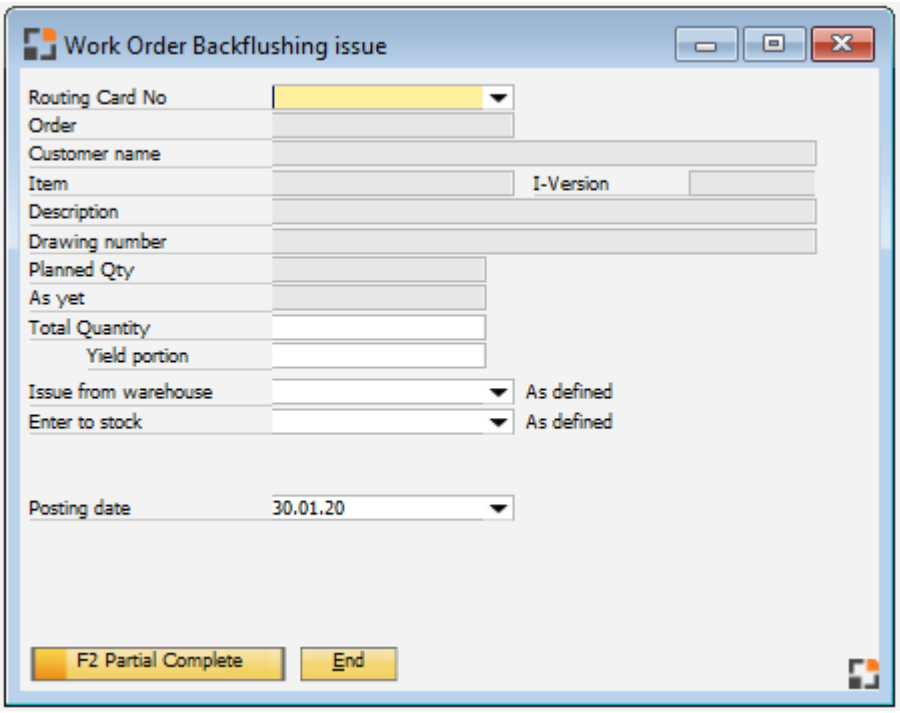


Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

See Terminal settings in Configuration wizard.

Clicking on this app will open the Work Order Backflushing issue window.

© 2026 Boyum IT Solutions A/S



Window fert_retrograd_abbuchen.psr

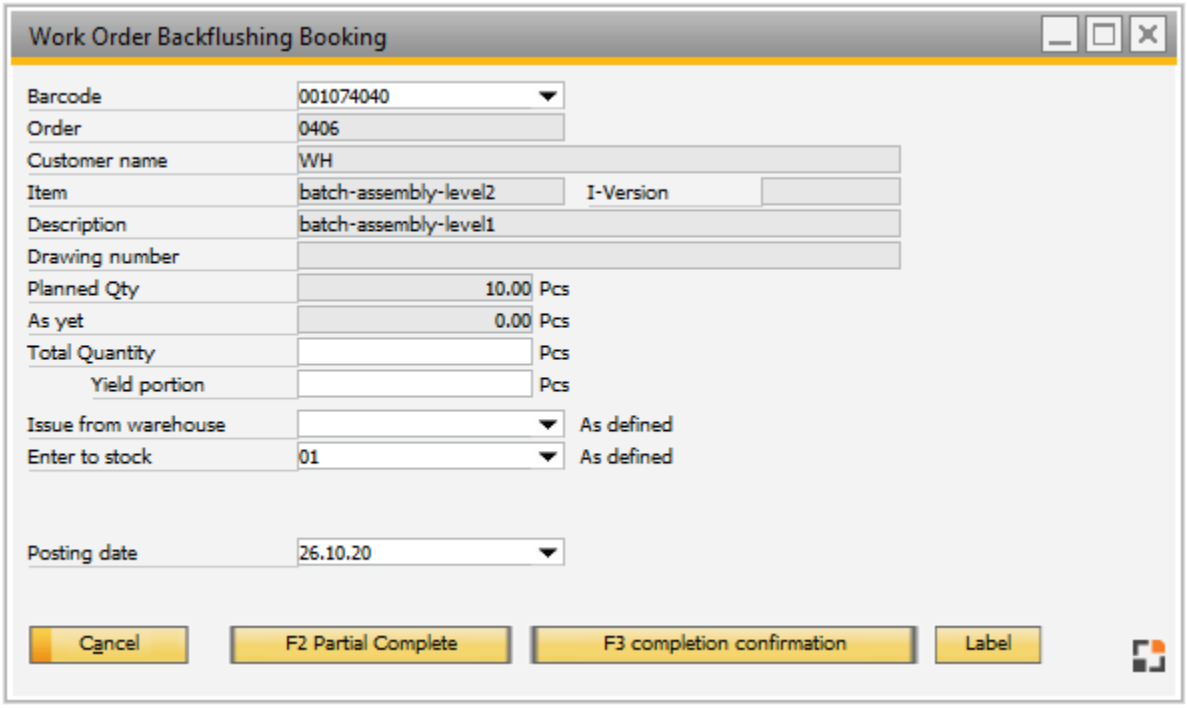
With this function you can create a receipt for the finished goods item and backflush all necessary materials.

For this you only need:

- Bar code of the work order position
- Quantity

PATH: Production > Factory data capture > Work Order Backflushing Booking

© 2026 Boyum IT Solutions A/S



fert_retrograd_abbuchen

Backflushing is used to automatically remove material that is allocated to a work order and is marked as "backflush". The work order is selected for this (alternatively, the routing slip bar code can be scanned). Then, you specify the total quantity to be reported and the yield to be received. After inputting the number of units, the corresponding quantity of materials is issued and the finished good is entered.
The material is issued from the inventory location stored in the BoM and the primary item inventory, respectively. If an inventory location is specified for "Issue from storage location", the material is posted from this inventory location.

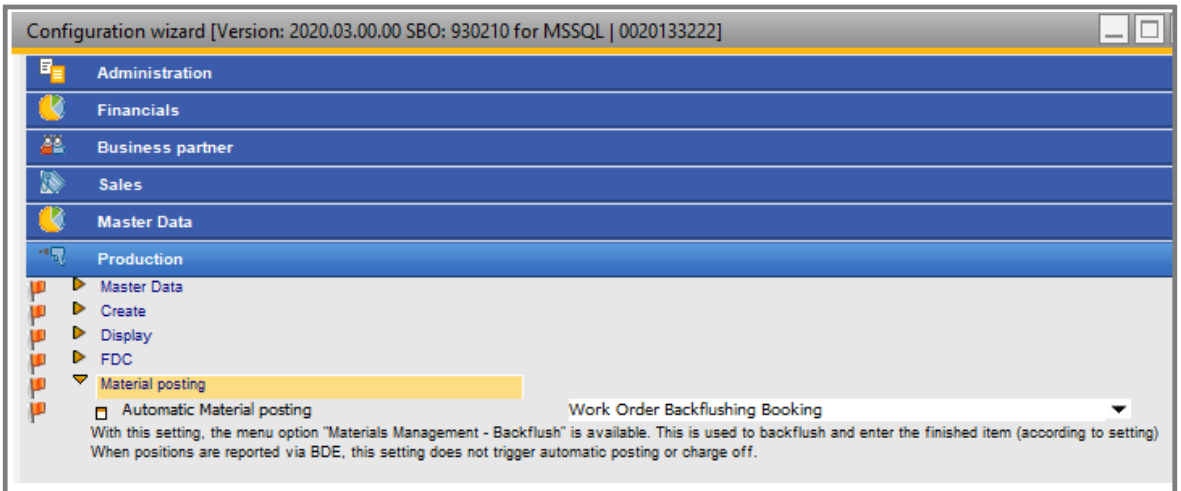
WMS Integration: Produmex WMS Batch attributes are supported.

You can use this window only if this window is activated in the Configuration wizard.

- Setup

  In the Configuration wizard you must activate **Production > Material posting**: **Work Order Backflushing Booking**

© 2026 Boyum IT Solutions A/S



Note:

It is not possible to use this window in parallel to the backflushing functionality on the last/first routing position!

In **Configuration Wizard > Production > Material posting > Backflushing** you can define all additional Backflushing options.

The "Exceeding planned quantity allowed" Configuration parameter affects WO material backflushing: Minimum/Maximum values are related to receipt quantity.

Setup: Configuration > Production > Work Order Backflushing Booking

These settings affect the following functions:

- Desktop version Work order backflushing
- WebApp WO Backflushing
- Manual receipt window.

They are visible only if in Configuration wizard > Production > Material posting > Material posting automatically at "Work order backflushing" was selected.

PATH: Administration > System Initialization > Configuration wizard > Production.

Parameters

Name	Description
Selection warehouse location	Activate the warehouse fields for issue and receipt process in backflush window Standard: use default warehouse defined in work order or in issue process

© 2026 Boyum IT Solutions A/S

Name	Description
issue Selection warehouse location at receipt	related to issue rules. If you activate this setting, the user as additional fields: "Issue from warehouse" and "Enter to stock"  Note for receipt: If the receipt warehouse is changed, problems may arise with the WIP account. That is why this option should not be activated when working with different warehouse-dependent WIP accounts.
Book times automatically	When active, planned times are reported as actual times confirming the last position. If this option is activated, the times are also automatically booked in the backflushing process.

© 2026 Boyum IT Solutions A/S

Name	Description
	 This function is available in Work order backflushing WebApp WO Backflushing Manual receipt for work order (only if ".. to employee" is defined !) It creates time receipts for the following routing position: - Clock mandatory is activated - Routing position is active - Duration time is defined - Routing position - Extended - "Block login" is disabled. **The default time is computed as follows:** First confirmation: `(planned processing time per unit * reported quantity) + setup time` Second confirmation: `(planned processing time per unit * reported quantity)`

© 2026 Boyum IT Solutions A/S

Name	Description
	 Setup Time: field "`Setting up Capacity`" Planned processing time: field "`Processing`" For correct calculation, the system checks Quantity per, Time Unit, Use factor and Work steps. "`Personnel`", "`Quality Control`" Parallel resources are supported. Fix times (Quantity per time=-1): The system calculates `Processing time / reported quantity` Only Cost type for processing is supported. Master Slave settings are ignored. The system creates the time receipt for all routing positions. Quality control orders in Routing positions are supported. Start/End Date for time receipt is Current or the Date defined in the receipt/backflushing window. Employee in time receipts is the currently logged in employee. For more information ***see*** setting "..to employee no" below. **ALTERNATIVE METHOD** As an alternative, use the option in **Configuration wizard > Calculation > Post-calculation > "Plan=Actual if no time receipts"**, or use the valuation method in **Configuration wizard > Production > Valuation and Posting of assembly - Valuation -** planned costs.
... To	Only displayed if option above "Enter times automatically" was enabled.

© 2026 Boyum IT Solutions A/S

Name	Description
employee no	Define t the employee number can be entered here for automated booking, if no employee is connected. **Terminal / WEB APP**: The system use always the current logged in Employee and ignore this setting **Beas Desktop**: If an Employee is linked to current use, it use the linked Employee, otherwise this setting.

see Material posting, backflushing

- Partial posting or final posting

The posting process without closing the WO is done via button "Partial posting" or clicking on F2.
The posting process with closing the WO position or WO is done via button "Final posting" or clicking on F3.

Completion confirmation – Button only visible if
a) There are no uncleared time records.
b) It is not about an overhead costs-order (definable in production type).
c) **Configuration wizard > Production > Valuation and posting of the assembly > Post finished parts when** is not set to manually.
d) The variable "lb_cannotclose" is not set to 1 in windowevent "cancloseorder".

Example script: General hide of button "Completion confirmation"

```
windowevent cancloseorder
setvar=lb_cannotclose=1
end event
```

- Automatic Pre-allocation

For items, set to "backflushing", quantities to be posted are automatically pre-allocated. Other entries are not pre-allocated.

Batches and serial numbers are only pre-allocated automatically, if in **Configuration wizard > Production > Material posting and reservation > Backflushing > "Post batches also" or "Post serial numbers"** has been enabled. Click on "pre-allocate" to pre-allocate batches or serial numbers manually. If batches or serial numbers has been reserved, independent of settings,

© 2026 Boyum IT Solutions A/S

these are always pre-allocated automatically.

Order of withdrawal is defined as:

1. Reserved goods
2. Allocation warehouse
3. Standard warehouse (as per BOM item or standard warehouse of item)
4. BoM definition, Bin location (when bin location is defined)
5. Within this order the withdrawal rules from **Configuration wizard > Production > Material posting and reservation > "Automatic batch issue by ..."** apply.

All other warehouses are not considered, but you can withdraw manually from these warehouses.

- Field description

This window can be accessed from the menu as well as from the terminal.

Field	Meaning
Bar code	Drop-down selection. Displayed: routing card no, bar code, order, item, item description, customer name.
Order	Order number from Work order.
Customer name	Customer name.
Item	Item.
I-Version	Item version (with activated item version control).
Description	Free Text.
Drawing number	Drawing number.
Planned Qty	Planned Qty from work order. Display in Inventory UoM.
As yet	Confirmed until now. Entry in Inventory UoM.
Total Qty	Total reported qty of the current time receipt.
Yield portion	Yield portion of the total reported quantity.
Issue from warehouse	- From which warehouse to issue. This field is only displayed if activated in **Configuration wizard - Production > production backflushing > Warehouse selection for issue**

© 2026 Boyum IT Solutions A/S

Field	Meaning
	If active, this warehouse is used for issue. This has a higher priority than the default warehouse in BoM.
Enter to stock	Receipt the assembly to which warehouse This field is only displayed if activated in **Configuration wizard > Production > production backflushing > Warehouse selection for issue** By default, the assembly is posted to the warehouse, given in work order item. ***See*** Warehouse rules. NOTE: Changing this warehouse with warehouse depending account determination active can lead to differences on the WIP account.
Bin Location	Define target Bin location Only visible if the receipt warehouse is a bin managed warehouse. Here you can define the bin location for the assembly. ***See*** Warehouse rules. Beas supports WMS, Beas, and SAP Business One Bin Management (Beas 9.3 PL3) The field has the following components: **Arrow icon** / List of all bins where the item is located. **Selection (Drop-down)** A list opens to select the desired bin location. 
© 2026 Boyum IT Solutions A/S

Field	Meaning
	The selected drop-down option displays the following information in receipt documents: • Bin Location • Warehouse Area • First item in this bin location • Stock of the first item in this bin location The list can be modified in the Configuration wizard. **The selected drop-down option displays the following information in issue documents:** • All stock information of all bin locations with batch- and serial number information. • ⊟ Reserved Batch quantities information  The drop-down contains information on reserved quantities in 3 columns:  The batch entry in the list is displayed in RED color if the Batch is not free. **Quantity-related information:** **Field** / **Description** Available / Available quantity is = Inventory - reserved quantity + reserved quantity for current work order position. This quantity is displayed in GREEN, if

© 2026 Boyum IT Solutions A/S

Field	Meaning
	<table><tr><th>Field</th><th>Description</th></tr><tr><td></td><td>quantity is reserved for the currently used Bill of Materials position. **WMS integration:** Goods issue > This field also considers all units available for WMS lock types Batch, LUID and Detail.</td></tr><tr><td>Reserved for BoM</td><td>Reserved Quantity for this BoM Position</td></tr><tr><td>Reserved Quantity</td><td>Total reserved Quantity **WMS integration:** Goods issue > This field also considers all WMS reservations for locking types Batch, LUID and Detail.</td></tr><tr><td>Inventory</td><td>Stock batch quantity in the bin location.</td></tr></table> **Select or List - Icon** By using the selection icon, an adjustable selection list opens. Window settings and templates are supported. Notes: Beas Bin Warehouse The Definition of the bin location is mandatory. Notes: SBO Bin Warehouse If the bin location is not defined, Beas uses the default bin location for this item for the specified transaction type. This is entirely managed by SAP Business One. Drop-down for volume or weight is not supported. Columns are always 0. *beas 9.3 PL 2* Notes: WMS Bin Warehouse Bin location is mandatory.

© 2026 Boyum IT Solutions A/S

Field	Meaning

	Drop-down for volume and weight not supported.
	Customizing of the drop-down list in Beas 9.3 PL 2 or newer release
	This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.
	
	The following priorities are considered:
	1. Window-related customization (`windowevent setbindropown`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	In the `e_bindropdownbsl` variable, the ODATA command can be defined.
	It is beneficial to use the Beas service layer, because Beas supports different warehouse systems that use different tables and logic.
	
	The standard functions for receipt and issue are as folows:
	`file stockmanagement.src`
	
	`function binreceiptdropdown`
	`setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bsl>)?$mask=1`
	`end function`
	
	`function binissuedropdown`
	`setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode,bsl>)?$select=BinLocation/BinCode,BinLocation/BinColor,OnHand,UoMCode,Batch,IVersionId,BatchAttribute1,BatchAttribute2,ExpirationDate&$filter=ItemCode eq <e_itemcode,bsl> and OnHand gt 0`
	`end function`
	
	For receipt, use BinLocation.
	For issue, use WareHouseStock.

© 2026 Boyum IT Solutions A/S

Field	Meaning

	For more information, ***see*** Beas Service Layer documentation.
	
	Example
	-- file stockmanagement.src --
	
	`// BinReceipt: Show all Bin Locations, ordered by OnHand descending, BinCode ascending:`
	`function binreceiptdropdown`
	`setvar=e_bindropdownbsl=BinLocation(<e_binwhscode,bsl>)?$select=BinLocation/BinCode,BinLocation/BinColor,OnHand&$orderby=OnHand desc,BinLocation/BinCode asc`
	`end function`
	
	`// BinIssue: Show only Bin Locations where OnHand > 0 of the selected ItemCode, ordered by OnHand descending, BinCode ascending:`
	`function binissuedropdown`
	`setvar=e_bindropdownbsl=WareHouseStock(<e_binwhscode,bsl>)?$select=BinLocation/BinCode,BinLocation/BinColor,OnHand,UoMCode,Batch&$filter=ItemCode eq <e_itemcode,bsl> and OnHand gt 0&$orderby=OnHand desc, BinLocation/BinCode asc`
	`end function`
	
	Customization of the drop-down list in Beas 9.3 PL 1 or earlier release
	
	Attention: This is available only up to Beas 9.3 PL 1 – in maintenance.
	
	This list can be modified in the Configuration Wizard. General manipulation is possible using the `stockmanagement.src` file or window-related changes using Windowevent `setbindropdown`.
	
	The following priorities are considered:
	1. Window-related customization (`windowevent`)
	2. General changes (`stockmanagement.src`)
	3. Settings in the Configuration wizard
	
	Window-specific adjustments:

© 2026 Boyum IT Solutions A/S

Field	Meaning

	Call the `setbindropdown` user event. The `dropdown:bin_from` variable can be defined.
	
	Example:
	`windowevent setbindropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE"`
	`from "BEAS_WHSBIN" where`
	`"WhsCode"=<e_binwhscode,dbstring> order by`
	`"STORAGESORT"`
	`end event`
	
	Note: This window event is supported in every window where the selection field is available.
	
	General adjustment
	Use the `stockmanagement:binreceiptdropdown()` function to store a custom drop-down configuration.
	
	`file stockmanagement.src`
	`function binreceiptdropdown`
	`setvar=e_bindropdown=ddsql=select "BINCODE"`
	`from "BEAS_WHSBIN" where`
	`"WhsCode"=<e_binwhscode,dbstring> order by`
	`"STORAGESORT"`
	`end function`

Posting date	Select a valuation date. **Important:** If a work order time receipt is edited subsequently or canceled, the revaluation or cancellation of the linked journal entries is performed on the new valuation date. NOTE: This date only affects "receipt" documents. For "Issue" documents, the system sets the current date by default and the only way to modify that date is to modify "Issue quantity changeable" to 'Yes'.

Label - Printing

If a report is stored, the button "Label" is displayed automatically, as soon as the work order

© 2026 Boyum IT Solutions A/S

was selected or posted. Always the information of the last posting is printed.
There is no default report.

Setup:
1. Create a report.
2. Store the report in this window in the macro.
3. Close window and re-open.
4. Printing is available now.

Available variables:
<docentry> = docentry from last document from table OIGE.DocEntry
<docnum> = Document number OIGE.DocNum

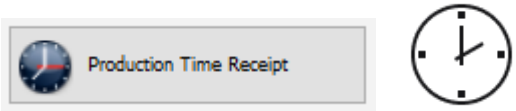
Compatibility:
Until beas9.0 Patch3 the button "Label" was displayed always and the report "Box label" was printed. If it was not existing, no label was printed.To enable printing, setup this report as described above.

See Macro

Webinar 8/2017, Part Work order Backflushing Booking

See also Work order backflushing booking, Material posting

17.3.4.7 Production Time Receipt



Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.
See Terminal settings in Configuration wizard.

With this app you can create a Time receipt for production.
This menu option can be used to call the receipt window for manual time receipt.
If data is entered via bar code, this is recorded in the Bar code field. After the first input, the cursor

© 2026 Boyum IT Solutions A/S

remains in the Bar code field for each new input.
Only new entries are possible; existing entries cannot be changed.

The behavior of the visible fields is set up in **Configuration Wizard > Production > FDC - Time receipt view.**
All other rules can be configured in **Configuration Wizard > Production > FDC.** The login rules are not considered.
Further rules are stored in the operation itself (***See*** **Master data > Edit Item Master > Routing** - in the tab Extended).
WMS Integration: Produmex WMS Batch attributes are supported.

This window can also be reached from:
- Manage production times
- FDC time receipt
- Work order structure - Right-click on routing position – Create receipt
- Production list - Double-click on a receipt report
- Terminal – Close work order

Note: Because material postings and journal entries are created, extended rights in SAP B1 are required if you do not work with the terminal solution.
See Mandatory SAP-B1 rights

Material posting, assembly posting
With a report, material is also issued where applicable or the assembly received. For further information ***see*** Material posting.
The "Exceeding planned quantity allowed" Configuration parameter affects Production Time receipt: Minimum/Maximum values are related to receipt quantity.

PATH: Production > Factory Data Capture > Production Time Receipt

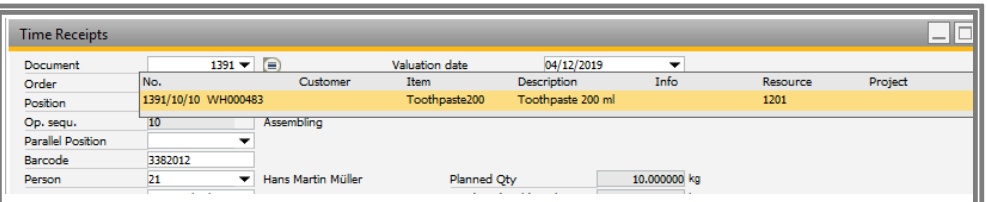
Window fert_arbzeit_erfassen.psr

Choose Routing position in time receipt window

Field Description

Field	Description
Document	Search by Work Order Number (Order Number) Search work order by work order document number. In this field there are always 2 modes to choose a work order. **Drop-down Icon:** Search for work order, on which you made last time receipts. ***Example***: There are employees working many times on the same routing positions and thousands of open routing positions. In this way you can simply find your last routing position. The system searches for the last 190 time receipts and groups them by routing position. This only works if the personnel number is defined.

© 2026 Boyum IT Solutions A/S

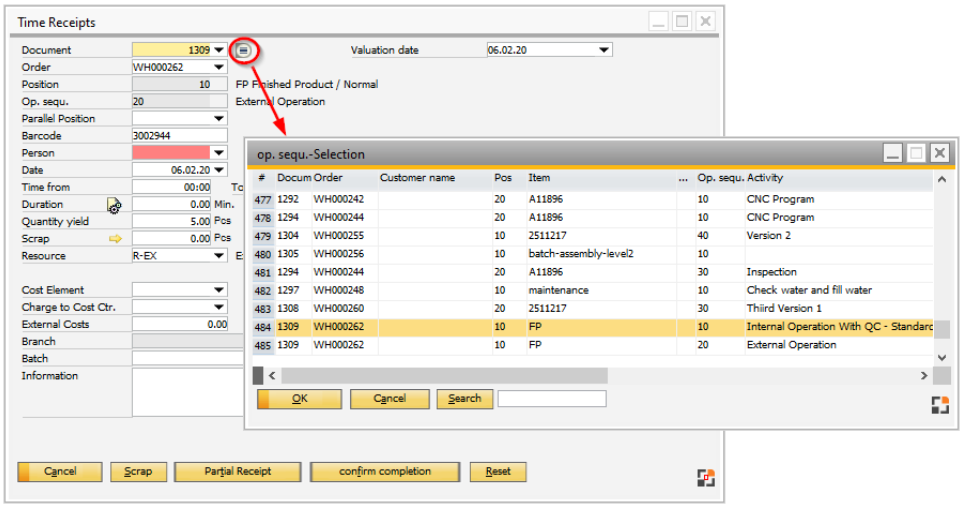


Choose by Icon

If you click on the icon, the system displays all open operations.

The system does not check any rules. All open routing positions are displayed.

Window settings and templates are available.



Window fert_arbzeit_erfassen_afoauswahl.psr

Valuation date	Enter the desired valuation date Material postings are carried out on this date. Determining the resource costs is independent of the valuation date. The current costs are always used. ***See*** Resource costs Post-calculation – last movement; refers to the valuation date, even for order time receipts. If the order date was changed, the valuation date is adapted as long as the order date is not set to the future. The valuation date can be changed any time, independent of the order date.
Work Order	Work order number. The drop-down field lists all open documents. When selecting a number, the order

© 2026 Boyum IT Solutions A/S

	is opened. When entering a number, the first open work order with that number is opened.
Position	Work order position of the selected work order.
Op. sequ.	Operation sequence position to be reported. **Master-Slave operations - time receipt creation** **IMPORTANT NOTE:** When the user defines Master-Slave operations when creating a Time receipt for a "master" operation, Beas first generates all Time receipts for the slave operations, and *then* the time receipt for the master operation. Due to this sequence, if something fails during the time receipt process of the master operation, the previous Time receipts are **not** rolled back.
Parallel position	Selection of a parallel resource in case there are parallel resources defined in the routing. **NOTE:** Parallel operations do not consider quantities and do not manage Open/Close status! Time receipt creation does not close a parallel operation.
Barcode	Unique number to identify the work order number, position and operation. If the user enters the bar code, the work order number, position and operation are recognized. This is a fast way to identify the operation in a work order routing. The Barcode is stored in the operation and is printed on the production document. Also displayed in Work order routing – Position – Extended – Barcode *(BEAS_FTAPL.NUMMER)* and in Parallel Resource *(BEAS_FTAPL.NUMMER + BEAS_FTAPLWKZ.POS_ID)*
Person	Personnel number of the employee who performed the work (configurable in **Human resources > Personnel**) Entries are checked for validity. A card number can also be entered to search for personnel number (in case it exists). The selection list is sorted by name, first name and middle name. Only employees with login authorization are displayed at a work order.
Date	Date of the time receipt. "Date To" is only visible if multiple date entry is configured. ***See* Configuration Wizard > Production > FDC > time receipt View > Multi-day Input.**

© 2026 Boyum IT Solutions A/S

Time from-to	Optional start and end time of the activity. The duration can be reported without time from / to. After the time is provided, the duration is re-calculated automatically. Visibility of the fields can be stored in the settings.
Duration	Duration of order time. This can also be changed after automatic calculation. Data is input in time hours, time minutes or industry hours. NOTE: Beas does not support entering times in any units smaller than minutes, e.g. seconds/milliseconds and so on. The type of the entry is selectable of the input via the gear symbol / . This setting is station-specific and can only be entered in the input screen. Note on industrial hours: Full minutes are used, seconds are not supported. The entered time in industrial hours is rounded down to normal minutes. ***Example:*** 14,09 → 14:05 Minutes and 24 Seconds. Rounded to 14:05, equals 14:08 Industrial minutes In case of automatic calculation, additional rules are considered which can be stored in the Configuration Wizard. ***See*** Time linking, parallel calculation. ***See*** the option "Calculation result" to see how the duration was calculated. Reported time is subtracted from reserved time immediately. This is displayed in graphical resource utilization display, in the bar right below, in the work order structure and in other windows. Note: Time receipts can only be entered in minutes. For planned times, more digits can be entered because of multiple quantities. Display calculation results Use the cogwheel icon to display the result of the calculation, to see how

© 2026 Boyum IT Solutions A/S

	the duration was computed and which factors had an effect. Function is available from *beas 9.1 PL: 07* ⊟ Why is time receipt not available in millisecond accuracy This feature is a factory data capture, not machine data capture. For capturing machine data, connect an MDC-device. Beas offers an interface to ILS. The MDC device can register times in seconds or milliseconds. Then, you can run evaluations. The MDC-device only transfers to Beas the start/end-time, yield and scrap quantity. ⊟ Negative cycle time Another possibility of cancellation is to enter negative cycle time. This is only possible if no costs were stored. At order log-off negative values are blocked. You can enter negative values only in production time receipt.
Quantity yield	⊟ The produced, defect-free quantity in receipt units If backflushed material is assigned to the routing position, the material is automatically posted with the appropriate quantity (yield quantity + scrap rate). In the case of the last reportable routing position: • the appropriate number of the assembly to be produced is received (converted to units of store), if in **Configuration Wizard > Production > Valuation and Posting of Assembly > Posting > Booking Finished Items when > Like Material (Last Operation or Backflushing)** is configured. • the production position and the work order are closed – depending on the setting under **Configuration Wizard > Production > Valuation and Posting of Assembly > Close production position** **Specification of the quantity to be reported:** The quantity to be reported can be specified. This is activated in **Configuration Wizard > Production > FDC > Login Rules > Suggest Remaining Quantity**. The planned quantity is then proposed minus the previously reported yield quantity + scrap quantity. If **Maximum previous quantity reportable** is also activated in the same area, the yield quantity reported in the preceding reportable routing

© 2026 Boyum IT Solutions A/S

	position minus the quantity reported to this previously reported yield quantity + scrap quantity is proposed. **Unit of measure** For time receipt, the unit stored in the operation is used. If not set up, the consumption unit of the assembly is used and is converted, if it is different from the warehouse unit (order time to consumption unit and material to warehouse unit). ***See*** Edit routing - Extended. Material is posted with this quantity ***see*** Material Entry.
Scrap	Scrap quantity in reporting units Quantities that are considered rejected during the process. If a goods issues process links to the time receipt, this quantity is considered as total scrap quantity at the goods issues. Use the orange arrow to enter a scrap reason. A new window opens to select scrap reason and quantity. Scrap reasons need to be defined before they can be used. If you want to make further use of the scrap material in **Configuration wizard > Production > FDC > view time receipt –** there is a possibility to **post back scrap material**. Enable this, to get a list of issued items in the Cancellation screen after the issue is processed. In this screen scrap quantities can be allocated and posted back to the original warehouse. Material is posted – ***see*** Material posting. Entry quantity is in entry units defined in the operation sequence. ***See*** Production – Routing – Extended – Time receit unit **Note:** If working with scrap, Cut-off and scrap may not be considered in the planned quantity, because otherwise the material would be posted twice. In case of incorrect settings, a warning screen opens once per program start. ***See*** Configuration wizard – backflushing.
Resource	The resource or machine on which the work is performed The cost rate of the activity comes from the resource. If a resource group was defined at the routing, a resource must be selected from the specified group on the time receipt.

© 2026 Boyum IT Solutions A/S

	Available resources depend on personnel settings. Only resources allowed for each employee in **Human Resources > Personnel > FDC Tab** can be selected from the drop-down list. **NOTE:** The default data loaded by the system may contain a resource that the selected personnel has no rights to. By default, Beas allows a time receipt to be created for this resource. To avoid this situation, and block this resource from the list, you can add the following customization: Production Time Receipt resource selection codes: fert_arbzeit_erfassen.src fert_arbzeit_erfassen_afoauswahl.src ***See*** Personnel master
Time Type	Time type of the time receipt If time types are stored in the resource, the time type (setup time, processing time and so on) can be selected. If the time type is changed, the cost element of the routing position is entered into the Cost element field. ***See*** Configuration wizard – Master data – Resource – Time types Concept time types
Cost element	Cost element to which the costs are to be posted. Entry is determined automatically according to the information of the resources and time type. It is possible to manually change the selection. ***See*** Cost elements
Cost Center	The cost center to be charged The default cost center can be defined in **Configuration wizard > Production > FDC >** Cost Center determine by If a journal entry is set up in the time receipt, the cost center applies to the journal entries created by the time receipt. Yet, this cost center does not apply to material transactions. For material transactions, the system reads the cost center from the item.
Branch	The branch that the time receipt is made from

© 2026 Boyum IT Solutions A/S

	The branch from which the time receipt was made. If the multi-branch solution is activated, the branch is displayed in which the order time receipt was created. Only the branches, that are stored in a work order position can be used for time receipt.
Batch	The batch (temporary batch for the reported quantity) **Note:** This batch does not affect the batch number of the assembly. The information is for reporting purposes only. This field is used if working with a temporary batch. Beas does not take this input into account. The batch number can be displayed in various time reports using the right-click menu window settings option, marking the batch field.
Canceled	Marking: Message canceled Under certain conditions it is not possible to delete an order time receipt. It can only be canceled at that point. Canceled time receipts are hidden in most evaluations. In work order structure they are displayed in gray. A cancellation cannot be undone. A time receipt is canceled instead of being deleted if the cost elements are stored in the operation which creates the journal entries. Thus, the order time receipt is linked to a journal entry. For better traceability, it is possible to enable **Configuration Wizard > Production > FDC > Order Time Receipt: protocol.** In this case, a journal entry is created for every time receipt, even for time receipts without a cost.
Information	Free text for information.
Price	For external operations: the costs incurred.
Logout attendance	If active, the employee is logged off from attendance automatically This field is only visible if attendance linking is activated in the Configuration Wizard. For further information ***see*** Attendance linking.
UDF 1–15	User-defined fields UDF 5–15 fields are not visible in the window. **Make UDF5-15 fields visible:**

© 2026 Boyum IT Solutions A/S

The user can create text boxes and link with those fields or assign them via BeasScript:

```
dw_1.item.udf5.value=prueba
message=<dw_1.item.udf5.value>
```

Create a text box in the window and link it with UDF5:

```
windowevent open
//Create a field for codebar
create=column=x=2030,y=80,width=457,height=52,id=udf5,name=udf5
create=text=x=1445,y=80,width=562,name=udf5_t,text=UDF5 example
end event
```

The system saves the information automatically when the time receipt is created.

The following are displayed on the time receipt screen, but can be deactivated:

Field	Description
Planned Qty	Quantity to be produced in receipt units.
Produced yield quality	Quantity previously reported defect-free in receipt units.
Produced Scrap	Previously reported scrap.
Planned Time for Planned Quantity	Default time.
Actual Time	Previously reported time.
Personnel daily time	Time reported today for the selected person.
Tool	Field is only displayed, if a tool entry was found which determines lead time. In this case, all active tools are displayed for the selection.

Button	Description
Delete	Delete time receipt Only available if working in change mode and if the work order item has not yet been closed. **Note:** If a cost type is stored with accounts, a journal entry is created. On deletion, a reversing entry is made first to this booking.

© 2026 Boyum IT Solutions A/S

	For more information ***see*** Production Time Administration. **Important:** Existing time reservations are not restored. Re-scheduling may be necessary. To make all confirmations comprehensible, a cancellation can be performed instead of a deletion. This can be activated in Configuration wizard > Production > FDC > Production time receipt: block deletion This function has the following effect: • It is no longer possible to remove the operation sequence from the work order structure window. • The operation is not be deleted but canceled. Time and quantity is set to 0, and the cancellation switch is activated. A canceled order time receipt can no longer be activated. If costs are booked at the moment of time receipt creation, this option should be enabled. Canceled order time receipts have no value and they are not displayed in lists (for example, post-calculation). In the work order structure view, the canceled entries are displayed in light gray. ***See*** Webinar: Adjustment user mistakes at the work orders 10/2017 At cancellation these values are entered to the activity log: • Key1 = "cancel" • Key2 = Duration (minutes) • Key3 = Yield Quantity (in assembly unit) • Key4 = Scrap (in assembly unit) • Key5 = Costs to marginal costs • Key6 = Costs at full cost • Key7 = Assignment to the journal entry, if existing
Scrap	Opens a new window to provide the scrap quantity and scrap reason. The total quantity is transferred to the scrap quantity at the time receipt.

© 2026 Boyum IT Solutions A/S

Partial Receipt	Create a new, partial receipt Creates the time receipt document without closing the operation. Users can continue reporting at this operation. Only available at a new entry: • Saves the order time • Posts the assigned, backflushed material. ***See*** Material Entry • If it is the last routing position: post the assembly to be produced In case of the last routing position a security prompt is displayed: With this time receipt the assembly will be posted. Continue? (Id ftpos_lastafo239545). This prompt can be disabled in Configuration wizard Note: if "Close operation sequence automatically" is activated and total receipt quantity + scrap quantity >= planned quantity and no additional employee is working on this operation, the system closes this operation and ignores that you clicked on "Partial receipt".
Intermediate report	Intermediate report, behavior of this button depends on these settings.
Confirm completion	Creates the time receipt document closing the routing position. Workflow: • Saves the order time • Posts the assigned, backflushed material. ***See*** Material Entry • If it is the last routing position: post the assembly to be produced • Close routing position If another is working on this routing position in parallel, it is not possible to close the routing position. The system returns an error message "*(bdeostmp45) There are Clock times for this Operation! Cannot close!*" Close work order position automatically If this is the last operation and If "close work order position automatically" is activated, the system closes the work order

© 2026 Boyum IT Solutions A/S

	position. For more information ***see*** Configuration wizard Note: The system does not check the quantity. If you post 0 from 10Pcs and click on "Confirm completion", the system closes the work order position, too. If "Close work order automatically" is activated, the system closes the complete work order if all work order positions are closed. NOTE: If it is the last routing position, it closes the production position including any necessary journal entries (WIP balancing) After closing, it is not possible to report any other information at this operation. The button "**Confirm**" is only visible if the following conditions apply: • the operation is not an overhead order. ***See*** Production types • no other employee is currently logged on to the operation • in the respective time type close operation is not disabled. ***See*** Configuration wizard – master data – resource – time types • only when creating a new entry
Save	Saves the changes. Only available in change mode. **Note:** If a cost category is stored and in turn accounts are stored in the category, a journal entry is made when creating the report. If the order report is changed, the journal entry is canceled, and then a new journal entry is created with the new values.
Change log	List of all changes. ***See*** Change log.

© 2026 Boyum IT Solutions A/S

Time protocol	Detailed protocol, of how the duration is calculated.

Note: If the production position is closed, time receipt can no longer be changed.

Videos

Function: Open material issue form from time receipt window

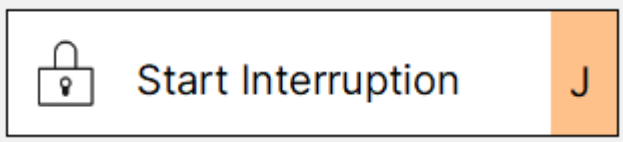
Change log in the database

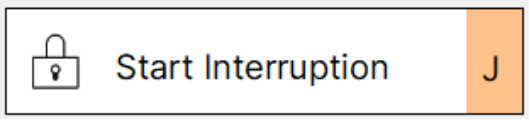
Every change is logged in the change log. As the costs cannot be changed directly, because they are calculated automatically, if a change is made a separate data record is inserted with the following content in the information field: "Change to information: Marginal costs previously ... new, full costs previously ... new"

The new key fields contain:

- Key1= “change info“
- Key2= duration (minutes)
- Key3 = yield quantity (in assembly units)
- Key4 = scrap (in assembly units)
- Key5 = costs at marginal costs
- Key6 = costs at full costs
- key7 = assignment to journal entry, if available
- key8 = allocation to cancellation journal entry, if available

17.3.4.8 Start Interruption





Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

See Terminal settings in Configuration wizard.

With this app you can start an interruption for a resource or tool.

To start an interruption, a resource type and an interruption reason is required. When starting an interruption, the time of running operation from the related resource is stopped. With the **Start Interruption** button, the interruption starts.

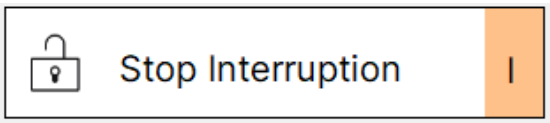
17.3.4.9 Stop Interruption



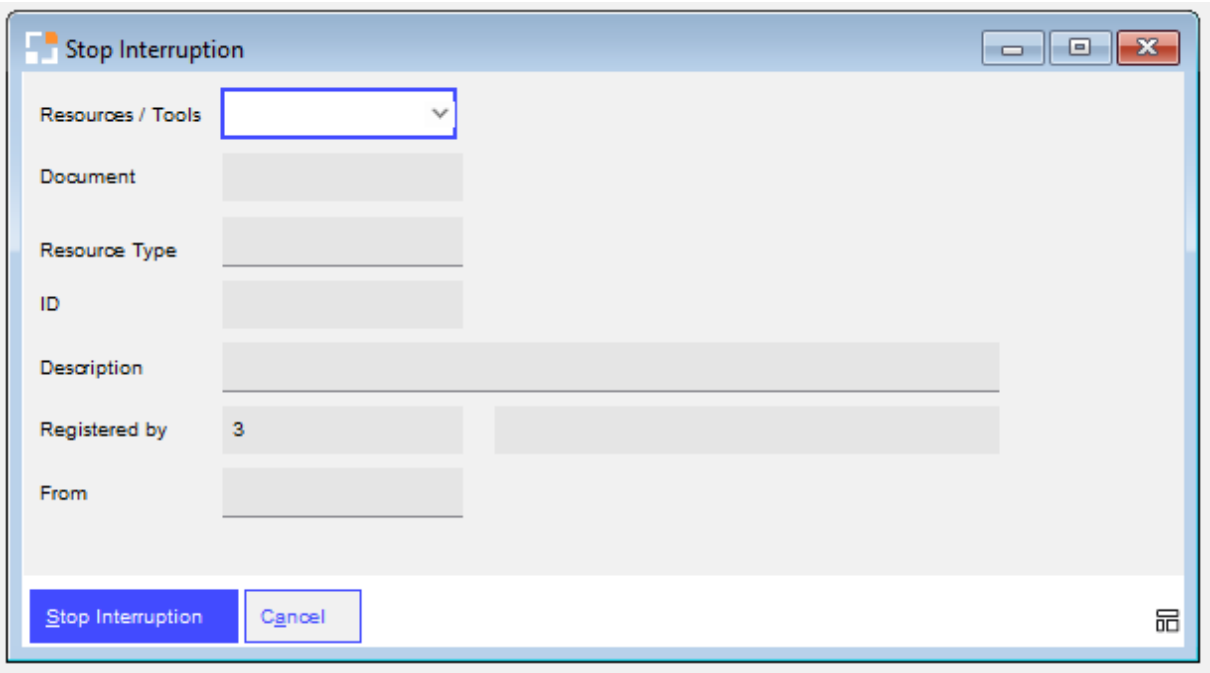
Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

See Terminal settings in Configuration wizard.

With this app you can stop an interruption for a resource or tool.

If there is no active interruption, the system shows a message. A new window is displayed with the information from the current active interruption. The system automatically knows the user or worker who originally started the interruption. With the **Stop Interruption** button, Beas allows you to stop the interruption. After a refresh of the Interruption tab, the information is updated.

© 2026 Boyum IT Solutions A/S



Window bde_terminal_stillstand_aus.psr

Resource: Select the resource or tool with the interruption. This is the only changeable field in this window.

The following fields cannot be changed and only display information:

- Document: A counter for the interruption.
- Type: Displays the resource type.
- ID: Displays the interruption reason.
- Description: Displays the description of the interruption reason.
- Registered by: Displays the person responsible for starting the interruption.
- From: Displays the start date of the interruption.

17.3.4.10 Logoff work order

Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

See Terminal settings in Configuration wizard.

Use this function to log off from a running work order. Accessible via Terminal-Applications - App "Order logoff". This is the opposite function to "Login work order"

It is the same window as Production time receipt with 2 restrictions:

1. Only currently running work orders can be selected,
2. The time is calculated automatically.

NOTE: Parallel operations do not consider quantities and do not manage Open/Close status!. Time receipt creation does not close a parallel operation.

See Production time receipt

- Special case: same start- and end date

  If an order was started in whose resource the setting "same start- and end date" was enabled, the screen "work order logoff" is opened, which is specifically tailored for such time receipts.
  If several work orders were started and in at least one of these a resource has the setting "same start- and end date" activated, first a resource selection screen is opened. After the selection of the resource, the screen "work order logoff" is opened. ***See*** Order logoff Start/End date

- Automatic attendance reports

  If in **Configuration wizard > FDC** the option "**attendance linking**" was enabled, the employee is automatically registered in attendance.
  See Configuration wizard > FDC > Attendance linking

- WebApp

  This function is also available as WEB-Application with the following restrictions: only the time is reported, no material is posted. Optionally, assembly posting can be activated, as long no manual entry of batches and serial numbers is necessary. ***See*** WO Stop WebApp.

© 2026 Boyum IT Solutions A/S

17.3.4.10.1 WO logoff Start/End date

This window opens at work order logoff if the option "same start- and end date" was enabled in the selected resource.

See

Logon work order

Resource: same Start- and End date

Example of use for same start- and end date

A sheet metal punching machine creates several individual pieces for multiple work orders with one push. For this purpose, the orders are successively registered on this machine (resource). This can take some time, though actually all orders have the same starting point. When the punching operation is finished, all registered orders are completed at the same time. Therefore only the quantity is entered and the times are automatically distributed as a percentage in the Production time receipt window .

The expense is distributed by a fix formula according to the stored planned times of the work orders.

Distribution rule for order times

Standard parallel time calculation is disabled. The complete lead time is distributed to the time receipts.

Calculation: job time * (yield+scrap qty) : (Sum of all job times * (yield+scrap)) * lead time

Example:

Lead time 234 minutes, job time operation 1: 78 mins, operation 2: 240 mins, confirmation operation 1: 2*yield, operation 2: 3*yield (see picture)

Operation 1 = job time 78 mins * 2 yield = 156 mins

Operation 2 = job time 240 mins * 3 Gut = 720 mins

Sum = 876

Calculation Operation 1 =156 mins / 876 total * 234 reported mins = 42 mins

Calculation Operation 2 =720 mins / 876 total * 234 reported mins = 192 mins

If, due to rounding, the sum of the individual times does not correspond to the total time, the difference shall be divided equally among the reported work orders.

Restrictions

© 2026 Boyum IT Solutions A/S

Parallel resources are not supported. No posting of material (backflushing) and no assembly posting!

The function is not supported by WEB-APPS

17.3.4.11 Login work order

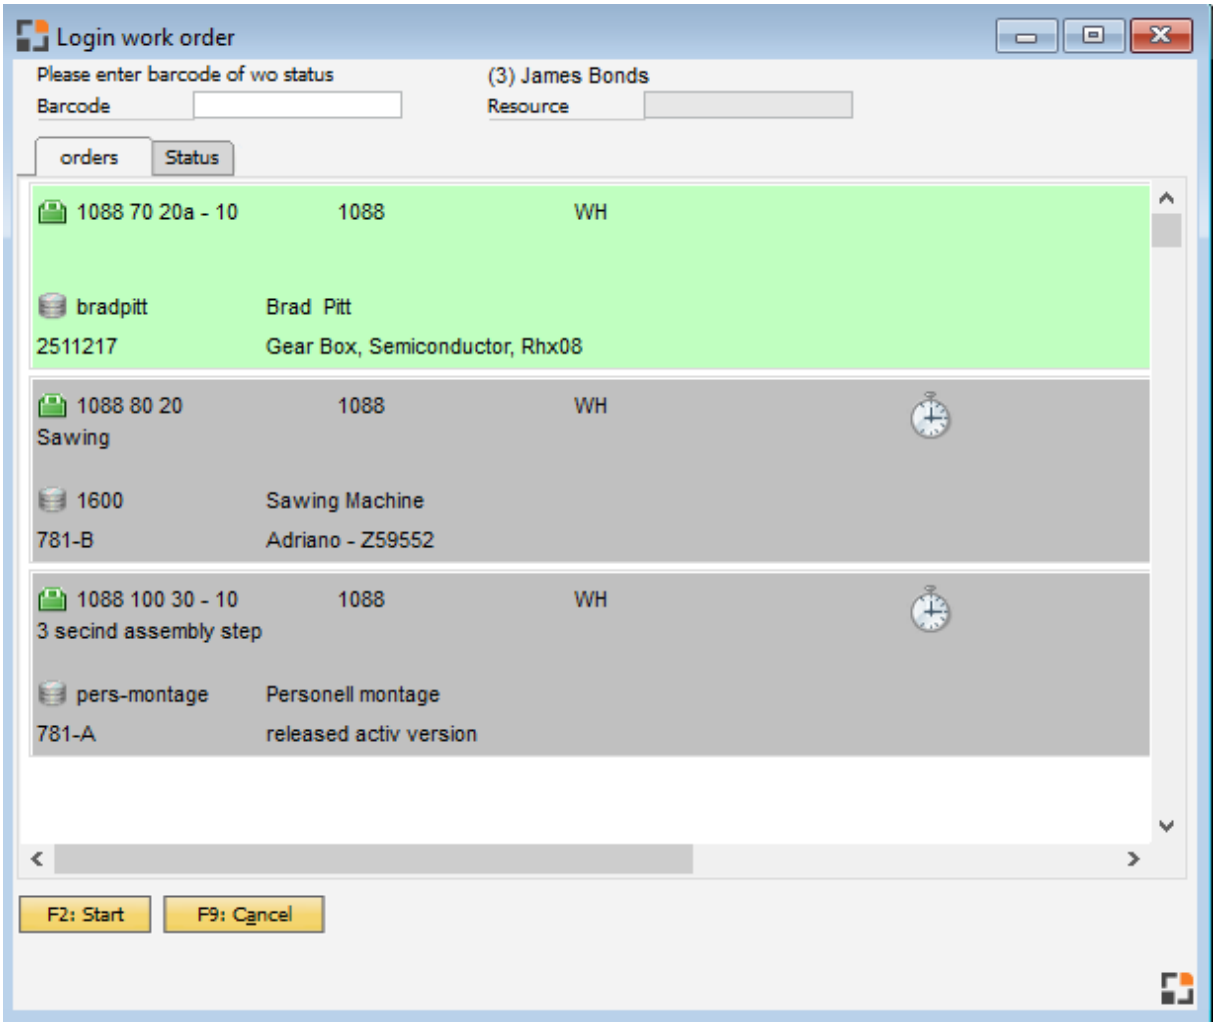
Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

See Terminal settings in Configuration wizard.

Use this function to login to a routing of a work order. The working time is registered until the order is logged out again.
The app is affected by the "Work order must be set to planned" setting.
ATTENTION: The setting "Order times Enter" setting of "Operation types" affects the what operations are displayed in the "orders" list.

PATH: Production > Factory data capture >Terminal > enter user+password > select "**Login work order**" app.

© 2026 Boyum IT Solutions A/S



Window fert_ftstmp_anmeldung.psr

Logon the operation sequence via barcode which is printed on the WO. There is an manual selection alternatively.

Only displayed operation sequences can be selected. Exception: Personnel master > FDC -> allow logon to op. sequ. of all pools has been enabled. At the top the currently logged on employee is displayed.

Operation sequences from following are displayed:

- Working with pools

Pool function active:

All operations are displayed, which are located in current pool and which use operations that the employee is entitled to view.

Pool function not active:

© 2026 Boyum IT Solutions A/S

All operations are displayed without restrictions.

Adjustable in the Configuration wizard – Production
For more information about pool ***see*** Pool administration

- The station and the resources assigned to the employee

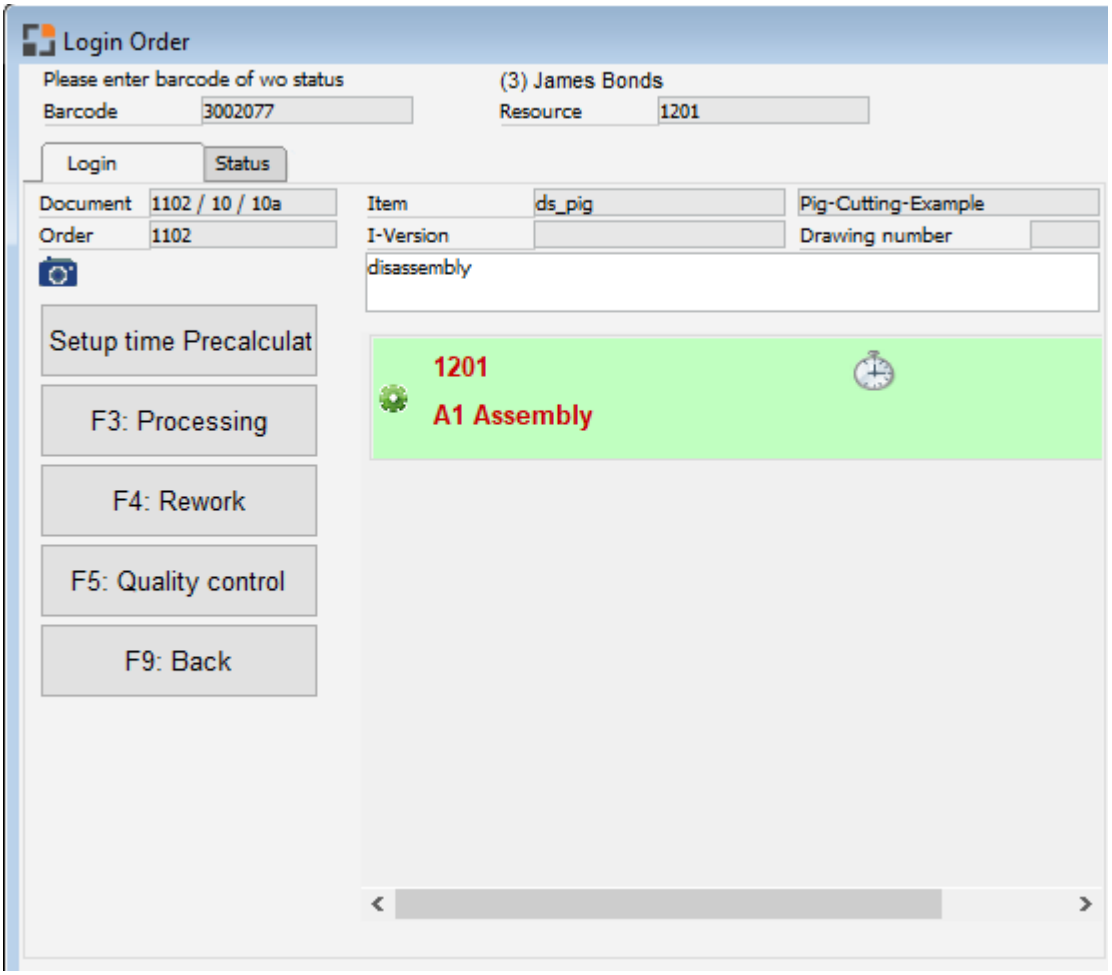
See:
Personnel master > FDC
Station settings

The following is displayed:

- Work order, assembly, position, production number, customer (or warehouse)
- optionally interruption information
- Resource ID and description
- Assembly, item number and description
- A clock if the order has been logged on already by the employee

Enter the bar code to log in, selection with ENTER or F2
Then the second page is opened.

© 2026 Boyum IT Solutions A/S



Window fert_ftstmp_anmeldung.psr

You can select:

- Working on which resource

  The resource stored in the operation sequence is pre-selected
  All additional resources are displayed which
  - belong to the same resource group
  - are stored as alternative resource in the routing position

  - all resources if the view is active in Personnel master > FDC

- Time type

  Up to 4 time types can be selected in the resource.
  These are set up in Configuration wizard – Master data – Resource – Time type

© 2026 Boyum IT Solutions A/S

The operation sequence is started by F2, F3, F4, or F5

The display of functions depends on the set time type.

The window can be closed or the next operation sequence can be selected directly has been enabled in Configuration wizard – Production – FDC.

NOTE: Parallel operations do not consider quantities and do not manage Open/Close status!. Time receipt creation does not close a parallel operation.

- Display documents and images

  Click on the camera symbol which displays the list of all available documents and images.
  An entry selected here is displayed directly with the display program installed on windows.
  The Preview window is supported

- Instructions

  Click on the , symbol and the Instructions dialog window opens. Add instructions to the work order here.

- Automatic attendance reports

  If in **Configuration wizard > FDC** the option "**attendance linking**" was enabled, the employee is automatically registered in attendance.
  See Configuration wizard – FDC – Attendance linking

Multi logon

Activate option Order logon: multi logon to logon several orders subsequently via bar code. The option is ignored if you call up the window via the pool list. *(beas 9.1 PL:08 HF: 2)*

- Automatic attendance logon

  If in **Configuration wizard > FDC** the option "**Attendance linkage**" is active, the employee will be logged on automatically for attendance registration.
  See Configuration wizard – FDC – Attendance linkage

- Performance

  The pool function should be deactivated if this view is too slow.
  Adjustable in the Configuration wizard – Production

See

Opposite function: Logout work order

Customizations

If you want to change the list of displayed operations, use the following event to manipulate the filter:

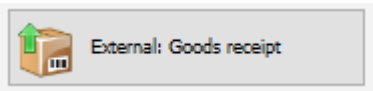
```
windowevent preretrieve
setvar=is_mmfilter=   (empty - disable multi-machine filter, grouping)
setvar=ls_where2= and (your filter - filter routing positions)
setvar=ls_where3= and (your filter - filter parallele resources)
end event
```

Example:

Employee 501 is allowed to report only work orders of type "AB"

```
windowevent preretrieve
setvar=is_mmfilter=
setvar=ls_where2= and "BEAS_FTHAUPT"."TYP" = 'AB'
setvar=ls_where3= and "BEAS_FTHAUPT"."TYP" = 'AB'
end event
```

17.3.4.12 External Goods Receipt



Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

See Terminal settings in Configuration wizard.

This app opens the Goods receipt from external production window.
If the external supplier has delivered their service, the service can be posted in here. In this list all suppliers with existing purchase orders are displayed.
Use "Open" to show all details of the purchase order and to process the goods receipt.

Via **Right-click > Layout** a report can be stored. It is printed automatically after creating the goods receipt.
If provision parts are used or a backflushing process is triggered, printing takes place before these.

PATH: Production > External production > Goods receipt from external production.

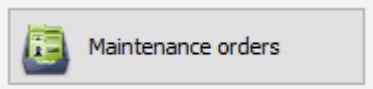
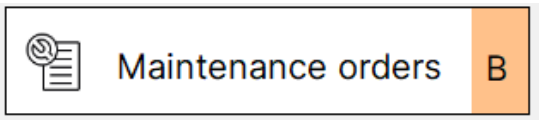
17.3.6 Maintenance orders





© 2026 Boyum IT Solutions A/S

Available with Production Data Collection, Start, Interrupt, Completion, Finished Goods, Scrap license.

With this app you can report manage Maintenance orders.

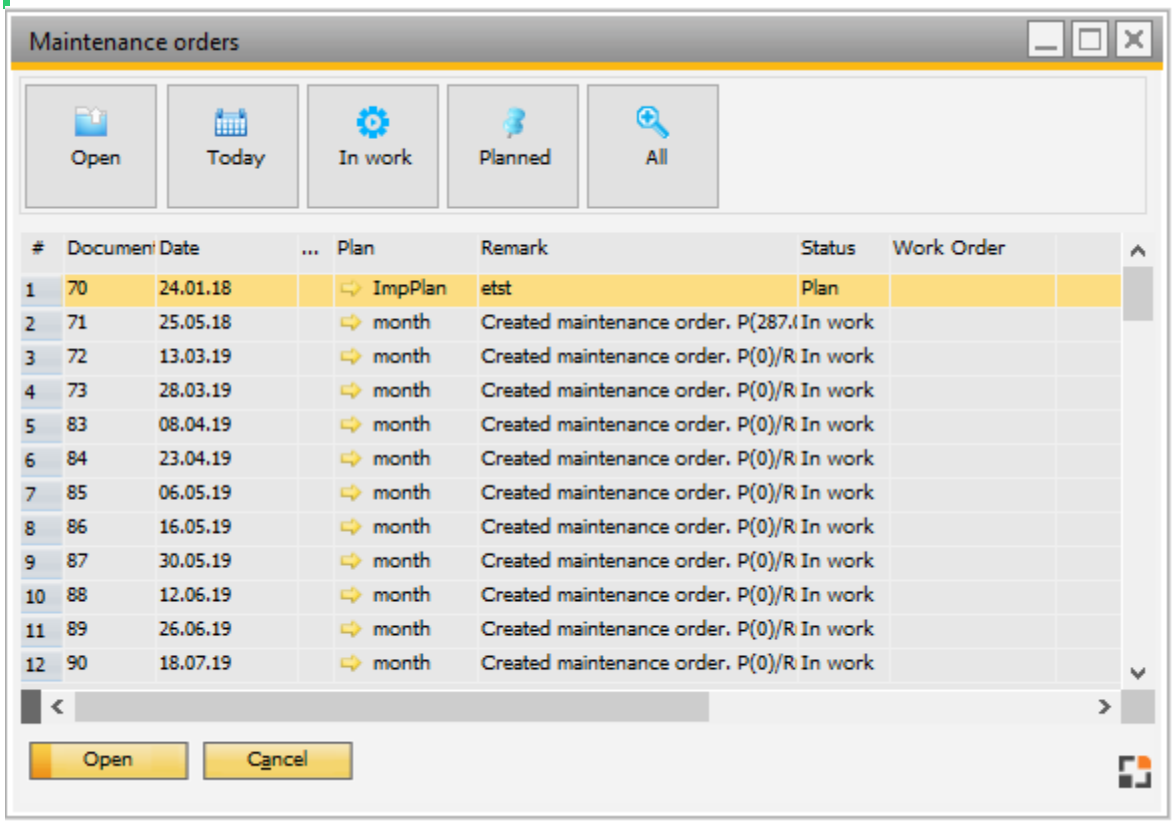
Internal and external maintenance

- Maintenance list
  - Master data
  - Maintenance plan
    - Components
  - History
- **Maintenance orders**
  - Maintenance order

This window can be used by the service worker.

The worker can see all active maintenance orders, start or stop the orders, and can create time receipts for their activity and a lot more.

PATH: Service > Maintenance orders.



Window maintenance_order_browse.psr

© 2026 Boyum IT Solutions A/S

Boyum Style button design:

All active maintenance orders will be displayed and managed in this list. Window settings and templates are supported.

The authorization for **Maintenance orders** is necessary.

License: You need the maintenance license or in terminal mode the Production Data Collection License.

Terminal mode

The window can also be opened via the terminal app: Maintenance order

In Terminal the functionality is limited:
- Administration tasks are not available
- No history from closed maintenance orders (Filter: All)
- No access to Bill of Materials and Routing Details
- No activity (= SAP Function)
- No service calls (= SAP Function)
- Not possible to open the linked work order
- No History Log

For field descriptions ***see*** Edit maintenance master data, Maintenance plan.

Buttons

Button	Description
Open	Open maintenance order.
Today	All active maintenance orders, which are due today or were already due earlier.
In work	All maintenance orders with status "In work".
Planned	All maintenance orders with status "Planned".
All	All maintenance orders (not in Terminal mode).
Add	Create a new maintenance order (not in Terminal mode).

17.4 WEB APPS Version 2.1

Factory data capture provides an up-to-date overview on all work orders. It is used for a simple reporting of work order times, statuses and quantities, goods issue and receipting, and retrieving various inventory information.

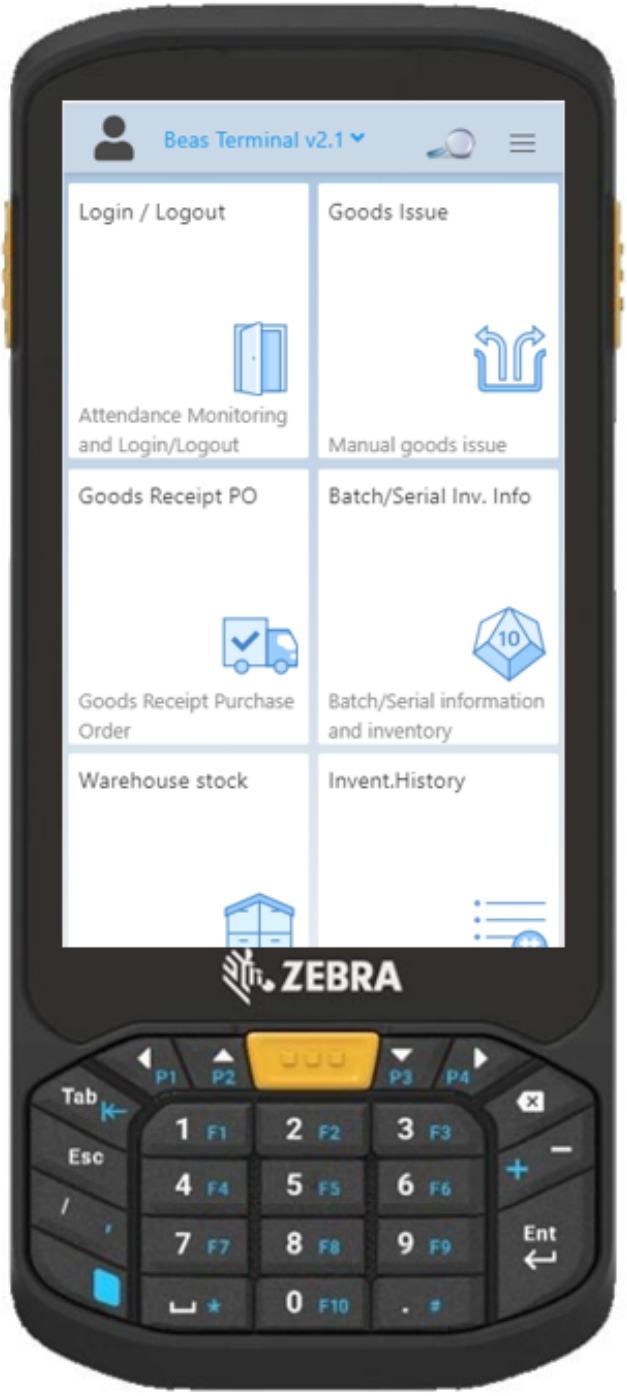
See License information.

WebApps Webinar (English)
WebApps Webinar (Spanish)
WebApps Webinar (German)

Data can be registered via WEB and PC. Functions are made available in "Apps" collected in the program group "Terminal".
Web applications version 2.1 is accessible with any hand-held smart device such as smart-phones, tablets, and desktop computers.

Our main device is Zebra TC20 with keyboard.
Upon logging into the terminal, the apps available to the user appear in the screen:

© 2026 Boyum IT Solutions A/S



Installation of WebApps on Zebra TC20:

For a detailed description ***see*** Installation on Zebra TC20

Open WebApps from inside SAP B1:

1. Go to **Tools > Web Server**.

© 2026 Boyum IT Solutions A/S

2. The system does automatic port search.
3. Click on WEB Application Version 2.1, and your default browser will open the login screen. Enter a card number.
4. Do not close the WEB Server window in SAP B1 while working with the apps.

Sytem requirements:

The mobile solution is conceived for the use of mobile terminal devices.

Component	Requirements
Operating system and browser	Any Operating system with a browser capable to run HTML5/CSS3/ES6: - Chrome 70+ - Edge 17+ - FF 63+ - Safari 11.1+
Resolution	The minimum recommended resolution is 360x640. A higher resolution is recommended.
Used technology	HTML5, CSS3, Java script ES6
Web server	Internal Beas Web Server

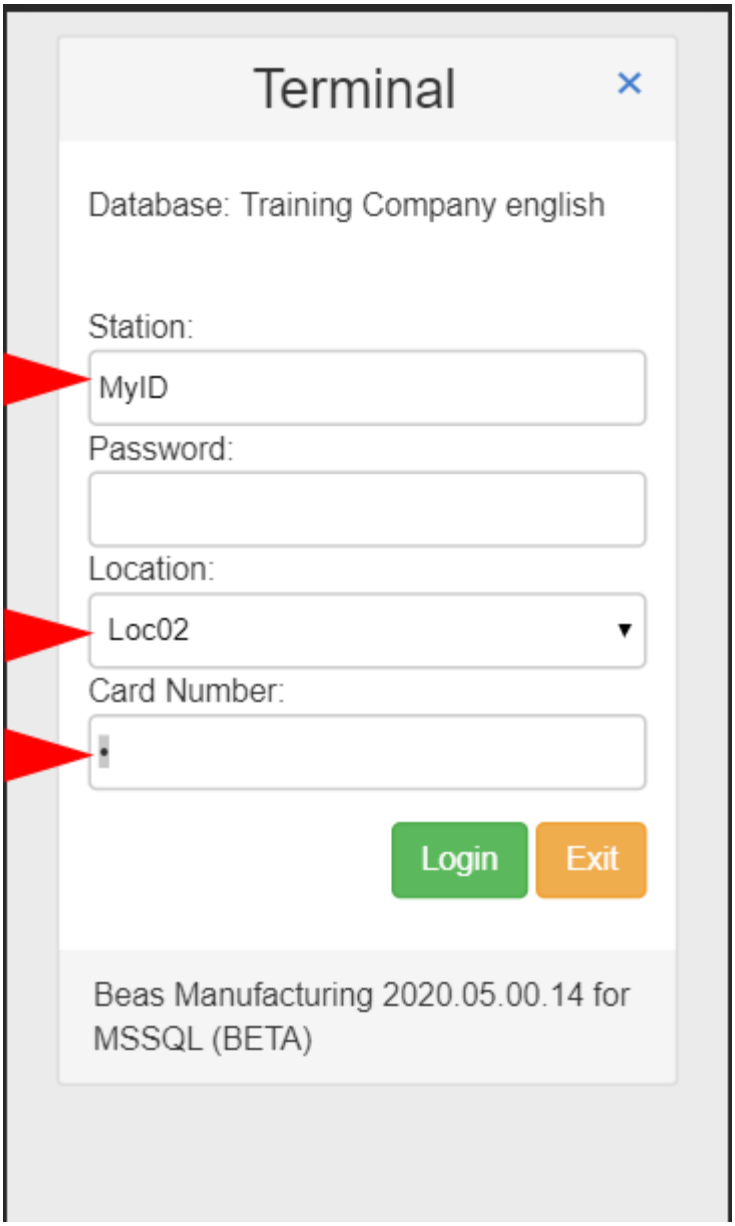
See Integration with SAP Business One Web Solution

17.4.1 General information

Login to the terminal

You can log in to the Terminal in the Login screen, where Station/Location/Card Number information is saved as a cookie in the local machine.
Next time you try to log in, the system pre-fills those values with the last one you logged in.
This is especially useful for the "Location" field.

© 2026 Boyum IT Solutions A/S



To log in with **Personnel name + Password**, go to setting for terminal20 in Program group definition.

General controls:

The following controls are provided with the solution.

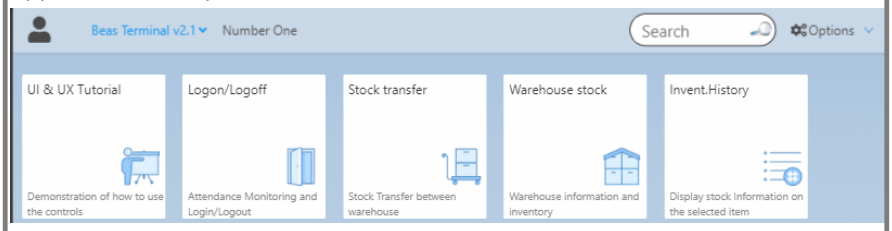
Note: The number of controls inside an app may vary depending on its complexity.

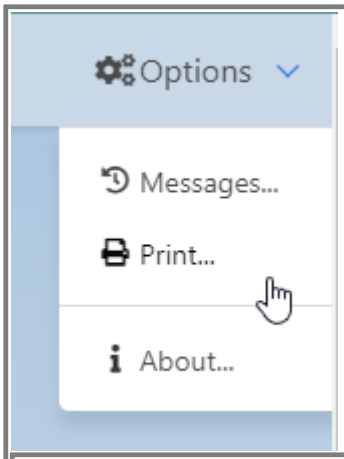
© 2026 Boyum IT Solutions A/S

Screen attributes

Field / Button	Description
Home button	Tapping on the **Home** button always navigates back to the starting screen with all WebApps available for the user.
Search field	Visible in the main menu. With this search field you can do a quick search to find an app in the Terminal. On smaller devices with limited screen size, the function appears as a magnifying glass icon in the top right screen section.

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field / Button</th><th>Description</th></tr>
<tr><td></td><td>Tap on it to open the field. On larger screens, the function automatically appears as an input field (see GIF below).
 


Note: Search hits only display the apps available to the user.</td></tr>
<tr><td>Terminal name with drop-down</td><td>In the main menu of the terminal tap on Beas Terminal v2.1 drop-down for two functions:
- Reload application = reload the entire terminal
- Logout = log out current user.</td></tr>
<tr><td>Options</td><td>Options visible in the main menu of the terminal.
Tap on the Options drop-down (on smaller displays) to see menu options
 


<table>
<tr><td>Messages...</td><td>List of the following information regarding Last transactions:<table>
<tr><td>Request</td><td>The type of request registered in the terminal</td></tr>

Save button</td><td>After adding all the lines to a single document, tapping the Save button creates the document.
Note: The Save button remains inactive (

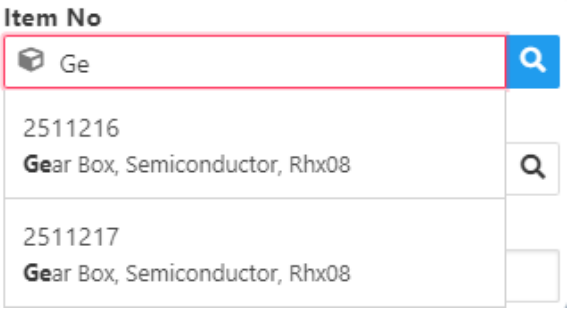
) until all mandatory information are filled for the line currently being edited. It is also inactive at apps designed for providing information only.
Document creation is verified with a message box:
 </td></tr>
<tr><td>
Plus icon</td><td>Add lines to the document.
Note: It is not possible to tap on the plus icon multiple times in a row: If a blank Line(s) tab opens, all mandatory information have to be entered before proceeding in creating another line.</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field / Button	Description
Tabs	When opening an app, there is a number of tabs to enter information. The active tab switches to the next one in sequence once all necessary information have been entered or selected.
Magnifying glass icon	When active, the magnifying glass is of blue color – ***see*** image above. Tapping on it opens a new Search/Filtering screen for the given field, and a full catalog of items appears with a Filter field to narrow down the search.
Extended information	When active (blue), it opens a screen for extended information. ***See*** further details on Extended information screen below.
Trash can icon	Delete a line from the current document.
1 / 16 Navigation bar	With the help of the navigation bar controls found bottom center in filtering screens, it is possible to scroll a list to find an item.

The behavior of the fields

The search/filtering fields use auto-completion; you can start typing the name of the entry, and a number of entries matching the already typed characters will be displayed (***see*** image below). Alternatively, you can tap the magnifying glass button and select an item from the list.



Mandatory fields: The system indicates that mandatory information is to be added for the current item line with a red frame around the field.

Other item-specific fields: The related item-specific fields become active only after providing mandatory information, and only if the field is applicable at the current item.

Examples: (1) Warehouse information field is only activated after Item Number is entered.

(2) At a version-managed item, the I-version field is also activated when Item Number is entered.

(3) Bin Location field is only activated if bin locations for the selected warehouse exist.

Limitation:

© 2026 Boyum IT Solutions A/S

UDFs are not supported.

17.4.1.1 Batch/Serial Extended Information screen

The icon opens a list of further attributes on the selected batch/serial in another screen in the apps.

Batches: Extended Information
Serials: Extended Information

17.4.1.1.1 Batch Extended Information

In this pop-up screen you can access and/or enter several batch-related information.

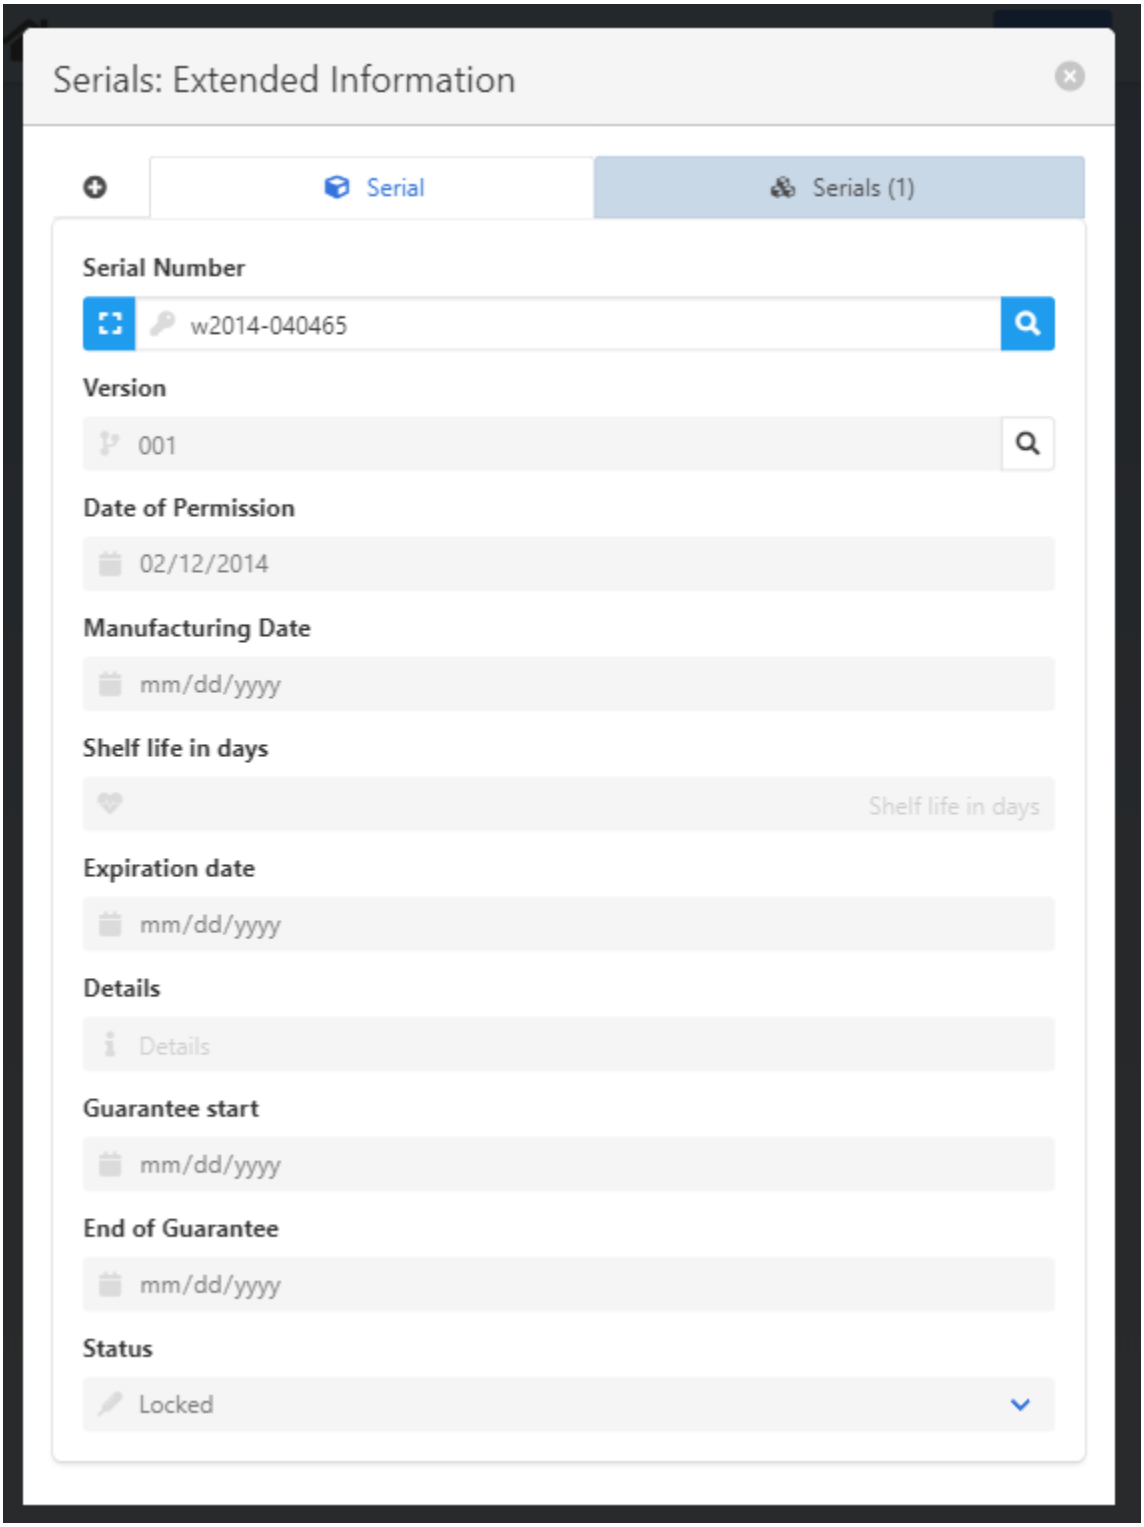
17.4.1.1.2 Serial Extended Information

In this pop-up screen you can access and/or enter several serial-related information.

© 2026 Boyum IT Solutions A/S



Serials: Extended information fields

Field Descriptions

© 2026 Boyum IT Solutions A/S

Field	Description
+	Add details for another serial number. The new serial will, then, appear in the "Serials (x)" tab on the right. **IMPORTANT:** If you wish to add other serial numbers in different bin locations, you must insert an additional line by pressing "+": Serial Number	Serial number
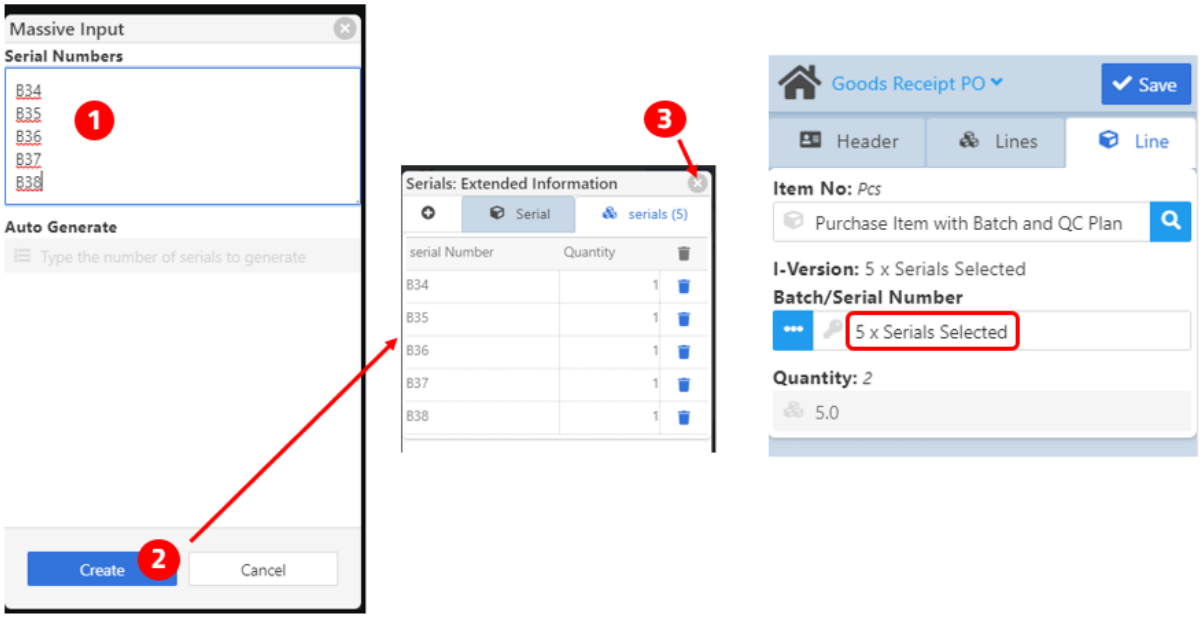
Version	Item version
Date of Permission	
Manufacturing Date	Mandatory field for the date of manufacturing. The "Shelf life in days" and "Expiration date" are calculated based on this information.
Shelf Life in days	Define shelf life in days. When you provide this information, the system automatically calculates the expiration date.
Expiration date	Counted based on the number of shelf life days added to the manufacturing date. Changing the expiration date will also automatically calculate the number of shelf life days.
Details	Further details
Warranty start	Customized field for items with a warranty period.
End of Warranty	Customized field for items with a warranty period.

Massive input of serials:

It is possible to scan / input and auto-generate a number of serial numbers when creating a Goods Receipt PO document. After selecting a line with a Batch/Serial managed-item in a Purchase Order,

© 2026 Boyum IT Solutions A/S

the "Serials: Extended Information" screen opens. Tapping on the icon opens the "Massive input" screen:

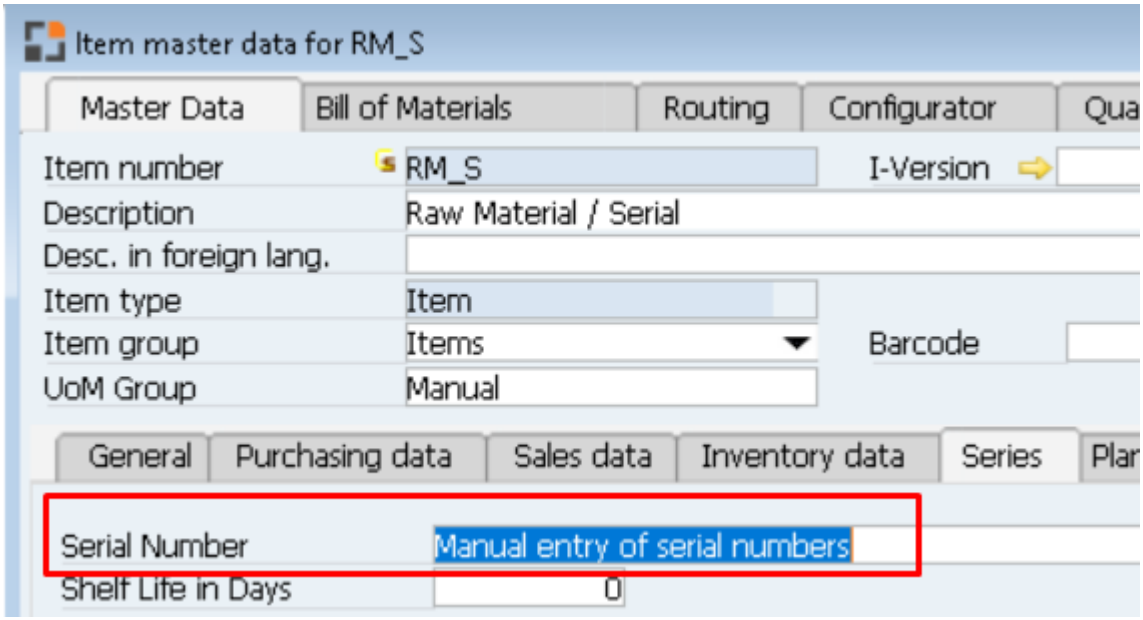


The Process:

1. Input / Scan serial numbers
2. Tap button "Create" to create serial numbers in the system for the received items
3. Close the "Serials: Extended Information" screen
4. The serials have been created.

> Note: For the Massive input of serials you need to select "Manual entry of serial numbers" in **Item Master > Master data tab > Series tab > "Serial Number**" field:

© 2026 Boyum IT Solutions A/S



After finishing this process for each PO item of a selected Purchase Order, and clicking Save, you can create another Goods Receipt PO document starting with the Header tab.

Availability of fields

We can group applications in 3 fundamental modes concerning the behavior and availability of the fields found in the "External information" screen:

Issue mode: Goods Issue, WO Goods Issue, Stock transfer

Receipt mode: Goods Receipt, GRPO, WO Goods Receipt

Information mode: all other apps with a batch / serial field

Mode	Description
Issue mode	Only the batch/serial number and quantity fields are active. The rest of the fields are read-only. It is possible to add multiple batches and serials with the "+" icon.
Receipt mode	All fields are active and editable. Note: "Version" field is only editable in case the item has a version. ***See*** Item Version
Information mode	All fields are read-only.

Note: Only Released batches are displayed in the following apps:

- Allocation
- Goods Issue

© 2026 Boyum IT Solutions A/S

- Picking List
- Picking SO
- Reservation
- StrockTransfer
- WO Backflushing
- WO Time Receipt
- WO Goods Issue
- (class_batches.js) Generic library to deal with more than one batch per line

17.4.1.2 Asynchronous Working

If the WEB client starts a transaction, the WEB Server must create the SAP Transaction, which can take long.
With the Asynchronous working, the WEB Server moves the SAP Transaction request to the Beas Common Service and returns a request ID only.
In this case, the WEB Client and the WEB Server do not need to wait for the SAP Transaction.

The client itself can wait for the result (Standard), but this does not block the WEB Server.
The Common service executes the SAP Transaction if the Service has time and returns the result back to the WEB Server.

If the client asks for the result, the WEB server sends this to the client and the client can display the result.

General information about Asynchronous Working:

Settings
- Activate "Asynchronous Processing" in **Administration > Utilities > Beas Manage Server > Extended tab**.
- Activate Common Service in **Tools > Web Server**.
- Go to **HR > Personnel Master Data > Terminal functions > Open Program group: Terminal20 > "Basic settings" button**. Set parameter WebApps Common Service Result Behavior.
  Time to wait (sec.): Define the time on how many seconds the app should wait before moving on to the next transaction.

See more details on the setup of asynchronous working in this video:

- More about Common Service

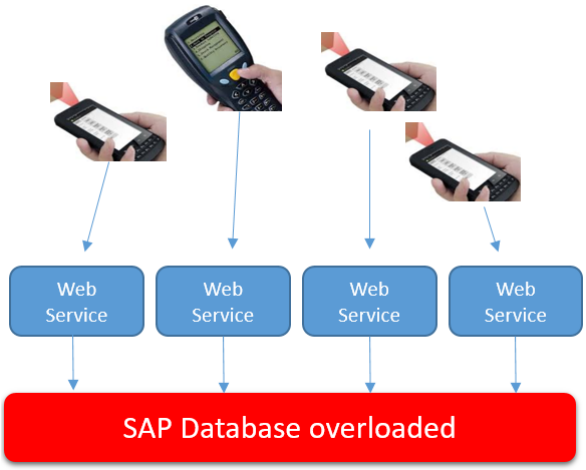
© 2026 Boyum IT Solutions A/S

The functionality of Beas Common Service

- print asynchronously (Example WEB Application)
- create all SAP transactions asynchronously (Example WEB Application)
- simple interface to third applications.

The concept of asynchronous operation

If lots of clients are working in **parallel** with the SAP Transaction on one SAP Table, it does not work because SAP must lock the database for every transaction.
This working tends to get unstable causing long waiting time for clients.

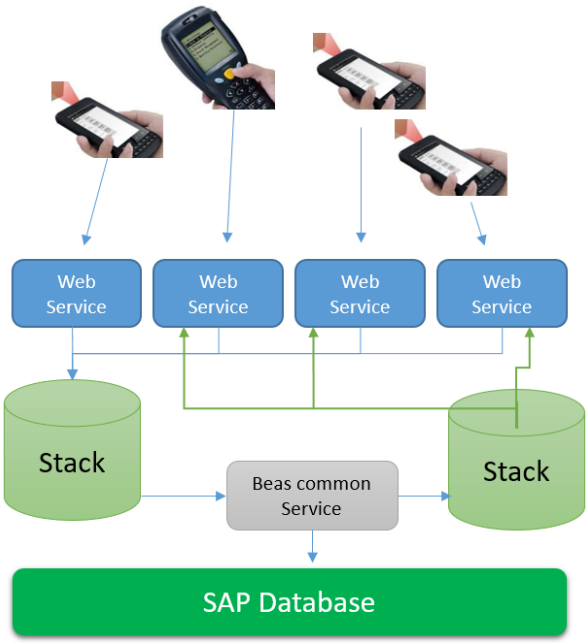


In the Beas common service work is carried out with a stack. Every service sends the transaction command in this stack.
The Beas common service executes this in SERIAL and not PARALLEL.

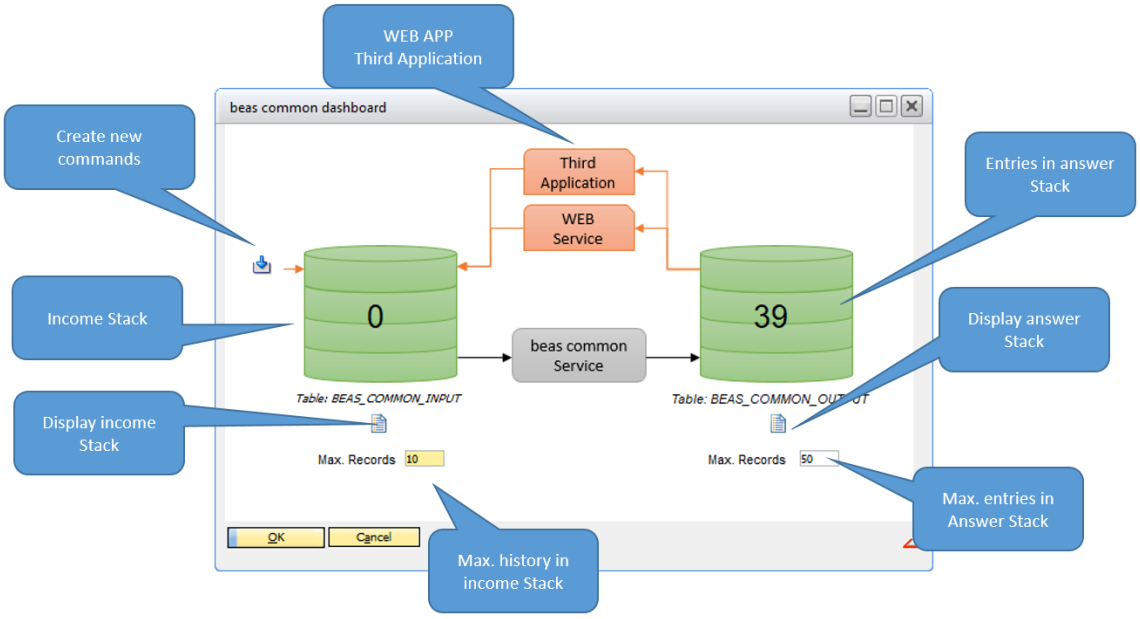
This does not create deadlocks or an overload of the database and results in stable execution.
The worker does not need to wait for a response and can continue since the web service does not execute the transaction itself.

The Beas common service sends the answer (good, docentry number, error message etc.) in an answer stack.
The client can check if an answer is available at any moment, and can display it in the window (= synchronous working).

© 2026 Boyum IT Solutions A/S

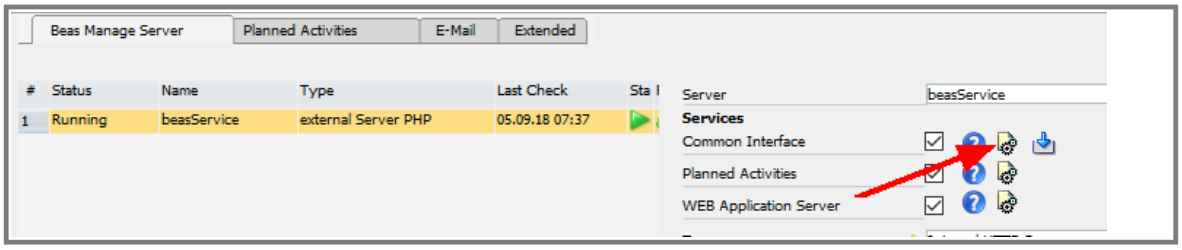


In Beas you can see the current stack in the Beas common dashboard.



To open the Beas common dashboard from Beas manage server, click on the configuration Icon ***see*** image below.

© 2026 Boyum IT Solutions A/S



The WEBAPP print solution also uses the asynchronous concept.

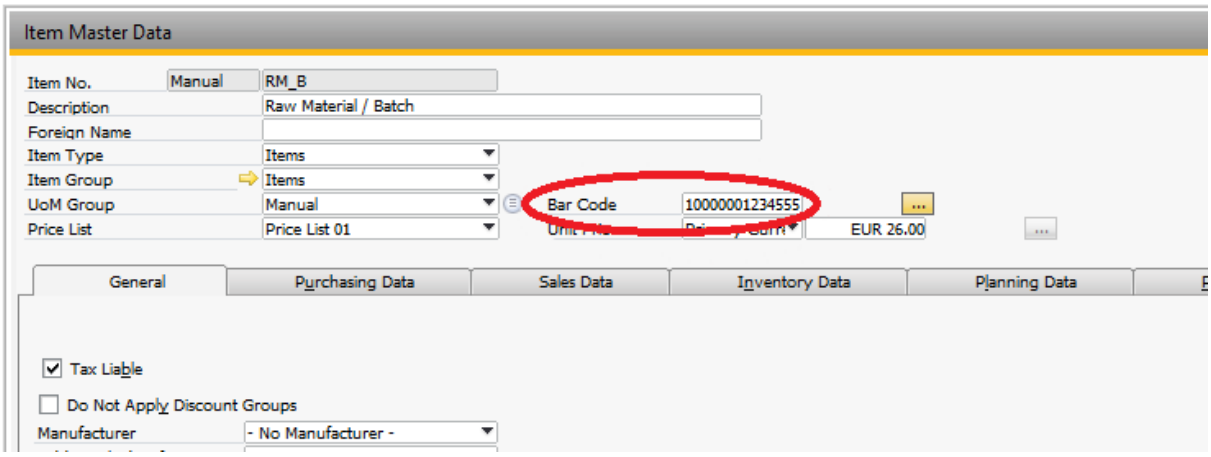
Beas 2020.02

17.4.1.3 GS1-128–standard Bar Code Support

Terminal WebApps version 2.1 uses GS1-128 (formerly UCC/EAN-128) global bar code standard to match item codes from the item master data.

Frist step: Create a GTIN bar code in the Item Master data

Beas uses GTIN (EAN-14) bar codes for item identification. For the further encoding of GS1 standard, a 14 digit-bar code must be set up in the Item Master Data (***see*** image below). The item code identifier in this case is "01": **01**01234567891552



Window: artikel_edit.psr, artikel_edit_barcode_master.psr

- Currently the following applications are supported by the GS1 standard:

- Goods receipt
- Goods issue

© 2026 Boyum IT Solutions A/S

- Batch/Serial Inv. Info
- Warehouse Stock
- WO Backflushing
- WO Time Receipt
- Allocation
- Goods Receipt PO
- Inventory Counting by list
- Inventory Counting by item
- Pick Delivery
- Picking List SAP
- Picking SO
- Reservation
- Stock Transfer
- Stock Transfer Request

A GS1-128 symbol comprises of one or more Application Identifiers (AI) to indicate the type of data encoded inside.
For more information on GS1-128 ***open*** the link GS1-128 Bar codes.

Application identifiers (AI)

Within the GS1 standard, AIs are used to prefix the encoded data. In the Terminal WebApps, we use 14-digit numeric characters as bar codes and the AI "01" denotes the alphanumeric information to match a specific code to the item master data. In the Terminal we use the following application identifiers to match item codes when using bar codes:

AI	Description/FieldName	Data Format
Ê00	SSCC (Serial Shipping Container Code)	18 digit - numeric
Ê01, **Ê**02	Bar code search and insert Item code	14 digit – numeric
Ê10	Batch Number (or Serial Number)	1-20 alphanumeric
Ê21	Serial Number	1-20 alphanumeric
Ê30	Quantity Each	–
Ê11 (not in Goods Issue / Transfer)	Manufacturing Date	6 digits: YYMMDD

© 2026 Boyum IT Solutions A/S

AI	Description/FieldName	Data Format
Ê13 (not in Goods Issue / Transfer)	Date of Permission	6 digits: YYMMDD
Ê17 (not in Goods Issue / Transfer)	Expiration Date	6 digits: YYMMDD
Ê20 (not in Goods Issue / Transfer)	Version	2 digits
Ê241	ItemCode	N3+X..30
Ê400	Customer Purchase Order	1-29 alphanumeric

These AIs are added to the 14-digit code to make up the entire bar code information.
Note: the AI(400) allows the input of only 29 characters instead of the 100 available in SAP in the Header tab. To be able to use this AI for Customer Purchase Order Number information, reduce characters to max. 29.

For further Application Identifiers ***see*** Application Identifier Values.

- Bar code structure

In SAP B1 it is possible to create bar codes for the single items in **Inventory > Bar Codes**. Besides Item number filtering, there is a button "Bar Code List" to help manage bar codes. Once the 14-digit numeric code is saved in the system, the item number is ready for bar code generation according to the GS1 standard.

Examples:
1. Bar code for serial-managed item with the serial name at the end of the string:

(01) + the fourteen-digit bar code stored in SAP + (21) + serial name

2. Bar code for a batch-managed item with the batch number at the end of the string:

© 2026 Boyum IT Solutions A/S

(01) + the fourteen-digit bar code stored in SAP + (10) + Batch number

3. To generate Quantity in the end of the bar code, place backslash as an end of string character + add the number of items to the string. The following example is a bar code for a batch-managed item with batch number and quantity at the end of the string:

(01) + the fourteen-digit bar code stored in SAP + (10) + Batch number + (30) + quantity.
In this case the bar code reads 23 items in Batch01 to process in the terminal.

- Bar code structure in WebApps 2.1

In the following section you can see examples of how the 14-digit GTIN (EAN) code is constructed with application identifiers in the defined fields of certain webapps.

Example 1:

Stock Transfer:

0101234567891552**10**0528**Ê30**5

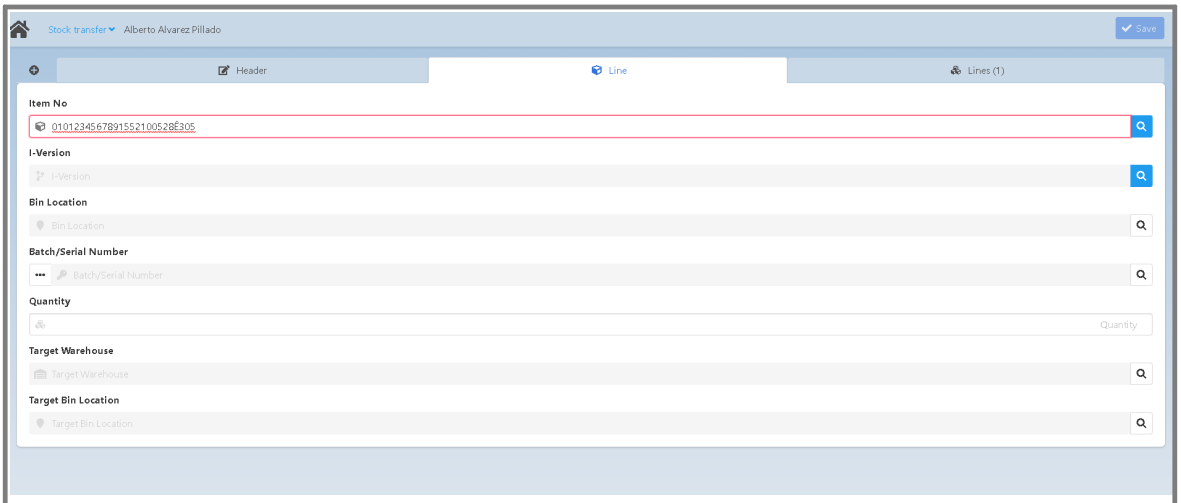
01 – ItemCode Identification

10 – Batch Identification

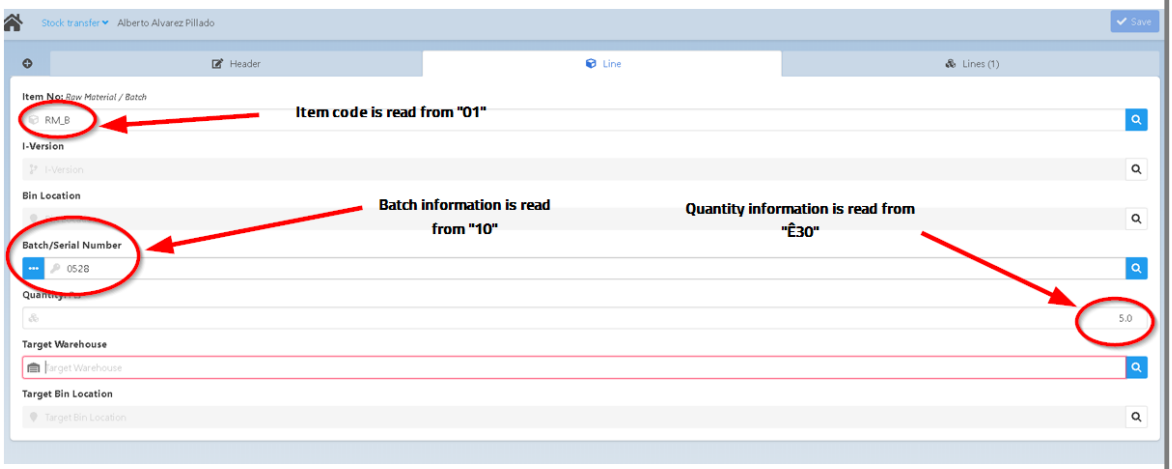
Ê30 - Quantity

1. Add the bar code in the Item No field of the Line tab:

© 2026 Boyum IT Solutions A/S



2. Bar code is read by WebApp as follows:



Example 2:

Goods Receipt PO:

0101234567891552**10**0528**Ê30**5

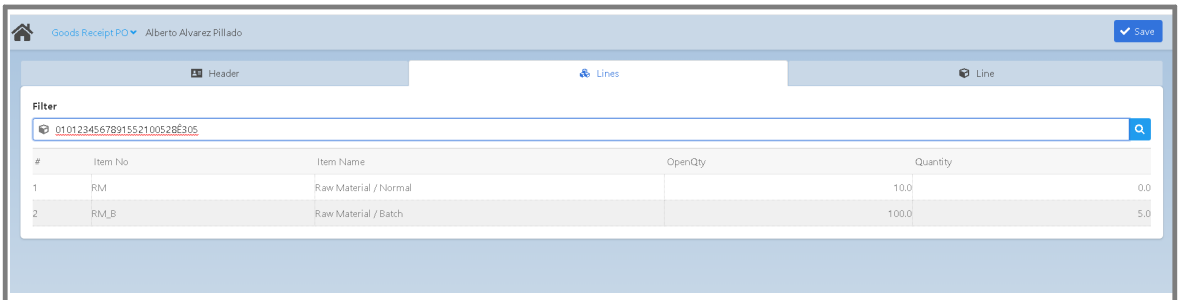
01 – ItemCode Identification over Bar code ID from the item

10 – Batch Identification

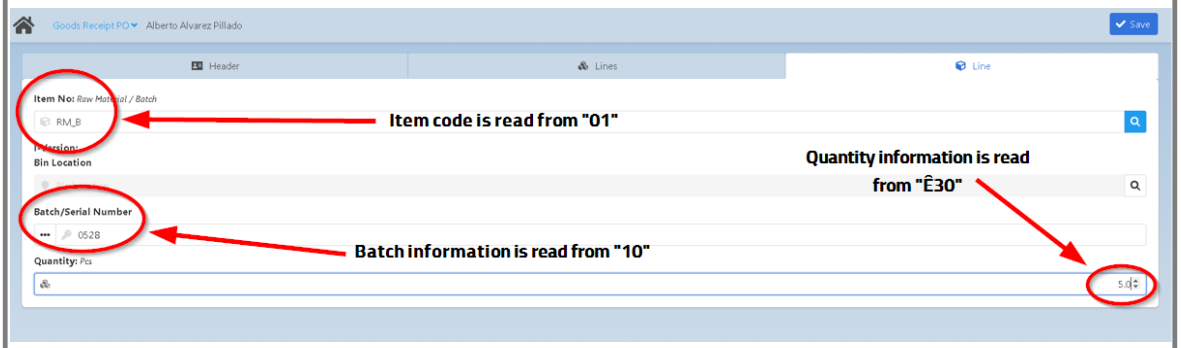
Ê30 - Quantity

1. Add the bar code in the Filter field of the Lines tab:

© 2026 Boyum IT Solutions A/S



2. Bar code is read by WebApp as follows:



Example 3

Goods Issue:

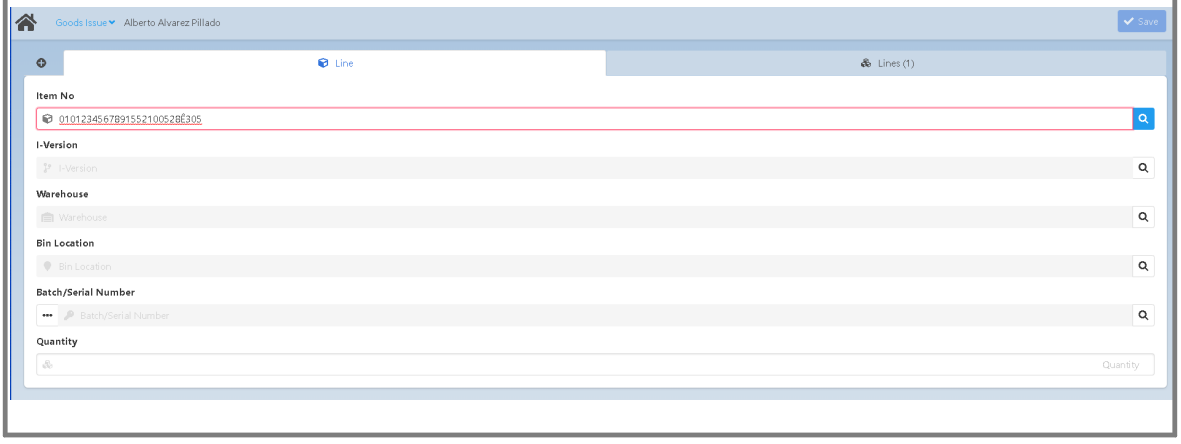
0101234567891552**10**0528**Ê30**5

01 – Item Code Identification

10 – Batch Identification

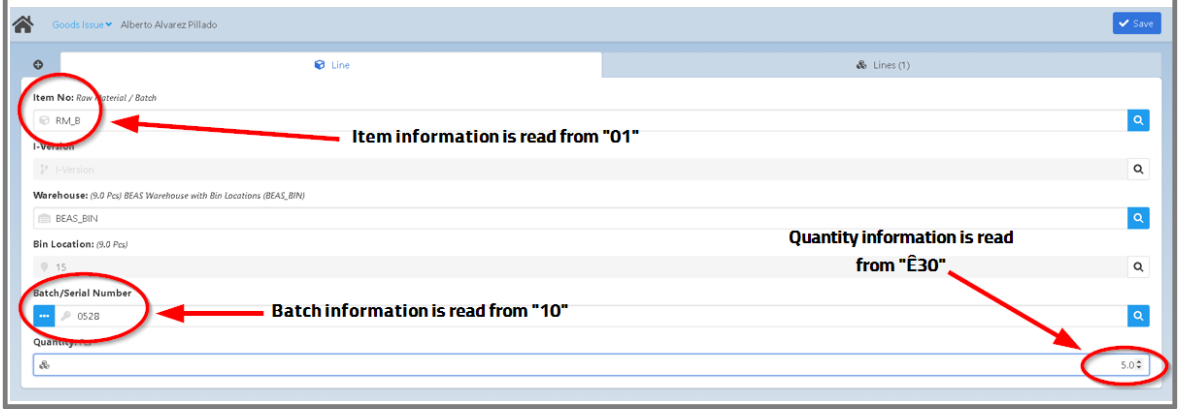
Ê30 - Quantity

1. Add bar code in the Item No field of the Line tab:



© 2026 Boyum IT Solutions A/S

2. Bar code is read by the WebApps as follows:



Using multi-line bar codes with Zebra TC20

Zebra TC20 is able to scan Multi-line bar codes. To do so, the function has to be activated in the device. Once activated, the device is ready to read the pre-defined number of bar codes to complete a sequence.

Note: the scanner can only be used to scan multi-line bar codes or single bar codes at a time.

Device configuration to scan a number of bar codes:

1. Open Apps search on Zebra TC20
2. Tap the App "DataWedge" ***See*** image 1. below.
3. Tap the default Profile.
4. Select the "Reader params" menu item.
5. Scroll down to select "Scanning Modes". It is possible to define a "Single" or "MultiBarcode" function. ***See*** image 2. below.
6. Go back to the main menu and select "Multibarcode params" option to define the number of bar codes. ***See*** image 3. and 4. below.

Image 2.

17.4.1.4 Bin Management Support

Receipt Rules
Issue Rules

Limitation of Beas Bin Management:
- RFID definition is not supported
-Batch/Serial Extended selection: It is not possible to select multiple bin locations from an SAP Bin-managed warehouse or Beas bin-managed warehouse.

Limitation of SAP Bin Management:
- not all Bin Rules are supported in the current view
- Weight/Volume are currently not supported in the current view
- Batch/Serial Extended selection: It is not possible to select multiple bin locations from an SAP Bin-managed warehouse or Beas bin-managed warehouse.

17.4.1.5 Installation on Zebra TC20

Installation of the Terminal WebApps v.2.1 mobile application consists of a few steps.

1. Open the Chrome web browser on Zebra TC20.
2. Enter Card Number on the Beas Web Terminal 2.1 login screen and tap the **Login** button.
3. The WebApps home screen appears with the IP address in the Google Chrome search field on the top. ***See*** image 1. below.
4. Tap for Options in the top right corner of Chrome.
5. Scroll down and tap "Add to Home screen" menu item. ***See*** image 2. and 3. below.
6. A notification appears: "Beas Terminal v2.1 was added to your Home screen"
7. Close Chrome browser and start terminal application from the home screen of the Zebra device.

The IP address bar on the top disappears, and you have an Android, mobile application of the Terminal solution.

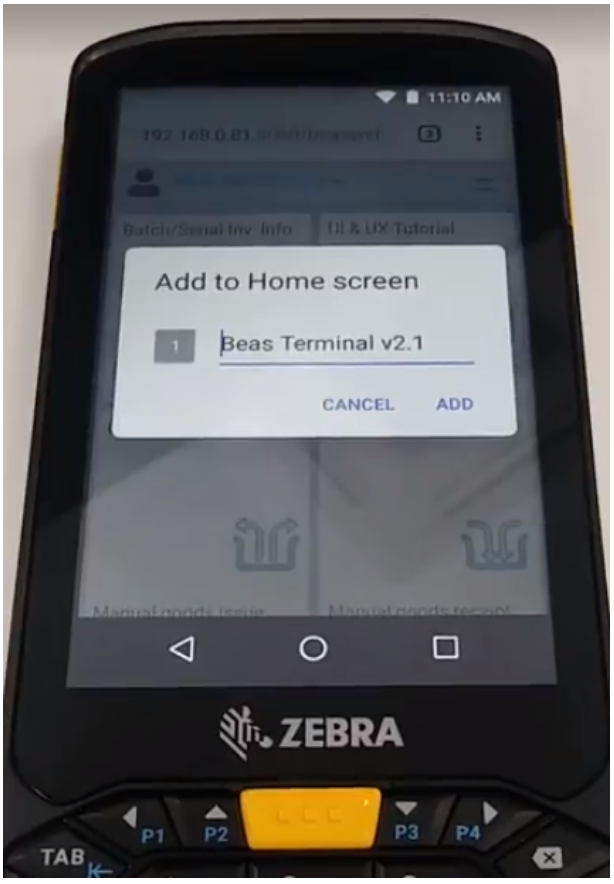

Image 3.

For further information on how to setup the device to read a pre-defined number of bar codes, ***see*** Multi-line bar code scanning.

17.4.1.5.1 Multi-Line Barcode with Zebra TC20

Zebra TC20 is able to scan Multi-line bar codes. To do so, the function has to be activated in the device. Once activated, the device is ready to read the pre-defined number of bar codes to complete a sequence.

> Note: the scanner can only be used to scan multi-line bar codes or single bar codes at a time.

Device configuration to scan a number of bar codes:

1. Open Apps search on Zebra TC20
2. Tap the App "DataWedge" ***See*** image 1. below.
3. Tap the default Profile.
4. Select the "Reader params" menu item.

© 2026 Boyum IT Solutions A/S

5. Scroll down to select "Scanning Modes". It is possible to define a "Single" or "MultiBarcode" function. ***See*** image 2. below.

6. Go back to the main menu and select "Multibarcode params" option to define the number of bar codes. ***See*** image 3. and 4. below.

17.4.1.6 Print Solution

General and detailed information about the Print Solution.

- Using the Print Solution

The Print solution is working in asynchronous mode. Therefore, on a mobile device you can continue on working on next documents while the Server is creating the document in the background.

General information about Asynchronous Working

- More about Common Service

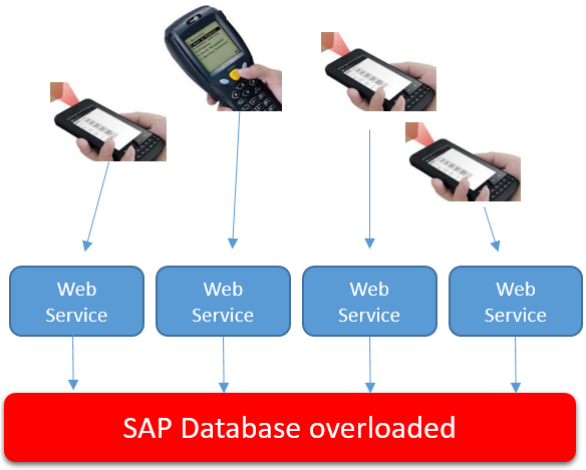
The functionality of Beas Common Service

© 2026 Boyum IT Solutions A/S

- print asynchronously (Example WEB Application)
- create all SAP transactions asynchronously (Example WEB Application)
- simple interface to third applications.

The concept of asynchronous operation

If lots of clients are working in **parallel** with the SAP Transaction on one SAP Table, it does not work because SAP must lock the database for every transaction.
This working tends to get unstable causing long waiting time for clients.

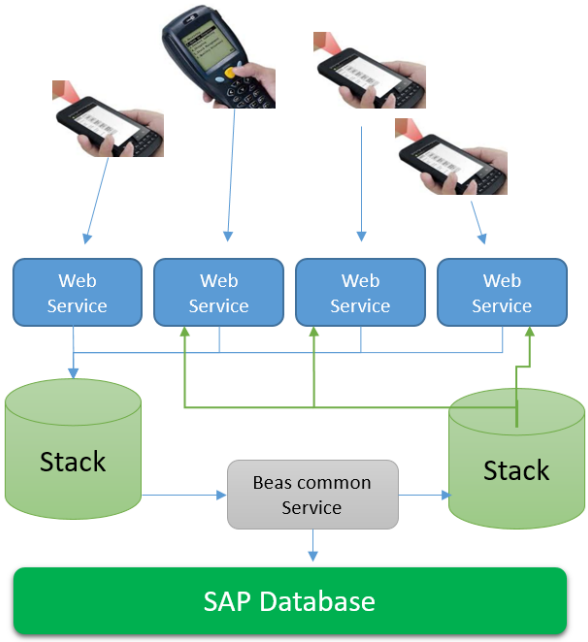


In the Beas common service work is carried out with a stack. Every service sends the transaction command in this stack.
The Beas common service executes this in SERIAL and not PARALLEL.

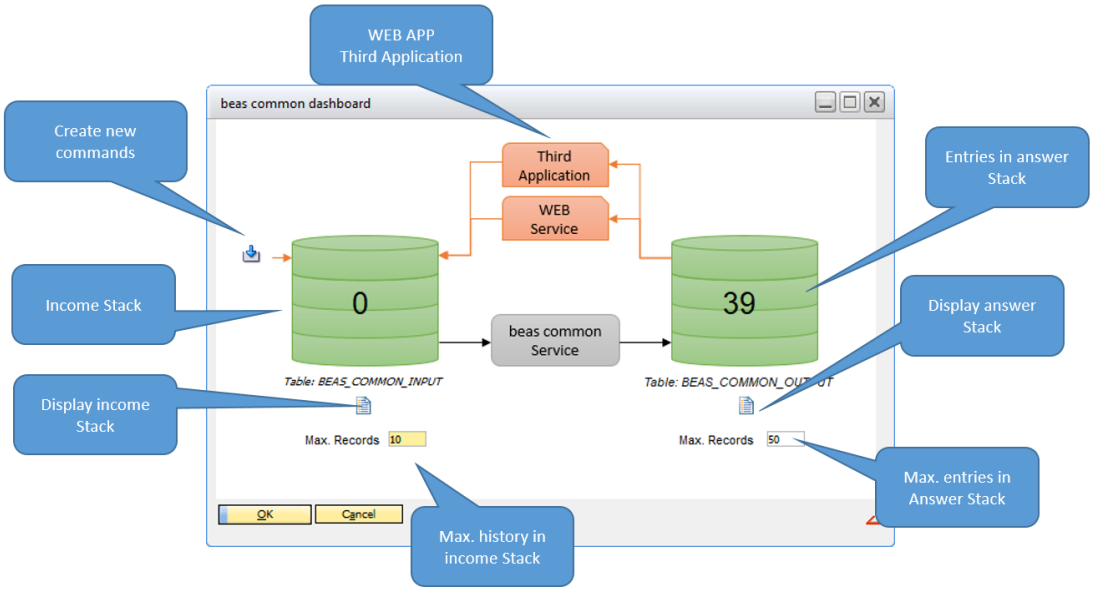
This does not create deadlocks or an overload of the database and results in stable execution.
The worker does not need to wait for a response and can continue since the web service does not execute the transaction itself.

The Beas common service sends the answer (good, docentry number, error message etc.) in an answer stack.
The client can check if an answer is available at any moment, and can display it in the window (= synchronous working).

© 2026 Boyum IT Solutions A/S

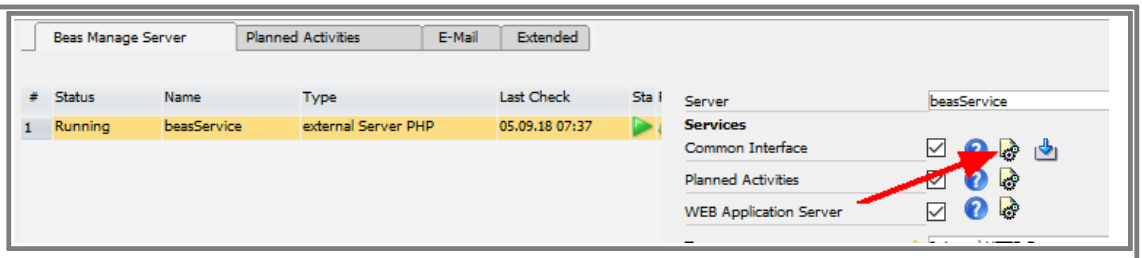


In Beas you can see the current stack in the Beas common dashboard.



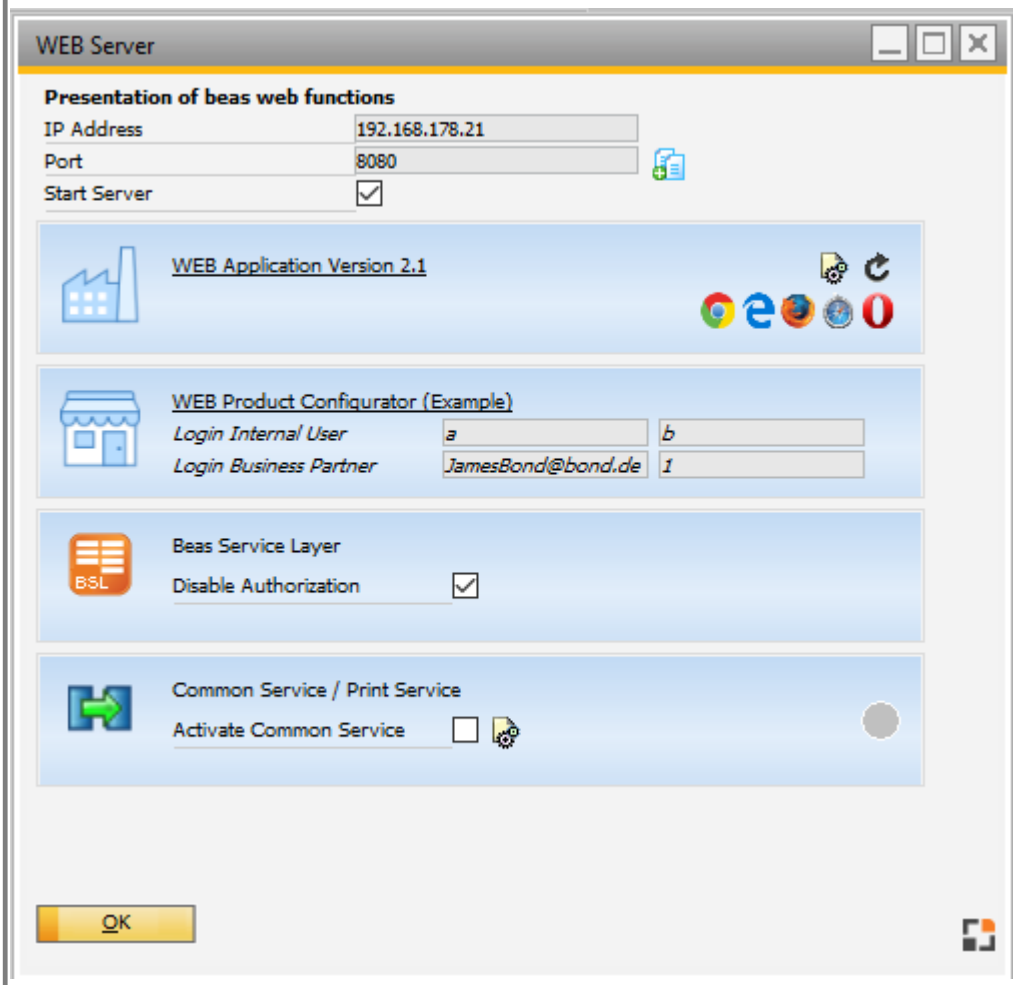
To open the Beas common dashboard from Beas manage server, click on the configuration Icon ***see*** image below.

© 2026 Boyum IT Solutions A/S



Use Print solution in Beas Demo WEB Server

Activate "Common Service":



Use Print solution in standard installation

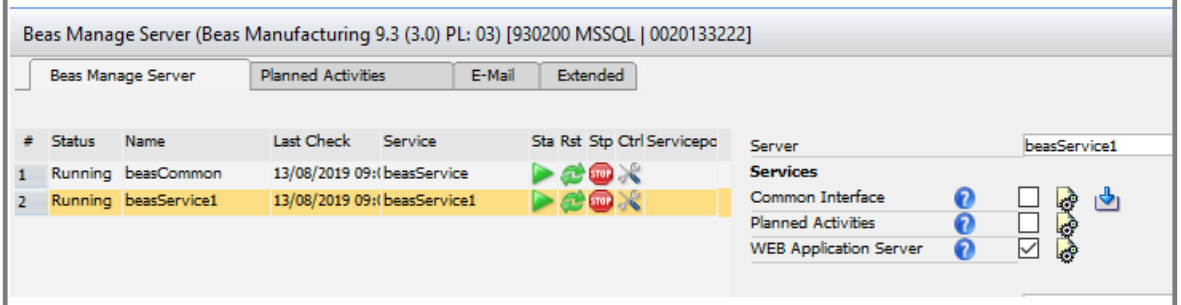
The services are defined in Tools > Beas Server management

You always need 2 services

a) The Beas Common Service (Common Interface)

© 2026 Boyum IT Solutions A/S

b) The WEB Application server



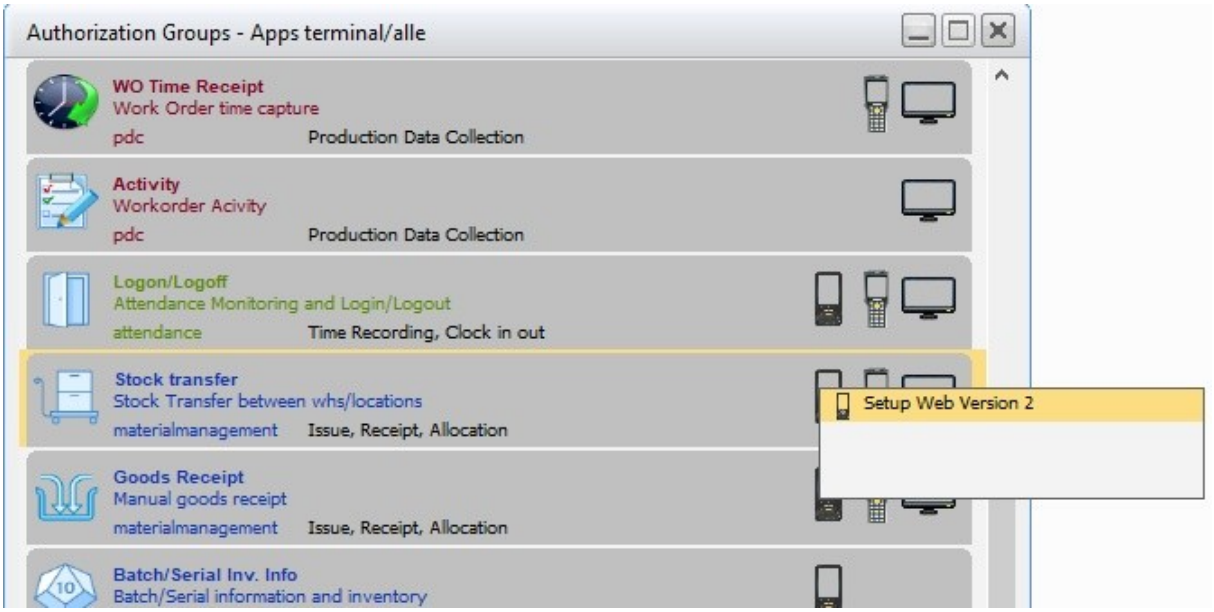
IMPORTANT: Do not activate common Interface and WEB Application for one Service.

Setup Print solution per APP

Human Resources > Master data > Terminal Functions > Edit Authorization

In this window click on the Mobile Device icon > "Setup Web Version 2".

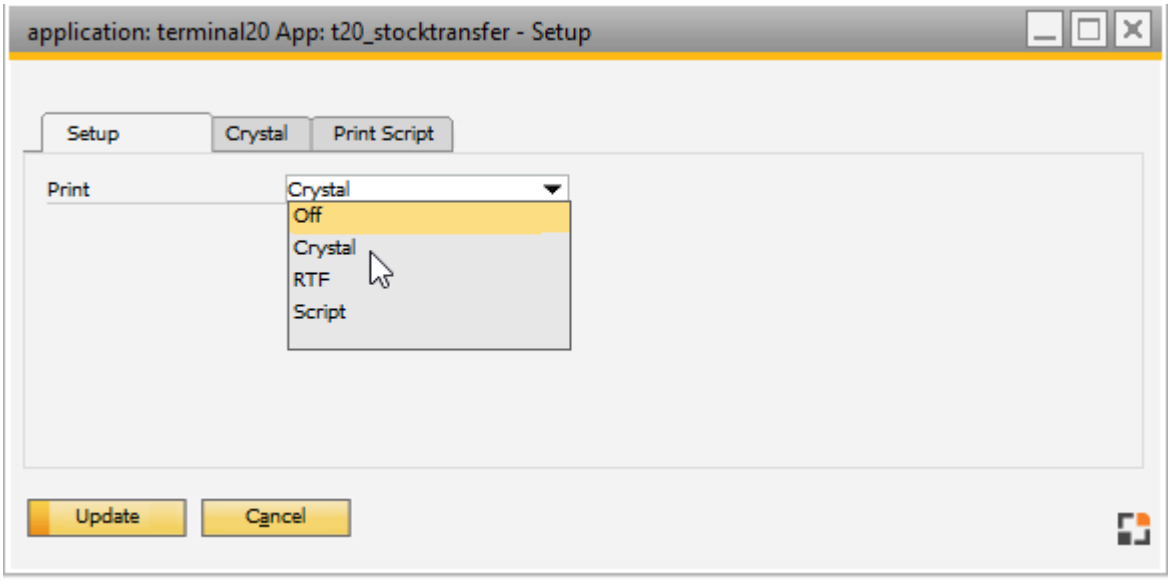
This setting is for all users, not only for the current Authorization Group.



Window menu_ entry_ to.psr

In the Setup window select Crystal and in tab "Crystal" select the RPT File name.

© 2026 Boyum IT Solutions A/S



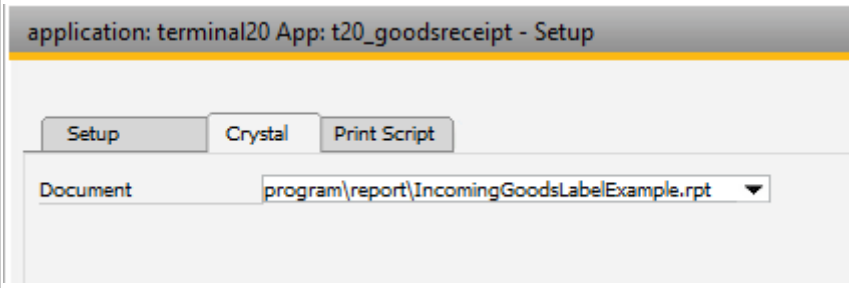
Window webwindow_user_setup.psr

Print type	Description
Crystal	Create a crystal document

Selecting this option makes it possible to print a Crystal document:

PATH: Human Resources > Personnel > Edit an entry > Master Data – Attendance sub-tab > double-click right of "WEB terminal group" field > single-click relevant WebApp 2.1 > "Setup Web Version 2" > select "Crystal" from drop-down > Click "Crystal" tab

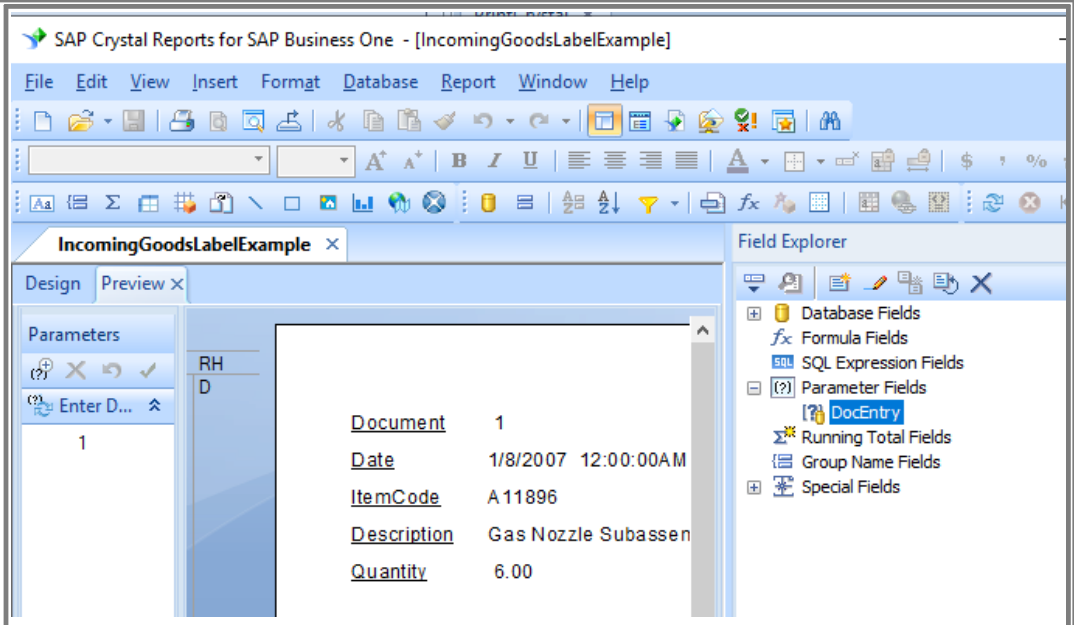
See also extended App Setup.



Window webwindow_user_setup.psr

Example: Report "IncomingGoodsLabelExample" for Goods receipt

© 2026 Boyum IT Solutions A/S



The following variables are available in the Print interface:
(only for apps which create SAP transaction document as receipt, issue, transfer, invoice document)

Variable	Description
DocNumber	Document Number
DocEntry	Document Entry (internal key)
PrimaryObject	SAP Object code for generated document
PrimaryTable	SAP Table for generated document, for example OIGE for Issue document
DocumentName	Document name in system language

This variables are available as PrintObject Variable and instance variable.

Note:

The Report "sale_and_purchase_example.rpt" is not working together with this Print Service.

For Testing you can choose "IncomingGoodsLabelExample.rpt" for Stockmanagement – Receipt App.

© 2026 Boyum IT Solutions A/S

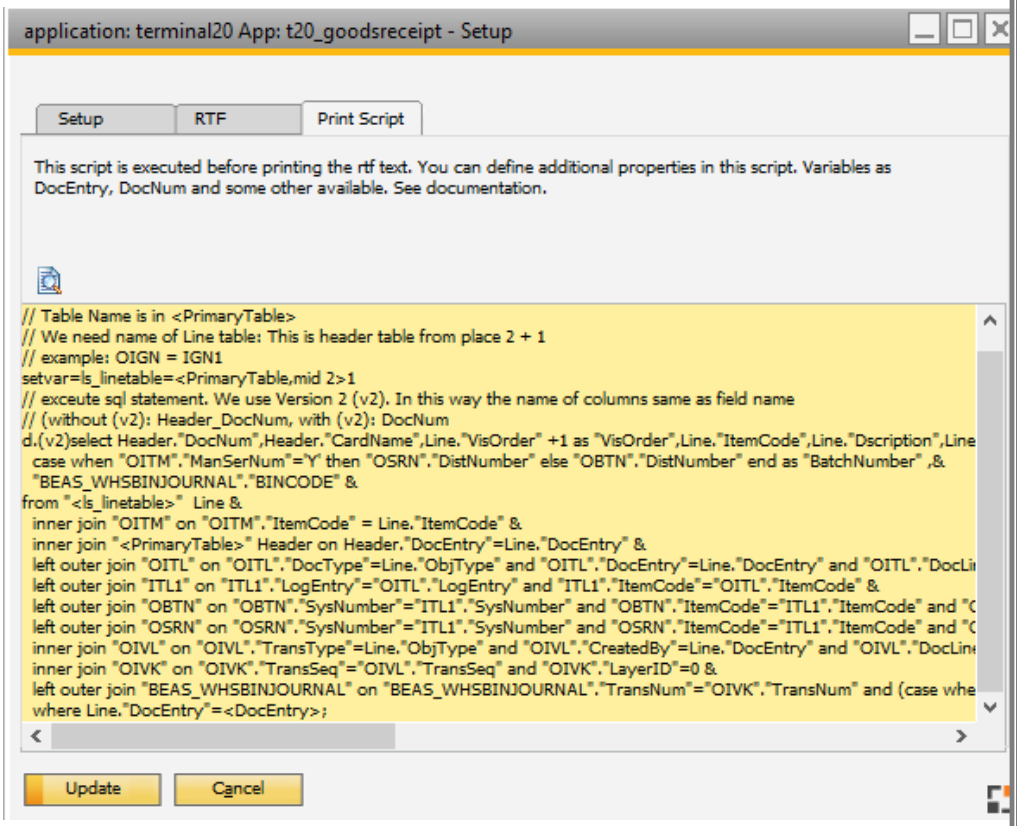
Send additional information to Crystal document as argument

It is possible to read additional information and to send this as arguments to the Crystal document.

You can do this in the tab "Print Script", which is executed before printing

- The following script works for every document type

With the following SQL Statement you can read Serial numbers, Bin locations (only Beas), Item Code, ItemName and other information from the generated document:



```
instance datastore d
// Table Name is in <PrimaryTable>
// We need name of Line table: This is header table from place 2 + 1
// example: OIGN = IGN1
setvar=ls_linetable=<PrimaryTable,mid 2>1
// exceute sql statement. We use Version 2 (v2). In this way the name of columns same as field name
// (without (v2): Header_DocNum, with (v2): DocNum
d.(v2)select Header."DocNum",Header."CardName",Line."VisOrder" +1 as "VisOrder",Line."ItemCode",Line."Dscription",Line."WhsCode",Line."Quantity",&
  case when "OITM"."ManSerNum"='Y' then "OSRN"."DistNumber" else "OBTN"."DistNumber" end as "BatchNumber" ,&
  "BEAS_WHSBINJOURNAL"."BINCODE" &
from "<ls_linetable>"  Line &
  inner join "OITM" on "OITM"."ItemCode" = Line."ItemCode" &
```

© 2026 Boyum IT Solutions A/S

```
  inner join "<PrimaryTable>" Header on
Header."DocEntry"=Line."DocEntry" &
  left outer join "OITL" on "OITL"."DocType"=Line."ObjType" and
"OITL"."DocEntry"=Line."DocEntry" and "OITL"."DocLine"=Line."LineNum"
&
  left outer join "ITL1" on "ITL1"."LogEntry"="OITL"."LogEntry" and
"ITL1"."ItemCode"="OITL"."ItemCode" &
  left outer join "OBTN" on "OBTN"."SysNumber"="ITL1"."SysNumber" and
"OBTN"."ItemCode"="ITL1"."ItemCode" and "OITM"."ManBtchNum"='Y' &
  left outer join "OSRN" on "OSRN"."SysNumber"="ITL1"."SysNumber" and
"OSRN"."ItemCode"="ITL1"."ItemCode" and "OITM"."ManSerNum"='Y'  &
  inner join "OIVL" on "OIVL"."TransType"=Line."ObjType" and
"OIVL"."CreatedBy"=Line."DocEntry" and
"OIVL"."DocLineNum"=Line."LineNum" &
  inner join "OIVK" on "OIVK"."TransSeq"="OIVL"."TransSeq" and
"OIVK"."LayerID"=0 &
  left outer join "BEAS_WHSBINJOURNAL" on
"BEAS_WHSBINJOURNAL"."TransNum"="OIVK"."TransNum" and (case when
"OITM"."ManSerNum"='Y' then CAST("OSRN"."SysNumber" AS varchar(30))
when "OITM"."ManBtchNum"='Y' then "OBTN"."DistNumber" else '' end) =
"BEAS_WHSBINJOURNAL"."BatchNum" &
  where Line."DocEntry"=<DocEntry>;
// send all information to print object
printobject=setvar=ItemCode=<d.itemcode>
printobject=setvar=BatchNumber=<d.batchnumber>
// destroy datastore
destroy=d
```

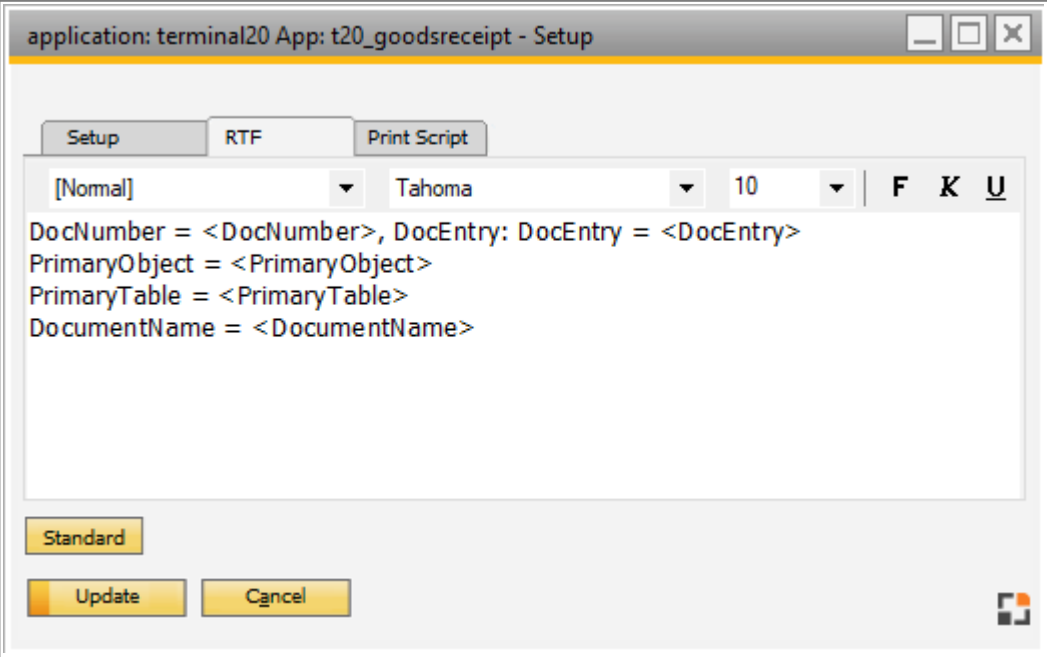
RTF

Create RTF document

You can create Labels / Documents with RTF text.

It is possible to work with placeholders.

© 2026 Boyum IT Solutions A/S



Window webwindow_user_setup.psr

See also extended App Setup.

The following variables are available in the Print interface:
(only for apps which create SAP transaction document as receipt, issue, transfer, invoice document)

Variable	Description
`DocNumber`	Document Number
`DocEntry`	Document Entry (internal key)
`PrimaryObject`	SAP Object code for generated document
`PrimaryTable`	SAP Table for generated document, for example OIGE for Issue document
`DocumentName`	Document name in system language

This variables are available as PrintObject Variable and instance variable.

Button "Standard"

If you click on the **Standard** button, Beas inserts an example.

Additional Variables

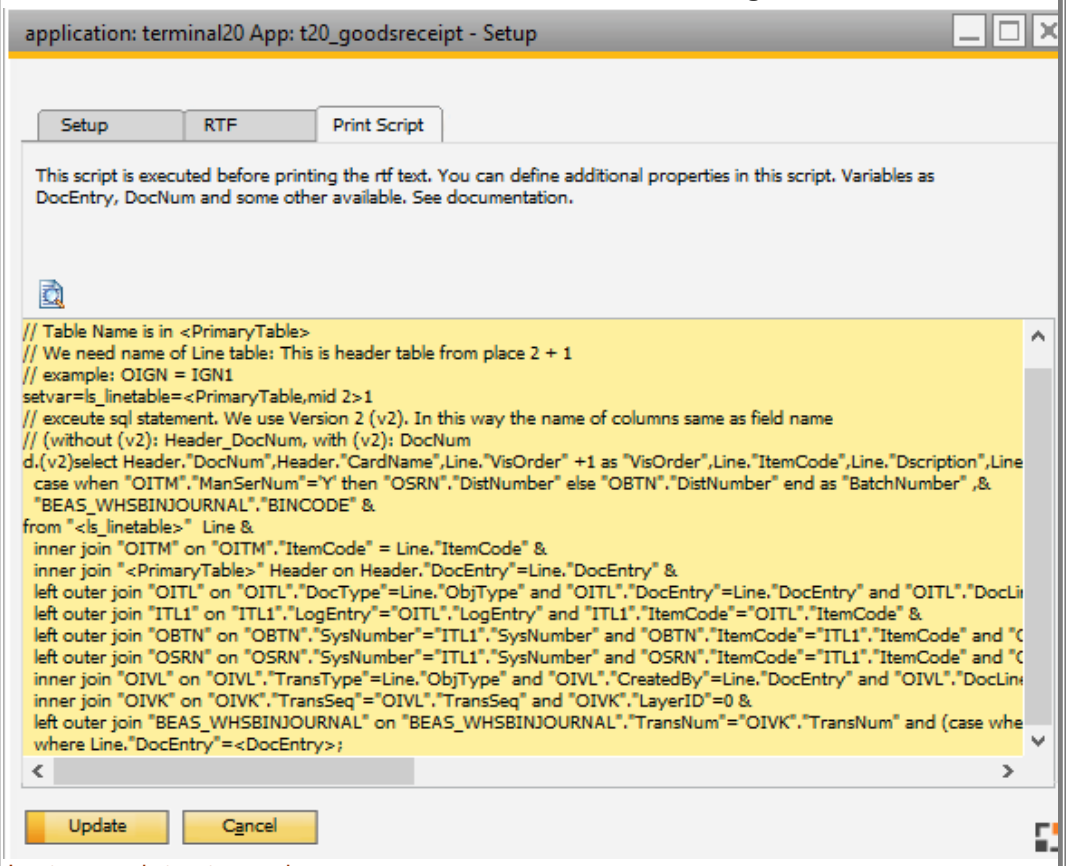
© 2026 Boyum IT Solutions A/S

If you need additional variables, you can define them in tab "Print Script". Beas executes the script before printing the RTF text.

(beas 9.3 PL 3 HF 1)

Example: You want to send ItemCode, ItemName, DistNumber, Quantity and another information

With the following SQL Statement you can read Serial numbers, Bin locations (only Beas), Item Code, ItemName and other information from the generated document:

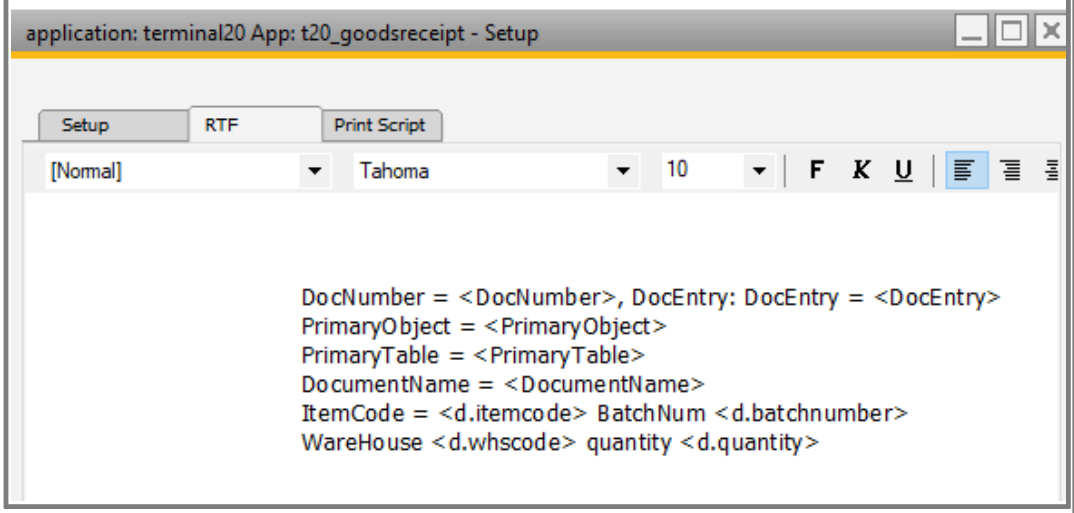


```
instance datastore d
// Table Name is in <PrimaryTable>
// We need name of Line table: This is header table from place 2 + 1
// example: OIGN = IGN1
setvar=ls_linetable=<PrimaryTable,mid 2>1
// exceute sql statement. We use Version 2 (v2). In this way the name of
columns same as field name
// (without (v2): Header_DocNum, with (v2): DocNum
d.(v2)select Header."DocNum",Header."CardName",Line."VisOrder" +1 as
"VisOrder",Line."ItemCode",Line."Dscription",Line."WhsCode",Line."Quantit
y",&
  case when "OITM"."ManSerNum"='Y' then "OSRN"."DistNumber" else
"OBTN"."DistNumber" end as "BatchNumber" ,&
  "BEAS_WHSBINJOURNAL"."BINCODE" &
from "<ls_linetable>"  Line &
  inner join "OITM" on "OITM"."ItemCode" = Line."ItemCode" &
  inner join "<PrimaryTable>" Header on Header."DocEntry"=Line."DocEntry"
```

© 2026 Boyum IT Solutions A/S

```
&
  left outer join "OITL" on "OITL"."DocType"=Line."ObjType" and
"OITL"."DocEntry"=Line."DocEntry" and "OITL"."DocLine"=Line."LineNum" &
  left outer join "ITL1" on "ITL1"."LogEntry"="OITL"."LogEntry" and
"ITL1"."ItemCode"="OITL"."ItemCode" &
  left outer join "OBTN" on "OBTN"."SysNumber"="ITL1"."SysNumber" and
"OBTN"."ItemCode"="ITL1"."ItemCode" and "OITM"."ManBtchNum"='Y' &
  left outer join "OSRN" on "OSRN"."SysNumber"="ITL1"."SysNumber" and
"OSRN"."ItemCode"="ITL1"."ItemCode" and "OITM"."ManSerNum"='Y'  &
  inner join "OIVL" on "OIVL"."TransType"=Line."ObjType" and
"OIVL"."CreatedBy"=Line."DocEntry" and "OIVL"."DocLineNum"=Line."LineNum"
&
  inner join "OIVK" on "OIVK"."TransSeq"="OIVL"."TransSeq" and
"OIVK"."LayerID"=0 &
  left outer join "BEAS_WHSBINJOURNAL" on
"BEAS_WHSBINJOURNAL"."TransNum"="OIVK"."TransNum" and (case when
"OITM"."ManSerNum"='Y' then CAST("OSRN"."SysNumber" AS varchar(30)) when
"OITM"."ManBtchNum"='Y' then "OBTN"."DistNumber" else '' end) =
"BEAS_WHSBINJOURNAL"."BatchNum" &
  where Line."DocEntry"=<DocEntry>;
```

in RTF you can insert all additional placeholders:



Script

Execute only script

Execute the script.

If the print type is Crystal or RTF, Beas executes the script BEFORE printing.

In this way you can define additional variables or arguments.

The following variables are available in the Print interface:

(only for apps which create SAP transaction document as receipt, issue, transfer, invoice document)

Variable	Description
DocNumber	Document Number

© 2026 Boyum IT Solutions A/S

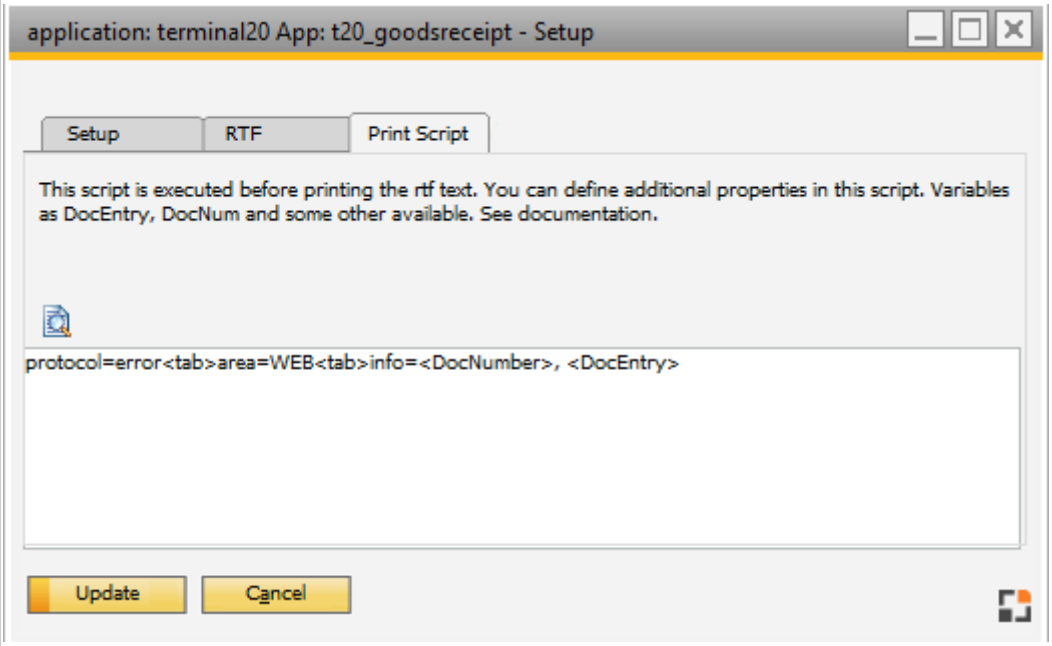
Variable	Description
DocEntry	Document Entry (internal key)
PrimaryObject	SAP Object code for generated document
PrimaryTable	SAP Table for generated document, for example OIGE for Issue document
DocumentName	Document name in system language

This variables are available as PrintObject Variable and instance variable.

Example:

Write Information in the Beas protocol:

```
protocol=error<tab>area=WEB<tab>info=<DocNumber>, <DocEntry>
```



Window webwindow_user_setup.psr

See also extended App Setup.

Attention:

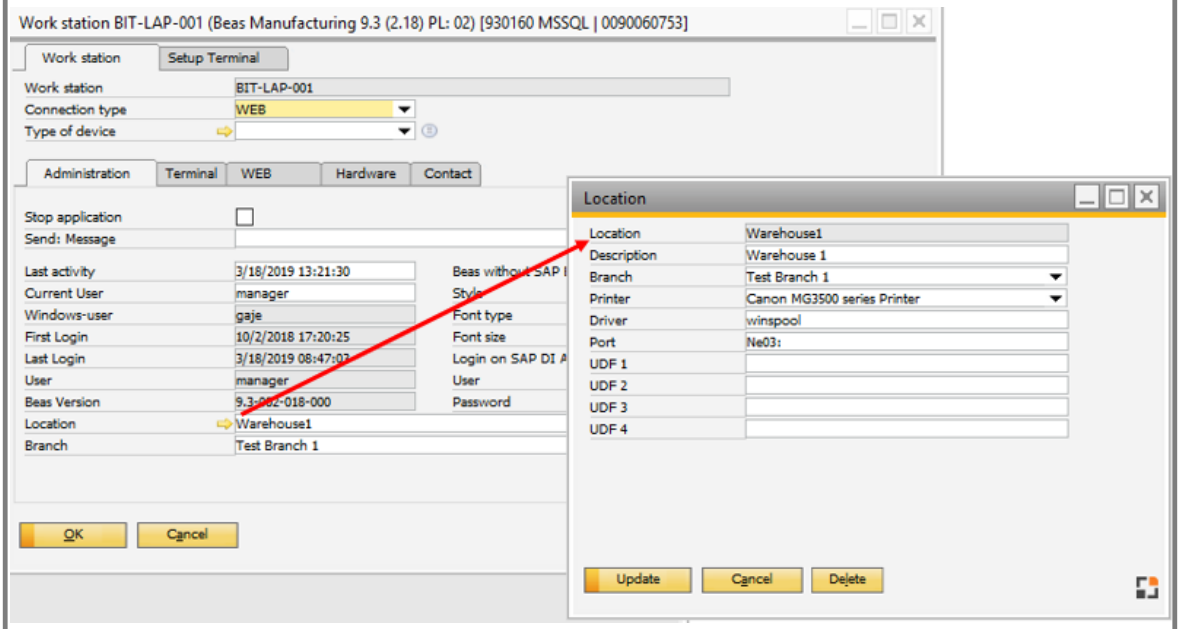
How to use the Print Solution

The WEB Client cannot print the document itself. The document is created by the Beas service which is running on the Server.

© 2026 Boyum IT Solutions A/S

The Server and the windows user of the running Service need connection and access to the Printer (for example network printer)
Location settings are best configured directly on the Server.
Check if the user has access to this printer (with the Service is started).

The WEB Client must be defined as the known Station
Administration > System Initializations > Work station setting wizard
- insert new station
- Tab WEB: Define a password for this station configuration
- define location and a printer for this location
- insert the location in the Work station settings



Window system_location_edit.psr

Now the printer is linked to a location and the station to a location.

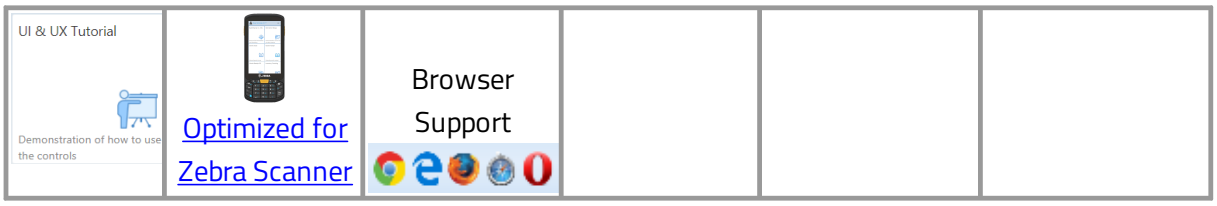
The WEB Client must register the Location.
Human Resources > Master data > Terminal Functions > Edit Authorization > "Basic Settings" button

© 2026 Boyum IT Solutions A/S

Define "Selection" in Work station Name"

Now you can define the Station and Station Password on a mobile device in the login mask.

17.4.2 UI & UX Tutorial



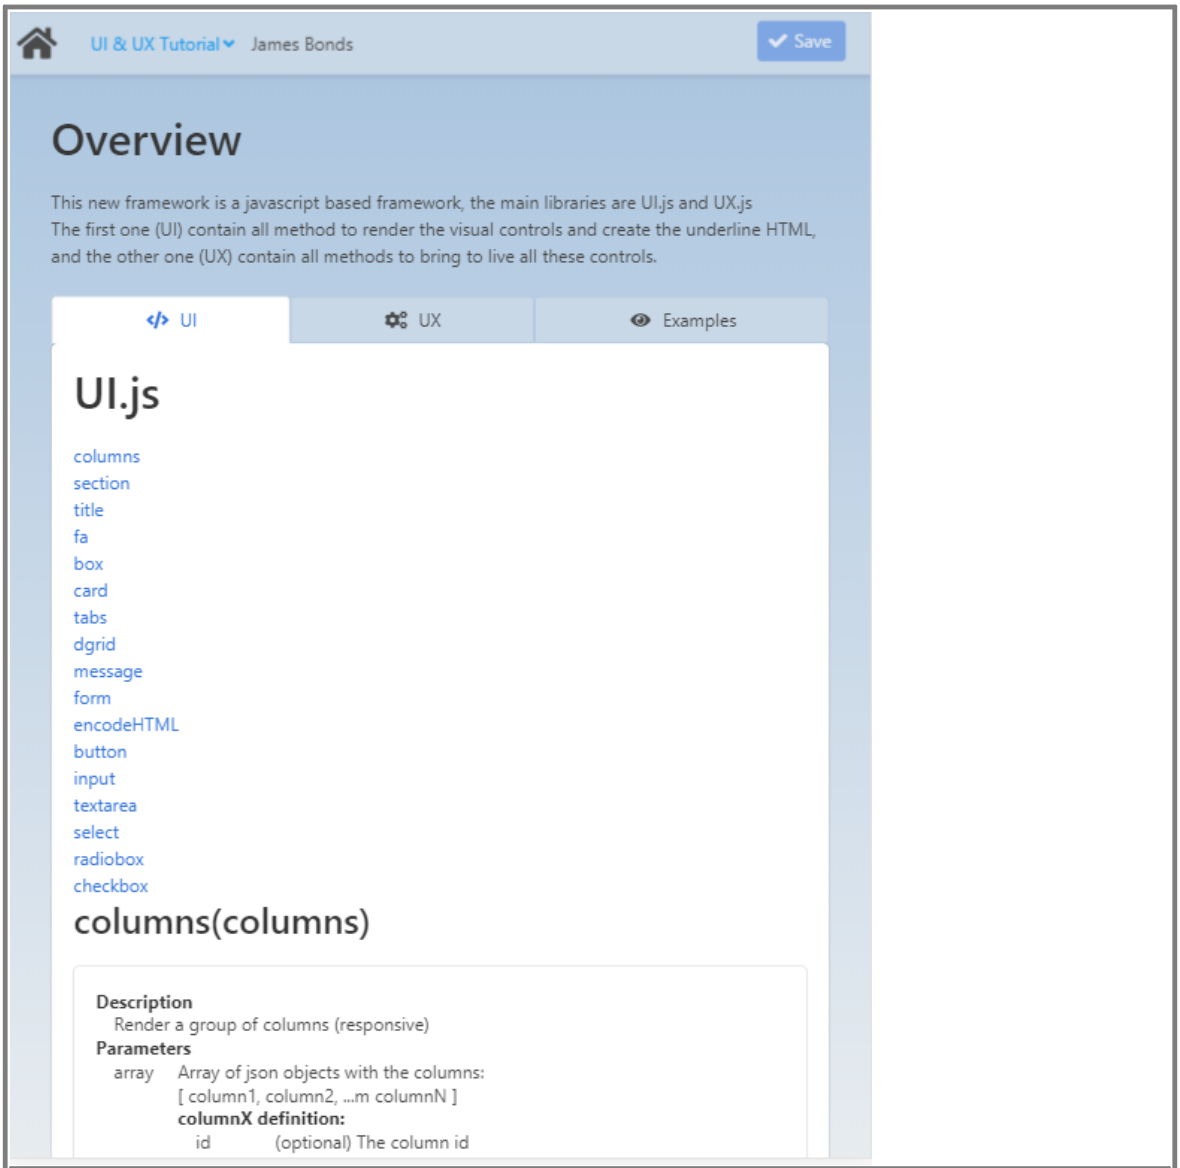
With this app you can gain information on how to use the controls of Terminal 2.1 and create your own Beas WebApps.

Although the app is optimized for the Zebra scanner, it is recommended to use it on larger (tablet size) displays for better readability and perception of topics and examples.

The app consists of three tabs:

- **UI**

© 2026 Boyum IT Solutions A/S



Topic	Method
columns	**columns(columns)**

Description
Render a group of columns (responsive).
Parameters

array	Array of json objects with the columns:

© 2026 Boyum IT Solutions A/S

	[column1, column2, ...m columnN] **columnX definition:** ID: (optional) The column ID size: Size for this column. Available sizes are: 3/4, 2/3, 1/2, 1/3, 1/4, 4/5, 3/5, 2/5, 1/5 content: The column content
Return	
string	The HTML to create the columns
Example	
	`> ui.columns( [{size:"1/5",content:"This columns should be 1/5 of the size. (Or all width in a mobile)"}, {size:"3/5",content:"This columns should be 3/5 of the size. (Or all`

© 2026 Boyum IT Solutions A/S

	width in a mobile)"}, {size:"1/5", content:"This columns should be 1/5 of the size. (Or all width in a mobile)"}]);
	Preview: In the preview of the example you can see how the above string can modify the size of the columns.
section	**section(content, options)**
	Description
	A simple container to divide your page into sections.
	Parameters
	string: The HTML content
	object: json object with the options: ID: (optional) The control ID; hero: The section is a hero. (true|false)
	Return
	string: The HTML to create the section
	Example
	`> ui.section( "Put here the content" );`

© 2026 Boyum IT Solutions A/S

		Preview: In the preview of the example you can see the result of the string: "Insert content here."
title	**title(content, options)**	

Description

Create a title/subtitle (title/subtitle).

Parameters

string	The HTML content
object	json object with the options: type: Type of title: (title|subtitle) size: The size: (1,2,3,4,5,6,7,8)

Return

string	The HTML to render the title

Example

```
>
ui.title( "This is a title" );
```

Preview:
In the preview of the example you

© 2026 Boyum IT Solutions A/S

		can see the result of the string: **"This is a title."**
fa	**fa(iconName, size)**	
	Description	
	Render the HTML to represent a font-aweson icon.	
	Parameters	
	string	The icon name (check names here: https://fontawesome.com/icons?d=gallery)
	string	(optional, default:"small") The icon size: small, medium, large, 2x, 3x
	Return	
	string	The HTML to create the icon
	Example	

		`> ui.fa( "smile-wink" );`
		`< <span class="icon"><i class="fas fa-smile-wink"><></span>`
		
		Preview:
		In the preview of the example you can see the result of the string, a wink icon:

© 2026 Boyum IT Solutions A/S

box	**box(content, options)** **Description** A simple box. **Parameters** string: The HTML content object: JSON object with the options ID: (optional) The ID for this tab **Return** string: The HTML to render the control ***Example*** `> ui.box( "This is the box's content" );` **Preview**: In the preview of the example you can see the result of the string: This is the content of the box.
card	**card(content, options)** **Description** The card component comprises several elements: • header title, subtitle, icon, image

© 2026 Boyum IT Solutions A/S

- content (at this moment all your output after command header until a footer command is executed)
- footer

Parameters

object	JSON object with the options	
	title	The tab title
	subtitle	The tab subtitle
	img1	The image next to the title
	img2	The image next to the content
	content	The tab content
	buttons	Array ob json objects with the buttons definitio n: title The butt on title link A link

© 2026 Boyum IT Solutions A/S

	onclick	for the button JS to execute onclick

Return

string	The HTML to render the control

Example

```
>
ui.card( { title
:"MyCard",subtit
le:"underline
title",img1:"ass
ets21/img/app_t2
0_demo.png",
content:"
This is the
content.
You can put
anything here.
Button 3 will
call a JS
function.
", buttons:
[ {title:"Button
1",link:"#"},
{title:"Button
2",link:"#"},
{title:"Button
3",link:"",
onclick:"alert('
JDG::JS-
test')"}]  });
```

Preview:

In the preview of the example you

© 2026 Boyum IT Solutions A/S

		can see the result of the string:
tabs	**tabs(id, tabs)**	**Description** Create a tab control. **Parameters** string: The tab ID array: An array of json objects with all options to render each tab: [tab1, tab2, ..., tabN] tabX structure: ID: (optional) The ID for this tab title: The tab title icon: The tab icon (You can use ui.fa() to render the icon) content: The tab content **Return** string: The HTML to create the tab

© 2026 Boyum IT Solutions A/S

	Example
	`> ui.tabs( "tabExample01", [ {title:"Tab1", icon:ui.fa("fire"), content:"Content for tab 1"}, {title:"Tab2", icon:ui.fa("water")}, {title:"Tab3", icon:ui.fa("wind")}] );` **Preview**: In the preview of the example you can see the result of the string:
dgrid	**dgrid(id)**
	Description
	Create the container to hold a DataGrid.
	Parameters
	string — The control id
	Return
	string — The html to contain the control created by the UX library
	Example
	`> ui.dgrid( "gridExample01" );` **Preview**: In the preview of the example you

© 2026 Boyum IT Solutions A/S

		can see the result of the string.
message	**message(errorCode, errorText)**	
	Description	
	Create a message box.	
	Parameters	
	number	The error code. If it is lower than 0 is considered an error
	string	The HTML with the message
	Return	
	string	The HTML to create the control
	Example	
		`> ui.message( -1, "Ups. This is an error box!" );` **Preview**:
form	**form(id, action, content)**	
	Description	
	Render the html to represent a form.	
	Parameters	
	string	The form ID
	string	The action to perform when you submit the form
	string	The content
	Return	

© 2026 Boyum IT Solutions A/S

		string: The HTML to create the form ***Example*** `> ui.form( "formExample", "?page=myApp", html_with_the_content ); < html_with_the_content`

encodeHTML	−	**encodeHTML(s)**
		Description
		Encode a string to be used as value in a HTML tag.
		Parameters
		string The string to be encoded.
		Return
		void
		Example
		`> ui.encodeHTML( "This & this " );`
		`< This & this <is a test>`

button	−	**button(id, label, options)** **Description** Render the HTML to represent a button. **Parameters** string: The control ID string: The title of the control options: json object with all options to render the control: link: Define the

© 2026 Boyum IT Solutions A/S

			target URL for this button
		type	Define the type applied to the button
		licon	Define the left icon displayed into the button (You can use a fontawesome name)
		readonly	Define the control as read-only
		disabled	Define the control as disabled
	Return		
	string	The HTML to create the control	
	Example		

© 2026 Boyum IT Solutions A/S

<table>
<tr><td></td><td></td><td>

select	**select(label, name, value, kv, options)** **Description** Render the HTML to represent an select box (dropdown). **Parameters** string — The control's label string — The control's name string — The control's default value array — [[key1,value1], ..., [keyN,valueN]] options — json object with all options to render the control: licon — Define the left icon displayed into the button (You can use a fontawesome name with the prefix "fa-") readonly — Define the control as read-only

© 2026 Boyum IT Solutions A/S

			disabled: Define the control as disabled
			error: Error if the user has selected nothing
		Return	
		string	The HTML to create the control
		Example	
			`> ui.select( "Choose an option", "select-example", "", [[1,"Option 1"],[2,"Option 2"],[3,"Option 3"]], {licon:"fa-bolt"} );` **Preview**: In the preview of the example you can see the result of the string:
radiobox		**radiobox(name, value, kv, options)**	
		Description	
		Render the HTML to represent a group of excluding options (radio-box).	
		Parameters	
		string	The control's name

© 2026 Boyum IT Solutions A/S

		string: The control's default value
		array: [[key1,value1], ..., [keyN,valueN]]
		options: json object with all options to render the control: readonly: Define the control as read-only disabled: Define the control as disabled
		Return
		string: The HTML to create the control
		Example
		`> ui.radiobox( "radiobox-example", "", [[1,"Option 1"],[2,"Option 2"],[3,"Option 3"]], {licon:"fa-bolt"} );` **Preview**: Option 1 Option 2 Option 3
checkbox		**checkbox(label, name, checked, options)**
		Description
		Render the HTML to represent a group of options (check box).

© 2026 Boyum IT Solutions A/S

Parameters	
string	The control's name
string	The control's default value
array	[[key1,value1], ..., [keyN,valueN]]
options	json object with all options to render the control:
readonly	Define the control as read-only
disabled	Define the control as disabled
Return	
string	The html to create the control
Example	
	`> ui.checkbox( "Do you like our new framework?", "checkbox-example", true );` **Preview**: In the preview of the example you

© 2026 Boyum IT Solutions A/S

		can see the result of the string: Do you like our new framework?
more	**more(title, content)**	

Description

Render a line with more information collapsed.

Parameters

string	The title of the control
string	The content of the control

Return

string	The html to create the control

Example

```
>
ui.more( "Click here to expand the information", "This is the information inside of this control Hello!!" );
```

Preview:

In the preview of the example you can see the result of the string - a link appears:

Click here to expand the information

- By clicking the link in the app, you can test how the

© 2026 Boyum IT Solutions A/S

			information is expanded. You can close the displayed message box by tapping the "Close" button in the right top corner of the box.

UX

Topic	Method
click	**click(ID, func)**
	Description

© 2026 Boyum IT Solutions A/S

		A wrapper for the listen function.
		Parameters
		string — The element ID to add the onclick event
		function — The function to trigger on the event
		Return
		No return value
		Example

		`<span id="click-example">Try to click me</span>`
		`<script>ux.click("click-example",function(){alert("Not so strong! XD");});</script>`
		
		Preview:
		In the preview of the example you can see the result of the string:
		A click function is displayed: "Try to click me". When clicking the function, a message appears in a separate box which you can close with "OK".

listen	⊟	**listen(eventName, ID, func)**
		Description
		Listen on the element ID for the event name and then trigger the function given
		Parameters
		string — The event to listen
		string — The element ID to watch
		function — The function to trigger on the event
		Return
		No return value
		Example
		`<span id="listen-example">Try to pass over me</span>` `<script>`

© 2026 Boyum IT Solutions A/S

```
 ux.listen("mouseover","listen-example",function()
{this.className='has-background-danger';});
 ux.listen("mouseout","listen-example",function()
{this.className='';});
</script>
```

Preview:

In the preview of the example you can see the result of the string:

A function to trigger an event appears: "Try to pass over me". When you hover over the line, it is highlighted wit red until you keep the mouse over it.

getElement

getElement(ID)

Description	
Search an element by ID or Name	
Parameters	
string	The element ID or name
Return	
	The element if it is found or null
Example	

```
<input id="getElement-exampleID" name="getElement-exampleName">
<input type="button" value="Example 1" onclick="ux.getElement('getElement-exampleID').value = 'By ID';">
<input type="button" value="Example 2" onclick="ux.getElement('getElement-exampleName').value = 'By Name';">
```

loading	**loading(display)**	
	Description	
	Show a loading mask to avoid the user click on any control	
	Parameters	
	boolean	Activate o DeActivate the loading mask
	Return	
		No return value
	Example	

		`<a href="#" onclick="loading_example()">Click here</a> to display the loading mask for 5 seconds`
		`<script>`
		`function loading_example() {`
		`ux.loading(true);`
		`setTimeout(function()`
		`{ ux.loading(false); }, 5000); }`
		`</script>`
		
		Preview:
		In the preview of the example you can see the result of the string:
		By clicking the link in the "Click here to display the loading mask for 5 seconds" message, the app displays the loading mask for 5 seconds.

dialog	**dialog(title, content, options, onclose)**	
	Description	
	A modal dialog box	
	Parameters	
	string	The title
	string	The HTML content
	object	json object with all options to render the control:

© 2026 Boyum IT Solutions A/S

	icon: An icon to show in the message
	buttons: Array of objects with the definitons of the buttons (id, title, type [is-success/is-info/is-warning/is-danger]])
function	Function to call when the dialog is closed or a button is pressed The pressed button id is sent as parameter (or null if closed without press any button)
Return	
	No return value
Example	

```
<a href="#"
onclick="dialog_example()">Click
here</a> to display a modal
dialog
 <script>
    function dialog_example() {
      ux.dialog("UX
Tutorial","This is a dialog.<br>
Do you like it?", {buttons:
[ {id:'Y', title:'Yes'},
{id:'SY',title:'SUper Yes'}]},
function(b) { alert('You pressed
the button with id: '+b); } );
    }
</script>
```

Preview:

"Click here to display a modal dialog box."

© 2026 Boyum IT Solutions A/S

			- by clicking the link in the preview, a dialog box to opens for testing: set		**set(idName, status, options)**	

Description	
Provide a visual feedback to the input controls	
Parameters	
string	The control's id or name
string	The new status: show|hide|readonly|disabled|error|title|subtitle|clear
object	json object with all options

buttons	Apply the status to the attached buttons (true|false)
bX	Apply the status to the attached

© 2026 Boyum IT Solutions A/S

		button number X(true|false)
Return		
object	The element	
Example		

```
<div id="set-example"
class="preview"></div>
<script>
document.getElementById("set-
example").innerHTML =
ui.input( "User Name", "name",
"", {placeholder:"Type your
name", licon:"fa-user",
rbutton:"fa-search" } )
 + ui.button( "set01", "set
Error", {type:"is-link",
link:"javascript:set01()",
licon:"error"} )
 + ui.button( "set02", "set
Disabled", {type:"is-link",
link:"javascript:set02()",
licon:"eye"} )
 + ui.button( "set03", "set
Clear", {type:"is-link",
link:"javascript:set03()",
licon:"clean"} ) ;
 function set01() { ux.set("set-
example","error"); }
 function set02() { ux.set("set-
example","disabled"); }
 function set03() { ux.set("set-
example","clear"); }
</script>

tabs

tabs(id, action, params=null)

Description	
Add functionality toÂ ui.tabs	
Parameters	
string	The control's ID or name
string	The command: init|active
object	The params depend of the command:

© 2026 Boyum IT Solutions A/S

			action=init	set params to null to init all tabs or set an id to init only the specified one
			action=active	set the name of the tab to activate
		Return		
		void		
		Example		
		<pre>document.getElementById("your-container").innerHTML = ui.tabs("tabExample01ux", [{title:"Tab1", icon:ui.fa("fire"), content:"Content for tab 1"}, {title:"Tab2", icon:ui.fa("water")}, {title:"Tab3", icon:ui.fa("wind")}]); ux.tabs("tabExample01ux","init") ;</pre> **Preview**: In the preview of the example you can see the result of the string:		
dgrid	**dgrid(id, params)**			
		Description		
		Create a functional data grid and fill it with data from a valid oData source		
		Parameters		
		string	The control's ID	
		object	JSON object with the options to create the grid:	
			fields	Array of field: [field1, field2, ..., fieldN] Field structure:

© 2026 Boyum IT Solutions A/S

title	The title of the field
sort_key	Name of the field if it's possible to be sorted by this field
align	left| center| right
hidden	true| false
type	text| number| date| time| datetime| boolean
width	Set the width for this field
ondraw	Function with the value of the current field

© 2026 Boyum IT Solutions A/S

	and you must return the html to draw this cell
rows	(It will be fill up using the url). Array of Array with the rows data: [[row1_col1,row1_col2,...,row1_colN], ..., [rowN_col1,...,rowN_colN]]
URL	string with the url to get the data (oData or beas generated dgrid data)
sort_key	string with the name of the field to sort the result
sort_dir	Set order to (asc) ending or (desc) ending. Default: asc
onclick_row	function to be executed when the user select a row, the row's data is passed as argument

© 2026 Boyum IT Solutions A/S

	limit: Set the maximum number of rows to retrieve at time. Default: 25
Return	
void	
Example 01 (using Beas Service Layer)	

```
// Create the container
document.getElementById("ux-
dgrid-example").innerHTML =
ui.dgrid( "ux-dgrid" );
// Initialize the datagrid
ux.dgrid('ux-dgrid',
{   limit:10
                        ,fields:
[ {title:_t("Item No"),
sort_key:'ItemCode'},
{title:_t("Item Name"),
sort_key:'ItemName'} ]
                        ,url:'/o
data4/v1/Item?$ProgramId='+appIn
fo.gid+'&$AppId='+appInfo.appID+
'&$format=jsonarray&$inlinecount
=allpages&$transaction=receipt&$
orderby=ItemCode&$select=ItemCod
e,ItemName'
                        ,onclick
_row:function(d,rid)
{ console.log('Data in Row
selected: ',d); }
                    }
                );
// Later, we can set a new url
with a filter
// ux.dgrid('ux-dgrid').url =
**we can reset the url with a
filter if we want**

// And reload the page(x)
ux.dgrid('ux-dgrid').page(1);
```

autocomplete

autocomplete(id, url, options)

Description	
Add auto-complete functionality to any input box.	
Parameters	
string	The control's ID
string	The URL to fetch the data (the value of the filter must be *q* this function will replace it later by the current value)
object	JSON object with the options to create the auto-completion component:

ondraw	Function with the value of the current field and you must return the HTML to draw this cell

Return

			0**01**23456789012345679012345679 0
			08FF001414
			0815
			08FF0**01**415-234

focus		**focus(fs, f)**	
		Description	
		You can set the focus to a selected field with rules. Giving a list of controls as an array and the name of a target control: If the target control has error, we set the focus to this control, otherwise we should set the focus to the next non-disabled field in the list.	
		Parameters	

© 2026 Boyum IT Solutions A/S

array	array of controls ordered to be focused
string	current focused control
Return	
void	
Example	

```
// Create three fields
document.getElementById("ux-focus-example01").innerHTML =
    ui.input( "Field 1", "ux-focus01", "" )
        +ui.button("ux-focus01b1","Set error",{link:"javascript:ux.set('ux-focus01','error')"})
        +ui.button("ux-focus01b2","Set clear",{link:"javascript:ux.set('ux-focus01','clear')"})
    +'<br>'
    +ui.input( "Field 2", "ux-focus02", "" )
        +ui.button("ux-focus02b1","Set disabled",{link:"javascript:ux.set('ux-focus02','disabled')"})
        +ui.button("ux-focus02b2","Set clear",{link:"javascript:ux.set('ux-focus02','clear')"})
    +'<br>'
    +ui.input( "Field 3", "ux-focus03", "" )
    +'<br>'
    +'<br>'
    +ui.button("ux-focus01b1","ux.focus(next after =<br> 'Field 1')",{link:"javascript:ux.focus(['ux-focus01','ux-focus02','ux-focus03'],'ux-focus01')"});
```

Preview: (Try to set error/disable and then click Set Focus)

In the Preview section of the example you can try using the button controls "Set error" and "Set clear"

saveAll

saveAll(url, data, callback, options={})

Description	
Send data to the backend and block the app in the meanwhile. It switch the "Save" button to "Saving" also.	
Parameters	
string	URL
object	JSON object with the parameters to send
function	Callback function to execute after the command receives a reply.
object	JSON object with the options: contentType: json|multipart|standard timeout: Max time to wait a reply loading: Block the app while sending/receiving data. Default: true
Return	
void	
Example	

```
ux.saveAll( '/odata4/v1/issue?$P
        , json_with_all_data_to_
        , function(err, result)
            if ( !err /* && resu
                    ux.dialog(_t
                                );
            } else {
                ux.dialog(_t("Er
```

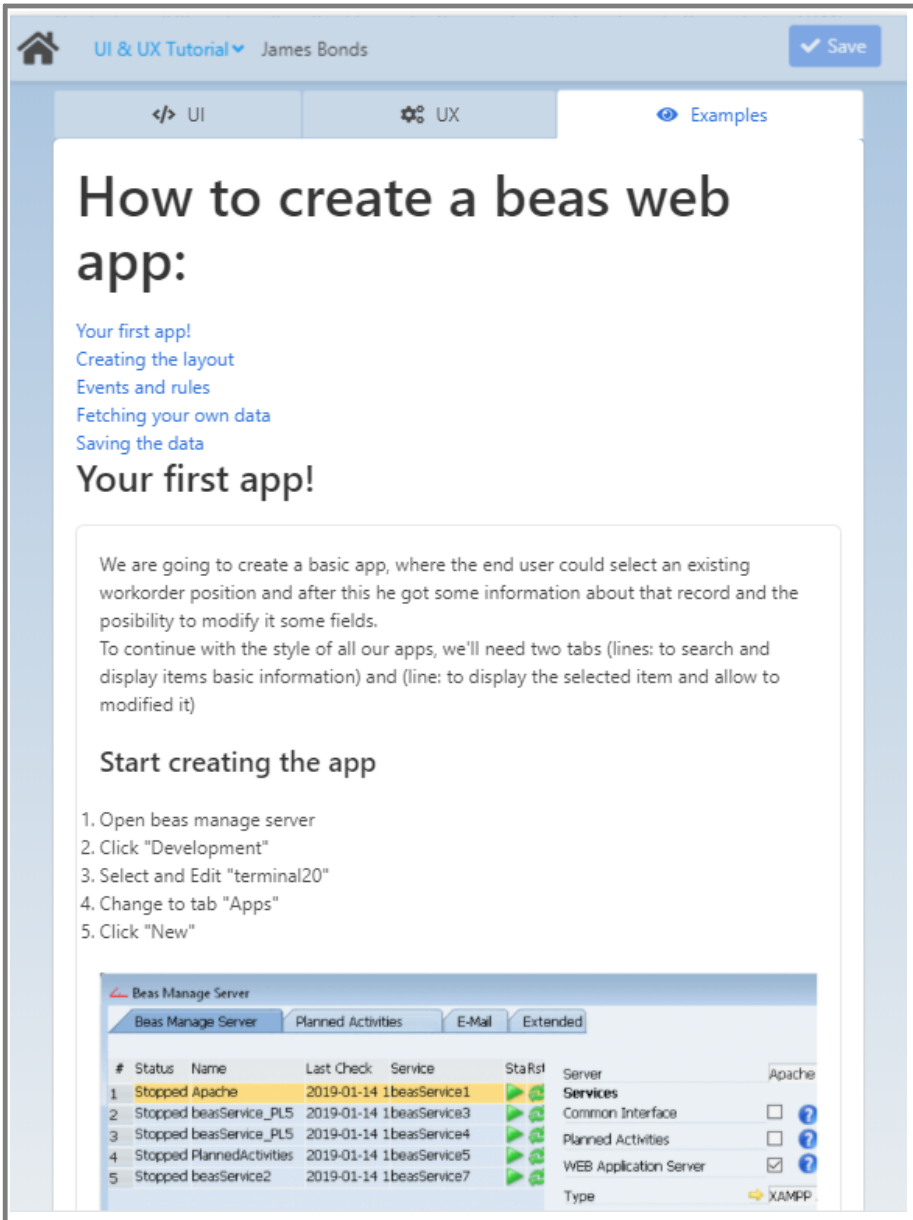
Examples

© 2026 Boyum IT Solutions A/S

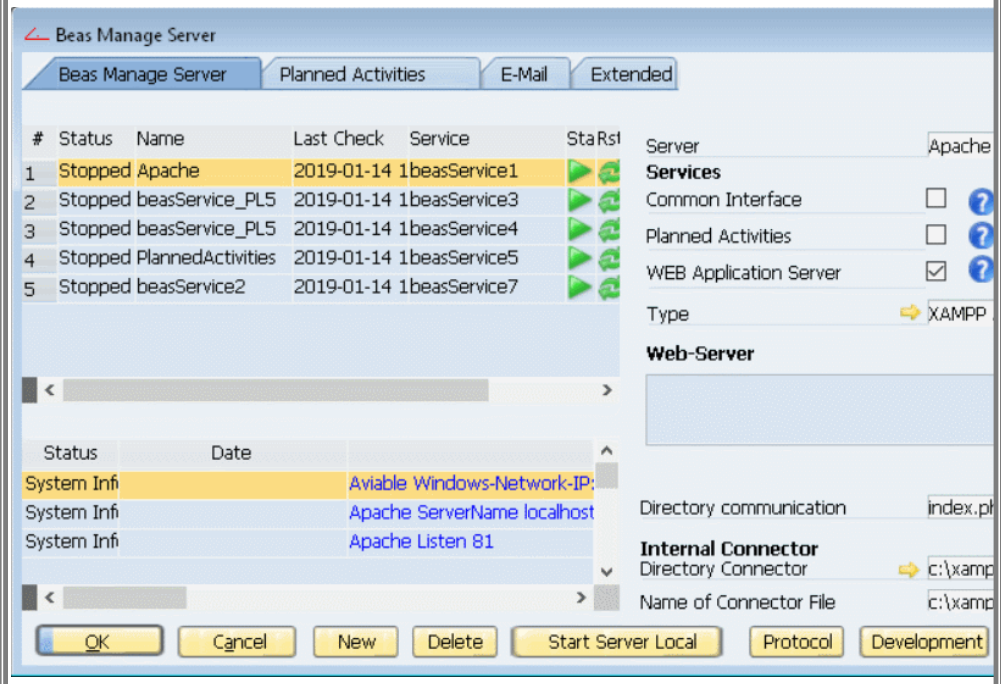


In this tab you can learn how to create a basic app with step-by-step instructions.

Step of creating an app	Description/Code
Your first app!	Start creating the app 1. Open Beas manage server 2. Click "Development" 3. Select and Edit "terminal20"

© 2026 Boyum IT Solutions A/S

4. Change to tab "Apps"
5. Click "New"



Defining the basic settings:

1. All not standard apps should start with the prefix "mod_"

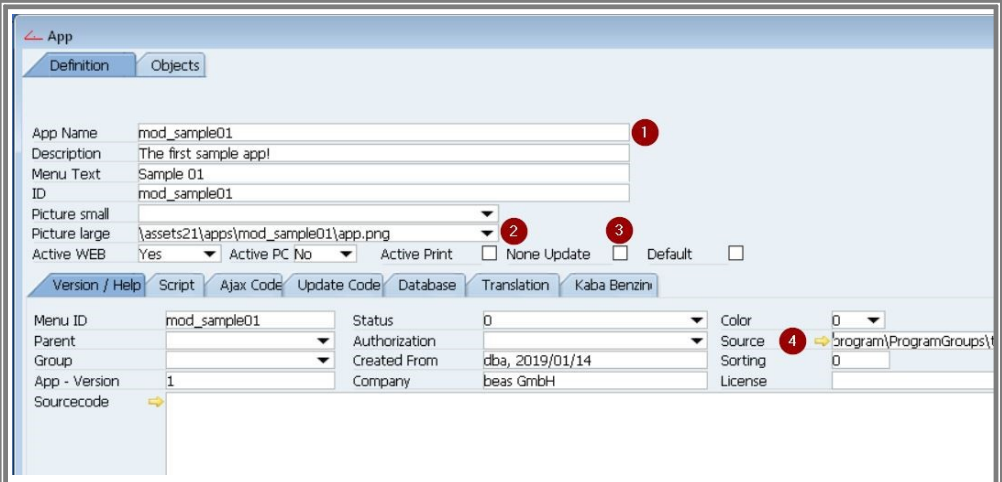
Set the long "Description" and the title "Menu Text" for this app

Set the "ID" as (1) the "App Name"

2. Set the icon for this app (we should create the folder and put the icon there)
3. Uncheck the "None Update" option to save this app to file
4. Check that the folder is writable

Finally add this code, and save it.

© 2026 Boyum IT Solutions A/S



```
_header()
gui()
_footer()
return success

//
-----------------------------------------------------------------------
---------------------
function gui
    [html]
        <script
src="assets21/apps/mod_sample01/i18n/@currentlanguage@.js"></script>
        <script src="assets21/apps/mod_sample01/app.js"></script>
    [/html]
end function
//
-----------------------------------------------------------------------
---------------------
```

The `_header()` and `_footer()` will load the standard header and footer for our application.

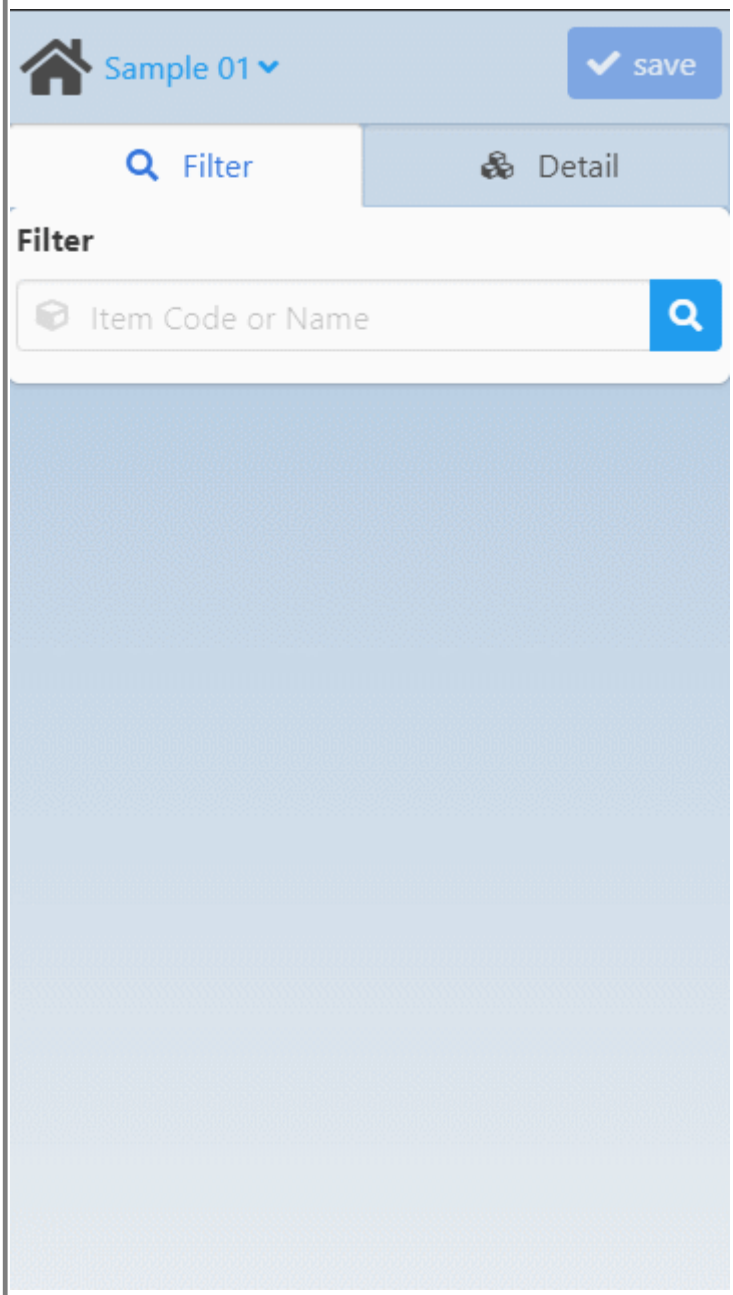
The first script, should contain the translations for the `@currentlanguage@`. And the second script is the apps itself.

The next step should be create the folder `assets21/apps/mod_sample01` and inside of this folder the files `"app.png"` (the app icon) and `"app.js"`, and optionally "i18n/XX.js" where XX is the language to translate the app to (EX. ES=Spanish, FR=French, E=English).

Creating the layout	We want to create two tabs (Filter/Detail). The tab filter contains a field to search/filter by (WorkOrderID/Positon) or (Produced ItemCode/ItemName) + a button to execute the action. Also the result for such filter will be displayed below this field.

© 2026 Boyum IT Solutions A/S

If the user clicks on any result, we want to jump to the second tab (Detail), which will display some details about that work order and the possibility to modify the fields "Description" and/or "Info".



Edit the file `app.js` and add the basic code:

```
class customAPP {
            constructor() {
            this.gui();
        }
```

	gui() {
	// Create the APP UI Template_____
	var ui = new UI;
	
	// Using the UI.js library we create an input field and the container for a data grid
	var tabFilter = ui.input(_t("Filter"), "filter", "", {licon:"fa-cube",rbutton:"fa-search", autofocus:true, placeholder:_t("Item Code or Name"), error:_t("Please select an item")}) +
	ui.dgrid("dgFilterResult");
	
	// We define later the content for the second tab
	var tabDetail = ui.box('later we will put details about the selected item here',{id:"itemDetail"}) +
	ui.input(_t("Description"), "description", "", {licon:"fa-asterisk"}) +
	ui.textarea(_t("info"), "info", "", {licon:"fa-info"})
	;
	
	// Now we create the "Tab" container and set for each tab the layout defined in the previous lines
	var html = ui.tabs("MApp",
	[
	{icon:ui.fa("search"), title:_t("Filter"), active:true, content:tabFilter, id:"tabFilter"},
	{icon:ui.fa("cubes"), title:_t("Detail"), content:tabDetail, id:"tabDetail"}
	]
	);
	
	// Finally we render the app into the app container
	document.getElementById("app-container").innerHTML = html;
	
	// Start by initializing all tabs controls
	ux.tabs('MApp', 'init');
	
	}
	}
	var app = new customAPP;

Events and rules	constructor() {
	this.appData_clear();
	this.gui();
	}
	appData_clear() {
	// We clear all appData we stored previously
	this.appData = { woID:0, woPosition:0, itemCode:'', itemName:'', quantity:0, description:'', info:'' };
	}
	gui() {
	// ... at the bottom

© 2026 Boyum IT Solutions A/S

```
  // Apply the UX
_____________________________________________________________________
________
        // All previous steps define only static content, now we are
use the UX.js to bring to live these controls
        // Listen for a changing event in the control MApp, we want
to prevent that user change to the second tab if nothing has been
selected
        ux.listen(  'changing',
                    'MApp',
                    function (e) {
                                    switch(e.detail.targetTab) {

ux.set("appSave","enable");
return has_error;
}
```

Fetching your own data

You should use Beas Service Layer (BSL) and oData to request information but if you need request custom data then we can use beasScript to deliver them.

In our example, we need two sort of request: (1) A List of work orders (2) The detail for the selected work order.

Open the app in **Beas manage server > development > terminal20:[apps] > mod_sample01** and add the next piece of code at the beginning:

```
     //
--------------------------------------------------------------------
--------------------
        if  = 'wo' then
            shtml.web.responseType=json
            getWorkOrderList()
            return
        end if
        if  = 'detail' then
            shtml.web.responseType=json
            getWorkOrderDetail()
            return
        end if
        //
--------------------------------------------------------------------
--------------------

        //
--------------------------------------------------------------------
--------------------
        function getWorkOrderList
            setvar=al_limit=
            setvar=page=
            setvar=qLike=%%

            if  in {woIdPos,ItemCode} then
                // ...
            else
```

© 2026 Boyum IT Solutions A/S

	setvar=sort_by=woIdPos
	setvar=sort_dir=ASC
	end if
	
	if in {desc,asc} then
	// ...
	else
	setvar=sort_dir=ASC
	end if
	
	setvar=ls_sql= cast("BELNR_ID" as varchar)||'/'|| cast("BELPOS_ID" as varchar) as "woIdPos", "ItemCode", "MENGE" from "BEAS_FTPOS" &
	where = '' or (cast("BELNR_ID" as varchar)||'/'||cast("BELPOS_ID" as varchar)) like or "ItemCode" like &
	ORDER BY ""
	shtml.web.dgrid=sql,
	,,select
	end function
	//
	---------- 	
	function getWorkOrderDetail
	setvar=ls_sql= p."BELNR_ID", p."BELPOS_ID", p."ItemCode", i."ItemName", p."MENGE", p."ItemName" description, p.zusatztext info from "BEAS_FTPOS" p inner join "OITM" i on (i."ItemCode"=p."ItemCode") &
	where (cast("BELNR_ID" as varchar)||'/'|| cast("BELPOS_ID" as varchar)) =
	shtml.web.dgrid=sql,1,1,select
	end function
	//
	---------- 	

Saving the data	Saving the data has three parts: (1) The part where we prepare the data and send to some backend (beasScript in this example), (2) The backend to process and save those data, (3) and finally check the answer from the backend and display the result to the user or prepare the app for a new transaction.

The "Overview" header is visible on the top for all three tabs. In each tab, you can see the list of contents linked to the given topic on top (***see*** images above).

Therefore, you can have a quick overview of the whole tab content and easily access the chapter of your interest.

At the end of each topic you can jump back to the top using the "TOP" button located bottom right under the frame of the chapter (***see*** image in UX above).

© 2026 Boyum IT Solutions A/S

As the app serves informational purposes, the "Save" button has not function and remains inactive.

17.4.3 Logon / Logoff

Login / Logout Attendance Monitoring and Login/Logout	 Optimized for Zebra Scanner	Browser Support		License Time Recording, Clock In Out	

With this app it is possible to monitor attendance and log on/off the Terminal.

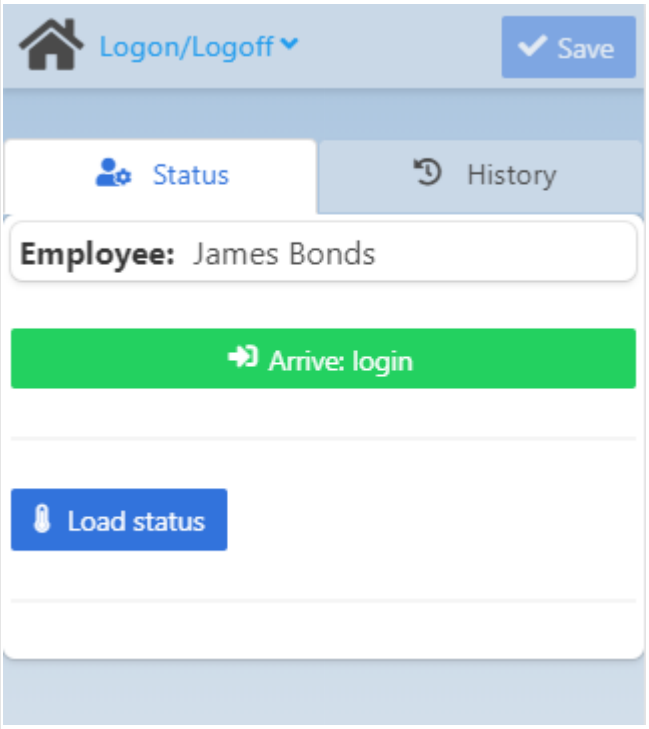
See basic WebApp controls in General Information on WEB APPS Version 2.1.

The app consists of a message field on top and two tabs below it: Status and History.

See Configuration wizard settings of the Web Terminal.

Status tab

Once you provide the employee card number upon logging into the Terminal 2.1, the Employee information linked to the card number is displayed in this app under the Status tab (***see*** image below).



Note: Manual shift definition is not supported in this WebApp.

Field Descriptions

© 2026 Boyum IT Solutions A/S

Field / Controls	Description
Message field	Dynamic screen section above the two tabs broaden when showing a message. The number of messages is indicated in the right bottom corner (***see*** image in "Arrive: login" section. The "Msg: 1" indicates the number of messages displayed). When the employee exits the app to start work with the Terminal functions, and returns to this app, this field is blank / not displayed (***see*** image in "Logged in since" field description row below.)
Employee	Information field automatically filled at login with card number.
Logged in since:	Date and exact time in mm/dd/yyyy and hh:mm AM/PM format showing the last login time of the employee: Arrive: Login / Leave: Logout	⊟ Tap button to login Once you tap the "Arrive: login" button, the message "Login successful" is displayed in the message field on the top. The button color turns red and displays "Leave: logout" .

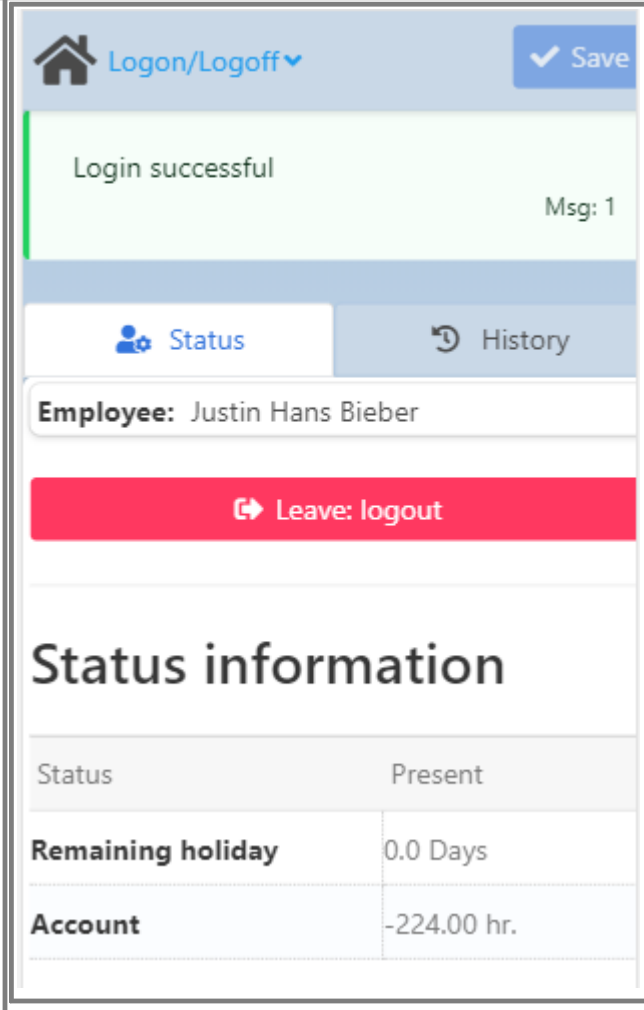
© 2026 Boyum IT Solutions A/S

Field / Controls	Description
	 At the end of the shift you can tap the "Leave: logout" button and the "Logged out OK!" message is displayed on the top. The button color turns back to green and displays "Arrive: login" (***see*** image below).

© 2026 Boyum IT Solutions A/S

Field / Controls	Description
	Load status	⊟ Check status information of the employee Tap this button (***see*** image above) to see status information on the remaining holidays and working hours of the logged in employee:

© 2026 Boyum IT Solutions A/S

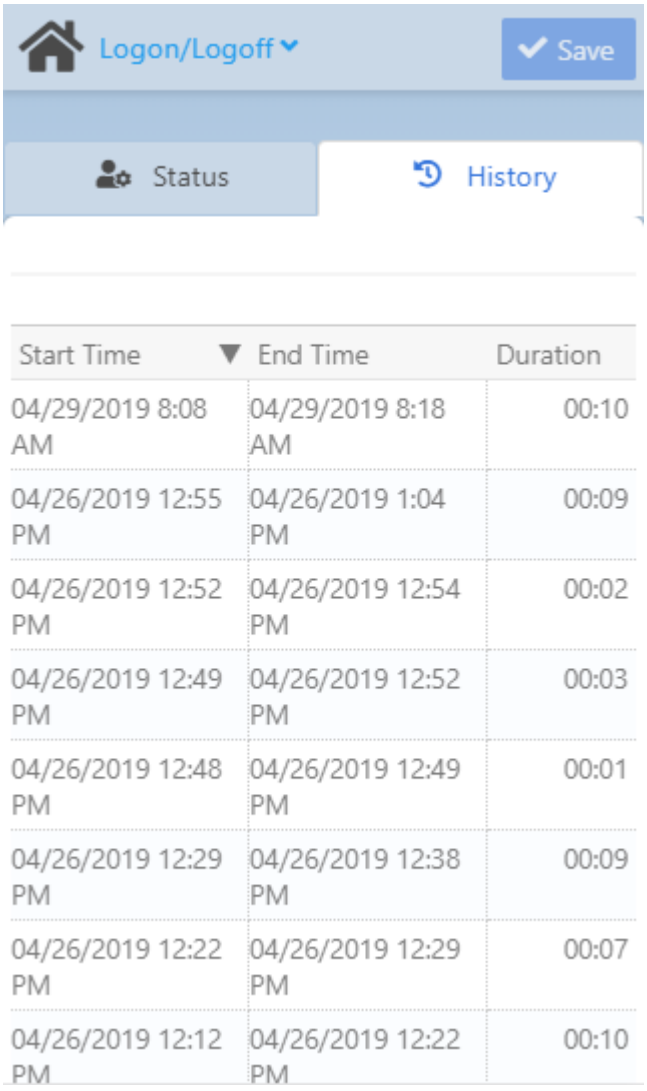
Field / Controls	Description
	


History tab

The History tab lists the last login times in a chronological order with the most recent on top. Start / End Times and the Duration are indicated for each login in the list.

Start / End times are provided in mm/dd/yyyy and format, and duration is displayed in hh/mm/ss. It is possible to reverse the chronological order of logins with the ▼ button in the right side of the "Start Time" column.

© 2026 Boyum IT Solutions A/S



Field Descriptions

Field	Description
Start Time	dd/mm/yyyy 0-12h AM/PM format for attendance starting time.
End Time	dd/mm/yyyy 0-12h AM/PM format for logoff time
Duration	Time elapsed between start and end time in hours and minutes.

Limitations

Shift model "Manually" is not supported.

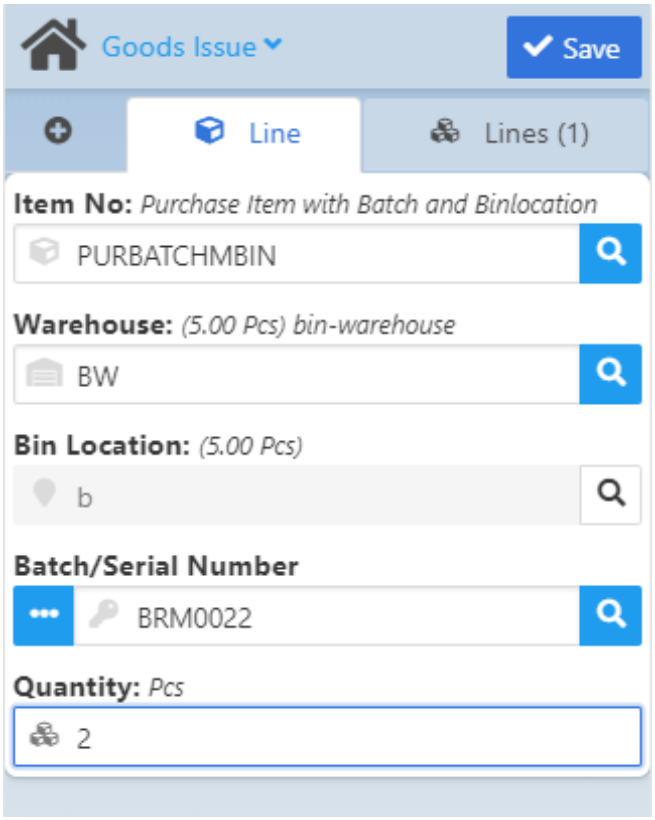
17.4.4 Goods Issue

	Optimized for Zebra Scanner	Browser Support	Bar code Support	License Material Management (Issue, Receipt, Allocation)	Warehouse Support SAP Bin Management Beas Bin Management WMS Bin Management	Print Document Support Asynchronous working

The Goods issue app makes it possible to issue multiple items of all types with a single document.
Once a goods issue document is created, it appears in the relevant screens of SAP B1.
The app consists of two tabs: Line and Lines (number of lines indicated in brackets).
See basic WebApp controls in General Information on WEB APPS Version 2.1.
See Manual postings - Goods issue.
See Configuration wizard settings of the Web Terminal.
See App Setup.

Line tab
In this tab you can provide all mandatory and various optional information to issue an item.
Once all information are entered for an item, you can add another line to the Goods issue document with the plus icon.

© 2026 Boyum IT Solutions A/S



Field descriptions

Field	Description
Item No.	Select the Item to issue. The caption above the field gives a description on the exact type: in the example (***see*** image above) the selected entry is a "Purchase Item with Batch and Bin location". This field supports GS1-128 bar code scanning. Search for an item. Note on WMS Quality Status filtering **WMS Integration -** When working with a WMS database, and connected Produmex Add-On, the list is filtered based on the **Produmex WMS Add-On > Organizational structure > Quality Status >"Can be used for production"**. If the "Can be used for production" field is active, this BEAS screen section only displays WMS items that were set to "Released" status in WMS. NOTE: WMS quality status is not defined per serial number. For this reason, all serial numbers of the same LUID will be displayed in the material issue list, even if they have different

© 2026 Boyum IT Solutions A/S

Field	Description
	WMS quality statuses. Only quantity available in an unblocked for production status can be issued. ***See*** further, up-to-date information on WMS-BEAS integration.
I-Version	Editable in case of version-managed items. If the item has several versions, you can select the version with the magnifying glass or simply start typing it in the field. When the item is batch-managed, this field also shows the number of selected batches.
Warehouse	Select the warehouse for the goods issue. After the selection, the Warehouse code is displayed. The exact name of the warehouse and the available number with the unit of measure for the selected item are indicated in brackets above the field. ***see*** image: "*(5.00 Pcs) bin-warehouse*". When adding a new line, the last used Warehouse (and bin location if applicable) is automatically filled by the system and can be changed.
Bin Location	Display bin location When the Warehouse for the item has been selected, this field shows the exact bin location (if available). In case of a batch/serial-managed item, this field is automatically filled by the system after selecting the batch/serial in the Batch/Serial Number field. The available number for the selected item is indicated in brackets above the field. (***see*** image above). WMS support for LUID/SSCC selection For normal items, select the Produmex WMS logistic unit of your choice in the "Location Search" screen that opens when you tap the magnifying glass icon.

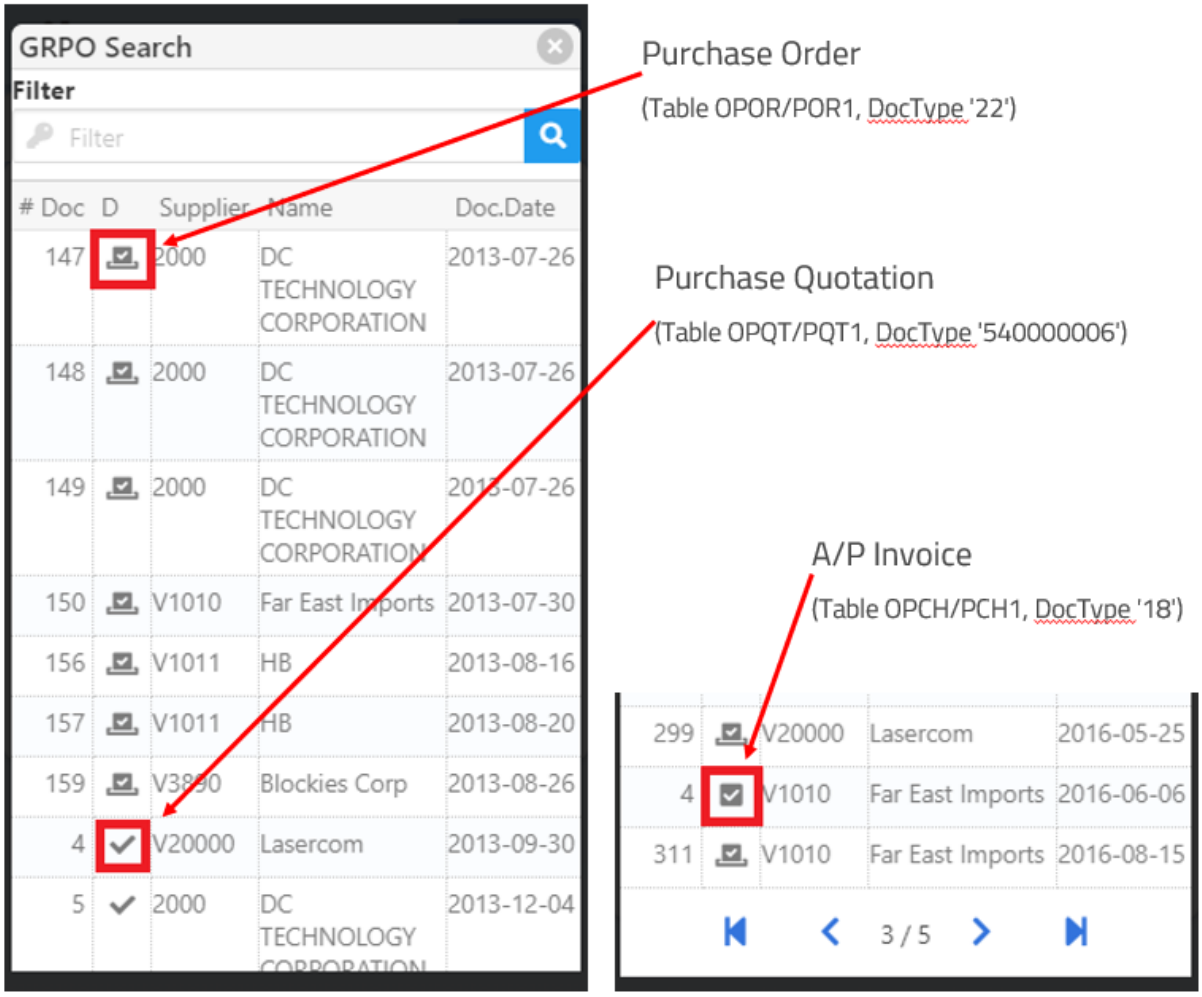
Target Warehouse	Select a warehouse for the incoming goods.
Remarks	Enter your remarks for the goods receipt document.
Document No	The number of the PO document in SAP.
Supplier	Card Code of supplier in SAP.
Name	Name of supplier.
Document Date	The day that the PO was created.

© 2026 Boyum IT Solutions A/S

Filter screen for documents:

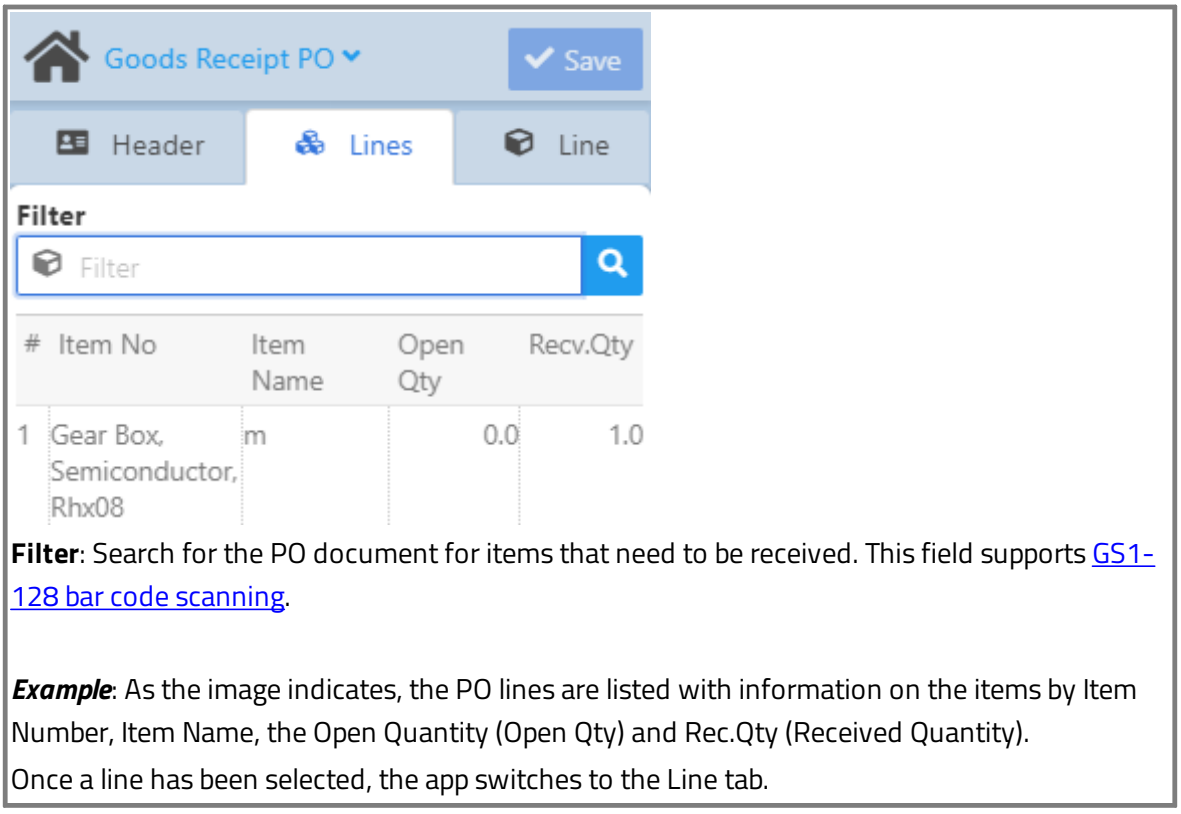
In this app, we display different icons based on the Document Type. ***See*** image below.



Lines tab

The Line – Lines tabs function are therefore located in reverse order.
The reason for this is that, in a Purchase Order, the number of lines is given, and therefore a PO line has to be selected first.
Once the mandatory information are entered in the Header tab, the app switches right to the Lines tab.

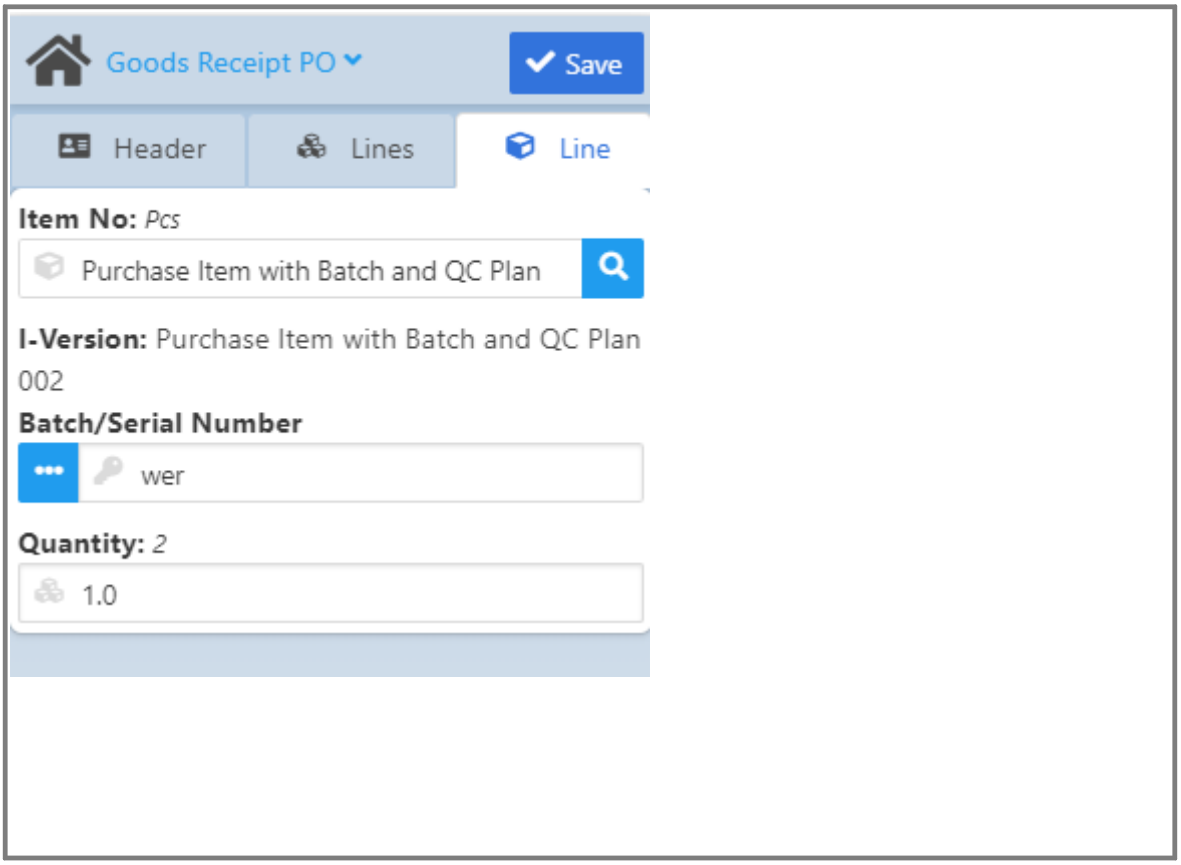
© 2026 Boyum IT Solutions A/S



Filter: Search for the PO document for items that need to be received. This field supports GS1-128 bar code scanning.

Example: As the image indicates, the PO lines are listed with information on the items by Item Number, Item Name, the Open Quantity (Open Qty) and Rec.Qty (Received Quantity).
Once a line has been selected, the app switches to the Line tab.

Line tab



© 2026 Boyum IT Solutions A/S

In the Line tab you can enter the quantity of the selected item to be received in the relevant unit of measure. Item Number and also I-Version (if applicable) are automatically filled.

Bin Location

When the target warehouse is a bin warehouse, you need to select a bin location, as well. The actual number of items in the bin is indicated in brackets above the field.

LIMITATION: The receipt process linked with a purchase order is not able to create receipt for the same line into 2 different bin locations at the same time. As a workaround for this, the user can generate the receipt document in 2 steps or receipt full quantity in one bin location and move the required quantity to a different location after the receipt is created.

The screen also displays Batch/Serial Number information when applicable. ***See*** Batch/Serial extended information.

After entering the quantity below, the Goods Receipt PO document is ready to be created. (also ***see*** Save button)

Example: In the above image we selected 1Pcs of an item. By going back to the Lines tab you can see that the receipt of 1 Pcs for the selected item has been entered:

#	Item No	Item Name	Open Qty	Recv.Qty
1	Purchase Item with Batch and QC Plan	Pcs	NaN	1.0

See Massive input of serials.

Settings

Waiting time: In this parameter you can define the number of seconds that the app should wait until moving forward with the next transaction.

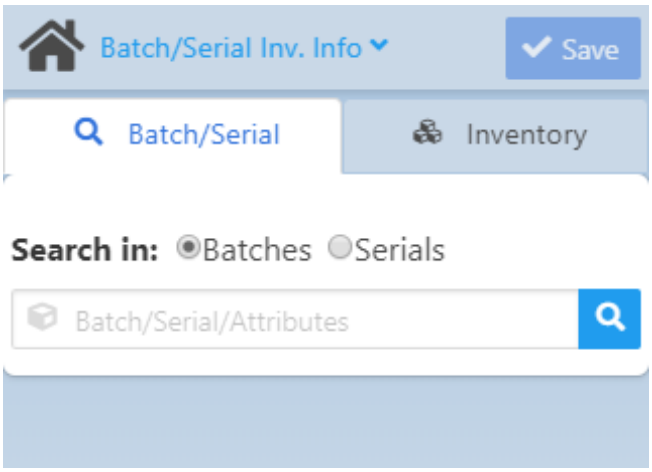
					WMS Bin Management

With this app it is possible to get "stock-on-Warehouse" information for batches and single serials.
The app consists of two tabs: Batch/Serial tab and Inventory tab.
See basic WebApp controls in General Information on WEB APPS Version 2.1.
See Configuration wizard settings of the Web Terminal.

App setting
Show attachments: Activate check box to display attachments of an item in the app.

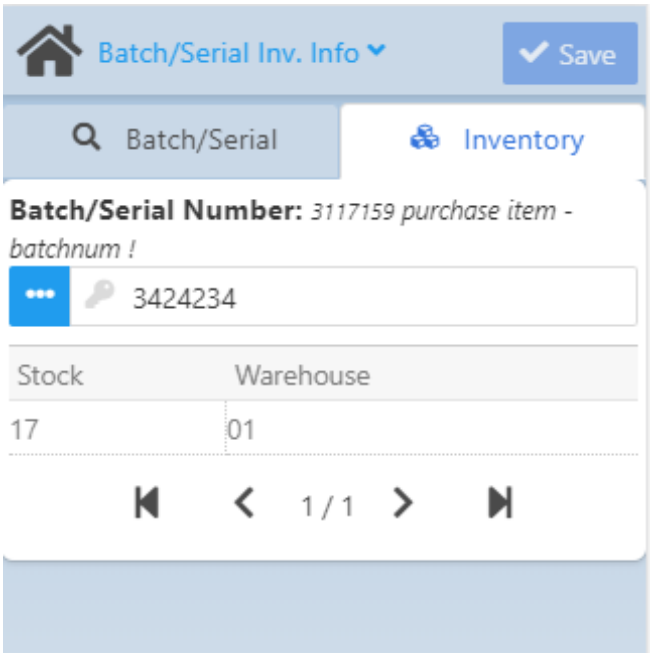
Batch/Serial tab



Search in: select Batches or Serials before selecting an item to retrieve information on it. ***See*** image above.
The listed item(s) are displayed with ItemNo, ItemName and Batch/Serial number information.
When selecting an item, the tab switches to the Inventory tab.
This field supports GS1-128 bar code scanning.

Inventory tab

© 2026 Boyum IT Solutions A/S



The inventory tab displays the Stock and Warehouse information for the selected batch/serial.
In the ***example*** (***see*** image above) we searched for the Inventory information of a specific batch of purchase item - batchnum! "3117159"
According to the search result, the batch contains 17 items in Warehouse 01.

Note: the same batch can be located in more than one warehouse simultaneously.

Field Descriptions

Field	Description
Batch/Serial Number	This field displays the selected batch/serial number. Click on the ••• button to open a list of further attributes on the selected batch/serial in another screen named "Extended information". The attribute fields in this app are only for information purposes. The information is directly called from the Item master and is non-editable (in "issue mode"). ***See*** the different modes.
Stock	Displays the stock level of the batch/serial-managed item in inventory UoM.
Warehouse	The warehouse where the batch/serial item is found.

17.4.8 Inventory Counting - by item

Inventory Counting Item Inventory Counting by Item	Optimized for Zebra Scanner	Browser Support	Bar code Support	License Inventory	Warehouse Support Beas Bin Management

See basic WebApp controls in General Information on WEB APPS Version 2.1.

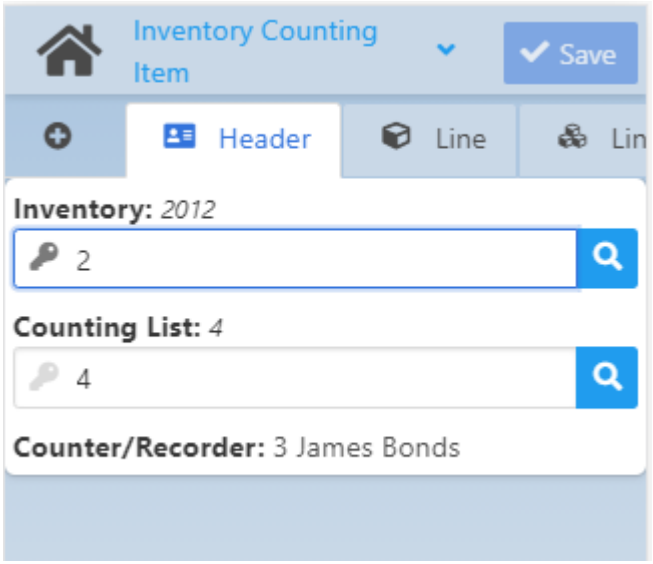
See Configuration wizard settings of the Web Terminal.

With the Inventory Counting Web App it is possible to select the counting list, read item bar codes, and add quantities to an existing counting list without displaying the counting list.

The app consists of three tabs in the order of Header, Line and Lines.

Header tab

The Header tab is used to identify the counting list.



Field Descriptions

Field	Description
Inventory	Select the inventory for counting. By tapping the Magnifying glass icon right to the field, the "Inventory Search" filter screen appears.

© 2026 Boyum IT Solutions A/S

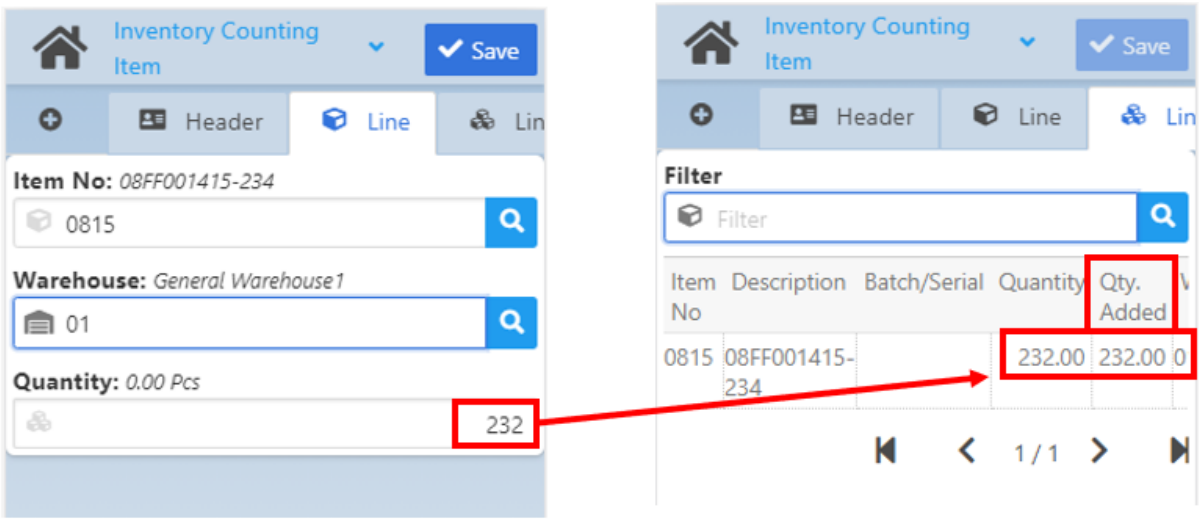
Field	Description
Counting list	In this field you can provide the counting list. By tapping the magnifying glass icon right to the field, the "Counting Search" filter screen appears.
Counter/Recorder	The name of the user performing inventory counting.

Line and Lines tabs

Once you define the counting list, the app switches to the Line tab. Here you must provide all item-specific information such as Item number, Warehouse information, Bin location (in case of bin warehouse), batch/serial number/ I-version (if applicable) and quantity.

Note: Only one, existing batch/serial is available per line. New batches cannot be added.

Once all mandatory information are filled for the item in the Line tab, tap **Save** and the item is displayed with the added quantity in the list of items in the Lines tab (***see*** image below). When adding a new line, the last used Warehouse and Bin location information are automatically filled.



Line

Field Descriptions

Field	Description
Item No	Item number. The item name is displayed on top of the field in *italics*.
I-Version	Field is active in case of version-managed items. Select an item version by tapping the Magnifying glass button. Note: Only active versions are displayed.
Batch/Serial Number	Batch/Serial Number. ***See*** also Batch/Serial Extended Information.
Warehouse	The warehouse where the item is found.

© 2026 Boyum IT Solutions A/S

Field	Description
Quantity	Quantity based on the warehouse stock

Lines

Field Descriptions

Field	Description
Item No	Item number
Description	(Descriptive) item name
Batch/Serial	Batch/Serial number
Quantity	Quantity based on the warehouse stock
Qty. Added	Quantity based on the warehouse stock added to the counting.
Warehouse	Warehouse code
Location	Bin Location

See also Enter barcodes

Inventory Couting by Item and List

17.4.9 Inventory Counting - List

Optimized for Zebra Scanner

Browser Support

Bar code Support

License Inventory

Warehouse Support

Beas Bin Management

See basic WebApp controls in General Information on WEB APPS Version 2.1.

See Configuration wizard settings of the Web Terminal.

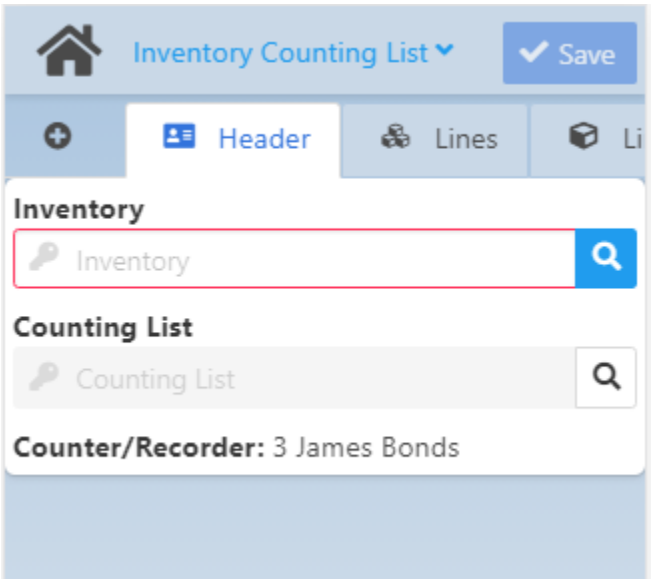
With this app it is possible to select a counting list and edit the quantity directly in the list view.

The app consists of three tabs in the order of Header, Lines and Line.

Header tab

In this tab you can identify the counting list.

© 2026 Boyum IT Solutions A/S



Field Descriptions

Field	Description
Inventory	Select the inventory for counting. By tapping the Magnifying glass icon right to the field, the "Inventory Search" filter screen appears.
Counting list	In this field you can provide the counting list. By tapping the Magnifying glass icon right to the field, the "Counting Search" filter screen appears.
Counter/Recorder	The name of the user performing inventory counting.

Lines tab

Once the counting list is selected in the Header tab, the screen switches automatically to the Lines tab where you can select the quantity by using the "-" and "+" buttons (***see*** image below).
To add an item that is not in the list, tap the plus icon top left.

Filter field

1. Select items by providing the "ItemCode" Barcode field stored in the Item Master Data.

or

2. Scan GS1-128 Barcode.

Use a GS1-128 Code from the filter list to set the Quantity for a given BarCode and Batch/Serial in one shot.
See VIDEO

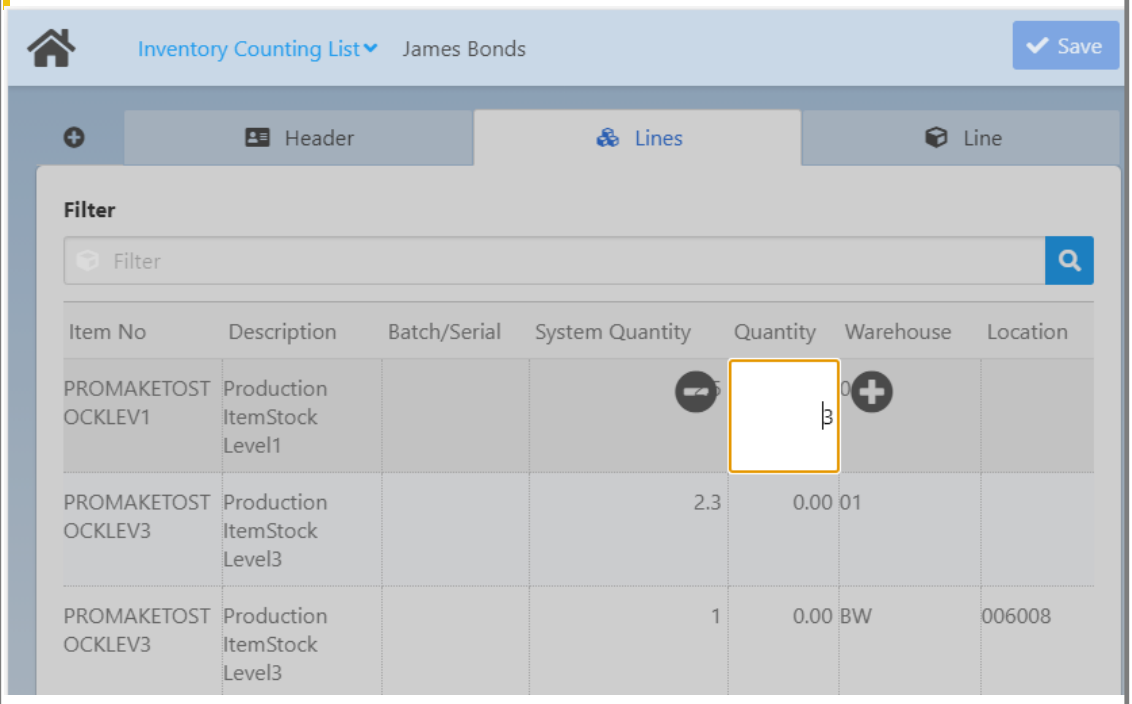
The AI needed in the GS1-128 are:

© 2026 Boyum IT Solutions A/S

- 01 GTiN (the EAN barcode)
- 10 or 21 Batch/Serial code
- 30 Quantity

Filter the list by bar code and batch/serial and if there is one result only, set the given price to this line (The line remains open to accept any modification but any touch/click outside will bring back the focus to the filter control to scan the next bar code).

Note: Smaller tablet screens and mobile phones show only 3 columns. Therefore, the app is recommended for larger screens or tablets as the line in the list needs to display warehouse, batch/serial and bin location information and confirmed quantity.

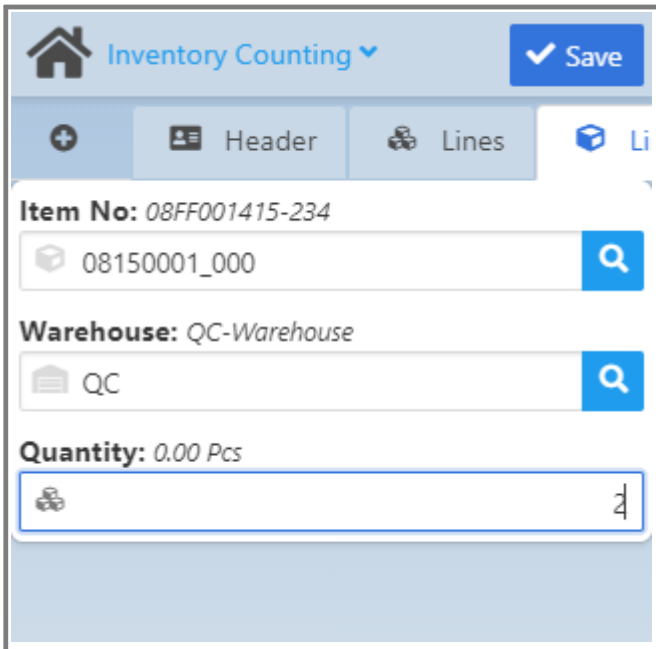


Note: Only one, existing batch/serial is available per line. New batches cannot be added.

Line tab

The Line tab becomes available once the user taps "**+**"in the left top corner to add a new line. It is mandatory to add item-specific information such as Item number, Warehouse information, Bin location (in case of bin warehouse), batch/serial number/ I-version (if applicable) and quantity.

© 2026 Boyum IT Solutions A/S



Field Descriptions

Field	Description
Item No	Item number. The field can be filled at once by scanning the "Item Code", and the "Batch/Serial" and the quantity. GS1-128 Bar code is supported.
Warehouse	Select a warehouse
Quantity	Confirm quantity to add to the counting list.

Note: As of Beas 9.3 PL03 changing the quantity in the WebApp is not indicated in the Change history of the Inventory list in the system.

See also Enter counting: selection

Inventory Couting by Item and List

17.4.10 Invent.History

	 Optimized for Zebra Scanner	Browser Support	Bar code Support	License Material Management (Issue, Receipt, Allocation)	Warehouse Support SAP Bin Management Beas Bin Management

© 2026 Boyum IT Solutions A/S

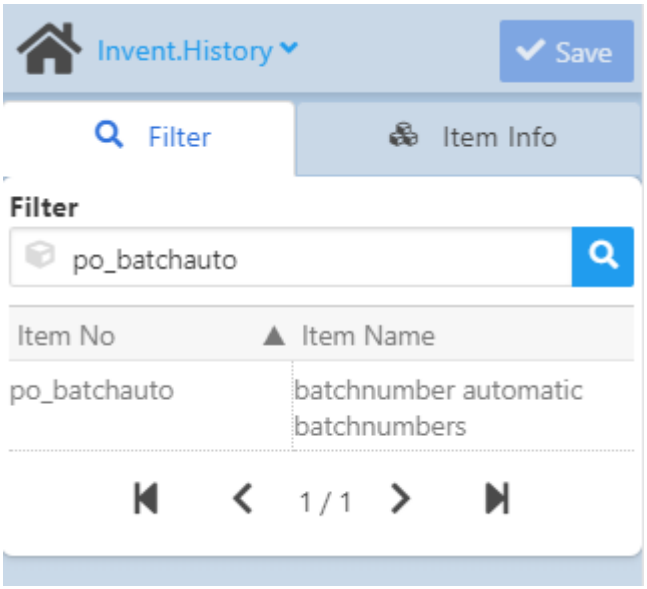
					WMS Bin Management

With the Invent.History app it is possible to display stock information on selected items.
The app has three tabs:
- Filter
- Item info
- Reserved

See basic WebApp controls in General Information on WEB APPS Version 2.1.
See Configuration wizard settings of the Web Terminal.
See App Setup.

App setting
Show attachments: Activate check box to display attachments of an item in the app.

Filter tab
The filtered items are displayed with Item Code and Item Name information.
General filtering controls are available.



Item Info tab

The item name is located top left in the Item Info tab screen. The type of item is indicated as a brief description in smaller font under the Item name – ***see*** image below: "Purchase item with batch"

© 2026 Boyum IT Solutions A/S

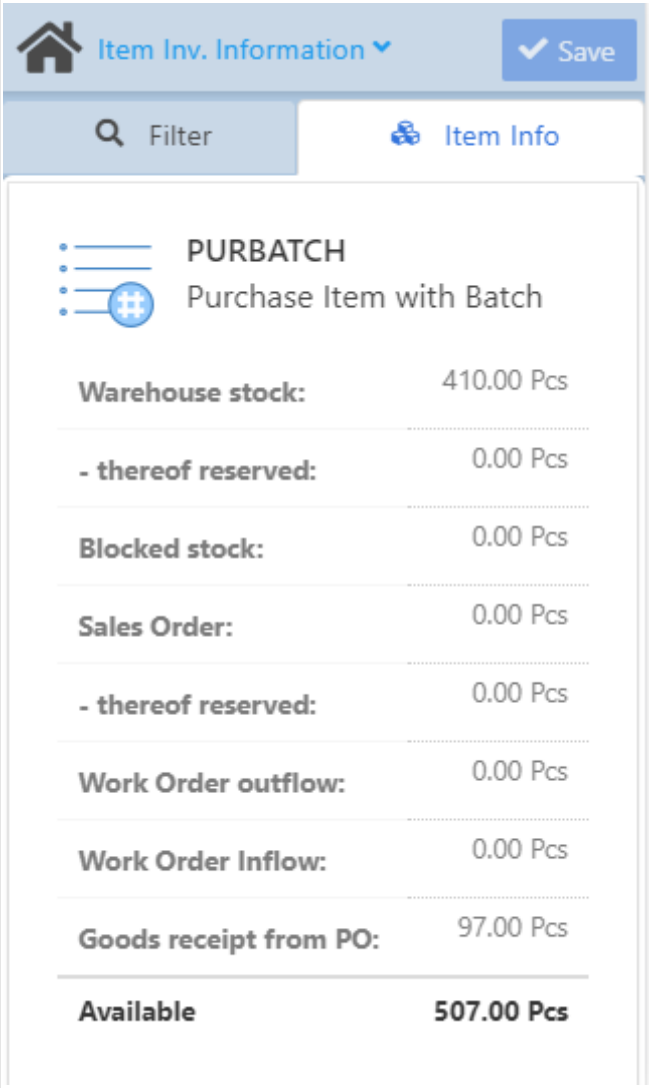
The upper section of the screen gives a summary of all available warehouse stock by breaking it down to blocked stock, *thereof reserved stock, WO inflow / outflow quantities, Sales Order and SO reserved stock counted in the Unit of Measure set in the Master Data. The summary also contains quantities coming from Goods Receipt from Purchase order (GRPO). ***Example***: ***see*** image below: 97.00 Pcs come from GRPO.

IMPORTANT:

NOTE on WMS Integration:

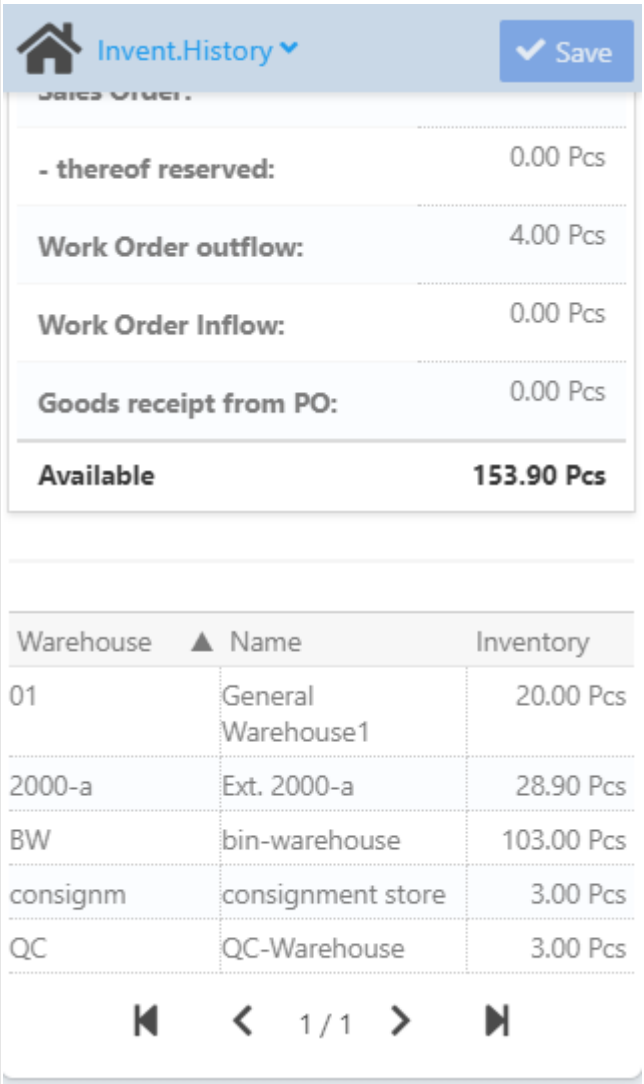
*thereof reserved stock: This field considers all units available for WMS lock types Batch, LUID and Detail.

See details in the desktop solution documentation.



© 2026 Boyum IT Solutions A/S

The lower screen section provides a breakdown view into the single warehouses where the stock (without GRPO) is distributed. Scroll down to see stock distribution.
Example: ***see*** image below: Out of the 153.90 Pcs distributed in the various warehouses, General Warehouse 1 (with Warehouse code: 01) contains 20.00 Pcs of the item.



In case of batch/serial-managed items, it is possible to tap on a specific warehouse line in the lower screen section.
This will open the Warehouse Info screen with a list showing available stock in the pre-defined unit of measure by batches/serials.
In case of items not managed by batches or serials, the system displays detailed information only for Beas warehouses. For normal and SAP Bin warehouses, the system does not display any additional information.

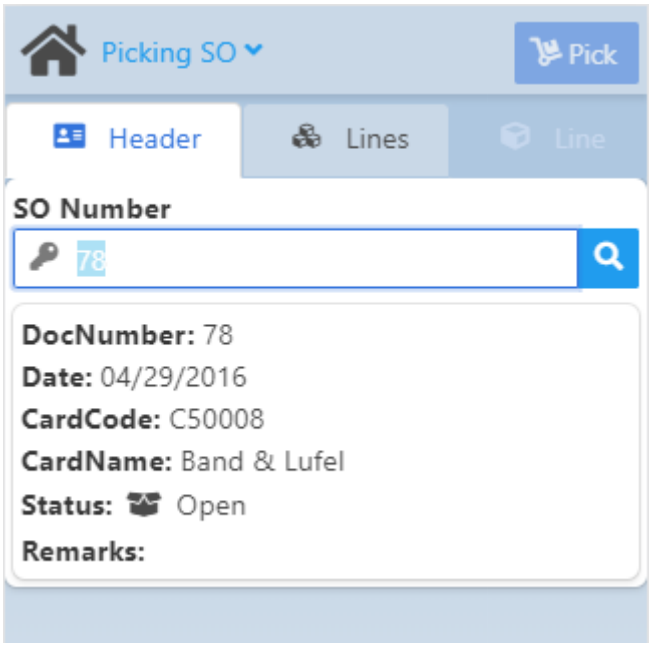
Script: Print Inventory or Sales Order

See detailed description of Print types.

Header tab

After selecting a Sales Order, the following information are displayed:



Field Descriptions

Field	Description
SO Number	Filter field for Sales orders. This field supports GS1-128 bar code scanning.
DocNumber	The number of the Sales order document in SAP
Date	Displays the creation date of the Sales order document
CardCode	Customer code
CardName	Customer name
Status	Document status read from SAP Business One:

© 2026 Boyum IT Solutions A/S

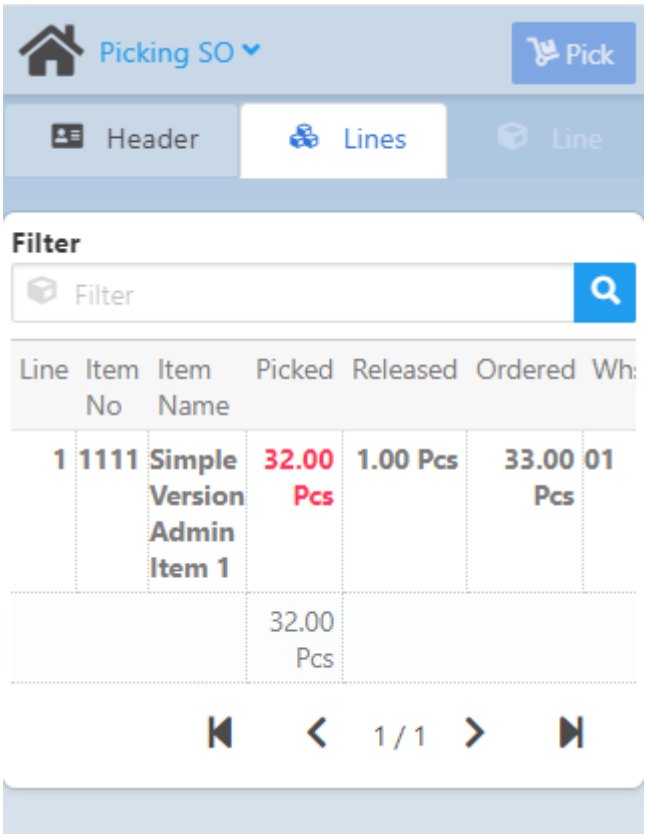
Field	Description
	- Open - Closed
Remarks	Free text.

Lines tab

In the Lines tab the user can select the items and the reserved quantities from the document.

The list is read-only and displayed with 2 types of rows" 1 with the item required and total picked quantity and each of them with secondary lines that show details: the picked Bin location / Batch or Serial / and Quantity / delete icon.

After selecting any Main line, the system goes to line tab to add a new quantity.



Available Quantity is based on the quantity that is not reserved, considering Batches -Serials - Bin Locations.

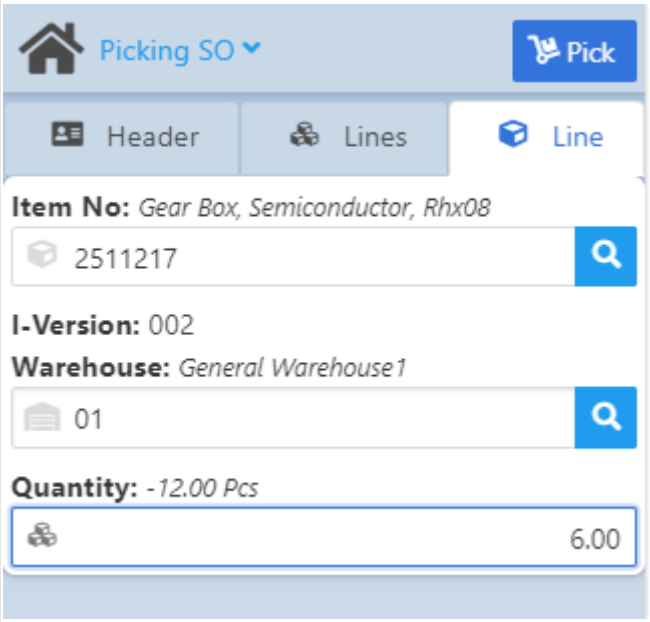
Field Descriptions

© 2026 Boyum IT Solutions A/S

Field	Description
Line	Line number inside the sales order document
Item No	Item number
Item Name	(Descriptive) Item name
Picked	Picked quantity
Released	Released quantity
Ordered	Ordered quantity
WhsCode	Warehouse code

Line tab

In the Line tab you can provide Warehouse and item-specific information and the quantity to be picked.



Field Descriptions

Field	Description
Item No.	Item number. Select an item from the filter screen that opens with the magnifying glass button.
I-Version	Item version - field displays information in case of version-managed items.
Warehouse	Warehouse used for the picking process. The Warehouse code is indicated in the field. Select the

© 2026 Boyum IT Solutions A/S

Field	Description
	warehouse with the magnifying glass button.
Bin Location	Receipt Rules Issue Rules Limitation of Beas Bin Management: - RFID definition is not supported -Batch/Serial Extended selection: It is not possible to select multiple bin locations from an SAP Bin-managed warehouse or Beas bin-managed warehouse. Limitation of SAP Bin Management: - not all Bin Rules are supported in the current view - Weight/Volume are currently not supported in the current view - Batch/Serial Extended selection: It is not possible to select multiple bin locations from an SAP Bin-managed warehouse or Beas bin-managed warehouse.
Batch/Serial Number	The opens the "Batch/Serials: Extended Information" screen. ***See*** different behaviors of this screen in Extended information screen. Note: If mandatory information is missing in the Extended information screen, the Batch/Serial Number field indicates it with a red border in the main screen, even though the field itself is not empty. In case of a serial-managed item, the serial mode is automatic: you can leave the serial field empty, and the quantities are picked automatically by Beas. On how to input a large number of serials ***see*** Massive serial input.

© 2026 Boyum IT Solutions A/S

Field	Description
	IMPORTANT: If you wish to add other serial numbers in different bin locations, you must insert an additional line by pressing "+":  .
Quantity	Picked quantity. the UoM is displayed in italics after the quantity right of the field name.

To **Pick** (reserve) use the button at the top right corner or just go to Lines.
The quantity will be added to the quantity already reserved.

Note: Button **Save** does not exist because with every selection we make reservations directly in the Beas reservation system.

See also: Issue / Reservations screen

Reservation is possible when:

Using the **Pick** button and all rules are OK.

User goes to Lines or Header and all rules are OK.

After using the **Pick** button, the Quantity is summed to the current lines, and the screen jumps back to the Lines tab.

When the main line is completed, it changes the color to green:

I-Version	Item version - field displays information in case of version-managed items.
Bin Location	Source Warehouse bin location where the item is stored.
Batch/Serial Number	The magnifying glass opens the Batch/Serial search screen where you can perform further filtering for the name of the batch/serial. The screen shows the names and bin locations of the available batches/serials. The opens the "Batch/Serials: Extended Information" screen. In this application you can edit Batch/Serial number, Version and Quantity fields. ***See*** other, non-editable attributes in Extended information screen. **WMS integration:** Tap the magnifying glass or to filter by LUID. ***See*** further, up-to-date information on WMS-BEAS integration. **Limitation:** All selected serials in a line must be from the same warehouse/bin location. If you wish to add other serial numbers in different bin locations, you must insert an additional line by pressing "+":  .
Quantity	Item Quantity to be transferred. With this app it is possible to create transfer request for reserved material (linked to a work order).
Target Warehouse	Select a target warehouse to for the stock transfer.
Target Bin Location	Select a target bin location (if it exists) for the stock transfer.

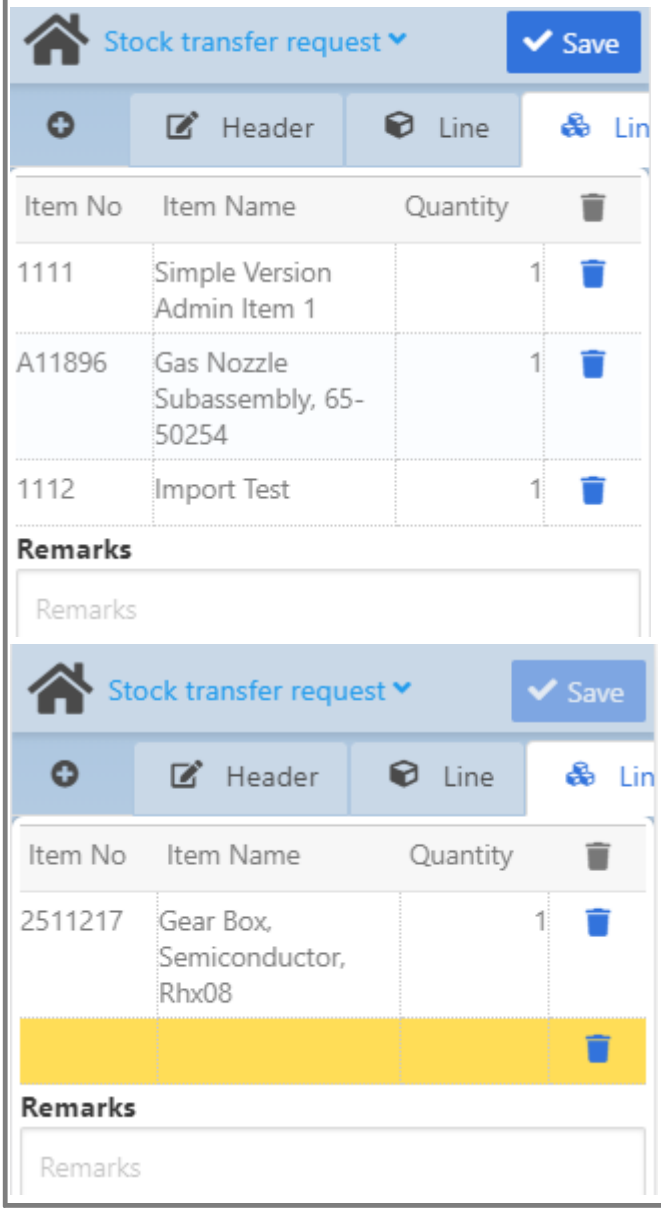
- Lines tab

After adding a line to the transfer request document, it appears in a list view in the "Lines" tab. Incomplete information of a line is indicated with yellow highlighting in this tab (***see*** right image

© 2026 Boyum IT Solutions A/S

below).

The list view contains Item number, Item Name and Quantity.



Once you have saved the document, you receive notification of the transfer request in the system:

Settings

Waiting time: In this parameter you can define the number of seconds that the app should wait until moving forward with the next transaction.

17.4.16 Warehouse Stock

	Optimized for Zebra Scanner	Browser Support	GS1 Bar code Support	License Material Management (Issue, Receipt, Allocation)	Warehouse Support SAP Bin Management Beas Bin Management WMS Bin Management

With this app it is possible to get physical Warehouse information together with detailed Inventory within the selected warehouse.

The app consists of two tabs: Warehouse tab and Inventory tab.

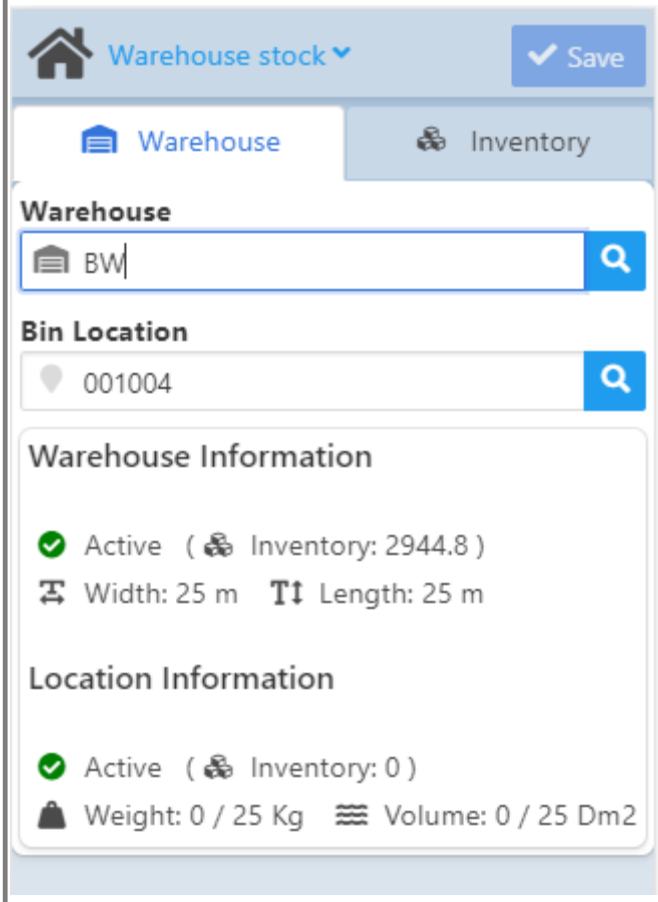
See basic WebApp controls in General Information on WEB APPS Version 2.1.

See Configuration wizard settings of the Web Terminal.

© 2026 Boyum IT Solutions A/S

Warehouse tab

After selecting a warehouse, the app displays the following information:



Field Descriptions

Field / displayed information	Description
Warehouse	Tapping on the magnifying glass opens the Warehouse search screen displaying a list of warehouses with WhsCode and WhsName. Upon selection, the warehouse code is indicated in the field.
Bin Location	Tapping on the magnifying glass opens the Location search screen with filtering option. The indicated information are Location codes with Description and available stock.
Warehouse Information	Displays status, inventory count and physical dimensions of the selected Warehouse.

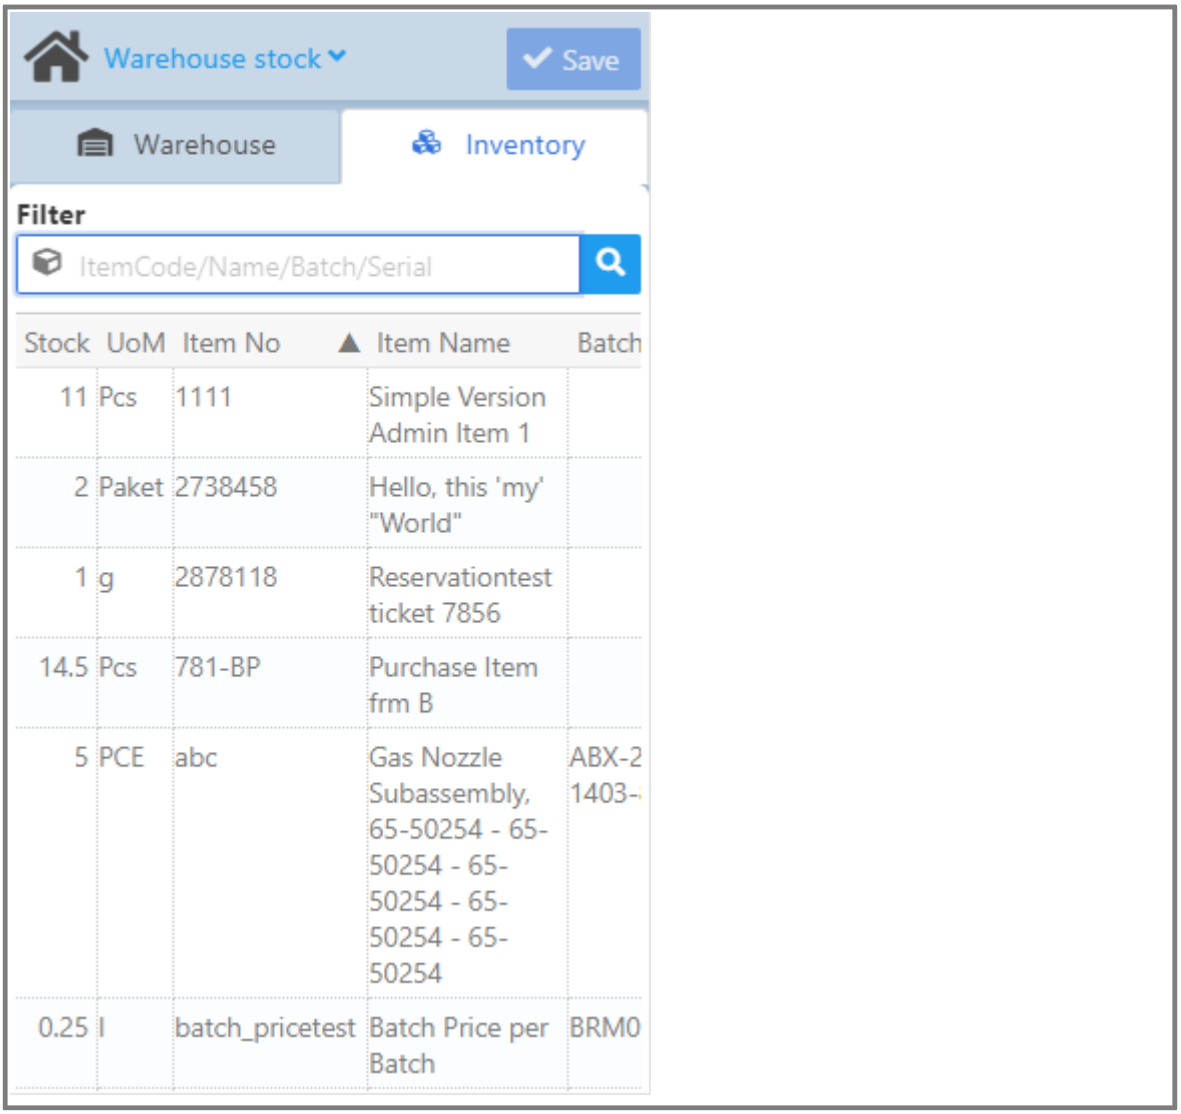
© 2026 Boyum IT Solutions A/S

Field / displayed information	Description
Location Information	When selecting a Bin Location, the "Location Information" section also appears under the Warehouse Information
Active / Inactive	Shows if warehouse/bin locations are active Active (having inventory, used in orders) or inactive Inactive.
Inventory: XX	the Warehouse/Location information section shows the available stock in the selected warehouse / bin location
Width	The width dimension of the warehouse provided in meters.
Length	The length dimension of the warehouse provided in meters.
Weight/Volume xx / yy	The currently used weight/volume on shelf against the total weight/volume for the shelf. In the example above, the current weight/volume is 0. In case of SAP bin locations, the system always displays zero (0). In the image above total weight on shelf is 25kg and total volume is 25dm^2

Inventory tab

The Inventory tab displays stock information for the selected Warehouse. It is possible to filter inventory by Item Number, Item Name and Batch/Serial number.
The displayed inventory information then provides details on Stock (quantity), unit of measure, Item Number, the descriptive Item Name and Batch/Serial number:

© 2026 Boyum IT Solutions A/S



Stock	UoM	Item No	Item Name	Batch
11	Pcs	1111	Simple Version Admin Item 1	
2	Paket	2738458	Hello, this 'my' "World"	
1	g	2878118	Reservationtest ticket 7856	
14.5	Pcs	781-BP	Purchase Item frm B	
5	PCE	abc	Gas Nozzle Subassembly, 65-50254 - 65-50254 - 65-50254 - 65-50254	ABX-2 1403-
0.25	l	batch_pricetest	Batch Price per Batch	BRM0

17.4.17 WO Start

	Optimized for Zebra Scanner	Browser Support	Bar code Support	License Production Data Collection	

This app makes it possible to start / login to a Work Order operation. The application consists of two tabs.

See basic WebApp controls in General Information on WEB APPS Version 2.1.

See Configuration wizard settings of the Web Terminal.

© 2026 Boyum IT Solutions A/S

IMPORTANT: The "Exceeding planned quantity allowed" production configuration setting affects the WO Start app. ***See*** Configuration setting.

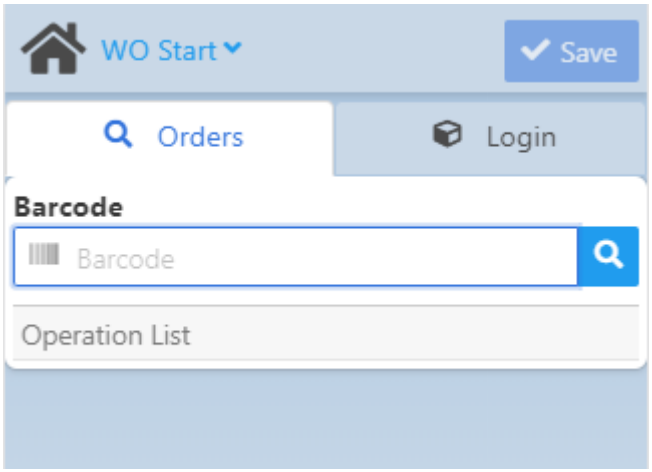
The app is affected by the "Work order must be set to planned" setting. If you change this setting, you must restart the Web service.

NOTE: Parallel operations do not consider quantities and do not manage Open/Close status!. Time receipt creation does not close a parallel operation.

ATTENTION: The setting "Order times Enter" setting of "Operation types" affects the what operations are displayed in the "orders" list.

Orders tab

In this first tab you can provide the bar code of the WO position (operation) to login. It is possible to scan the bar code of the WO position, or, alternatively, you can use the "Barcode" filter field to find the work order.



Tapping on the magnifying glass icon opens the list of work order positions – ***see*** "Operation list" in the image below. Here you can select the operation you wish to start.

Logon mask icons

Icon	Description
(red)	In WO Start: A user (current or other) has already logged in to/ started the operation. In Pool Report: Current user is logged into the operation.
(gray)	No user has logged in to the operation yet.

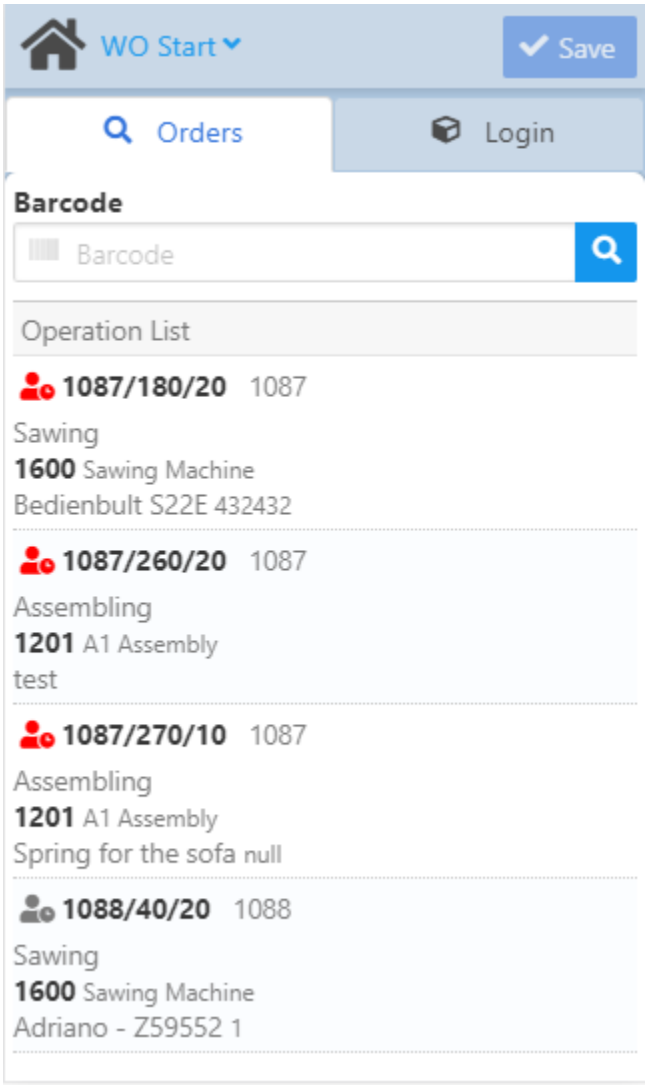
© 2026 Boyum IT Solutions A/S

Icon	Description
(orange)	Available in WebApp Pool Report. Another user has logged into the operation.
	Open: resource is available
	Locked: If used for other running activity and Resource Option "Single operator per operation sequence" is active.
	Available in WebApp Pool Report. Red: Not enough material to complete the work order. Gray: Material is enough to complete the work order. Note: The system displays this only if it is activated in the configuration.
	Interruption is active.

The Operation List gives detailed information on the work orders. WO positions are represented in separate lines which contain all relevant WO-specific information: WO number, WO position, Operation type, Resource, item name, I-Version.
The resources for the user can be selected and set up in Personnel administration > FDC settings.

Example: The first operation in the list in the image below is WO position "1087/180/20" of work order number 1087: it is a "Sawing operation" done with resource "1600 Sawing Machine" for the finished product "Bedienbult S22E 432432".

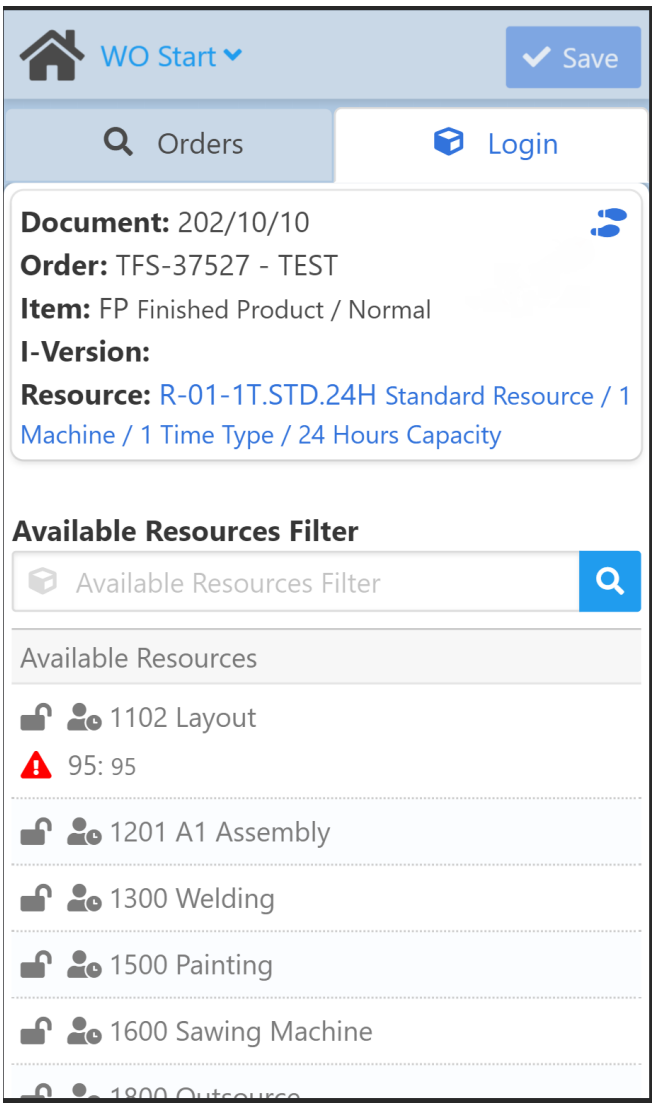
© 2026 Boyum IT Solutions A/S



Login tab

The Header section shows the same WO-specific information as in the Operation List. Scanning the bar code of a work order position will take you to the Login tab automatically.
Once selecting an operation from the list, the app switches to the Login tab which provides filtering for available resources.

© 2026 Boyum IT Solutions A/S



Tap the footprint symbol, and the instructions will appear in another dialog box.

Time Types

By selecting the resource for the operation, the app opens the "Select time type" screen. You can select the resource from the "Available Resources" list or by tapping on the actual resource in the Header.

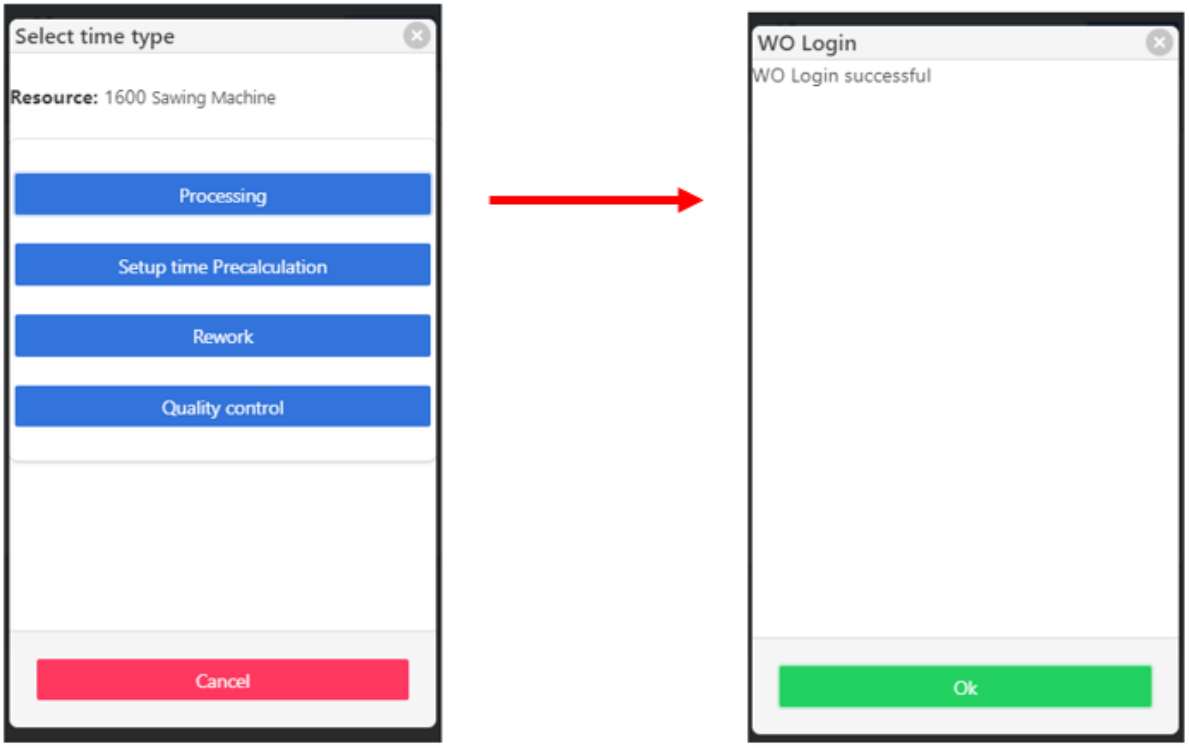
Note: You can only select resources that were previously selected for the user in **Personnel Administration > Master Data > FDC > "Resource" + "Resource selectable**".

The screen displays the name of the resource and the following 4 time types:
Processing, Setup time Precalculation, Rework, Quality control.

© 2026 Boyum IT Solutions A/S

Note: The number of Time Types options depends on how many cost elements are set for the resource in the **Resource Master Data > Cost tab > "Expand to cost elements"**.

This concludes the Login process.



After selecting the time type, the WO Login is performed and the login information is displayed in the Work order list in SAP B1, as well:

17.4.18 WO Goods Receipt

		Browser Support	Bar code Support	License Material Management	Warehouse Support SAP Bin Management	Print Document

© 2026 Boyum IT Solutions A/S

	Optimized for Zebra Scanner			(Issue, Receipt, Allocation)	Beas Bin Management WMS Bin Management	Support Asynchronous working

With this app you can create receipts on a Work order Position – Assembly and all BoM Positions with 0 or negative quantity.

See basic WebApp controls in General Information on WEB APPS Version 2.1.

See Configuration wizard settings of the Web Terminal.

Multiline is supported for serial numbers, but not for Batches. It is not possible to choose a different target warehouse for one position.

See also Massive input of serial numbers.

> Note: This is a receipt function without cancellation and automatic backflushing options.

WMS Integration:

Beas Manufacturing WebApps support WMS Batch Attributes.

After inserting a Batch Number, the system checks the mandatory attributes. If such attribute is saved for the batch, the field frame turns red, indicating the missing of mandatory information.

All field types (String, Date, List, Numbers) are supported.

See Batch Extended Information srceen.

WebApp support:

WO Goods Receipt

WO Backflushing

WO Stop

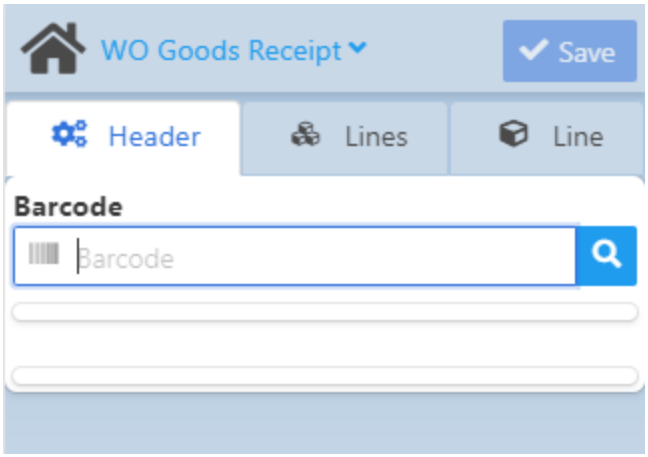
Wo Time Receipt

Goods Receipt

Header tab

In the "Barcode" field you can enter the bar code manually or scan a WO Position bar code.

© 2026 Boyum IT Solutions A/S



See field descriptions.

In work order the system defines a bar code for

- Work order position
- Bill of Materials position
- Routing position

You can display every Bar code in the work order document (by customizing with Crystal report)

© 2026 Boyum IT Solutions A/S

In all Work order apps you can choose the work order / work order position with all 3 bar code types.

Scanner can be used for:

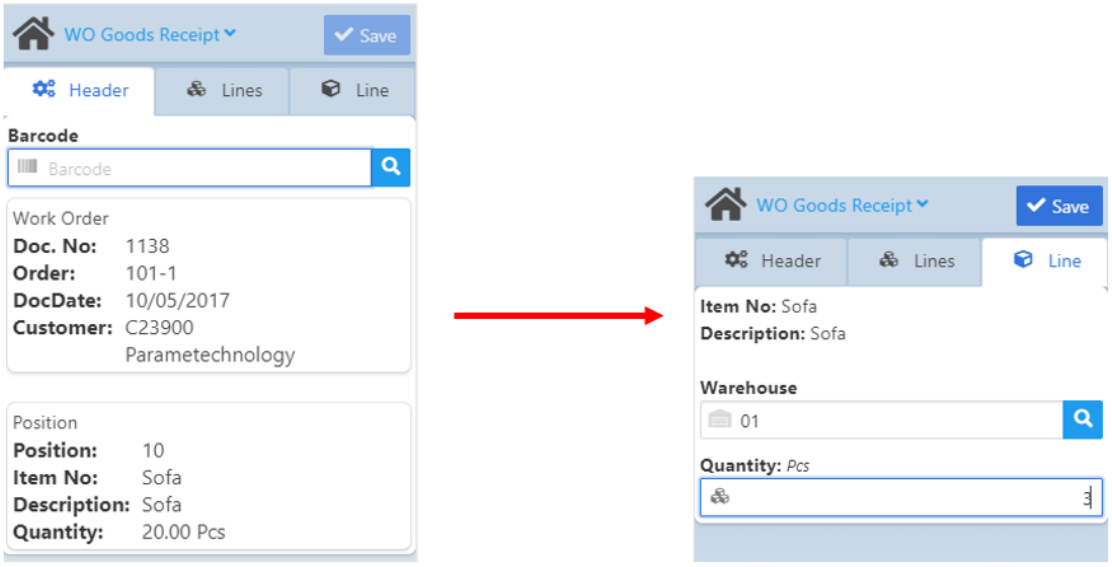
Bar code	App behavior
BoM position	Only BoM bar codes are allowed if the first scanning was a BoM bar code. The app displays the scanned line only.
Routing position	When scanning a Routing position, the app loads the WO position but only displays the lines that are linked to the scanned routing position.
Work order position	When scanning a Work order position, the app displays all the lines belonging to that position.

© 2026 Boyum IT Solutions A/S

Line tab

After the input of the WO Position bar code, the necessary WO information appear in the Header tab and the screen automatically switches to the Line tab. Once the necessary quantities are entered, the WO Goods Receipt document is ready to be saved – ***see*** image right below.

The Warehouse field shows the default warehouse saved in the BoM entry. Any other warehouse can be selected in the Warehouse Search screen after tapping the magnifying glass icon.



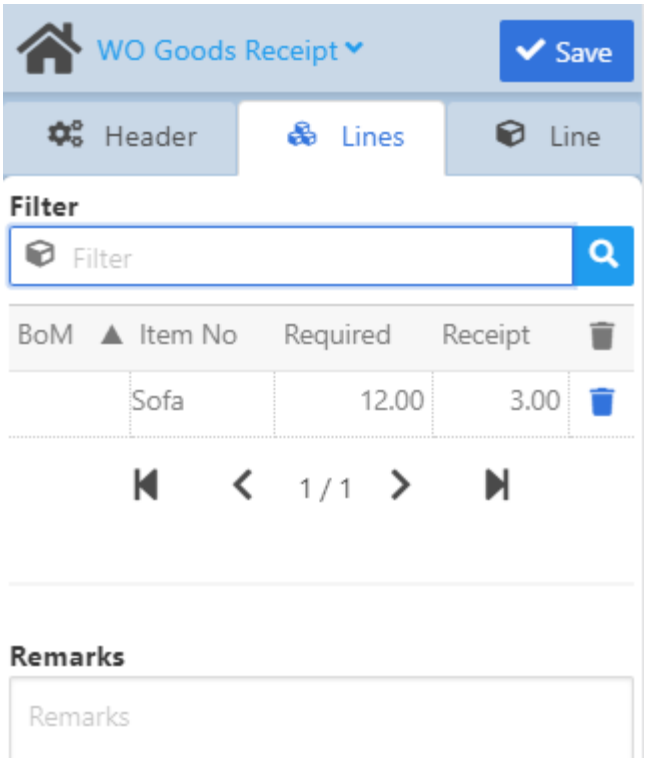
See rules of Batch/Serial Extended information screen.

WMS integration: WMS Batch attributes are supported.

Lines tab

In the Lines tab you can edit or delete a line for a received item.

© 2026 Boyum IT Solutions A/S



Field Descriptions

Field	Description
BoM	Work order position > BoM position number. The lines in this app are loaded with negative BoM only.
Item No	Item number
Required	Required quantity
Issue	Issued quantity
Warehouse	Warehouse
Remarks	Free text.

Settings

Waiting time: In this parameter you can define the number of seconds that the app should wait until moving forward with the next transaction.

Note: Working with this app is a manual process, as automatic allocation is not supported.

17.4.20 WO Issue by SSCC

	Optimized for Zebra Scanner	Browser Support	Bar code Support	License Material Management (Issue, Receipt, Allocation)	Warehouse Support: SAP Bin Management Beas Bin Management WMS Bin Management	Print Document Support Asynchronous working

With this app you can create a work order material issue based on SSCC information.

See basic WebApp controls in General Information on WEB APPS Version 2.1.

See Configuration wizard settings of the Web Terminal.

App settings

Print solution:

Select which document should be printed by the print solution.

Off: no printing

Crystal: Print Open Qty, Max. Reserved, Remaining on SSCC

RTF: Print Open Qty, Max. Reserved, Remaining on SSCC

Script: Print Open Qty, Max. Reserved, Remaining on SSCC

See detailed description of Print types.

Steps:

Select a Work order manually or by Bar code.

The app displays all related lines.

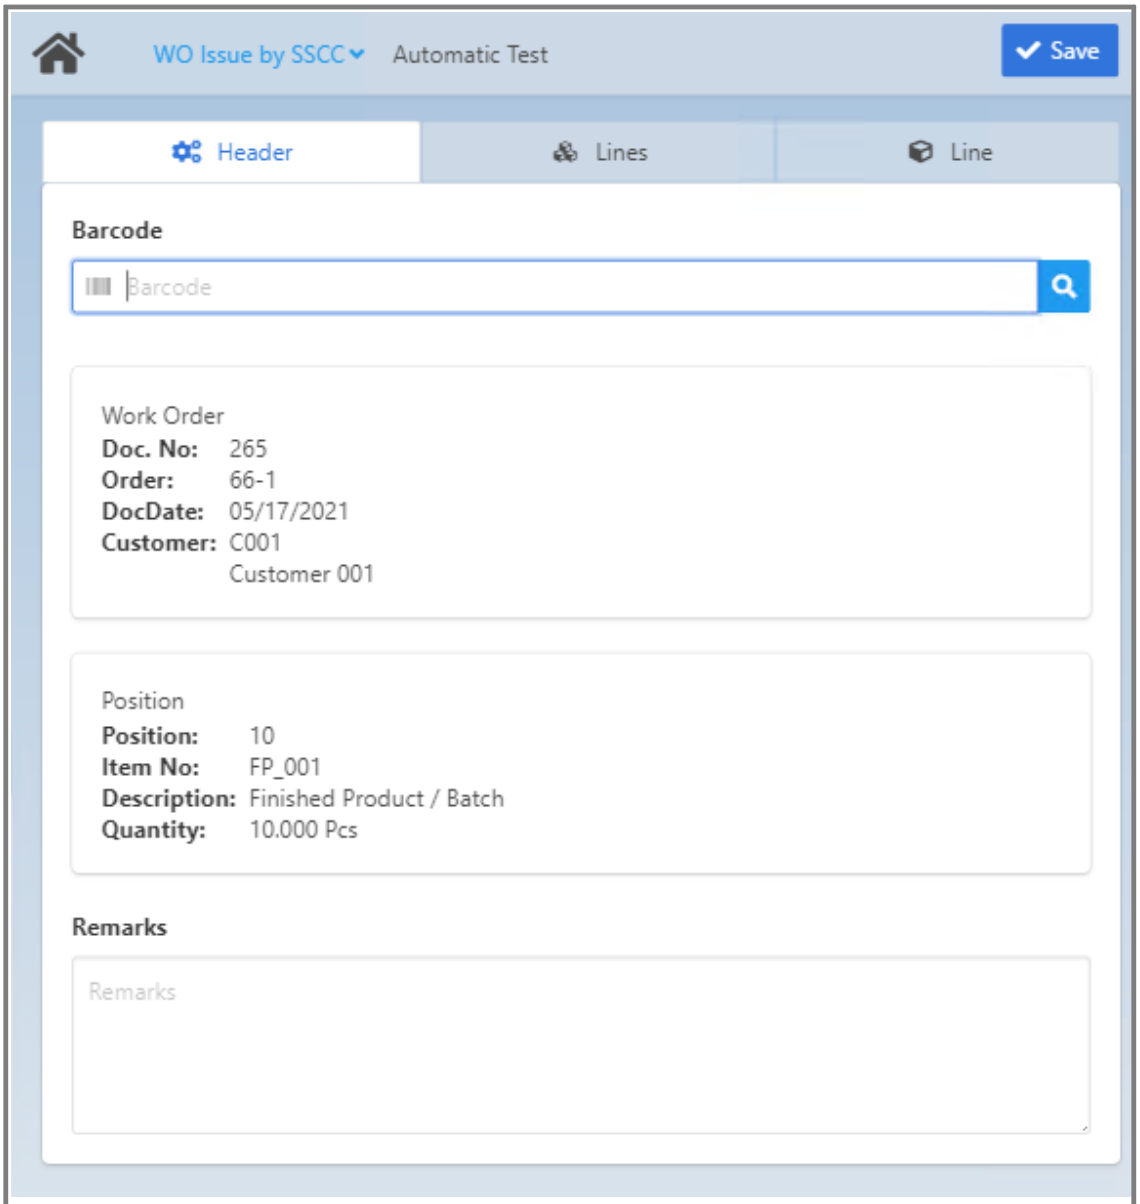
Scan GS1-128 barcode or manually choose material that you want to issue for the work order.

For WMS Customers:

For users without WMS installation:

- **Header - Choose work order**

© 2026 Boyum IT Solutions A/S

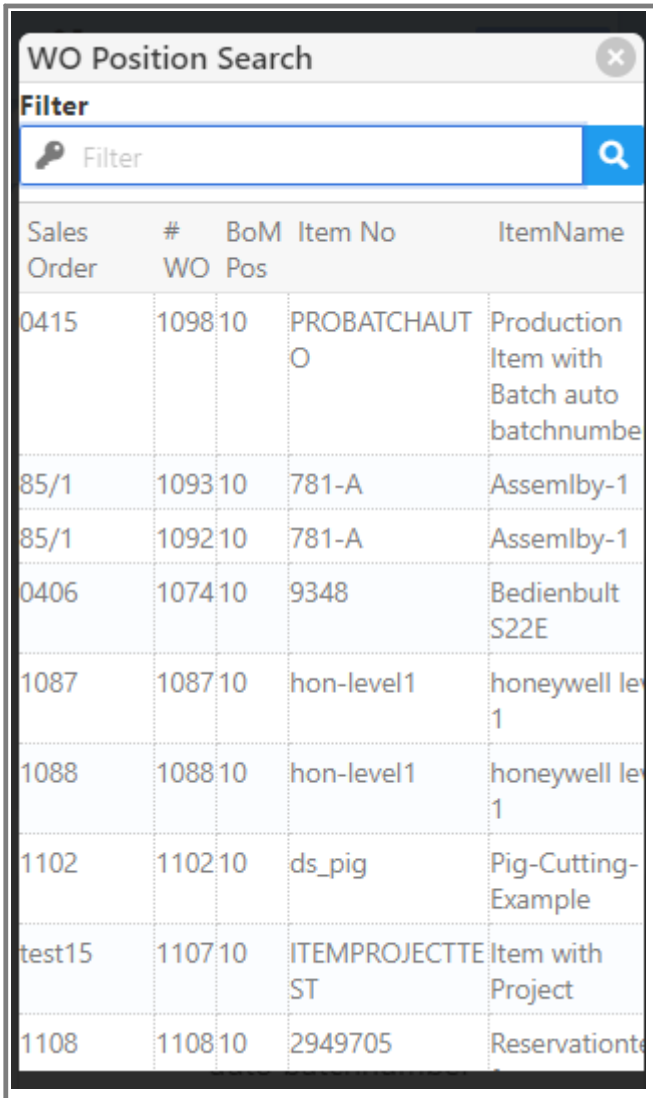


Scan the Bar code of the Work order position. ***See*** Work order bar code

Alternatively, you can use the magnifying glass icon to select a position from the list in the "WO Position Search" filter.

The "WO Position Search" filter displays information regarding the linked Sales Order, the WO number, BoM position, Item number and Item name:

© 2026 Boyum IT Solutions A/S



After selecting the WO position, the system switches to the "Lines" tab.

Production Data Collection

Warehouse Support

SAP Bin Management

Beas Bin Management

WMS Bin Management

With this app you can create a Time Receipt for a Production order. ***See*** basic WebApp controls in General Information on WEB APPS Version 2.1.

The app consists of three tabs: Header, Lines and Line.

It is possible to provide the bar code of the WO information by scanning or manual input. Filtering is possible with the magnifying glass icon: tapping on it opens the "WO Routing Search" screen, where you can select the operation to receipt. (***See*** image below).

Settings:

Time Display

PATH: Administration > System Initialization > Configuration wizard > Terminal and WEB APP > Beas Web Terminal 2.1 > "App Setup".

Select the layout of time-related fields to be displayed in the selected app:

- Time From/To
- Duration

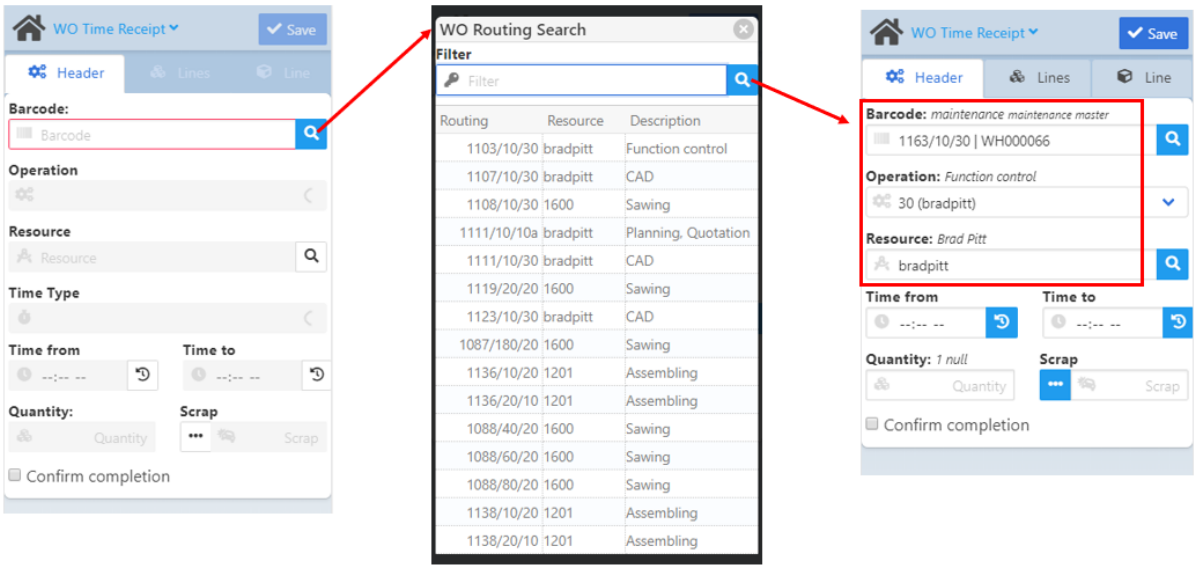
© 2026 Boyum IT Solutions A/S

- Time From/To + Duration

Setting is available for WebApps:
WO Time Receipt
WO Backflushing
WO Stop

See also extended App Setup.

See Logon/Logoff rules, app setup and other parameters in the Configuration wizard settings of the Web Terminal.



Upon saving, the Time Receipt is visible in **SAP B1 > Work orders**. The below image displays the receipt for the operation selected above:

IMPORTANT: The "Exceeding planned quantity allowed" production configuration setting affects WO Time Receipt. ***See*** Configuration setting.

© 2026 Boyum IT Solutions A/S

Header tab

Once all mandatory information are filled, click the **Save** button to jump to the Lines tab.

Field Descriptions

Field / Function	Description
Barcode	Using the bar code scanner, the bar code of the WO operation appears in the field, filling all WO-related information automatically (***see*** third image above). The information is displayed with WO number / WO positions and indicating the WO item name in italics right to the field name (***see*** third image above).
Operation	The field is automatically filled with the information coming from WO-number scanning or manual input. The WO position number of the operation appears in the field along with the name of the used Resource in brackets – ***see*** third image above: 30 (bradpitt) . The description of the operation is indicated in italics right to the field name ("Function control" in our example above). **NOTE:** Parallel operations do not consider quantities and do not manage Open/Close status!. Time receipt creation does not close a parallel operation.
Resource	The field is automatically filled with the information coming from WO-number scanning or manual input. The name of the Resource appears in the field, and its description is displayed right to the field name. The resources for the user can be selected and set up in Personnel administration > FDC settings.
Time Type	Select a time type. ***See*** also Concept Time Types.
Time from / Time to	Enter the time period of the operation with these fields. The earliest possible "Time from" input is the actual time according to the system. AM or PM is mandatory information to add once the fields are edited. Tapping on either of the two icons will display the actual time in the given field according to the system. Once the

© 2026 Boyum IT Solutions A/S

Field / Function	Description
	duration of the operation is set with the two fields, the duration is indicated in minutes right to the "Time to" field name – ***see*** image below: the duration is *119* minutes.  **Note**: The app can only be used for the current day, and it is not possible to create a time receipt over midnight.
Duration	According to the app setup, you can make this field visible. Note: The field is not editable if "Field duration blocked" parameter was selected in **Configuration wizard > FDC > View Time Receipts**. ***See*** also extended App settings and the **Settings** section below.
Quantity	Provide the quantity to be receipted. Indicated right of the field name: - pending/total quantity. Pending quantity is based on previously reported time receipt quantities - Unit of measure
Scrap	Scrap quantity - field is not changeable.
Partial / Completion / Intermediate	Select one of the options to be performed at booking: - **Partial**: Create a partial time receipt for the operation. - **Completion**: Confirm completion of the operation and close the position. - **Intermediate**: Create an Intermediate report in the Time receipt. The button is visible only if the parameter in the Configuration wizard is left unchecked.
Batch/Serial Number	Visible only in case of Batch/Serial-managed items. The icon opens the Batch/Serial: Extended Information screen in Receipt Mode (***see*** the same link). **WMS integration:** WMS Batch attributes are supported.
Bin Location	Select the bin location by tapping the magnifying glass icon.

© 2026 Boyum IT Solutions A/S

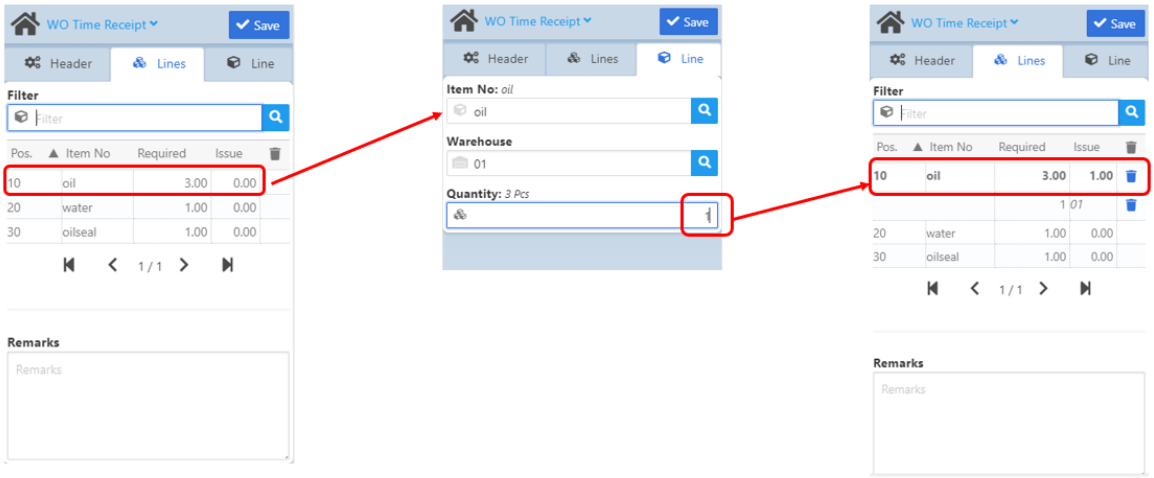
Lines tab

Once mandatory information are filled in the Header, the screen automatically switches to the Lines tab.

Other relevant information can be entered at this point by going back to the Header tab (***see*** fields in the table above).

The Lines tab displays a list of the WO positions of the operation by Position number, Item number, Required quantity and Issued quantity.

By selecting a WO position in the list, the screen automatically switches to the Line tab where you can provide the quantity to be issued for the given item (***see*** image below).



Field Descriptions

17.4.23 Start Interruption

		Browser Support		License Production Data Collection	

The Start interruption app allows to log an interruption on a resource in the system. This app starts the clock on the interruption time.

See basic WebApp controls in General Information on WEB APPS Version 2.1.

See Configuration wizard settings of the Web Terminal.

NOTE: This WebApp does not support the option to create a Maintenance order in Interruption reasons master data (Desktop solution). ***See*** Maintenance order creation parameter.

There are two tabs available:

- Resource
- Tool

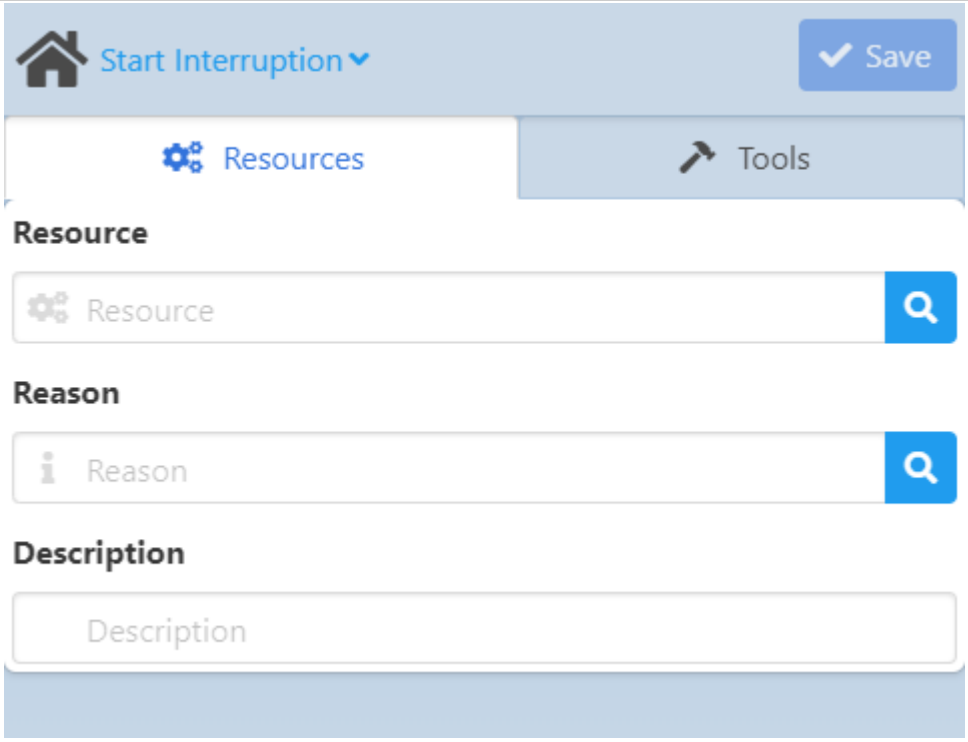
Resource tab

1. Search by resource code or name.

   As you enter the name or code, the app filters the results. Alternatively, use the search icon to display and select from all available resources.

   Only the resources that are available to the user are displayed. Resource groups, external or inactive resources are not available.
   The resources for the user can be selected and set up in Personnel administration > FDC settings.

© 2026 Boyum IT Solutions A/S

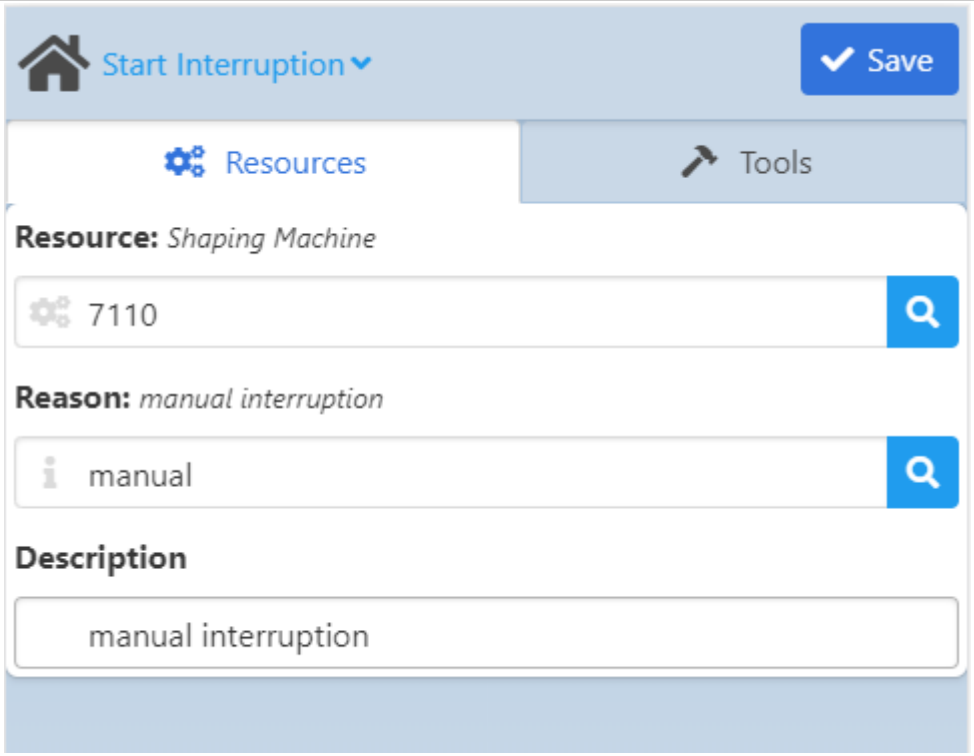


2. Enter the interruption reason in the *Reason* field or choose from the list, using the search icon.

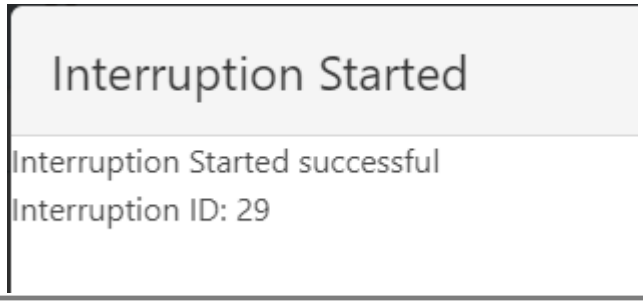
   After the interruption reason is selected, the description is automatically added, but can be changed if necessary.

   .

© 2026 Boyum IT Solutions A/S



3. Click the **Save** button to start the interruption timer.



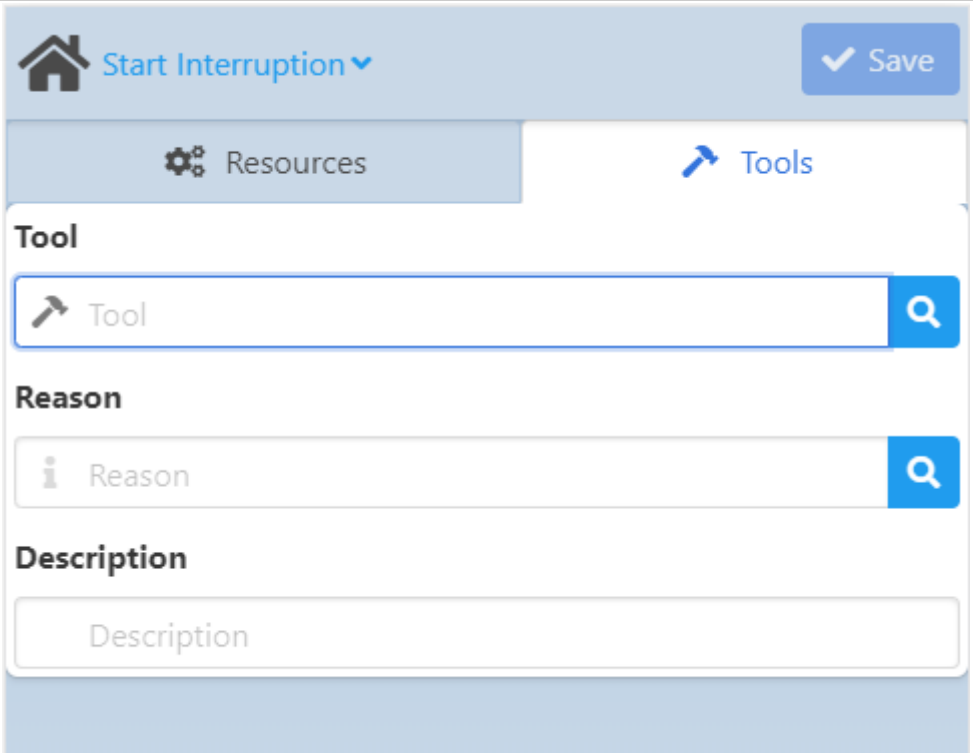
Tools tab

1. Search by tool code or name.

   As you enter the name or code, the app filters the results. Alternatively, use the search icon to display and select from all available tools.

   Only active tools are displayed. Inactive tools are not available.

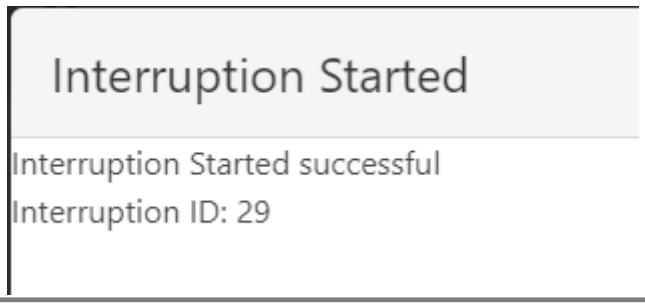
© 2026 Boyum IT Solutions A/S



2. Enter the interruption reason in the *Reason* field or choose from the list, using the search icon.

   After the interruption reason is selected, the description is automatically added, but can be changed if necessary.

3. Click the **Save** button to start the interruption timer.



17.4.24 Stop Interruption

	Browser Support		License Production Data Collection	

The Stop interruption app allows to log the end of an interruption on a resource in the system. This app stops the clock on a logged interruption.

See basic WebApp controls in General Information on WEB APPS Version 2.1.

© 2026 Boyum IT Solutions A/S

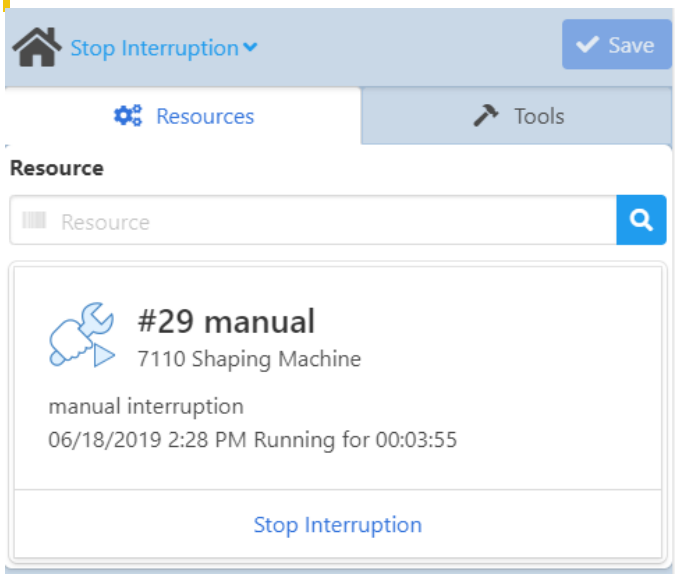
See Configuration wizard settings of the Web Terminal.

There are two tabs available:

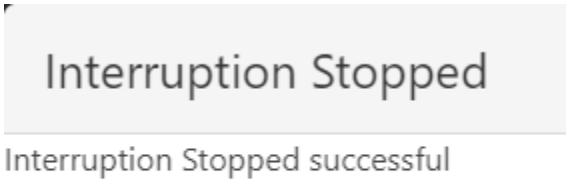
Resource tab

1. Ongoing interruptions are displayed to the user.

   Only the resources that are available to the user are displayed.
   The resources for the user can be selected and set up in Personnel administration > FDC settings.



2. Click the **Stop Interruption** button to start the interruption timer.

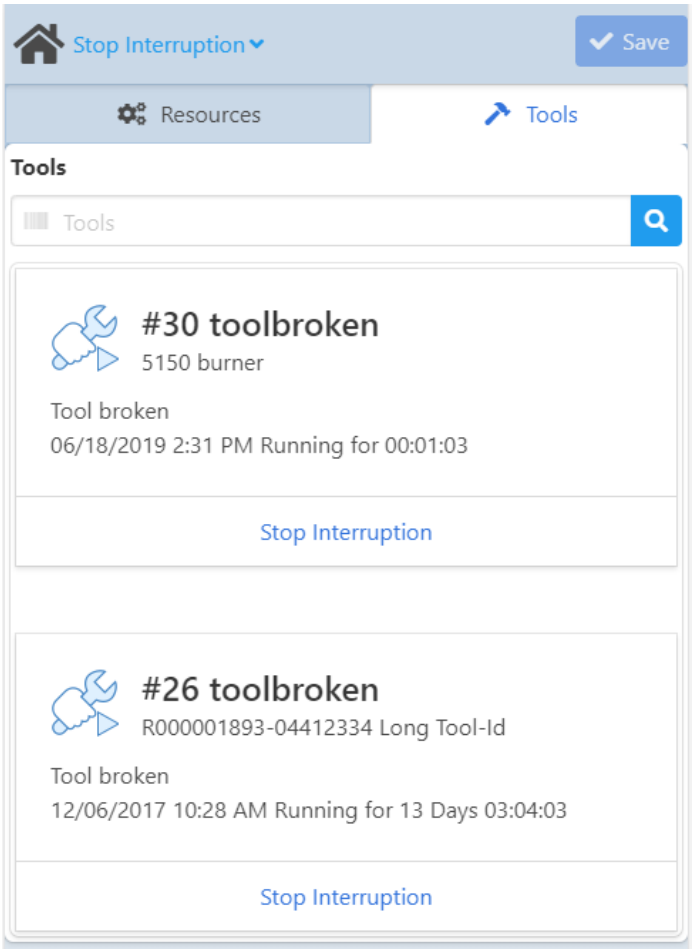


Tools tab

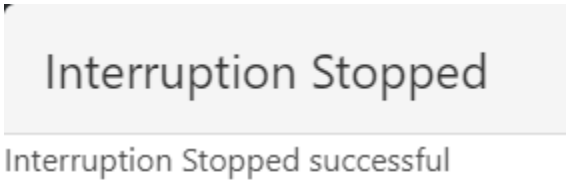
1. Ongoing interruptions are displayed to the user.

   Only the tools that are available to the user are displayed.

© 2026 Boyum IT Solutions A/S



2. Click the **Stop Interruption** button to start the interruption timer.



17.4.25 WO Backflushing

WO Backflushing Work Order Backflushing Issue	Optimized for Zebra Scanner	Browser Support	Bar code Support	License Production Data Collection	Warehouse Support SAP Bin Management Beas Bin Management

17.4.26 WO Material Reservation

	Optimized for Zebra Scanner	Browser Support	Bar code Support	License Material Management (Issue, Receipt, Allocation)	Warehouse Support SAP Bin Management Beas Bin Management WMS Bin Management	Print Document

With this app you can display and create a material reservation for a work order in Beas.

See basic WebApp controls in General Information on WEB APPS Version 2.1.

See Configuration wizard settings of the Web Terminal.

See App Setup.

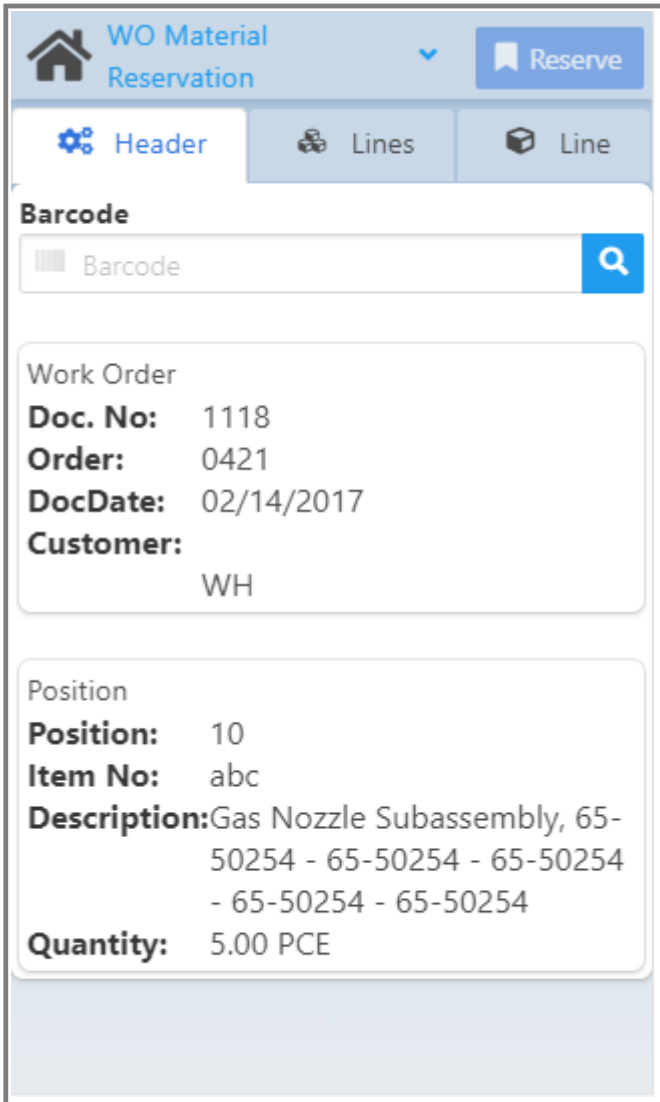
Note: For this feature, the reservation system has to be activated.

Reservation from a Sales order will not be provided because it is part of the Reservation in the SAP client > Sales Order and used with access to Beas license, and available in the the WebApps using Picking functionality.

Header tab

In the Barcode field, you can search for a work order position to which you would like to reserve material quantities. You can scan the barcode or tap the magnifying glass to enter the WO Position Search filtering screen.

© 2026 Boyum IT Solutions A/S



Field Descriptions

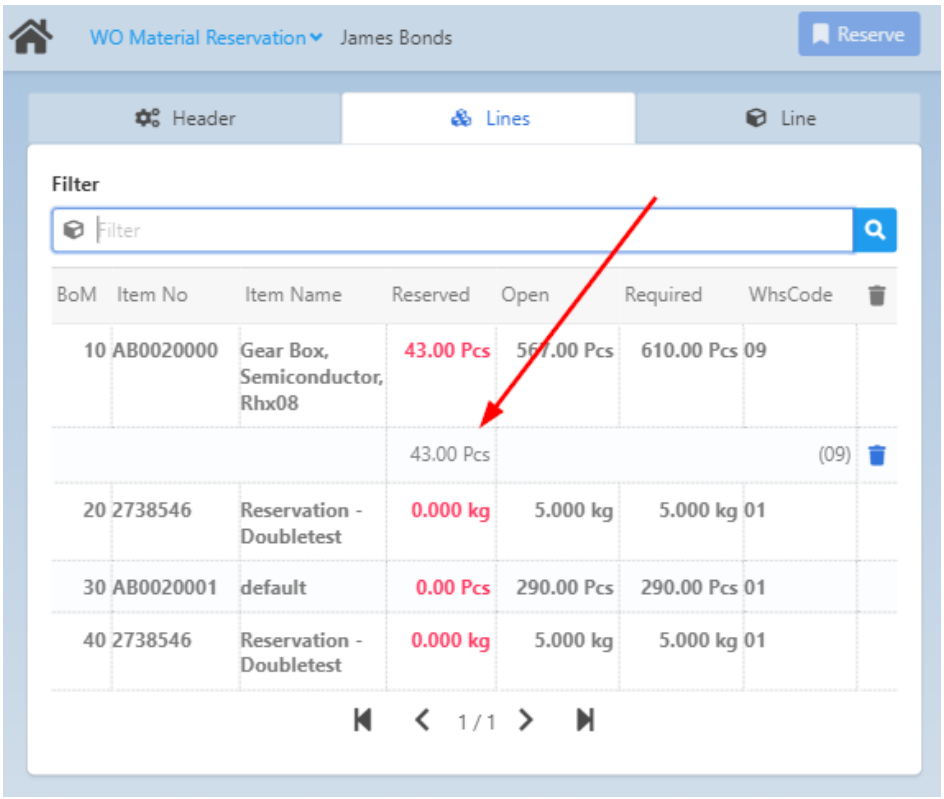
Field	Description
Barcode	Barcode of the work order position / Select barcode.
Work order	*Work order related information fields (not editable)*
Doc. No.	Work order document number.
Order	Work order number
DocDate	Creation date of the selected work order.
Customer	Customer code.

© 2026 Boyum IT Solutions A/S

Field	Description
Position	*Work order position related information fields (not editable)*
Position	Number of the selected work order position.
Item No.	Item number
Description	Description
Quantity	Quantity for the finished product

Lines

The Lines tab contains the open work order positions of the selected work order.
Click on a line (position) to add quantities to be reserved. If there is any previously reserved quantity, it it displayed as well (***see*** image below).



Field Descriptions

Field	Description
Filter	Search for an item. Note on WMS Quality Status filtering

© 2026 Boyum IT Solutions A/S

Field	Description
	WMS Integration - When working with a WMS database, and connected Produmex Add-On, the list is filtered based on the **Produmex WMS Add-On > Organizational structure > Quality Status >"Can be used for production"**. If the "Can be used for production" field is active, this BEAS screen section only displays WMS items that were set to "Released" status in WMS. NOTE: WMS quality status is not defined per serial number. For this reason, all serial numbers of the same LUID will be displayed in the material issue list, even if they have different WMS quality statuses. Only quantity available in an unblocked for production status can be issued. ***See*** further, up-to-date information on WMS-BEAS integration.
BoM	Bill of Materials position
Item No	Item number
Item Name	Name of the item
Reserved	Quantities already reserved. ▪ Red: when Open Quantity is > 1 ▪ Green= When open Quantity is 0 ▪ Yellow= When open Quantity is < 0 (negative) when reserved more than planned.
Open	Open quantities
Required	Quantity required by the work order
WhsCode	Warehouse Code
LUID/SSCC	Logistic Unit / SSCC information (WMS) The logistic unit ID is displayed in front in bold

Logon mask icons - descriptions

Logon mask icons	
Icon	**Description**
(red)	In WO Start: A user (current or other) has already logged in to/ started the operation. In Pool Report: Current user is logged into the operation.
(gray)	No user has logged in to the operation yet.
(orange)	Available in WebApp Pool Report. Another user has logged into the operation.
	Open: resource is available
	Locked: If used for other running activity and Resource Option "Single operator per operation sequence" is active.
	Available in WebApp Pool Report.

© 2026 Boyum IT Solutions A/S

Icon	Description
	Red: Not enough material to complete the work order. Gray: Material is enough to complete the work order. Note: The system displays this only if it is activated in the configuration.
	Interruption is active.

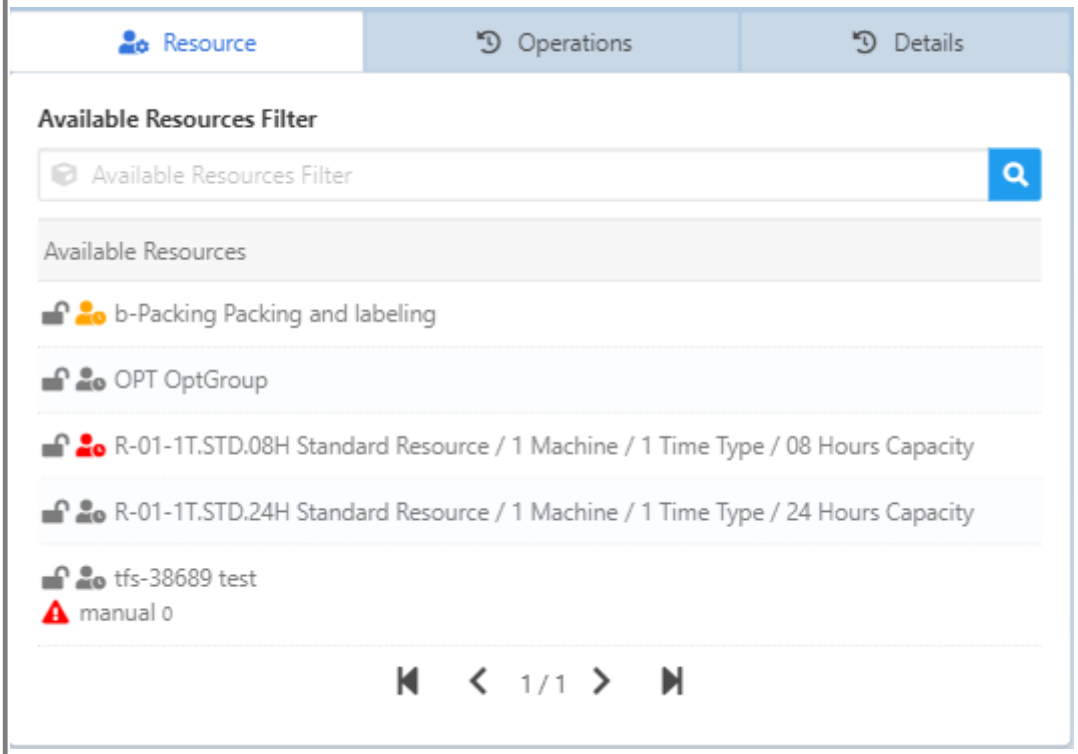
TABS:

Resource

This first tab displays all resources of the current Pool list.
The system reloads the list only if the app is started or if you select "Reload the application" in the WebApp Header, because the calculation of Pool report can take time. ***See*** Performance.
See Logon mask icon descriptions above in this chapter.

Select a Resource from the "Available Resources Filter".

The filter is applied with "Enter" or pressing the search (button; auto-complete function is not supported.



After selecting the resource, the app switches to the next tab.

Note: If you switch to other tabs, the system does not reload the pages.

© 2026 Boyum IT Solutions A/S

IMPORTANT: Multi-logon/off of resources is not possible in the WebApp version.

Operations

This tab displays all operations of the pool report and the resource selected in the first tab "Resource".

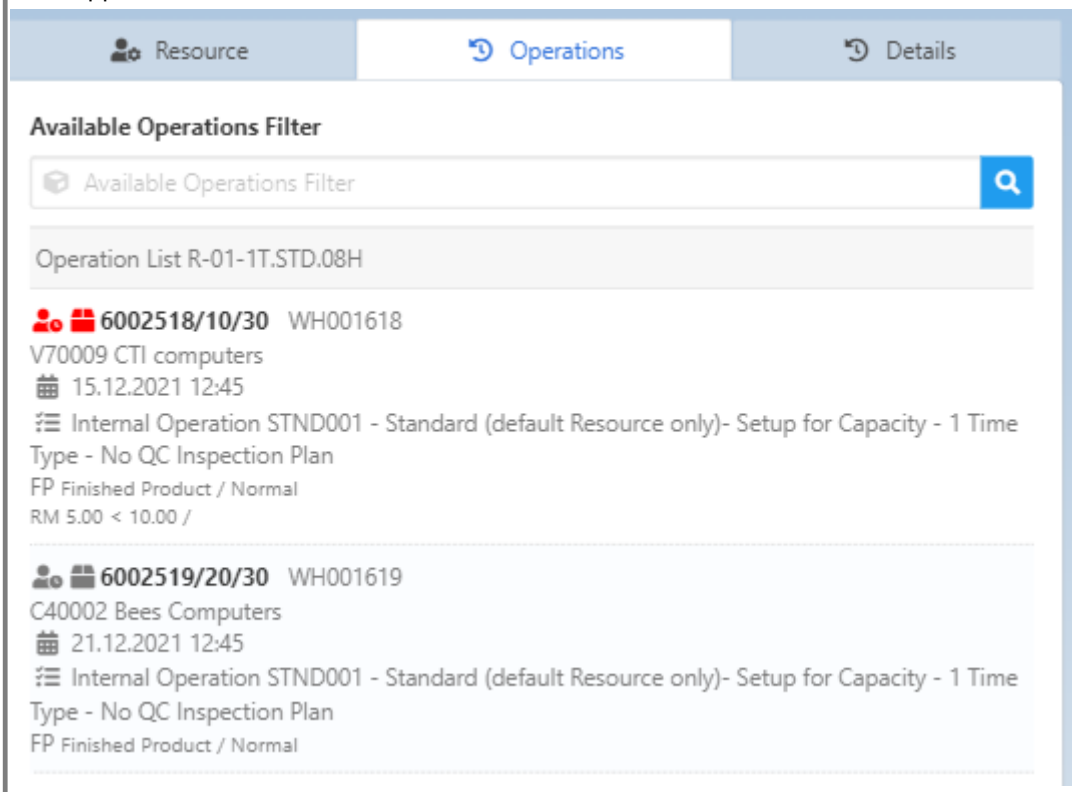
Select an operation from the "Available Operations Filter"

You can search by:

- Document Number
- Order Number
- Operation Bar code

Note: You must type the complete Order number or bar code. Document number can be typed partially to provide search hits.

The filter is applied with "Enter" or pressing the search (button; auto-complete function is not supported.



After you select the resource, the system displays the Operation list. The operations are sorted according to predetermined pool priority (working identically in the Desktop Terminal version):

© 2026 Boyum IT Solutions A/S

"Operation List" entry details

Information	Example (*see* above image)
Icons	***See*** Logon mask icon descriptions above in this chapter.
Work order document / Position / Routing position and WO number	600218/10/30 and WH001618
Customer ID and Name	V70009 and CTI Computers
Planned Start Date and Time	15.12.2021 and 12:45
Operation description	Internal Operation STND001 - Standard (default Resource only) - Setup for Capacity - 1 Time Type - No QC Inspection Plan
Item and Item Name	FP Finished Product/Normal
Material check	RM 5.00 < 10.00 / NOTE: Only visible if the parameter is enabled and if there is not enough material.

Details

This last tab displays the details of the Operation, and you can start and stop the operation.

- Login

  - Login as Sales employee

Go to user and password set up in **HR > Personnel > Login tab**.
The function searches for the first user with login information inside.

© 2026 Boyum IT Solutions A/S

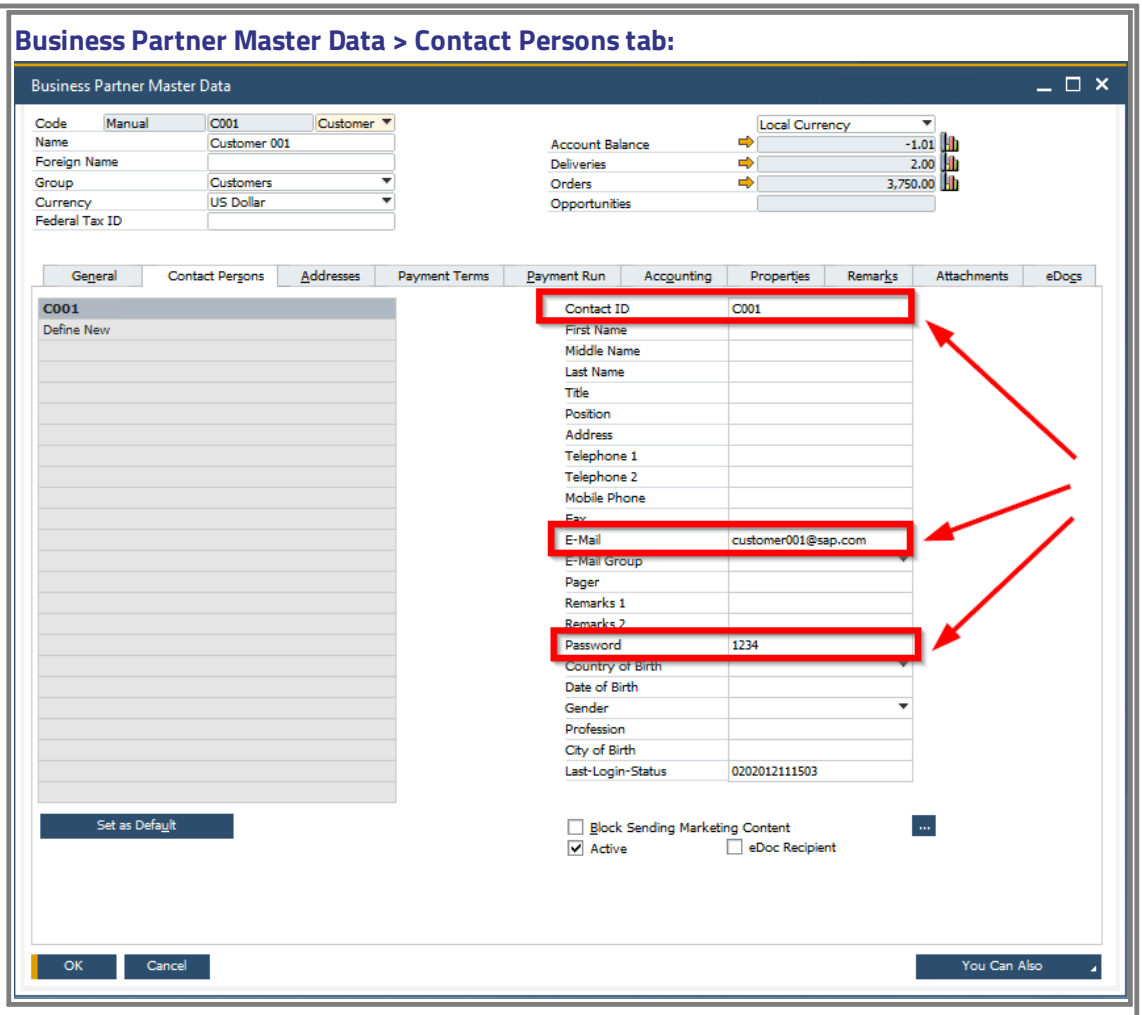
Login as Customer

A customer must be stored for the login. A contact person, an email address and a password are stored in this customer entry in **SAP Business One > Business Partners >**

© 2026 Boyum IT Solutions A/S



Login protection:

If the user tries to login 3 times with a wrong password, the system locks the user for 2 hours. This prevents a bot attempting a brute force attack based on a dictionary.

See Logon and Edit Personnel Master data.

See functions and field descriptions in Web Product Configurator User interface.

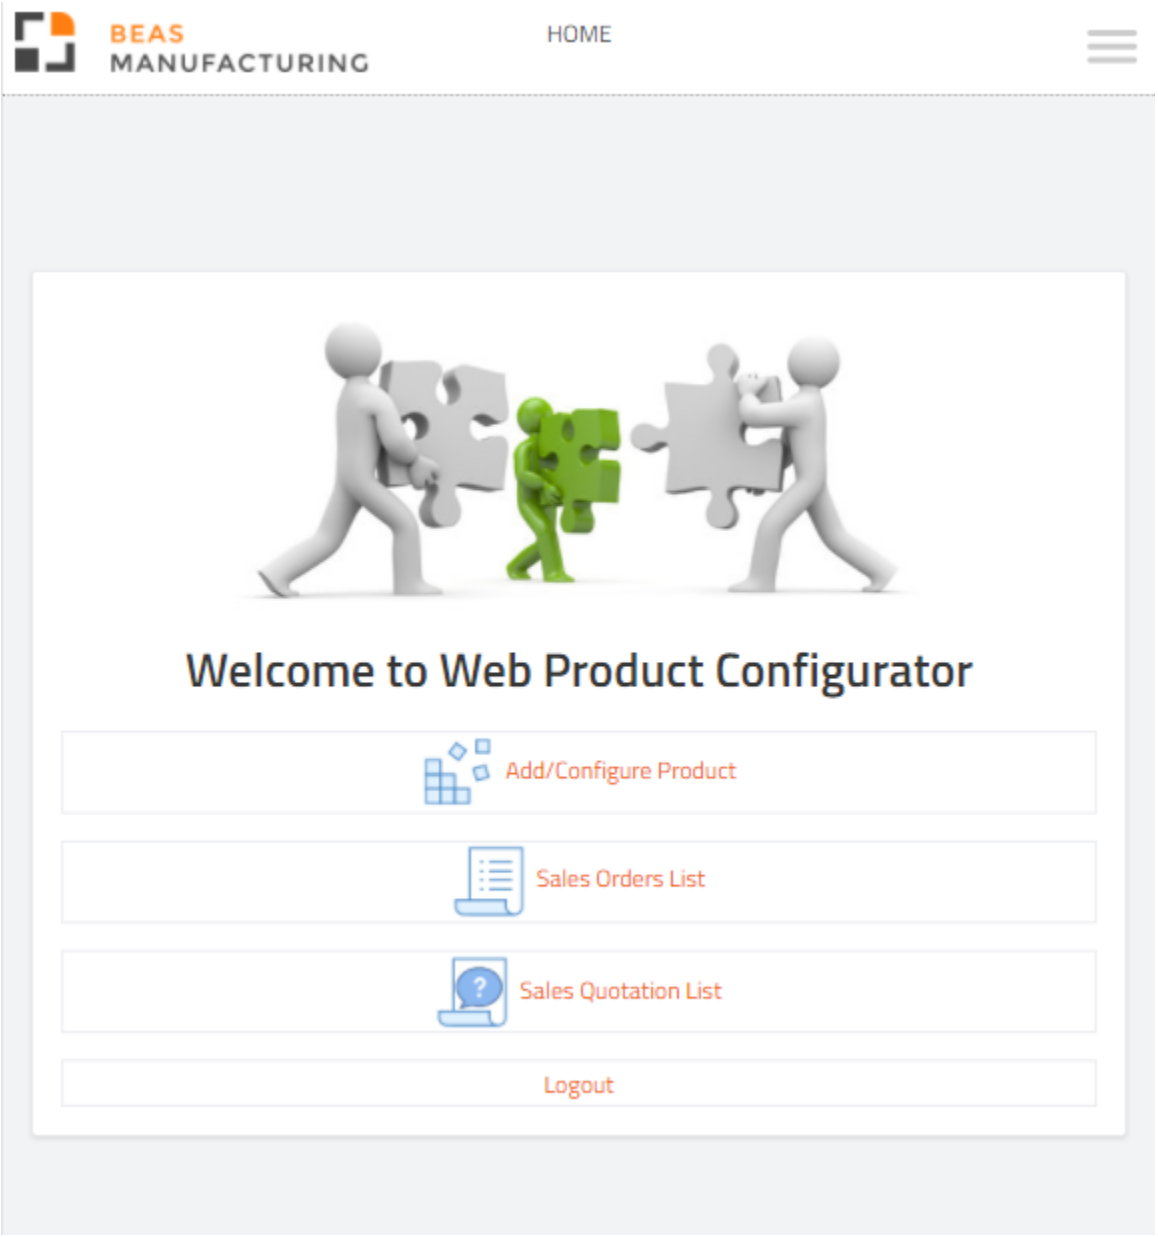
17.5.1 Web Product Configurator – User Interface

This chapter provides a detailed description of the user interface of the Web Product Configurator.

Note: Before working with the Web Product Configurator ***see*** the different Basic settings.

HOME screen

© 2026 Boyum IT Solutions A/S



Field descriptions

Field	Description
Change/Select a Customer	Only visible when logged in as a Sales Employee. Click menu entry and the "Select Customer" screen opens with Card Code/Name filters.
View Cart (x items)	Only visible when cart already contains item configurations created with the Web Product Configurator.

© 2026 Boyum IT Solutions A/S

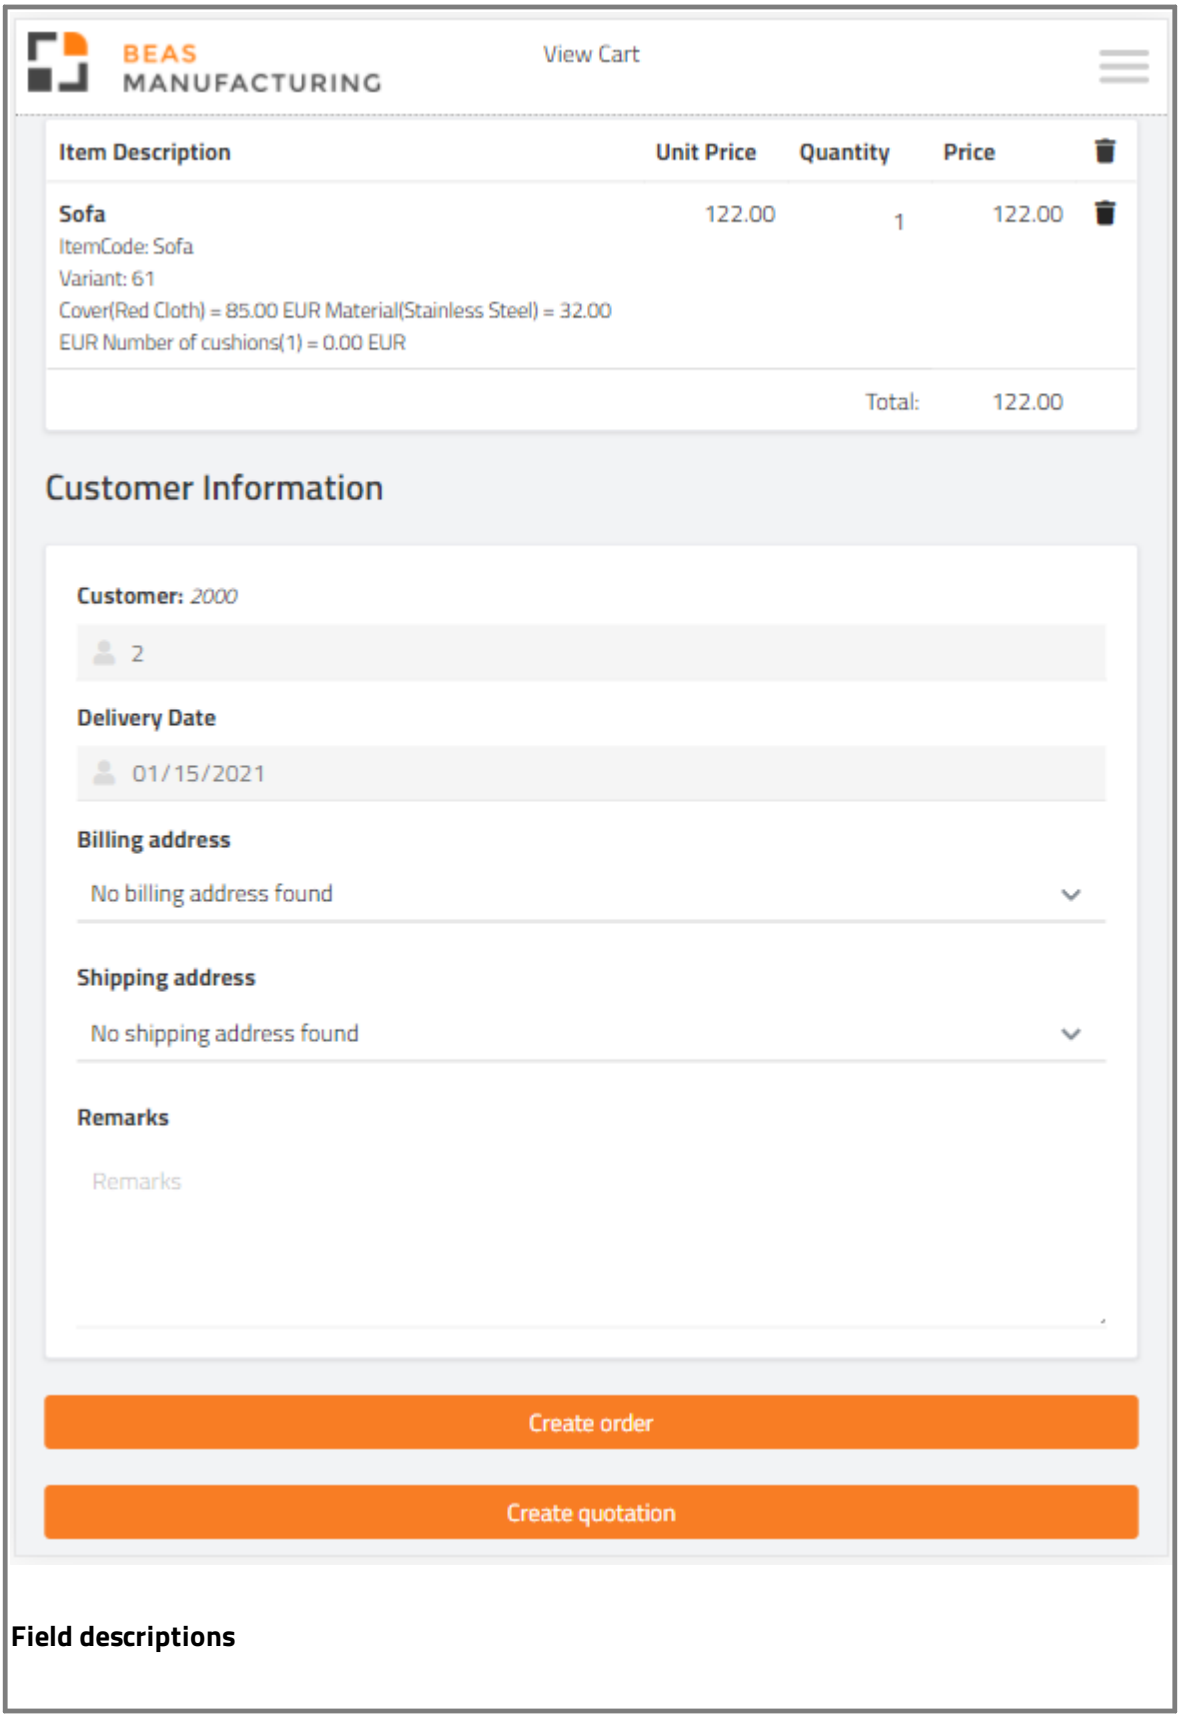
Field	Description
Add/Configure Product	Create a new product configuration.
Sales Orders List	Displays the list of sales orders. ***See*** settings.
Sales Quotations List	Displays the list of sales quotations. ***See*** settings.
Logout	Log out with the current user.
Welcome XY	Displays the name of the logged in user. - Visible in the collapsible menu on the right.
Customer	Customer code. - Visible in the collapsible menu on the right.

The collapsible menu on the right contains the same menu entries.

- View Cart

  In this screen the user can manage item configurations added to their cart.

© 2026 Boyum IT Solutions A/S



Field descriptions

© 2026 Boyum IT Solutions A/S

Field/Function	Description
Item Description	The description of the item, containing all details of the configuration (materials, colors, prices etc.)
Unit Price	Unit Price
Quantity	Quantity to be ordered.
Price	Total price. The logo of the actual currency (for example "$" or "€") is displayed right of the value.
Customer information	
Customer	Customer code. Visible when logged in as a Sales employee.
Requirement Date	Requirement date of the document to be created. For Sales orders: "Delivery date" For Sales quotation: "Valid until"
Billing Address	The address to which the order should be invoiced.
Shipping Address	The address where the order should be transported.
Remarks	Free text for notes regarding the order.
Create the order	Click this (orange color) button to create the sales order. - Visible if set up in Document settings.
Create quotation	Click this (orange color) button to create the sales quotation. - Visible if set up in Document settings.

- Add/Configure Product

In this screen you can select an item configuration to edit and create a new configuration.

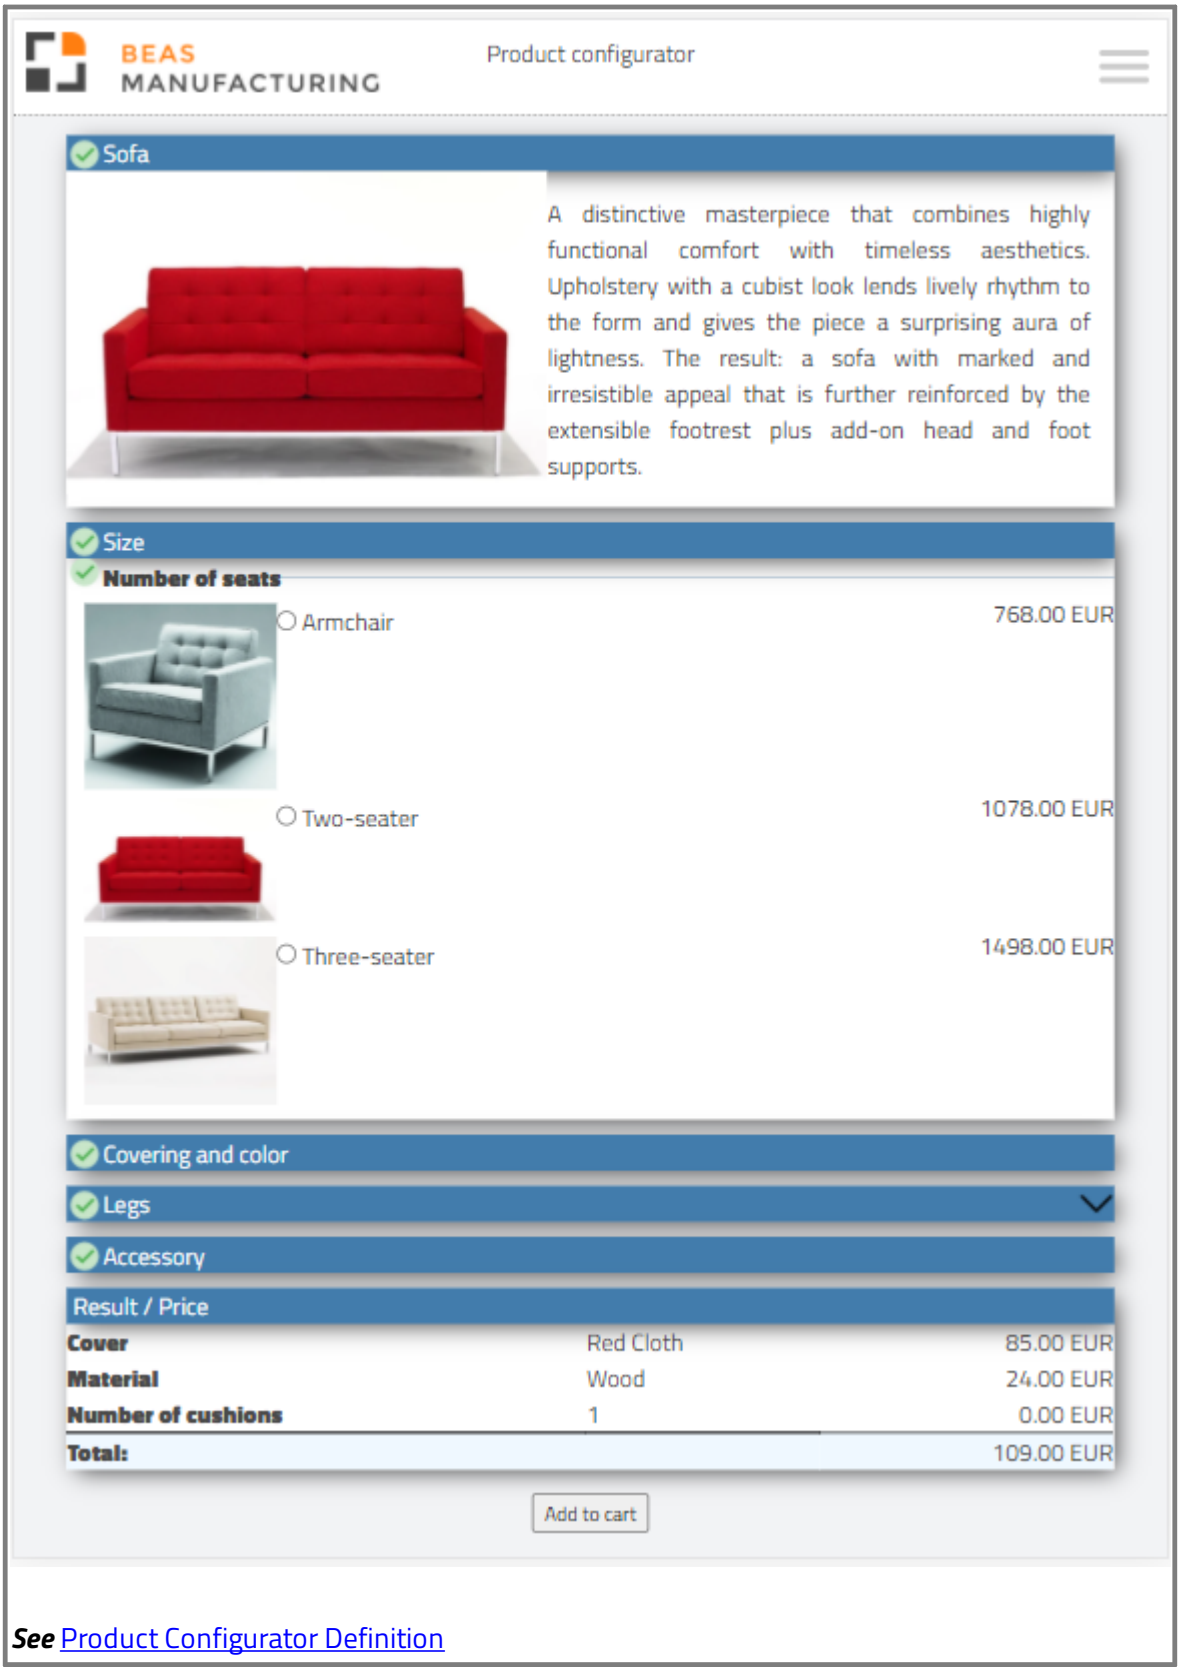
Field	Description
Item Code/Item Name	Enter an item code- or name to filter the list.

© 2026 Boyum IT Solutions A/S

Field	Description
Filter	Click the button to filter according to input of the ItemCode field.
Image	Default image set up in the Product Configuration Definition.
Description	Short description of the item.

After selecting an item from the list, the configurator interface opens. Once all mandatory selections are made, you can add the new configuration to the cart.

© 2026 Boyum IT Solutions A/S



See Product Configurator Definition

- Sales Orders List

© 2026 Boyum IT Solutions A/S

The Sales orders list contains all sales orders that are made visible for the user based on the Document settings.

Field/Function	Description
Doc Date (from-to)	Two (From-To) fields to list all available sales orders that were created in that period. Click on the calendar icon right of the field. Dates are provided in mm/dd/yyyy format.
Filter	Click the filter button to list sales orders according to the Doc Date selections.
DocNum	Sales order document number.
Status	Status of the Sales order: open, partially open, or closed.
ReqDate	Requirement date for the total quantity.
Total	Total price.
CUR	Currency.

- Sales Quotation List

The Sales quotations list contains all sales orders that are made visible for the user based on the Document settings.

Field/Function	Description
Doc Date (from-to)	Two (From-To) fields to list all available sales orders that were created in that period. Click on the calendar icon right of the field. Dates are provided in mm/dd/yyyy format.
Filter	Click the filter button to list sales orders according to the Doc Date selections.
DocNum	Sales order document number.
Status	Status of the Sales order: open, partially open, or closed.
ReqDate	Requirement date for the total quantity.
Total	Total price.
CUR	Currency.

- Sales order view

© 2026 Boyum IT Solutions A/S

Field /Function	Description
Customer	Customer code.
Name	Customer name.
Contact Person	Contact person set up in **SAP Business One > Business Partners > Business Partner Master Data > Contact Person.**
Customer Ref.	Customer reference number. For example "WebOrder"
No.	Sales order document number
Status	Sales order status: Closed, Open
Posting Date	The posting date of the product. Format in mm/dd/yyyy.
Delivery Date	Delivery date.
Document Date	The date when the sales order was created. Format in mm/dd/yyyy.
Image	Default image set up in the Product Configuration Definition.
Description	Description of the item
Quantity	Ordered quantity.
Price	Price of one unit per line.
Total	Total price of all units per line.
Sales Employee	The Sales employee provided in the SAP BusinessOne Sales order document.
Remarks	Free text.
Cancel Sales order	Click this button to cancel the sales order/quotation. ***See*** Allow to cancel sales orders. The "Cancel Document" dialog box appears where you can confirm cancellation. Note: If a work order has been created from the sales order, the function is not available, and the button does not appear.

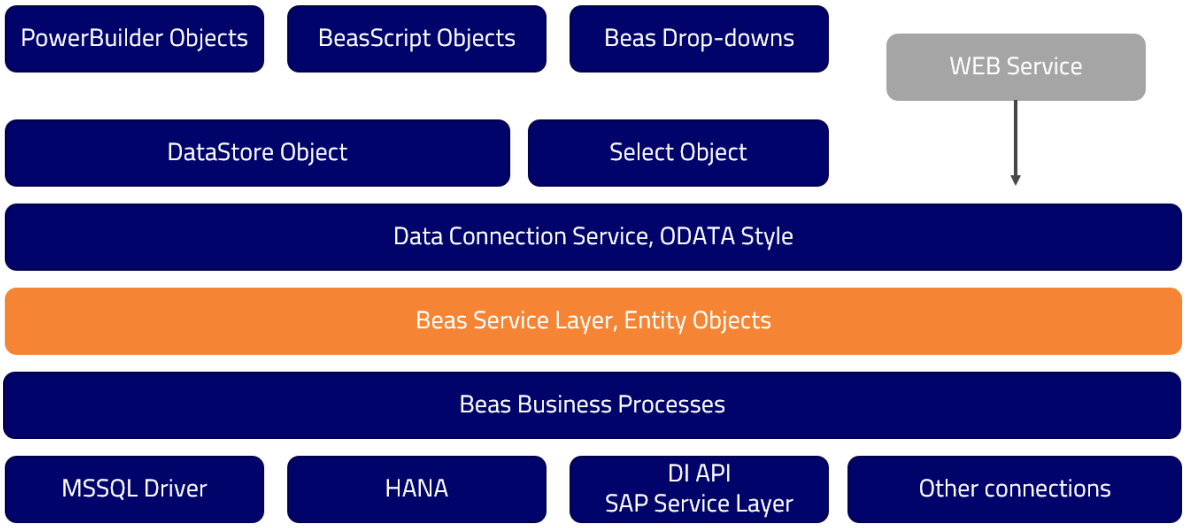
Back to Web Product Configurator

17.6 Beas service layer

The Beas service layer is a middle layer between the application and the database.

The Beas service layer is a new generation of extension API for consuming Beas and SAP Business One data and services.

It builds on a core protocol, such as HTTP and OData, but you can also use it with Beas script, macro script, or PowerBuilder.
BSL provides a uniform way to expose full-feature business objects on top of highly scalable, high-availability applications.
Service layer currently supports OData versions 2, 3 and 4 (with limited compatibility).



For more information ***see*** BSL Documentation

© 2026 Boyum IT Solutions A/S

18 Beas dashboards

Beas dashboards is a field- and visualization tool that is available in Beas with the B1 Usability Package. A set of dashboards are available out of the box.

Concept

The Beas Analytical Insights are a set of dashboards that comprehends a great amount of analysis over several areas and modules of the software, offering valuable information and insights that can help you to monitor and grow your business.

Compatibility

The dashboards are compatible to B1UP version 2020.02 or superior.

The Production Scheduling Calendar is compatible to B1UP version 2021.03 or superior.

Beas must be installed on the database for the dashboards to work. All dashboards (including the Production Scheduling Calendar) are compatible to both SQL and HANA environments.

18.1 Prerequisites

To use the Beas dashboards, the following is required:

- Beas 9.3 PL 02 or later
- B1UP 2020.02 or later
- License for SAP with Beas and B1 Usability Package

The dashboards are only available in the Beas desktop application (not in the WebApps terminal).

18.2 Installing and upgrading

Installing the B1 Usability Package

For instructions on installing the B1 Usability Package, follow the *Installation and upgrade guide* that is supplied with the software download package. If this is an initial installation of B1UP, the dashboards are loaded automatically.

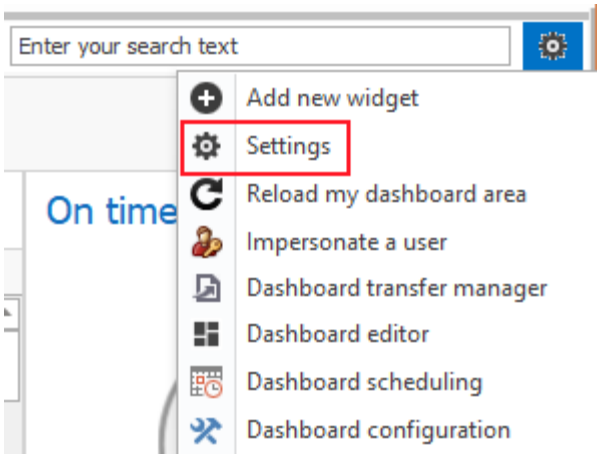
The dashboards automatically load the data from the database that is detected upon the initial run, whether it is SQL or HANA. Any new queries for new dashboard elements must be written in the respective database syntax.

Upgrading the B1 Usability Package

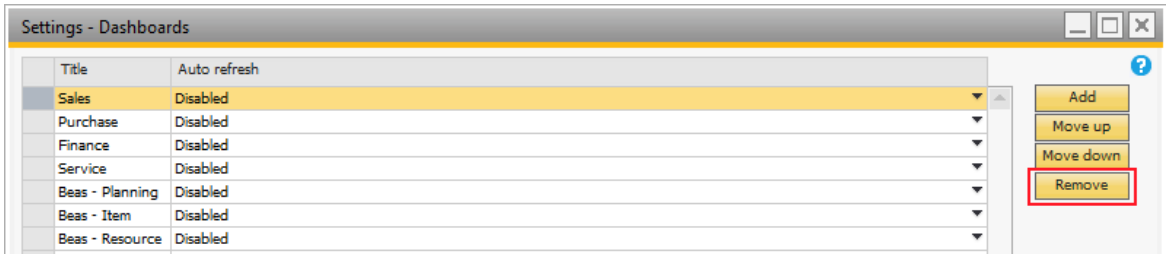
If you are upgrading from a previous version of the B1 Usability Package, follow the installation instructions. In this case, the new dashboards do not load automatically. To load the new views reset the dashboards:

© 2026 Boyum IT Solutions A/S

1. Go to Settings.



2. Select a row and click the **Remove** button.



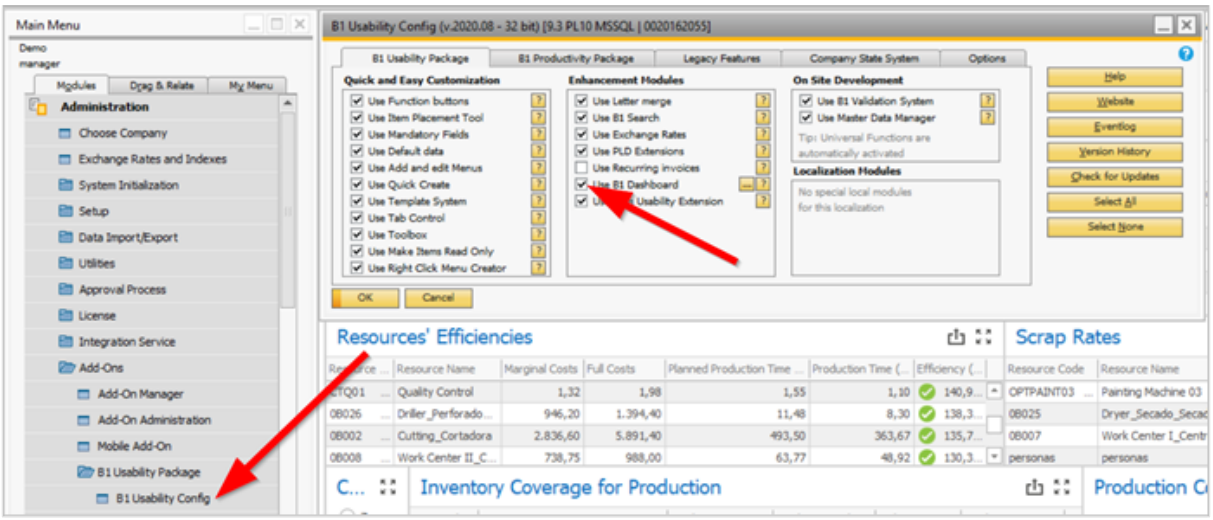
3. Repeat for all dashboards in the list.
4. Click the **Update** button.

The views are all reloaded, including the new views. This process should be repeated for all users.

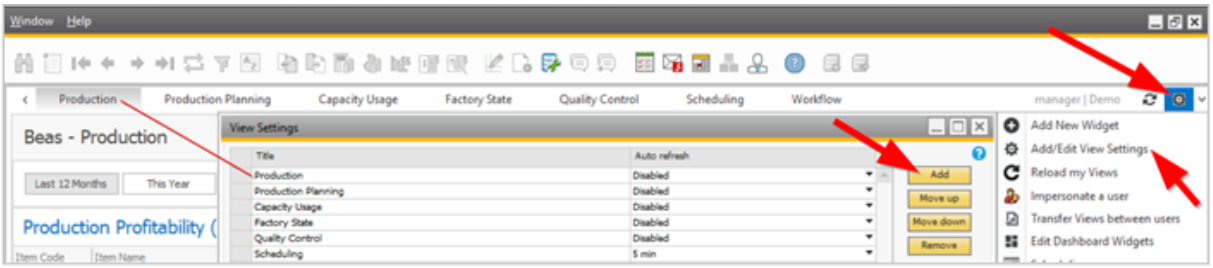
18.3 Installing the Dashboards

To install the dashboards, you need to activate the B1 Dashboard feature first. You can do it on the B1 Usability Configurations:

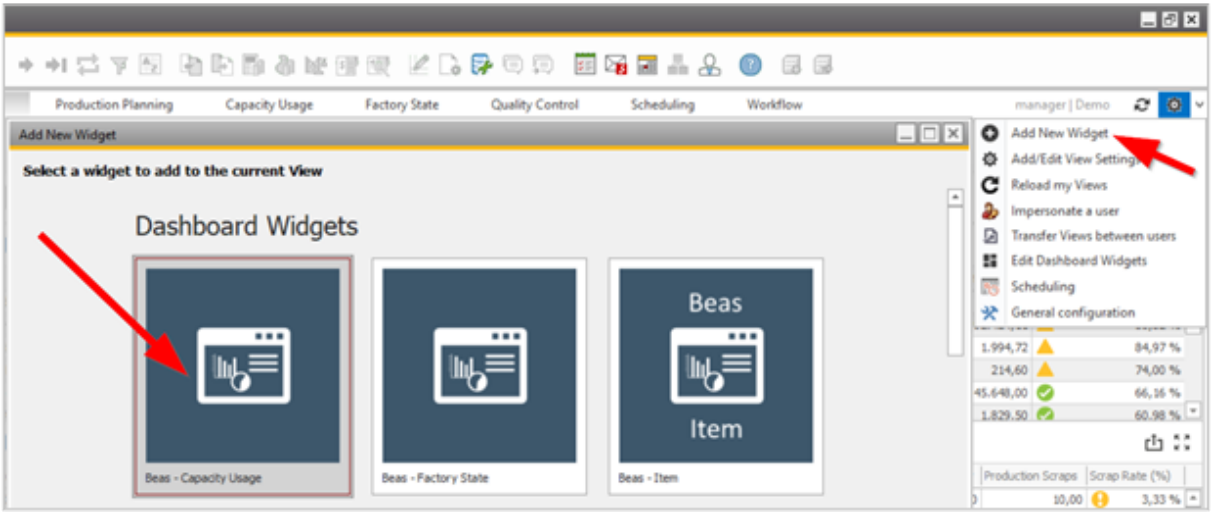
© 2026 Boyum IT Solutions A/S



After that, you can add the dashboard sections by selecting “Add/Edit View Settings” and clicking on “Add”.



Then, you just need to click on “Add New Widget” and select the ones corresponding to each dashboard section.



In this video, you can find more information about the B1Up dashboards. The dashboards can also be accessed from a web browser, by activating the web dashboards feature. If you want to enable the dashboards for web access, please check this video on how to do it.

© 2026 Boyum IT Solutions A/S

18.4 Language

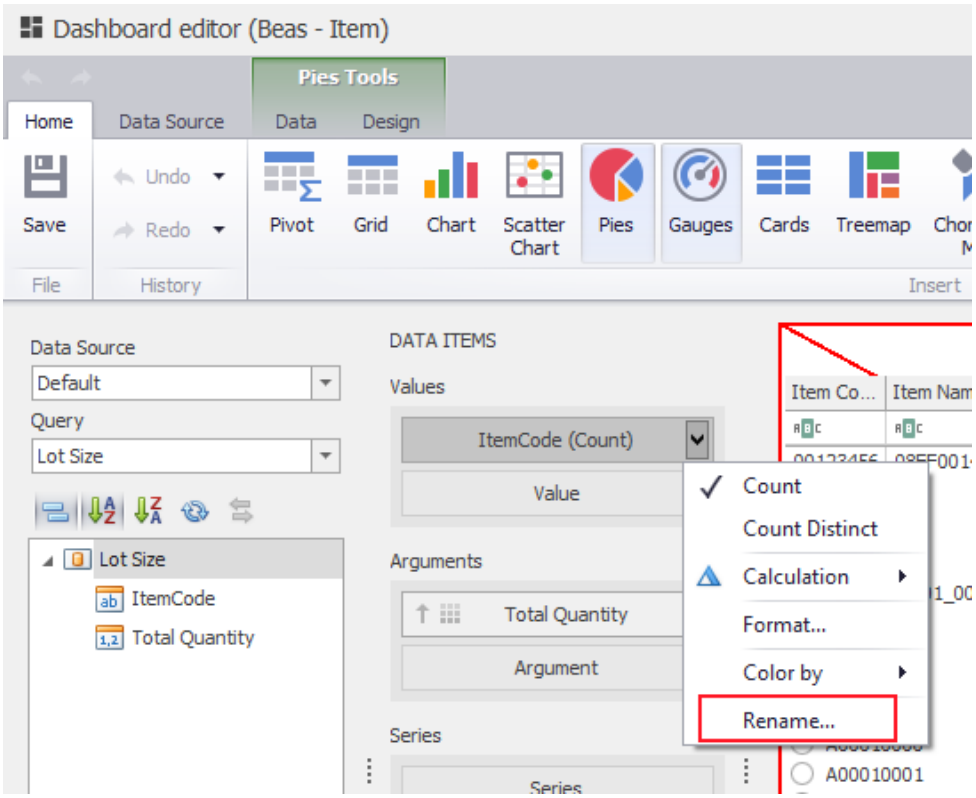
The dashboards are delivered in English. Field names can be customized using the Dashboard editor.

It is also possible to use keywords from the B1 Translation system. For details ***see*** the B1 Usability Package online help.

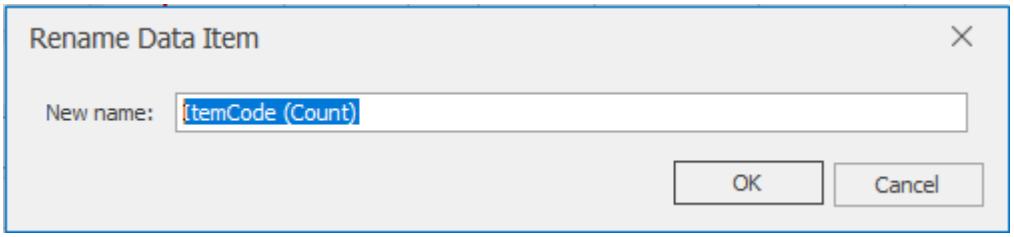
18.4.1 Customizing field names

Administration > Add-ons > B1 Usability Package > Module Configuration > B1 Dashboard > Dashboard editor

1. Go to the Dashboard editor.
2. Select the dashboard to modify and click the **Edit** button.
3. To change the text on an item, click the drop-down arrow and choose **Rename...**.



4. Type the new or translated name and click the **OK** button.



For more information on the Dashboard editor, refer to the B1 Usability Package online help.

© 2026 Boyum IT Solutions A/S

18.5 Using the dashboards

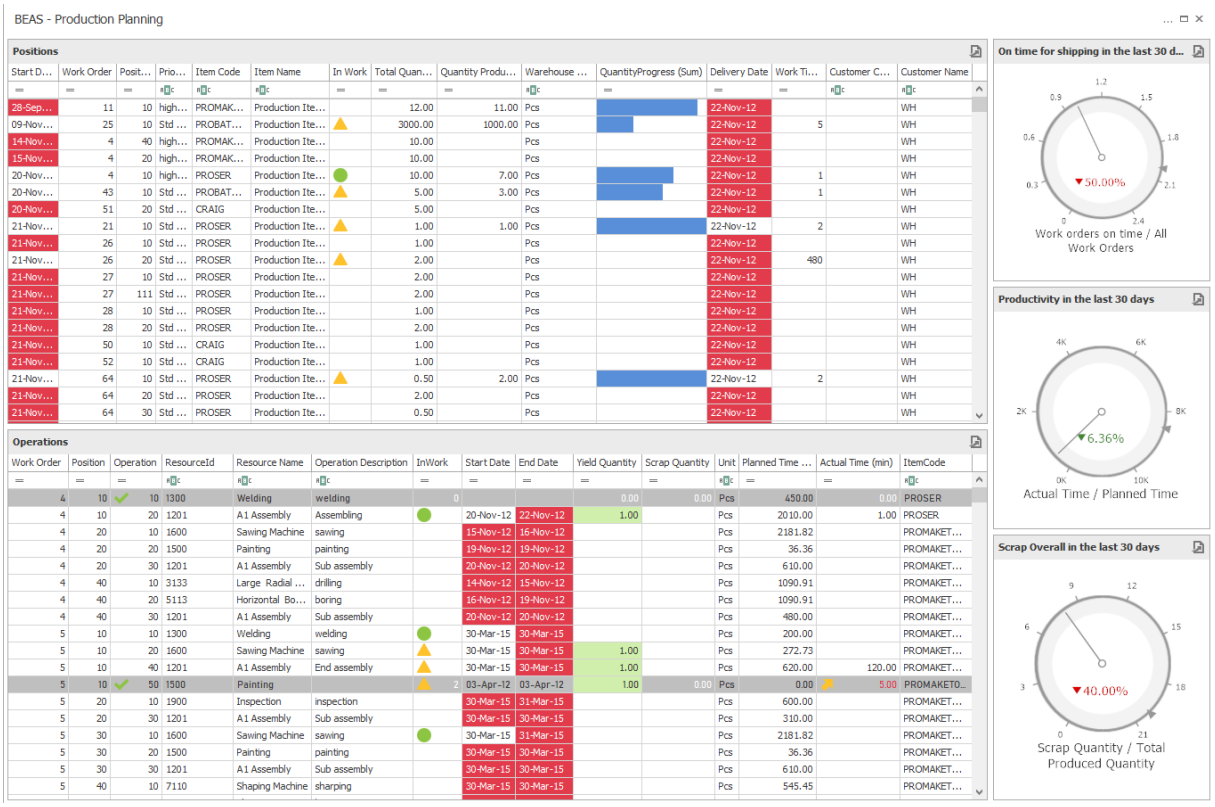
The following dashboards are available for Beas:

- Production Planning dashboard
- Resource dashboard
- Item dashboard
- Production Analysis
- Capacity Usage
- Factory States
- Production Scheduling Calendar
- Maintenance Dashboard
- Maintenance Calendar

18.5.1 Production Planning dashboard

The production planning dashboard has several areas for different sets of information:

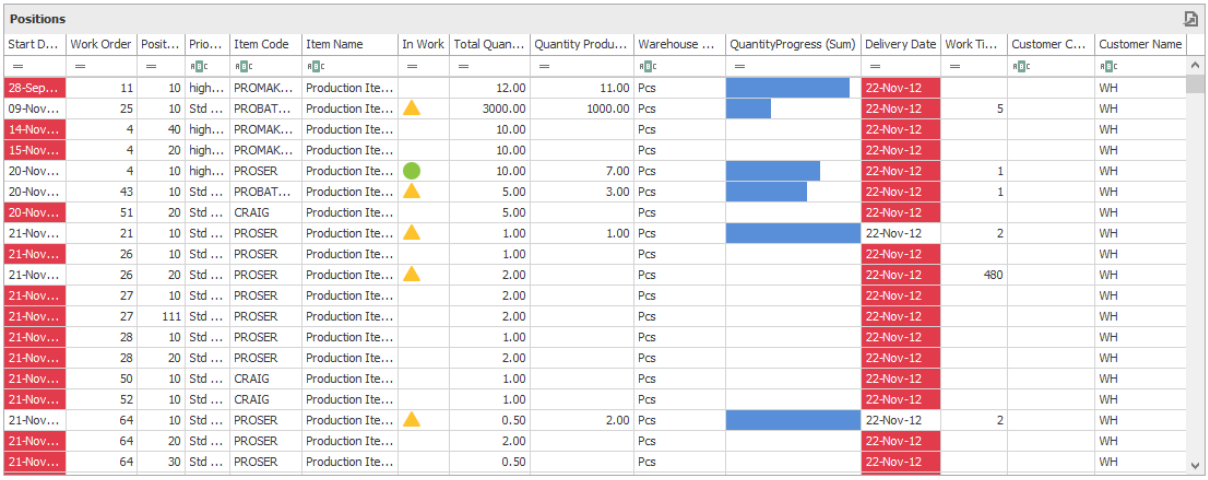
- Positions area
- Operations area
- Gauges



© 2026 Boyum IT Solutions A/S

18.5.1.1 Positions area

Work order Progress - Positions



Positions

Start D...	Work Order	Posit...	Prio...	Item Code	Item Name	In Work	Total Quan...	Quantity Produ...	Warehouse ...	QuantityProgress (Sum)	Delivery Date	Work Ti...	Customer C...	Customer Name

This table displays work order positions and provides information about their completion progress. The table uses color-coding to show progress and delays, depending on the start and delivery date. It also shows the quantity that has been produced. The grid selects the positions using a data range. The default data range is as follows:

- All positions (opened and closed positions) between the previous day and the next 7 days.
- All positions (opened and closed positions) with delivery date between the last 5 days and the next day.
- All open positions (from open work orders only) with start date in the past (earlier than the previous day).

Adjusting the date range

The number and operator can be changed using SQL `(GETDATE() - 5)` or SAP HANA `add_days(current_date, -5).` The number is always interpreted as the number of days which is added or subtracted depending on the operator. The result includes date and time in MSSQL, but not in HANA.

Date	MSSQL	HANA
Previous day	`(GETDATE() - 1)`	`add_days(current_date, -1)`
Next day	`(GETDATE() + 1)`	`add_days(current_date, +1)`
Last five days	`(GETDATE() - 5)`	`add_days(current_date, -5)`

© 2026 Boyum IT Solutions A/S

Date	MSSQL	HANA
Next five days	`(GETDATE() + 5)`	`add_days(current_date, +5)`

It is sometimes useful to get all the work orders from the previous day, regardless of the time of the day in SQL. For example, if today is `"2019-01-10 10:28:00"` the expression `(GETDATE() - 1)` results in `"2019-01-09 10:28:00"`. The time is the same, which means that if the query is set to give the work orders from the previous day, it omits the work orders that happened during that day before the current time `10:28:00`. It is possible to get the date at 00:00 using the expression:
Previous day at 00:00:00: `DATEADD(DAY, DATEDIFF(DAY, 1, GETDATE()), 0)`

Last 30 days 00:00:00: `DATEADD(DAY, DATEDIFF(DAY, 30, GETDATE()), 0)`

Auto filter row

The first row of the position table is an auto filter row which allows the user to filter for specific information in a column - for example, search for a specific work order number or a specific date. The filter for each row works as follows:

Column	Description	Table Field
Start Date	Start date of the position. **Red:** The position was supposed to be started (before the current day), but it is not in progress.	View: `BEASV_WORKORDER_POS.StartDate`
Work Order	Work order number.	View: `BEASV_WORKORDER_POS.DocEntry`
Position	Position number in the work order. A green checkmark in this field indicates that the position is closed (). If the position is closed the row will be completely **green**.	View: `BEASV_WORKORDER_POS.LineNumber`
Priority	Priority of the work order.	View: `BEASV_WORKORDER_POS.Priority`
Item Code	Item Code.	View: `BEASV_WORKORDER_POS.ItemCode`
Item Name	Item Name.	View: `BEASV_WORKORDER_POS.ItemName`
InWork	0-Blank: No work started on position.	View: `BEASV_WORKORDER_POS.InWork`

© 2026 Boyum IT Solutions A/S

	1-Green Icon: Active position, that has an active work order. **2-Yellow Icon:** A position that has time receipts, but is not active.	
Total Quantity	Total quantity to produce (measured in the warehouse unit).	View: `BEASV_WORKORDER_POS.QuantityWhsUnit`
Quantity Produced	Sum of the quantities that have been produced or received (measured in the warehouse unit).	View: `BEASV_WORKORDER_POS.QuantityProduced`
Warehouse Unit	Warehouse unit.	View: `BEASV_WORKORDER_POS.WhsUnit`
Quantity progress (%)	A blue bar that represents the percentage of the quantity produced out of the total quantity.	**Calculated field** in dashboard: `[QuantityProduced] * 100 / [Total Quantity]`
Delivery Date	Delivery date. **Red:** A position that had to be delivered (before the current day), but the total quantity has not been produced.	View: `BEASV_WORKORDER_POS.DELIVERYDATE`
Work Time (min)	Total time of work in minutes for the position.	View: `BEASV_WORKORDER_POS.WORKTIME`
Customer Code	Customer code.	View: `BEASV_WORKORDER_POS.CardCode`
Customer Name	Customer name.	View: `BEASV_WORKORDER_POS.CardName`

MSSQL examples of the Work order progress - Positions grid queries

```
-- All positions (opened and closed) between the previous day (at 00:00) and the next 7 days:

(("BEASV_WORKORDER_POS"."StartDate" > DATEADD(DAY, DATEDIFF(DAY, 1, GETDATE()), 0)
AND "BEASV_WORKORDER_POS"."StartDate"< (GETDATE()+7) )

-- All the open positions from open work orders only with start date in the past (before the previous day)

OR ("BEASV_WORKORDER_POS"."StartDate"<  DATEADD(DAY, DATEDIFF(DAY, 1, GETDATE()), 0)
AND "BEASV_WORKORDER_POS"."PositionClosed" != 1
AND "BEASV_WORKORDER_POS"."WorkOrderClosed"  != 1 )

--All the positions with delivery in the last 5 days and until the next day
OR  ("BEASV_WORKORDER_POS"."DELIVERYDATE" > (GETDATE()-5) AND "BEASV_WORKORDER_POS"."DELIVERYDATE" < (GETDA
```

Operation Progress-Operations

This table displays all the operations for the date range of the respective position. It provides information about the completion progress of the operation. The table uses color-coding to show delays related to the start and end date as well as the yield quantity that was produced.

Auto filter row

The first row of the position table is an auto filter row, that allows the user to filter for specific information in a column, for example, search for a specific work order number or a specific date.

Column	Description	Table Field
Work Order	Work order number.	View: `BEASV_WORKORDER_ROUTING.DocEntry`
Position Number	Position number in the work order.	View: `BEASV_WORKORDER_ROUTING.LineNumber`

© 2026 Boyum IT Solutions A/S

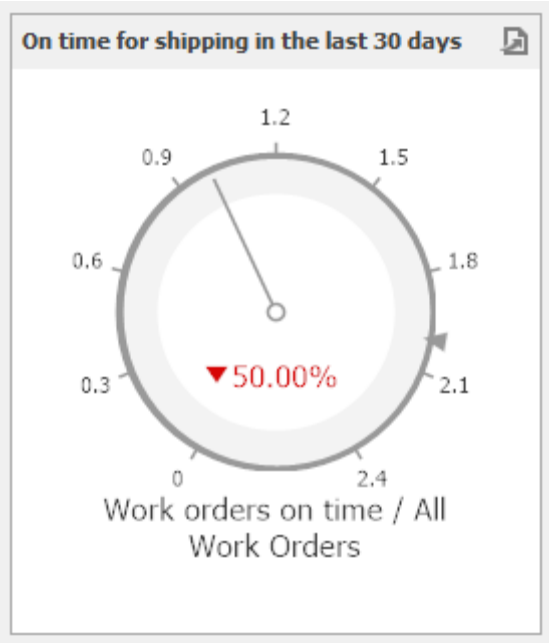
Operation	Operation number in the respective position. **Gray:** The position is closed. The color is applied to the row and a green checkmark appears next to the operation number. 	View: `BEASV_WORKORDER_ROUTING.LineNumber2`
Resource Id	Resource ID.	View: `BEASV_WORKORDER_ROUTING.ResourceId`
Resource Name	Resource description.	View: `BEASV_WORKORDER_ROUTING.ResourceDescription`
Operation Description	Operation description.	View: `BEASV_WORKORDER_ROUTING.Description`
InWork	0-Blank: No work started on operation. **1-Green Icon:** Active operation, that has an active work order. **2-Yellow Icon:** An operation that has time receipts, but is not active.	View: `BEASV_WORKORDER_ROUTING.InWork`
Start Date	Start of process. **Red:** The process was supposed to be started (before the current day), but it is not in progress.	View: `BEASV_WORKORDER_ROUTING.ProcesssStartDateTime`
End Date	End of process. **Red:** The process was supposed to be finished (before the current day), but it is not in progress.	View: `BEASV_WORKORDER_ROUTING.ProcessEndDateTime`
Yield Quantity	Sum of the receipted goods quantity (in BOM units).	View: `BEASV_WORKORDER_ROUTING.QUANTITYGOOD`

© 2026 Boyum IT Solutions A/S

	1-Green: A position that has partially or fully received the required goods.	
Scrap Quantity	Total scrap quantity (in BOM units).	View: `BEASV_WORKORDER_ROUTING.QUANTITYSCRAP`
BomUnit	BOM unit.	View: `BEASV_WORKORDER_POS.BomUnit`
Planned Time	Sum of the planned time for work in minutes.	View: `BEASV_WORKORDER_ ROUTING.PlannedTime`
Actual Time	Total time of work in minutes. **Yellow Icon:** The actual time is more than the planned time and the numbers in this column is therefore **red**. 420.00	View: `BEASV_WORKORDER_ ROUTING.WORKTIME`
Item Code	Item Code.	View: `BEASV_WORKORDER_POS.ItemCode`

18.5.1.3 Production gauges

On time for shipping in the last 30 days



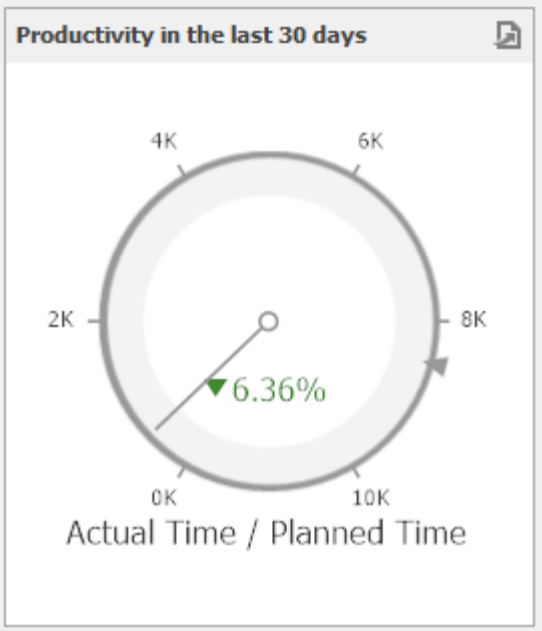
This gauge shows the percentage of work orders which have been finished before or on the end date. This indicator includes only closed work orders by default, and the data range is the last 30 days. This can be changed in the query described in the Positions area.

Data items used	Description	View/Table field
Work orders on time	Count of the closed work orders that have been finished before or on the end date.	Calculated field in dashboard editor: `CountDistinct(Iif([Latest receipt date] <= [End Date], [Work Order], null))`
Work Order	Distinct count of all the closed work.	View: `BEASV_WORKORDER_POS. [DocEntry]`
End date	Scheduled end date of the work orders	View: `BEASV_WORKORDER_POS.[EndDate]`
Last receipt date	Compares the *Last material receipt date* and the *Last work receipt date* and chooses the most recent one.	`CASE WHEN COALESCE("LastMaterialRece THEN COALESCE("LastMaterialRece ELSE COALESCE("LastWorkReceiptD END AS "Latest receipt date" FROM "BEASV_WORKORDER_POS"`
Last material receipt date	Last date when a material was received.	View: `BEASV_WORKORDER_POS.LastMaterialReceiptDate`
Last work receipt date	Last date when work was received.	View: `BEASV_WORKORDER_POS.LastWorkReceiptDate`

Note: The percentage is calculated setting the value type to percent of target in the gauge. The default conditions for the data range are set in the query.

Productivity in the last 30 days

© 2026 Boyum IT Solutions A/S



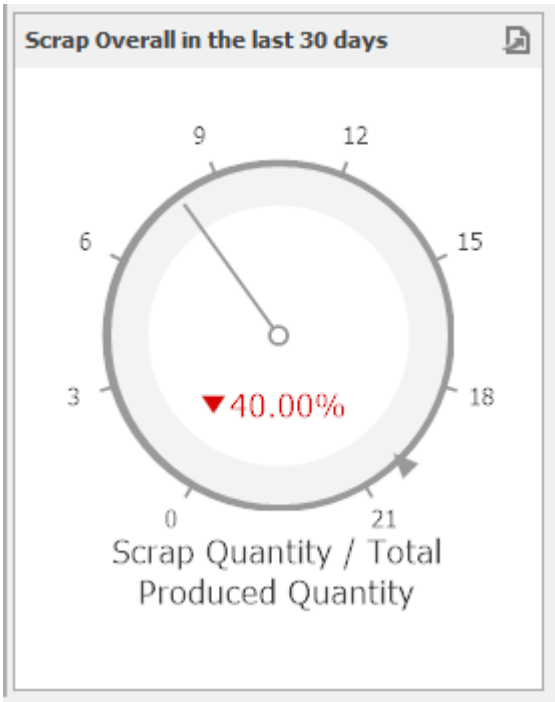
This gauge shows the percentage of the actual total work time compared to the total planned work time. This indicator includes only closed work orders and a data range of the last 30 days by default. This can be changed in the query described in the Positions area.

Data items used	Description	View/Table field
Planned Time	Total of the planned time for work in minutes.	View: `BEASV_WORKORDER_ROUTING.PlannedTime`
Actual Time	Total of the reported time in minutes.	View: `BEASV_WORKORDER_ROUTING.WORKTIME`

Note: The percentage is calculated setting the value type to percent of target in the gauge. The default conditions for the data range are set in the query.

Scrap overall in the last 30 days

© 2026 Boyum IT Solutions A/S



This gauge shows the percentage of the scrap quantity, produced during the operations, compared to the total produced quantity (scrap quantity + yield quantity). This indicator includes only closed work orders and a data range of the last 30 days by default. This can be changed in the query described in Positions area.

Data items used	Description	View/Table field
Total Quantity Produced	Sum of the yield and scrap quantities.	Calculated field in dashboard editor: `[YieldQuantity] + [ScrapQuantity]`
Yield Quantity	Sum of the received goods quantity (in BOM unit).	View: `BEASV_WORKORDER_ROUTING.QUANTITYGOOD`
Scrap Quantity	Sum of the scrap quantity (in BOM unit).	View: `BEASV_WORKORDER_ROUTING.QUANTITYSCRAP`

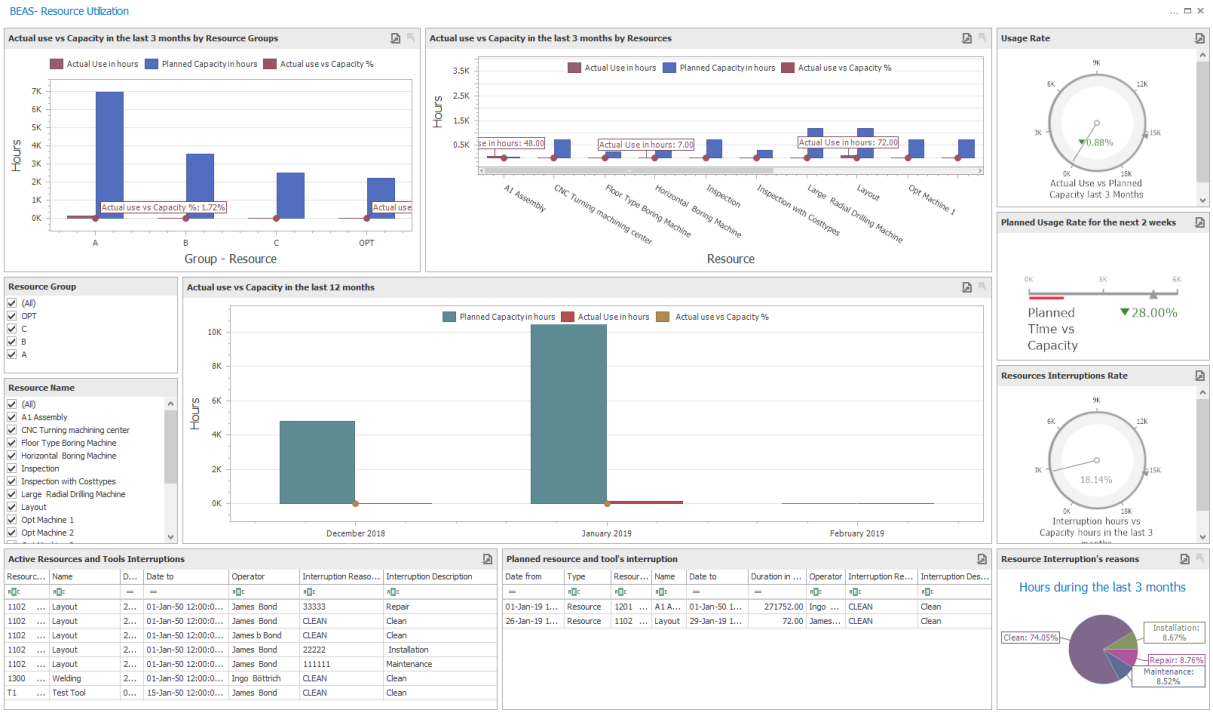
Note: The percentage is calculated setting the value type to percent of target in the gauge. The default conditions for the data range are set in the query.

18.5.2 Resource dashboard

The resource planning dashboard has several areas for different sets of information and controls:

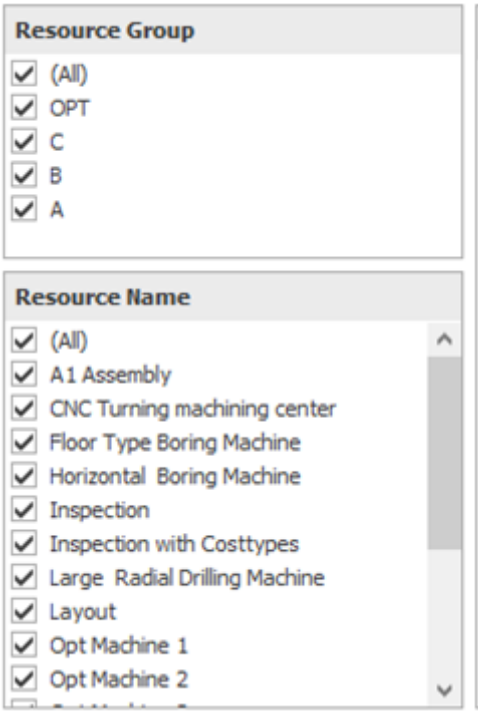
- Resource filters
- Actual use vs capacity bars
- Resource gauges
- Resource tables and charts

© 2026 Boyum IT Solutions A/S



18.5.2.1 Resource filters

Filters by resource group or name

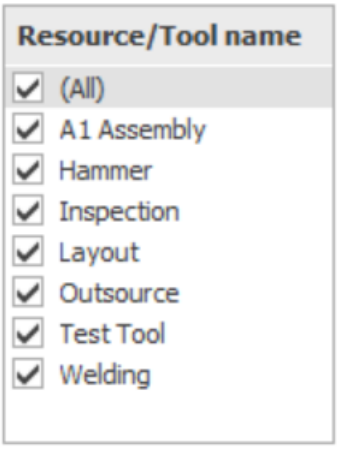


Two filters are included in the resource utilization dashboard that allows the user to filter and search for a specific resource or resource group.

© 2026 Boyum IT Solutions A/S

These filters are **applied to all the graphs and gauges in the dashboard**. When one or more specific resource or resource group is selected all the graphs and gauges display the values and calculations for the specified resource or resource group only.

Filters by resource or tool

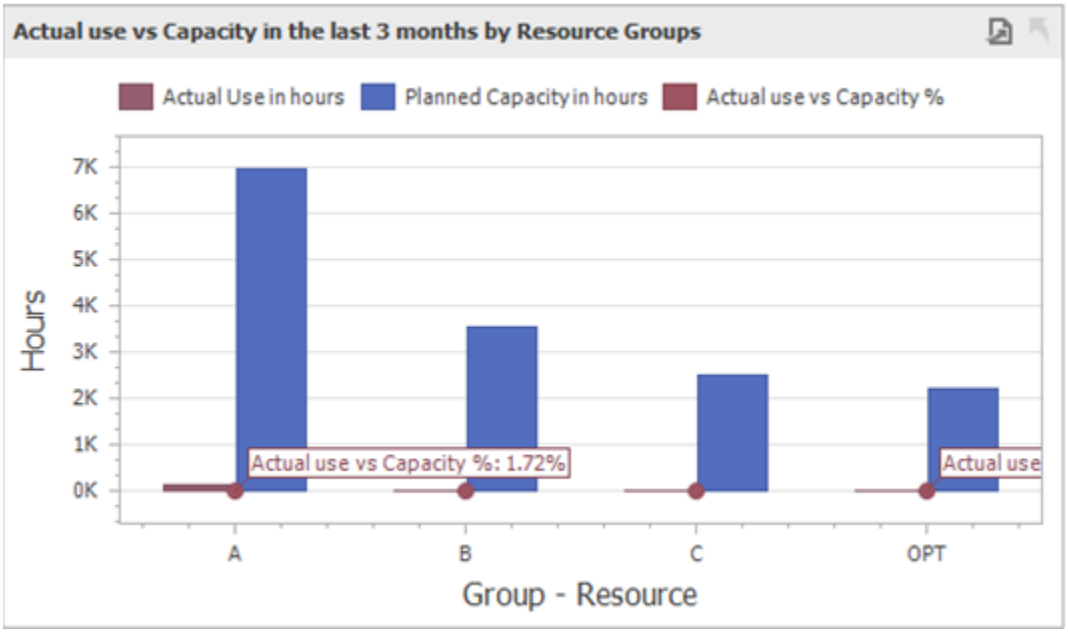


This filter allows the user to filter and search for a specific resource or tool.

This filters is **applied to the grids and the pie chart containing interruption data gauges only** in the dashboard, because this information includes the tools. When one or more specific resource or tool is selected, the pie chart and interruption tables, display the values and calculations for the specified resource or tool only.

18.5.2.2 Actual use vs capacity bars

Actual use vs Capacity in the last 3 months by resource groups



© 2026 Boyum IT Solutions A/S

This graph displays the total hours of resource utilization, the hours of the total planned capacity, and the percentage of the actual resource utilization out of the total planned capacity. The values are presented by resource groups.

This indicator includes by default the last 3 months as the data range, active resources only with capacity planning and it excludes the resources set for service or cost.

Drill down: It is possible to see the resources that belong to each group by clicking on the values for the specific group.

Data Items used	Description	View/Table field
Planned Capacity	Total hours of the planned capacity in the last 3 months.	View: `"BEASV_RESOURCE_UTILIZATION"."PlannedCapacity"`
Actual Use	Total hours of the actual use in the last 3 months.	View: `"BEASV_RESOURCE_UTILIZATION"."ActualUtilization"`
Resource group	Resource group name.	View: `"BEASV_RESOURCE_UTILIZATION"."ResourceGroup"`
Resource name	Resource name that is displayed after drilling down.	View: `"BEASV_RESOURCE_UTILIZATION"."NAME"`

Actual use vs Capacity in the last 3 months by Resources

This graph shows the total hours of resource utilization, the hours of the total planned capacity, and the percentage of the actual resource utilization out of the total planned capacity. The values are presented by individual resources.

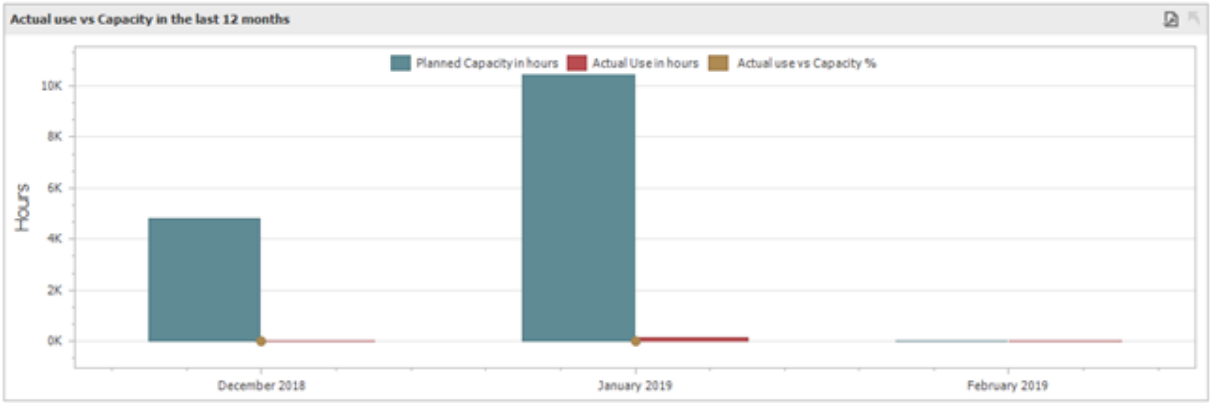
This indicator includes by default the last 3 months as the data range, active resources only with capacity planning and it excludes the resources set for service or cost.

© 2026 Boyum IT Solutions A/S

Data Items used	Description	View/Table field
Planned Capacity	Total hours of the planned capacity in the last 3 months.	View: "BEASV_RESOURCE_UTILIZATION"."PlannedCapacity"
Actual Use	Total hours of the actual use in the last 3 months.	View: "BEASV_RESOURCE_UTILIZATION"."ActualUtilization"
Resource name	Resource name.	View: "BEASV_RESOURCE_UTILIZATION"."NAME"

Actual use vs Capacity in the last 12 months (by months)

The following example uses a database which contains data for the past three months only. A complete database would show a graph with the last 12 months and their values.



This graph shows the total hours of the resource utilization, the hours of the total planned capacity, and the percentage of the actual resource utilization out of the total planned capacity. The values are presented by month.

This indicator includes by default the last 12 months as the data range, active resources only with capacity planning and it excludes the resources set for service or cost.

Drill down: It is possible to see the resources that belong to each month by clicking on the values for the specific month.

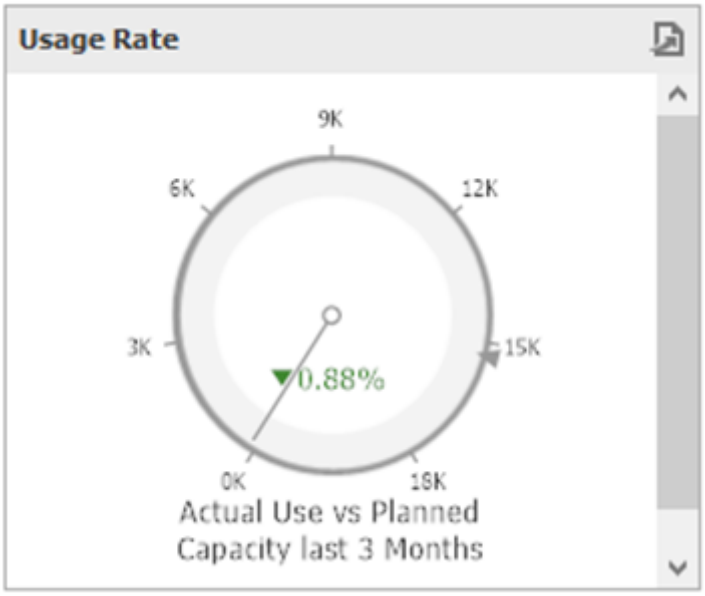
Data Items used	Description	View/Table field
Planned Capacity	Total hours of the planned capacity in the last 12 months.	View: "BEASV_RESOURCE_UTILIZATION"."PlannedCapacity"

© 2026 Boyum IT Solutions A/S

Actual Use	Total hours of the actual use in the last 12 months.	View: "BEASV_RESOURCE_UTILIZATION"."ActualUtilization"
Date	Capacity planning date used as an argument. It includes only the dates in the last 10 months.	View: "BEASV_RESOURCE_UTILIZATION"."Date"
Resource name	Resource name used as an argument. It is shown after drilling down.	View: "BEASV_RESOURCE_UTILIZATION"."NAME"

18.5.2.3 Resource gauges

Usage rate



This gauge shows the percentage of the actual resource utilization from the planned capacity for all resources.

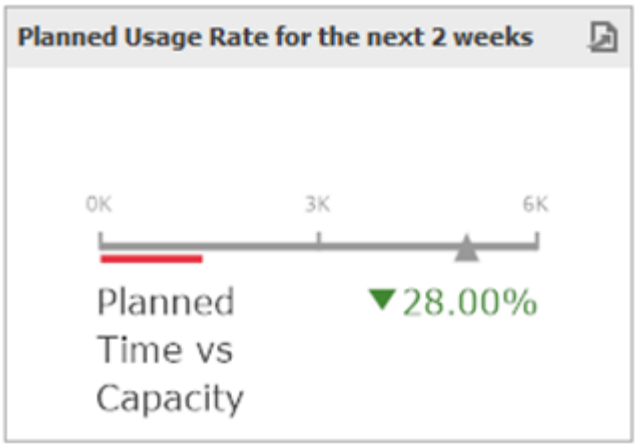
This indicator includes by default the last 3 months as the data range, active resources only with capacity planning and it excludes the resources set for service or cost.

Data Items used	Description	View/Table field
Planned Capacity	Sum of the hours for the planned capacity in the	View: "BEASV_RESOURCE_UTILIZATION"."PlannedCapacity"

© 2026 Boyum IT Solutions A/S

	last 3 months.	
Actual Use	Sum of the hours for the actual use in the last 3 months.	View: "BEASV_RESOURCE_UTILIZATION"."ActualUtilization"

Planned usage rate for the next two weeks



This linear gauge shows the percentage of the planned work time for the resources from their planned capacity.

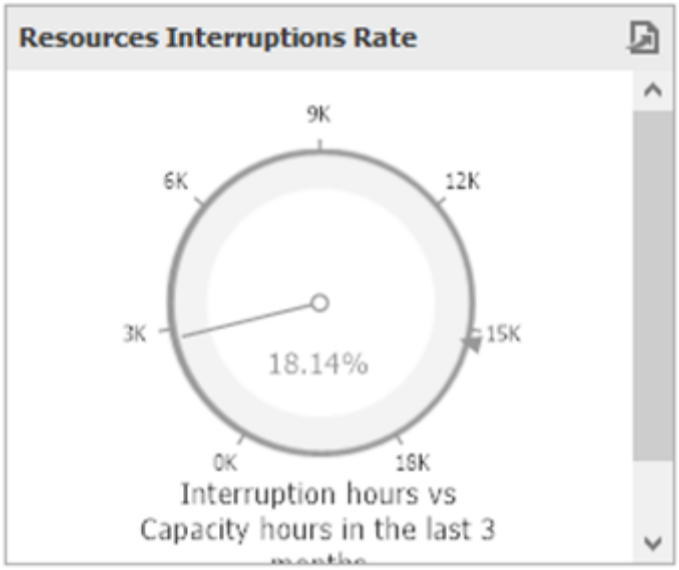
This indicator includes by default the next 2 weeks as the data range, active resources only with capacity planning and it excludes the resources set for service or cost.

Data Items used	Description	View/Table field
Reserved Time	Total reserved working time for the resources in the next 2 weeks.	View: BEASV_RESERVED_TIME.ReservedTime Date range: `COALESCE((SELECT SUM(BEASV_RESERVED_TIME."ReservedTime") FROM "BEASV_RESERVED_TIME" WHERE BEASV_RESOURCE_UTILIZ AND (BEASV_RESERVED_TIME."ToDateTime" <= ADD_DAYS(NOW`

Planned capacity in the next two weeks	Total hours of the planned capacity of the resources.	`COALESCE(SUM("PlannedCapacity"), 0) AS "PlannedCapacity"`
		Next two weeks date range:
		`WHERE (BEASV_RESOURCE_UTILIZATION."Date" <= ADD_DAYS(NOW AND BEASV_RESOURCE_UTILIZATION."Date" > NOW())`
		It is possible to calculated a filed in the dashboard, instead of having the date range in the query:
		`Sum(Iif(DateDiffDay([Date], Today()) <= 15 And [Date] > T`

Resources Interruptions Rate

© 2026 Boyum IT Solutions A/S



This gauge shows the percentage of interruption hours from the total capacity hours of all the resources.

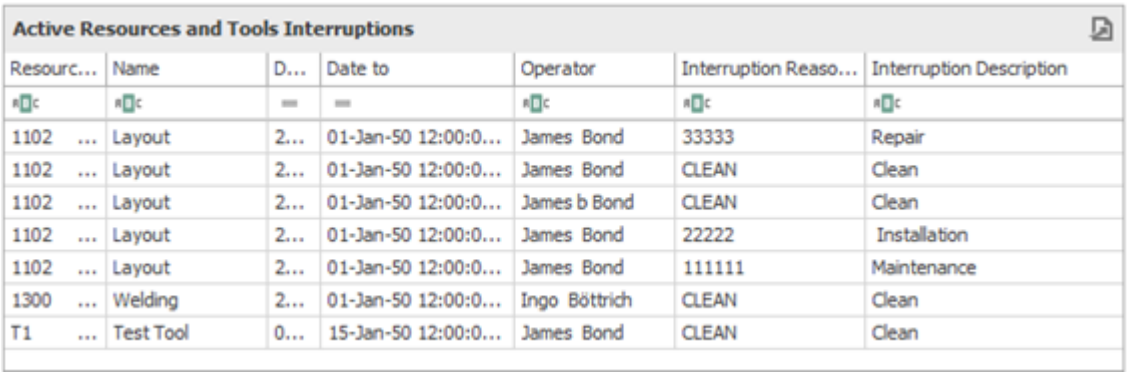
This indicator includes by default the last 3 months as the data range, active resources only with capacity planning and it excludes the resources set for service or cost. Only interruptions with completed or active status are taken into consideration for this gauge.

Data Items used	Description	View/Table field
Interruption duration	Total interruption duration in hours. Only those hours are taken into account that interfered with the resource working schedule during the last 3 months.	View: `BEASV_RESOURCE_UTILIZATION."InterruptionDuration"`
Planned capacity	Planned capacity hours of the calculated resources in the last 3 months.	View: `BEASV_RESOURCE_UTILIZATION."PlannedCapacity"`

© 2026 Boyum IT Solutions A/S

18.5.2.4 Resource tables and charts

Active Resources and Tools Interruptions



Active Resources and Tools Interruptions

Resourc...	Name	D...	Date to	Operator	Interruption Reaso...	Interruption Description

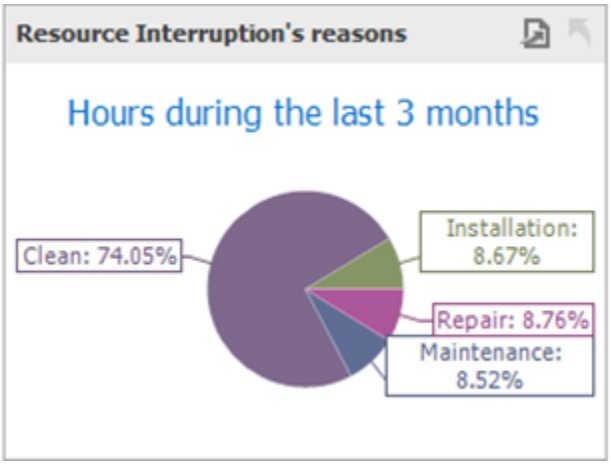
Resource Interruption's reasons



This pie chart shows the percentage of hours of different interruption reasons compared to the total sum of interruption hours for resources.

This indicator includes the last three months as the data range, active resources only with capacity planning and it excludes the resources set for service or cost. Only the interruptions that have the status completed or active are taken into consideration for this gauge.

Data item	Description	View Info

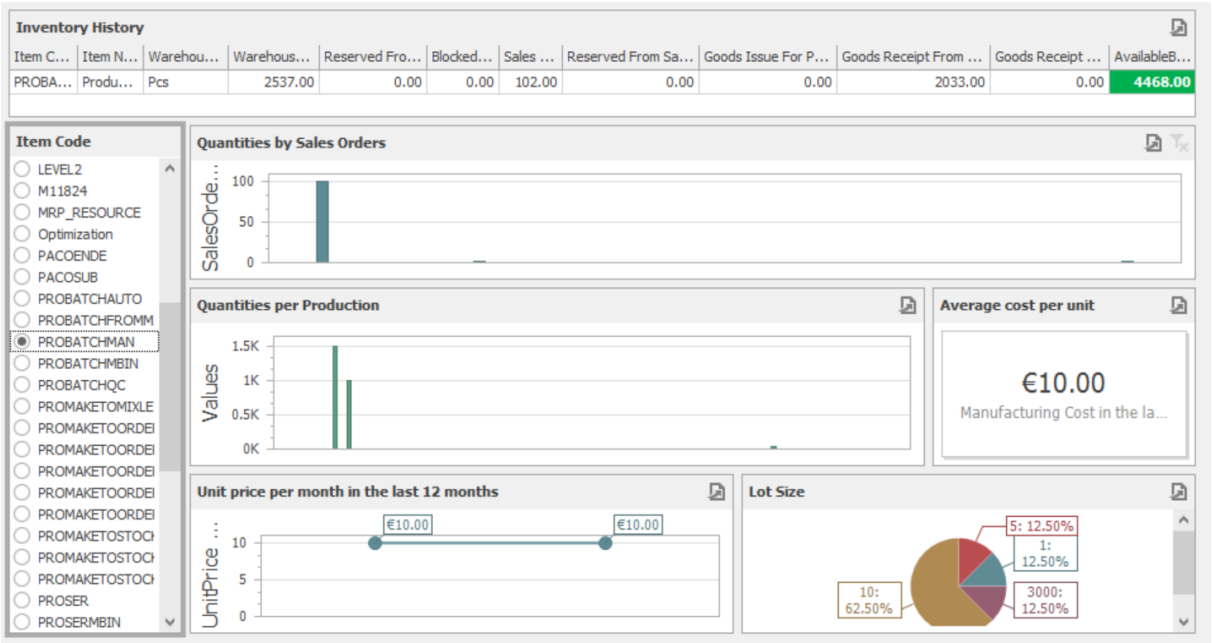
© 2026 Boyum IT Solutions A/S

Duration until today	Interruption duration up until the current day. If the interruption has an end date in the future, then the duration is calculated only until the current day, otherwise it is calculated as the start date time minus the end date time.	View: `BEASV_INTERRUPTIONS.InterruptionUntilToday`
Interruption Description	Interruption description.	View: `BEASV_INTERRUPTIONS.InterruptionDescription`

18.5.3 Item dashboard

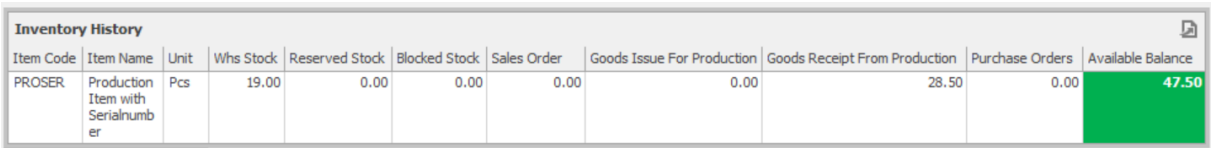
The item dashboard has several areas for different sets of information and controls:

- Inventory history table
- Item filter
- Item bars and charts

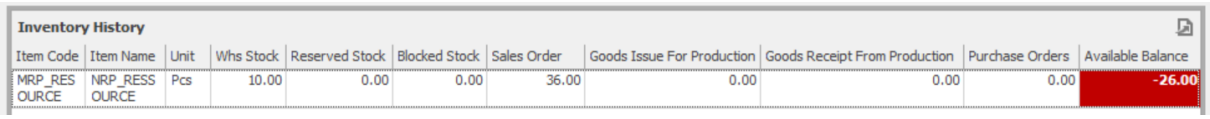


18.5.3.1 Inventory history table

Inventory history



© 2026 Boyum IT Solutions A/S



Inventory History

Item Code	Item Name	Unit	Whs Stock	Reserved Stock	Blocked Stock	Sales Order	Goods Issue For Production	Goods Receipt From Production	Purchase Orders	Available Balance
MRP_RESOURCE	NRP_RESSOURCE	Pcs	10.00	0.00	0.00	36.00	0.00	0.00	0.00	-26.00

This table that shows the inventory history data of the selected item.

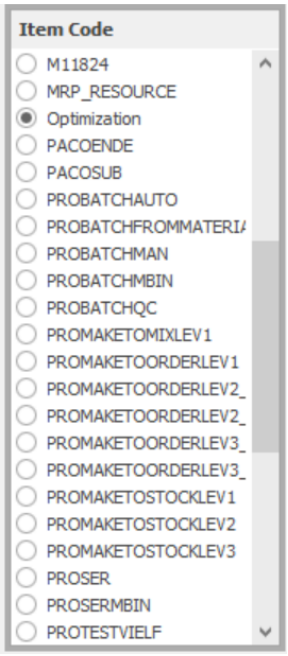
Only items with procurement mode set to *Make* are displayed in this dashboard.

Column	Description	Table Field
Item Code	Item code.	View: `"BEASV_INVENTORY_HISTORY"."ItemCode"`
Item Name	Item name.	View: `"BEASV_INVENTORY_HISTORY"."ItemName"`
Unit	Inventory UoM.	View: `"BEASV_INVENTORY_HISTORY"."WarehouseUnit"`
Whs Stock	Sum of stock amounts in Inventory UoM.	View: `"BEASV_INVENTORY_HISTORY"."WarehouseStock"`
Reserved Stock	Sum of the amounts reserved from the warehouse stock in Inventory UoM.	View: `"BEASV_INVENTORY_HISTORY"."ReservedFromStock"`
Blocked Stock	Sum of the blocked stock amounts in Inventory UoM.	View: `"BEASV_INVENTORY_HISTORY"."BlockedStock"`
Sales Order	Sum of sales order amounts in Inventory UoM.	View: `"BEASV_INVENTORY_HISTORY"."SalesOrder"`
Goods Issue for Production	Sum of the goods issue amounts for production in Inventory UoM.	View: `"BEASV_INVENTORY_HISTORY"."GoodsIssueForProduction"`
Goods Receipt From Production	Sum of the goods receipt from production in Inventory UoM.	View: `"BEASV_INVENTORY_HISTORY"."GoodsReceiptFromProduction"`
Purchase Orders	Sum of the goods receipt from purchase orders in Inventory UoM.	View: `"BEASV_INVENTORY_HISTORY"."GoodsReceiptFromPO"`
Available Balance	Available balance for the item: **Green:** Positive or 0 balance. **Red:** Negative balance.	View: `"BEASV_INVENTORY_HISTORY"."AvailableBalance"`

© 2026 Boyum IT Solutions A/S

18.5.3.2 Item filter

Item Code



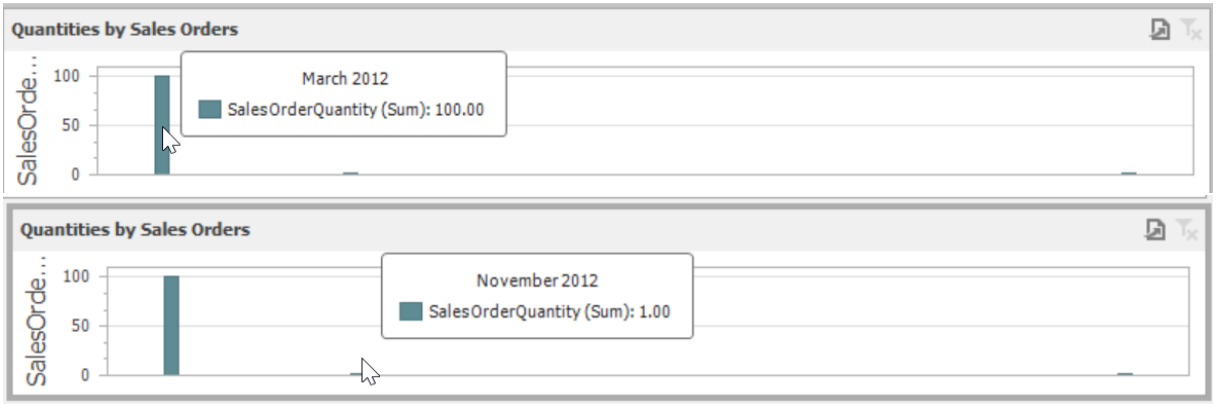
This filtering list box filters the results by item code. It allows the user to select one item code. When the item code is selected, all the visualization in the item dashboard changes to display the information corresponding to the selected item.

Only items with procurement mode set to *Make* are displayed in this dashboard.

Column	Description	Table Field
Item Code	Item code.	View: `"BEASV_INVENTORY_HISTORY"."ItemCode"`

18.5.3.3 Item bars and charts

Quantities by sales order



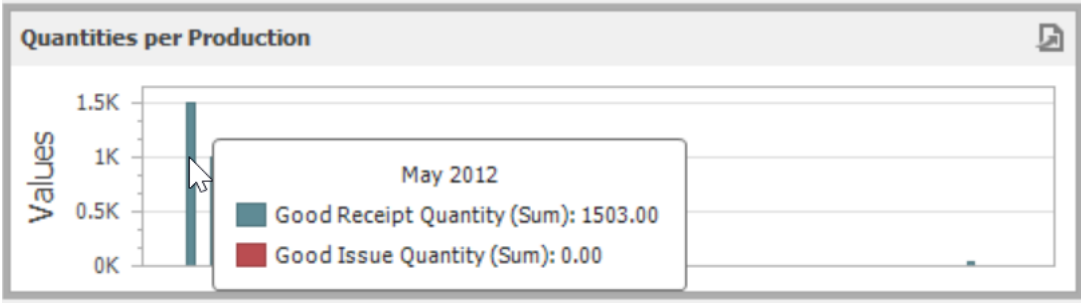
This bar graph shows the total item quantity for sales orders.

© 2026 Boyum IT Solutions A/S

This indicator includes by default the last 12 months as the date range, only items with procurement mode set to *Make* and only sales orders that have not been canceled.

Column	Description	Table Field
Sales Order Quantity	Total sales order quantity for the selected item in warehouse units.	View: `"BEASV_ITEM_SALES_ORDER"."Quantity"`
Shipment date	The month and year of the shipment date (only the last 12 months are selected by default).	View: `"BEASV_ITEM_SALES_ORDER"."ShipDate"`

Quantities by production



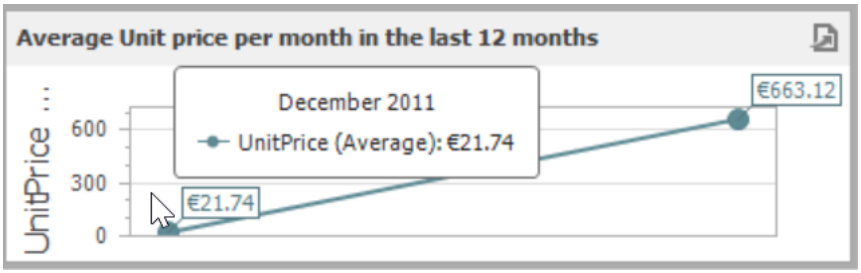
This bar graph shows the total item quantity for goods issue in production and the total item quantity for goods receipts from production.

This indicator includes by default the last 12 months as the date range, only items with procurement mode set to *Make* and only the entries for goods issue and goods receipts for production that have not been canceled.

Column	Description	Table Field
Good Issue Quantity	Total goods issue quantity for production for the selected item in warehouse units.	View: `"BEASV_ITEM_PRODUCTION"."GoodIssueQuantity"`
Good Receipt Quantity	Total the goods receipt quantity from production for the selected item in warehouse units.	View: `"BEASV_ITEM_PRODUCTION"."GoodReceiptQuantity"`
Document date	The month and year of the document date (only the last 12 months are selected by default).	View: `"BEASV_ITEM_PRODUCTION"."DocDate"`

Average Unit Price

© 2026 Boyum IT Solutions A/S

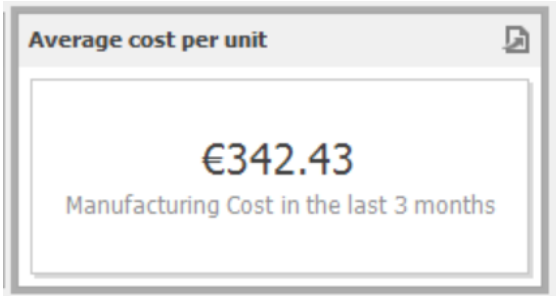


This line graph shows the average item price in goods receipts from production. The average is calculated per month.

This indicator includes by default the last 12 months as the date range, only items with procurement mode set to *Make* and only the entries for goods receipts from production that have not been canceled.

Column	Description	Table Field
Unit Price (Average)	The price for the item in the goods receipt document. The average price per month is calculated in the graph.	View: `"BEASV_ITEM_PRODUCTION"."UnitPrice"`
Document date	The month and year of the document date (only the last 12 months are selected by default).	View: `"BEASV_ITEM_PRODUCTION"."DocDate"`

Average cost per unit



This line graph shows the average item price in goods receipts from production. The average is calculated using the item manufacturing price for the last 3 months.

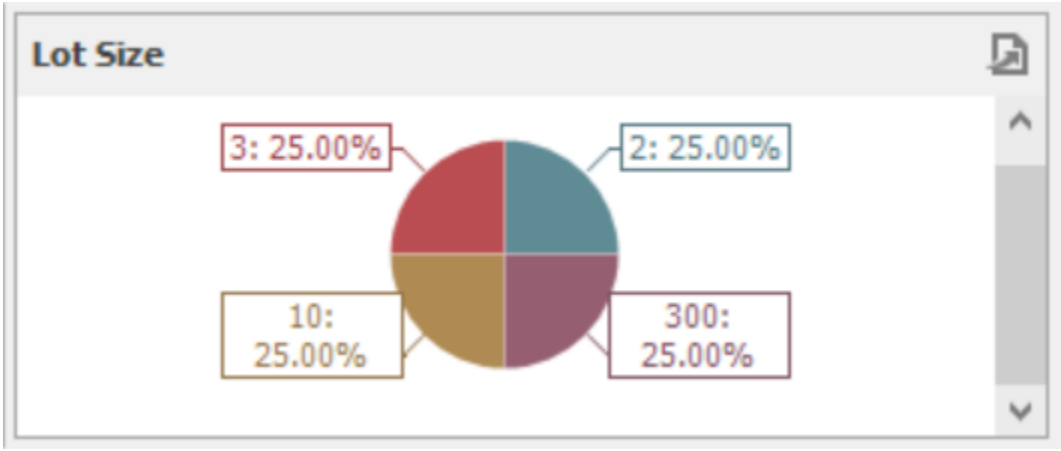
This indicator includes by default the last 3 months as the data range, only items with procurement mode set to *Make* and only the entries for goods receipts from production that have not been canceled.

Column	Description	Table Field

© 2026 Boyum IT Solutions A/S

Unit Price in the last 3 months (Average)	The price for the item in the goods receipt document. The average price per month is calculated in the graph.	Calculated field in dashboard editor: `Iif(DateDiffMonth([DocDate], Today()) <= 3 And [DocDate] <= Today(), [UnitPrice], 0)`
Unit Price	The price for the item in the goods receipt document.	View: `"BEASV_ITEM_PRODUCTION"."UnitPrice"`
Document date	The month and year of the document date.	View: `"BEASV_ITEM_PRODUCTION"."DocDate"`

Lot Size



This pie chart that shows the percentage of the lot sizes for the good receipts of the item selected. The percentage represents the amount of work orders that have their lot sizes.

This indicator includes by default the last 10 work orders, and only items with procurement mode set to *Make*.

Query for choosing the lot sizes from the last 10 work orders (MSSQL/HANA):

Only modify the 10 after the highlighter RowNumber to choose the last n number of work orders.

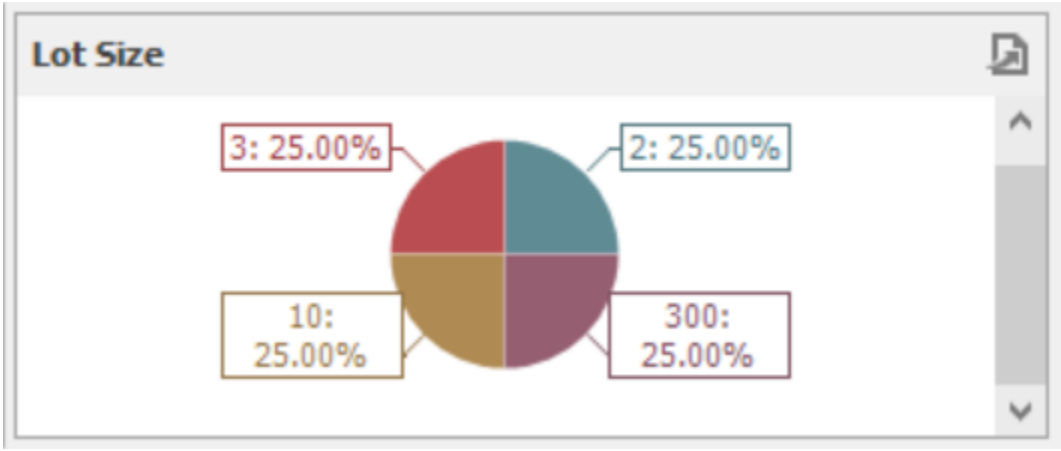
```
SELECT "Total Quantity",
  "ItemCode"
    FROM
(SELECT "QuantityWhsUnit" AS "Total Quantity",
"StartDate",
"ItemCode",
ROW_NUMBER()
          over (Partition BY  "ItemCode"
                ORDER BY "StartDate" DESC ) AS "RowNumber"
FROM "BEASV_WORKORDER_POS"
WHERE "AutomaticallyScheduled" =1)AS "InnerQuery" WHERE "RowNumber" <=10
```

Column	Description	Table Field
Item Code	Item code.	VIEW: `BEAS_WORKORDER_POS.ItemCode`

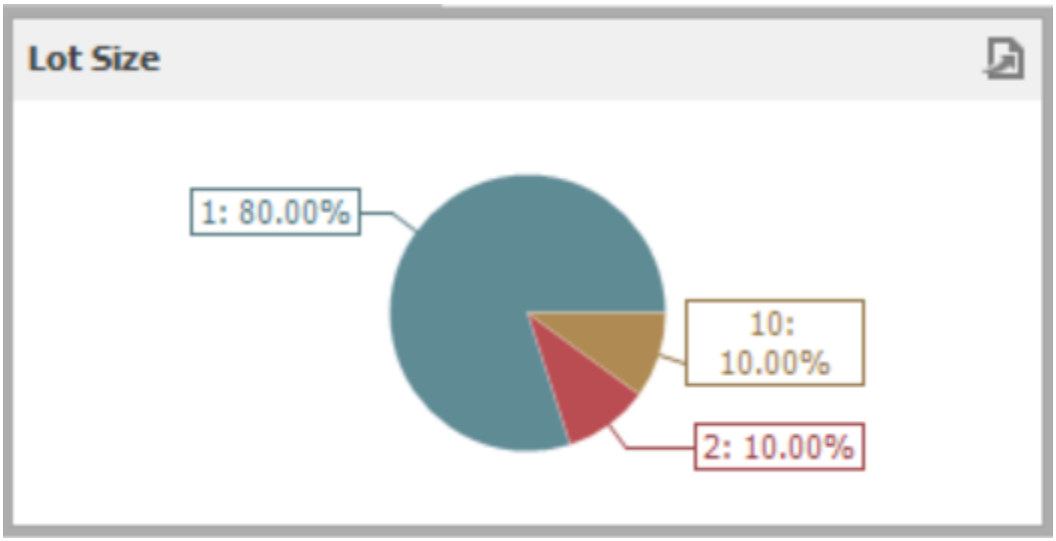
© 2026 Boyum IT Solutions A/S

Lot Size	The total quantity (lot size) in the work order position for the selected item in warehouse units.	VIEW: `BEAS_WORKORDER_POS.QuantityWhsUnit`

Example of an item that has four good receipts. One of them has lot size=2, the next one has lot size=300, another one has lot size=10 and the last one has lot size=3. Therefore each of the lot sizes are represented in 25% of the chart.



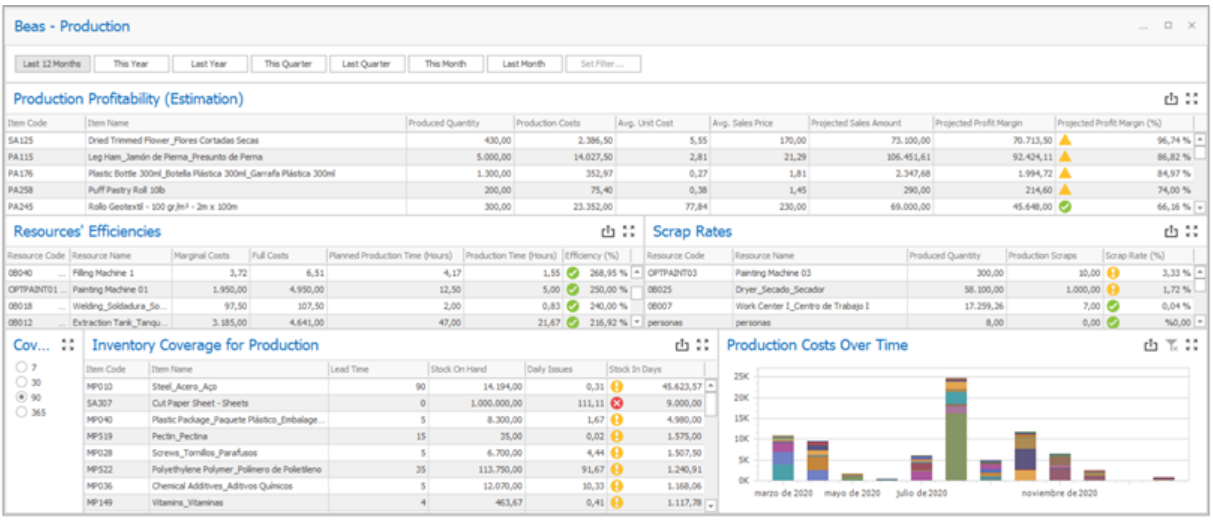
Example of an item that has lot sizes set to 1 more often (80%) than the rest of its lot sizes, which are 10 and 2.



18.5.4 Production Analysis

The Production dashboard contains a series of analytical views over the executed production. The data can be filtered using the pre-made filters for defined time ranges (last 12 months, this year, last year, this quarter, last quarter, this month and last month). Manual filtering can be done by clicking on “Set Filter…”.

© 2026 Boyum IT Solutions A/S



The Production Analysis dashboard includes the following four tabs:

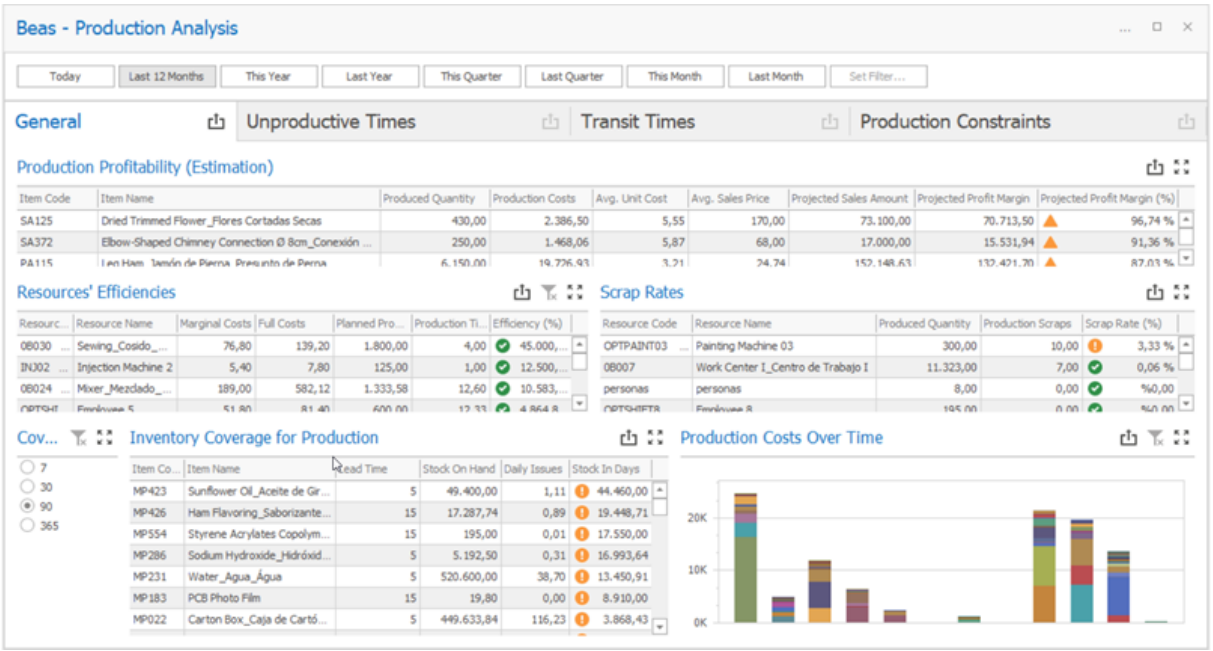
[General Tab]

[Unproductive Times Tab]

[Transit Times Tab]

[Production Constraints Tab]

18.5.4.1 General tab



© 2026 Boyum IT Solutions A/S

The General tab includes analyses regarding production profitability, efficiency and costs of the production resources, scrap rates per resource, inventory coverage for production, and a chart that shows how the production costs are evolving over time.

Dashboard sections:

Production Profitability (Estimation)

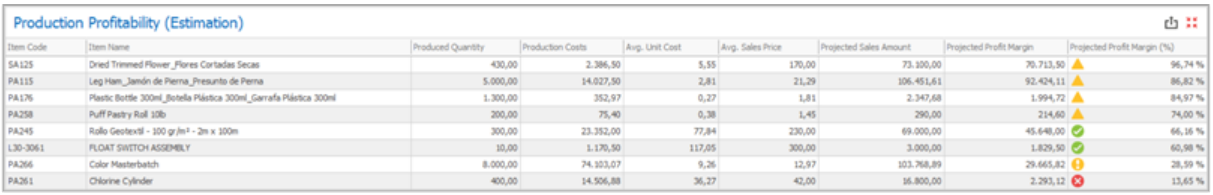
Resources' Efficiencies

Scrap Rates

Inventory Coverage for Production

Production Costs Over Time

18.5.4.1.1 Production Profitability (Estimation)



With this report, you can have a deeper understanding on which items are more or less profitable to produce. The report lists all items produced over the selected time range, detailing the production amounts and costs, and getting the average sales price for each product. Then, the following calculations are performed:

a) **Projected Sales Amount**: Produced quantity multiplied by average sales price. This column represents the estimated revenue for selling the entire production;
b) **Projected Profit Margin**: Projected sales amount discounted of production costs. This column represents the estimated gross profit for selling the entire production;
c) **Projected Profit Margin** (%): Projected profit margin divided by projected sales amount. This column represents the percent of estimated profit margin for selling the entire production.

By default, four icons can be presented by this report. The icons can be customized by editing the dashboard and defining new color rules.

Profit margin greater than 70%. Can indicate costing errors or undesirably high profits.

Profit margin between 35% and 70%

Profit margin between 20% and 35%

Profit margin lower than 20%

© 2026 Boyum IT Solutions A/S

18.5.4.1.2 Resources' Efficiencies

With this report, you can see the costs (marginal and full) registered for each resource in the selected time range, and compare the planned production times to actual production times. The report calculates the actual efficiency by dividing the planned production times for the actual production times. So, if an operation is planned to last 1 hour and is executed in 2 hours, the actual efficiency is of 50% (1h/2h).

By default, three icons can be presented by this report. The icons can be customized by editing the dashboard and defining new color rules.

Efficiency greater than 70%

Efficiency between 50% and 70%

Efficiency lower than 50%

18.5.4.1.3 Scrap Rates

With this report, you can see the comparison between the good and the scrapped produced items. The scraps are calculated according to the “scrap” units identified in the Time Receipts (by default, there is no linking to the QC inspections, although this functionality could be added by customizing the dashboard’s query). The scrap rate is calculated by dividing the scrapped units by the good units.

By default, three icons can be presented by this report. The icons can be customized by editing the dashboard and defining new color rules.

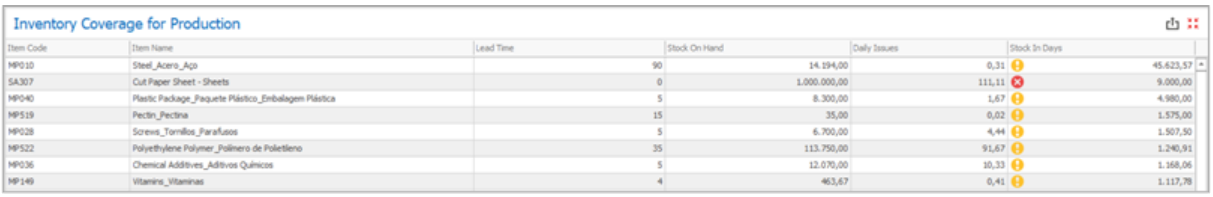
© 2026 Boyum IT Solutions A/S

Scrap rate lower than 1%

Scrap rate between 1% and 10%

Scrap rate greater than 10%

18.5.4.1.4 Inventory Coverage for Production



This report can compare the stock on hand with the calculated average daily material issues for production, resulting in the calculated days of stock for each component. Then, by comparing the days of stock to the components' lead times, an icon indicated possible overstock, enough stock, or insufficient stock. The "Inventory Coverage for Production" report is not linked to the time ranges filter on the top of the report; instead, it is linked to the "Coverage Range (Days)" selector at the left side of it. Using this selector, you can choose to calculate the estimated days of stock based on the transactions from the last 7, 30, 90 or 365 days.

By default, three icons can be presented by this report. The icons can be customized by editing the dashboard and defining new color rules.

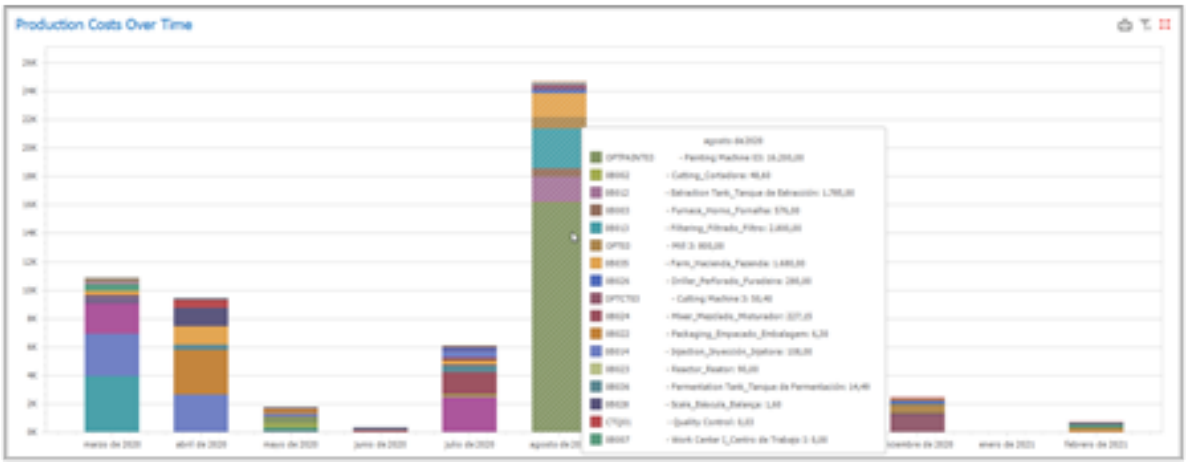
Stock in days between the item's lead time and the double of the item's lead time

Stock in days greater than the double of the item's lead time

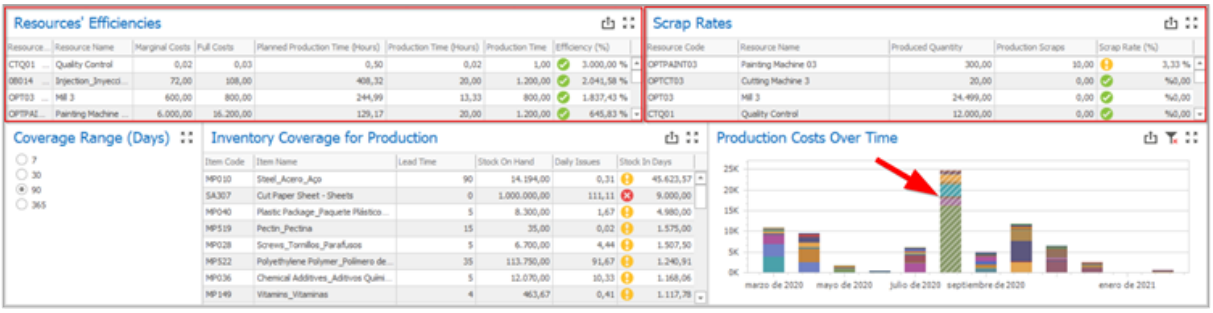
Stock in days lower than the item's lead time

© 2026 Boyum IT Solutions A/S

18.5.4.1.5 Production Costs Over Time



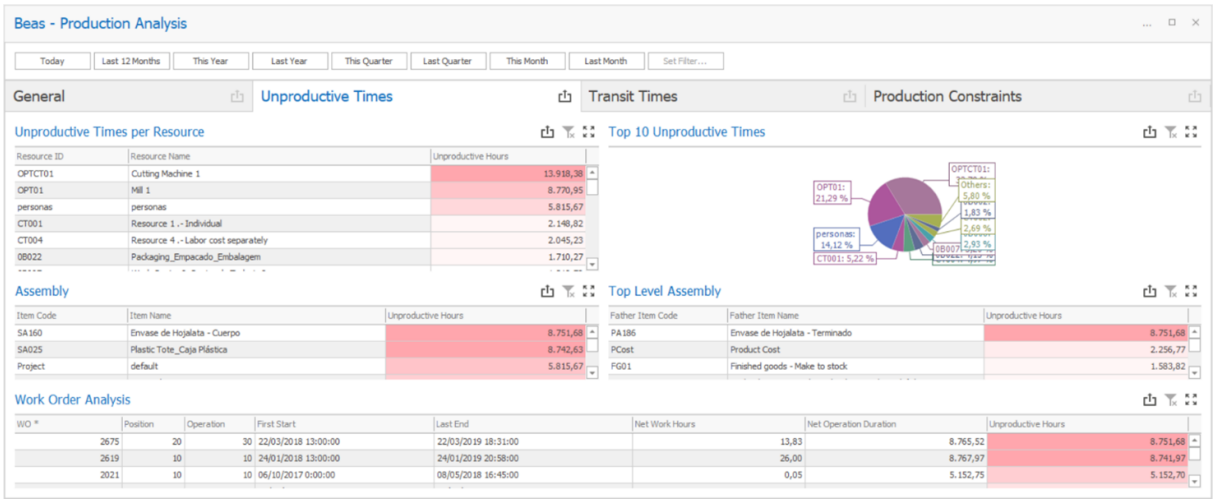
This chart displays the sum of full costs (from production time receipts) for each month in the selected time range, detailing how each resource participated in the costs' composition. The "Production Costs Over Time" chart can also be used to filter the data on the "Resources' Efficiencies" and "Scrap Rates" reports: when you click on any bar of the chart, the two reports are filtered to display only display for the selected month. This can come in handy if you want to see the detailed list of the resources and their costs, which will be displayed on the "Resources' Efficiencies" report.



This selection, however, will not affect the "Inventory Coverage for Production" or "Production Profitability (Estimation)" reports.

© 2026 Boyum IT Solutions A/S

18.5.4.2 Unproductive Times Tab



The Unproductive Times tab provides an analysis over the times in between different partial productions of the same operations. This dashboard can help you to identify possibilities for improving your processes to reduce time wasting and achieve a higher productivity.

Dashboard sections:

Unproductive Times per Resource

Top 10 Unproductive Times

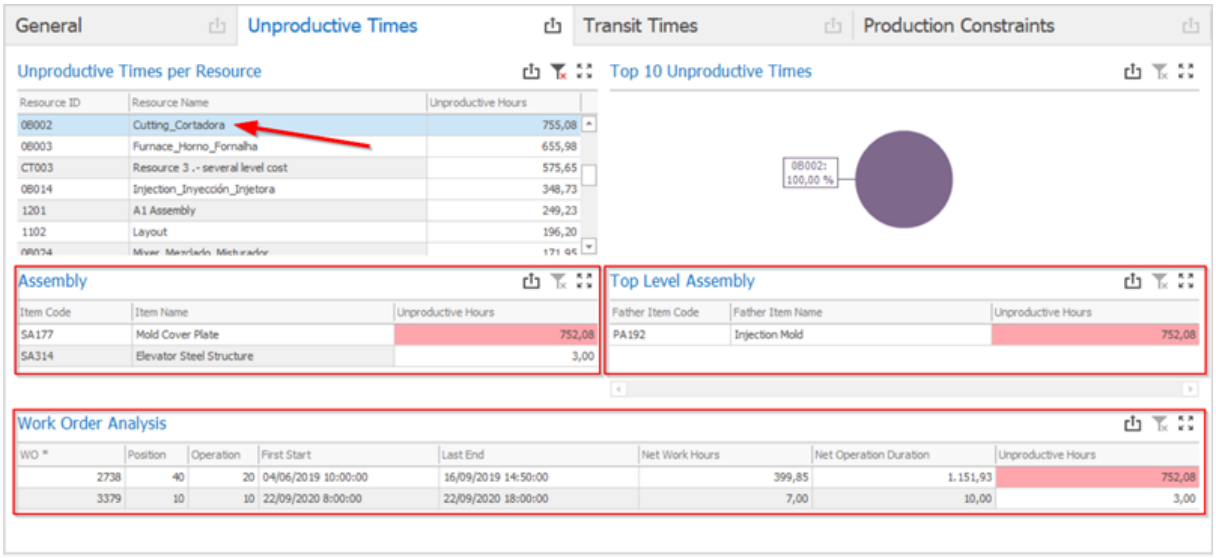
Assembly / Top Level Assembly

Work Order Analysis

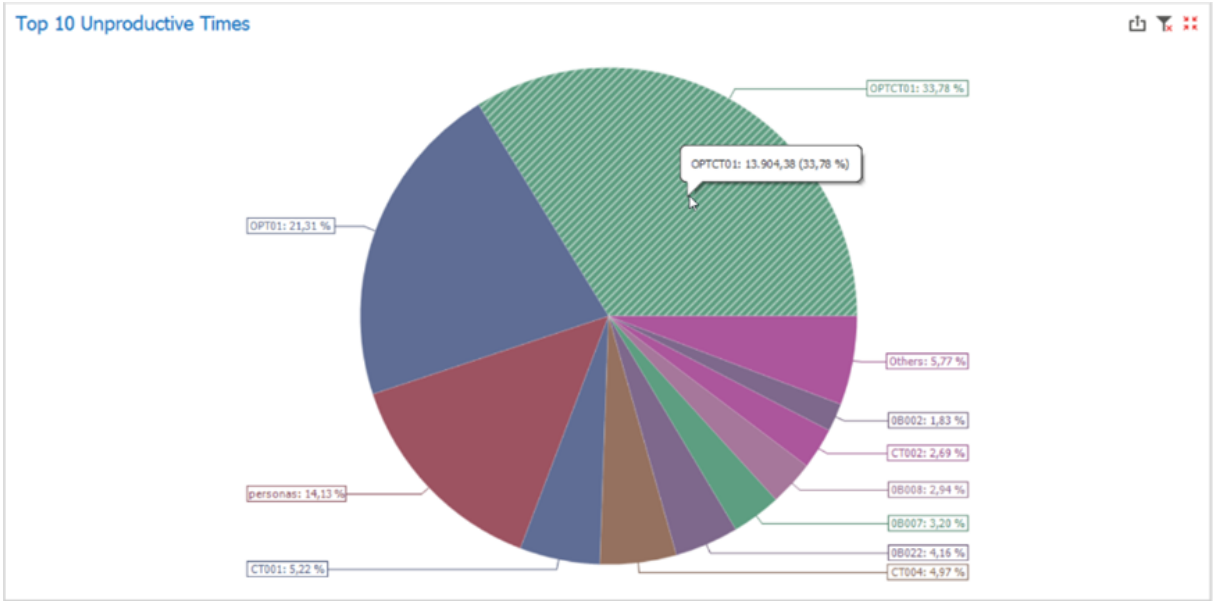
18.5.4.2.1 Unproductive Times per Resource

This report presents the sum of all unproductive times related to each resource used in the production process. To know which assemblies and work orders composed the unproductive times of a resource, you just need to click on the resource and see the results in the Assembly"/"Top Level Assembly and "Work Order Analysis grids.

© 2026 Boyum IT Solutions A/S



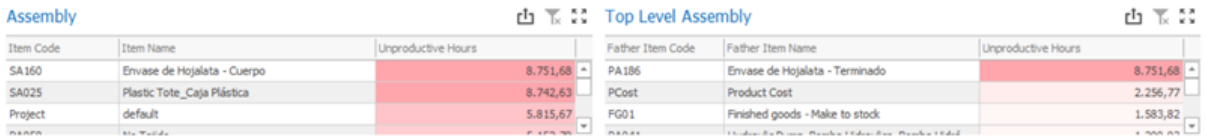
18.5.4.2.2 Top 10 Unproductive Times



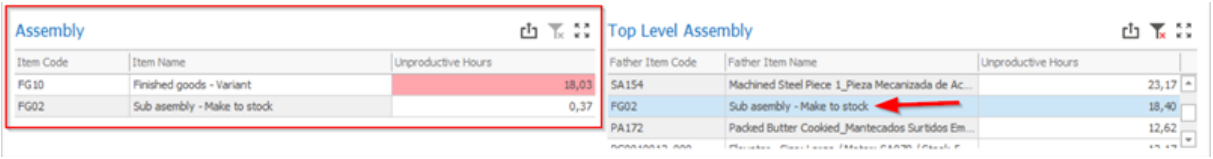
This chart displays the top 10 resources responsible for generating unproductive times. When clicking on a resource, the data on Assembly/Top Level Assembly and Work Order Analysis grids will be updated in the same way as when selecting a resource from the Unproductive Times per Resource grid.

© 2026 Boyum IT Solutions A/S

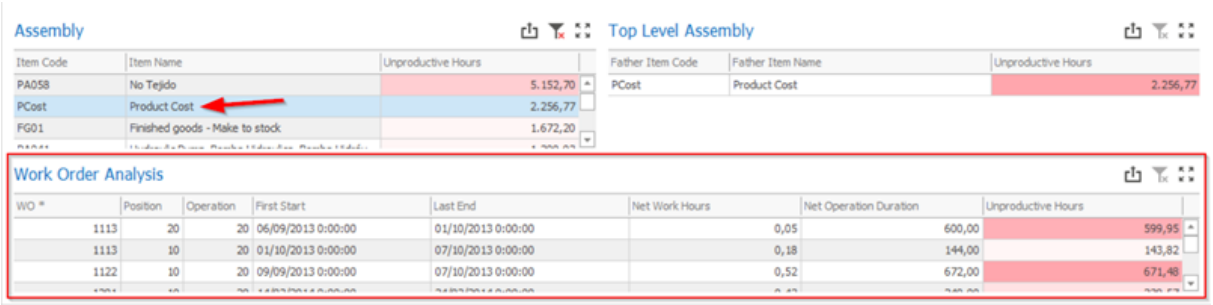
18.5.4.2.3 Assembly / Top Level Assembly



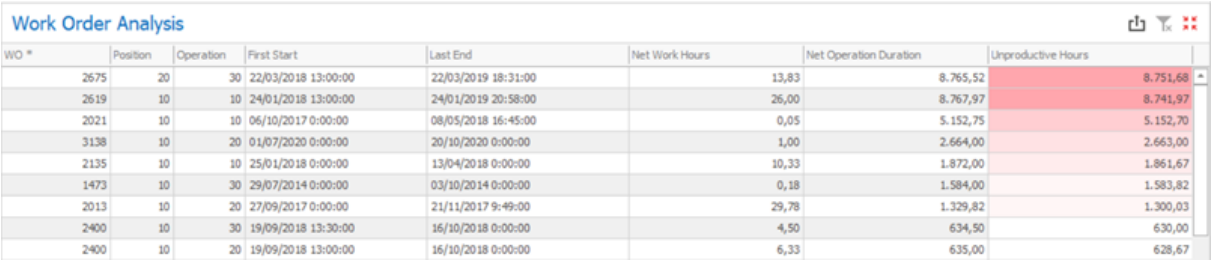
The “Assembly” and “Top Level Assembly” grids work together to display the manufactured items and corresponding father items related to unproductive times. When clicking on a parent item, it is possible to know which assemblies or sub-assemblies have generated more unproductive times.



To understand in which work orders the unproductive times were produced, you just need to click on an assembly or top-level assembly and check the results under the Work Order Analysis grid.



18.5.4.2.4 Work Order Analysis

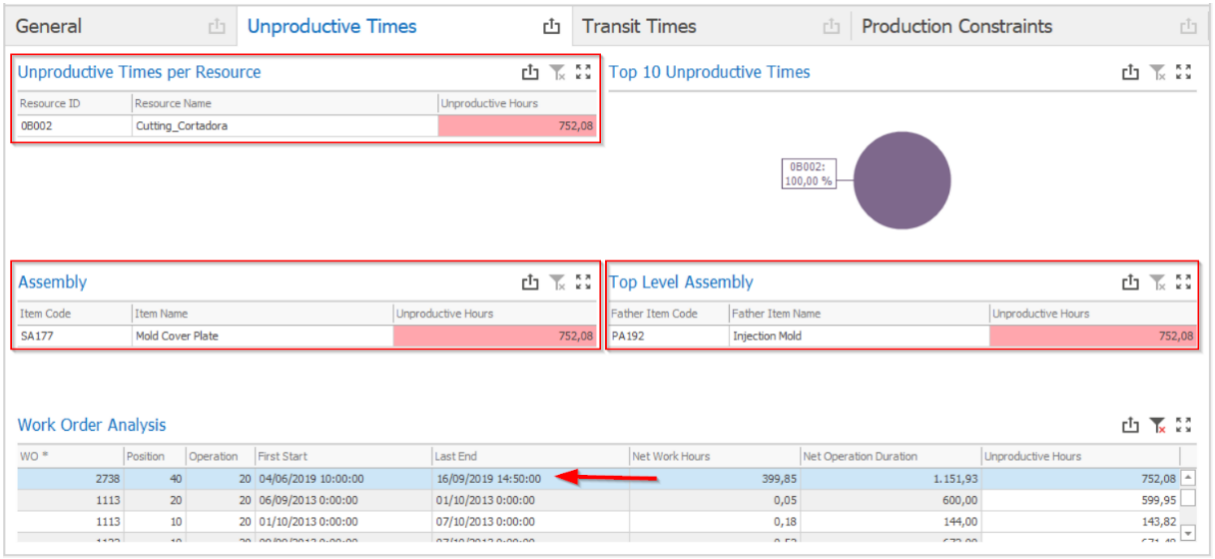


This grid displays all the work orders that had unproductive times while being processed, highlighting in stronger red the ones with more unproductive times. The “Work Order Analysis” grid presents the following information:

© 2026 Boyum IT Solutions A/S

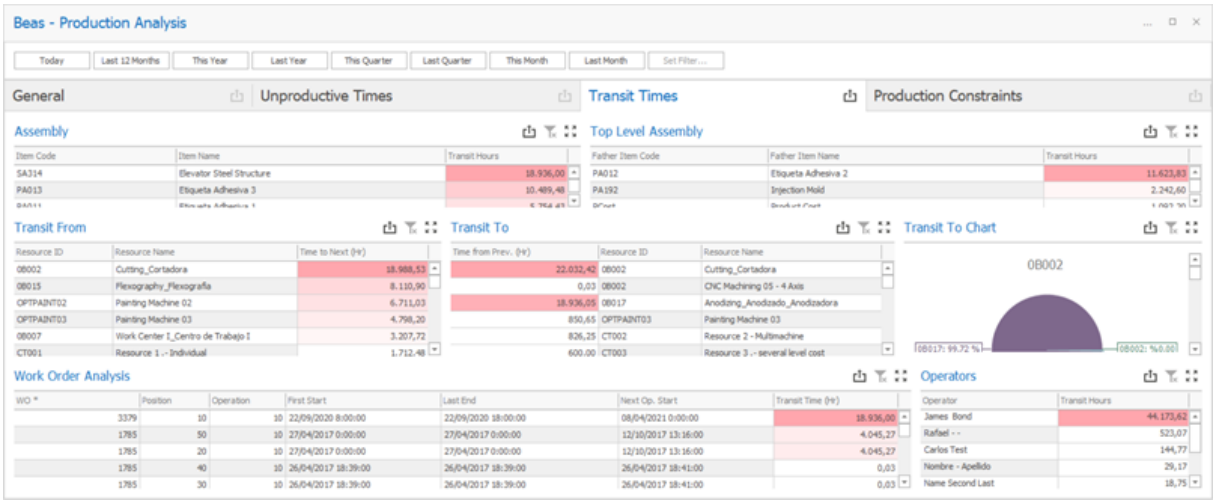
a) **WO / Position / Operation**: Identification of the work order. When double-clicking the "WO" column, Beas automatically opens the structure view for the selected work order, enabling a fast analysis of possible problems;
b) **First Start / Last End**: Date and time of the first and the last time receipts related to each routing position that presented unproductive times;
c) **Net Work Hours**: Total work hours registered for each routing position, discounting the non-workable hours (according to the resources' calendars) from the work hours when the time receipts last for more than one day. If the first start or last end happened before or after the resources' available hours, those are not discounted and are considered as overtime (the discounts are only applied to the days in between the first and last days);
d) **Net Operation Duration**: Total amount of hours in between the first start and the last end of each routing position, discounting the non-workable hours (according to the resources' calendars) from the number of hours when the first start and last end happened on different days. If the first start or last end happened before or after the resources' available hours, those are not discounted and are considered as overtime (the discounts are only applied to the days in between the first and last days);
e) **Unproductive Hours**: The calculated difference in between the Net Operation Duration and the Net Work Hours.

If you wish to know which assemblies or resources were related to a specific work order, you just need to click on it and check the results under the Unproductive Times per Resource, Assembly / Top Level Assembly grids.



© 2026 Boyum IT Solutions A/S

18.5.4.3 Transit Times Tab



The Transit Times tab provides an analysis over the times wasted across the different production operations for manufacturing the products, considering any delay in between the end of an operation and the beginning of the next one (due to internal movements, waiting for materials, waiting for operator, etc.) as transit time. This dashboard can help you to identify possibilities for improving your processes to reduce time wasting and achieve a higher productivity.

Important: Only the times registered in between the routing positions of a same work order position are part of the transit times calculation. Times in between the end of a work order position and the beginning of another one do not affect the calculation of transit times.

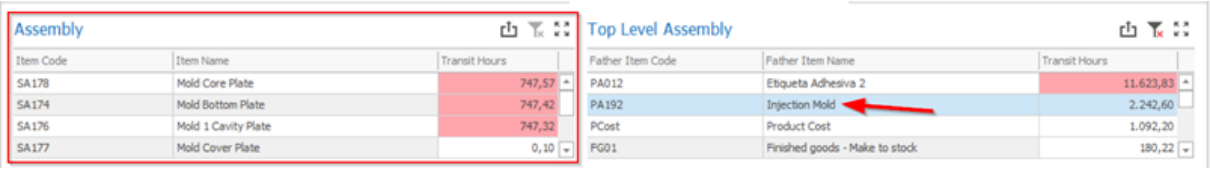
Dashboard sections:

Assembly / Top Level Assembly
Transit From / Transit To
Transit To Chart
Work Order Analysis
Operators

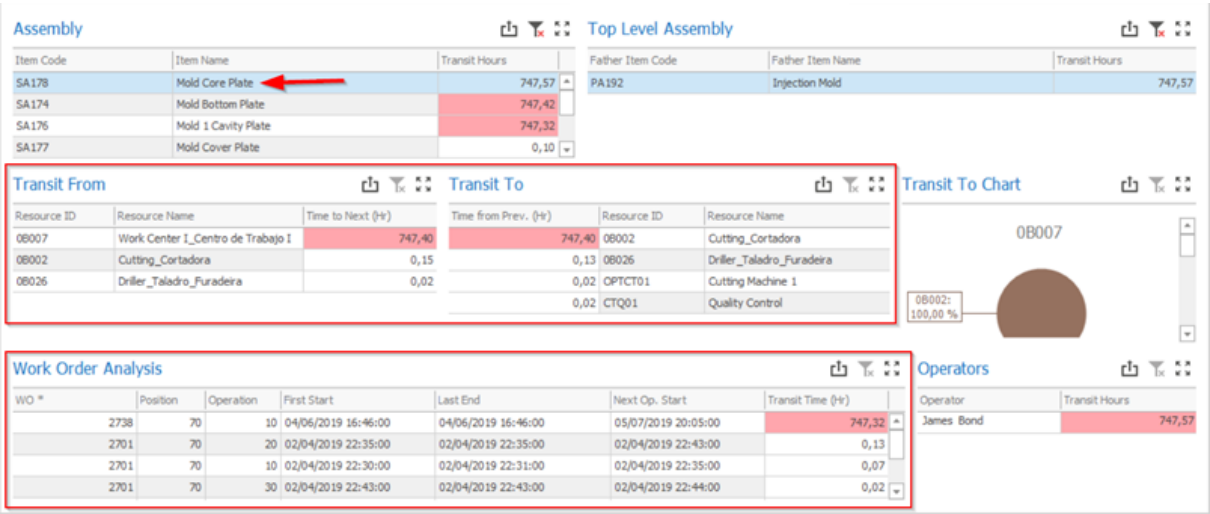
18.5.4.3.1 Assembly / Top Level Assembly

© 2026 Boyum IT Solutions A/S

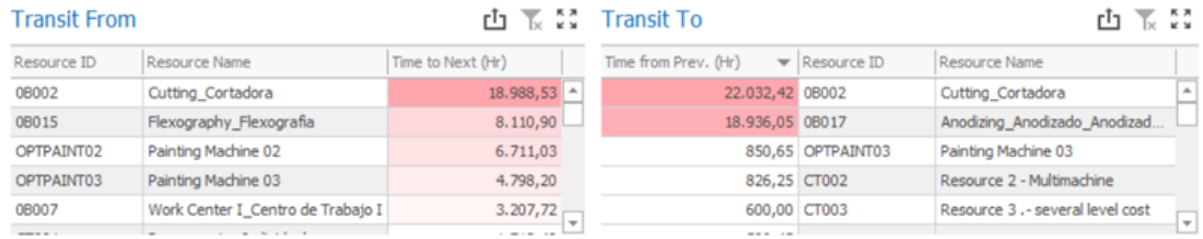
The “Assembly” and “Top Level Assembly” grids work together to display the manufactured items and corresponding father items related to transit times. When clicking on a father item, it is possible to know which assemblies or subassemblies have generated more transit times.



To understand in which resources and work orders the transit times were produced, you just need to click on an assembly or top-level assembly, and check the results under the Transit From/Transit To and Work Order Analysis grids.



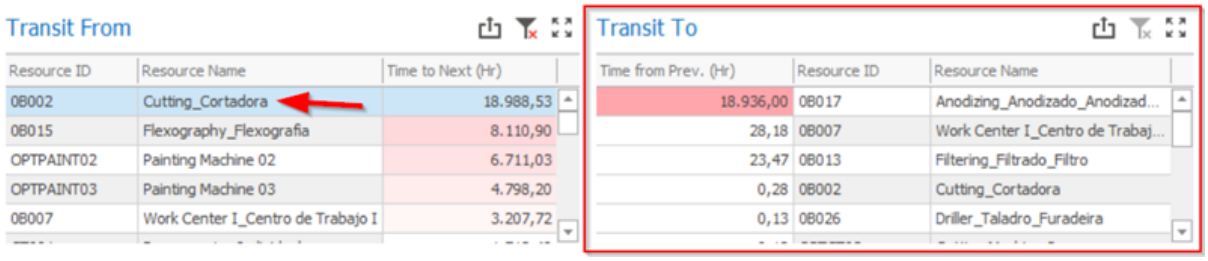
18.5.4.3.2 Transit From / Transit To



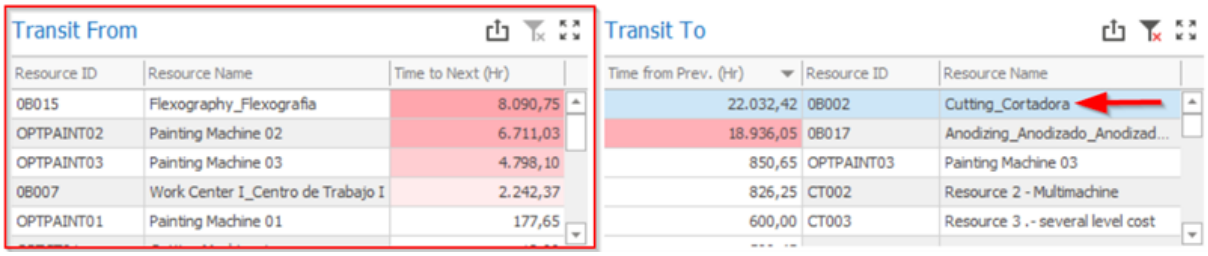
The “Transit From” and “Transit To” grids enable you to view both the resources that are generating more transit times when moving the production into the next resources, and the resources that required more transit times to receive the production from the previous resources, as well as the relationships between them.

© 2026 Boyum IT Solutions A/S

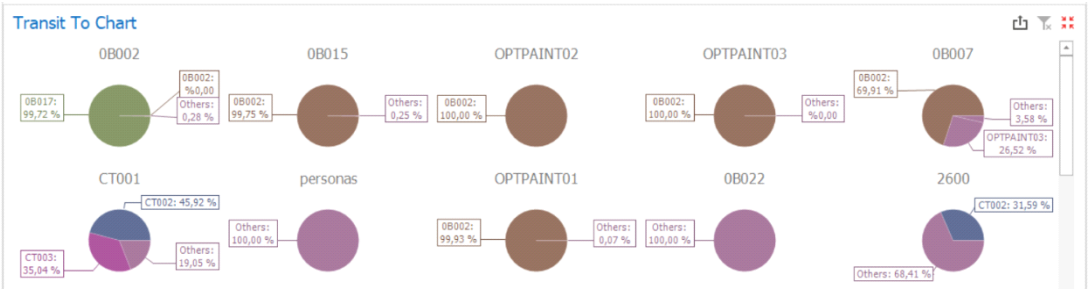
By clicking on a resource contained in the “Transit From” grid, “Transit To”, the information is updated to display all the resources that followed the selected one across the production processes and how the transit time was distributed.



When clicking on a resource contained in the “Transit To” grid, “Transit From”, the information is updated to display all the resources that preceded the selected one across the production processes and how much transit times were generated.



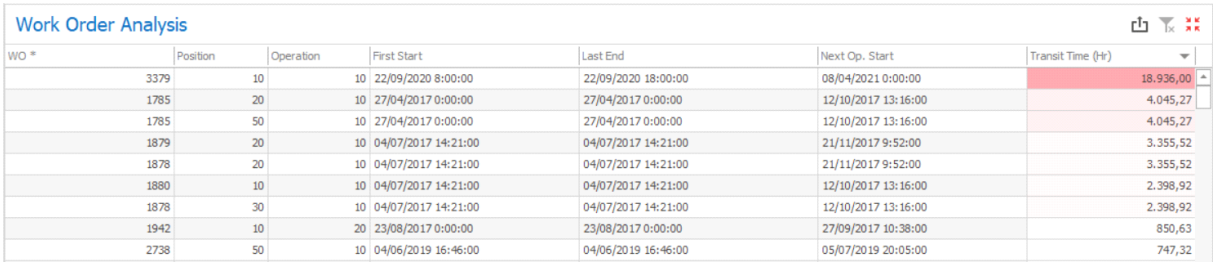
18.5.4.3.3 Transit To Chart



This chart is displayed as individual pies all resources from the “Transit From” grid and detail in slices how their transit times were distributed into the resources listed in the “Transit To” grid.

© 2026 Boyum IT Solutions A/S

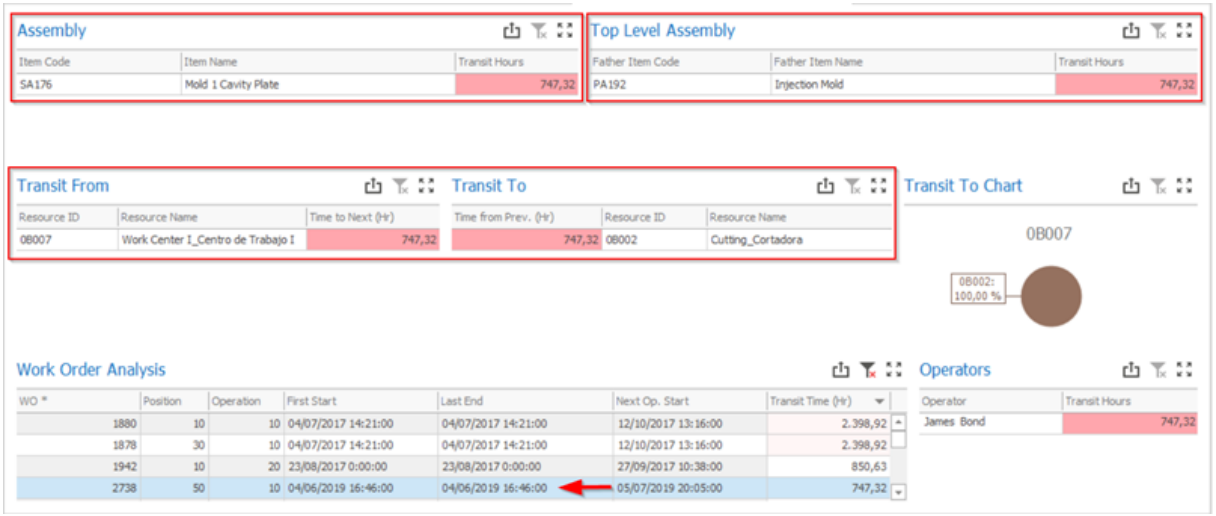
18.5.4.3.4 Work Order Analysis



This grid displays all the work orders that had transit times while being processed, highlighting in stronger red the ones with more transit times. The "Work Order Analysis" grid presents the following information:

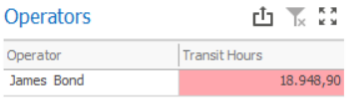
a) **WO / Position / Operation**: Identification of the work order. When double-clicking the "WO" column, Beas automatically opens the structure view for the selected work order, enabling a fast analysis of possible problems;
b) **First Start / Last End**: Date and time of the first and the last time receipts related to each routing position that presented transit times;
c) **Next Op. Start**: Date and time in which the next operation (within the same work order position) started, ignoring all the last routing positions as they don't have a succeeding operation.

If you wish to know which assemblies or resources were related to a specific work order, you just need to click on it and check the results under the Assembly / Top Level Assembly, Transit From / Transit To grids.



© 2026 Boyum IT Solutions A/S

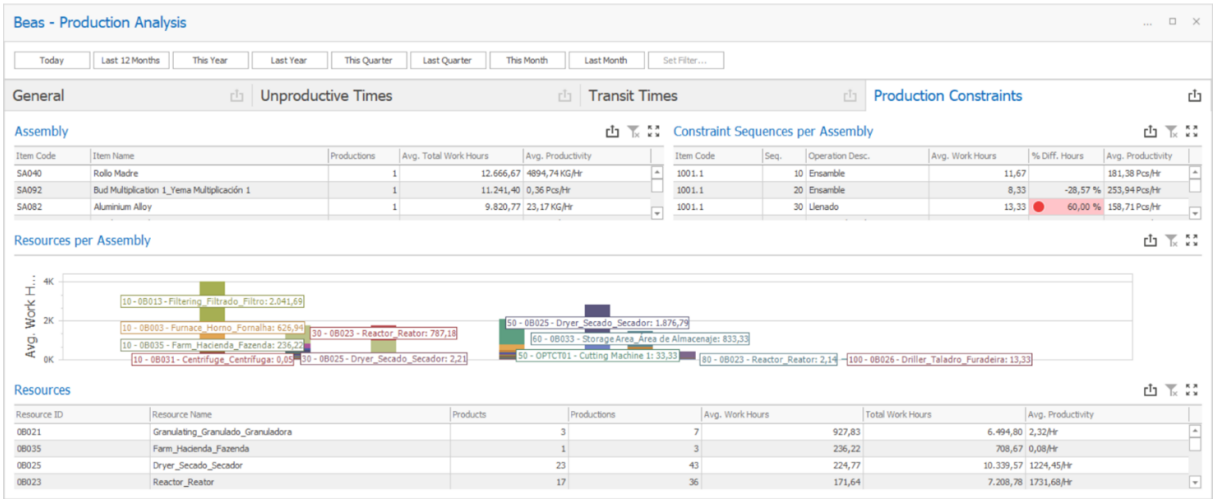
18.5.4.3.5 Operators



The “Operators” grid shows all the operators related to productions with associated transit times. When clicking in an operator, the dashboard filters all work orders, resources and assemblies in which the selected operator has worked.

18.5.4.4 Production Constraints Tab

The Production Constraints tab is aimed at identifying the production stages, assemblies, and resources that could represent constraints for the different production processes, showing the average productivity per hour for each one of them and how the productivity varies across the manufacturing steps. This dashboard can help you to identify which processes are preventing you from having a shorter production cycle time, as well as to find the best stages of your manufacturing process for which you could build inventory buffers, aiding in the implementation of DDMRP practices.



Dashboard sections:

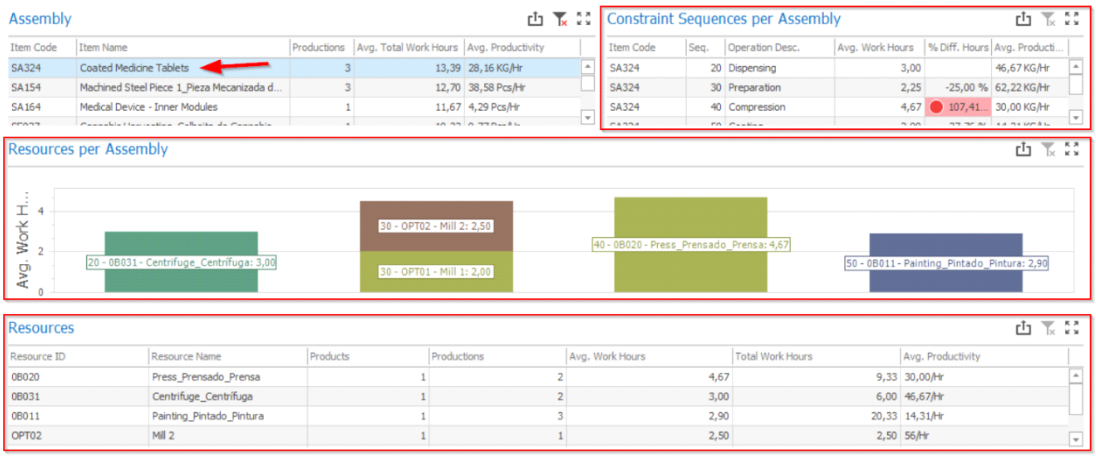
© 2026 Boyum IT Solutions A/S

Assembly
Constraint Sequences per Assembly
Resources per Assembly
Resources

18.5.4.4.1 Assembly

This grid displays all the produced assemblies and their average productivity per hour. The "Assembly" grid presents the following information:

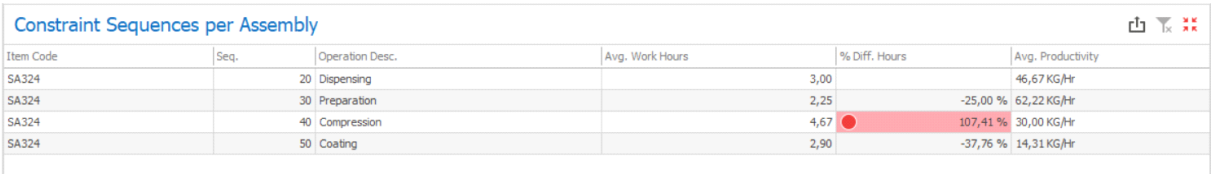
a) **Item Code / Item Name**: Identification of the assemblies;
b) **Productions**: Number of times that the assemblies were produced (counting of work order positions);
c) **Avg. Total Work Hours:** Global average of net work hours registered for the production of each assembly, across all their routing positions. The net work hours are calculated by discounting the non-workable hours (according to the resources' calendars) from the work hours when the time receipts last for more than one day. If the first start or last end happened before or after the resources' available hours, those are not discounted and are considered as overtime (the discounts are only applied to the days in between the first and last days);
d) **Avg. Productivity**: How much of the assemblies' unit of measures were produced during the total net work hours registered for their production.



© 2026 Boyum IT Solutions A/S

If you wish to know how much the productivity for each assembly varied during their production stages and which resources were used in their manufacturing process, you just need to click on an assembly and check the results under the Constraint Sequences per Assembly, Resources per Assembly, and Resources sections.

18.5.4.4.2 Constraint Sequences per Assembly

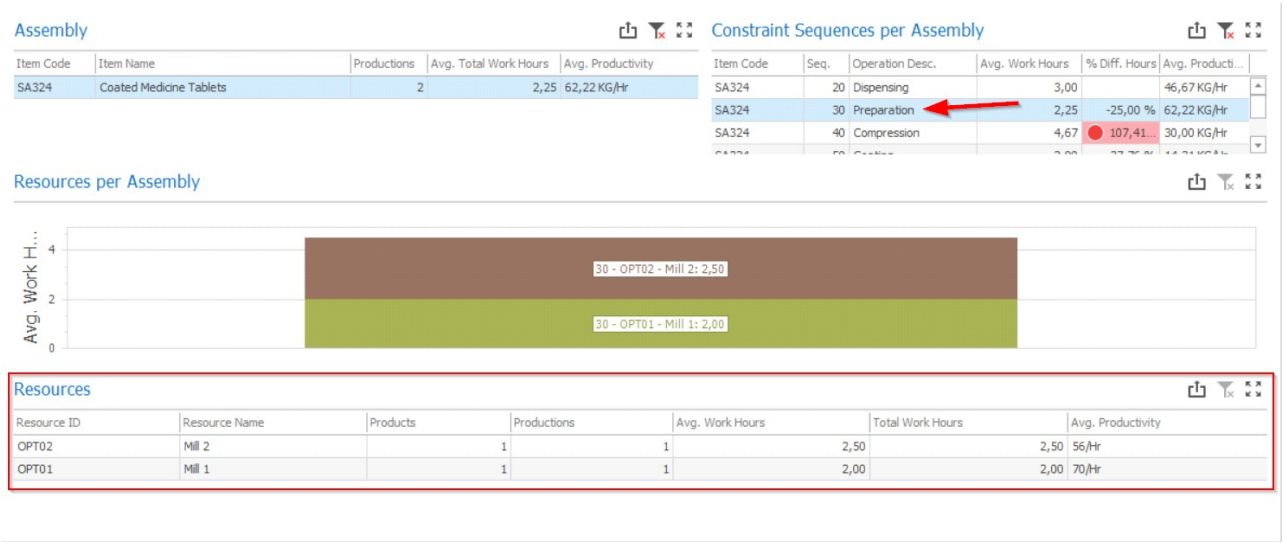


This grid displays all the manufacturing stages (routing positions) for each assembly and their average productivities per hour, as well as the variations between them. The Assembly grid presents the following information:

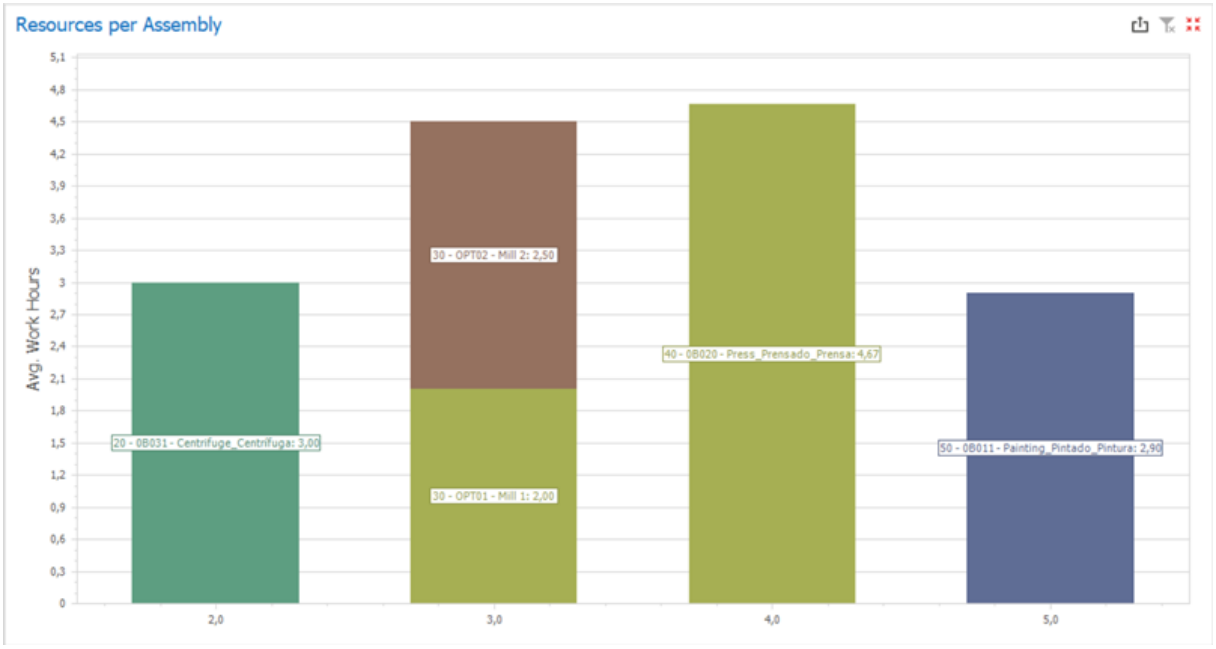
a) **Item Code**: Identification of the assembly;
b) **Seq**.: ID of the routing position;
c) **Operation Desc**.: Description of the routing position;
d) **Avg. Work Hours**: Average net work hours registered for each routing position executed for the assemblies' manufacturing. The net work hours are calculated by discounting the non-workable hours (according to the resources' calendars) from the work hours when the time receipts last for more than one day. If the first start or last end happened before or after the resources' available hours, those are not discounted and are considered as overtime (the discounts are only applied to the days in between the first and last days);
e) **% Diff. Hours**: Percentual variation in between the productivity of the current routing position and the previous one. The differences are highlighted in a red scale, with a stronger red representing a higher variation. Additionally, all percentual differences higher than 50% are identified with a red circle.
f) **Avg. Productivity**: How much of the assemblies' unit of measures were produced during the total net work hours registered for each routing position (this grid does not consider different UoMs per routing position, the UoMs are read directly from the assembly).

To understand which resource or resources were used in each routing position, you could either check the Resources per Assembly chart or click on a routing position and check the results under the Resources grid.

© 2026 Boyum IT Solutions A/S



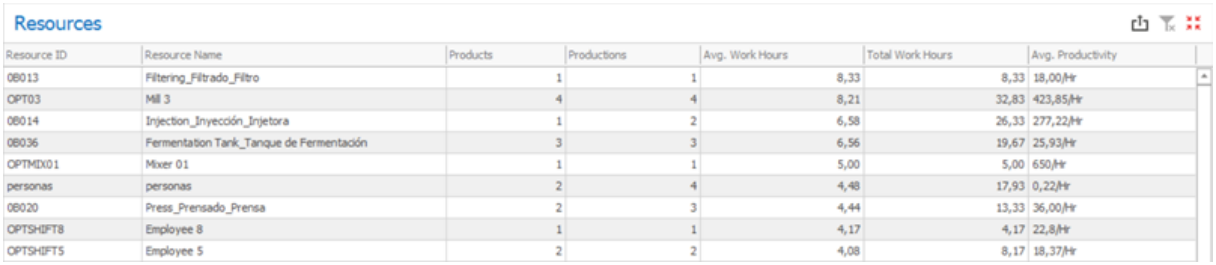
18.5.4.4.3 Resources per Assembly



This chart displays the average net work time for each routing position used in the different production processes, making it easier to see variations in productivity and understand the steps that are making the processes slower. When more than one resource was used in a same routing position (like in the cases of alternative resources), they are both displayed on the chart, each one of them with its current average work time.

© 2026 Boyum IT Solutions A/S

18.5.4.4.4 Resources



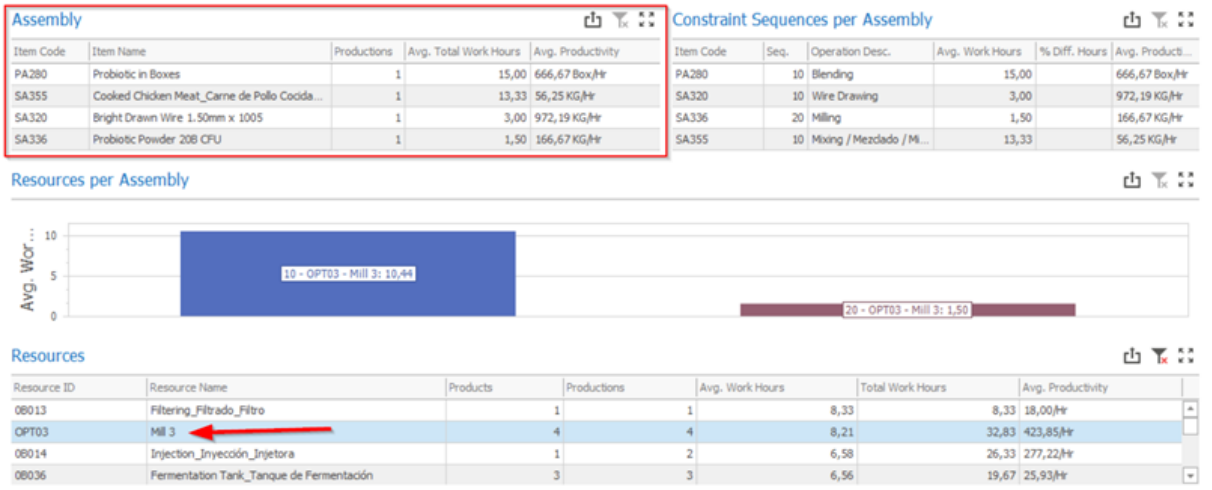
Resource ID	Resource Name	Products	Productions	Avg. Work Hours	Total Work Hours	Avg. Productivity
08013	Filtering_Filtrado_Filtro	1	1	8,33	8,33	18,00/Hr
OPT03	Mill 3	4	4	8,21	32,83	423,85/Hr
08014	Injection_Inyección_Injetora	1	2	6,58	26,33	277,22/Hr
08036	Fermentation Tank_Tanque de Fermentación	3	3	6,56	19,67	25,93/Hr
OPTMIX01	Mixer 01	1	1	5,00	5,00	650/Hr
personas	personas	2	4	4,48	17,93	0,22/Hr
08020	Press_Prensado_Prensa	2	3	4,44	13,33	36,00/Hr
OPTSHIFT8	Employee 8	1	1	4,17	4,17	22,8/Hr
OPTSHIFT5	Employee 5	2	2	4,08	8,17	18,37/Hr

This grid displays all the produced assemblies and their average productivities per hour. The Assembly grid presents the following information:

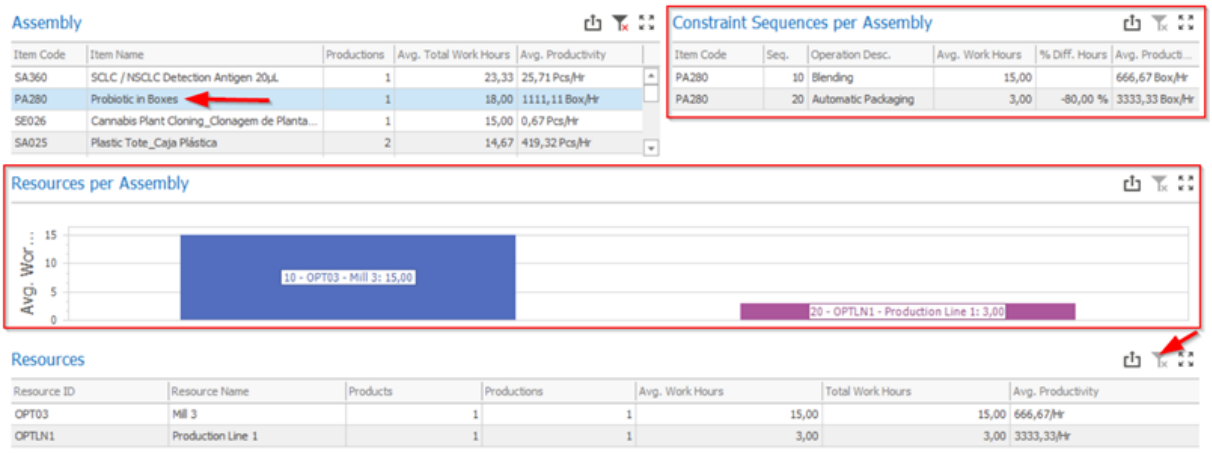
a) **Resource ID / Resource Name:** Identification of the resources;
b) **Products**: Number of products processed by each resource (counting of item codes);
c) **Productions**: Number of productions executed by each resource (counting of work order positions);
d) **Avg. Work Hours**: Global average of net work hours registered for each resource, across all their productions. The net work hours are calculated by discounting the non-workable hours (according to the resources' calendars) from the work hours when the time receipts last for more than one day. If the first start or last end happened before or after the resources' available hours, those are not discounted and are considered as overtime (the discounts are only applied to the days in between the first and last days);
e) **Total Work Hours**: Total net work hours registered for each resource, across all their productions. The net work hours are calculated by discounting the non-workable hours (according to the resources' calendars) from the work hours when the time receipts last for more than one day. If the first start or last end happened before or after the resources' available hours, those are not discounted and are considered as overtime (the discounts are only applied to the days in between the first and last days);
f) **Avg. Productivity**: Global average productivity for the resources, considering the produced amounts and the total net work hours registered for each one of them. As the same resource can be used to process items with different units of measurement, no UoM is displayed in the resources' productivities.

Using the Resources grid, it is very easy to know how a resource with lower-than-expected productivity might be affecting the productivities across the different products, and in which routing positions they are used. For that, you just need to click on a resource and check the processed items under the Assembly grid.

© 2026 Boyum IT Solutions A/S



Then, to understand how this resource is affecting the manufacturing stages of a particular product, you just need to click on the assembly, clear the resource filter, and check the results under the Constraint Sequences per Assembly and Resources per Assembly sections.



18.5.5 Production Planning Overview

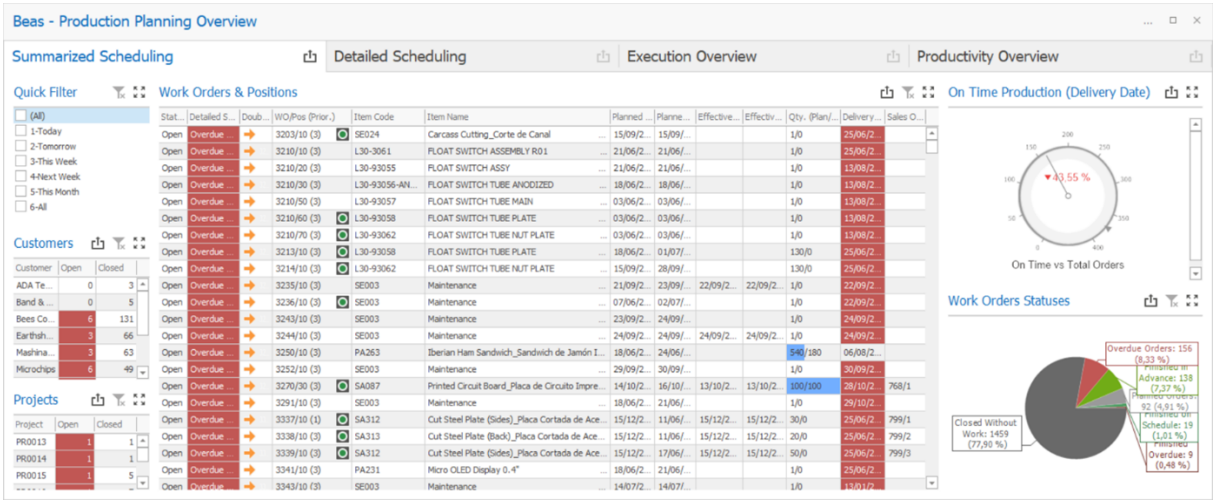
The Production Planning Overview dashboard contains a series of analytical views over the scheduled production and the execution of the work orders and is separated in four tabs:

Summarized Scheduling,
Detailed Scheduling,
Execution Overview,
Productivity Overview.

© 2026 Boyum IT Solutions A/S

Since tabs 2 and 4 of this dashboard work with current data, there is no possible filtering; for tab 1, it is possible to filter the data using the Quick Filter, or directly filtering the desired columns; for tab 3, the data can be filtered using the pre-made filters for defined time ranges (last 7 days, this month, last month, this year, last year, last 12 months). Manual filtering can be done by clicking on "Set Filter...". For performance reasons, this dashboard will load data from the current and from the previous year only.

18.5.5.1 Summarized Scheduling Tab



The Summarized Scheduling tab is aimed at providing an overview of the open and closed work orders, with quick filters to easily know the orders that are planned, were started, or were finished in specific time ranges, a delivery performance KPI, and a chart that groups the orders according to their status. Additionally, the Summarized Scheduling tab interacts with the Detailed Scheduling tab, meaning that any filters or selections applied on Summarized Scheduling also filter the data under the Detailed Scheduling tab.

Dashboard sections:

Work orders and Positions

Quick Filter

Customers

Projects

On Time Production (Delivery Date)

Work Order Statuses (Current Month)

© 2026 Boyum IT Solutions A/S

18.5.5.1.1 Work Orders and Positions

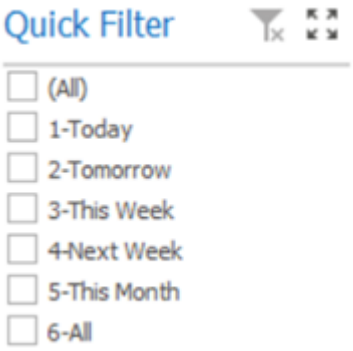
This grid displays all the open and closed work orders from this and from the past year, whose data can be filtered using the auxiliary grids, or by directly defining filters for the desired columns. When double-clicking any line on this grid, Beas opens the structure view for the selected work order. The "Work Orders & Positions" grid presents the following information:

a) **Status**: Work order/position status, which can be "Open" or "Closed";
b) **Detailed Status**: Specific status to help understanding the situation of each work order:
    Closed work orders:
        Finished on Schedule: Work order closed during its scheduled dates;
        Finished in Advance: Work order closed before its scheduled dates;
        Finished Overdue: Work order closed after its scheduled dates;
        Closed Without Work: Work orders opened and closed without any transaction.
    Open work orders:
        Planned Orders: Work order with end date scheduled for today or for the future;
        Overdue Orders: Work order with end date scheduled for past days.

c) **WO/Pos (Prior.)**: Work order number/position number (work order priority). When any of the work order position's operations are in work (have active times registered from the terminals), a green icon is displayed at its side;
d) **Item Code / Item Name**: Identification of the manufactured item;
e) **Planned Start**: First scheduled start date and time for the work order position;
f) **Planned End**: Last scheduled end date and time for the work order position;
g) **Effective Start:** First time receipt's start date and time for the work order position;
h) **Effective End**: Last time receipt's end date and time for the work order position;
i) **Qty. (Plan/Actual)**: Quantity (planned / actual). A blue progress bar represents how much of the planned quantities were already produced and, in the cases where actual production surpassed the planned amounts, the values are highlighted in bold dark gray 100/150;
j) **Delivery Date**: Delivery date of the work order position. When the delivery date is already overdue or if the planned end is for after the delivery date, the Delivery Date is highlighted with a red background color;
k) **Sales Order**: Sales order/line linked to the work order position.

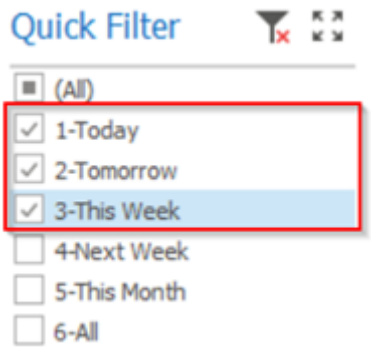
© 2026 Boyum IT Solutions A/S

18.5.5.1.2 Quick Filter



The quick filter contains pre-made smart filters for displaying work orders whose planned start, planned end, effective start, or effective end fall under the selected category.

Important: Each Quick Filter category does not include the previous ones. This means that "3-This Week" does not include "1-Today" or "2-Tomorrow", only orders after tomorrow and until the end of this week. To list all the work orders belonging to this week, you must select the three categories: "1-Today", "2-Tomorrow", and "3-This Week". The same applies "5-This Month", for which you must select all categories prior to it as well.

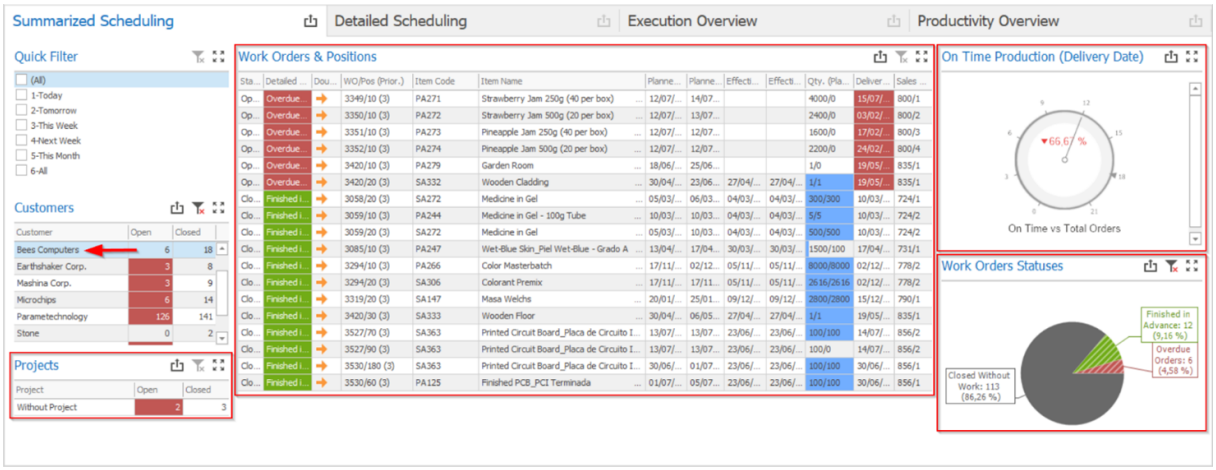


18.5.5.1.3 Customers

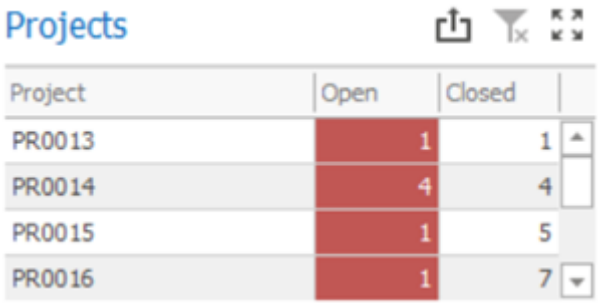
© 2026 Boyum IT Solutions A/S

This grid shows all the customers related to the work order positions, counting the open and closed work order positions in different columns. Whenever a customer is linked to overdue work order positions (considering the delivery date as comparison base), the “Open” column is highlighted with a red background color. When the work order positions are not linked to customers, they will be displayed as “Without Customer”.

If you wish to know the status of the work order positions and projects linked to the customers, or to understand how the delivery dates are being fulfilled for each one of your customers, you just need to click on the desired customer and check the results under the Projects, Work Orders & Positions, Work Order Statuses, and On Time Production (Delivery Date) sections.



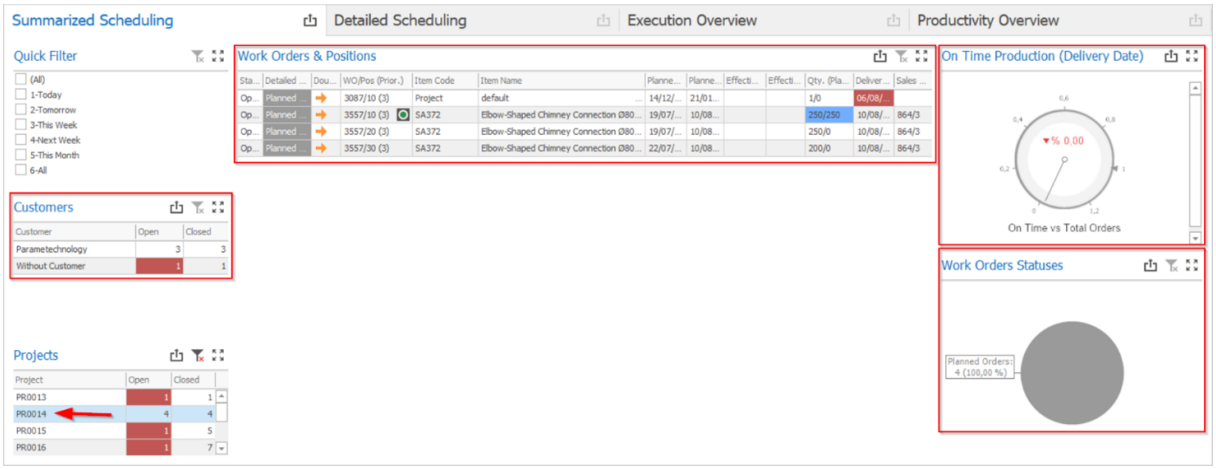
18.5.5.1.4 Projects



This grid shows all the projects related to the work order positions, counting the open and closed work order positions in different columns. Whenever a project is linked to overdue work order positions (considering the delivery date as comparison base), the “Open” column is highlighted with a red background color. When the work order positions are not linked to projects, they will be displayed as “Without Project”.

© 2026 Boyum IT Solutions A/S

If you wish to know the status of the work order positions and customers linked to the projects, or to understand how the delivery dates are being fulfilled for each one of your projects, you just need to click on the desired project and check the results under the "Customers", Work Orders & Positions, Work Order Statuses, and On Time Production (Delivery Date) sections.

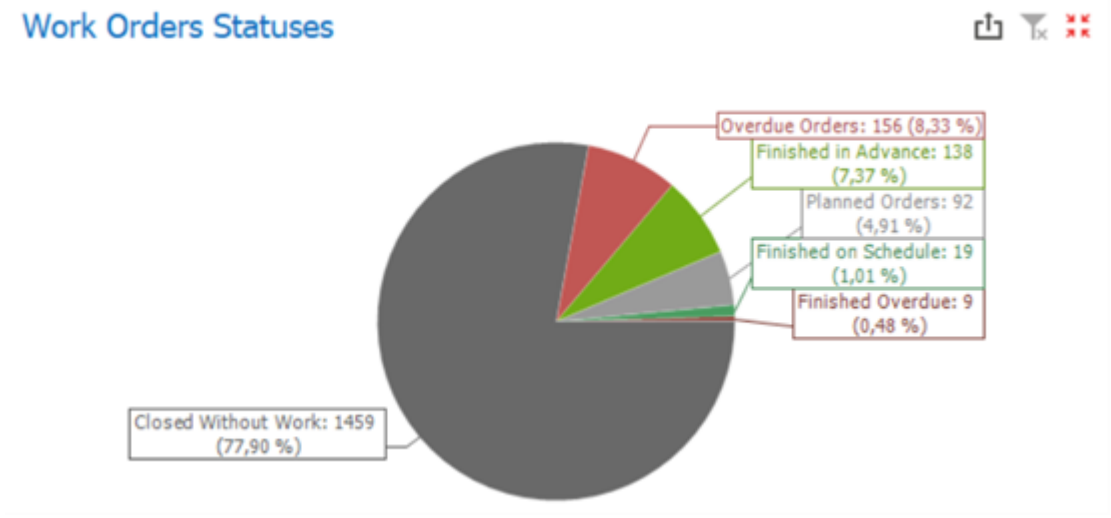


18.5.5.1.5 On Time Production (Delivery Date)

This chart shows how the delivery dates are being fulfilled, either globally or by customer, project, or any other filter that can be applied in the dashboard. Only work order positions that are closed or whose delivery dates are already overdue (passed or when the planned end is after the delivery date) are considered for the On Time Production (Delivery Date) KPI calculation.

© 2026 Boyum IT Solutions A/S

18.5.5.1.6 Work Order Statuses (Current Month)



This chart details the execution of the work orders in the selected time range (using the Quick Filter or directly filtering the date columns). The available statuses are different for closed and open work orders:

Closed:

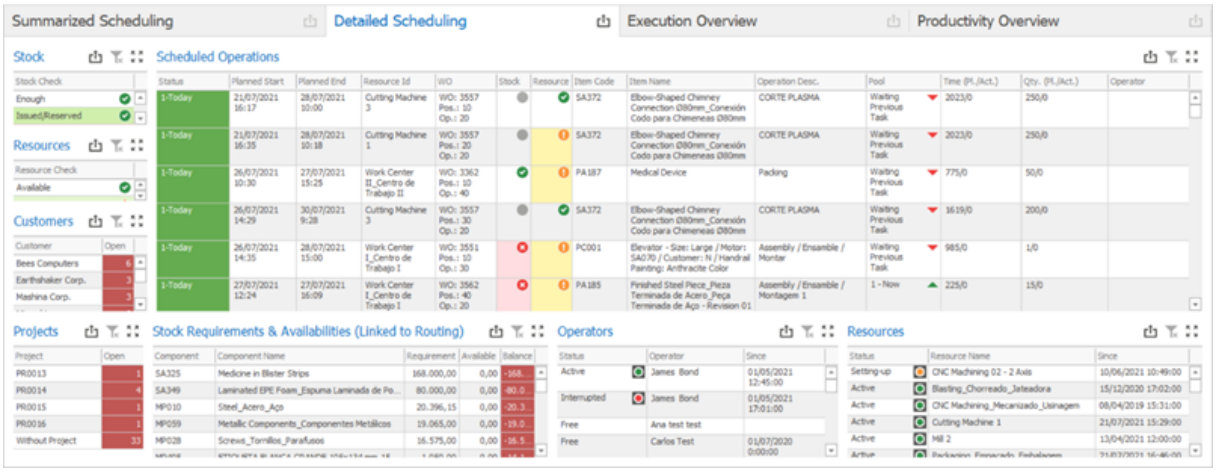
a) **Finished on Schedule**: Work order closed during its scheduled dates;
b) **Finished in Advance**: Work order closed before its scheduled dates;
c) **Finished Overdue**: Work order closed after its scheduled dates;
d) **Closed Without Work**: Work orders opened and closed without any transaction.

Open:

a) **Planned Orders**: Work orders with end dates scheduled for today or for the future;
b) **Overdue Orders**: Work orders with end dates scheduled for past days.

© 2026 Boyum IT Solutions A/S

18.5.5.2 Detailed Scheduling Tab



The Detailed Scheduling tab has two main objectives:

1) being a tool for the production managers to understand how the different processes are being planned and performed, the material and resource restrictions for executing the production tasks, and monitoring how the operators and resources are working; and

2) serving as a panel for the shop floor employees to have up-to-date information about the production scheduling and the next tasks that should be performed (especially when using B1UP dashboards from the web).

This tab only presents routing positions that are still open, and the data can be filtered using the auxiliary panels ("Stock", "Resources", "Customers", "Projects", "Operators", and "Resources") or by directly applying filters to the "Scheduled Operations" columns.

Dashboard sections:

Scheduled Operations

Stock (Status)

Resources (Status)

Customers

Projects

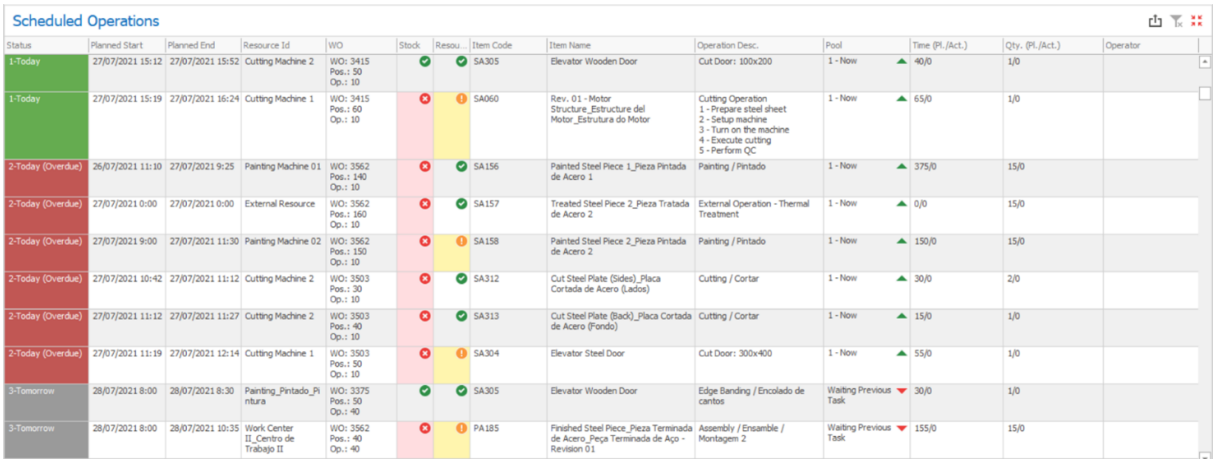
Stock Requirements & Availability (Linked to Routing)

Operators

Resources

© 2026 Boyum IT Solutions A/S

18.5.5.2.1 Scheduled Operations



This grid displays all the open routing positions for the work orders, whose data can be filtered using the auxiliary grids, or by directly defining filters for the desired columns. The “Scheduled Operations” grid presents the following information:

a) **Status**: Routing position scheduling status, which can be “Open” or “Closed”:

1-**Today**: Current date and time are between the planned start and end dates and times for the routing position;

2-**Today (Overdue)**: Current date is between the planned start and end date for the routing position, but the current time is already after its planned end time;

3-**Tomorrow**: The routing position’s planned start is scheduled for tomorrow;

4-**Overdue**: Current date and time are posterior to the planned end date for the routing position;

5-**Future**: The routing position’s planned start is scheduled for a future date (not including tomorrow).

b) **Planned Start:** Planned start date and time for the routing position;

c) **Planned End:** Planned end date and time for the routing position;

d) **Resource ID:** Code of the resource linked to the routing position, which can display two icons:

: Resource setting-up;

: Resource in work;

: Resource interrupted.

e) **WO**: Work order number, position number, and routing position number;

f) **Stock**: Quick stock check for the routing position, which can display the following icons:

© 2026 Boyum IT Solutions A/S

: All required materials are available in stock;

: All required materials have already been consumed or reserved;

: Some or all of the required materials are not available in stock;

: There are no materials linked to the routing position (**important**: materials not linked to any routing position are automatically be linked to routing position **10**).

g) **Resource**: Quick resource availability check for the routing position, which can display the following icons:

: Resource currently available;

: Resource with an active setup time registered for the routing position;

: Resource with an active production time registered for the routing position;

: Resource busy, currently working for another routing position;

: Resource with an active interruption.

h) **Item Code / Item Name**: Identification of the item;

i) **Operation Desc**.: Description of the routing position;

j) **Pool**: Current pool to which the routing position is allocated:

1 – Now: Routing position is in pool 1;

Waiting Previous Task: Routing position is in pool 0 (waiting for the preceding operations to be completed);

NN – In Pool: Routing position is currently allocated to pool NN.

k) **Time (Pl./Act.):** Times (planned / actual). The blue progress bar represents how much of the planned times were already reported and, in the cases where actual times surpassed the planned times, the values are highlighted in bold dark red

;

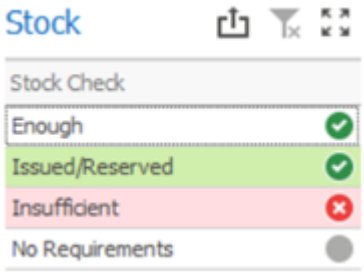
l) **Qty. (Pl./Act.)**: Quantity (planned / actual). The blue progress bar represents how much of the planned quantities were already produced and, in the cases where actual production surpassed the planned amounts, the values are highlighted in bold dark gray

;

m) **Operator**: Name of the operator currently logged in the routing position, as well as the login date and time.

© 2026 Boyum IT Solutions A/S

18.5.5.2.2 Stock (Status)



This grid allows an easy filtering of the Scheduled Operations according to the stock status of each routing position. By holding Shift or Ctrl, it is possible to select more than one status at once.

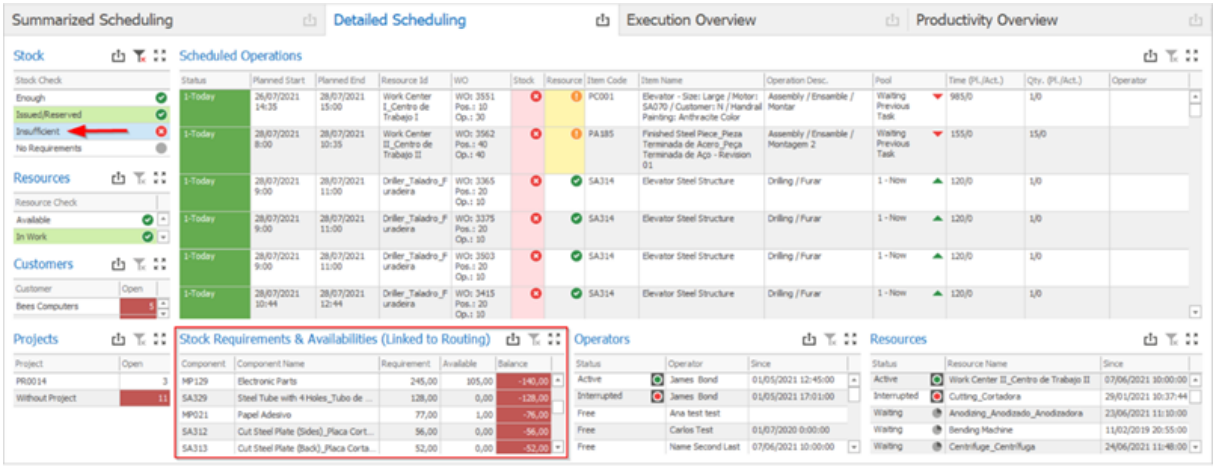
Enough : Show routing positions for which all required materials are available in stock;

Issued/Reserved : Show routing positions for which all required materials have already been consumed or reserved;

Insufficient : Show routing positions for which some or all of the required materials are not available in stock;

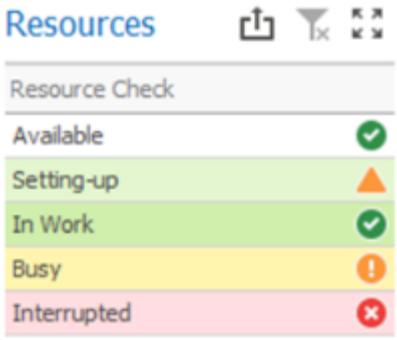
No Requirements : Show routing positions without any materials linked to them (important: materials not linked to any routing position will automatically be linked to routing position 10).

If you wish to have a list of all the materials that are currently missing from stock and affecting the scheduled production operations, you can just click on the "Insufficient" status and check the results under the Stock Requirements & Availabilities (Linked to Routing) grid.



© 2026 Boyum IT Solutions A/S

18.5.5.2.3 Resources (Status)



This grid allows an easy filtering of the Scheduled Operations according to the status of the resources linked to the routing positions. By holding Shift or Ctrl, it is possible to select more than one status at once.

Available : Show routing positions for which the resource is currently available;

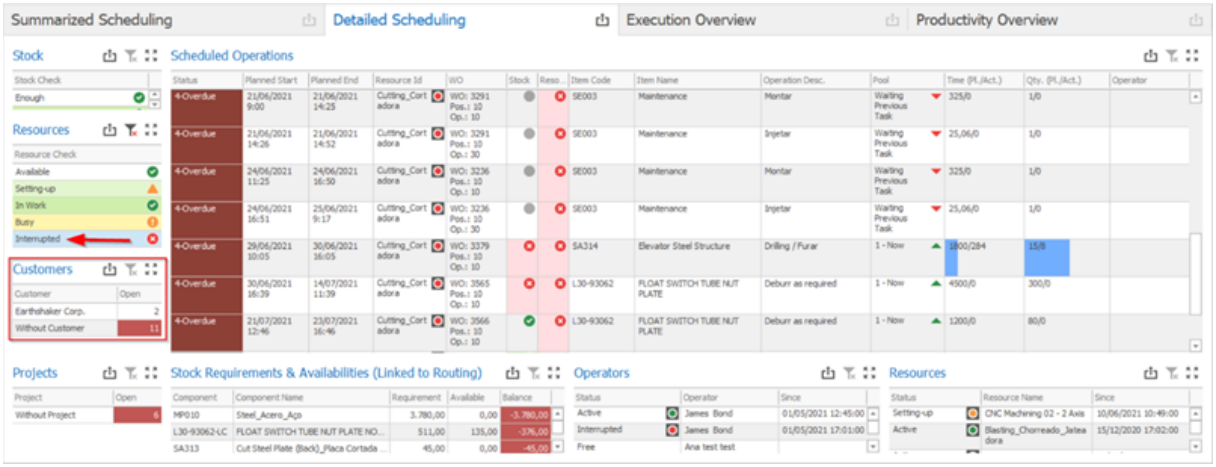
Setting-up : Show routing positions for which the resource has an active setup time registered;

In Work : Show routing positions for which the resource has an active production time registered;

Busy : Show routing positions for which the resources are busy, currently working for other routing positions;

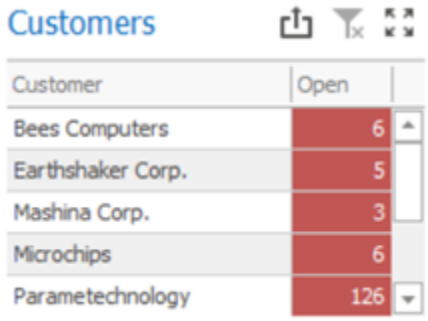
Interrupted : Show routing positions for which the resource has an active interruption.

If you wish to see a list of customers affected by interrupted machines, you can just select the "Interrupted" status and check the results under the "Customers" grid.



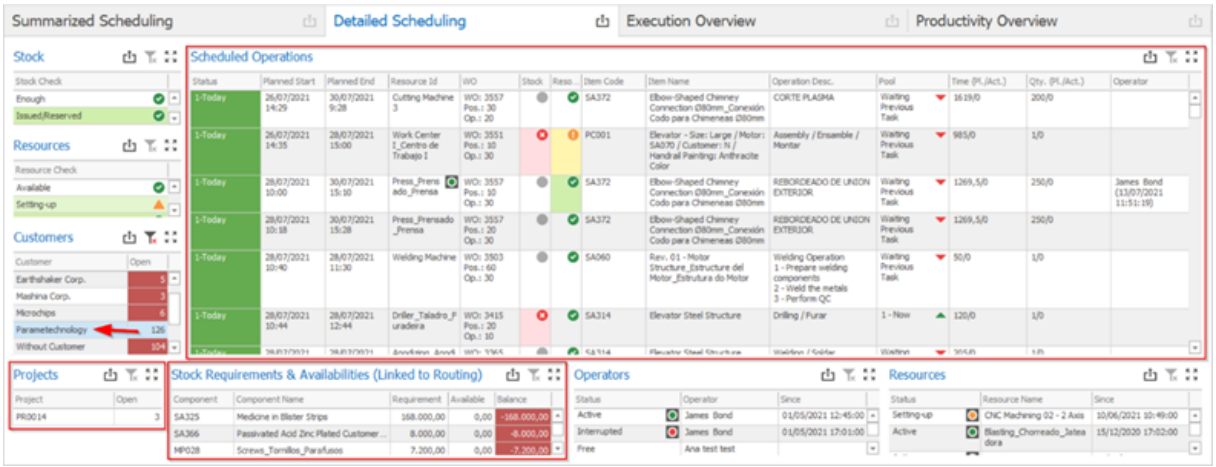
© 2026 Boyum IT Solutions A/S

18.5.5.2.4 Customers



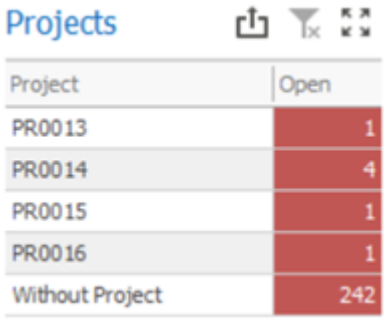
This grid shows all the customers related to open routing positions, counting the open work order positions linked to them. Whenever a customer is linked to overdue work order positions (considering the delivery date as comparison base), the “Open” column is highlighted with a red background color. When the work order positions are not linked to customers, they will be displayed as “Without Customer”.

If you wish to know the status of the routing positions and the projects linked to customers, or to see which materials are missing from stock to complete the production processes, you just need to click on the desired customer and check the results under the Projects, Scheduled Operations, and Stock Requirements & Availabilities (Linked to Routing) grids.



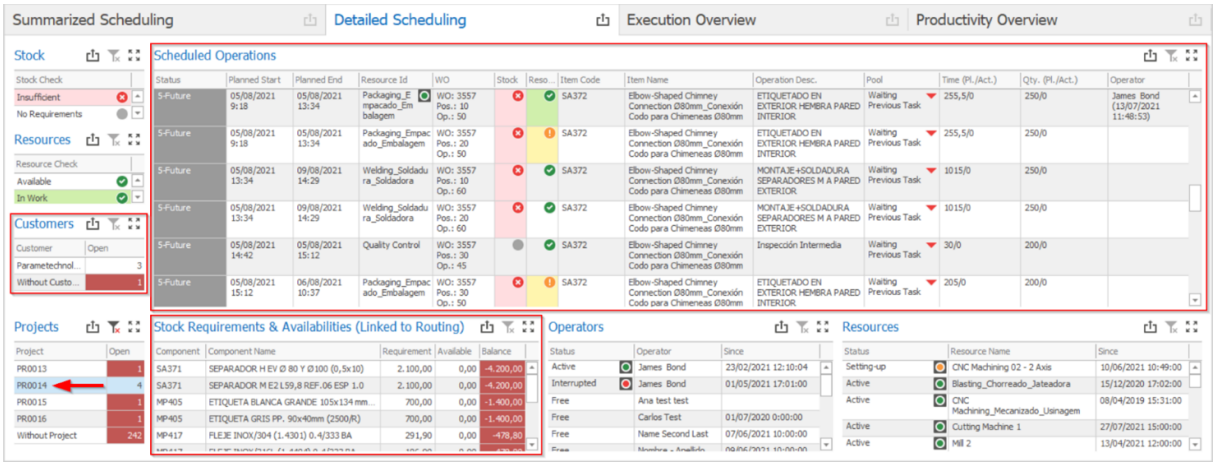
© 2026 Boyum IT Solutions A/S

18.5.5.2.5 Projects



This grid shows all the projects related to open routing positions, counting the open work order positions linked to them. Whenever a project is linked to overdue work order positions (considering the delivery date as comparison base), the “Open” column is highlighted with a red back color. When the work order positions are not linked to projects, they are displayed as “Without Project”.

If you wish to know the status of the routing positions and the customers linked to projects, or to see which materials are missing from stock to complete the production processes, you just need to click on the desired project and check the results under the Customers, Scheduled Operations, and Stock Requirements & Availabilities (Linked to Routing) grids.



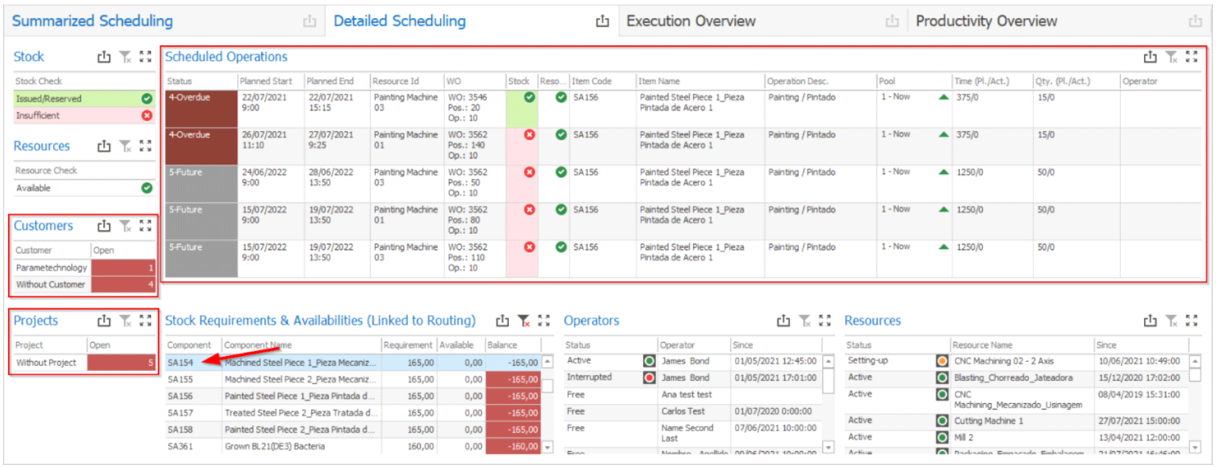
© 2026 Boyum IT Solutions A/S

18.5.5.2.6 Stock Requirements & Availability (Linked to Routing)

Stock Requirements & Availabilities (Linked to Routing)

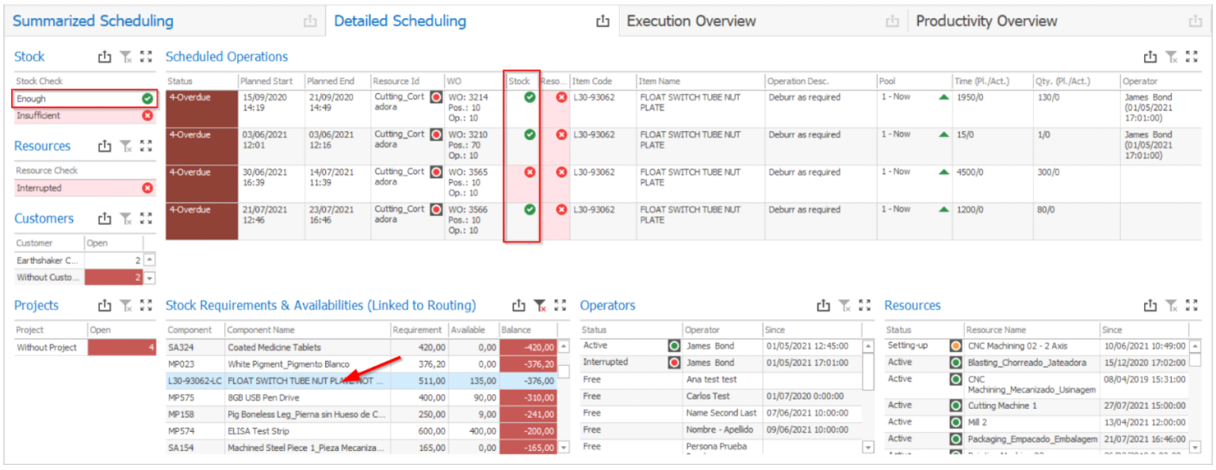
Component	Component Name	Requirement	Available	Balance
MP241	Large Screws_Tornillos Grandes_Parafusos Grandes	1.100,00	0,00	-1.100,00
SA362	SCLC / NSCLC Rapid Test Plate	800,00	0,00	-800,00
SA360	SCLC / NSCLC Detection Antigen 20µL	600,00	0,00	-600,00
MP236	LANA DE ROCA E30 mm (D:100 Kg/m³)	496,00	0,00	-496,00
SA324	Coated Medicine Tablets	420,00	0,00	-420,00
MP023	White Pigment_Pigmento Blanco	376,20	0,00	-376,20
L30-93062-LC	FLOAT SWITCH TUBE NUT PLATE NOT DEBURRED	511,00	135,00	-376,00
MP575	8GB USB Pen Drive	400,00	90,00	-310,00
MP158	Pig Boneless Leg_Pierna sin Hueso de Cerdo_Perna sem...	250,00	9,00	-241,00
MP574	ELISA Test Strip	600,00	400,00	-200,00
SA154	Machined Steel Piece 1_Pieza Mecanizada de Acero 1	165,00	0,00	-165,00
SA155	Machined Steel Piece 2_Pieza Mecanizada de Acero 2	165,00	0,00	-165,00
SA156	Painted Steel Piece 1_Pieza Pintada de Acero 1	165,00	0,00	-165,00

This grid shows all the materials required in production, showing the required amounts (discounting the materials already issued, allocated, or reserved), available stock, and calculated balance. Whenever the balance is negative, the "Balance" column is highlighted with a red background color. If you wish to know which routing positions, customers or projects are affected by the shortage of a specific component, you just need to select the desired component and check the results under the Scheduled Operations, Customers, and Projects grids.



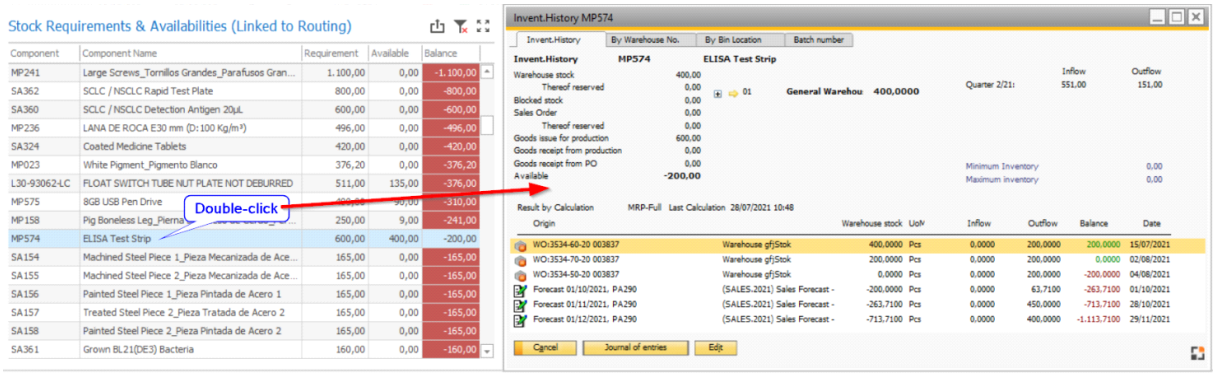
Important: On this grid, balances are calculated for all routing positions currently displayed on the Scheduled Operations grid. This means that, if multiple routing positions require a same component, the component total balance might be negative while the routing positions' stock check shows "Enough" icons; in these cases, the stock is enough for the routing positions individually, but not for all of them together.

© 2026 Boyum IT Solutions A/S



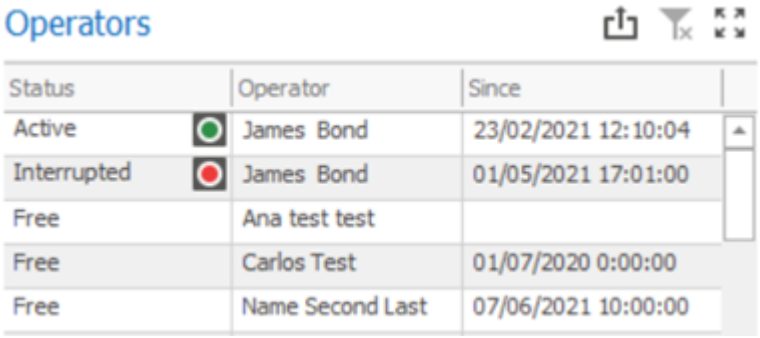
Important: Only outflows are considered for calculating the balances. Future purchases or planned production receipts will not increase the available amounts, the available amounts will only represent the stock available at the current moment, as the goal of this dashboard is to be a tool for short-term production management and execution control.

For viewing future purchases or planned production receipts, the "Stock Requirements & Availabilities (Linked to Routing)" grid has also a B1UP Universal Function embedded into it to automatically display a Beas Inventory History analysis for the components when double-clicking them. If you wish to activate this feature, you must download the UF and import it into B1UP.
DOWNLOAD: Right-click on the link DASH-PPO-INVHISTORY and Save the xml file.



© 2026 Boyum IT Solutions A/S

18.5.5.2.7 Operators



This grid shows all the active employees registered in Beas personnel master data, indicating their current status and since when they are on that status.

a) **Status**: Status of the operator:

Active : Operator with active production times;

Interrupted : Operator with active production times on resources that were interrupted after the production started.

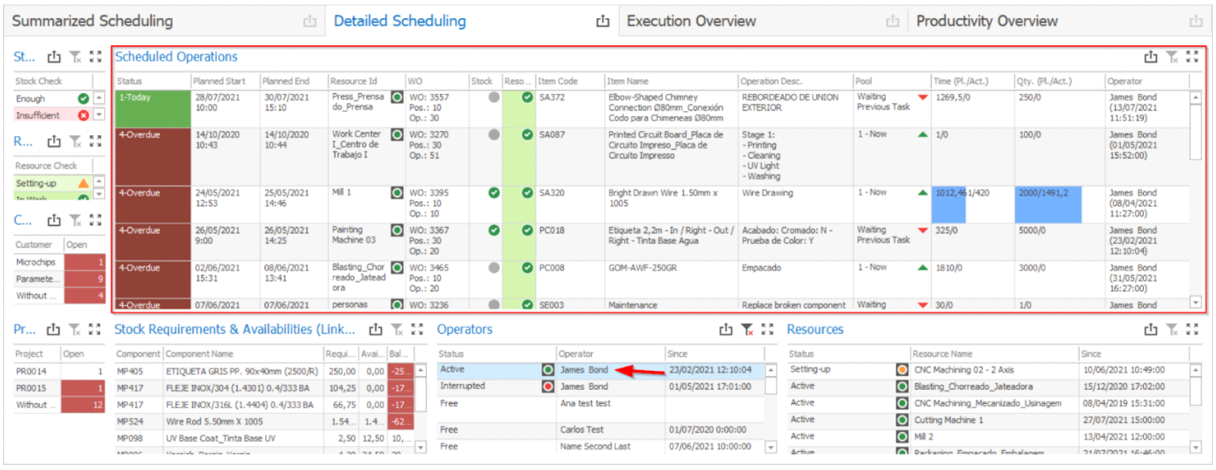
Free: Operator without any active production time.

b) **Operator**: Name of the operator;

c) **Since**: Date and time that represent since when the operators are on the current status. If the operators have active times, the "Since" column displays the date and time in which they logged into the first active production task; if they are free, the "Since" column displays the date and time in which they finished their latest production task. In the cases in which the employees have never worked in production tasks, the "Since" column displays an empty value.

If you wish to know in which routing positions the operators are working or which ones are affected by interruptions, you just need to select the desired operator and status and check the results under the Scheduled Operations grid.

© 2026 Boyum IT Solutions A/S



18.5.5.2.8 Resources

This grid shows all the active resources registered in Beas resource master data, indicating their current status and since when they are on that status.

a) **Status**: Status of the resource:

Setting-up : Resource with active setup times;

Active : Resource with active production times;

Interrupted : Resource with active interruptions;

Waiting : Resource without any active times or interruptions, but with scheduled tasks.

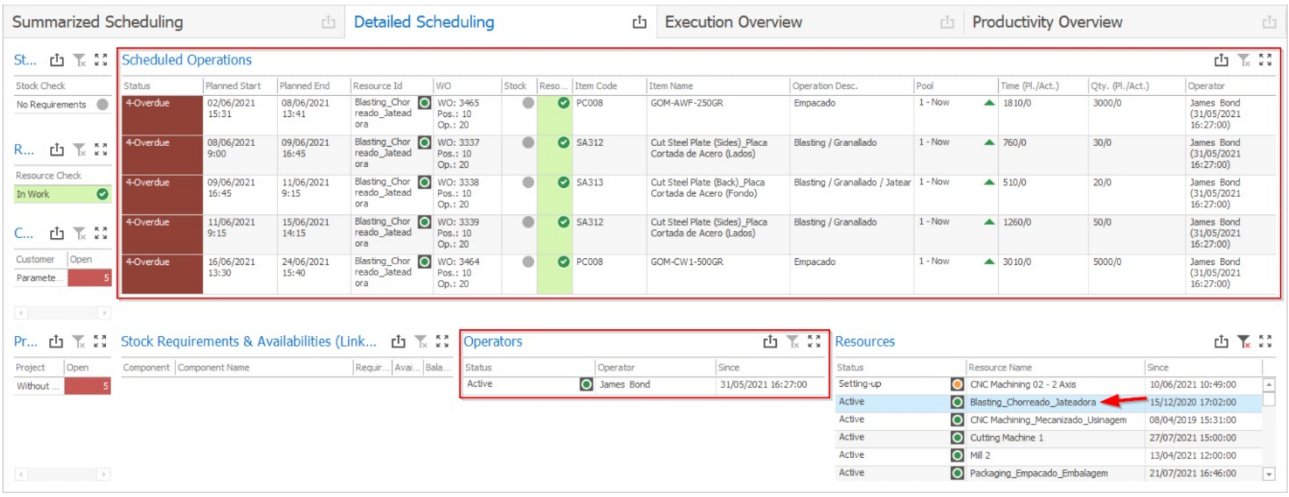
Free: Resource without any active times, interruptions, or production scheduling.

b) **Resource Name:** Description of the resource;

c) **Since**: Date and time that represent since when the resources are on the current status. If the resources have active times, the "Since" column will display the date and time in which the first active production task was logged in by an operator; if they are waiting or free, the "Since" column will display the date and time in which they finished their latest production task. In the cases in which the resources have never worked in production tasks, the "Since" column displays an empty value.

© 2026 Boyum IT Solutions A/S

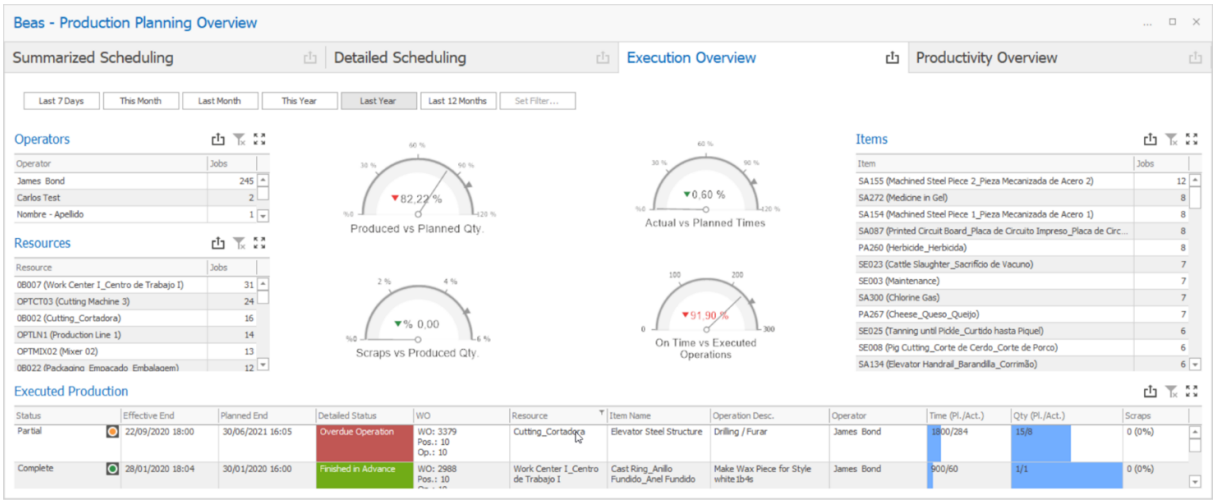
If you wish to know in which routing positions the resources are working, which ones are affected by interruptions, their scheduled tasks, or which operators are currently working on them, you just need to select the desired resource and status and check the results under the Scheduled Operations and Operators grids.



Important: On the Scheduled Operations grid, the routing positions will display the resource that is currently linked to them, not the alternative or parallel resources, while the "Resources" grid, for the "Active" status, shows all currently active resources, even if they are alternative or parallel resources. In situations like these, when you click on a resource from the "Resources" grid that is different from the default resource set to the routing positions, the currently active routing position(s) will not be displayed under the "Scheduled Operations" grid (as the dashboard filters for the exact resource identification). If this happens, you can check the currently active operations for the resource using the Beas function Production Time Administration, inside the Active work order times tab.

© 2026 Boyum IT Solutions A/S

18.5.5.3 Execution Overview Tab



The Execution Overview tab displays a series of KPIs over the executed production that can be easily filtered to calculate the indicators based on operators, resources, or items' performances. Additionally, the Execution Overview tab displays a list of executed routing positions for the selected filters, enabling a detailed performance analysis.

Dashboard sections:

KPIs Area

Operators

Resources

Items

Executed Production

© 2026 Boyum IT Solutions A/S

18.5.5.3.1 KPIs Area

The KPIs area presents four KPIs related to production execution:

a) **Produced vs Planned Qty.**: Comparison between the produced and the planned quantities. Every time that the produced quantities fall below 100% of the planned quantities, a red icon is displayed;

b) **Scraps vs Produced Qty.**: Comparison between the scrapped amount (coming from the scraps registered in the time receipts) and the produces quantities. Every time that the scrapped amount is greater than 5% of the produced quantities, a red icon is displayed;

c) **Actual vs Planned Times**: Comparison between the actual and the planned production times. Every time that the production times are greater than 100% of the planned times, a red icon is displayed;

d) **On Time vs Executed Operations**: Comparison between the routing positions executed before or during the scheduled dates and the total number of executed operations. Every time that the number of on-time operations is below 100%, a red icon is displayed.

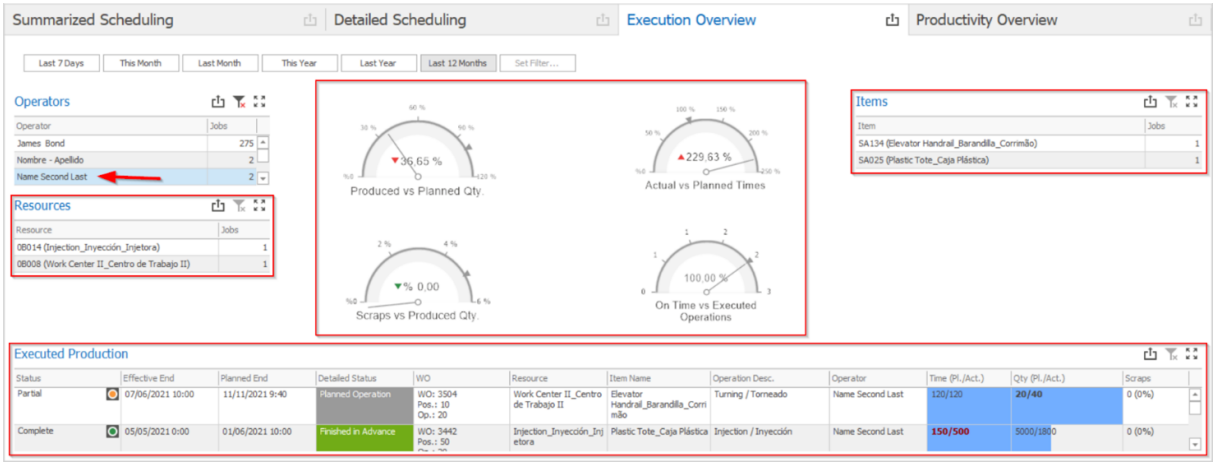
18.5.5.3.2 Operators

Operator	Jobs
James Bond	54
Carlos Test	2
Nombre - Apellido	1
Name Second Last	1

© 2026 Boyum IT Solutions A/S

This grid shows all the operators that have executed production activities and the numbers of jobs (unique routing positions) that they have worked on.

If you wish to see the KPIs for a specific operator, or to know in which resources they have worked on, which items they produced, and which routing positions they completed, you just need to select the desired operator and check the results under the Resources, Items, and Executed Production grids, as well as on the KPIs area.

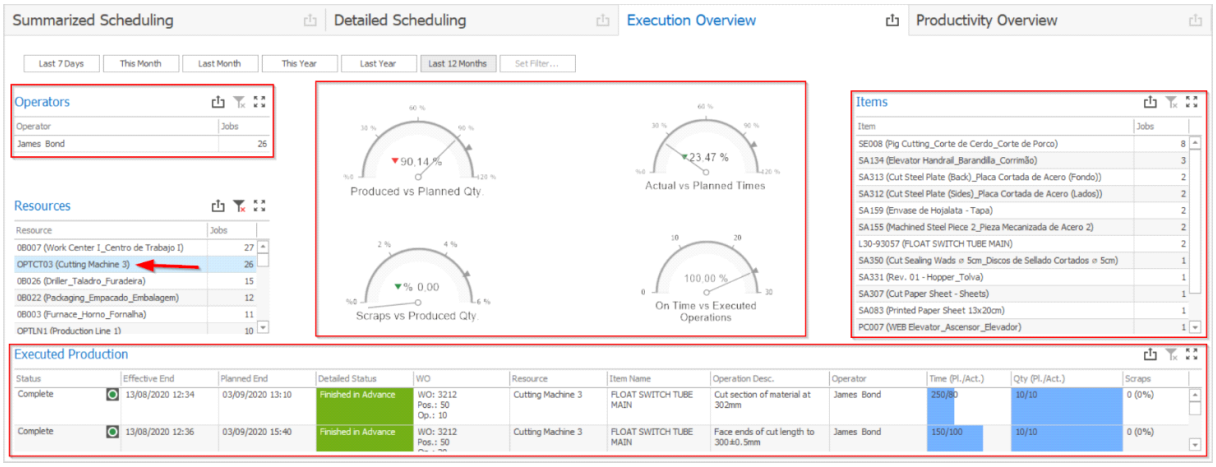


18.5.5.3.3 Resources

This grid shows all the resources that have executed production activities and the numbers of jobs (unique routing positions) that they have worked on.

If you wish to see the KPIs for a specific resource, or to know which operators have worked on them, which items they produced, and which routing positions they completed, you just need to select the desired resource and check the results under the Operators, Items, and Executed Production grids, as well as on the KPIs area.

© 2026 Boyum IT Solutions A/S

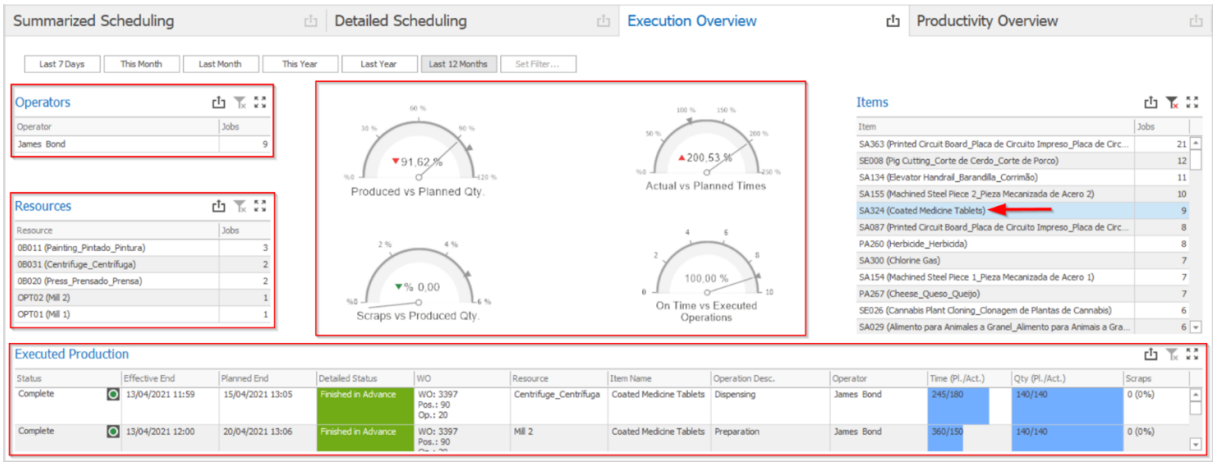


18.5.5.3.4 Items

This grid shows all the manufactured items and the numbers of jobs (unique routing positions) executed for producing them.

If you wish to see the KPIs for a specific item, to know which operators or resources manufactured them, and which routing positions were completed for them, you just need to select the desired item and check the results under the Operators, Resources, and Executed Production grids, as well as on the KPIs area.

© 2026 Boyum IT Solutions A/S



18.5.5.3.5 Executed Production

This grid shows all the executed routing positions for the current set of filters and selections.

a) **Status**: Routing position status, which can be “Partial” or “Complete”:

Partial : Routing position partially executed, but remains open waiting for more time receipts;

Complete : Completed and closed routing position.

b) **Effective End**: Last time receipt’s end date and time for the routing position;

c) **Planned End**: Planned end date and time for the routing position;

d) **Detailed Status**: Specific status to help understanding the situation of each routing position:

Closed routing positions:

Finished on Schedule: Routing position closed during its scheduled dates;

Finished in Advance: Routing position closed before its scheduled dates;

Finished Overdue: Routing position closed after its scheduled dates.

Open routing positions:

Planned Operation: Routing position with end date scheduled for today or for the future;

Overdue Operation: Routing position with end date scheduled for past days.

e) **WO**: Work order number, position number, and routing position number;

f) **Resource**: Description of the resource;

© 2026 Boyum IT Solutions A/S

g) **Item Name**: Description of the item;

h) **Operation Desc**.: Description of the routing position;

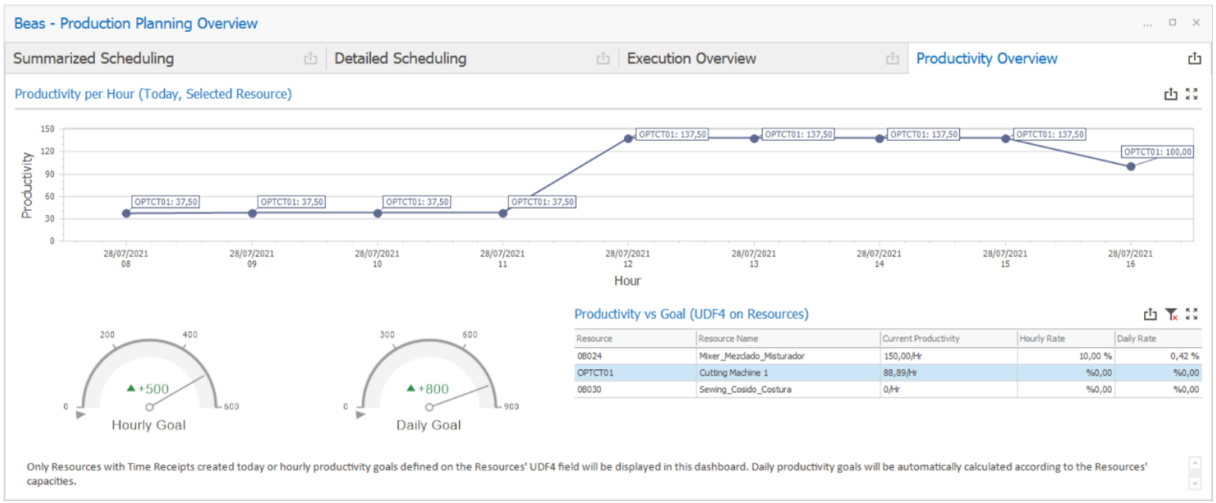
i) **Operator**: Name of the operator that registered time receipts for the routing position. When more than one operator have worked on the same routing position, all of them will appear as individual rows in the "Executed Production" grid;

j) **Time (Pl./Act.)**: Times (planned / actual). A blue progress bar represent how much of the planned times were already reported and, in the cases where actual times surpassed the planned times, the values are highlighted in bold dark red **45/60**;

k) **Qty. (Pl./Act.)**: Quantity (planned / actual). A blue progress bar represent how much of the planned quantities were already produced and, in the cases where actual production surpassed the planned amounts, the values are highlighted in bold dark gray **100/150**;

l) **Scraps**: Amount of scraps registered for the routing position and their representativeness over the produced quantities.

18.5.5.4 Productivity Overview Tab



The Productivity Overview tab shows how the resources' productivity per hour is evolving at each hour of the day, as well as enable you to define productivity goals and track how close or far you are from them.

This tab only presents data from the current day (resources that have worked today) and/or resources who have productivity goals defined for them.

Dashboard sections:

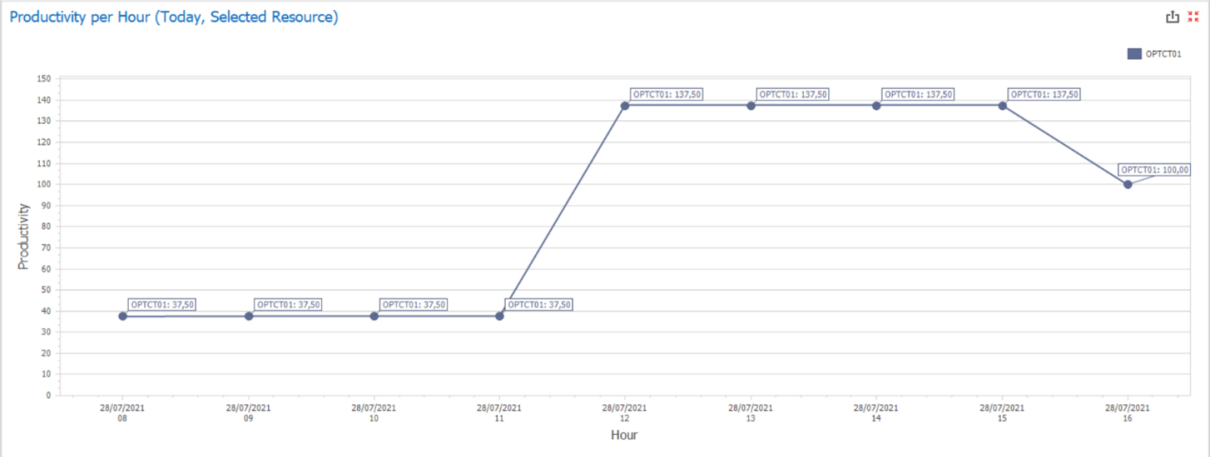
Productivity Per Hour (Today, Selected Resource)

KPIs Area

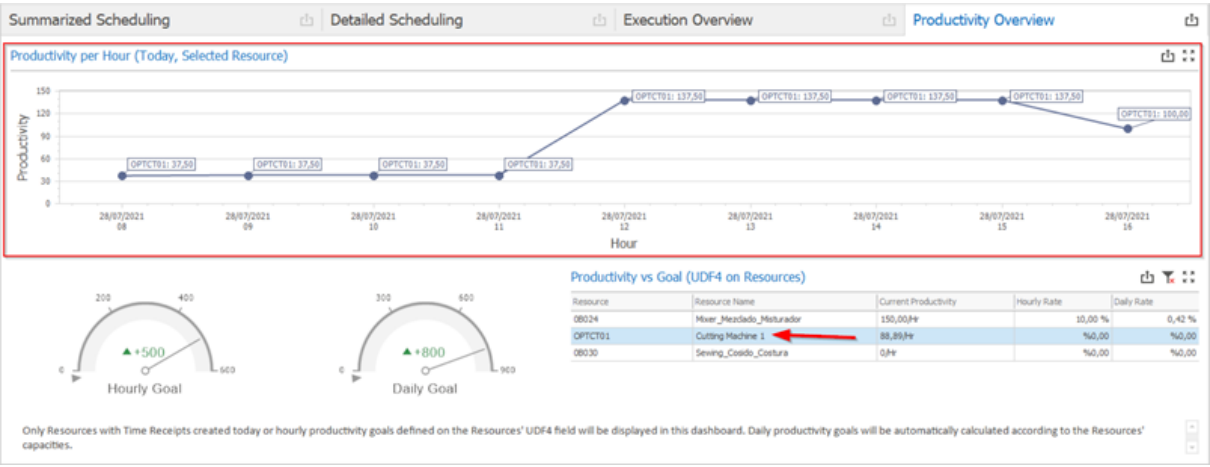
Productivity vs. Goal (UDF on Resources)

© 2026 Boyum IT Solutions A/S

18.5.5.4.1 Productivity Per Hour (Today, Selected Resource)



This chart displays how the productivity is varying for the selected resource at each hour of the day, considering the quantities produced per hour (when the time receipts last for more than one hour, the total quantity is divided by the number of hours and showed across all the hours covered by the time receipt). The resources can be selected from the Productivity vs Goal (UDF4 on Resources) grid.



18.5.5.4.2 KPIs Area

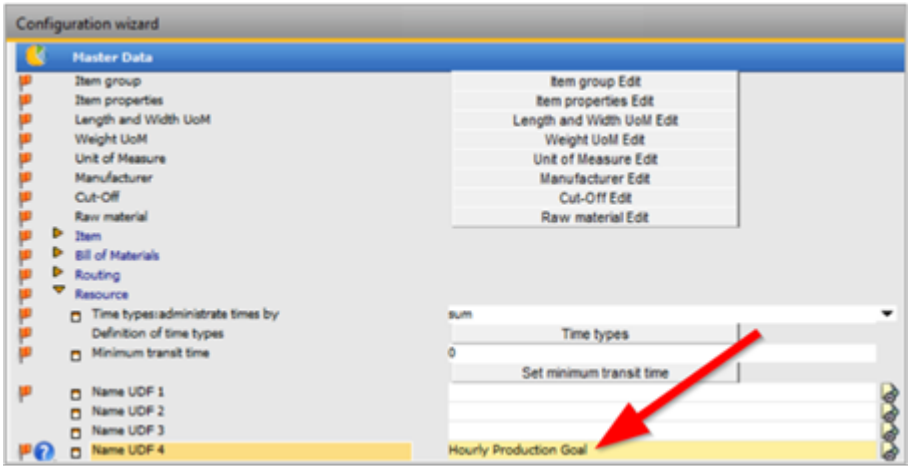
© 2026 Boyum IT Solutions A/S

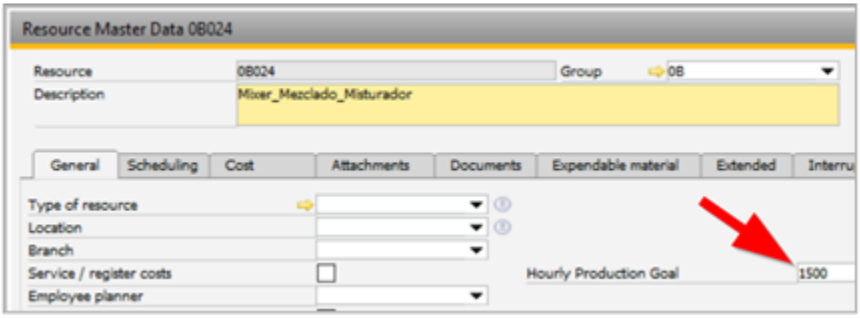
The KPIs area presents two KPIs related to resources' productivities:

a) **Hourly Goal**: Completion of the hourly production goals defined for the resources, retrieving all time receipts that ended in the current hour (this KPI resets every hour). This KPI is shown in absolute values, the corresponding percentages is displayed on the Productivity vs Goal (UDF4 on Resources) grid;

b) **Daily Goal**: Completion of the daily production goals defined for the resources, retrieving all time receipts that ended in the current day (this KPI resets every day). This KPI is shown in absolute values, the corresponding percentages is displayed on the Productivity vs Goal (UDF4 on Resources) grid.

Important: The hourly production goals should be defined in the Resource master data, using the UDF4 (if not enabled, you can enable the UDF4 on the Configuration Wizard). The daily production goals are automatically calculated according to the resources' capacities (for example, if a resource has 8 hours of capacity per day, the goal will be multiplied by 8), considering all planned downtimes and interruptions.





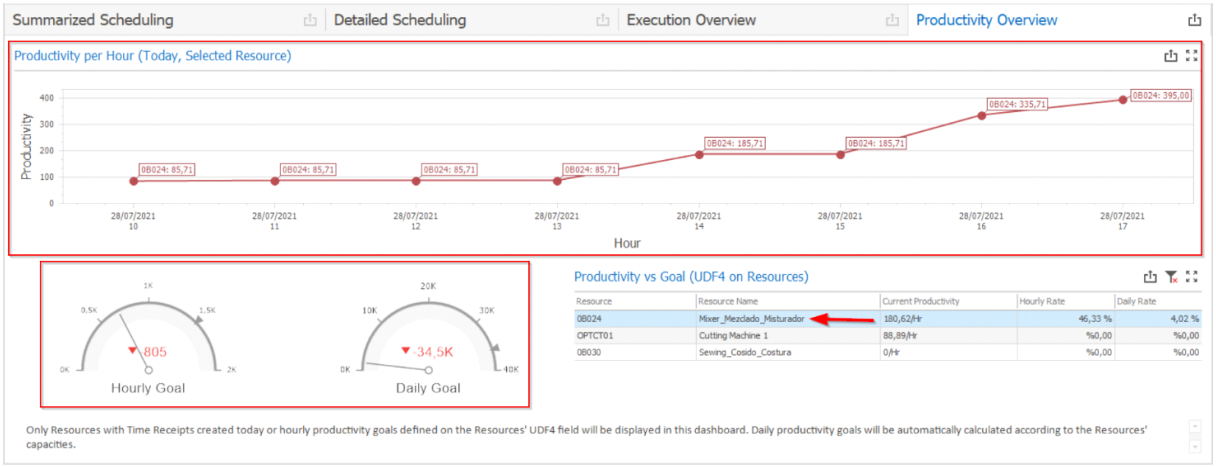
© 2026 Boyum IT Solutions A/S

18.5.5.4.3 Productivity vs. Goal (UDF4 on Resources)

Productivity vs Goal (UDF4 on Resources)

Resource	Resource Name	Current Productivity	Hourly Rate	Daily Rate
0B024	Mixer_Mezclado_Misturador	180,62/Hr	46,33 %	4,02 %
OPTCT01	Cutting Machine 1	88,89/Hr	%0,00	%0,00
0B030	Sewing_Cosido_Costura	0/Hr	%0,00	%0,00

This grid gives you the possibility of tracking the current average productivity per hour and how the productivity goals are being met for each resource, both hourly and daily.
If you with to view the evolution of productivity hour by hour in the day, or to see the absolute values for the resource's hourly and daily production against its goals, you just need to select the desired resource and check the results under the Productivity per Hour (Today, Selected Resource) chart and on the KPIs area.



18.5.6 Capacity Utilization

The Capacity Utilization dashboard contains a series of analytical views to achieve a deep understanding about how the company's production capacity is being utilized and how productive manufacturing resources are, considering different kinds of losses that might affect availability and productivity.

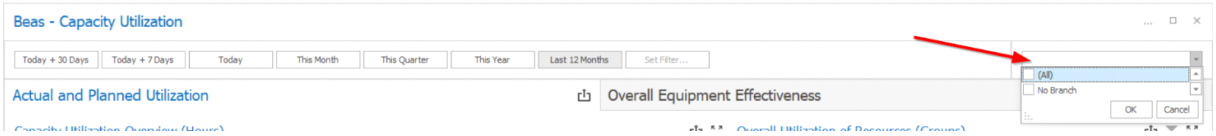
This dashboard contains two tabs:
Actual and Planned Utilization Tab
Overall Equipment Effectiveness (OEE) Tab

The data can be filtered using the pre-made filters for defined time ranges (today + 30 days, today + 7 days, today, this month, this quarter, this year, and last 12 months). Manual filtering can be done

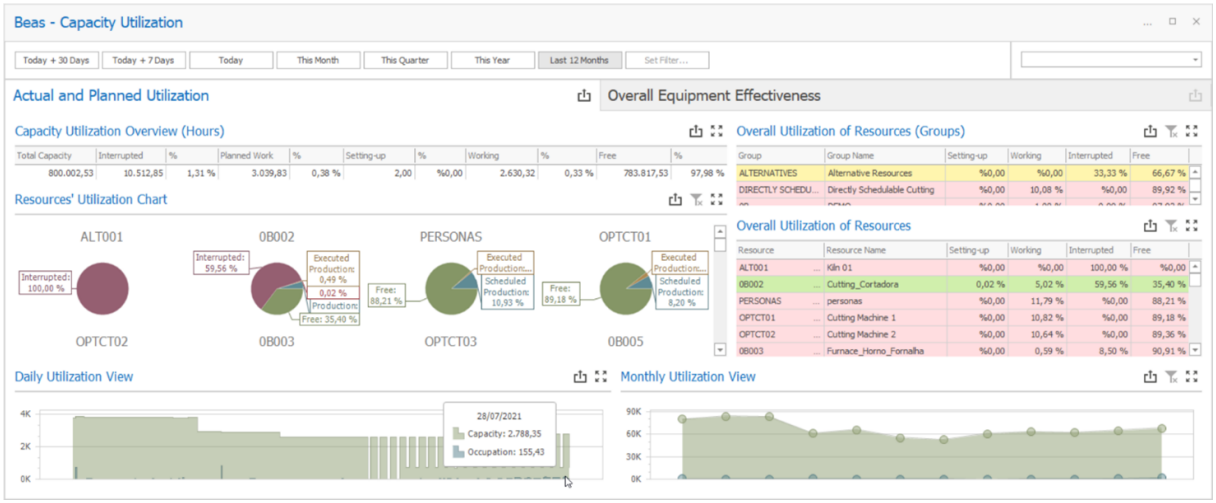
© 2026 Boyum IT Solutions A/S

by clicking on “Set Filter…”. For performance reasons, this dashboard will load data from the current and from the previous year only.

When using this dashboard on multibranch databases, the desired branches can be selected using the filter on the upper right corner of the dashboard. If there is no branch created for the databases, “No Branch” will be the only available option.



18.5.6.1 Actual and Planned Utilization Tab



The Actual and Planned Utilization displays how the company’s capacity is being utilized, either in terms of executed or scheduled production, and times wasted on setups or interruptions. The capacity utilization can be seen in global numbers, per resource group and per resource, as well as per day and per month. Additionally, the Actual and Planned Utilization tab will interact with the Overall Equipment Effectiveness tab, meaning that any filters or selections applied on Actual and Planned Utilization will also filter the data under the Overall Equipment Effectiveness tab.

Dashboard sections:

Capacity Utilization Overview (Hours)

Resources' Utilization Chart

Overall Utilization of Resources (Groups)

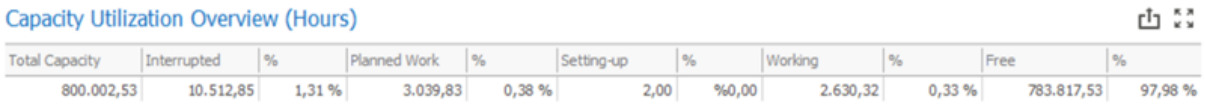
Overall Utilization of Resources

© 2026 Boyum IT Solutions A/S

Daily Utilization View

Monthly Utilization View

18.5.6.1.1 Capacity Utilization Overview (Hours)

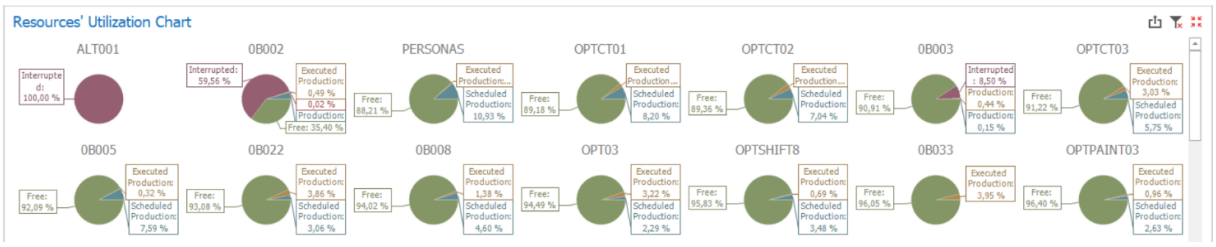


Total Capacity	Interrupted	%	Planned Work	%	Setting-up	%	Working	%	Free	%
800.002,53	10.512,85	1,31 %	3.039,83	0,38 %	2,00	%0,00	2.630,32	0,33 %	783.817,53	97,98 %

This single row report details the usage of the capacity for the selected parameters, combining the time range filter to the chosen resource groups or resources.

a) **Total Capacity**: Total capacity in hours, summing the capacities from all the resources;
b) **Interrupted**: Total interruption hours registered for the resources. Interruptions can come from planned downtimes, like preventive maintenances, or unplanned downtimes, like broken machines. When an interruption is created without a planned end date, it might affect the resource's capacity for a long period until it is ended; therefore, whenever the planned end date could be estimated, it is recommended to update the interruptions with the corresponding planned end dates;
c) **Planned Work**: Total scheduled (and not executed) work hours for the resources (if the time range is in the past, having values on "Planned Work" means that there are open and overdue work orders with planned dates for the past);
d) **Setting-up**: Total setup times registered for the resources (time receipts created for the "Setup" time type; if the "Setup" time type is not enabled for the resources, all times are registered and considered as production times);
e) **Working**: Total work hours registered for the resources (time receipts created for all time types that are not "Setup"; if not using more than one time type, all times are considered as production times);
f) **Free**: Remaining capacity after discounting interruptions, scheduled work, setup times, and work times.

18.5.6.1.2 Resources' Utilization Chart



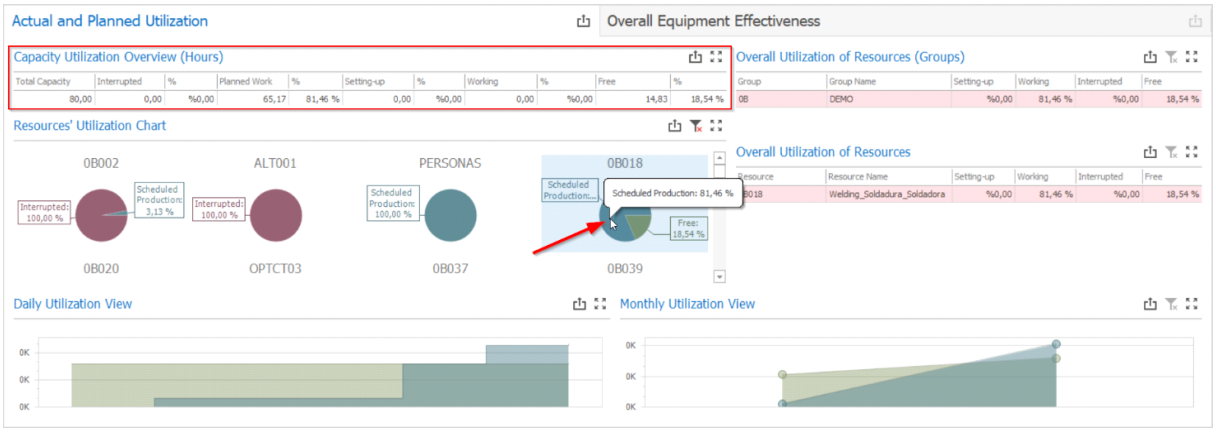
This pie chart shows how the capacities from each resource are used, slicing them into four parts (see detailed explanations under " Capacity Usage Overview (Hours)"):

© 2026 Boyum IT Solutions A/S

a) **Interrupted**: Total interruption hours registered for the resource;
b) **Scheduled Production**: Total scheduled (and not executed) work hours for the resource;
c) **Setting Up**: Total setup times registered for the resource;
d) **Executed Production**: Total work hours registered for the resource;
e) **Free**: Remaining capacity after discounting interruptions, scheduled work, setup times, and work times.

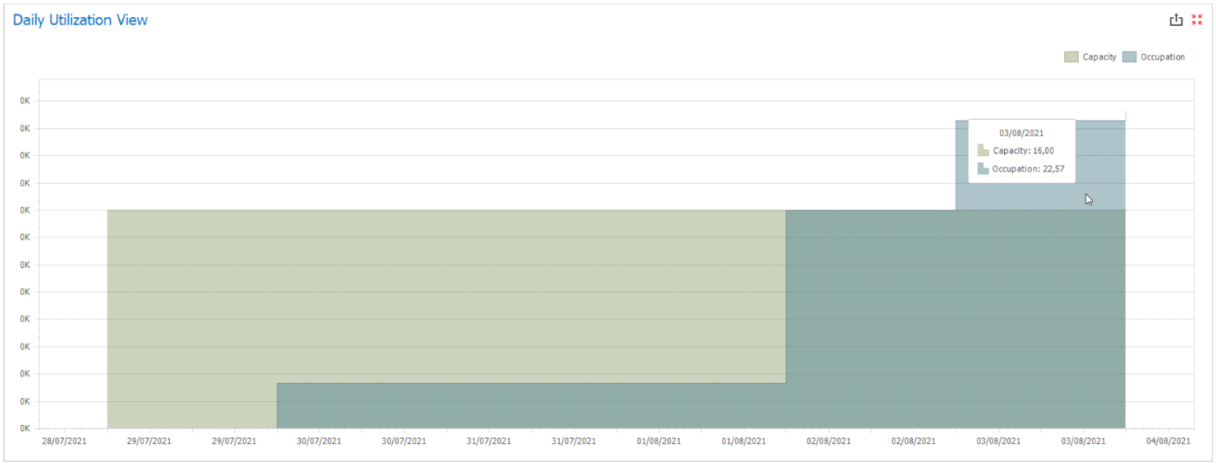
The resources are displayed according to the applied filter. For example, if you wish to check how all the resources will be occupied in the next seven days, you just need to select “Next 7 Days” on the time range filters. Then, if you wish to filter further for specific resource groups or resources, you can select them on the corresponding charts. The same can be done for filtering specific months, using the “Capacity Usage Overview” chart.,

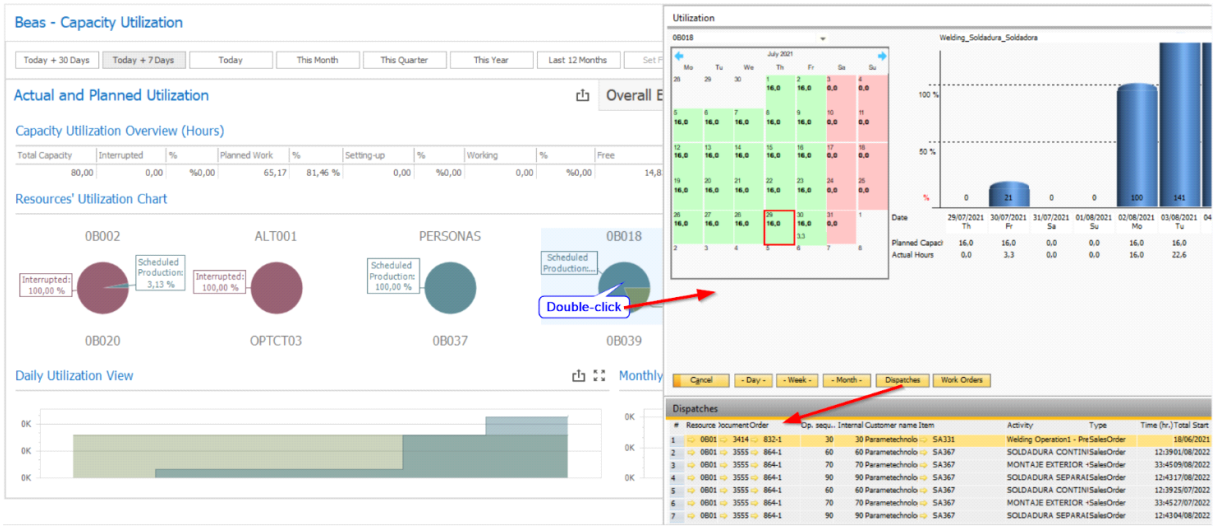
The resources are displayed according to the applied filters. For example, if you wish to check how all the resources will be occupied in the next seven days, you just need to select “Today + 7 Days” on the time range filters. In the Resources’ Utilization chart, the utilizations are always represented in percentual values; to know the absolute values corresponding to the percentages of a specific resource, you just need to select the desired resource and check the results on the “Capacity Utilization Overview (Hours)” grid.



Then, if you wish to understand how the utilization evolves on each day of the week or of the month, you can either check the Daily Utilization View chart, or double-click the resource to trigger a B1UP Universal Function embedded into the dashboard for automatically opening the Beas Graphic Display Utilization function. If you wish to activate this feature, which also allows you to navigate into the resources’ dispatches and view the scheduled work orders, you must download the UF and import it into B1UP. **DOWNLOAD:** Right-click on the link DASH-CAP-CAPACITY and Save the xml file.

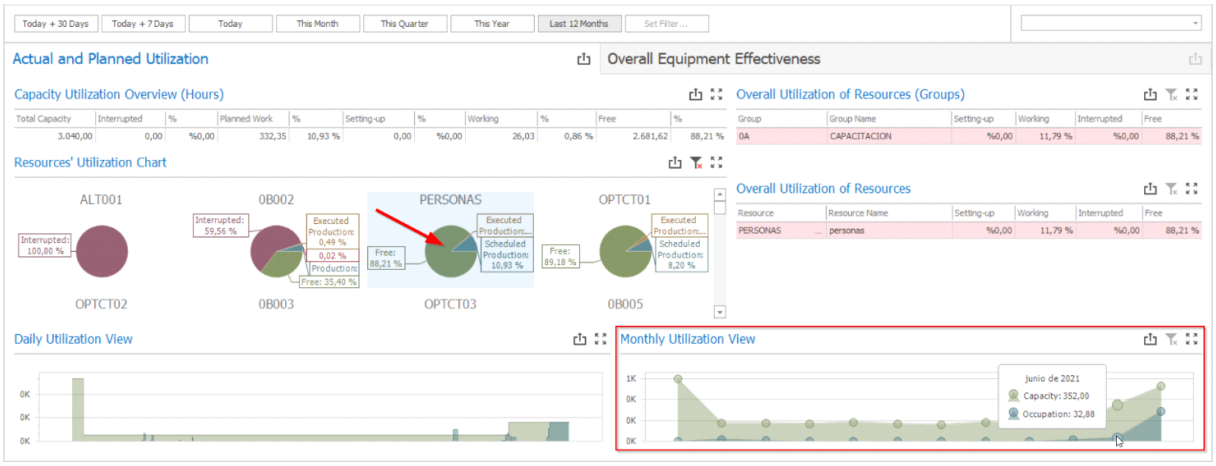
© 2026 Boyum IT Solutions A/S





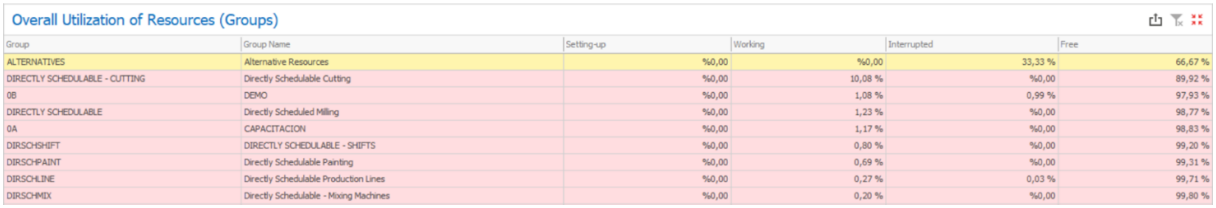
When choosing a time range that covers several months, it is also possible to understand how the capacity of a single resource was used across the different months by clicking on the resource and checking the results under the “Monthly Utilization View” chart.

© 2026 Boyum IT Solutions A/S



Important: For both "Daily Utilization View" and "Monthly Utilization View" charts, occupation will be expressed in terms of the executed and scheduled production. Interruptions and setup times will not be part of the occupation calculation.

18.5.6.1.3 Overall Utilization of Resources (Groups)



This report details how the capacities of the entire resource groups are used, revealing the following information:

a) **Setting-Up:** Total setup times registered for the resources;
b) **Working:** Total scheduled and executed work times registered for the resources;
c) **Interrupted:** Total interruption hours registered for the resources;
d) **Free:** Remaining capacity after discounting interruptions, scheduled work, setup times, and work times.

By default, three colors can be applied to the report rows. The colors can be customized by editing the dashboard and defining new color rules.

Red: Free capacity greater than 80%, or less than 20%;

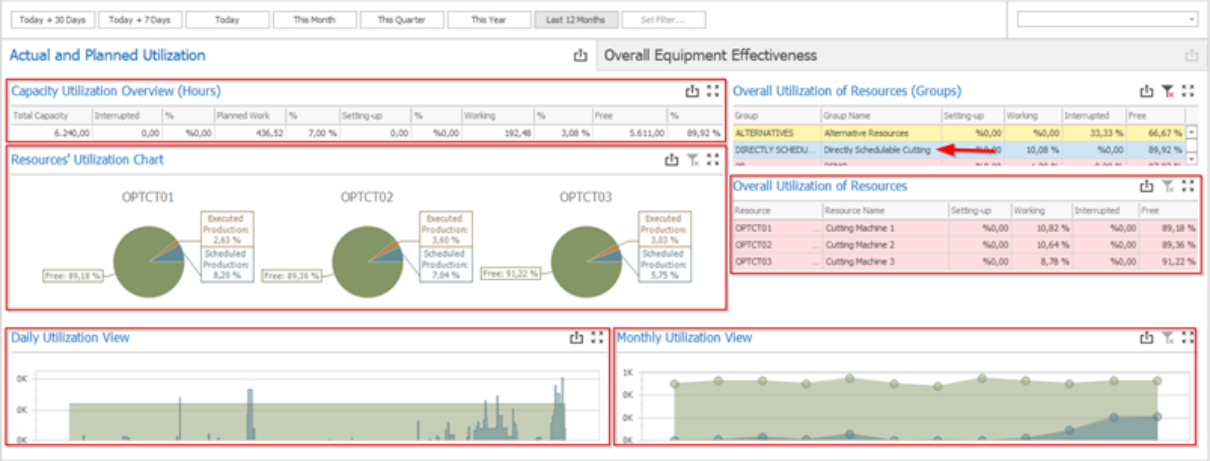
Yellow: Free capacity between 40% and 80%;

Green: Free capacity between 20% and 40%;

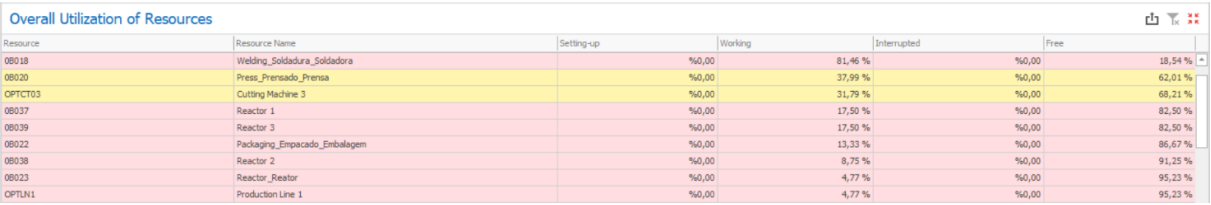
Any resource group can be selected for further insights on how the capacities are or were used (triggering filters on the other reports and charts from the dashboard). If you wish to check how the

© 2026 Boyum IT Solutions A/S

capacities of a single resource group were used, you can just click on the desired resource group and check the results under the Capacity Utilization Overview (Hours), the Resources' Utilization Chart, the Daily Utilization View, the Monthly Utilization View, and Overall Utilization of Resources sections.



18.5.6.1.4 Overall Utilization of Resources



This report details how the capacities of the resources are used, revealing the following information:

a) **Setting-Up**: Total setup times registered for the resource;
b) **Working:** Total scheduled and executed work times registered for the resource;
c) **Interrupted:** Total interruption hours registered for the resource;
d) **Free**: Remaining capacity after discounting interruptions, scheduled work, setup times, and work times.

By default, three colors can be applied to the report rows. The colors can be customized by editing the dashboard and defining new color rules.

Red: Free capacity greater than 80%, or less than 20%;

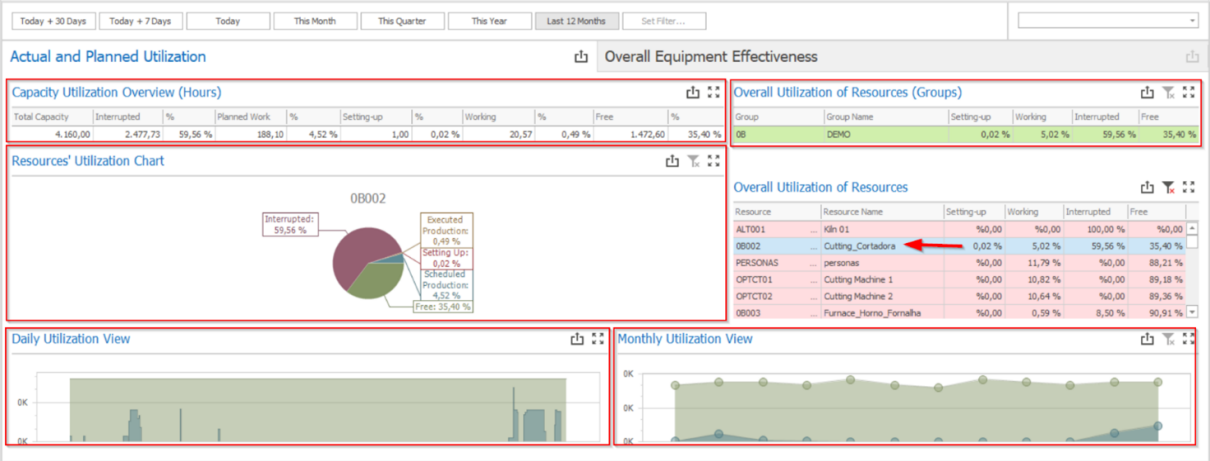
Yellow: Free capacity between 40% and 80%;

Green: Free capacity between 20% and 40%;

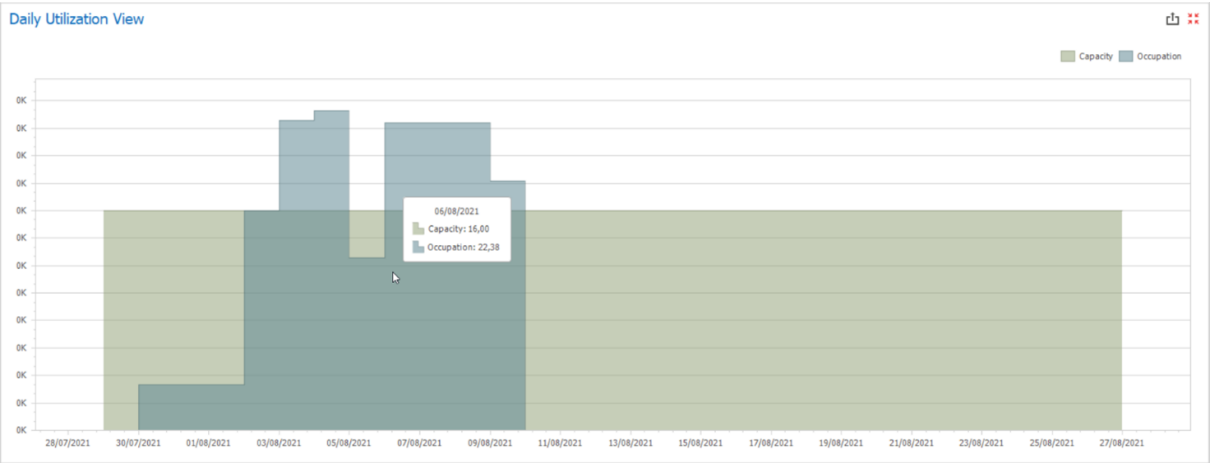
Any resource can be selected for further insights on how its capacity is or was used (triggering filters on the other reports and charts from the dashboard). If you wish to check how the capacities of a

© 2026 Boyum IT Solutions A/S

single resource were used, you can just click on the desired resource and check the results under the Capacity Utilization Overview (Hours), the Resources' Utilization Chart (Groups), the Daily Utilization View, the Monthly Utilization View, and the Overall Utilization of Resources (Groups) sections.



18.5.6.1.5 Daily Utilization View

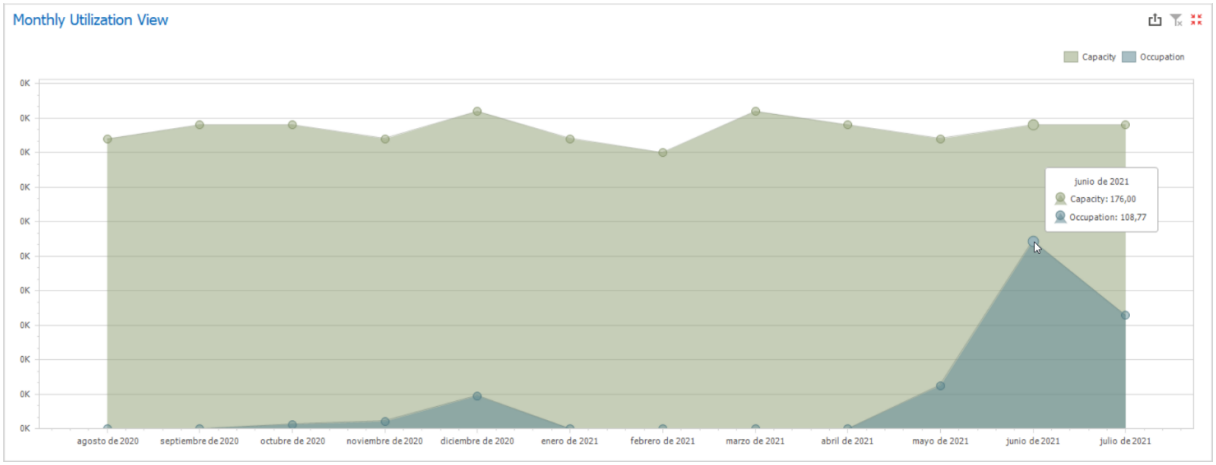


This chart combines two information in a single area with different colors, displaying the resources' capacities and occupations for each day (occupation = scheduled work + executed work, setups and interruptions are not considered as occupation). The Daily Utilization View will always present a summarized analysis for the selected filters, giving you the possibility to view capacity and occupation across the entire factory, for entire resource groups, or for single resources.

Important: All days with zero capacity are ignored, to improve the chart's visualization and the dashboard's performance.

© 2026 Boyum IT Solutions A/S

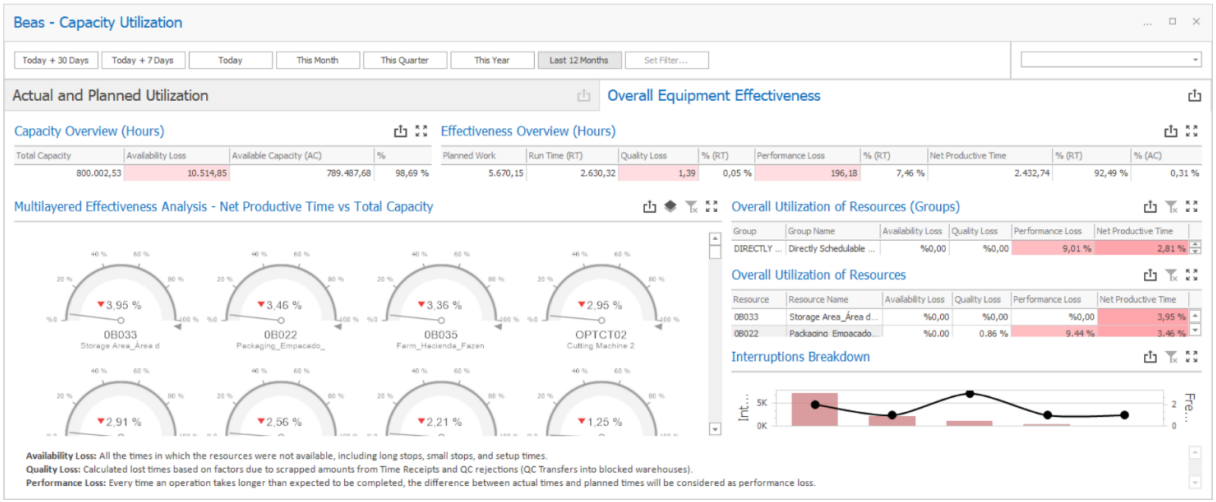
18.5.6.1.6 Monthly Utilization View



This chart combines two information in a single area with different colors, displaying the resources' capacities and occupations for each month (occupation = scheduled work + executed work, setups and interruptions are not considered as occupation). The Monthly Utilization View will always present a summarized analysis for the selected filters, giving you the possibility to view capacity and occupation across the entire factory, for entire resource groups, or for single resources.

Any month can be selected for further insights on how the capacities are or were used, triggering filters on the other grids and charts from the dashboard.

18.5.6.2 Overall Equipment Effectiveness (OEE) Tab



The Overall Equipment Effectiveness, or OEE, is a gold standard KPI for measuring manufacturing productivity, clearly indicating how effective the different resources are. The calculation of the OEE considers three losses to calculate effectiveness:

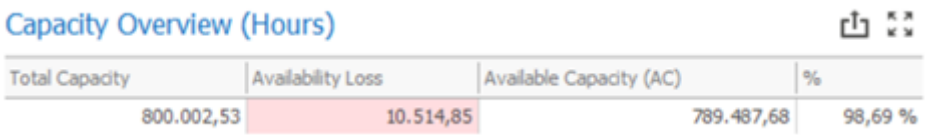
a) **Availability Loss**: All the times in which the resources were not available, including long stops, small stops, and setup times. The availability loss is used to calculate the Available Capacity (AC), by discounting it from the Total Capacity;
b) **Quality Loss**: Calculated lost times based on factors due to scrapped amounts from Time Receipts and QC rejections (QC Transfers into blocked warehouses). The quality loss is used, in combination to the performance loss, to calculate the Net Productive Time, by discounting it from the Run Time (RT);
c) **Performance Loss**: Every time an operation takes longer than expected to be completed, the difference between actual times and planned times will be considered as performance loss. The performance loss is used, in combination to the quality loss, to calculate the Net Productive Time, by discounting it from the Run Time (RT).

The Overall Equipment Effectiveness tab will interact with the Actual and Planned Utilization tab, meaning that any filters or selections applied on Overall Equipment Effectiveness will also filter the data under Actual and Planned Utilization tab.

Dashboard sections:

Capacity Overview (Hours)
Effectiveness Overview (Hours)
Multi-layered Effectiveness Analysis
Overall Utilization of Resources (Groups)
Overall Utilization of Resources
Interruptions Breakdown

18.5.6.2.1 Capacity Overview (Hours)



This single row report details the usage of the capacity for the selected parameters, combining the time range filter to the chosen resource groups or resources.

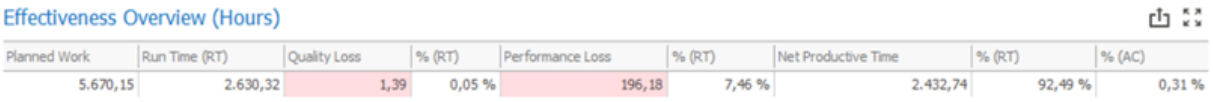
a) **Total Capacity**: Total capacity in hours, summing the capacities from all the resources;
b) **Availability Loss**: All the times in which the resources were not available, including long stops, small stops, and setup times;

© 2026 Boyum IT Solutions A/S

c) **Available Capacity (AC):** Calculated availability after discounting non-available times (due to availability loss) from the total capacity;

d) **%:** Available Capacity (AC) divided by Total Capacity, resulting in how much of the capacity was lost due to planned or unplanned stops.

18.5.6.2.2 Effectiveness Overview (Hours)



Planned Work	Run Time (RT)	Quality Loss	% (RT)	Performance Loss	% (RT)	Net Productive Time	% (RT)	% (AC)
5.670,15	2.630,32	1,39	0,05 %	196,18	7,46 %	2.432,74	92,49 %	0,31 %

This single row report details the factory's effectiveness for the selected parameters, combining the time range filter to the chosen resource groups or resources.

a) **Planned Work**: Sum of the total scheduled and executed production times for the resources;

b) **Run Time (RT)**: Total executed production times for the resources, not considering setup times;

c) **Quality Loss**: Calculated lost times based on factors due to scrapped amounts from Time Receipts and QC rejections (QC Transfers into blocked warehouses);

d) **% (RT):** Quality Loss divided by Run Time (RT), resulting in how much of the run time was lost due to bad quality;

e) **Performance L**oss: Every time an operation takes longer than expected to be completed, the difference between actual times and planned times will be considered as performance loss (**important**: only underperformance affects the "Performance Loss" calculation; overperformance will not be discounted from "Performance Loss");

f) **% (RT)**: Performance Loss divided by Run Time (RT), resulting in how much of the run time was lost due to underperformance;

g) **Net Productive Ti**me: Run Time discounted from Quality Loss and Performance Loss, discounting in the real productive time for the entire company or selected parameters and filters;

h) **% (RT**): Net Productive Time divided by Run Time (RT), resulting in how effective the executed production times after were discounting the losses;

i) **% (AC)**: Net Productive Time divided by Available Capacity (AC), resulting in the OEE calculation for the entire company or selected parameters and filters.

18.5.6.2.3 Multilayered Effectiveness Analysis

This gauge chart provides three layers for understanding the resources' effectiveness, which are:

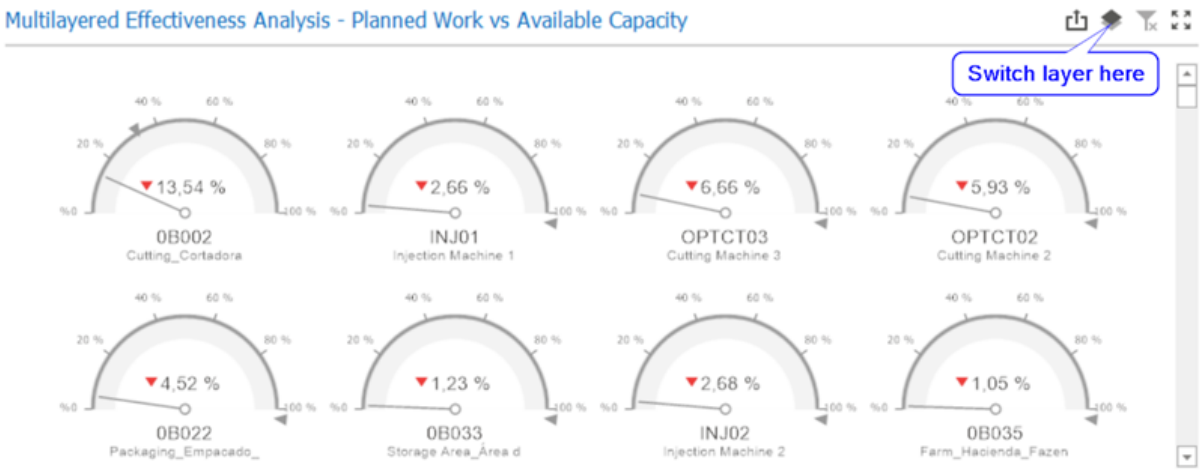
a) **Net Productive Time vs Total Capacity**: Net Productive Time divided by Total Capacity, without discounting availability losses (this is not the OEE calculation). This layer represents how effective the factory would be if there were no downtimes or setup times in production. A red icon is displayed every time that the Net Productive Time is lower than 70% of the Total Capacity;

© 2026 Boyum IT Solutions A/S

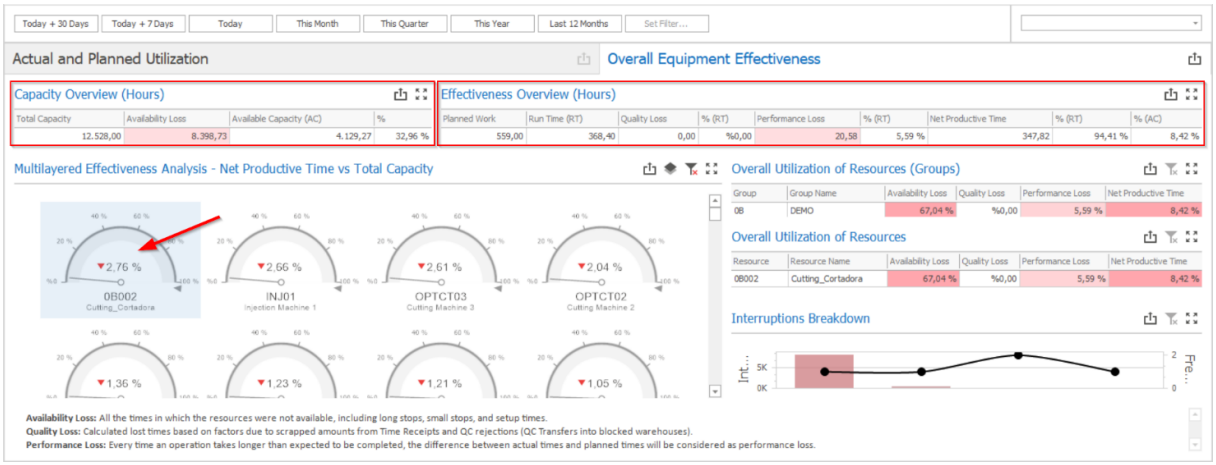
b) **Net Productive Time vs Available Capacity**: Net Productive Time divided by Available Capacity (AC), resulting in the OEE calculation for each resource. A red icon is displayed every time that the Net Productive Time is lower than 70% of the Available Capacity;

c) **Planned Work vs Available Capacity**: Planned Work (scheduled production plus executed production) divided by Available Capacity, without discounting quality and performance losses (this is **not** the OEE calculation). This layer represents how effective the factory would be if there were no losses related to how the production is being executed A red icon will be displayed every time that the Planned Work is lower than 70% of the Available Capacity.

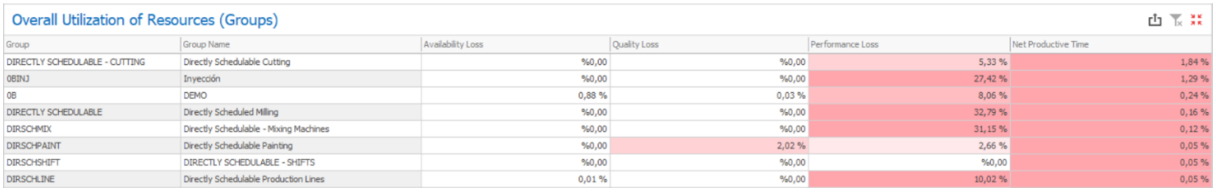
© 2026 Boyum IT Solutions A/S



In the Multilayered Effectiveness Analysis chart, the calculations is always represented in percentual values; to know the absolute values corresponding to the percentages of a specific resource, you just need to select the desired resource and check the results on the Capacity Overview (Hours) and the Effectiveness Overview (Hours) grids.



18.5.6.2.4 Overall Utilization of Resources (Groups)



Group	Group Name	Availability Loss	Quality Loss	Performance Loss	Net Productive Time
DIRECTLY SCHEDULABLE - CUTTING	Directly Schedulable Cutting	%0,00	%0,00	5,33 %	1,84 %
0BINJ	Inyección	%0,00	%0,00	27,42 %	1,29 %
0B	DEMO	0,88 %	0,03 %	8,06 %	0,24 %
DIRECTLY SCHEDULABLE	Directly Scheduled Milling	%0,00	%0,00	32,79 %	0,16 %
DIRSCHMIX	Directly Schedulable - Mixing Machines	%0,00	%0,00	31,15 %	0,12 %
DIRSCHPAINT	Directly Schedulable Painting	%0,00	2,02 %	2,66 %	0,05 %
DIRSCHSHIFT	DIRECTLY SCHEDULABLE - SHIFTS	%0,00	%0,00	%0,00	0,05 %
DIRSCHLINE	Directly Schedulable Production Lines	0,01 %	%0,00	10,02 %	0,05 %

This report details how effective are the different resource groups, revealing the following information:

© 2026 Boyum IT Solutions A/S

a) **Availability Loss**: Available Capacity (AC) divided by Total Capacity, resulting in how much of the capacity was lost due to planned or unplanned stops. This column is colored in a red scale to represent how large the availability losses were:

100.00 %	>=	25,00 %
25,00 %	>=	20,00 %
20,00 %	>=	10,00 %
10,00 %	>=	5,00 %
5,00 %	>=	0,00 %

b) **Quality Loss**: Quality Loss divided by Run Time (RT), resulting in how much of the run time was lost due to bad quality. This column is colored in a red scale to represent how large the quality losses were:

100.00 %	>=	4,00 %
4,00 %	>=	3,00 %
3,00 %	>=	2,00 %
2,00 %	>=	1,00 %
1,00 %	>=	0,00 %

c) **Performance Loss**: Performance Loss divided by Run Time (RT), resulting in how much of the run time was lost due to underperformance. This column is colored in a red scale to represent how large the performance losses were:

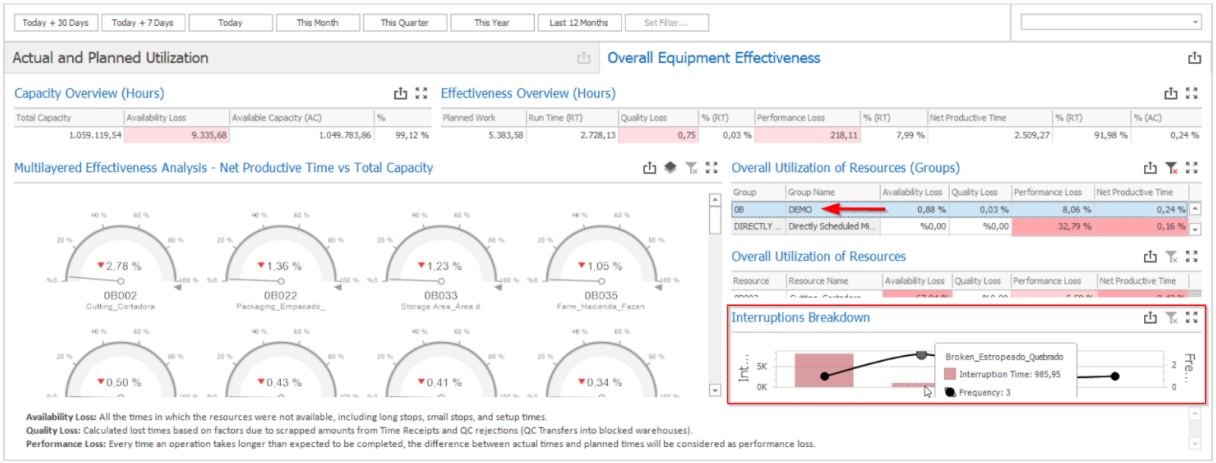
100.00 %	>=	10,00 %
10,00 %	>=	7,00 %
7,00 %	>=	5,00 %
5,00 %	>=	2,00 %
2,00 %	>=	0,00 %

d) **Net Productive Time**: Net Productive Time divided by Available Capacity (AC), resulting in the OEE calculation for the resource group. This column is colored in a green and red scale to represent how efficient the resources were:

100.00 %	>=	70,00 %
70,00 %	>=	60,00 %
60,00 %	>=	50,00 %
50,00 %	>=	40,00 %
40,00 %	>=	0,00 %

© 2026 Boyum IT Solutions A/S

Any resource group can be selected for further insights on how efficient their resources are (triggering filters on the other grids and charts from the dashboard). If you wish to check which interruptions affected the resources within a specific group and how much time was lost for each one of them, you can just click on the desired resource group and check the results under the "Interruptions Breakdown" grid.



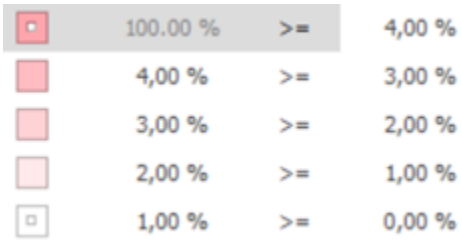
18.5.6.2.5 Overall Utilization of Resources

This report details the efficiency of the different resources, revealing the following information:

a) **Availability Loss**: Available Capacity (AC) divided by Total Capacity, resulting in how much of the capacity was lost due to planned or unplanned stops. This column is colored in a red scale to represent how large the availability losses were:

b) **Quality Loss**: Quality Loss divided by Run Time (RT), resulting in how much of the run time was lost due to bad quality. This column is colored in a red scale to represent how large the quality losses were:

© 2026 Boyum IT Solutions A/S

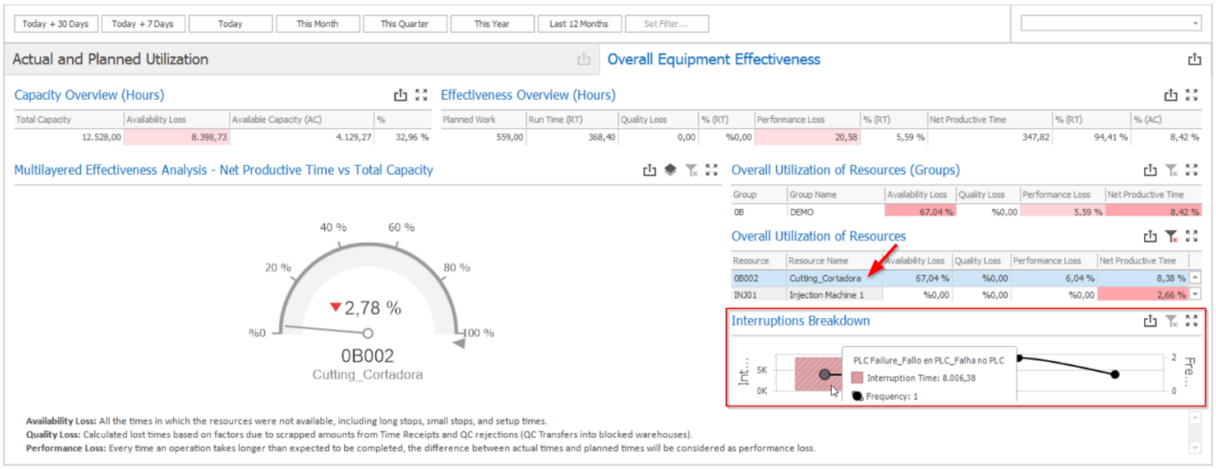


c) **Performance Loss**: Performance Loss divided by Run Time (RT), resulting in how much of the run time was lost due to underperformance. This column is colored in a red scale to represent how large the performance losses were:

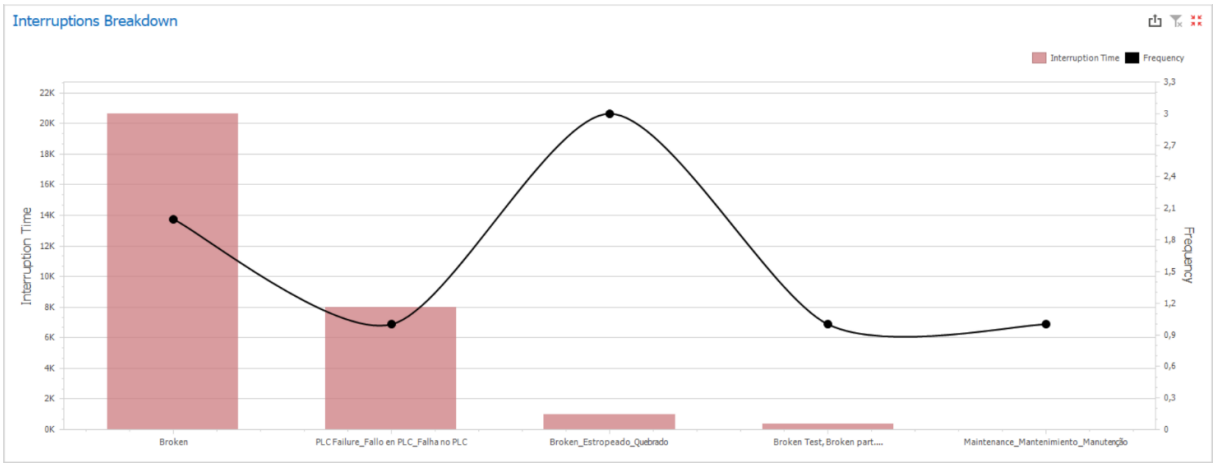
d) **Net Productive Time**: Net Productive Time divided by Available Capacity (AC), resulting in the OEE calculation for the resource group. This column is colored in a green and red scale to represent how efficient the resources were:

Any resource can be selected for further insights on how efficient they are (triggering filters on the other grids and charts from the dashboard). If you wish to check which interruptions affected a specific resource and how much time was lost for each one of them, you can just click on the desired resource and check the results under the Interruptions Breakdown grid.

© 2026 Boyum IT Solutions A/S



18.5.6.2.6 Interruptions Breakdown

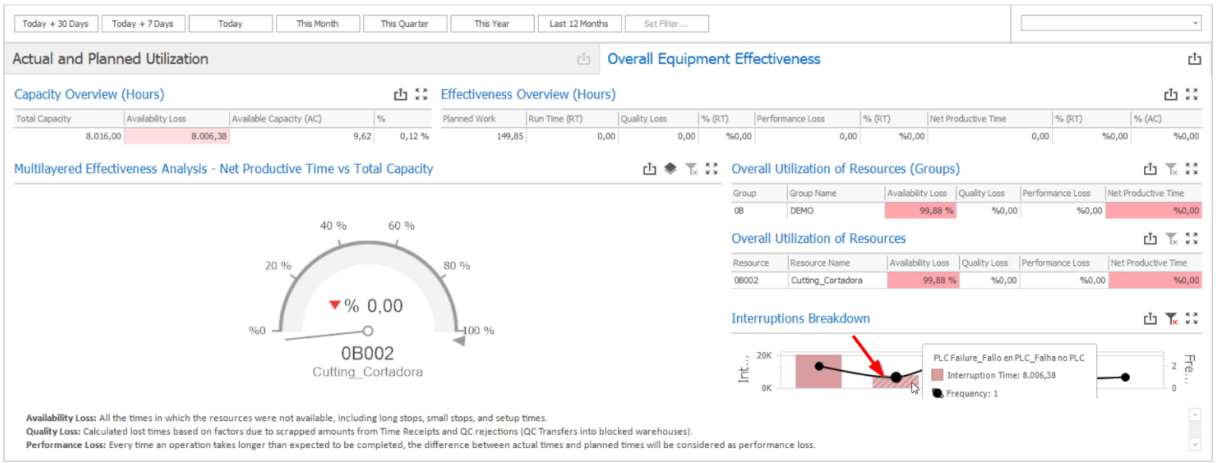


This chart combines two information in a single view: times lost for each interruption reason (red bars) and the frequency of each interruption reason (black line).

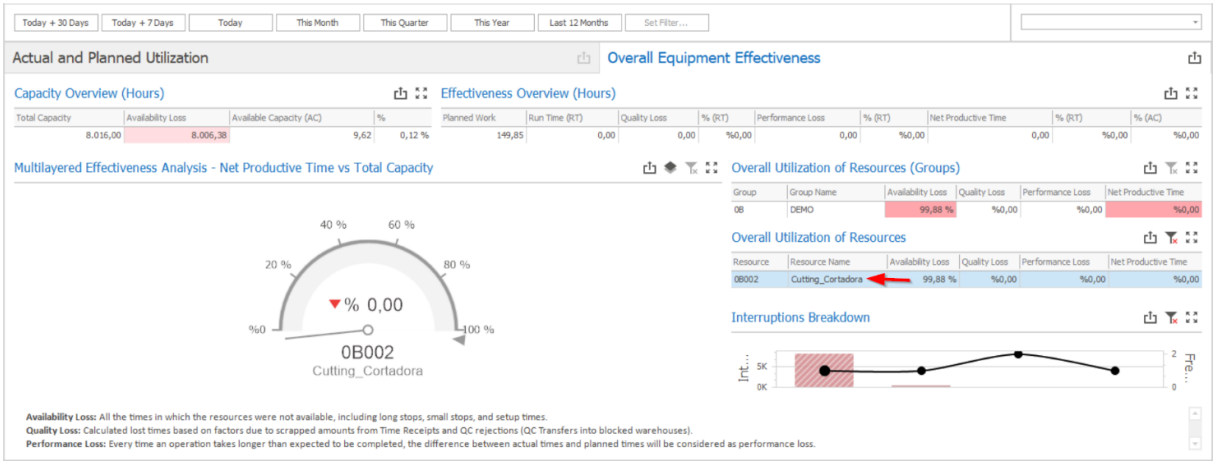
Important: It is possible to click on a specific interruption reason to check which resources were affected by that particular interruption. However, clicking on an interruption reason will make the dashboard to filter only for interruption transactions, making the KPIs to show incorrect values, as production transactions will not be correctly calculated. If you wish to understand which resources were affected by certain interruptions and what are their corresponding OEEs, you should:

1) Click on the interruption reason to filter the resources:

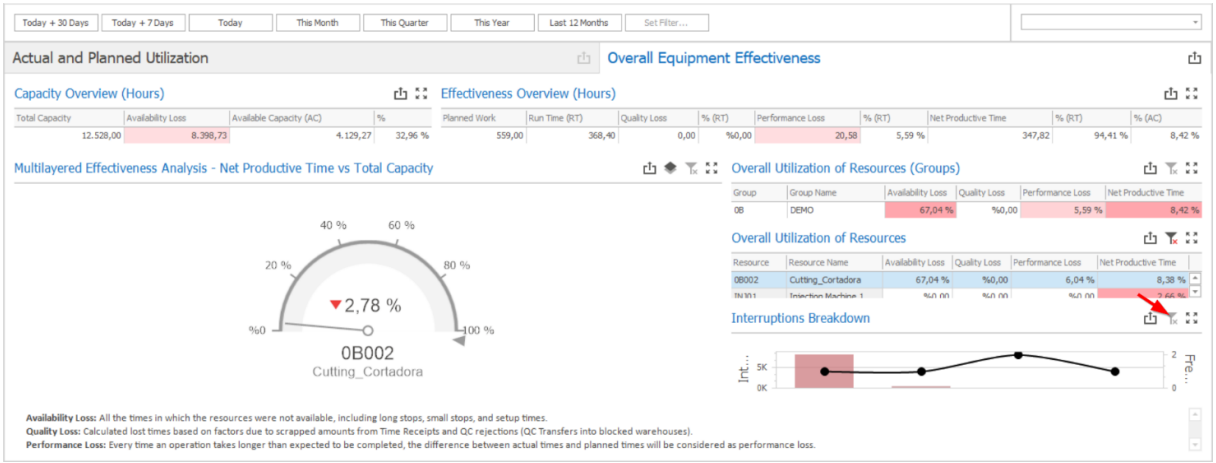
© 2026 Boyum IT Solutions A/S



2) Select the resource groups or resources using the “Overall Utilization of Resources (Groups)” or “Overall Utilization of Resources” grids:



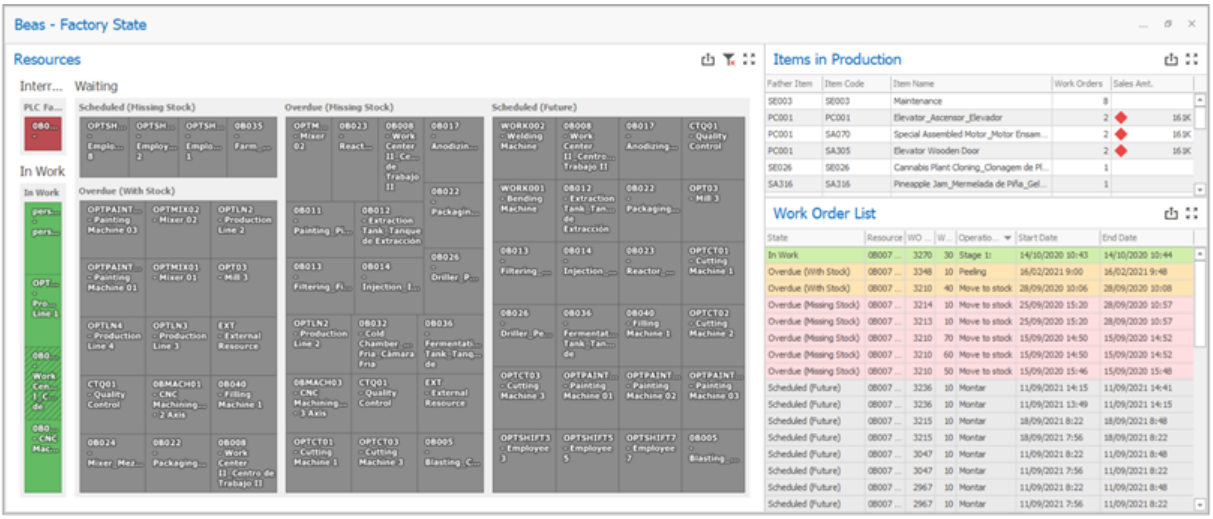
3) Clear the interruptions filter:



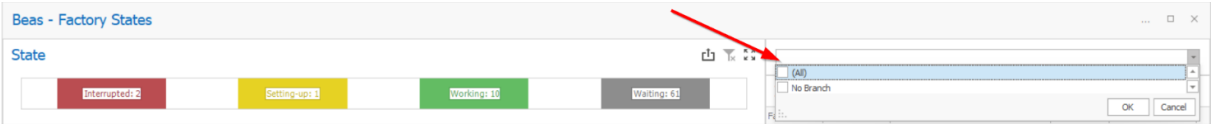
© 2026 Boyum IT Solutions A/S

18.5.7 Factory States

The Factory States dashboard lets you understand how your factory is running in glance. Since this dashboard works with the current data, there is no possible filtering.



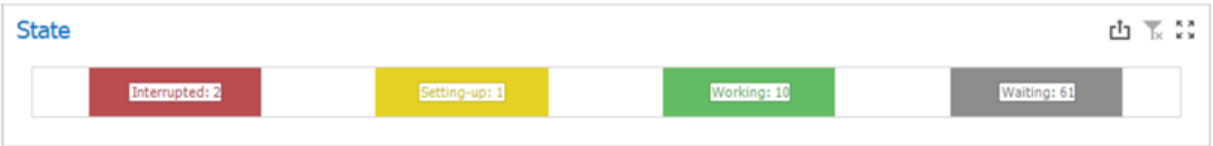
When using this dashboard on multibranch databases, the desired branches can be selected using the filter on the upper right corner of the dashboard. If there is no branch created for the databases, “No Branch” is the only available option.



Dashboard sections:

State
Resources
Items in Production
Work Order List
Free Resources

18.5.7.1 State

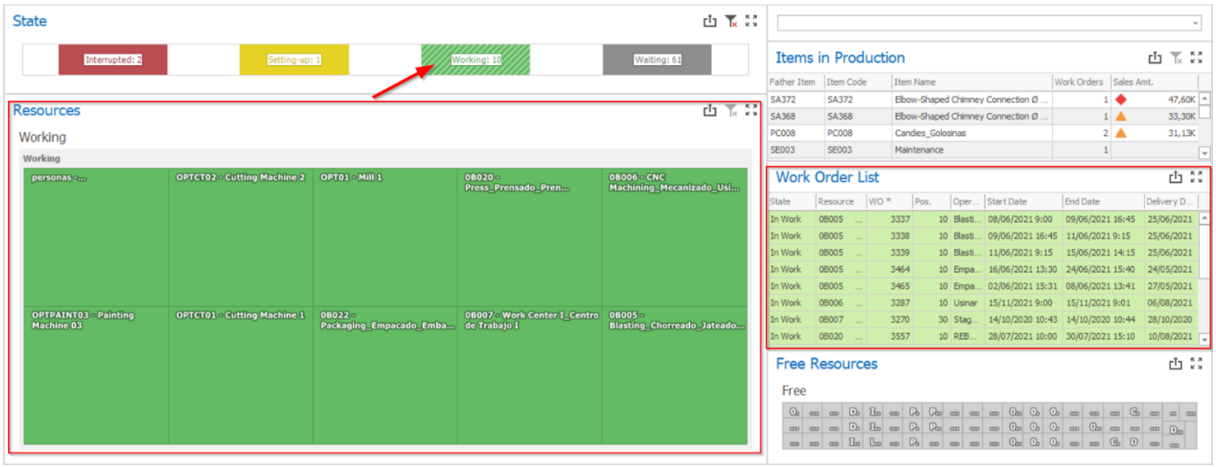


© 2026 Boyum IT Solutions A/S

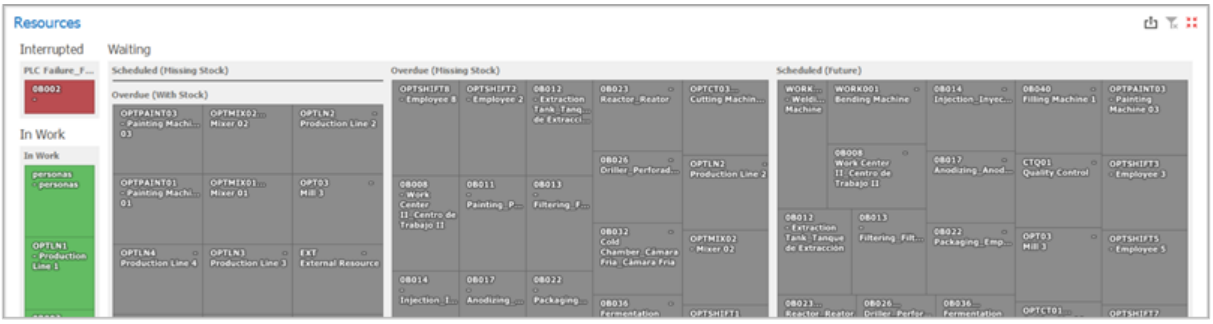
This chart presents the number of resources in each one of the possible main states, allowing an easy filtering just by clicking on the desired state. The possible states:

a) **Interrupted**: Resources with active interruptions;
b) **Setting-up**: Resources with active setup times;
c) **Working**: Resources with active production times;
d) **Waiting**: Resources without any active times or interruptions, but with scheduled tasks.

If you wish to know which resources are in a specific state or which work orders are affected by a particular state, you just need to click on the desired state and check the results under the Resources and Work Order List grids.



18.5.7.2 Resources



This chart groups the resources in three main states, subdivided into sub-states for further insights. For example, if you see that a machine is not operating (is on the "Waiting" state), you might want to know why, and the sub-states will give you the answer. The answer, however, could be in more than one sub-state, as the same machine can have scheduled work orders and work orders for

© 2026 Boyum IT Solutions A/S

which the required components are missing from stock. The possible states and sub-states are:

Interrupted:

a) **Interruption Reason**: The sub-states are dynamically defined to reflect the interruption reasons. In this way, you can instantly know, for example, which machines are down for corrective or preventive maintenance, and which kind of maintenance is being performed.

In Work:

a) **In Work**: There are no sub-states for resources that are in work.

Waiting:

a) **Scheduled (With Stock)**: Work orders are on schedule and with enough stock to produce them. The stock calculation takes into account the current stock and reservations for other work orders (for example, if a required component is in stock, but is reserved for another work orders, the report considers it as unavailable);

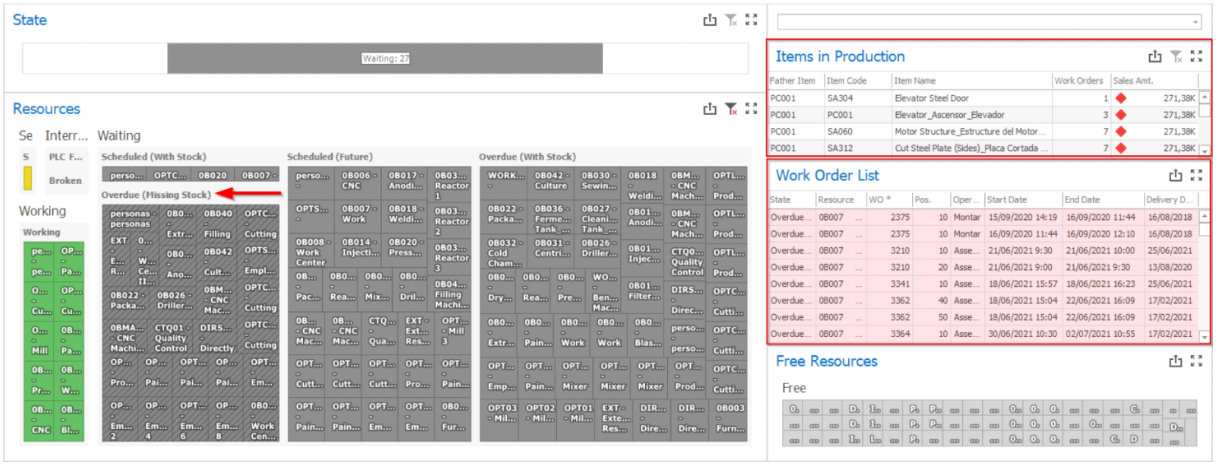
b) **Scheduled (Missing Stock)**: Work orders are on schedule, but the required components to produce them are missing from stock;

c) **Scheduled (Future)**: Work orders are scheduled for the future, with start dates greater than today. Stock is not checked for orders scheduled for the future;

d) **Overdue (With Stock)**: Work orders are overdue, but there is enough stock to produce them;

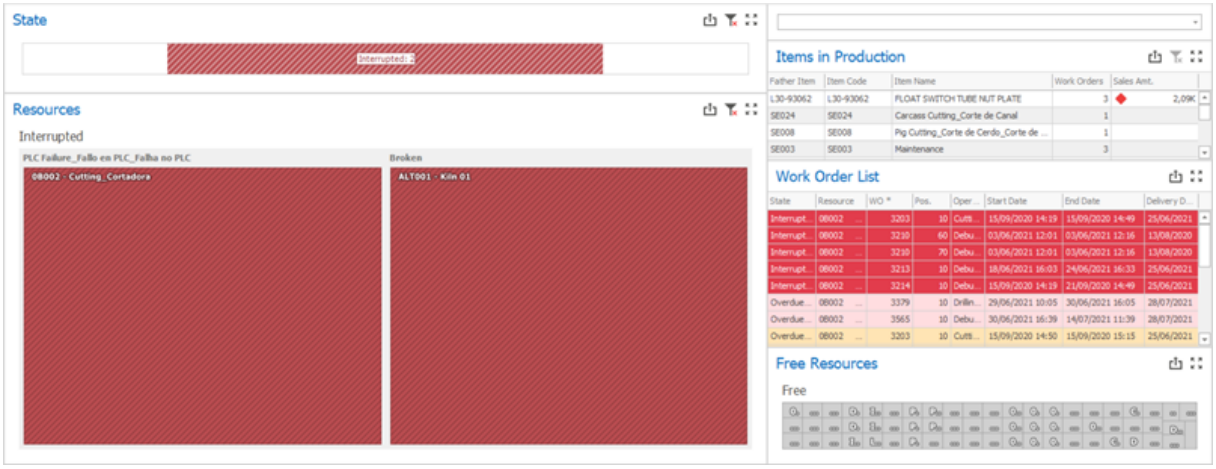
e) **Overdue (Missing Stock):** Work orders are overdue, and the required components to produce them are missing from stock.

If you want to know which work orders are included in each state, substate, or resource, you can just click on the state name, substate name, or on the resource you want to detail. The list of work orders are displayed on the Work Order List grid, and the list of manufactured items on the Items in Production report.



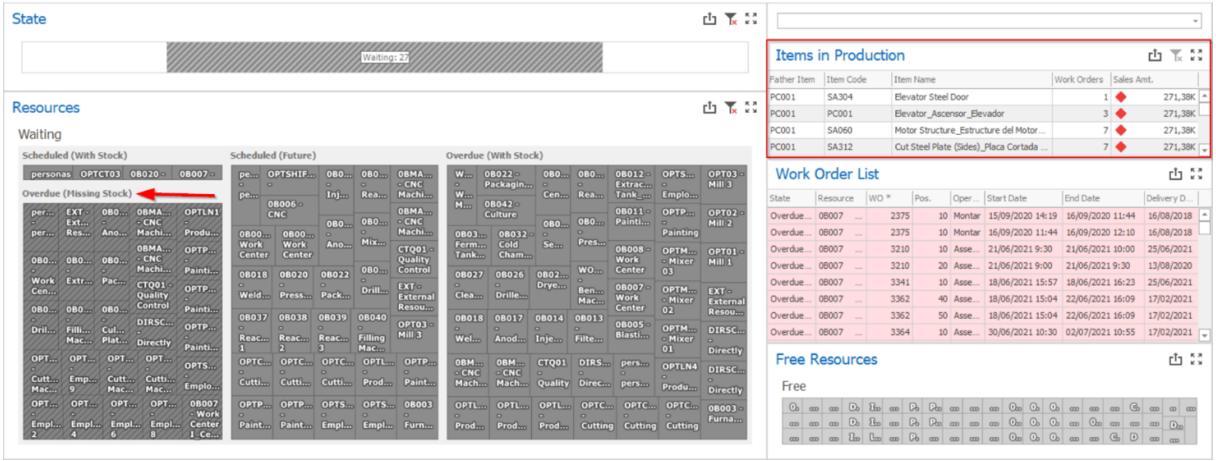
© 2026 Boyum IT Solutions A/S

When you select any resource from the “Interrupted” state, the reports display both work orders directly affected by the interruptions (work orders that were in work when the interruptions were started) and work orders that are scheduled but not started.



18.5.7.3 Items in Production

Using this report, you can instantly know the items affected by the different states, or in production on the different resources. For example, if you want to see a list of all items whose production had to stop because of a resource interruption or to understand the potential delayed sales amount because of missing components in stock, you just need to select the state “Interrupted” or the substates with “Missing Stock” for the report to present you this information instantly.



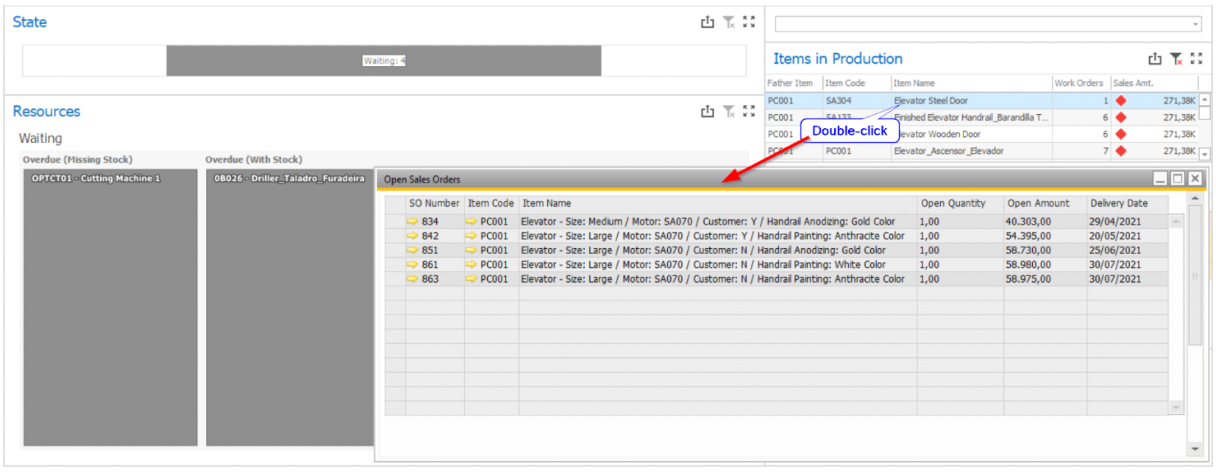
© 2026 Boyum IT Solutions A/S

Additionally, the report also displays the number of work orders open for each item and the total open sales orders amount for each father item (**important:** if different subassemblies are in production for the same father item, the sales amount for the father item might appear duplicated in the report, as the idea of this report is also to give an understanding of which subassemblies need to be completed for the father items to be produced).
By default, two icons can be presented by this report. The icons can be customized by editing the dashboard and defining new color rules.

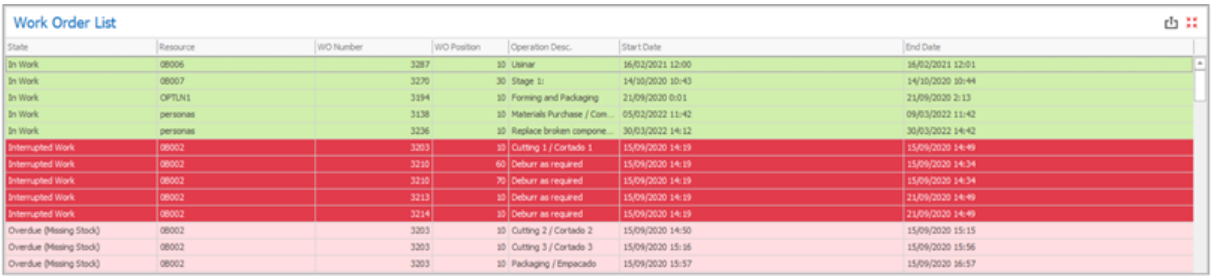
Sales with big impact

Sales with medium or small impact

For understanding which sales orders are open for each father item and their corresponding amounts, the Items in Production grid has also a B1UP Universal Function embedded into it to automatically display a SQL report when double-click any of the lines. If you wish to activate this feature, you must download the UF and import it into B1UP. **DOWNLOAD:** Right-click on the link DASH-FST-SALESORDERS and Save the xml file.



18.5.7.4 Work Order List



© 2026 Boyum IT Solutions A/S

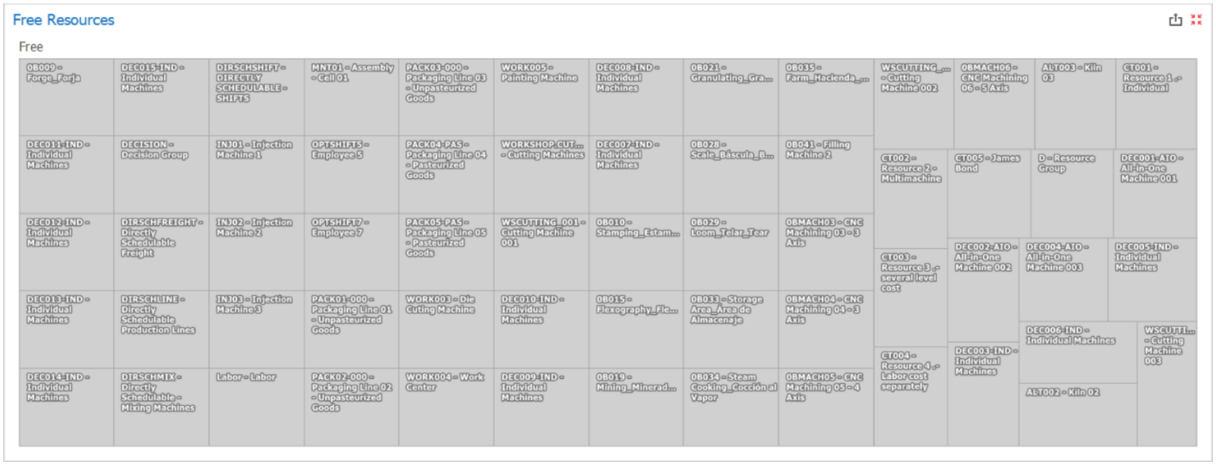
This report shows all the work orders' operations affected by the different states and sub-states, displaying their specific state (relevant for cases where, for example, a resource is in an interrupted state, but has work orders with several states linked to it), the work order number and position, the operation description, and the operation scheduling. The possible specific states are:

a) **Interrupted Work:** The work orders' operations are in work, but are affected by interruptions registered for the resources (highlighted in strong red).
b) **Setting-up**: The work orders' operations are in setup with no registered interruptions (highlighted in yellow).
c) **In Work:** The work orders' operations are in work with no registered interruptions (highlighted in green).
d) **Scheduled (With Stock):** The work orders' operations are on schedule and with enough stock to produce them (highlighted in gray). The stock calculation takes into account the current stock and reservations for other work orders (for example, if a required component is in stock, but is reserved for another work orders, the report will consider it as unavailable);
e) **Scheduled (Missing Stock)**: The work orders' operations are on schedule, but the required components to produce them are missing from stock (highlighted in yellow);
f) **Scheduled (Future)**: The work orders' operations are scheduled for the future, with start dates greater than today. Stock is not checked for orders scheduled for the future (highlighted in gray).
g) **Overdue (With Stock)**: The work orders' operations are overdue, but with enough stock to produce them (highlighted in orange);
h) **Overdue (Missing Stock)**: The work orders' operations are overdue, and the required components to produce them are missing from stock (highlighted in light red).

If you wish to see more details about the work orders, you can double-click the "WO" column and Beas automatically opens the structure view for the selected work order.

© 2026 Boyum IT Solutions A/S

18.5.7.5 Free Resources



This chart lists all the resources that are not interrupted, not started in any work or setup times, and without any production scheduling.

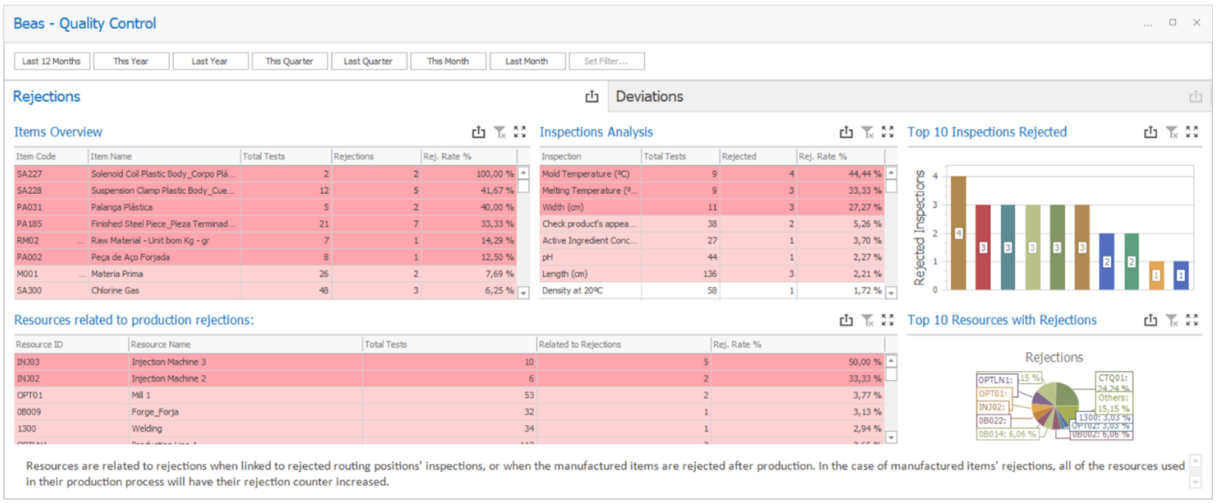
18.5.8 Quality Control

The Quality Control dashboard contains a series of analytical views aimed at giving you a detailed scrutiny over the quality control inspections results, enabling you to find where your highest rejection rates and highest deviations are located, as well as to find which resources might be related to more quality problems on the manufactured items. This dashboard contains two tabs: Rejections and Deviations. The data can be filtered using the pre-made filters for defined time ranges (last 12 months, this year, last year, this quarter, last quarter, this month and last month). Manual filtering can be done by clicking on “Set Filter…”.

Rejections Tab
Deviations Tab

© 2026 Boyum IT Solutions A/S

18.5.8.1 Rejections tab



The Rejections tab displays which items, types of inspections and manufacturing resources are more related to QC rejections, enabling you to find exactly where your quality problems are happening. Additionally, the Rejections tab interacts with the Deviations tab, meaning that any filters or selections applied on Rejections also filter the data under the Deviations tab.

Dashboard sections:

Items Overview

Inspections Analysis

Top 10 Inspections Rejected

Resources related to production rejections

Top 10 Resources with rejections

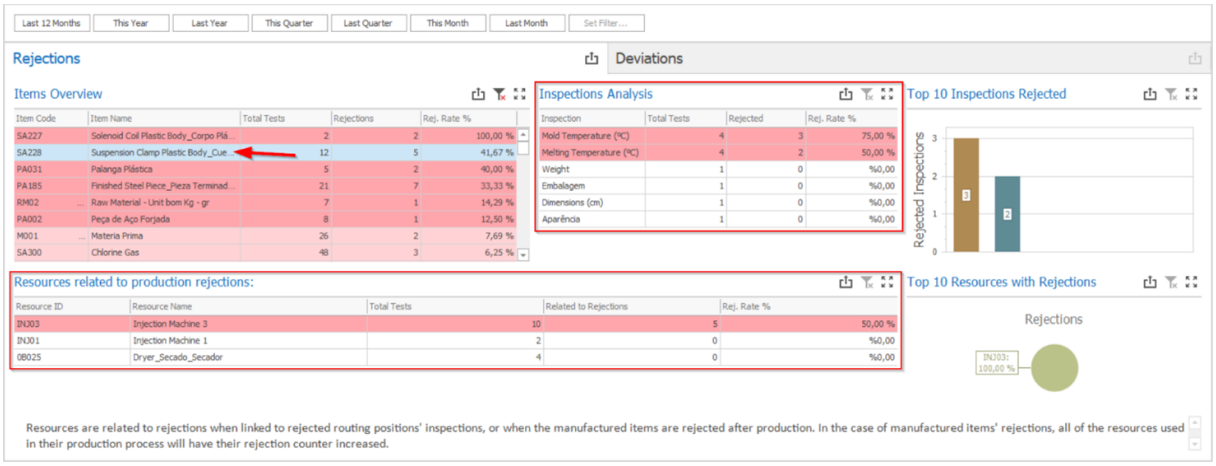
18.5.8.1.1 Items Overview

This grid shows all the items that have been tested in quality control, including the total number of tests, the number of rejected inspections, and their corresponding rejection rates. The rows are colored in a red scale to represent how large the quality rejection rates were:

	100.00 %	>=	10,00 %
	10,00 %	>=	2,00 %
	2,00 %	>=	0,00 %

To have a deeper understanding on which reasons made an item to be rejected, what are the most recurring rejection reasons for it, or how the resources used in its production process were related to the rejections, you can just select the item and check the results under the Inspection Analysis and Resources related to production rejections grids.

© 2026 Boyum IT Solutions A/S

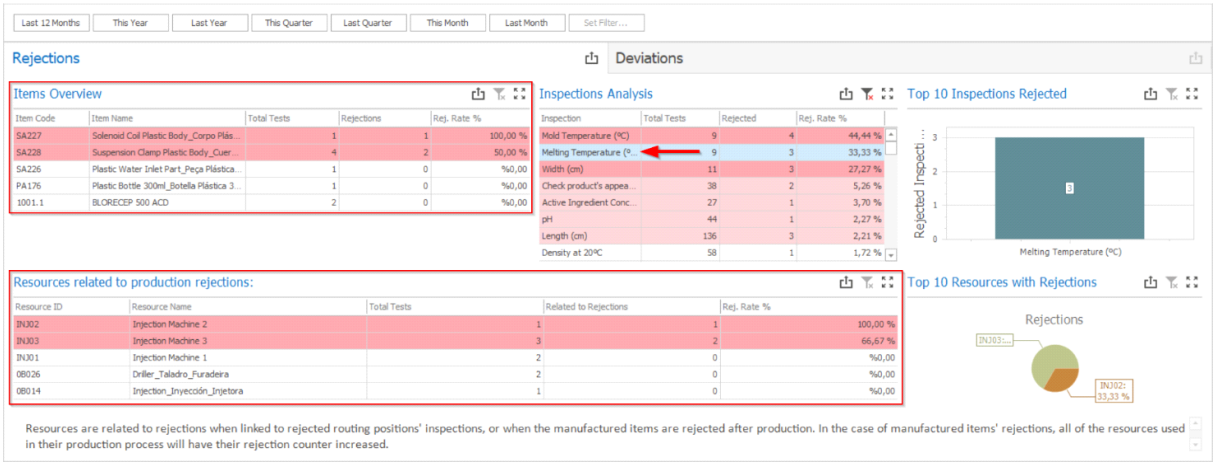


18.5.8.1.2 Inspections Analysis

This grid shows all the different types of inspections performed in quality control analyses, including the total number of tests, the number of rejected inspections, and their corresponding rejection rates. The rows are colored in a red scale to represent how large the quality rejection rates were:

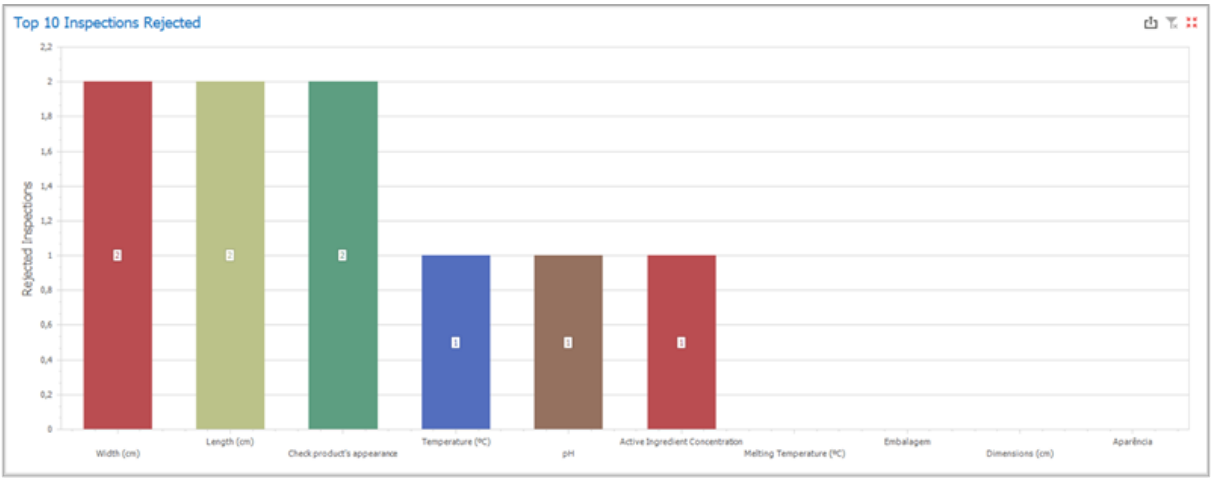
	100.00 %	>=	10,00 %
	10,00 %	>=	2,00 %
	2,00 %	>=	0,00 %

If you want to know which items were rejected for a particular reason or which production resources were used for items related to that inspection type, you can just select the desired inspection and check the results under the Items Overview and Resources related to production rejections grids.



© 2026 Boyum IT Solutions A/S

18.5.8.1.3 Top 10 Inspections Rejected



This chart presents a summary of the top 10 inspections that were rejected on quality control analysis, detailing the number of rejections and the name of the inspection.

Any inspection can be selected for further insights on which products were rejected and for which reasons (triggering filters on the other reports and charts from the dashboard).

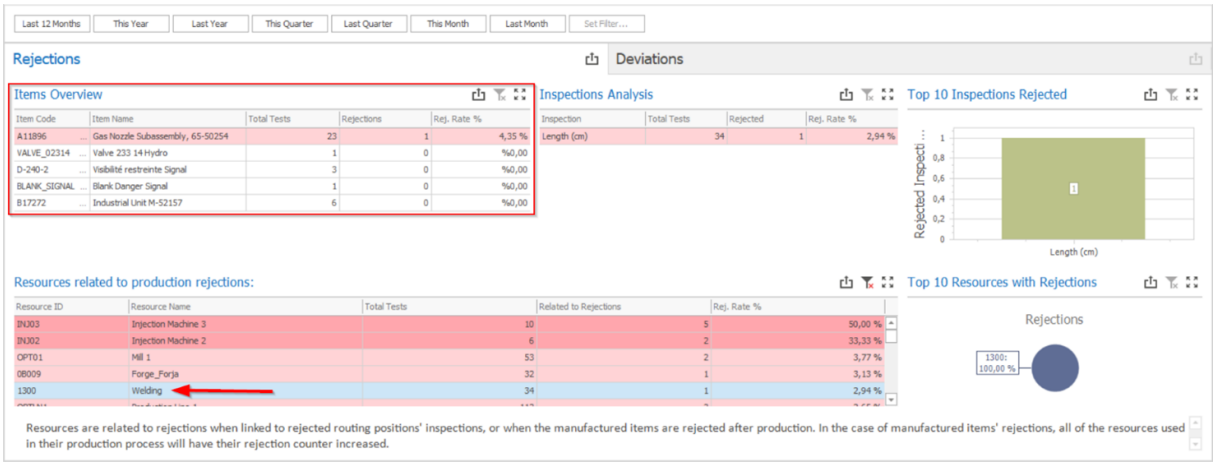
18.5.8.1.4 Resources related to production rejections

This grid shows all the different resources used to manufacture products that underwent quality control analyses, including the total number of tests, the number of rejected inspections, and their corresponding rejection rates. The rows are colored in a red scale to represent how large the quality rejection rates were:

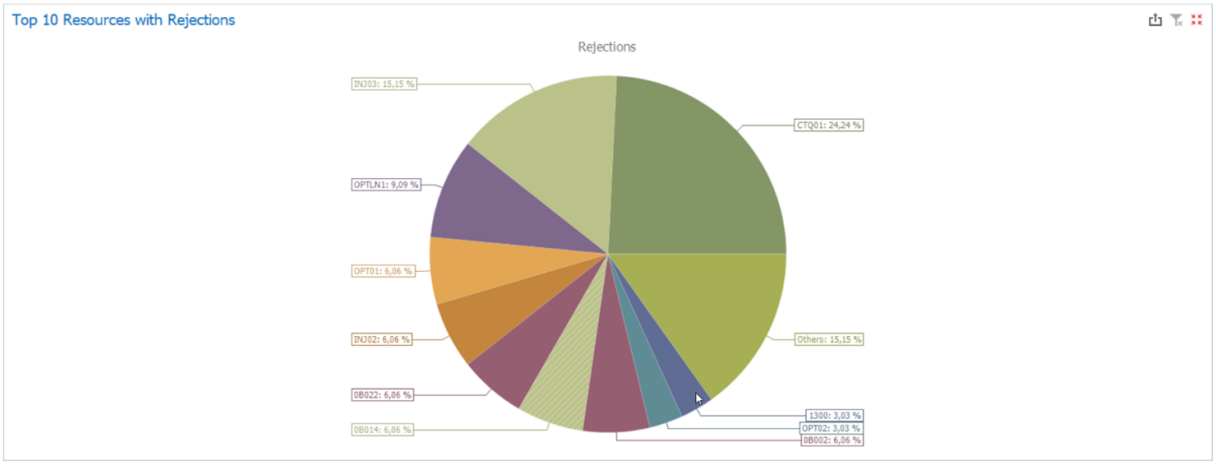
	100.00 %	>=	10,00 %
	10,00 %	>=	2,00 %
	2,00 %	>=	0,00 %

Important: The resources are related to rejections when they are linked to rejected routing positions' inspections (QC Inspection Plan and QC Order associated to a routing position), or when the manufactured items are rejected after production. In the case of manufactured items' rejections, all the resources used in their production process will have their rejection counter increased.
If you want to know the rejection rates of the products manufactured by a specific resource, you can just select the desired resource and check the results under the Items Overview grid.

© 2026 Boyum IT Solutions A/S



18.5.8.1.5 Top 10 Resources with Rejections

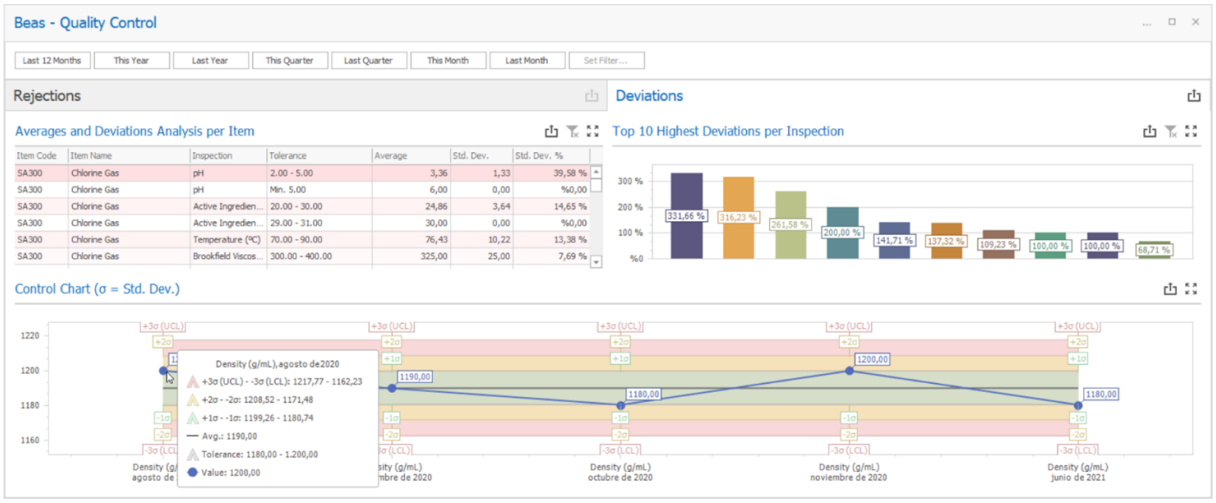


This pie chart presents a summary of the top 10 resources related to quality control rejections, detailing the resource code and the corresponding rejection rate.

Any resource can be selected for further insights on which products were rejected and for which reasons (triggering filters on the other reports and charts from the dashboard).

© 2026 Boyum IT Solutions A/S

18.5.8.2 Deviations tab



The Deviations tab displays the calculated averages and standard deviations for every inspection type related to all the inspected items, as well as a chart to understand the top 10 inspection types responsible for generating the highest deviations, and a control chart, a Statistical Process Control (SPC) tool for Six Sigma initiatives, for monitoring how the deviations of each inspection type are evolving over time. Additionally, the Deviations tab interacts with the Rejections tab, meaning that any filters or selections applied on Deviations also filter the data under the Rejections tab.

Dashboard sections:

Averages and Deviations Analysis per Item

Top 10 Highest Deviations per Inspection

Control Chart (sigma = Std. Dev.)

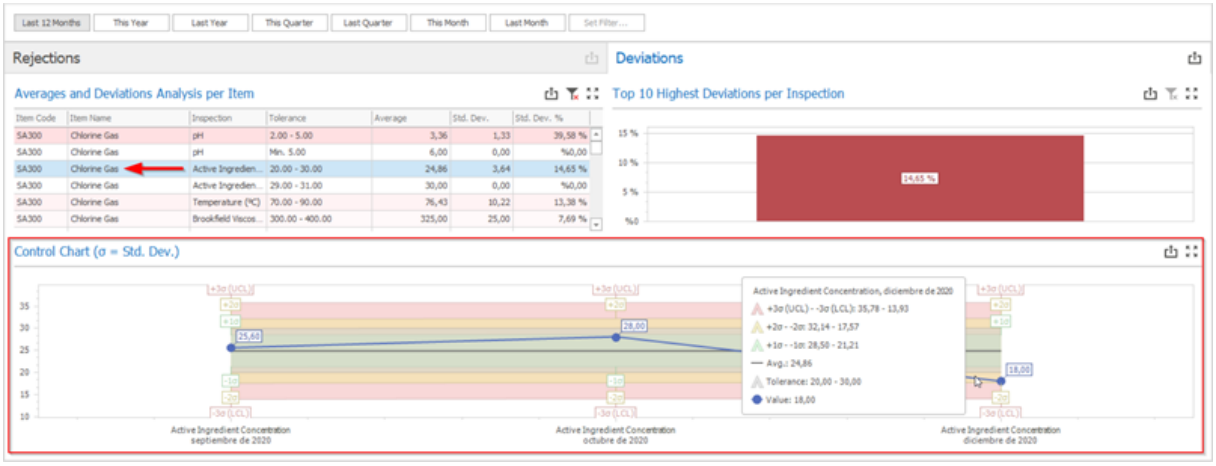
18.5.8.2.1 Averages and Deviations Analysis per Item

The Averages and Deviations Analysis per Item grid presents a detailed analysis over the inspections' measured averages and standard deviations, allowing you to effectively monitor deviations in quality control and how the averages are positioned within the inspections' tolerances. To allow a correct standard deviation calculation, the subjective inspections (OK or Not OK) are interpreted as numbers (1 for OK and 0 for Not OK) but identified as subjective on the tolerance (written as "OK - Not OK").

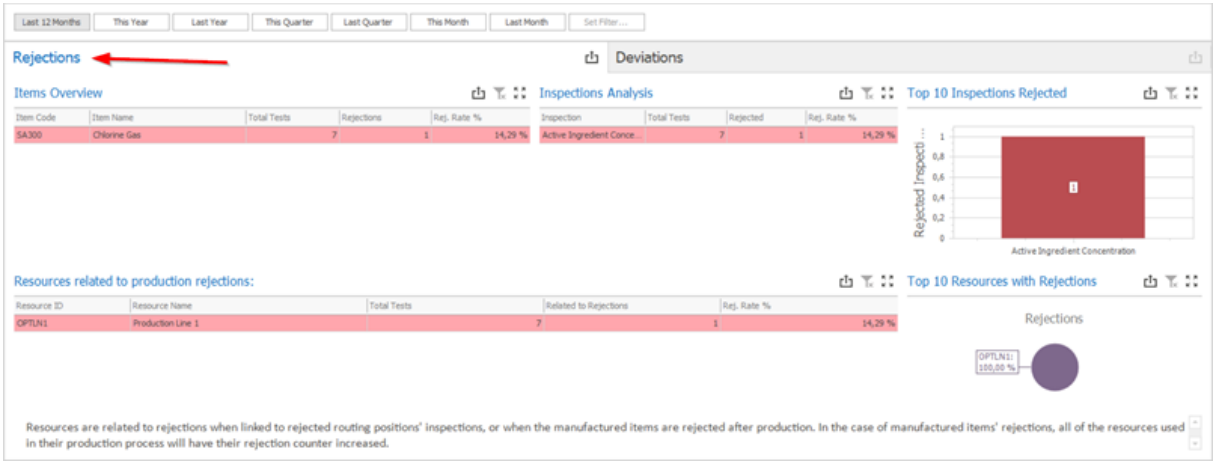
© 2026 Boyum IT Solutions A/S

The last column of this report will indicate the representativeness of the standard deviations over the measured averages, enabling you to easily identify big or small deviations. The rows will also be colored on a red scale according to the standard deviation representativeness.

If you wish to check how the deviations of a particular item and inspection type are evolving over time in a control chart, you just need to click over the desired item and inspection type and check the results under Control Chart (sigma = Std. Dev.).

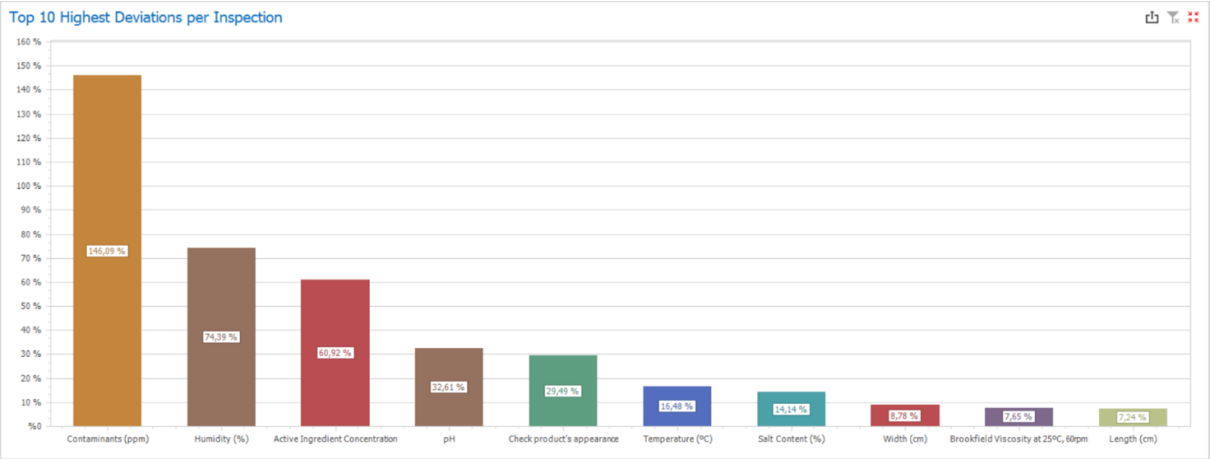


Additionally, if you want to check for rejections associated to the selected item and inspection, you can also check the results under the Rejections tab.



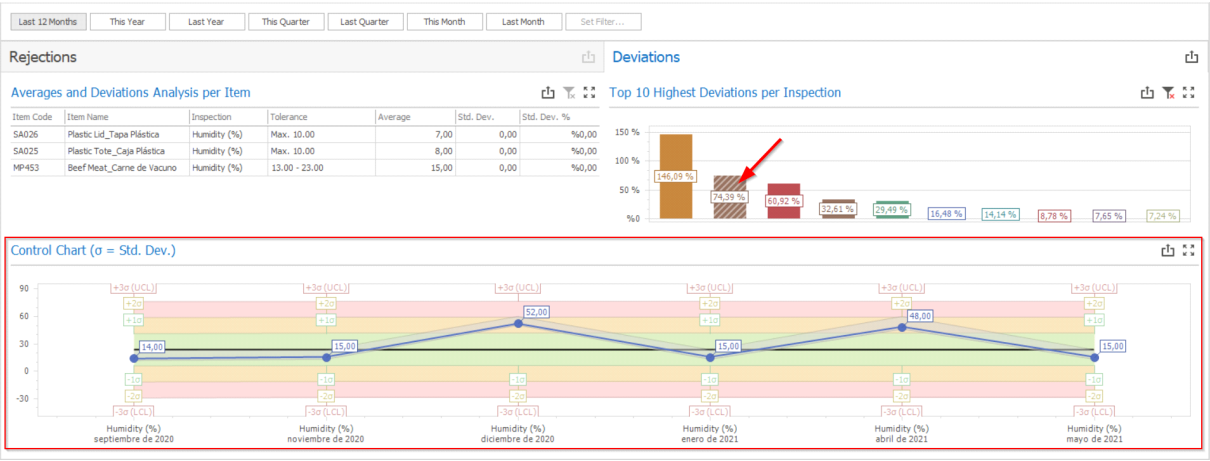
© 2026 Boyum IT Solutions A/S

18.5.8.2.2 Top 10 Highest Deviations per Inspection



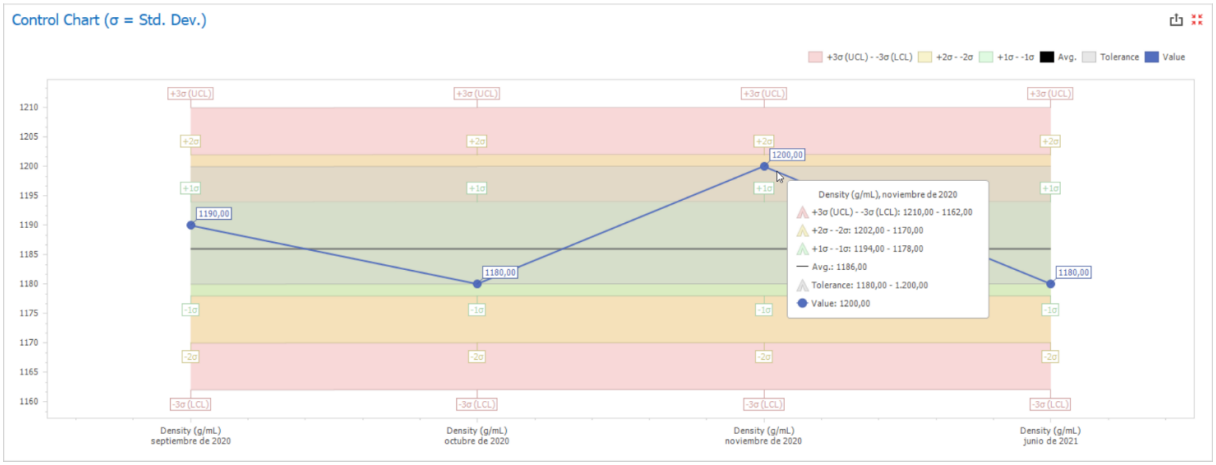
This chart presents a summary of the top 10 inspections with highest standard deviations on quality control, detailing the representativeness of the standard deviations over the measured averages (amongst all inspections performed for all the products – expect in cases in which you filter for a specific product).

Any inspection can be selected for further insights on which products were rejected or on the deviations registered for that specific inspection over time (triggering filters on the other reports and charts from the dashboard). For example, if you want to know how the deviations of "Humidity (%)" are evolving over time, you can just select it and see the results on the Control Chart (sigma = Std. Dev.) chart.



© 2026 Boyum IT Solutions A/S

18.5.8.2.3 Control Chart (σ = Std. Dev.)



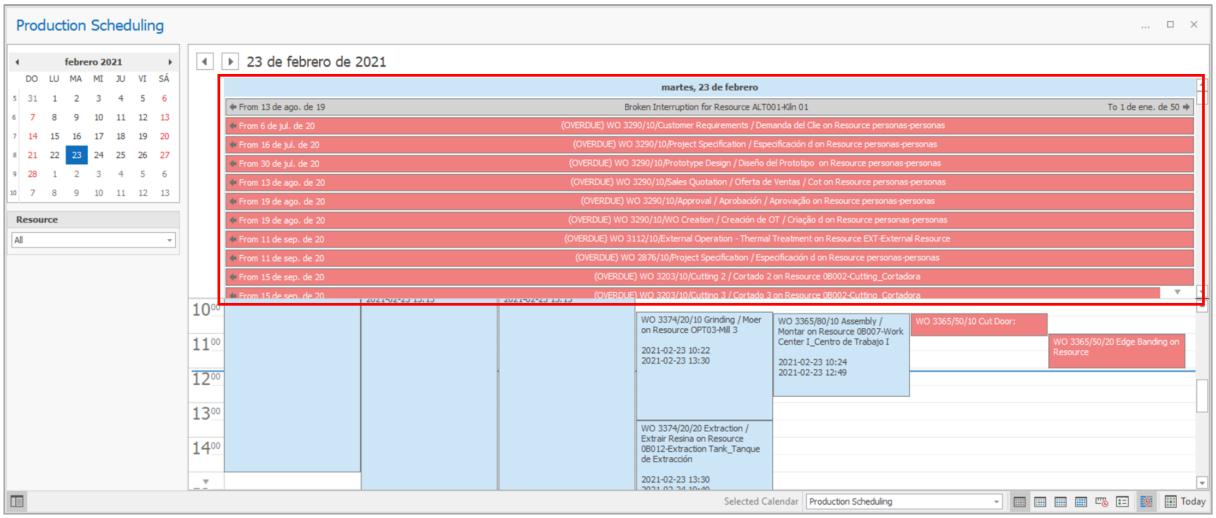
This chart places the monthly averages for each inspection type within control tiers, down to the Lower Control Limit (LCL) and up to the Upper Control Limit (UCL). On the center of the chart, the Center Line will represent the global average across all months (within the selected time range) for each inspection type, calculating the control tiers according to the global standard deviation:

+3σ (UCL): Global average plus three times the standard deviation (Upper Control Limit);
+2σ : Global average plus two times the standard deviation;
+1σ : Global average plus one time the standard deviation;
Avg.: Global average only;
-1σ : Global average less one time the standard deviation;
-2σ : Global average less two times the standard deviation;
-3σ (LCL): Global average less three times the standard deviation (Lower Control Limit).

18.5.9 Production Scheduling Calendar

The Production Scheduling Calendar is a tool built for many purposes around production scheduling. For example, right when opening the calendar, there is a list of all resources that are interrupted at this moment (gray lines on the top) and a list of all the overdue work (red lines on the top.)

© 2026 Boyum IT Solutions A/S



Right after it, the calendar, working in the same way as an Outlook calendar, can detail the scheduling per hours of a day, per week or per month. If there is any operation overdue at the present moment of the day, it is highlighted in red.

It is possible to filter for specific resources on the “Resource” filter and see the resource scheduling in the same formats as the complete scheduling (per day, week, or month). Additionally, the scheduling can be transformed into a work plan when selecting the “Agenda View” option.

Dashboard sections:

Daily View

Weekly View

Monthly View

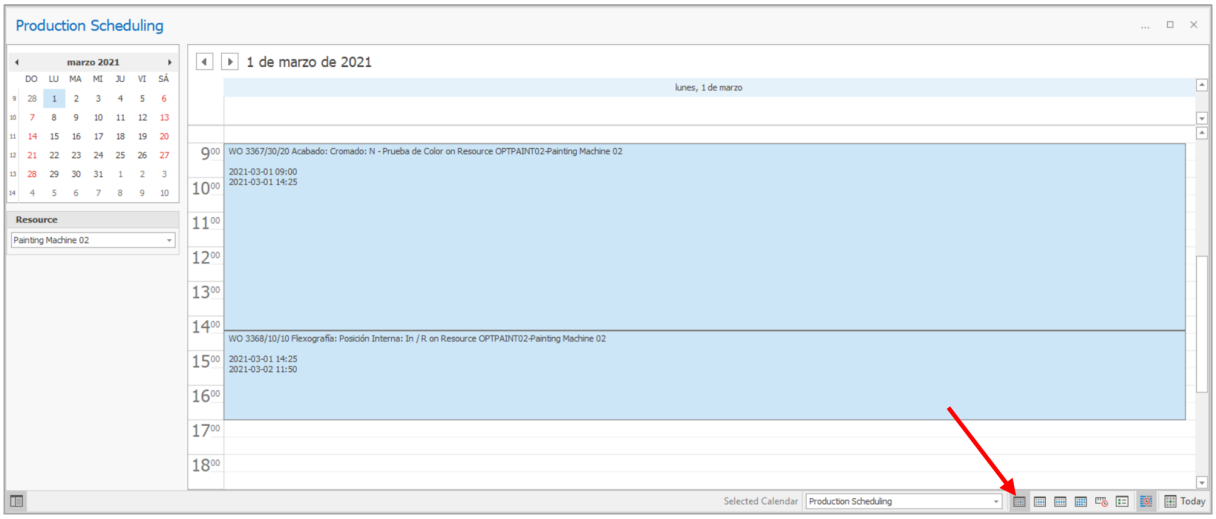
Agenda View

Using the Calendar to Monitor Production Execution

© 2026 Boyum IT Solutions A/S

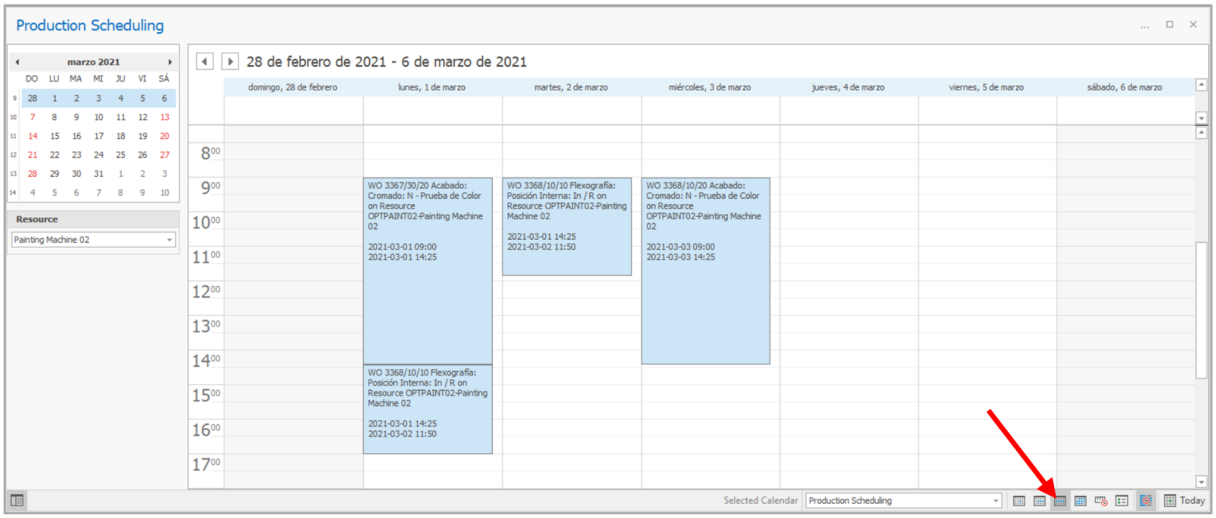
18.5.9.1 Daily View

All operations scheduled for the selected day.



18.5.9.2 Weekly View

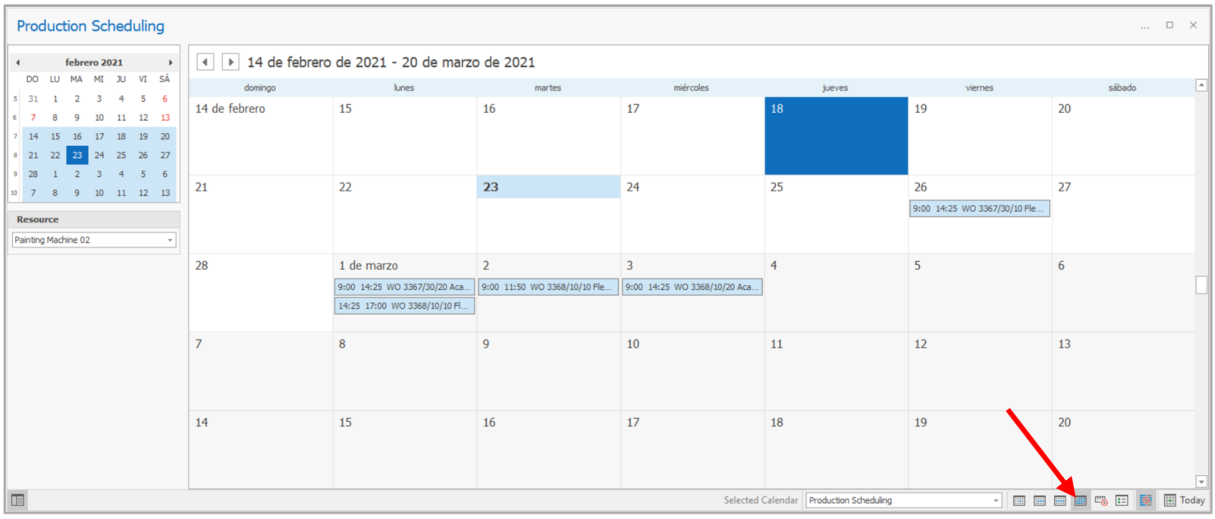
All operations scheduled for the selected week.



© 2026 Boyum IT Solutions A/S

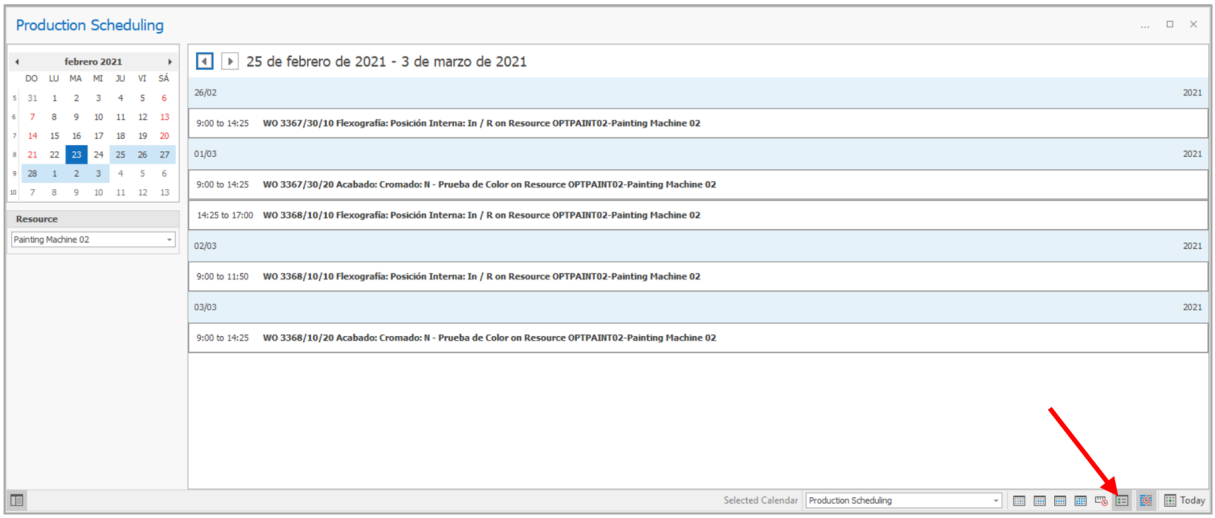
18.5.9.3 Monthly View

All operations scheduled for the selected month.



18.5.9.4 Agenda View

List of operations scheduled for the selected time range. The agenda view can be a very useful tool to list the work planned for the day.

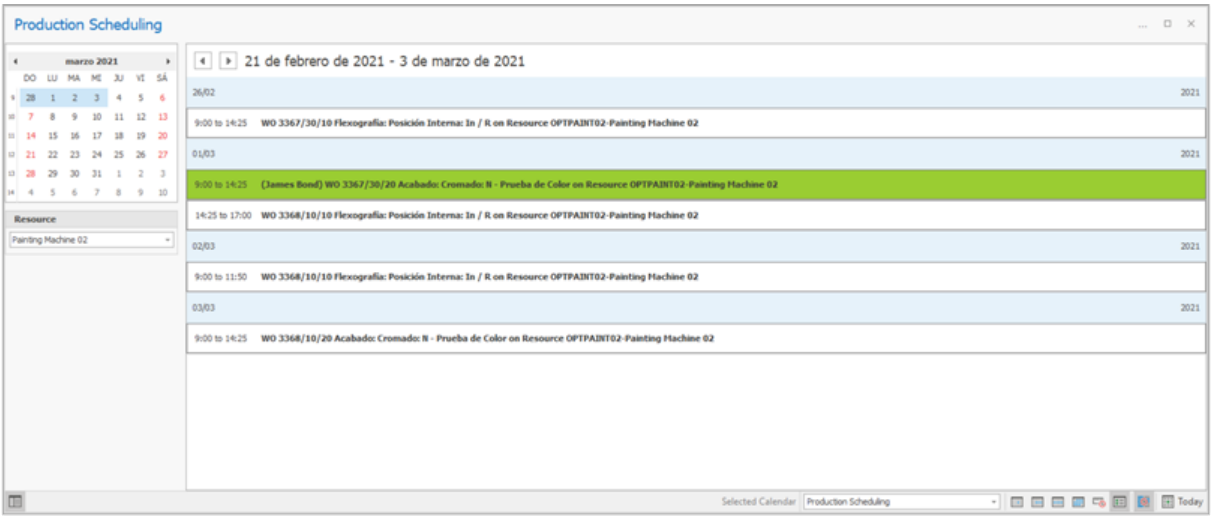


18.5.9.5 Using the Calendar to Monitor Production Execution

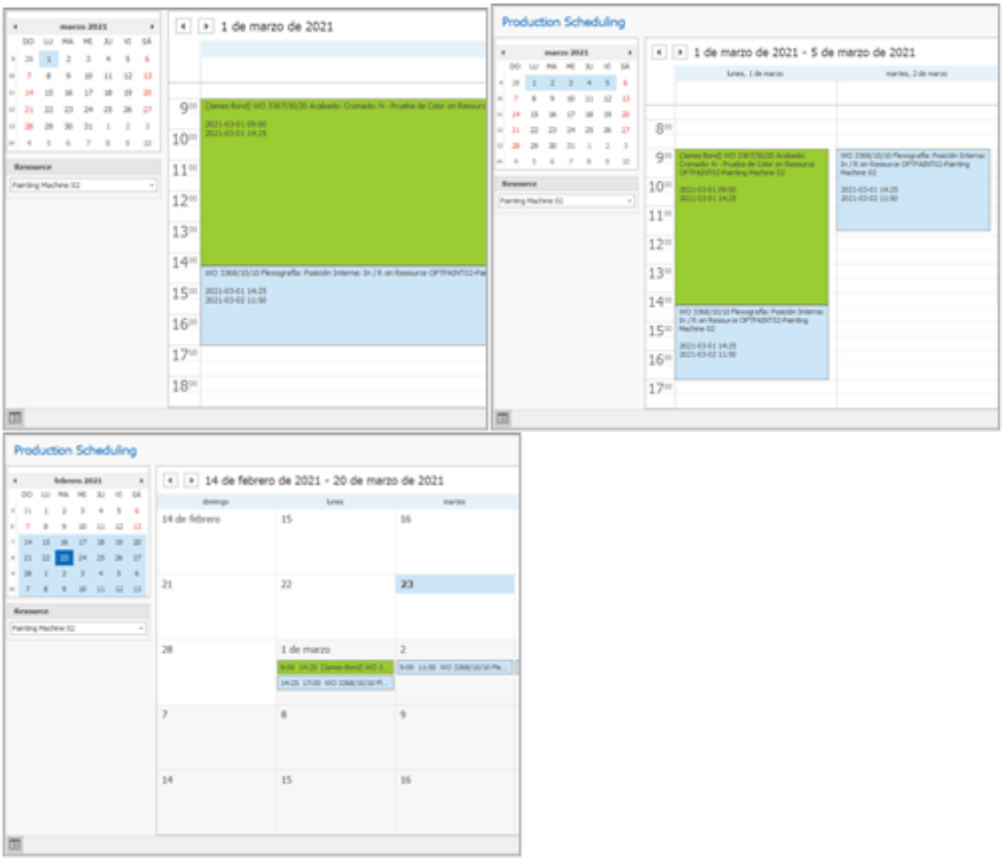
Apart from working as a tool to see the production scheduling in a simple and flexible way, the Production Scheduling Calendar can also help you to monitor the execution of the work orders in real time or serve as a console for the shop floor workers to know which operations need to be worked on now. Whenever an operation is started by a shop floor worker using the Beas Terminal functions, it is displayed in green in the calendar, indicating the name of the operator that is working on it.

© 2026 Boyum IT Solutions A/S

Therefore, when using the calendar as a work list for the shop floor, the workers can know which operations are still pending to be started, and which ones are already in work. The production supervisors and managers can also make use of this information in a summarized way, seeing the progress of the operations on multiple resources.



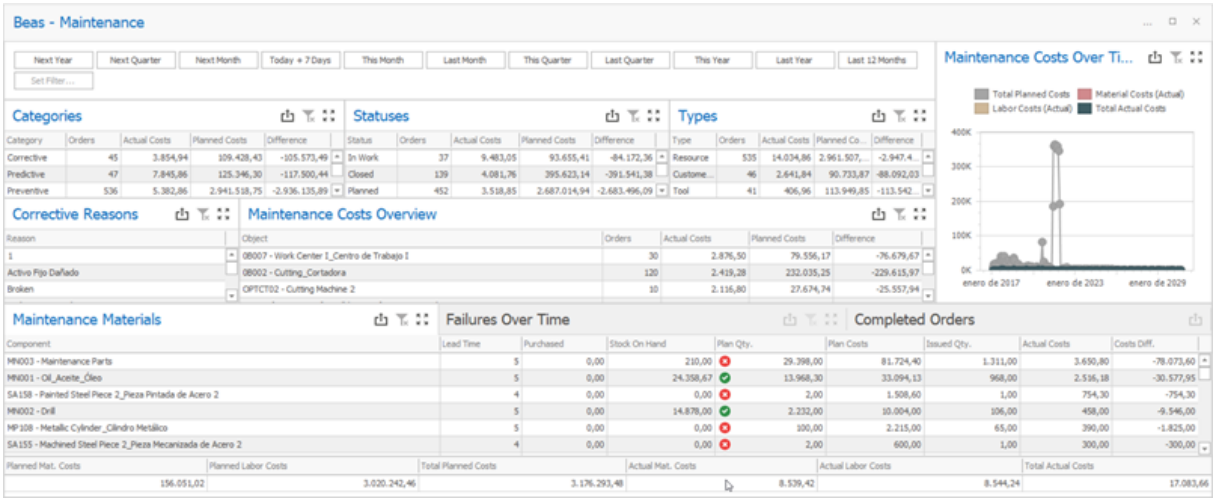
The operations are also highlighted in green in the daily, weekly, and monthly views.



© 2026 Boyum IT Solutions A/S

18.5.10 Maintenance Dashboard

The Maintenance dashboard contains a series of analytical views over the complete industrial maintenance process, enabling you to view its results and forecast future costs and material requirements. The data can be filtered using the pre-made filters for defined time ranges (next year, next quarter, next month, next 7 days, this month, last month, this quarter, last quarter, this year, last year and last 12 months). Manual filtering can be done by clicking on “Set Filter…”.



Dashboard sections:

[Categories, Statuses and Types]

[Corrective Reasons]

[Maintenance Costs Overview]

[Maintenance Costs Over Time]

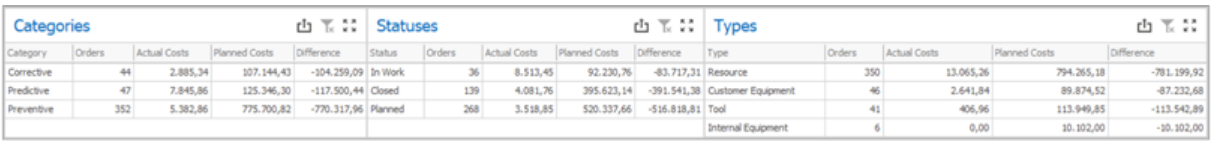
[Maintenance Materials]

[Failures Over Time]

[Completed Orders]

[Totals Area]

18.5.10.1 Categories, Statuses and Types



The first three grids of this dashboard contain the main filters for displaying all its data and the different analysis that can be triggered, showing the number of maintenance orders in each group

© 2026 Boyum IT Solutions A/S

and a comparison between the total planned and actual costs (material and labor – which includes internal labor and external services, all labor costs are calculated using the full costs rates). Those are the different groups available for selection:

Categories:

a) **Preventive:** Maintenance orders generated automatically from the maintenance calendars defined for the maintenance scenarios;
b) **Predictive:** Maintenance orders generated automatically based on the counters defined for the maintenance scenarios;
c) **Corrective:** Maintenance orders created manually or triggered from interruptions.

Statuses:

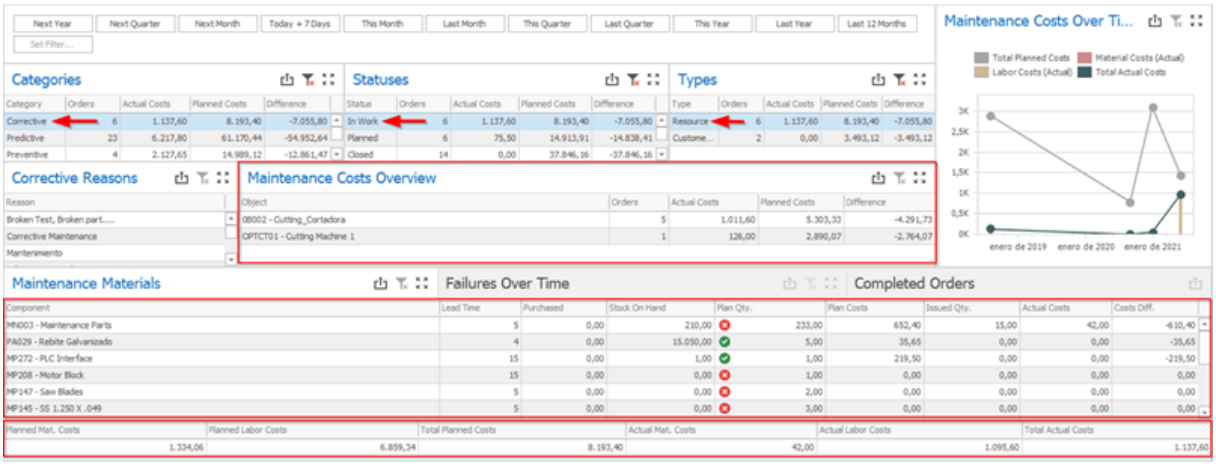
a) **Planned:** Open maintenance orders not set as "In Work";
b) **In Work:** Open maintenance orders set as "In Work";
c) **Closed:** Closed maintenance orders.

Types:

a) **Resource:** Maintenance orders created from maintenance scenarios related to resources;
b) **Tool:** Maintenance orders created from maintenance scenarios related to tools;
c) **Internal Equipment:** Maintenance orders created from maintenance scenarios related to serial numbers;
d) **Customer Equipment:** Maintenance orders created from maintenance scenarios related to customer equipment cards.

Each group can be selected for filtering the dashboard's data. For example, if you want to see all resources for which corrective maintenances are being performed at this moment, and the maintenance materials that their maintenance orders require, you can select the "Corrective" category, the "In Work" status, the "Resource" type and see the results under "Maintenance Costs Overview" and "Maintenance Materials". The total planned and actual costs, for both materials and labor, are displayed in the totals area.

© 2026 Boyum IT Solutions A/S

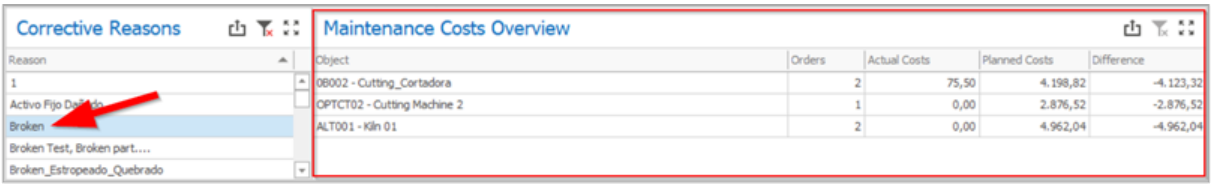


18.5.10.2 Corrective Reasons

This report displays all the corrective maintenances' reasons and will be a valuable guide to understand why the resources underwent corrective maintenance, as well as a filter to list all resources that had corrective maintenance for the same reasons. The reasons can come from the interruption reasons (when maintenance orders are triggered by interruptions) or from the maintenance orders remarks (when manual maintenance orders are created for corrective maintenance).

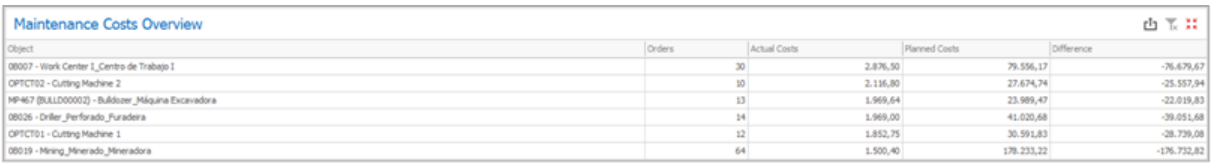
Important: Reasons will only be displayed for corrective maintenance. Preventive and predictive maintenance will not display reasons when selected on the "Categories" list.

Each corrective reason can be selected for filtering the dashboard's data. If you want to see a list of all equipment interrupted for the "Broken" reason, you can select "Broken" on the "Corrective Reasons" list and see the result on "Maintenance Costs Overview".



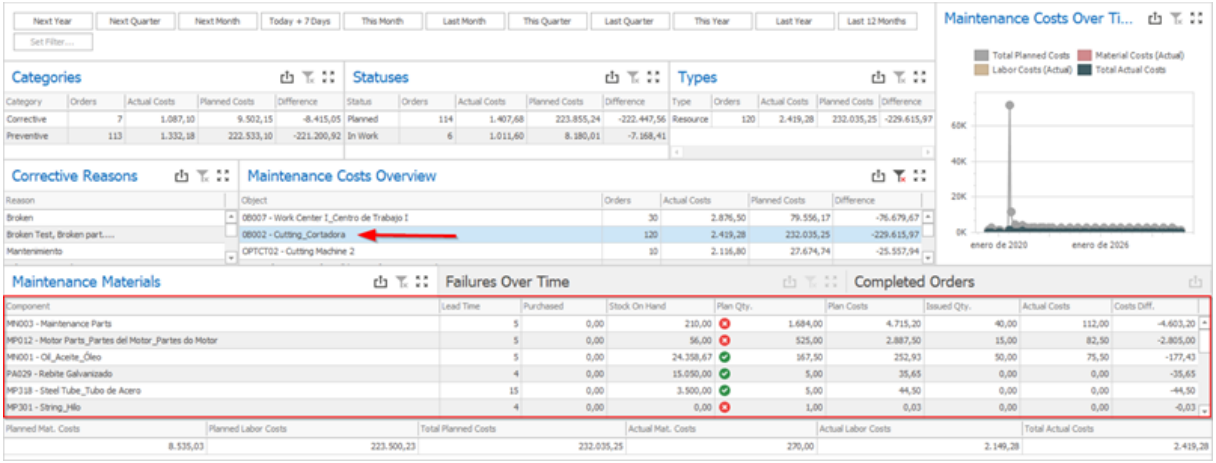
© 2026 Boyum IT Solutions A/S

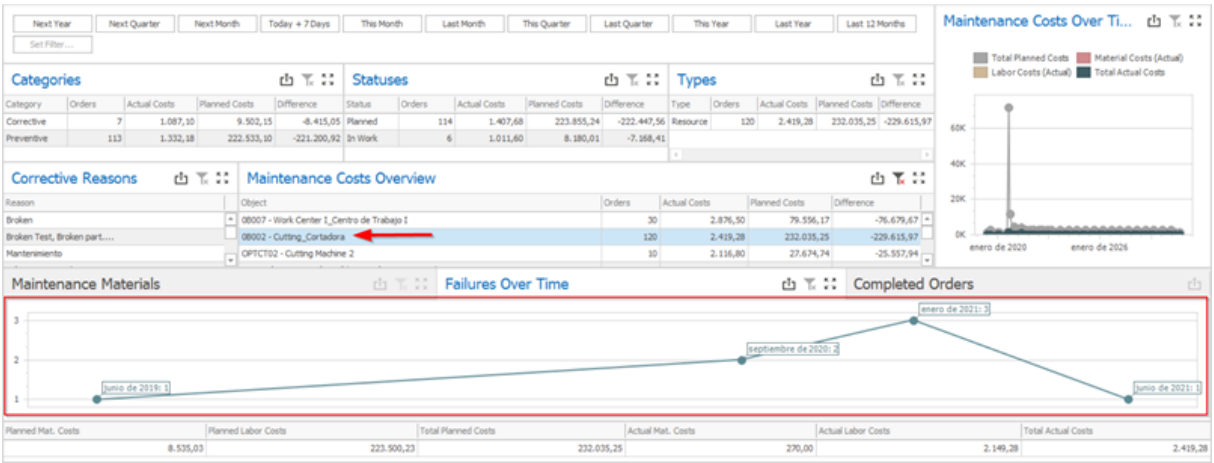
18.5.10.3 Maintenance Costs Overview



This report displays all equipment for which maintenance orders were created, showing the number of maintenance orders for each one and a comparison between the total planned and actual costs (material and labor – which includes internal labor and external services, all labor costs are calculated using the full costs rates). The list of equipment reflects the values selected on the previous reports; for example, if you have selected “Closed” on the statuses report, only values related to closed maintenance orders are shown.

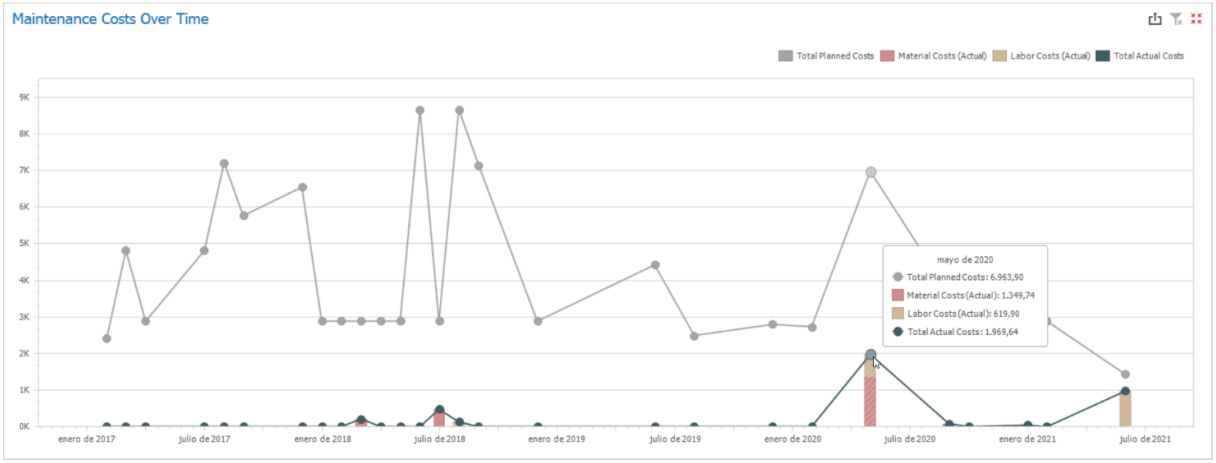
Each equipment can be selected for filtering the dashboard’s data. If you want to see a list of planned and consumed maintenance materials for a specific equipment, or a list of corrective maintenances over time registered for it, you just have to select the desired equipment and see the results under “Maintenance Materials” and “Failures Over Time”.





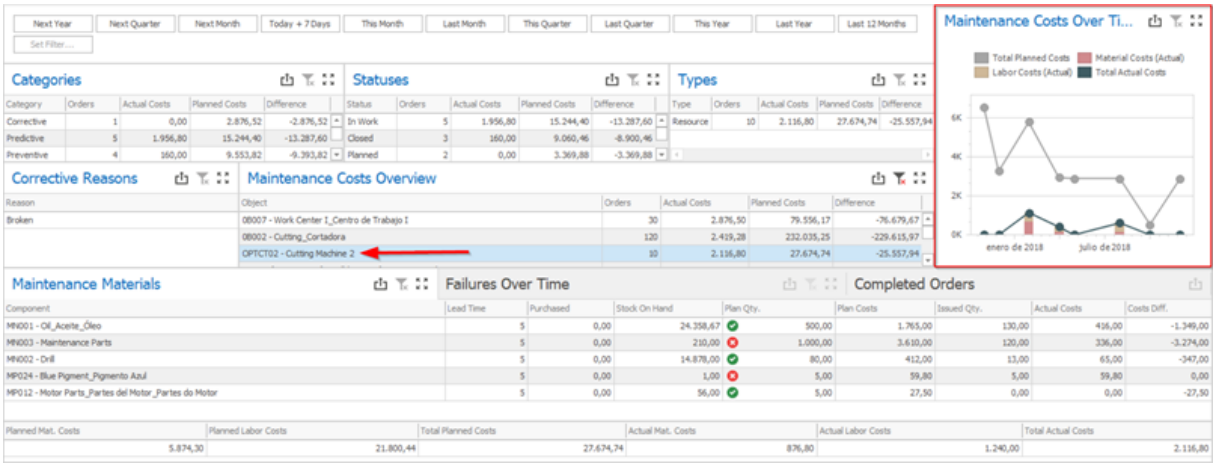
© 2026 Boyum IT Solutions A/S

18.5.10.4 Maintenance Cost Over Time



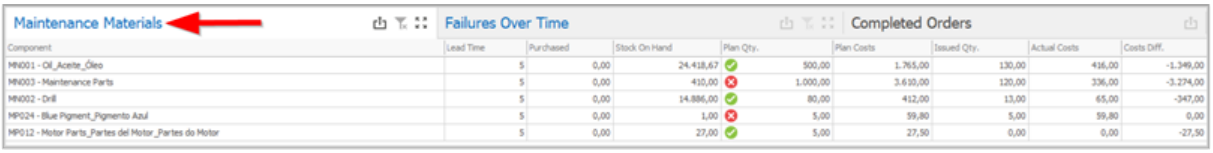
This chart shows how the planned and actual maintenance costs are evolving over time, breaking down the actual costs into material and labor (including both internal labor–calculated from full costs rates– and external services). The chart will reflect the current selections of the dashboard; for example, to check the planned and actual costs for corrective maintenances, you can select the "Corrective" category and see the results on the "Maintenance Costs Over Time" chart.

The same can be done for checking costs related to a specific equipment. To break down the planned and actual costs related to all maintenance orders created for the machine "OPTCT02", you can select it on the "Maintenance Costs Overview" report and see the results on the "Maintenance Costs Over Time" chart.



© 2026 Boyum IT Solutions A/S

18.5.10.5 Maintenance Materials



The “Maintenance Materials” report shows all materials planned or consumed for maintenance orders, according to the values selected on the previous lists. On this report, you will see the materials codes and names, their lead times, purchased amounts in open purchase orders, stock on hand, planned quantities, planned costs, issued quantities, actual material costs, and a difference between actual and planned material costs. On the “Plan Qty.” column, an icon can be displayed to indicate if the existing stock is sufficient or not to cover the components’ requirements for maintenance (the stock verification will only happen for open maintenance orders–planned or in work–, no stock verification will happen for closed maintenance orders, and, when viewing results for several statuses at the same time, the requirements belonging to closed maintenance orders will not be considered on the stock check).

a) **Component**: Item codes and item names of the maintenance materials;
b) **Lead Time**: Maintenance materials’ lead times;

Purchased: Purchased amounts of the maintenance materials in open purchase orders (**important**: the information of purchased amounts is on the dashboard only for reference purposes, as the stock check performed in the “Plan Qty.” column will not consider purchased quantities; for an overall calculation considering all the different demands on the ERP, it is recommended to use the MRP);

c) **Stock On Hand**: Amount of stock for the maintenance materials (base for the stock check performed in the “Plan Qty.” column);
d) **Plan Qty**.: Planned requirements for the maintenance materials from maintenance orders. This column will display a stock check considering the current stock on hand:

Enough stock

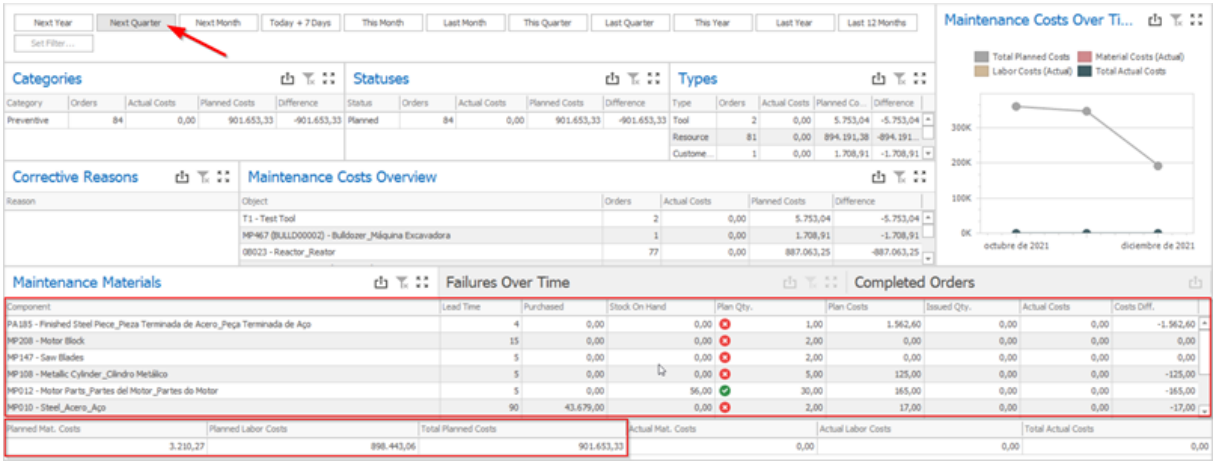
Insufficient stock

e) **Plan Costs**: Planned costs for the maintenance materials, considering their current costs and the requirements from maintenance orders;
f) **Issued Qty**.: Quantity already consumed of the maintenance materials in maintenance orders;
g) **Actual Costs**: Costs registered for the material issues of the maintenance materials performed on maintenance orders;

© 2026 Boyum IT Solutions A/S

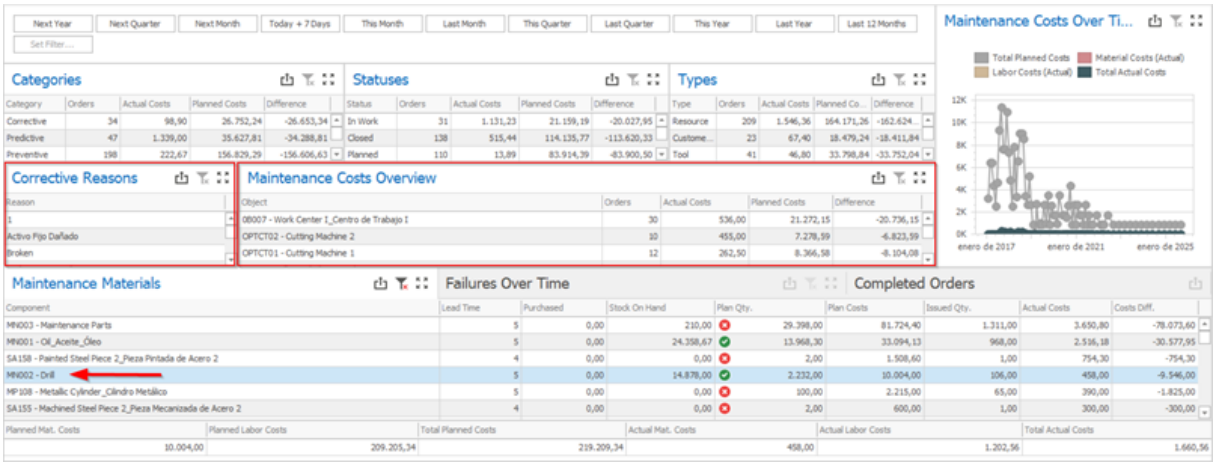
h) **Costs Diff.**: Difference between actual and planned material costs for the maintenance orders.

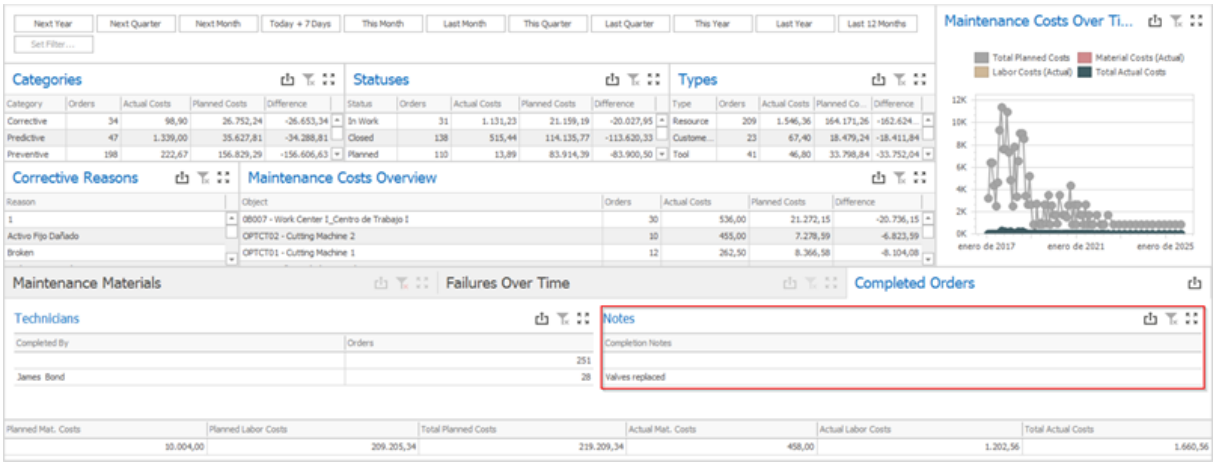
As the values on the "Maintenance Materials" report are filtered according to the previous selections done on the dashboard, it is possible, for instance, to select an equipment and see all the material requirements for a specific maintenance orders' category or status. Additionally, selecting time ranges on the future will enable you to forecast future material requirements for maintenance, as well as to have an estimation of the future financial impacts for maintenance expenses (for both materials and labor). For example, if you want to know which materials you will need and how much you will spend on maintenance during the next quarter, you can select "Next Quarter" on the time range filters and see the results on the "Maintenance Materials" grid and on the totals area.



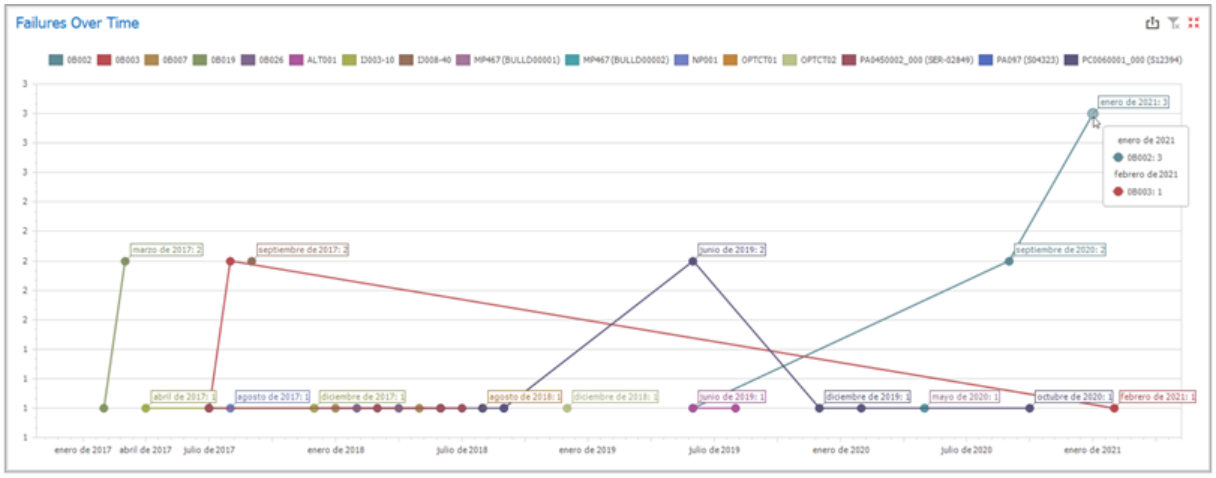
Each component can be selected for filtering the dashboard's data. If you're wondering about which equipment share a same maintenance component, which failure types were associated to maintenances using a specific component, or how maintenance tasks associated to a certain component were solved, you only need to select the maintenance component and see the results on the reports "Maintenance Costs Overview" (all equipment that also have the selected component on their maintenance plans or maintenance orders), "Corrective Reasons" (corrective maintenance reasons for maintenance orders that included the selected component), and "Completed Orders" (lists of technicians who completed maintenance orders associated to the selected component and the notes provided when completing the maintenance orders).

© 2026 Boyum IT Solutions A/S





18.5.10.6 Failures Over Time

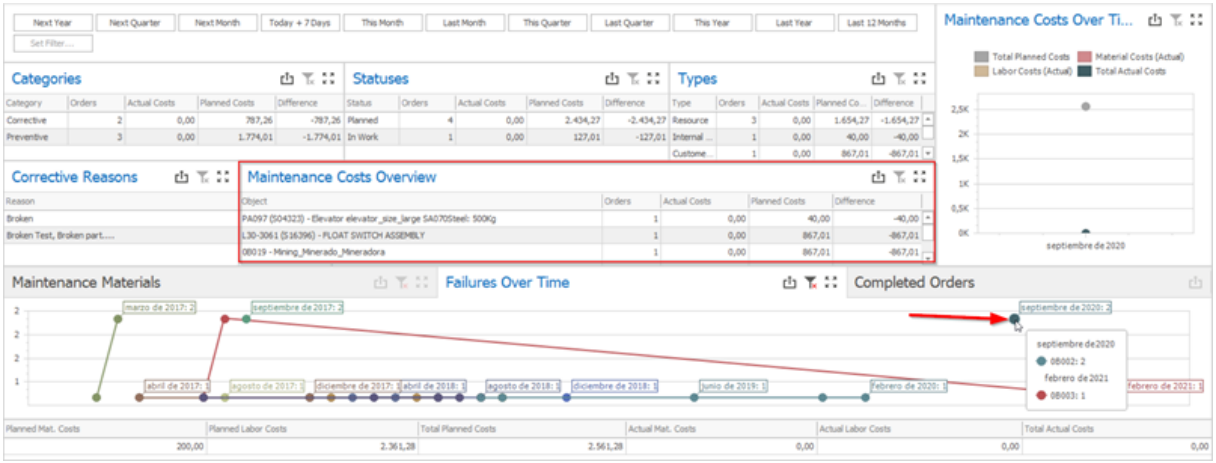


This chart presents all corrective maintenance orders created for the different equipment on a timeline. The data on the chart reflect the values selected on the other reports of the dashboard. Therefore, if you select “Tool” on the types list, the “Failures Over Time” chart will show a timeline of

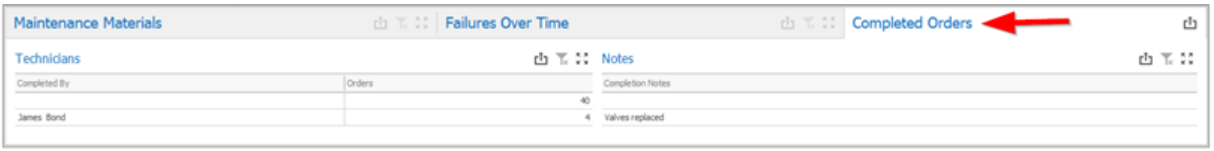
© 2026 Boyum IT Solutions A/S

all corrective maintenances performed for the company's tools. Additionally, if you want to see the pattern of failures on a timeline for one single equipment, you can select it on the "Maintenance Costs Overview" list and see the results on the "Failures Over Time" chart.

Important: The chart only reflects corrective maintenance orders, not other categories of maintenance orders. Each month displayed on the chart can be selected for filtering the dashboard's data. If, when analyzing the chart, you identify a month with an exceptionally high number of maintenances and wish to know which equipment failed in that month, you can just select it and see the results in "Maintenance Costs Overview".



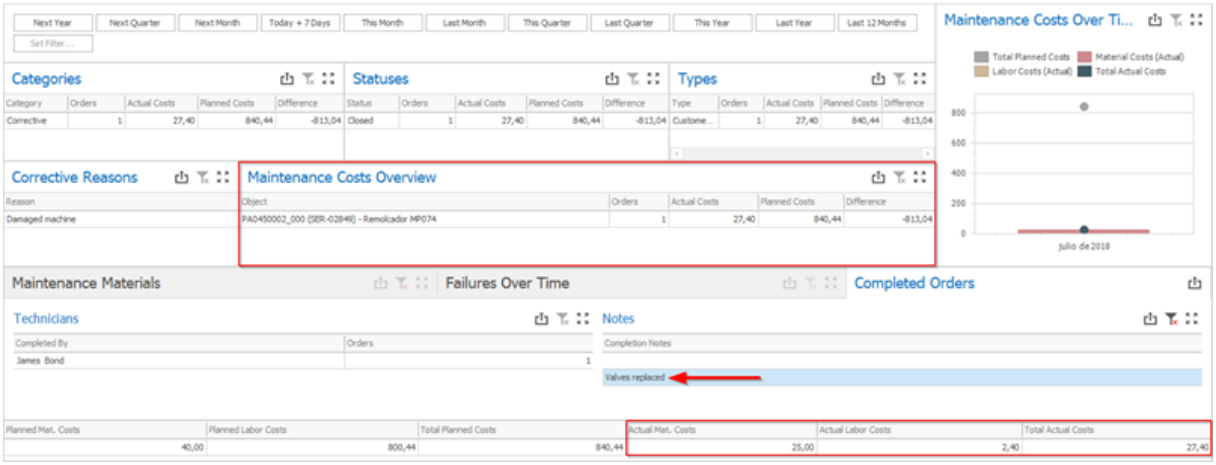
18.5.10.7 Completed Orders



The "Completed Orders" tab contains two reports that can be useful for interpreting closed maintenance orders. On the "Technicians" list, you can see all technicians that were responsible for closing maintenance orders and the number of orders closed by each one of them. On the "Notes" list, you can see the remarks added by the technicians when completing the orders, which explain what they have done on the maintenance orders to solve them. The data on the "Completed Orders" reports can both reflect the values selected on the previous reports of the dashboard and be used to filter the dashboard's data.

For example, if you wish to know a list of equipment that had their maintenance orders solved by "Valves replaced", you can just select this note and see the results on "Maintenance Costs Overview". Additionally, you can take a look at the totals area to understand the costs associated to the maintenance orders that were solved by the same procedure.

© 2026 Boyum IT Solutions A/S

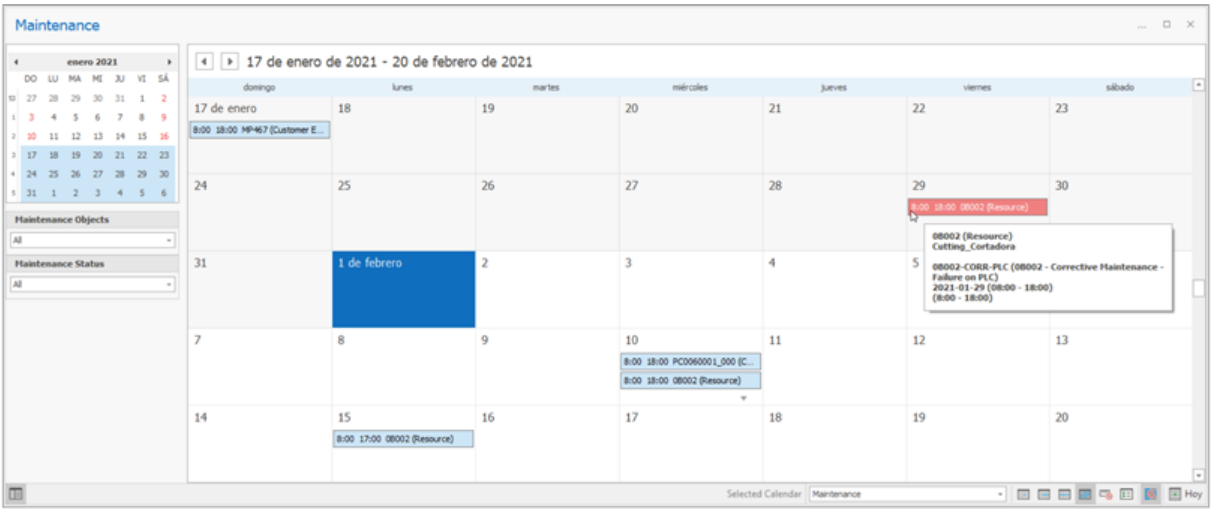


18.5.10.8 Totals Area

The totals area is a single row report at the bottom of the dashboard, in which you can find a summary of both planned and actual costs related to the values that you have selected on the different dashboard's reports. The totals are broken down by material and labor (including both internal labor and external services, all labor costs are calculated using the full costs rates), presenting their planned and actual values, and calculating the difference between planned and actual costs.

18.5.11 Maintenance Calendar

The Maintenance Calendar is a tool that gives you complete visibility over the company's maintenance orders, highlighting each order according to its current status.



© 2026 Boyum IT Solutions A/S

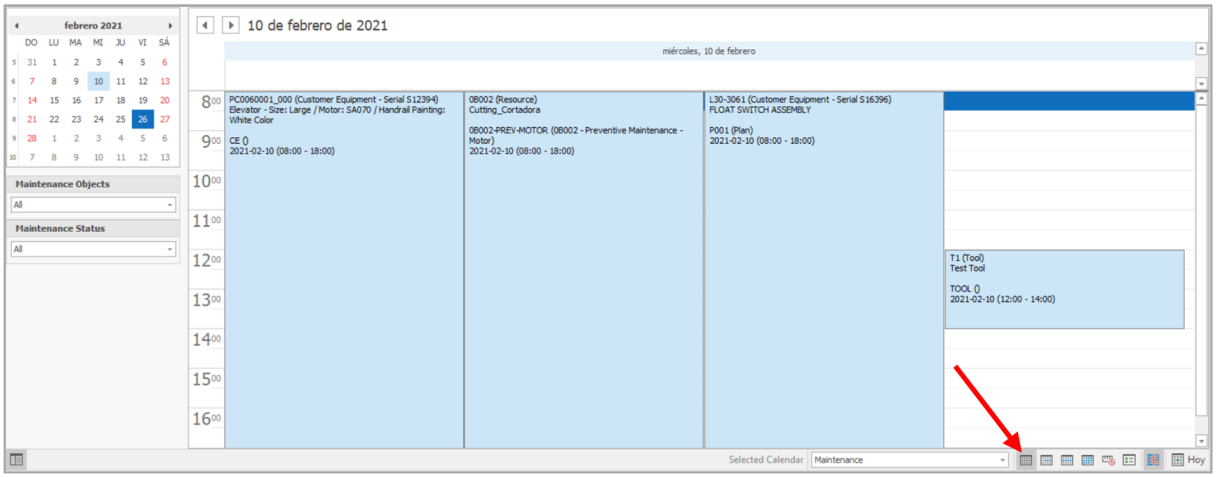
The calendar, working in the same way as an Outlook calendar, can detail the maintenance orders per hours of a day, per week or per month. The closed maintenance orders will be displayed in gray, the planned in blue, the in work in green, and, if there is any resource interrupted for maintenance, the open maintenance orders will be displayed in red, alerting of their importance.
It is possible to filter for specific equipment on the “Maintenance Objects” filter and for specific statuses on the “Maintenance Status” filter.

Dashboard sections:

Daily View
Weekly View
Monthly View
Agenda View

18.5.11.1 Daily View

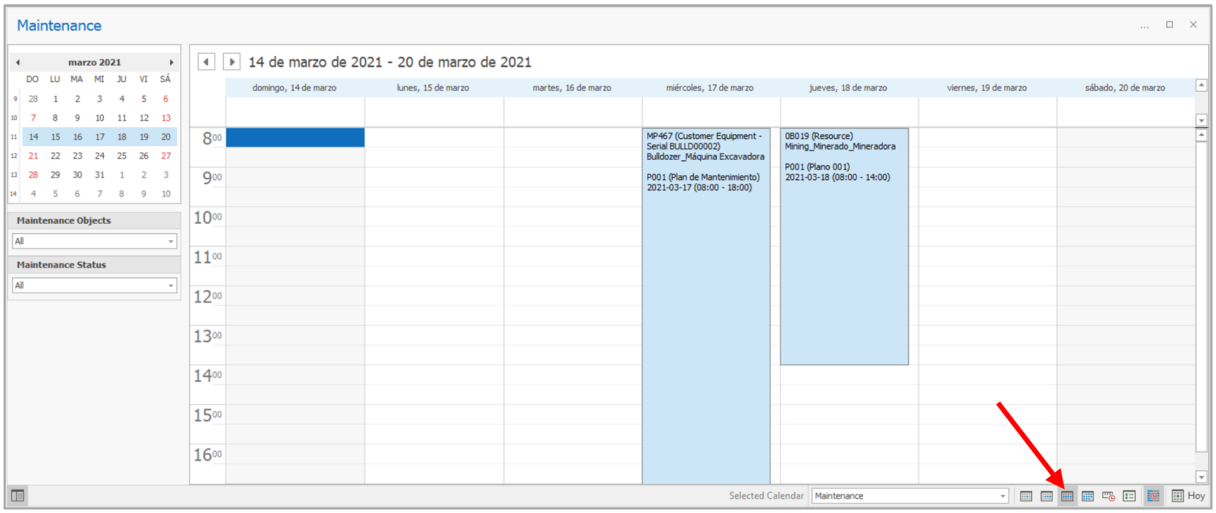
All maintenance orders for the selected day.



© 2026 Boyum IT Solutions A/S

18.5.11.2 Weekly View

All maintenance orders for the selected week.



18.5.11.3 Monthly View

All maintenance orders for the selected month.

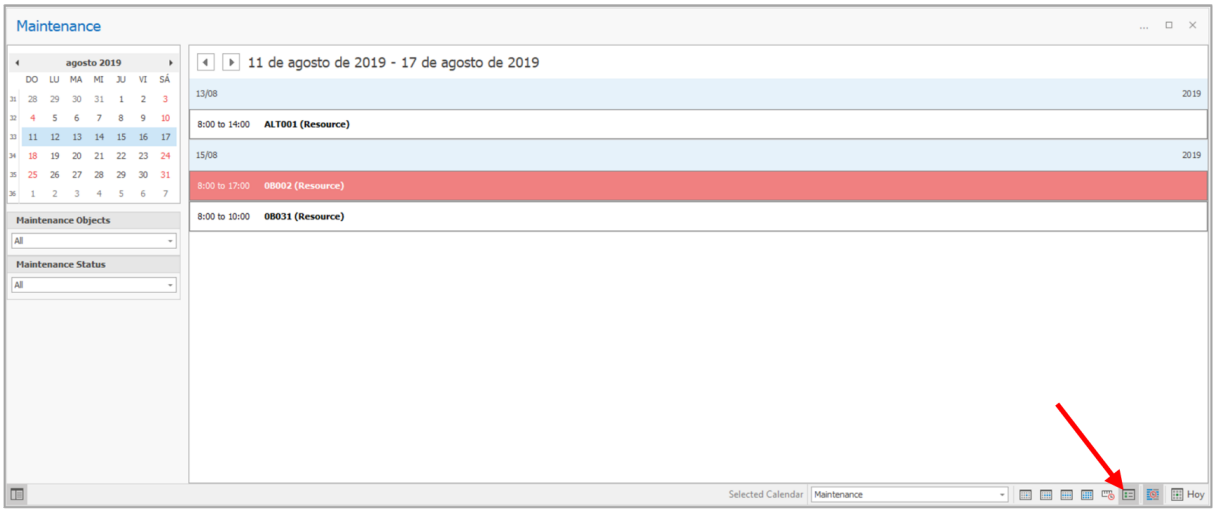
18.5.11.4 Agenda View

List of maintenance orders for the selected time range.



18.6 Beas views

The dashboards utilize views to provide the information to users. The basic views get information on work orders (`BEASV_WORKORDER`), their positions (`BEASV_WORKORDER_POS`), Bill of materials (`BEASV_WORKORDER_BOM`) and routing (`BEASV_WORKORDER_ROUTING`). These views are used together with the resources (`BEASV_RESOURCES`) and their reserved time (`BEASV_RESERVED_TIME`).

Additional views present data of
- Resource utilization: BEASV_RESOURCE_UTILIZATION,
- Interruptions: BEASV_INTERRUPTIONS,
- Items: BEASV_ITEM_SALES_ORDER, BEASV_ITEM_PRODUCTION, BEASV_INVENTORY_HISTORY.

See overview of the new Beas dashboard views in Database views.

© 2026 Boyum IT Solutions A/S

19 Concepts

In this chapter you can find various concepts of Beas Manufacturing explained.

19.1 APS Calculation Types

Beas supports two different calculation methods:
Detailed planning and *Exploit Full Capacity*
You can define the calculation method in
Production > Capacity Planning, APS > APS Calculation Types > Consider capacity limits

- Detailed planning

Beas applies this calculation method only if the following conditions are met:

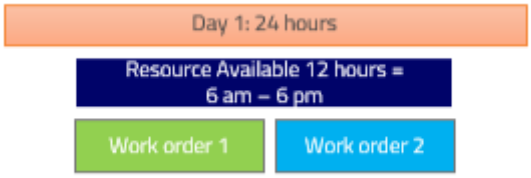
- Only when forward scheduling is used in APS
- Both the APS Calculation method and the work order priority are set to 100%
- In the routing of a work order the operation is set as Simple utilization / or Percentage = 100%
- The resource linked to each of the routing positions of the Work order is set to have the master data fieldÂ Number of machines/Pers = 1.

How Detailed planning works:

The detailed planning checks to the minute when a resource is available, and whether the work sequence can be completed in the available time windows.
Assumptions: our resource is the same on all routing position on the below reported examples and has a total capacity of 12 hours per day.

Example 1:
Work order No. 1 and Work order No. 2 start at 6am on the same date/time. Both work orders only have one routing position and each position has an entire duration of 6 hrs.
The result of an APS forward scheduling will be: Work order 1 starts at 6am, Work order 2 starts at 12pm because between 6am and 12pm the resource is not available and is occupied by work order No. 1.

© 2026 Boyum IT Solutions A/S



Example 2:

Work order No. 1: one routing position with a duration of 6 hours,
work order No. 2: one routing position with a duration of 3 hours and
work order No. 3: one routing position with a duration of 6 hours.

The result of an APS forward scheduling will be:
Work order No. 1 will start on day 1 at 6am,
Work order No. 2 will start on day 1 at 12pm,
Work order 3, even if you have set the same start date/time for the APS forward calculation, will be moved forward to start on day 1 at 3pm but will finish on day 2 at 9am.

Example 3

Work order No. 1: one routing position with a duration of 6 hours,
work order No. 2: one routing position with a duration of 3 hours and
work order No. 3: one routing position with a duration of 6 hours.

ATTENTION: The following example assumes that you are working on the APS Gantt and you have set work order No. 2 manually (by dragging it on the Gantt chart) to start at a specific time (and the operation is also then fixed by APS).
In this example, Work order 3 can start only start on the second day, because between Work order 1 and Work order 2 the free time is not enough.

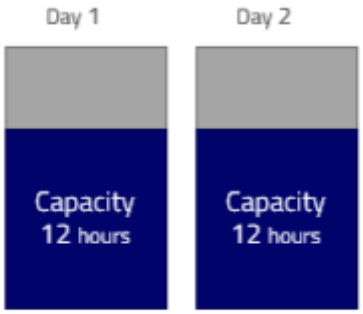
© 2026 Boyum IT Solutions A/S

See Capacity planning - APS, Exploiting the full capacity

Exploit Full Capacity

This method checks the total available capacity on a day for a resource.

Note: It does NOT check when the capacity is available.



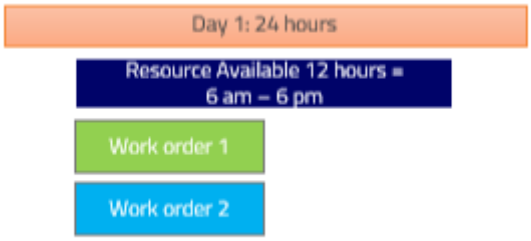
Example 1:

2 work orders, one routing position per work order, each routing position with a total duration of 6 hours. Both work orders are planned in APS with forward scheduling and with the same start date/time.

The result of an APS forward scheduling will be:

Both work orders will have the same start date and time because Work order 1 needs 6 hours and 6 additional hours are available for Work order 2. The start/end time of each work order is not checked by Beas.

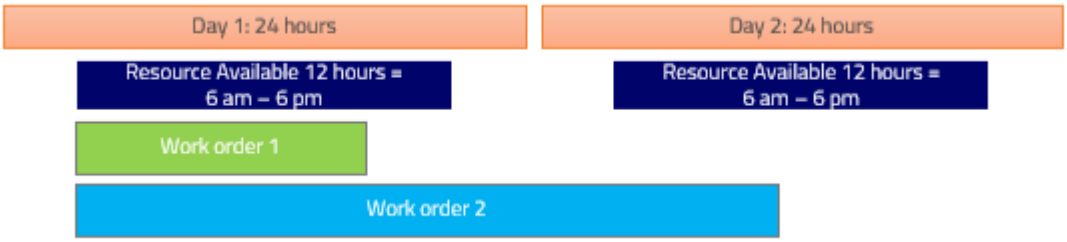
© 2026 Boyum IT Solutions A/S



Example 2:

2 work orders, one routing position per work order, each routing position take 8 hours. We have a total duration of 16 hours for both work orders with a total available capacity of 12 hours on the machines.

The result of an APS forward scheduling will be:

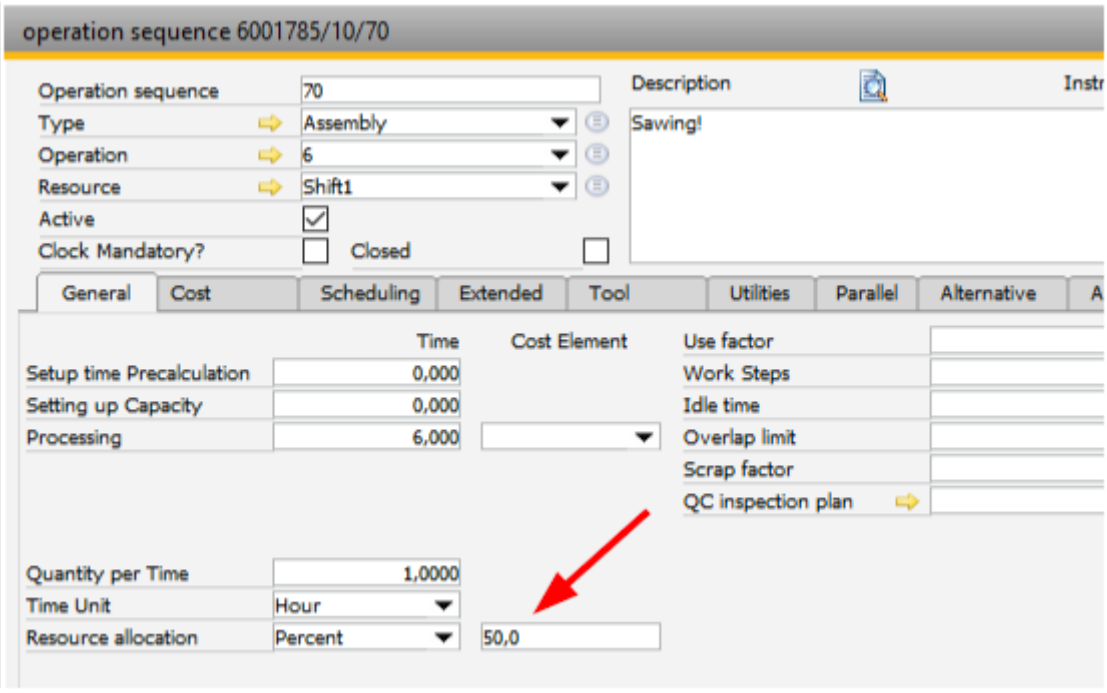


Here again both work orders start at same time but the time span by which Beas assigns the second work order is longer. The routing operation of the second work order will still be 8 hours (as well as the capacity occupied on the resource), but can take only 4 hours from Day 1 and will have to take 4 hours from the second day. This is why you will have representation in the APS GANTT for the second work order that is longer than the first one. If you check the **Resource > Dispatches > Detail**, you will see the calculated time zones for the second work order: Day 1: 6am – 10am (4 hours, as the remainder of the capacity has been taken by work order 1) Day 2: 6am – 10am (the remaining 4 hours of work order 2)

Example 3:

Work order 1 and 2 have been set to start on the same Day by APS with forward scheduling. Each of the work orders has one routing position and each of them lasts for 6 hours. You have assigned a resource allocation of 50% for each of the routing positions.

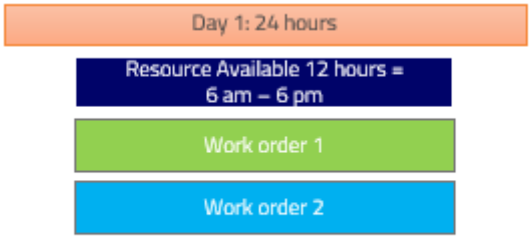
© 2026 Boyum IT Solutions A/S



In this situation, the Detailed planning will not be used.

The result of an APS forward scheduling will be:

The system plans the complete day, but on both work orders it will have the same start date/time, and they will be in parallel because of the 50% setting at the routing position resource allocation. The system will represent both work orders with a longer time span (12 hours each), but each of them will still occupy only 6 hours of resource capacity.



See Capacity planning - APS, Detailed planning

See Capacity planning - APS

© 2026 Boyum IT Solutions A/S

19.2 Backflushing

Backflushing means that with the creation of an order-related time receipt, the material is also posted. This operation has some dependencies.

The prerequisites for material postings during an order-related time receipt are described here. A posting is only performed when a new order-related time receipt is entered, but not when it is changed or canceled.

Material issue for Production

To enable backflushing, the following must be activated: **Configuration Wizard > Production > Material Posting and Reservation > Automatic Material Entry** for **First Operation** or **Last Operation**.

Important: Note the definition of the corresponding operations.

Only those materials are posted whose output method is set to backflushing in their master data. ***See*** **Item master > General tab > Output method** field.

The material is issued at the time of the terminal logoff, or when the time receipt is created. The reported quantity (yield quantity + scrap quantity) * default quantity as per BoM is issued. Fixed quantities are converted accordingly.

Issuing batch and serial number managed items

For batch and serial number managed items, the output method cannot be set to backflushing in the item master. This is prevented by SAP Business One . However, if the option **Configuration Wizard > Production > Material Posting and Reservation > Backflushing > Also Enter Batches** or **Also enter serial numbers** is activated, batch and serial number managed items are also issued. An item-specific output method cannot be configured here.

When batch- or serial number-managed items are backflushed, a new window opens in which the batch numbers or serial numbers must be selected.

Direct operation allocation

If a BoM position is assigned directly to a routing position, this position is backflushed when the time receipt of the allocated routing position is posted (not with the first or last reportable routing position is submitted).

Backflushing from warehouse

Issuing is always performed from the default warehouse of the item, except when a warehouse is specified in the BoM, from which issues should be performed. The warehouse specified in the BoM has priority.

© 2026 Boyum IT Solutions A/S

Backflushing from bin location

The backflushing function is an automatic process, therefore bin location management is not supported.

Backflushing of material positions

If a negative quantity is entered in a BoM position, a material credit is performed for the backflushing process. A negative BoM (dismantling) can also be performed using backflushing. Batches and serial numbers cannot be posted automatically.

Automatic receipt of and assembly

The behavior for receipt of the assembly to be produced is configured in **Configuration Wizard > Production > Valuation and Posting of Assembly > Posting**. The following options are available:

Like Material (Last Operation i.e. Backflushing)	Receipt is issued for time receipt of last reportable routing position at the reported yield quantity. If "first routing position" is configured for material, however, the receipt is performed for the last routing position. Receipt is also issued, if the assembly does not have the "backflush" output method configured in its master data.
No posting	Assembly is not received automatically.
Like Material (only backflushing assemblies)	Receipt is issued on time receipt of the last reportable routing position at the reported yield quantity, but only if the assembly output method is set to "backflush" in its master data.

The receipt is issued to the default warehouse of the assembly, unless a different warehouse is configured in **Configuration Wizard > Production > Valuation and Posting of Assembly > Booking finished items to warehouse**. Bin location management is supported - the bin location is queried after the receipt.

Batch and serial numbers are determined automatically - this is set up in **Configuration Wizard > Production > Valuation and Posting of Assembly > Serial Number / Batch Number** or item specifically in **Item Master > Batch > Batch Determination**.

IMPORTANT: The Close operation sequence automatically FDC parameter is not considered by Backflushing process.

Account setting

Accounts are determined the same way as for the material posting functions in SAP Business One. However, the contra account is always the WIP account of the assembly or, depending on the configuration, the material.

Production time receipt

19.3 Batch Generation

Beas can determine batches and serial numbers automatically. This feature, among others, is available in the following functions:

Goods Receipt	Clicking on the orange arrow next to the batch or serial number field generates a new number.
Beas goods receipt	A new batch or serial number is generated automatically if this has not been deactivated.
SBO goods receipt	(Only batches) There is a Next batch number button in the window where the batch numbers are checked and the next number is generated.
Production receipt	When receiving the finished part, a new number is generated. Requirement: The Automatic batch determination option must be activated in the Item master data.

Batch or serial number generation can be set up separately for all areas.

Specifying a batch number template

A template is available to determine the format of the the next number. This template has several configuration options:

1. Using simple decimal (0-9) or alphanumeric (0-9 A-Z) counter systems
2. Using placeholders in the counter system
3. Using free configuration with the extended setup
4. Using a BeasScript function

Simple decimal or alphanumeric configuration

Determines the template for the batch number structure.

xxx	Continuous number.
XXX	Alphanumeric number. This is the default setting.
aaa	Numeric without truncating the number.

© 2026 Boyum IT Solutions A/S

The counter type is determined, by searching the letter x, then a, then X. If an x is found, an a or X would be ignored.
The number of letters determines the number of displayed digits. The characters xxx mean 3 digits. Shorter numbers are filled with initial zeros, longer numbers are truncated, except when "XXX" is used. In this case, the minimum amount is determined, but longer numbers are not truncated.

The structure can be combined with other characters:

`ABX2009-xxxx-V` = `ABX2009-0001-V, ABX2009-0002-V`

Note: Unlike in SAP BusinessOne, the single quote sign (') is not supported as a batch number character.

Windows and counter readings are defined: ***see***

Configuration wizard - Production - Valuation and posting assembly - Batch management / Serial numbers

Materials management - Batch management

Materials management - Goods receipt

Examples:

`xxx`	`001, 002, 003 .... 009, 010, 011`
`x`	`1,2,3,8,9,0,1`
`XX`	`01,02,03,... 09,10,...98,99,100,102`
`aaa`	`001, 002 ... 009, 00A, 00B ... 00Z, 010, 011 ... 019, 01A ... 01Z, 020`
`a`	`1,2,..0,A,B...X,Y,Z,0,1`
`xxX`	results in `01X`, because "xx" is found first
`bbX`	`bb1, bb2, .. bb9, bb10`
`Xxx`	X is not considered as a counter, because "x" is found first Result: `X01, X02..`

Using placeholders

Placeholders can be used in the template, which are then replaced during run time. For production receipt, the „e_belnr_id“ and „e_belpos_id“ variables are available.

Example: `ABX-<e_belnr_id>-<e_belpos_id>-<today,yymm>-xx`

© 2026 Boyum IT Solutions A/S

Placeholders are replaced by work order and the current date.
The work order document is 123, Position is 10, today is October, 20th 2012 and the next counter is 5: `ABX-123-10-1210-5`

Use of "current date"
With `<today>` the current date can be inserted. The format is determined as follows:

Date area

Character	Meaning	Example
`d`	Day number with no leading zero	9
`dd`	Day number with leading zero if appropriate	09
`ddd`	Day name abbreviation	Mon
`dddd`	Day name	Monday
`m`	Month number with no leading zero	6
`mm`	Month number with leading zero if appropriate	06
`mmm`	Month name abbreviation	Jun
`mmmm`	Month name	June
`yy`	Two-digit year	97
`yyyy`	Four-digit year	1997

Examples

Format	Displays
`[red]m/d/yy`	1/30/98 (in red if this is a format for input field)
`d-mmm-yy`	30-Jan-98
`dd-mmmm`	30-January
`mmm-yy`	Jan-98
`dddd, mmm d, yyyy`	Friday, Jan 30, 1998

Time Area

Character	Meaning
`h`	Hour with no leading zero (for example, 1)

© 2026 Boyum IT Solutions A/S

Character	Meaning
hh	Hour with leading zero if appropriate (for example, 01)
m	Minute with no leading zero (must follow h or hh)
mm	Minute with leading zero if appropriate (must follow h or hh)
s	Second with no leading zero (must follow m or mm)
ss	Second with leading zero (must follow m or mm)
ffffff	Microseconds with no leading zeros. You can enter one to six f's; each f represents a fraction of a second (must follow s or ss)
AM/PM	Two-character, upper case abbreviation (AM or PM as appropriate)
am/pm	Two-character, lower case abbreviation (am or pm as appropriate)
A/P	One-character, upper case abbreviation (A or P as appropriate)
a/p	One-character, lower case abbreviation (a or p as appropriate)

Examples

Format	Displays
h:mm AM/PM	9:45 PM
hh:mm A/P	09:45 P
h:mm:ss am/pm	9:45:33 pm
h:mm	21:45
h:mm:ss	21:45:33
h:mm:ss:f	21:45:33:2
h:mm:ss:fff	21:45:33:234
h:mm:ss:ffffff	21:45:33:234567
m/d/yy h:mm	1/30/98 21:45

As a separator for dates: blanks, slash, dot and for time colon can be used.

Example:

<today,yyyymmdd>-<now,HHMM> returns 20241205-1630

<today,yyyy/mm/dd>-<now,HH:MM> returns 2024/12/05-16:30

Extended setup

© 2026 Boyum IT Solutions A/S

In the extended settings, the counter system can be freely configured. It is also possible to insert multiple counters after each other.
As the counting system does not have to be decimal and it may not be possible to convert from decimal to the counter, the default counter statuses cannot be used.

The definition is supplied in curved brackets. Everything outside the curved brackets is fixed.
For example, `ABC{ countdefintion }` results in `ABC000001`.

The parameters in the counter definition are separated by commas.
The counter system is specified by the count command: `count=01234` would result in:
`01,02,03,04,10,11,12,13,14,20 ...`

The following commands are available:

Property	Description
`count`	Counter system for decimal. 0123456789
`count[x]`	Additional counter systems, if a different counter systems are required for specific counter positions. Up to 8 extended definitions are permitted. For example: `count1=ABCD`
`pattern=00000000`	Defines which counter system is used for each character position. For example: pattern`=111000` The first 3 digits use the counter system defined in "`count1`" the digits 4-6 the setting as per the original "`count`" system.

`len=x`	Determines the length of the counter:
	`len=3 001`
	`len=6 000001`
	Up to 8 digits are allowed.

`start=x`	Determines the first counter status.
`setup=x`	Determines the name under which the counter status should be saved.

Examples:

```
ABC{count=0123A,len=3,setup=mycounter1,start=102}
```

© 2026 Boyum IT Solutions A/S

Counts:
ABC002,ABC003,ABC00A,ABC010,ABC011,ABC012,ABC013,ABC01A,ABC020,ABC021,ABC022,ABC023,ABC02A...

```
{count=012,count1=ABC,len=4,pattern=1100,setup=mycounter2,start=AA00}
```

Counts
AA00,AA01,AA02,AA10,AA11,AA12,AA20,AA21,AA22,AB00

- Use Script for generate every type of batch / serial numbers

You can use script language to create batch / serial numbers.
For this use the user events concept from Beas

See
Work order Receipt: Batch and Serial Numbers
Receipt and Receipt for Purchase order: Batch / Serial Number

19.4 Breakdown (Item)

In manufacturing and Beas, breakdown or explosion is the action of breaking apart the Bill of materials for each assembly or sub-assembly into its components. Differentiating between make-to-stock and make-to-order items helps in defining a production strategy. It also defines a combination of scenarios on production planning and execution processes.

The breakdown Variant is defined in **Item Master Data > General tab > Manufacturing Data > Breakdown**.
Note on APS: If no Breakdown method is defined, the item will not be considered correctly in the APS calculation.

The following Variants are available:

Breakdown	Procurement Method	Description
non breakdown	buy	- Ignores Bill of materials Recommended to be used when the item is a general purchase ("buy") item, which normally has no Bill of materials attached to it. Therefore, this item is considered as a purchase item. In work orders it is used for finished goods with mode of procurement set to buy, Beas considers all BoM positions as purchase items and suggests to create a purchase order, in case there is not enough in stock of that item.

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		Limitation: When this type of breakdown is used with Produce ("make") items, all information of the Bill of Materials will be ignored.
provision parts	buy	Bill of materials define the provision Items that are included in the purchase item. ***Example***: If you buy an engine from a supplier, and it always comes with a can of motor oil and a gallon of coolant. In this situation, you still need to keep track of how many cans of motor oil and gallons of coolant you have on inventory. The *Provision parts* option is used to define these types of item. This option allows to insert additional items in the bill of materials list so at the moment the goods receipt is issued for the purchase order, Beas suggests and completes the goods receipt for the existing provision parts. For Buy items, MRP generates purchase order recommendations. For Produce items, MRP generates production order recommendations. **Limitation in MRP:** Beas does not calculate MRP Sub-assembly requirements for items defined as "Provision parts". ***see*** Provision parts Goods receipt with provision
storage related	make	for storage related production or order related production This is an assembly for storage- or order-related manufacturing. Sub-assemblies are produced separately or order-related. • You can define a configuration • You can define a short variant • You **cannot** create a precalculation • You can plan stock in MRP

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		• You can use the produced assembly for other orders Video **Storage-related production** Use MRP for creating a work order. **Order-related production** For order-related production the activation of the reservation system is mandatory. Finished goods Activate Production - Reservation - Receipt reservation only at : always Working with MRP: - Click on the Sales order and create work order for this Sales order Semi-Finished goods Assemblies can be produced order-related, when the respective option was selected in **BOM item > breakdown.**  The setting has no effect when the work order is created by the calculation functionality. The possible settings are: - No: No work order positions will be created for the semi-finished goods - Always: Works exactly like order-related semi-finished goods - Only shortage: Creates order positions only if there is not enough inventory

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		In order recommendation report these assemblies will still be created as stock-related assemblies. ***See*** BoM position - breakdown
order related	make	**only order-related** This is an assembly that is produced by order, that is: The sub-assemblies are produced together with the main assembly. Note: Only order-related! • You can define a configuration in the Sales order. • You can define a short variant in the Sales order. • You can create a precalculation in the Sales order and can change the substructure inside the precalculation. You can use the definition in precalculation for order-related work orders. • You can create an order-related work order. • You **cannot** plan stock in MRP. • You **cannot** use the produced assembly for another order in a simple way. • Maximum structure level: 20 levels. Concept for order-related finished good products An order-related finished product has Bill of Materials and Routing. Use this only for Sales order  In Sales order you can create Precalculation or/and Configurations or/and Short variants. You can change the Bill of Materials/Routing in Precalculation.

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		Notes: Do not use MRP for planning the request. Do not work with lot size. It is always order-related. **Create work order** Work order created via Sales order to Work order.  You can see order-related items in MRP, but the MRP has a "stock view". It is not possible to plan the requirement for order-related items in the MRP. **MRP** In MRP you can see the sales order and it is possible via double-click to produce order-related. But the MRP is item related. Do not use it to manage order-related requirements.

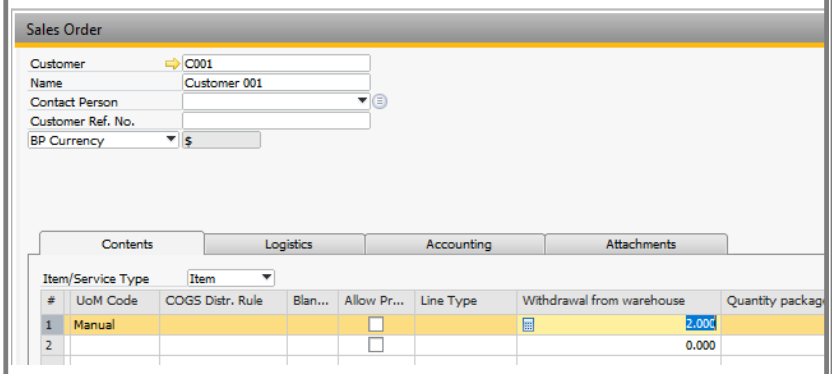
© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		 Use the window "Sales Order to production Order" This window has order-related view. You can create work orders directly and only see entries that do not have enough production orders. Here the system ignores the stock because of the order-related view:  **Special cases** Deliver from stock ***Example:*** You produced an order-related finished goods, but the customer canceled the order. Now the item is on stock. If you have a new sales order with the same product, you can

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description

define the quantity which you want take from stock in **Sales order > column "Withdrawal from Warehouse"** .



Note:

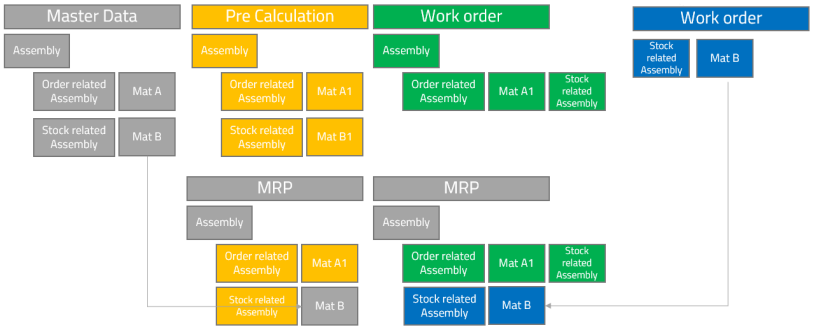
Use this functionality only for special cases. This is not the original idea of order-related production.

Order related Precalculation

In the MRP, order-related assemblies receive their data from the work order and stock-related assemblies from the item master data.

Therefore, the MRP ignores changes made in the precalculation for stock-related assemblies.

In the following video we describe the complete process:

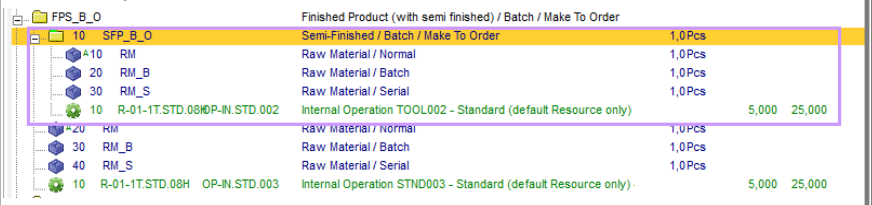


© 2026 Boyum IT Solutions A/S

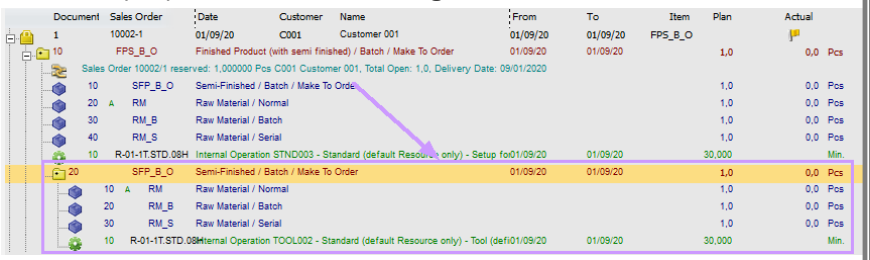
Breakdown	Procurement Method	Description
		Concept order related Semi-Finished items

Use order-related semi-finished products if you want to produce this item only for an order or stock-related finished product.
You can produce the order-related semi-finished product as Finished product for a sales order, but not on stock.
In MRP you can see the requirements for semi-finished product, but normally this does not change the balance.

In the following example you can see the semi-finished product "SFP_B_O", which is part if Finished Product "FPS_B_O"
In the Finished Product the semi-finished product is defined as a Bill of Materials position.



This example produces the following work order:



Inside the semi-finished product you can insert additional semi-finished products. Beas supports max. 20 levels.

Recursion: If you insert the same order-related item as Bill of Materials, the system does not break down this order-related semi-finished product. However, it is possible to create a recursive structure.

Example: Recursive structure

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		In the following example a recursive item is inside the structure: FP_RECURSIVE is inside FP_RECURSIVE. The system display sthis only as material. Inside FP_RECURSIVE2 you can see FP_REURSIVE. In this case it produces a recursion. This produces the following recursive production order: FP_RECURSIVE: no breakdown But inside "FP_RECURSIVE2" there is "FP_RECURSIVE" again, which produces the recursion, but max. up to 20 levels.  Beas displays the following error message:

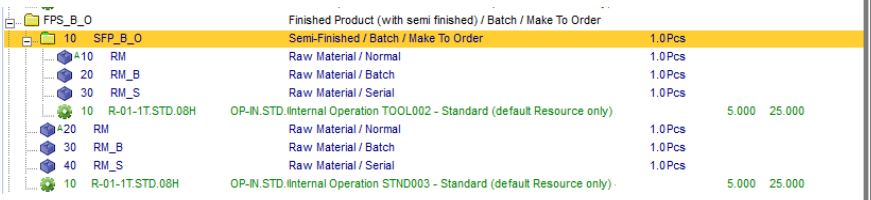
© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		BoM explosion of more than 10 levels not possible! Cancel sub-assembly FP_RECURSIVE

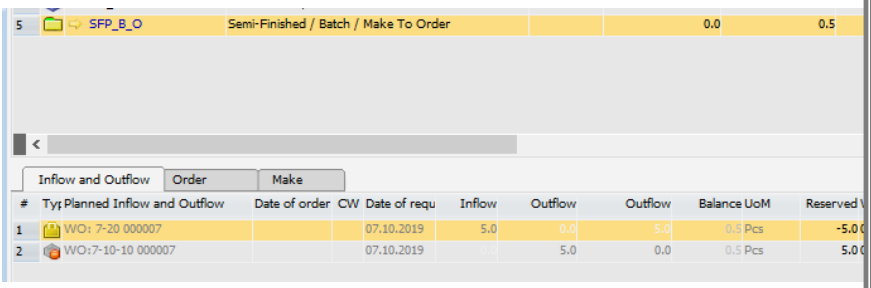
Reservations on storage related orders for order-related assemblies

For the following order-related work order, MRP displays the reservation. As it is an order-related work order, the balance of the reservation is neutral (we porduce 5 which fulfills the sales order -5).

WO:



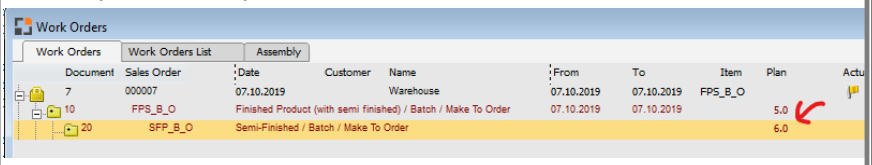
MRP:



The quantity of the work order is manually increased

WO:

Quantity is manually increased from 5-6.

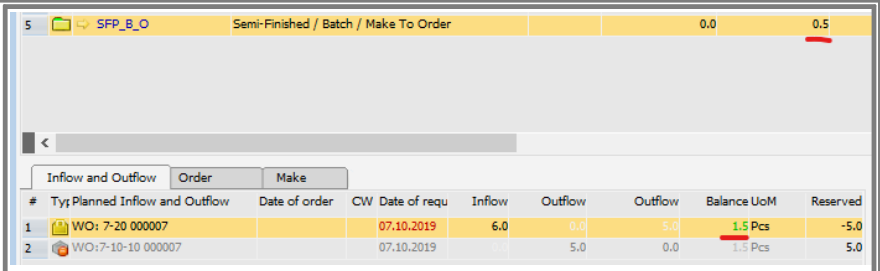


MRP:

In this case stock is produced (there was originally 0.5 in stock).

© 2026 Boyum IT Solutions A/S

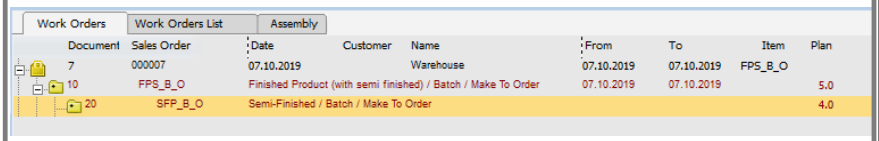
Breakdown	Procurement Method	Description



The quantity of the work order is manually decreased

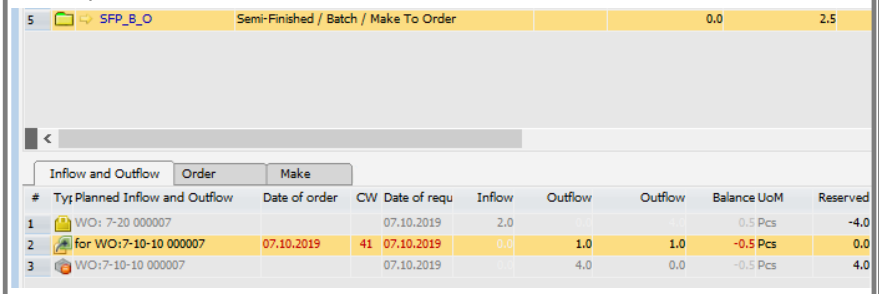
WO:

Quantity is manually decreased from 5-4.



MRP:

An additional line is added to produce the additional required piece and this is produced to stock.



- Special cases
  - Partial postings in order-related sub-assemblies are ignored in the MRP balance calculation

    WO: With partial posting

    MRP:

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		 Closed sub-position in order-related sub-assemblies If the sub-position is closed and the requirements are not fulfilled, a new work order is created to deliver the rest. This is a storage-related work order. WO: With closed position  MRP: phantom assembly group	make	Item is a phantom item This is a phantom assembly, i.e. its routing and Bill of materials are part of the used assembly. If the item has the type "Pseudo item", it behaves like an item with scheduling "Phantom assembly".
set item	make	Define this item as SAP Business One set item

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		The Sales BoM represent a finished product assembled at the sales stage, that is, the finished product is composed of its component items only when the parent product is actually sold. The component items are stored and tracked individually in the warehouse. For both the Sales BoM, you do not manage the parent product as an inventory item, but rather as a sales item. The components can also be sales and inventory items in their own right. When you create the delivery to dispatch the customer order, the components are backflush issued from inventory. Note The components for Sales BoMs and Assembly BoMs must be sales items. The BoM will be defined in SAP Business One Bill of Material window Use a Sales BoM where there is a fixed combination of components and the customer needs confirmation of each item. The component items cannot be altered or removed from a sales order. Other items cannot be inserted between the parent and component items in the sales order. However, the quantities of the component items can be modified. Example Sharon's Garden Ltd. sells garden tools and outdoor furniture. One of her best sellers is the Metal Table set. This set is composed of one metal and glass table, six metal chairs, and one umbrella. If she chooses the Sales BoM, the table, six chairs and one umbrella, and the Metal Table set all appear in the sales order. She can sell this set with only four chairs, but she cannot introduce a footstool as part of this set in the sales order. If she chooses the Assembly BoM, then only the Metal Table set (the parent product) is listed in the sales order.

© 2026 Boyum IT Solutions A/S

Breakdown	Procurement Method	Description
		In both cases, each of the component items is tracked individually in the inventory. When you create the delivery to dispatch the customer order, the components are automatically issued from the warehouse.
template	make	Define this item as template item The Template BoM is a bundle of items, where the parent product is the first item on the list. It does not act as a BoM once it is added to the sales document, but rather as a list of items brought together at the same time. You can update the quantity of those items, swap items, or delete them in the BOM or the sales order. The components appear below the parent as a list of items in a sales document. Use the Template BOM when you require flexibility in selecting components for a product. ***Example*** Computers can be sold as a standard unit, in which case the Production or Sales BoM is appropriate. However, to customize a sales order, use the Template BoM to allow for DVD burners, speakers, ergonomic keyboards, and so on. The BoM will be defined in SAP Business One Bill of Material window

19.5 Electronic Signature

An electronic signature, is any electronic means that indicates either that a person adopts the contents of an electronic message, or more broadly that the person who claims to have written a message is the one who wrote it (and that the message received is the one that was sent). By comparison, a signature is a stylized script associated with a person. In commerce and the law, a signature on a document is an indication that the person adopts the intentions recorded in the document. Both are comparable to a seal.

See

QC inspection plan – Release

© 2026 Boyum IT Solutions A/S

Personnel – Logon

19.6 Four eye principle

The Four eye principle or two-man rule is a control mechanism designed to achieve a high level of security for especially critical material or operations. Under this rule all access and actions require the presence of two authorized people at all times.

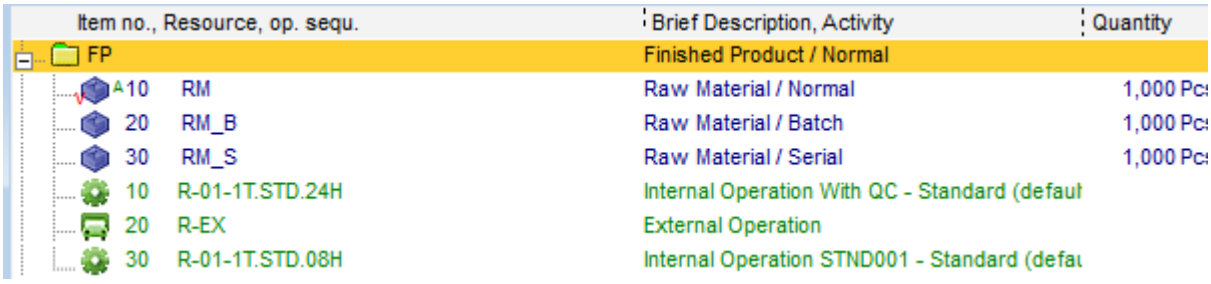
Source: Wikipedia

See QC inspection plan – Release

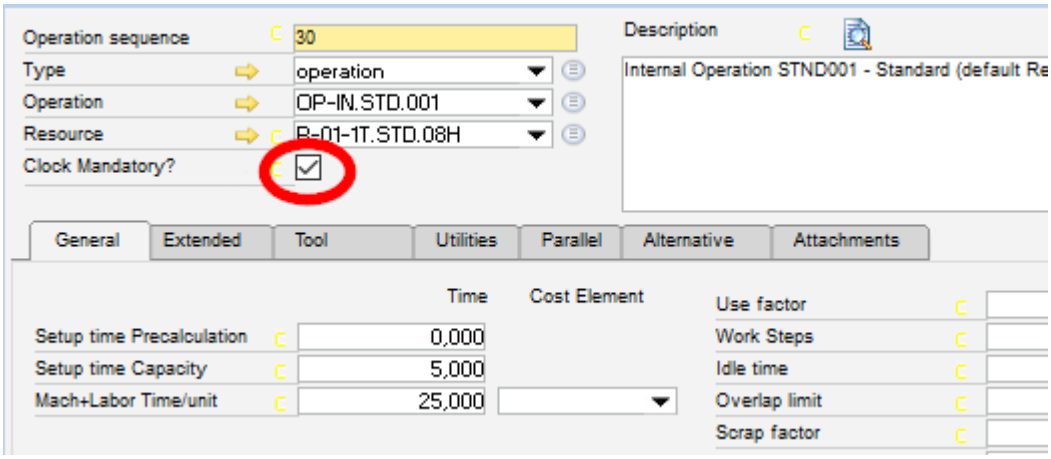
19.7 Last routing position

"Last routing position" is the last routing entry in the Routing plan, in which the flag "Clock mandatory" is active.

Example: Work order with 3 Routing positions



Normally "clock mandatory" is active in all positions.
In this case, Position "30" is the last position.



© 2026 Boyum IT Solutions A/S

> Note: It is not the Position number that defines the order. You can change the order in the Routing list by Drag & Drop.
>
> If the "clock mandatory" is disabled in Position 20 and 30, the position 10 turns out as the first and last operation.

If you close routing position 10 with a time receipt and "close work order position automatically" is activated in the Configuration wizard, the system ignores position 20 and 30 and closes the work order position.

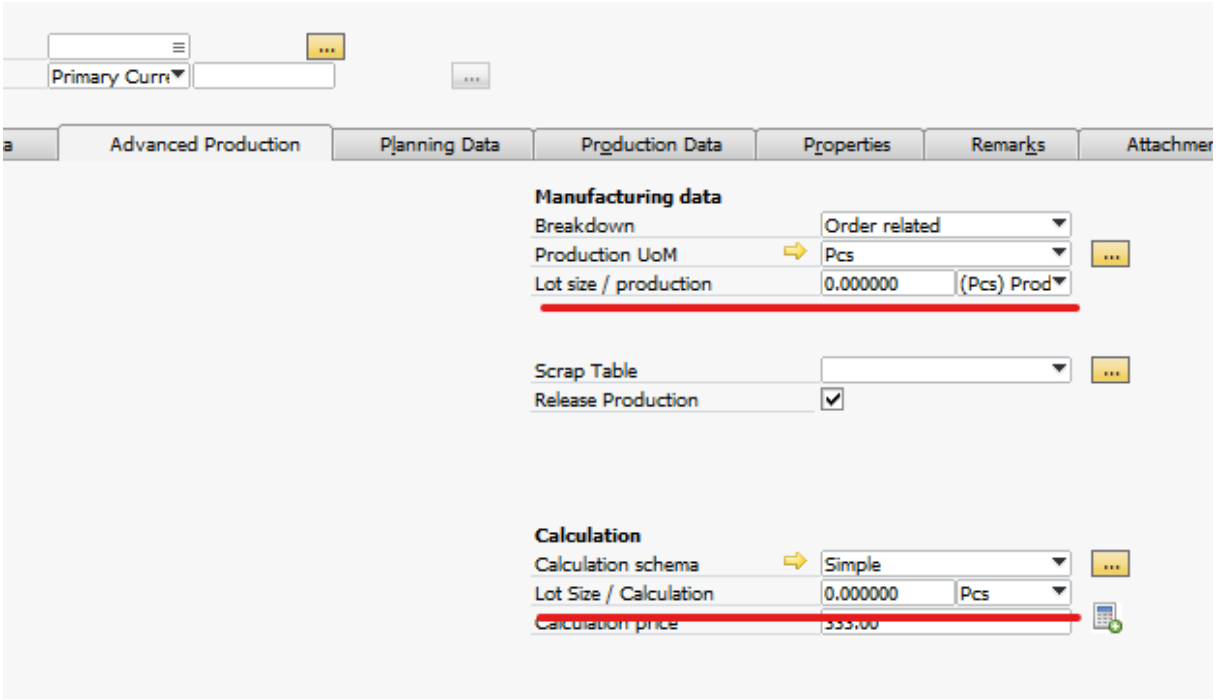
19.8 Lot size

In Beas we have 2 different lot sizes:

Production lot size: Maximum lot size for production (inventory UoM)

Calculation lot size: The average lot size for price calculation, e.g. for using in batch calculation (inventory or production UoM)

See Item Master Data - Advanced Production



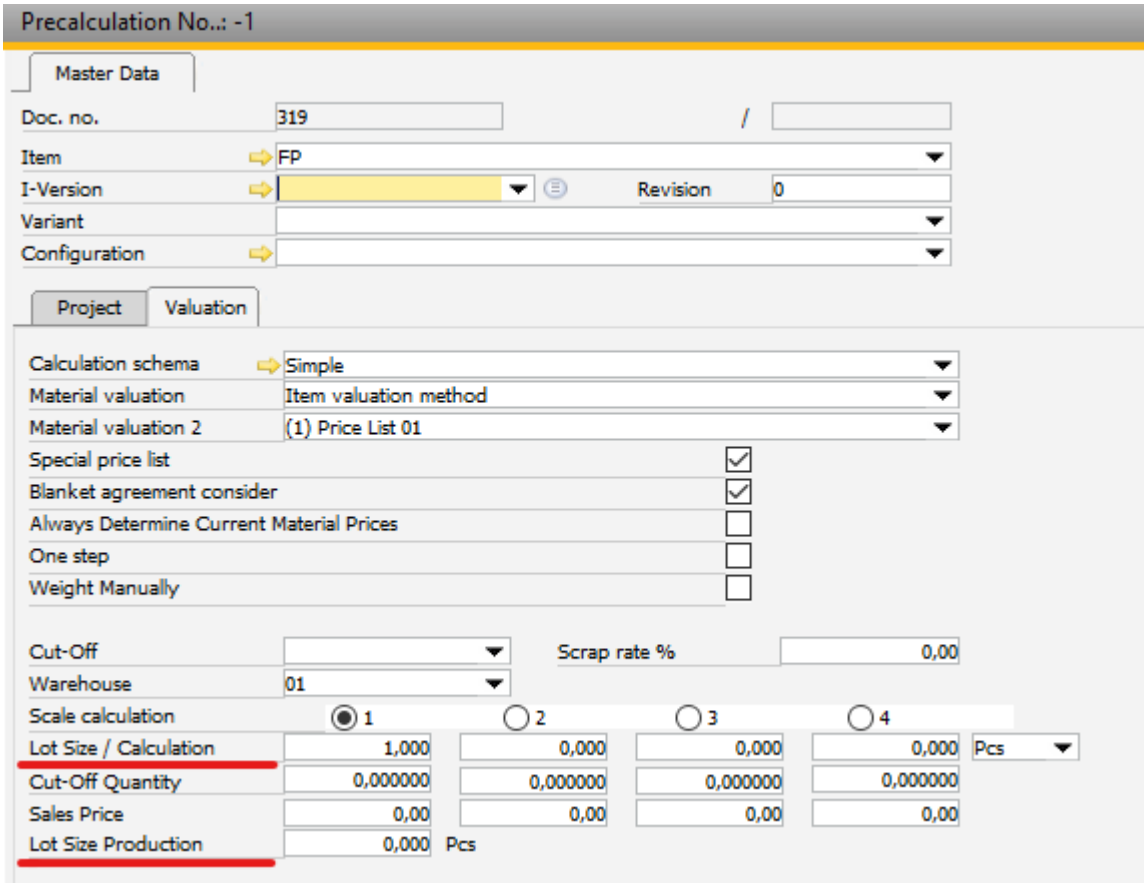
The lot size can be defined in Production UoM or inventory UoM.

Lot size - Precalculation

- "Calculation lot size" is the default lot size for the calculation.

© 2026 Boyum IT Solutions A/S

- "Production lot size" is the maximum lot size and is relevant for the calculation of fix costs.



Window pk_haupt_edit.psr

The production lot size affects:

- Setup times in a Bill of materials position.
- Fixed times (Quantity per = 0) in routing positions.
- Fixed surcharges.
- Purchase prices (special price list).
- Price per lot size

In sub-components the calculation uses the production lot size. If you activate Configuration wizard > Production > Create > Sub-assemblies: Consider production lot size, the system uses the production lot size defined in the sub-component, otherwise the lot size of the main item.

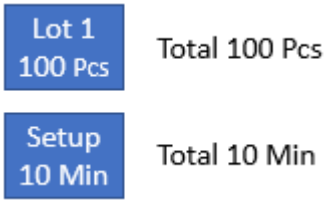
Example:

Routing position 10 Min setup time, 5 Min Mach+Labor time

Lot size calculation: 100, Production: 0 (ignore it)

© 2026 Boyum IT Solutions A/S

```
Cost  = 10 Min + 100* 5 Min = 510 Minutes * cost rate
```



Lot size calculation: 100, Production: 30

In this case we must calculate the production `30 + 30 + 30 + 10 = 4 times`.

```
Cost = 4*10 Min + 100*5 Min = 540 Minutes * cost rate
```

Working with sub-assemblies

If consider Sub Assemblies is activated, the system split the sub-assemblies too

Example:

Production 40 Pcs, Lot size 30 Pcs

Sub assembly is order related, Production lot size = 0 Pcs (no lot size)

This case is a WO position-related process.

If an order-related sub-assembly has its own lot size, the system checks this, as well - but always per production level from the parent item.

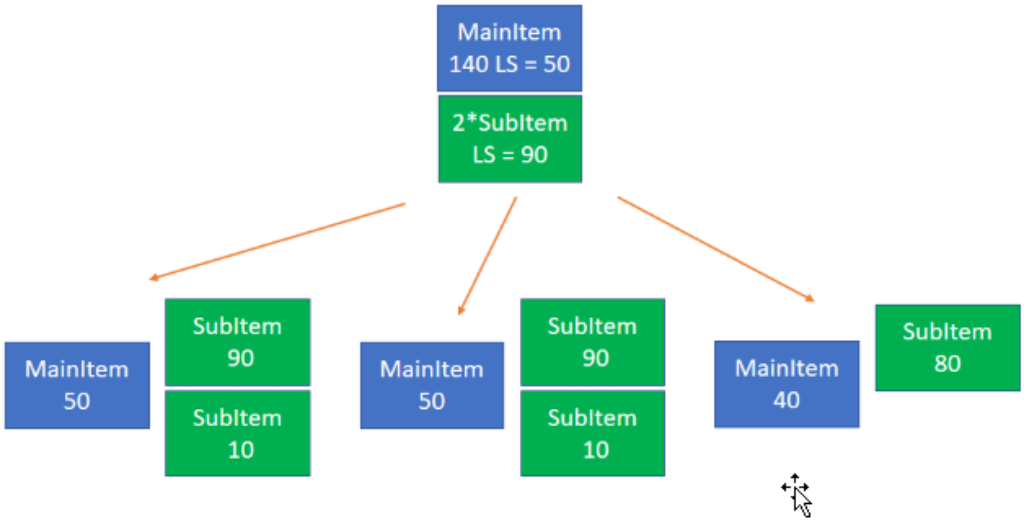
Example : Lot size 20 Pcs

In this case the setup time will be multiplicated with 4 in the sub assembly

© 2026 Boyum IT Solutions A/S

2. Example for order-related sub-assembly:

- Main and sub-item are order related, the lot size of the main item is 50
- We need the sub-assembly 2 times per main item, the lot size of the sub-item is 90
- We want to produce 140 Units of the main item

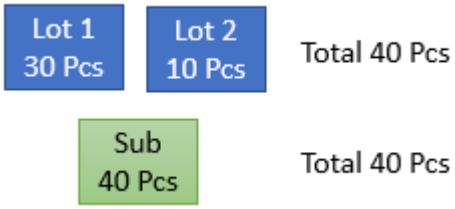


Result:

- We need to produce 3 lots for Main item (50 + 50 + 40)
- For the first and second lot of the main item we need 2 lots of the sub-item (90 + 10)
- For the last lot of the main item we need 1 lot of the sub item (80)

Stock-related

if the sub-assembly is stock-related, the sub-assembly ignores the lot size from the parent assembly:



if the stock related sub-assembly has its own lot size, the system uses it without relation to the lot size of the parent item.

Note:
This is working differently than in Beas 2020.11 or older. If you need the old functionality, you can change this in a user event. ***See*** Script documentation.

© 2026 Boyum IT Solutions A/S

Work order

If the work order is created by "Sales order to Production order", Beas Object, Beas Service Layer or Integration Hub, the system automatically checks the production lot size on main level and in sub-level only if you activate Configuration wizard > Production > Create > Sub-assemblies: Consider production lot size.

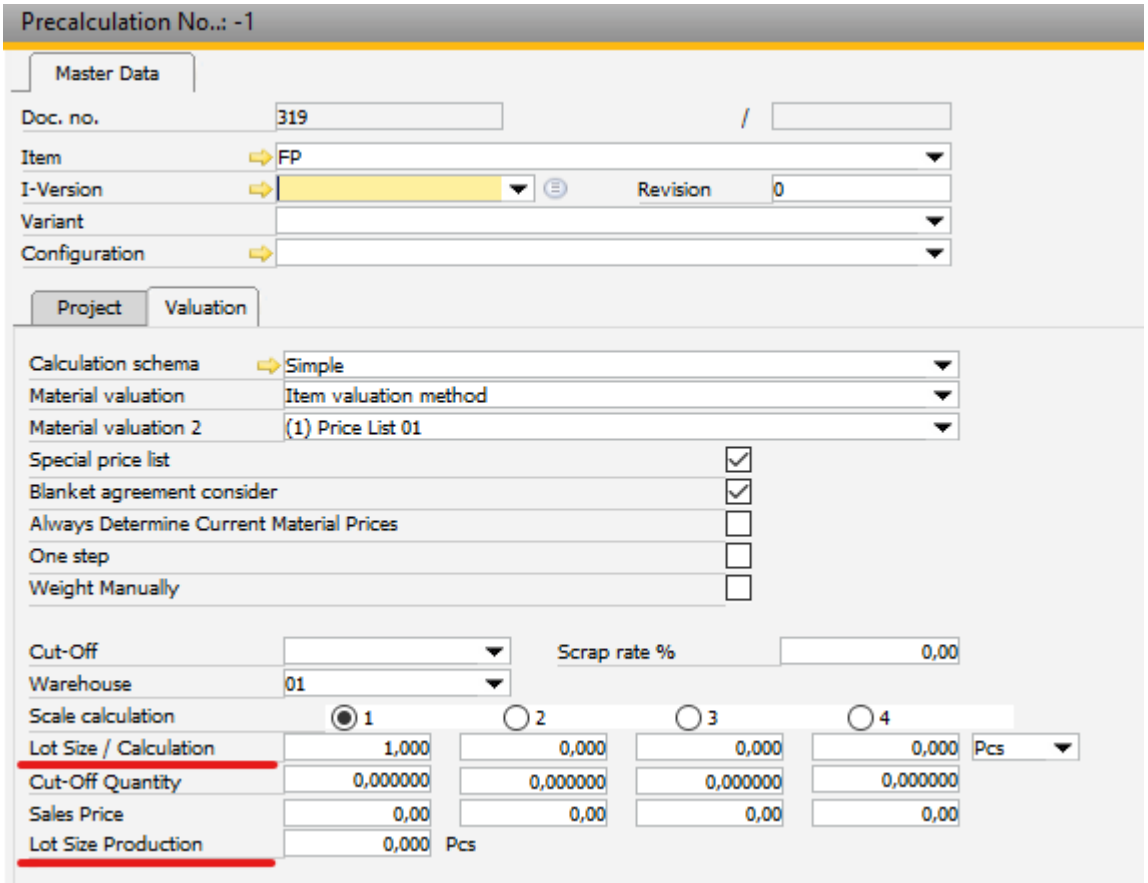
Note: If you activate "Consider Lot size production", the calculation in MRP can take longer.

Working with Lots size

19.8.1 Lot Size - Precalculation

Lot size - Precalculation

- "Calculation lot size" is the default lot size for the calculation.
- "Production lot size" is the maximum lot size and is relevant for the calculation of fix costs.



Window pk_haupt_edit.psr

© 2026 Boyum IT Solutions A/S

The production lot size affects:

- Setup times in a Bill of materials position.
- Fixed times (Quantity per = 0) in routing positions.
- Fixed surcharges.
- Purchase prices (special price list).
- Price per lot size

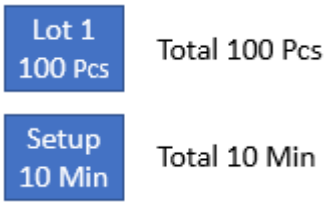
In sub-components the calculation uses the production lot size. If you activate Configuration wizard > Production > Create > Sub-assemblies: Consider production lot size, the system uses the production lot size defined in the sub-component, otherwise the lot size of the main item.

Example:

Routing position 10 Min setup time, 5 Min Mach+Labor time

Lot size calculation: 100, Production: 0 (ignore it)

```
Cost  = 10 Min + 100* 5 Min = 510 Minutes * cost rate
```



Lot size calculation: 100, Production: 30

In this case we must calculate the production `30 + 30 + 30 + 10 = 4 times`.

```
Cost = 4*10 Min + 100*5 Min = 540 Minutes * cost rate
```

Working with sub-assemblies

If consider Sub Assemblies is activated, the system split the sub-assemblies too

Example:

© 2026 Boyum IT Solutions A/S

Production 40 Pcs, Lot size 30 Pcs
Sub assembly is order related, Production lot size = 0 Pcs (no lot size)
This case is a WO position-related process.

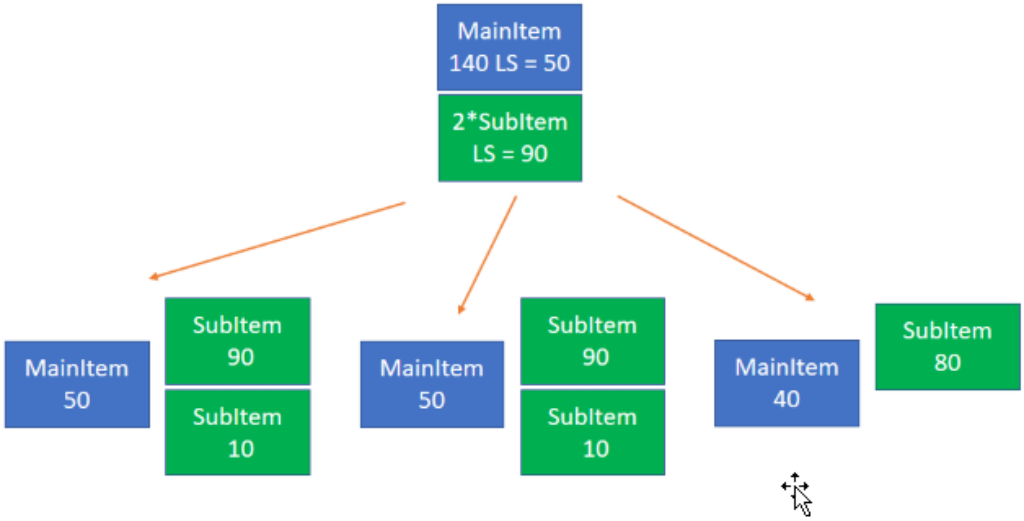
If an order-related sub-assembly has its own lot size, the system checks this, as well - but always per production level from the parent item.

Example : Lot size 20 Pcs

In this case the setup time will be multiplicated with 4 in the sub assembly

2. Example for order-related sub-assembly:

- Main and sub-item are order related, the lot size of the main item is 50
- We need the sub-assembly 2 times per main item, the lot size of the sub-item is 90
- We want to produce 140 Units of the main item



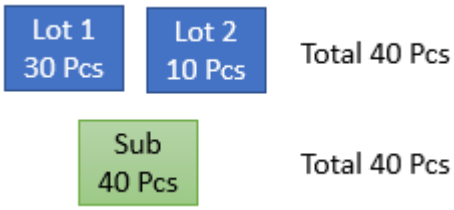
Result:

- We need to produce 3 lots for Main item (50 + 50 + 40)
- For the first and second lot of the main item we need 2 lots of the sub-item (90 + 10)
- For the last lot of the main item we need 1 lot of the sub item (80)

© 2026 Boyum IT Solutions A/S

Stock-related

if the sub-assembly is stock-related, the sub-assembly ignores the lot size from the parent assembly:



if the stock related sub-assembly has its own lot size, the system uses it without relation to the lot size of the parent item.

> Note:
> This is working differently than in Beas 2020.11 or older. If you need the old functionality, you can change this in a user event. ***See*** Script documentation.

19.9 Keyfields

All entries have a key field.

Example: for items: the item code, for Business partner: the card code and so on.

A key field must be a unique key.

Upper/lower letters

HANA checks upper/lower letters. *Example*: FP123 is not fp123.

MSSQL does not check upper/lower letters. *Example*: FP123 is fp123

The system tries to reduce the problem. If FP123 is defined and you insert FP123, the system replaces it automatically to FP123.

Beas does not allow to define the same key words width different upper/lower formats. But the system does not check this in all places.

Special characters

It is only allowed to use the following characters in key fields: `0-9, A-Z, a-z, _!$&/%()[]{}?\*+';:.-^°`

But not Unicode - other special symbols as `' " = ,` or spaces.

© 2026 Boyum IT Solutions A/S

Examples

`NYM4,4` --> wrong

`NYM4.4` --> correct

`NYM 5"` --> wrong

`NYM 5´´` --> correct

Note: You can insert all signs in the entry description, but not in the key field.

19.10 Marginal costs and full costs

Beas supports calculation per marginal costs and full costs.

- Marginal cost

Marginal costs are costs incurred by the production of a unit of measure of a product.

Example

For the production of an article, fixed costs of €100 are incurred, costs for the provision of machines or rent for a production site.

This is referred to as fixed costs.

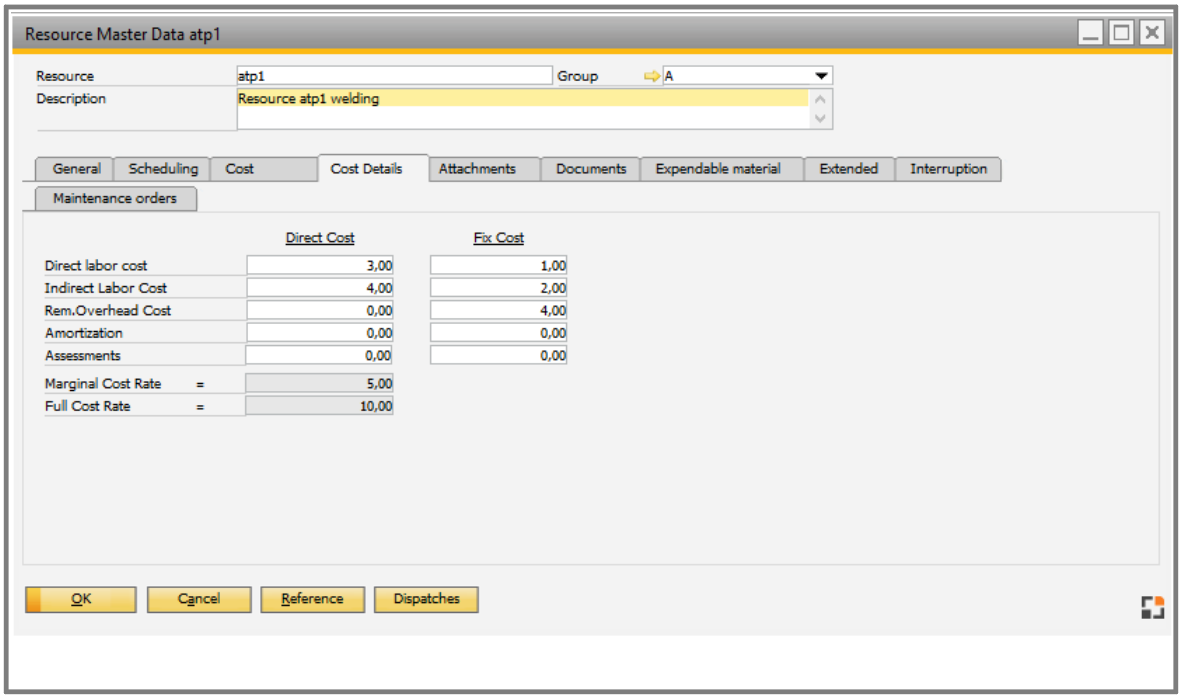
For material and resources there are flexible costs of 5€ per manufactured unit. One unit costs 105 €, two units 110 €. For each unit produced, the total cost increases by 5 EUR. This amount corresponds to the marginal costs.

Note: Setup time is part of Marginal costs.

Fixed costs are e.g. Overhead costs (accounting, electricity, water), Rent for production hall. Set-up times, for example, are not fixed costs, but part of the production process.

In the Resource Master Data **>** **Cost Details tab** you can define the Marginal and Fix costs and can calculate the Full cost.

© 2026 Boyum IT Solutions A/S



Full Cost

Full costs are all costs incurred in a period that are allocated to a service directly or indirectly via a cost center, as far as possible according to the source.

In contrast to direct costs, full costs include all costs that are are created within the framework of the operational provision of services.

In contrast to partial costs, effective costs include all costs that are actually incurred in the production of business activities. Whether and in which cases full costs are to be used is primarily a problem of costing. (Full cost principle, full cost calculation).

Speaking of full costs means that the entire costs of a period are settled up to the cost units of the enterprise. They represent the resulting unit costs. This means that the total unit costs for all cost objects produced or deducted in a period are the same as the total costs of the company. A similar distribution of all costs is carried out in the systems of full cost accounting.

In the Resource Master Data **> Costs tab** you can define the Marginal and Fix costs and can calculate the Full cost. Additionally, it is possible to define all costs in a resource (Cost details), and split costs in 5 different cost types (Time types concept)

In Precalculation and Post-calculation you can easily switch between Marginal- and Full Cost view.

Short description:

MC = Marginal cost

FC = Full Cost

19.11 MPS

What is MPS:

Master **P**roduction **S**cheduling is a rough production planning procedure and is used in Material Requirements Planning to develop a detailed production plan.

The Master Production Schedule is compiled by a Master Scheduler and takes into account the requirements of the various departments, including sales (delivery times), finance (minimizing inventory) and manufacturing (minimizing set-up times). The program plans the production periods and the purchase of materials taking into account the capacities and resources available to the production system.

Beas supports special forecasts, which are treated differently than usual forecasts. These can be used to integrate MPS features.

MPS scheduling can be realized in Excel or other programs and then imported by DTW into SAP Business One. As an alternative, you can use the forecast management of SAP Business One. Enter MPS-forecasts into the MRP-scenario under "MPS".

For the requirement calculation of MPS-planned items, **outflows**, forecasts and SCM orders are ignored, and planned outflow from the MPS scheduling is used instead.
MPS only takes place if the respective item was marked as an MPS item. This is indicated in item master (Beas) **> Master data > Planning Data > "MPS"**
Resulting entries are marked with MPS.

Special forecasts
Special forecasts are entered in the MRP scenario under MPS.
As opposed to MPS scheduling, the respective items are not marked as MPS items. All planned issues are ignored and not consumed. The peggings therein are marked with the *special forecast* term.

Note: Planned inflow and outflow of work orders and purchase orders are not affected.

19.12 Negative Bill of Material

Sometimes the user needs to indicate that several products are a result of a work order. These products can be:

© 2026 Boyum IT Solutions A/S

- Co-product: Usable product, automatically generated during the production of the main product.
- By-product: A product that occurs incidentally or undesirably during the manufacturing of the main product.
- Dismantling: Disassembling of assemblies and returning components to the inventory.

In these cases, the BoM quantity is entered as a negative entry.

Negative BoM quantity behavior

Procedure or module	Negative Bom quantity is treated as
Order recommendations	Planned receipts.
Backflushing	Posted automatically or manually.
Work order structure	Displayed in the same color as assemblies but with another icon. Displayed positive (as receipt).
Posting	Manually, backflushed or posted in via collective receipt. ***See*** Collective receipt.
Merging work orders	Individual receipts are inserted as negative BoM items and posted correctly to the WIA account.
Sales order	Negative items can be reserved for sales orders.
Pre-calculation	Valued according to Configuration wizard > Precalculation > Value negative quantity.
Post-calculation	Valuation based on post-calculation is not possible.

Order related sub assemblies

A Bill of materials position can be a sub-assembly with own Bill of materials list and Routing position.

How to manage this in the areas:

Procedure or module	Result
Pre-calculation	Bill of materials defined as receipt (negative costs) Valued according to Configuration wizard > Precalculation > Value negative quantity. Routing positions cannot produce negative costs. These are always zero.
Post-calculation	**Planned cost:** Bill of Materials: negative costs

© 2026 Boyum IT Solutions A/S

Procedure or module	Result
	Routing position: zero **Real costs:** Bill of Materials: Sum of all transactions Routing position: Sum of all time receipts. It can only be positive value.

Configuration example for disassembling:

For disassembling, there is no main product. Use a service item (not storage-related) and define the resulting products in the BoM. Expected quantities are entered as negative.

```
Service item
|_ Product 1
|_ Product 2
```

Configuration example for a by-product:

For by-products indicate a main product on top level. This way you can work with off-cut and reuse waste material.

```
Main item
|_ Material
|_ By-product
```

19.13 Overhead costs

Overhead costs mean costs that are attributable to no productive activity such as meetings, repair, cleaning, and so on.

If overhead costs are to be recorded with factory data capture (FDC) , the following setup is available:

- Create a production order, preferably as document 1:
  - Type: Overhead. Enable overhead costs in the production order header (***see*** **Production > Work Order**)
- Create a pseudo-assembly for an item, preferably without inventory management. Behind this assembly all overhead costs are stored as routing (repair, meeting, training, cleaning, and so on).

If there are different types of overhead costs, they can be distributed on different production positions.

If overhead costs need to be reported, the overhead order is used. The operation sequences of an overhead order cannot be confirmed with time receipt.

© 2026 Boyum IT Solutions A/S

The following reports are available :

FDC/ Reports: FDC

19.14 Precalculation

Precalculation is a calculation of prices for products that have not yet been manufactured, in particular for the purpose of drawing up quotations.

Precalculation is a calculation of expected or planned costs based on the activity unit or order. It is always product- or order-specific and, depending on the circumstances of the individual case, is carried out as a division, equivalence number, overhead or joint cost estimate (cost estimate).

Precalculation: Introduction

Precalculation is pure Cost Object Controlling, which calculates the resulting costs before the activity is performed, or which determines how high these may be in backflushed costing. Preliminary costing takes place before a new product is produced, and in make-to-order plans before the quotation is issued. The object of the Precalculation estimate is the cost object created. It can only refer to one activity (make-to-order production), but can also refer to a large number of similar products (series, varieties, or mass production).

The Precalculation estimate should record all costs incurred in the production of the service as completely and correctly as possible and thus serve to determine the cost price, the quotation price and the lower price limit and, for given and accepted prices, the achievable contribution margin.

Since the Precalculation estimate is to calculate the costs of future activities, there are often extensive uncertainties that turn the cost estimate into an estimate (for example, future cost development, uncertainty about development costs, circulation size, etc.). On the basis of work flow charts, work studies (REFA), design drawings, recipes and bills of material, direct costs and sometimes also overhead costs are recorded.

The overhead costs caused by the cost objects cause particular problems in Precalculation costing when they are entered and distributed. Once all costs have been calculated, you can enter the expected cost of goods sold and the bid price using a profit markup. Precalculation can be carried out on the basis of full costs or marginal costs. The lower price limit can only be determined exactly if marginal costs are used. Full cost calculation can be carried out in addition, possibly for the purpose of better comparison with the competing offers.

Example: Precalculation is used for

- Make-to-order production;
- New production of a product;

© 2026 Boyum IT Solutions A/S

- Submission of bids;
- Assessment of market prices (short-term price floor, long-term price floor, long-term price floor)

The following calculation types are available

- Precalculation
- Batch analysis
- Production costing analysis (incl. batch costing analysis)

You can open this from

Item master (Beas)	In the **item master > "Calculation" tab > "Calculation" button**. The calculation is opened and calculated at the calculation size stored in the item master. As the calculation is not stored here, it is purely a view function. All changes in the calculation are discarded when this is closed. The header cannot be changed or edited. ***See*** Item master – Calculation tab
Calculation > Precalculation	You can use **Calculation > Precalculation** to create, edit, view or copy a Precalculation. All options are accessible in this way. A Precalculation can also be assigned to a quotation or order subsequently. All of the changes made there are stored in the calculation. However the master data is not changed. A production document can be created from the calculation.
Quotation or order (SAP)	A "Calculation" button is available in the quotation or order. If you click on this, a new Precalculation is created and saved for this line, and an allocation inserted in the quotation line or order line. Stored variants or product configurations are considered. The calculated price is not automatically transferred to the quotation line or order line. All of the changes made there are stored in the calculation. However the master data is not changed. A production document can be created from the calculation.
Inventory > Stock transactions > Batch Calculation	The batch calculation can be used to calculate multiple items and the result can be stored in a price list. The calculation itself is not displayed here. The result can be called in the item master. ***See*** Batch-calculation

Basic structure of a calculation, Calculation schema

© 2026 Boyum IT Solutions A/S

A standard calculation is structured as follows:

	Material costs according to Bill of materials
+	Cost of external operation
+	Indirect material costs (according to material group)
=	Material Costs
	Manufacturing costs according to routing
+	Production overhead in %
=	Non Material Mfg Cost
=	Production Cost
+	Shipping costs, administration, sales
=	Cost of Sales
+	Profit Margin
=	Net Selling Price
+	Discount
=	Sales Price

This standard structure can be expanded and modified as desired and is used by all calculation systems. It is possible to change this calculation schema (***see*** calculation schema)

- The Beas Precalculation calculate per Marginal and Full Costs

Beas supports calculation per marginal costs and full costs.

- Marginal cost

Marginal costs are costs incurred by the production of a unit of measure of a product.

Example

For the production of an article, fixed costs of €100 are incurred, costs for the provision of machines or rent for a production site.

This is referred to as fixed costs.

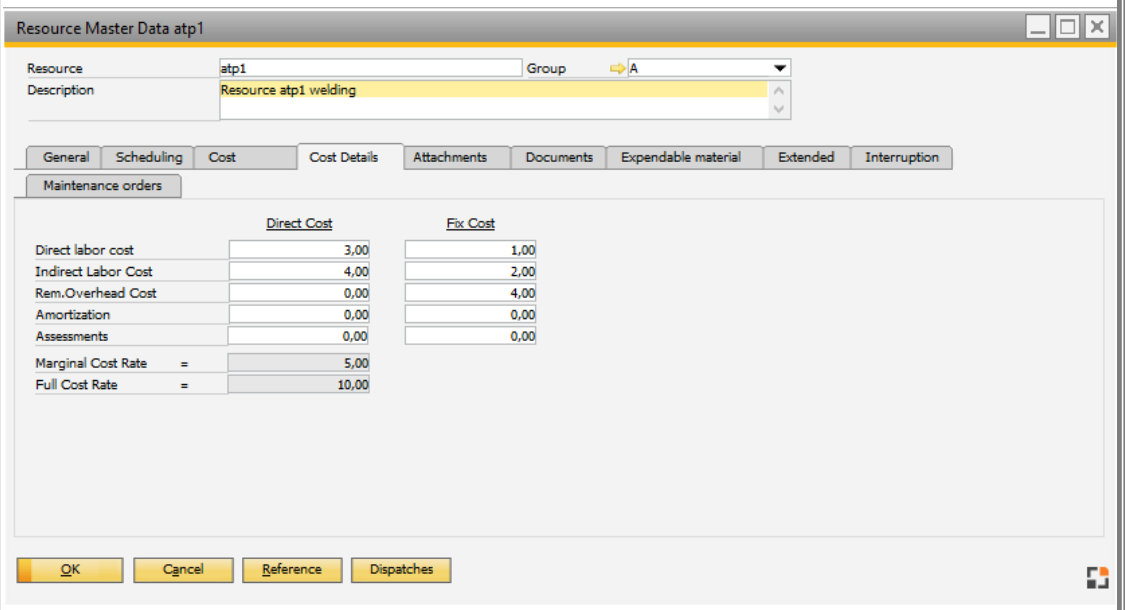
For material and resources there are flexible costs of 5€ per manufactured unit. One unit costs 105 €, two units 110 €. For each unit produced, the total cost increases by 5 EUR. This amount corresponds to the marginal costs.

© 2026 Boyum IT Solutions A/S

Note: Setup time is part of Marginal costs.

Fixed costs are e.g. Overhead costs (accounting, electricity, water), Rent for production hall. Set-up times, for example, are not fixed costs, but part of the production process.

In the Resource Master Data > **Cost Details tab** you can define the Marginal and Fix costs and can calculate the Full cost.



Full Cost

Full costs are all costs incurred in a period that are allocated to a service directly or indirectly via a cost center, as far as possible according to the source.

In contrast to direct costs, full costs include all costs that are are created within the framework of the operational provision of services.

In contrast to partial costs, effective costs include all costs that are actually incurred in the production of business activities. Whether and in which cases full costs are to be used is primarily a problem of costing. (Full cost principle, full cost calculation).

Speaking of full costs means that the entire costs of a period are settled up to the cost units of the enterprise. They represent the resulting unit costs. This means that the total unit costs for all cost objects produced or deducted in a period are the same as the total costs of the company. A similar distribution of all costs is carried out in the systems of full cost accounting.

© 2026 Boyum IT Solutions A/S

In the Resource Master Data > **Costs tab** you can define the Marginal and Fix costs and can calculate the Full cost. Additionally, it is possible to define all costs in a resource (Cost details), and split costs in 5 different cost types (Time types concept)

In Precalculation and Post-calculation you can easily switch between Marginal- and Full Cost view.

Short description:
MC = Marginal cost
FC = Full Cost

- Calculated Quantity, View per Quantity

The calculation can calculate up to 4 different quantities in one time
For Material price it is possible to define up to 8 different prices related to needed quantity for one item. Price lists, special price lists supported
Assembly Lot size in sub positions supported. See Lot size
It is possible to display the calculation in any Lot size (example: Produce 100 Pcs, but display all Quantities / Prices per 1.
See Lot Size and View per

It is possible to calculate every semi-finished product in one calculation. ***See*** Extended view

19.15 Post-calculation

Beas includes a flexible post-calculation function with the following features:

- Calculation of accrued costs

© 2026 Boyum IT Solutions A/S

- Projection
- Calculation of planned costs
- Calculation of marginal and full costs
- Support of calculation schema
- Various valuation methods
- View results in list or as a structure
- Valuation of assemblies

Type	Description
Visual	Structured view of the post-calculation (concurring calculation, comparison of plan/target projection). **Production > Post-calculation**
Batch calculation	Post-calculation of several work orders at the same time. Results are saved in lists and there is no structure information available. **Production > Post-calculation**
Valuation	With the respective setting, post-calculation can be used for valuing the assemblies to be posted in. ***See*** Configuration wizard > Production > Valuation of assembly.

Differences compared to pre-calculation:

Function	Pre-calculation	Post-calculation
Calculation of tools costs	available	not available
Extended resource cost rates	not available	available

19.15.1 Standard costs method

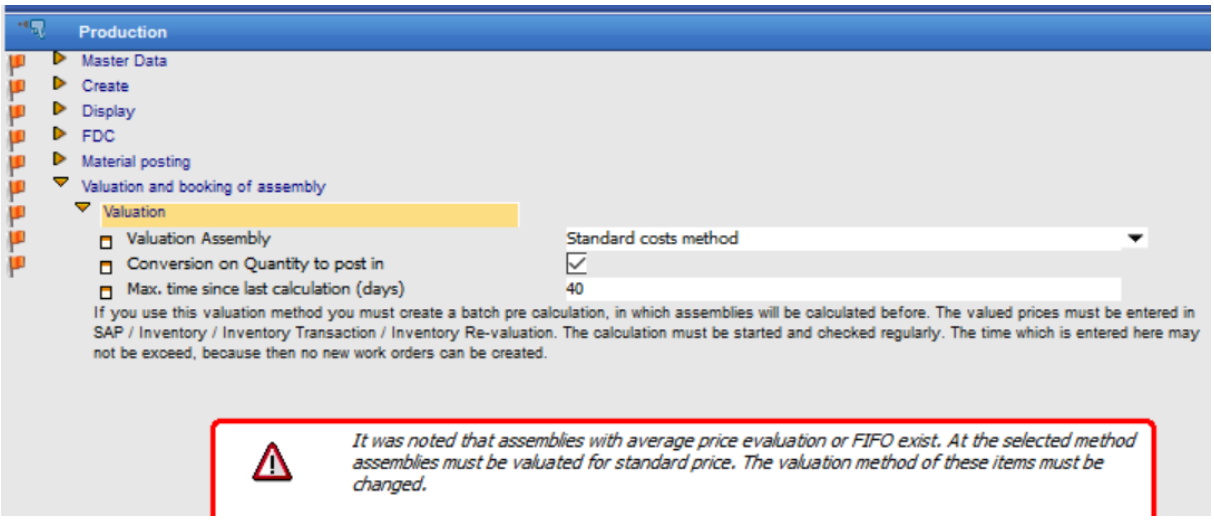
Using the standard cost method, the total value and the value of the parts of an assembly can be identified, such as materials, manufacturing costs, tool costs, or other surcharge costs. Standard cost means, that these values are not dependent on the volume of the production, only the budget figures are taken into account.

The standard cost method involves an entire workflow:

- Pre-calculation via batch pre-calculation
- Pricing based on the pre-calculation
- Copy of evaluation into the work order, including the calculation scheme. The Work order is properly linked to the pre-calculation
- Postings are performed with the current standard cost rate

Configuration Wizard > Production > Valuation and booking of the assembly > Valuation > Valuation of the assembly by "standard cost method"

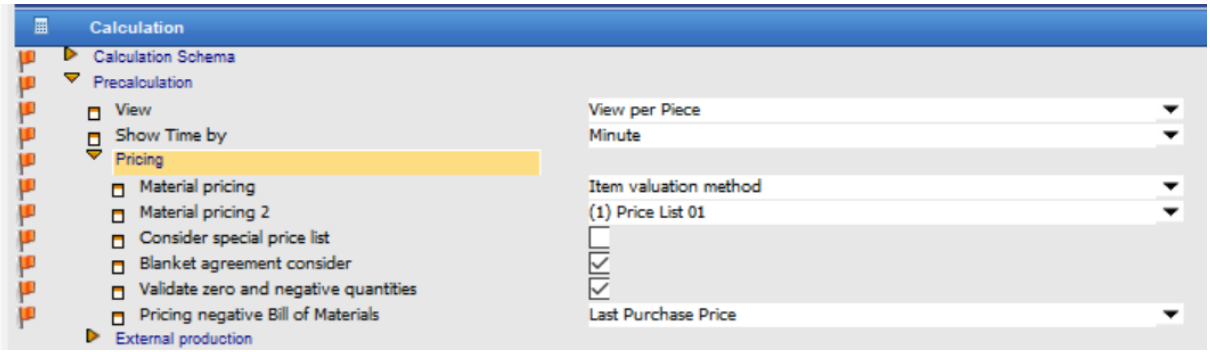
The *Max time for last calculation* field is displayed. This is the update interval for batch calculations. If the entered time is exceeded, no work orders can be created.



A correctly set pre-calculation valuation method is crucial. Set to "Item valuation". Set all items to "standard price".

Configuration Wizard > Calculation > Precalculation > Material pricing to "Item valuation method"

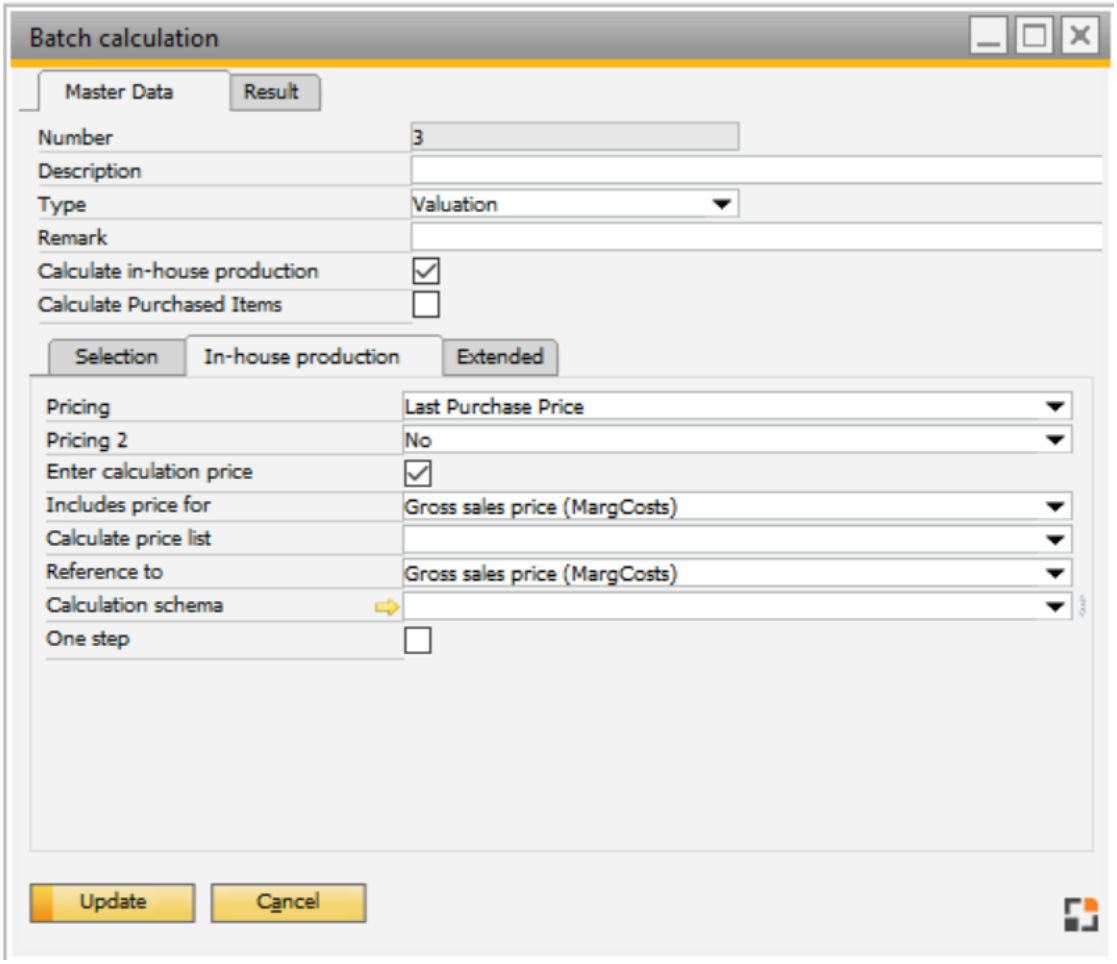
© 2026 Boyum IT Solutions A/S



Inventory> Inventory Transactions > Batch calculation

Setup a calculation for calculating standard costs

The price list or price calculation does not need to be filled. Select the desired evaluation method in *Pricing* and *Enter calculation price*, and the type of pricing procedure. One step evaluation can be enabled for standard cost.



© 2026 Boyum IT Solutions A/S

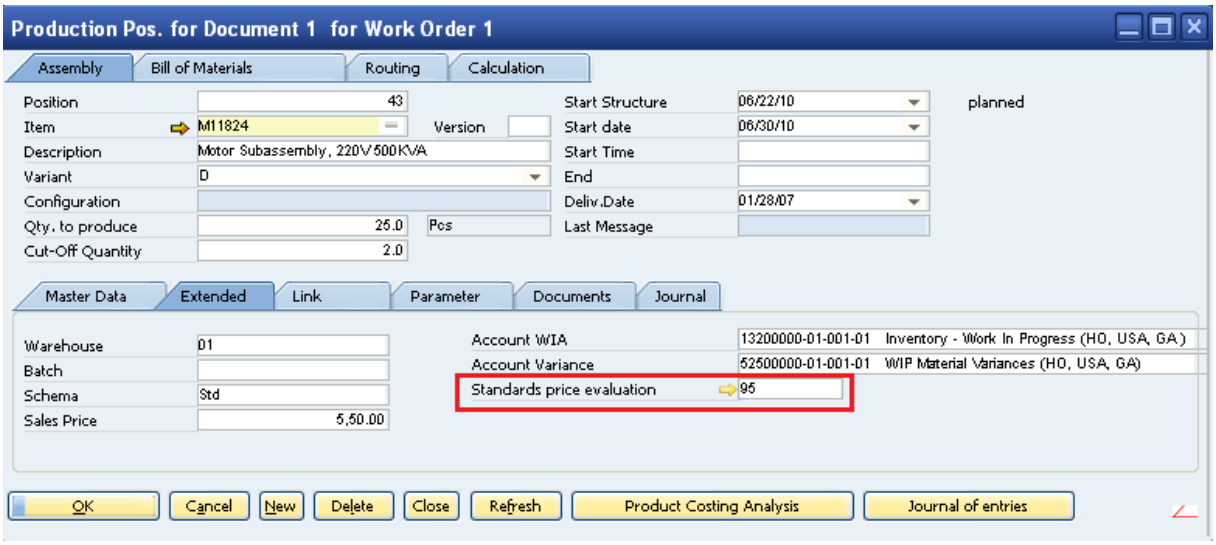
The defined calculation should be performed regularly and the update interval can be set in the Configuration Wizard. After calculating, change to the results tab and perform an inventory revaluation.

Note: If the price per warehouse is set, the batch calculation needs to be performed per warehouse. ***See*** Batch-calculation.

Connecting to a work order

All the work orders that are being created for the items, refer to the calculated standard costs. The connection to the standard costs calculation is available in:

Production assembly > Assembly tab > Extended >Standard price evaluation.



Valuation of assembly – Standard cost method

Concept: Valuation of assemblies

WO positions – Item

Batch-calculation – Standard costs

Affected database fields:

The following fields are filled:

BEAS_FTPOS.STANDARDCOST_NR = relates to the last calculation

BEAS_FTPOS.SCHEMA_ID = used schema in this calculation

BEAS_OITM_CALCPRICE = calculation result

BEAS_PK_BATCHKALK_HEADER = calculation definitions

© 2026 Boyum IT Solutions A/S

19.15.2 Projection of actual costs

Post-calculation offers a function to calculate the expected costs of a given quantity based on the previously reported quantities. Costs for material, operations and quantity with depending surcharges are calculated.

Example:

Operation with costs of 2€/Minute

Planned quantity: 10 pcs

	without projection	**with projection for 1 piece**	**with projection for 10 pieces**
1 minute, 0 pieces reported	2 €	0 €	0 €
1 minute, 1 piece reported	2 €	2 €	20 €
5 minutes, 2 pieces reported	10 €	5 €	50 €

This function is useful for actual costs evaluation methods with partial postings.

Example:

1. Operation planned: 10 minutes, costs 2€/minute

2. Operation planned: 10 minutes, costs 2€/minute

Planned 10 pieces, Partial completion 5 pieces

Planned costs: 1. operation 20 €, 2. operation 20 € = 40 = 4 € per piece

	without projection	**with projection**
1. operation: 10 minutes, 10 pieces reported 2. operation: 10 minutes, 5 pieces reported	20 € + 20 € = 40 € : 5 = 8 €/Piece	10 € + 10 € = 20 € : 5 = 4 €/piece
1. operation: 10 minutes, 10 pieces reported 2. operation: 10 minutes, 10 pieces reported	20 € + 20 € = 40 € - 40 € (of first posting) = 10 € : 5 = 2 €/pieces	20 € + 20 € = 40 € : 10 = 4 €/piece

© 2026 Boyum IT Solutions A/S

This example shows the difficulties of partial postings without projection. The first 5 pieces are valued at 6€, the next 5 pieces at 2€. In certain configurations even negative evaluations are possible.

Material evaluation example:
A BoM item has a requirement of 1 per 1 assembly and a value of 3€
Production quantity = 10

	Without projection	**With projection**
Material issue total 10 pcs	10 * 3 = 30€	10 * 3 = 30€
first partial posting 1 Pc	Posting 30€	Conversion to planned quantity, in this case 1/10 = Factor 0,1 30€ * 0,1 = 3€
second partial posting 1 Pc	Posting 30€ - already posted = 30€ = 0€ !	Conversion to planned quantity, in this case 1/10 = Factor 0,1 30€ * 0,1 = 3€
last posting and order completion	Posting 30€ - already posted= 30€ = 0€ !	Not the projection but the accrued costs are used. 30 € - already posted = (3€ + 3€ = 6€) 24 €

Webinar Product Cost determination from 2017/06, Part "Quantity Projection"
Post-calculation – Concepts

Example: Projection of actual costs

19.16 Pricing

Pricing types
Valuation at postings
WIP accounts

© 2026 Boyum IT Solutions A/S

19.16.1 Pricing types

Various pricing types can be set up in the Configuration wizard, in Pre-calculation and Post-calculation.

Valuation method	Area	Description
Posting price	Post-calculation	The actual posted price is summarized. If a foreign currency was used, it is converted at the moment of posting. If another item was posted than what is specified in the BoM, its posting price will not be considered for pricing. In Planned costs, the last posted price of the BoM is used.
Precalculation	Pre-calculation	Corresponds to the price entered in the production BoM item. This is to the price of the pre-calculation from which the work order was generated or according to the pricing, which was set up in **Configuration Wizard > Calcualtion > Precalcualtion**. The price is determined at the moment that the work order is created. In a production BoM item, the price is visible only if **Production > View > BOM > Prices changeable** is enabled.
Last purchase price	all	Corresponds to the price according to SAP Business One – last purchase price. All types of inflow are considered (credit vouchers, manual postings). If the price is stored in foreign currency, it is converted at the rate of the last goods movement.
Last valued price	all	In SAP Business One **> Report selection > Warehouse management > Stock valuation Simulation** a price can be calculated with different methods. The valuation method refers to the price determined there.
Calculation price	all	Corresponds to the price in Beas **Item master > Calculation > Calculation price**. It can be calculated regularly using batch precalculation, and then can be used as template.
Source Item - Actual cost	QC Transfer	The system reads the price from the issue document of the original Item. **Note:** this price only applies when QC Transfer > document type "Issue + Receipt" was selected.
Source Item - Price from Entry	QC Transfer	The system applies the price of the last entry of the original. **Note:** this price only applies when QC Transfer > document type "Issue + Receipt" was selected.

© 2026 Boyum IT Solutions A/S

Item valuation method	all	Valued at the item valuation price. **Note**: With the FiFo or Serial / Batch valuation method, an average price valuation of all goods on stock is performed. Fore more information ***see***: Item master – Valuation method. When applying Batch split with serial/batch valuation method, consider that Goods issues will be created according to the SAP serial/batch valuation method. However, Goods receipts are generated according to average price valuation. ***Example:*** An Item has 2 batches BN001 - 10 units x 10€ = 100€ BN002 - 10 units x 5€ = 50€ **Using the Batch split function:** Split 5 units of BN001 to BN002 (the system issues 5 units of BN001, then receipts 5 units of BN002) Cost of the goods issues of BN001 is calculated by SAP (using batch/serial valuation) as 5 units x 10€ = 50€ Cost of the goods receipt of BN002 is calculated as average price of all batches in stock at the moment the goods receipt is going to be created. BN001 5 units x 10€ = 50€ BN002 10 units x 5€ = 50€ Cost average at the goods receipt is = (50 + 50) / 15 = 6.66666666€
Price list	all	The price is according to the selected price list. Price list extensions are considered. Details:

© 2026 Boyum IT Solutions A/S

If the price is stored in a foreign currency, it is converted at the daily exchange rate to the local currency.
A gross price list is considered only in the goods receipt, as well as for posting transactions. In pre-calculation and post-calculation items may not be valued with a gross price list.

Note: Beas only supports price list with numbers 1–99.
Price lists with internal id > 99 are not supported.

Note: Beas supports Item Unit Groups in the following way:

Price list: last purchase price

(Beas 2022.09)

Item without Unit Groups always takes price in Inventory UoM.

Item with Unit Groups:
In the Item Master data you can define the Purchase Unit, Pricing unit and Inventory unit.
You can create a purchase order in many different UoMs and SAP saves the last purchase price for every UoM separately.
This means: You can have many different last purchase prices.

Beas supports price definition in a different unit of measure than the inventory unit. *(Beas 2025.04)*
If a last purchase price exists in the pricing unit of this item, it has higher priority. Beas converts this price automatically to price in Inventory unit.

Other price lists, special price lists

Beas does not support property "Pricing Unit". The system ignores all special price lists if the pricing Unit is not the stock unit.
Beas reads a price from a price list or special price list only if Item-Pricing Unit, Item-UoM Code and Price list UoM Code are the same.

© 2026 Boyum IT Solutions A/S

		Last price from goods receipt	all	Relates to Purchase – Goods receipt. If there is no goods receipt, the last purchase price is used as reference (conversion at daily rate). If there is no price, the item is valued at 0.

Special case: Precalculation – consider special price lists

If the *consider special price lists* option is enabled in the Configuration Wizard, the pricing is extended:

- If there is a special price list for a supplier, it is used as a reference.
- If there is no special price list for a supplier, then if the supplier has their own standard price list, it is used as a reference.
- If none of the above is true, the pricing is done according to the settings.

This refers to the Precalculation and creating the work order, which uses the same default as a reference.

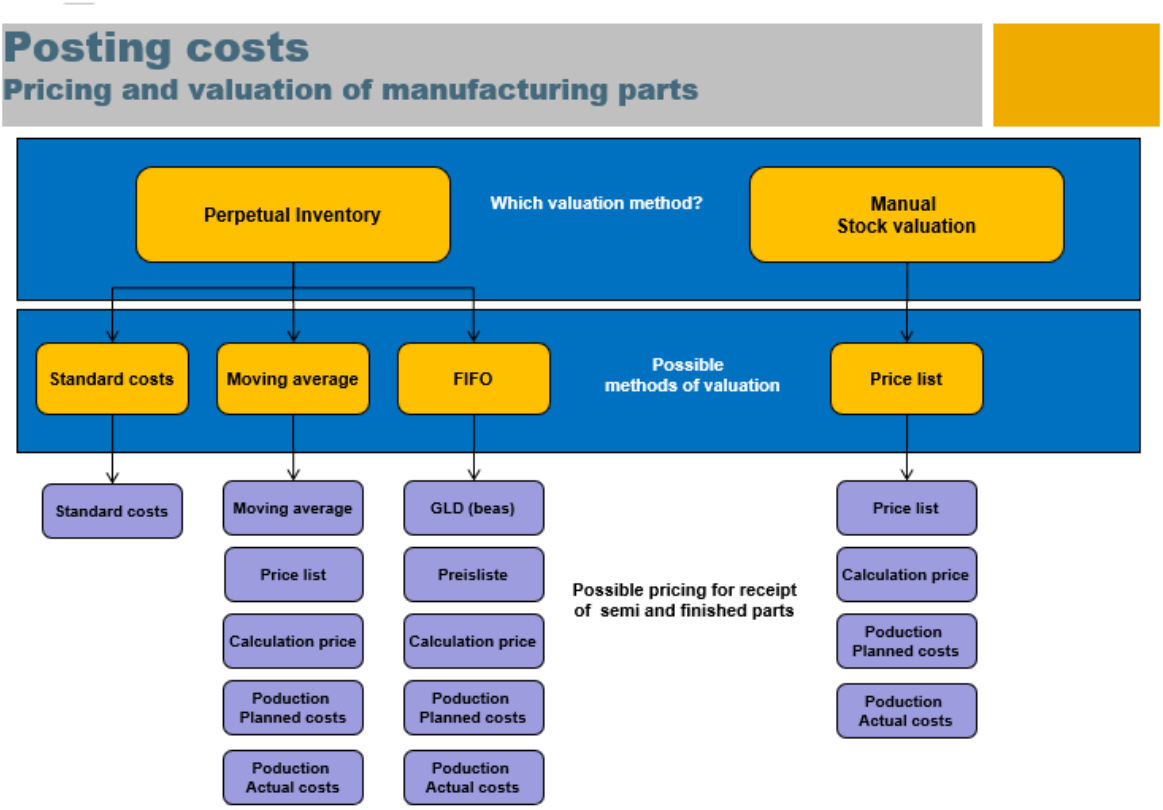
19.16.2 Valuation at postings

In Beas, prices cannot be entered in the posting transactions, therefore automatic pricing is performed, which can be configured.

Pricing affects all posting transactions, whether for adjustment entries, backflushed posting transactions, or crediting of in-house parts.

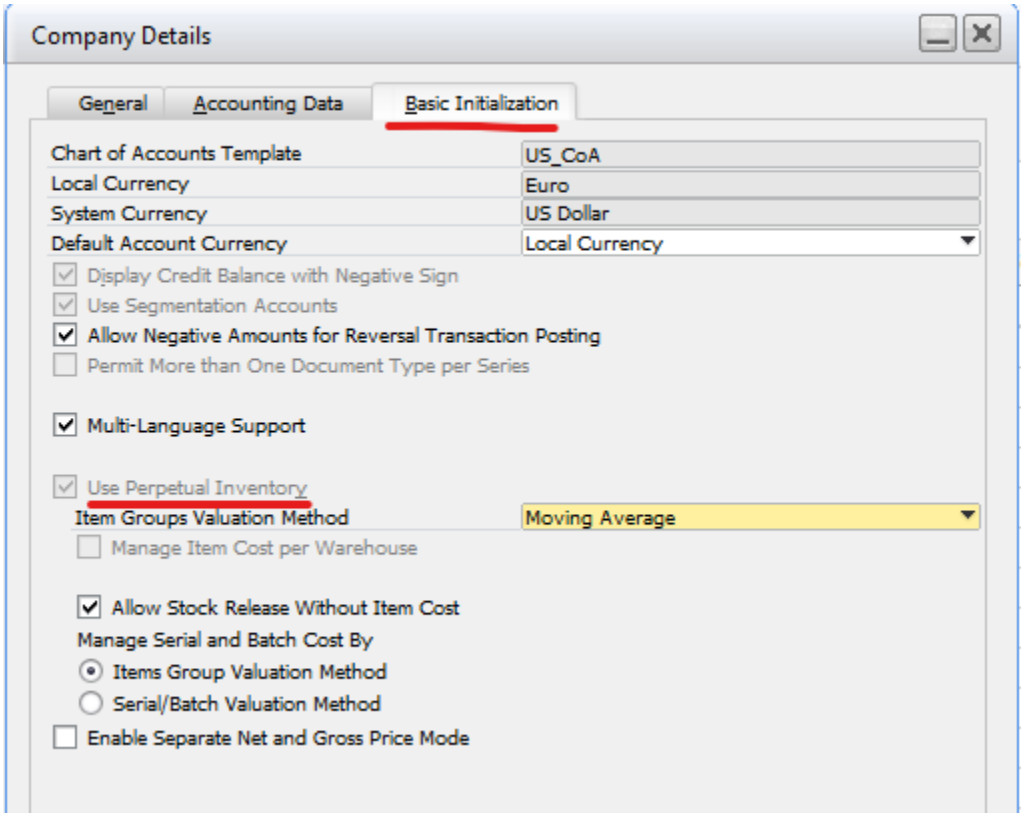
However there is another dependency, the configured item valuation method. To credit finished items (production), other valuation options are also available.

© 2026 Boyum IT Solutions A/S



If "User Perpetual Inventory is activated", the evaluation method is stored in the item master. The pricing method depends on this value.
You can set this in **Company Details > Basic initialization**:

© 2026 Boyum IT Solutions A/S



Pricing behavior:

Item valuation method	Posting	Issue
"Use Perpetual Inventory" is off	According to Configuration Wizard	According to Configuration Wizard
Standard price	Standard price	Standard price
FIFO	According to Configuration Wizard	FIFO
Average price	According to Configuration Wizard	Average price

19.16.3 WIP account

The WIP account is used as a contra account, for material issues and assembly receipts and it is which is in the item, warehouse, or item group. The WIP account of the material may differ from the WIP account of the assembly. In this case, the accounts are unbalanced. When closing the the work order or receipt of the assembly, a balancing posting of all WIP accounts to which postings were made is performed to the WIP difference account of the assembly.

© 2026 Boyum IT Solutions A/S

If you work with different WIP accounts, but only want the WIP account of the assembly to be used, you can activate this in **Configuration Wizard > Production > Valuation Assembly > Use For Component Transactions > Component WIP Account**. In this case, the WIP account of the assembly is used for material issue.

Overheads, manufacturing costs

Contra accounts can also be specified in the calculation objects and for time types. Depending on the setting, the transfer is performed from the account specified to the WIP account.

Possible configurations include the following:

1	Material in WIP	WIP > stock account of the assembly	This is the default behavior. Further settings are not necessary.
2	Material in WIP	WIP > stock account of the assembly and remaining amount in WIP difference account of the assembly	**Configuration Wizard > Production > Valuation and Posting of Assembly > Valuation > Balance WIP Account** must be enabled.
3	Material in WIP Manufacturing costs in WIP at the time production ends	WIP > stock account of the assembly and remaining amount in WIP difference account of the assembly	**Configuration Wizard > Production > Valuation and Posting of Assembly > Valuation:** **Balance WIP Account** must be enabled. Post overheads for partial delivery when closing the production position. **Calculation Objects > Overheads > Manufacturing Cost Object** enter the contra account for marginal or full costs here if required for *Post to account*.
4	Material in WIP Manufacturing costs in WIP at the time of the process time notification	WIP > stock account of the assembly and remaining amount in WIP difference account of the assembly	**Configuration Wizard > Production > Valuation and Posting of Assembly > Valuation** **Balance WIP Account** must be enabled. Post overheads for partial delivery: no dependency. **Calculation Objects > Overheads > Manufacturing Cost Object** Don't store any accounts.

© 2026 Boyum IT Solutions A/S

1	Material in WIP	WIP > stock account of the assembly	This is the default behavior. Further settings are not necessary.
			Create a time type in master data and insert the contra account in overheads or full costs. Store this time type in the work sequences. A transfer is now performed from the contra account specified in the time type to the WIP account at the time of the time report. If the time report is corrected, the journal entry is automatically corrected.
5	Material in WIP Post overheads (production and material surcharges) to the WIP account at the time of assembly receipt	WIP > stock account of the assembly and remaining amount in WIP difference account of the assembly	**Configuration Wizard > Production > Valuation and Posting of Assembly > Valuation** **Balance WIP Account** must be enabled. Post overheads for partial delivery: for assembly receipt. **Calculation Objects > Overheads** Create the corresponding overheads and surcharge objects here and specify the corresponding contra account for the accounts for marginal or full costs.

Examples for WIP settings

19.16.4 Production valuation and accounts

The evaluation methods and account movements are described in this chapter.

19.16.4.1 Account movement (default)

The documentation describes the behavior when continuous stock is activated.

Basic setting

Material transaction is posted to the WIP account on issue from the material account.

If the assembly is received, it is posted from the WIP account to the stock account of the assembly.

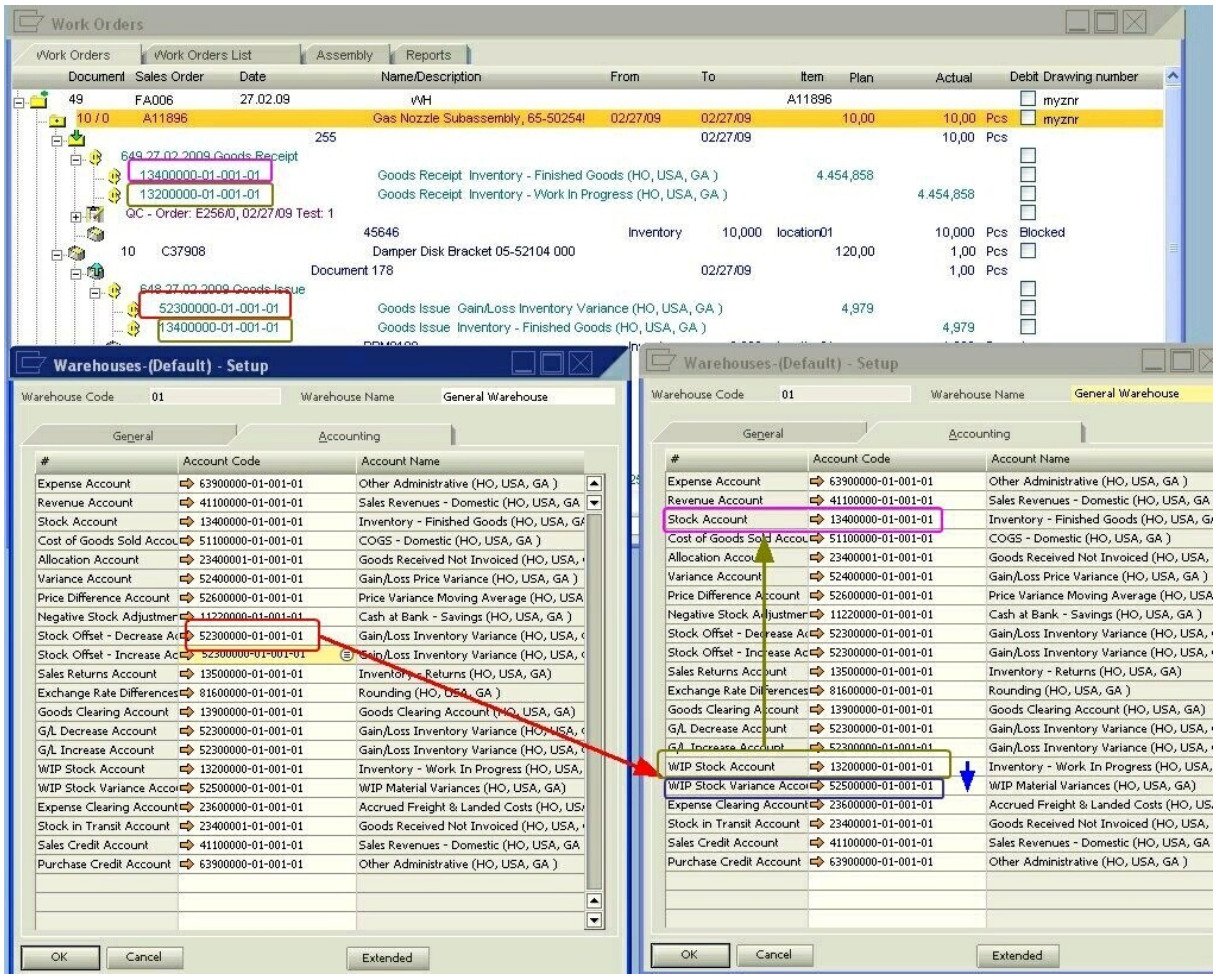
The difference of the amount, that is, the remainder in the WIP account, is posted to the WIP

© 2026 Boyum IT Solutions A/S

variance account. The difference posting is a separate journal entry made on receipt of the assembly or closure of the work order. This can be optionally configured.
WIP variance value is the calculated cost difference of issued material, costs from time receipt and external operations (depending on the configuration) and the receipt of the assembly.
The evaluation of the assembly depends on the settings in the **Configuration Wizard > Production > Valuation and booking of assembly**.
The costs of the issued material depends on the evaluation method of the item set in item master data. When the evaluation method of the material is defined as moving average, this price is used for calculating the WIP variance, because this is the value used for journal entry, representing the system-wide evaluation method for items.

The calculation is: costs of receipt assembly - (material costs + costs of time receipt (depending on configuration) + cost of purchase orders for external operations (depending on configuration))

In this example there is no account determined from the warehouse:



© 2026 Boyum IT Solutions A/S

Webinar: Financial accounting in Beas Manufacturing

19.16.4.2 Valuation and posting of assembly

When posting the assembly, a transfer from the WIP account of the assembly to the stock account of the assembly is performed.
The valued price of the assembly is posted, rather than the sum in the WIP account. The difference in the amount is then transferred, using a separate journal entry from all WIP accounts that have received postings to the WIP difference account of the assembly.

Normally, only the material costs are in the WIP account. However, the calculation objects or time types can be used to define whether other costs, such as manufacturing costs, overheads, or other surcharges are also posted to the WIP account. In this case, a more precise differentiation of the incurred costs is possible on account level, and the difference amount transferred to the WIP difference account is lower.

The evaluation of the assembly can be configured.
A valuation at planned costs, actually accumulated costs, a mixture of both, or at pre-calculated values stored in price lists can be configured.
The evaluation method that is most useful, depends on a lot of factors factors and must be analyzed accordingly.

Important: It is not the evaluation of the work order, but the real value of the assembly that must be posted.

Also see: Valuation of the assembly
Webinar: Financial accounting in Beas Manufacturing

19.16.4.2.1 Material and production overheads

To create a contra account for material and production overheads:

Accounts / calculation object

The contra accounts are stored in the calculation objects.
The surcharges (calculation objects) in the calculation template which are to be posted separately must be defined first. This is set in **Calculation > Calculation Objects**

© 2026 Boyum IT Solutions A/S

You can specify the calculation template to use for the cost analysis or account posting under **Configuration Wizard > Production > Valuation and Posting of Assembly > Valuation > Valuation Template**.
If a separate evaluation template is not set up, the default template for the assembly is used.

Note: When a Work order is created, the template is also copied to the Work order. A subsequent change to the calculation template therefore has no effect on existing work orders.

The template setup can be checked in Precalculation.

Time of posting
The posting is made either at the time the assembly is received or on closing the Work order.
At the time of the assembly receipt, on closing the work order, the system also checks again, whether another posting of overheads is required before the WIP account is balanced.

Settings in the Configuration Wizard:
Production > Valuation and Posting of Assembly > Valuation: Post overheads for partial delivery:
On assembly receipt or *On closure of the production position.*

19.17 Reservation system

Beas allows automatic reservation of normal items, batch and serial number managed items.
You can reserve material for Work orders and Sales orders (Pick and pack process).
The reserved quantities are fixed for each Work order or Sales order and are not available for other documents.

The reservation is later used as a pre-assignment for material issue from stock or for creating Sales delivery documents.

The reservation can be made with automatic pre-allocation by several techniques, including FIFO, Manufacturing date or serial number custom attributes.
Eventually, a WIP stock transfer can be performed in SAP Business One via the Beas Allocation function for accurate tracking of stock quantities and values.

Note: Beas does not allow reservations with negative stock. The item must have stock in order to be moved.

© 2026 Boyum IT Solutions A/S

Beas Manufacturing and Produmex WMS Integration

Beas Manufacturing Produmex WMS

Locks (WMS) and reservations (Beas) created by each system are automatically synchronized and so reflected in the other system.
Beas supports WMS Locking levels "Batch", "LUID" and "Detail".
For more information, ***see*** Beas Manufacturing reservation and PMX WMS locking systems integration documentation.

In the Reservation and issue window reservations, pre-allocations, provisions and postings can be performed.

	Grey barrel: Goods reserved, but planned quantity not yet reached.
	Geen barrel: Required quantity reserved.
	Red, overflowing barrel: More, than the required quantity is reserved.

Reservation / issue window

19.18 RFID

Radio-frequency identification (RFID) uses electromagnetic fields to automatically identify and track tags attached to objects. The tags contain electronically stored information. Passive tags collect energy from a nearby RFID reader's interrogating radio waves. Active tags have a local power source (such as a battery) and may operate hundreds of meters from the RFID reader. Unlike a bar code, the tag does not need to be within the line of sight of the reader, so it may be embedded in the tracked object.
RFID is a method of automatic identification and data capture (AIDC).

RFID tags are used in many industries. For example, an RFID tag attached to an automobile during production can be used to track its progress through the assembly line; RFID-tagged

© 2026 Boyum IT Solutions A/S

pharmaceuticals can be tracked through warehouses; and implanting RFID microchips in livestock and pets enables positive identification of animals.
(Wikipedia.com)

Where you can use RFID with Beas:

Time Receipt, Logon, LogOff:

Example: In personnel master data you can insert the RFID Number that is saved in the chip. Use the field "Card Code".

Material management

As identifier for Material. This can be a label with integrated RFID chip

Hardware:

For reading RFID, you need an RFID Scanner.
Beas does not support any RFID Scanners directly and can only read information from the keyboard.
For this reason, you need additional hardware to transfer all RFID information to the keyboard.

© 2026 Boyum IT Solutions A/S

RFID in Beas Bin Management

In Beas Bin Management a field "RFID" is available. You can use this field for working with Bin Management with additional Identifier for every single product via RFID.

It is also possible to use this RFID field for other Identifiers. Here it is recommended to use a serial number for identification and not the separate RFID field inside Beas Bin Management.

19.19 Resources

Resources are productive assets that Beas uses as the smallest capacity unit.

Machine hour rates for calculation, as well as the planned capacity, transition and vacation time for capacity planning are stored in resources.

Resources can be subdivided into resource groups. A resource group can be a number of individual machines that can be used alternatively, or a collection of machines belonging to a production unit. A resource does not have to be assigned to a resource group.

For Beas there is no difference between work stations, employees, machines or buildings. These are all resources to be assigned to the operation sequences.

Resources can be:

- Work stations
- Employees, Groups
- Tools
- Machines
- Buildings
- External operations
- Resource groups

Parallel resources

Parallel resources are separately planned resources that have the same start and end time that the main resource has (operation).

Parallel resources can only have one set of costs defined (for example, no separate staff costs and no extended costs).

Parallel resources always have the same start and end times, but can be used for more than 100% (time reservation %).

Parallel resources are calculated separately and must be reported separately.

Alternative parallel resources can also be defined. The appropriate parallel resource can be selected in manual scheduling or automatic optimization.

© 2026 Boyum IT Solutions A/S

If capacity planning is enabled in the parallel resource, the operation for a forward reservation can only be scheduled when both the main resource and the parallel resource are available.

Beas supports the following types of parallel resources:

- Tools with same start and end date
- Parallel resources with same start and end date and with any degree of utilization
- Alternative parallel resources
- Overlapping operations

Resource optimization

Utilization of the optimal resource in a resource group and utilization of the optimal parallel alternative resource in an operation can be optimized.

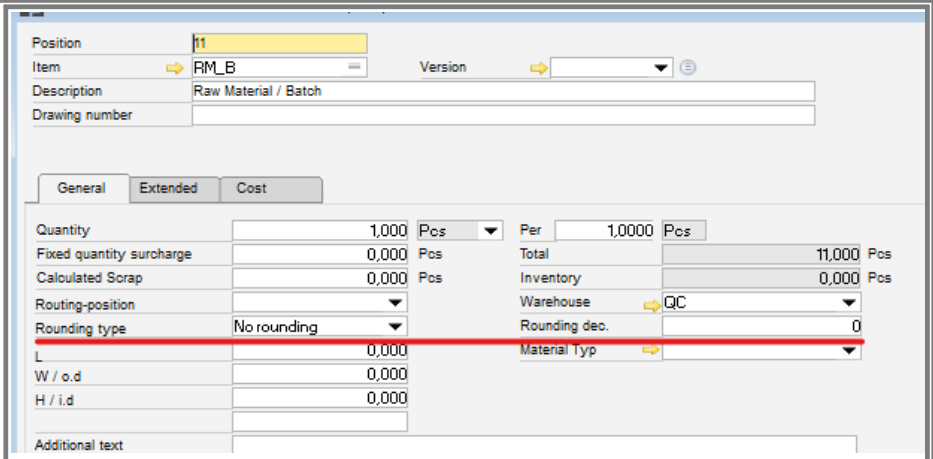
19.20 Rounding

Area	Description
General Rounding	Beas work with 6 decimal places
Rounding defined in SAP	if Beas create an SAP Business One, Beas uses the Rounding definition from SAP Business One
Bill of Material Rounding Type	In Bill of Materials you can define an additional Rounding Type The rounding rule can be defined here:

© 2026 Boyum IT Solutions A/S

Area	Description



Available settings:

No rounding	There is no rounding defined.
Round up	The number is rounded up. The exact decimal place can be defined in "Rounding Dec." ***Example:*** You have defined 1 piece per 18: the factor is then = 0.055556 If you multiply 0.555556 x (17+1) = 1.000008 After this you apply a round up --> The final result is 2.
Round off	
Rounding at 5	From 0,5 (1 Decimal place) or 0,5 (2 Decimal places) will be rounded up. Lower will be rounded off ***Examples:***

Requirement	Decimal place	Rounded
1,45	2	1,45
1,45	1	1,50
1,45	0	1,00

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Area</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>
<table>
<tr><th>Requirement</th><th>Decimal place</th><th>Rounded</th></tr>
<tr><td></td><td></td><td>Note: Only the last decimal place is considered. Thus, there is no rounding up of the second decimal place.</td></tr>
<tr><td>1,49</td><td>0</td><td>1</td></tr>
<tr><td>-1,5</td><td>0</td><td>-2</td></tr>
<tr><td>-1,45</td><td>0</td><td>-1</td></tr>
<tr><td>-1,45</td><td>1</td><td>-1,5</td></tr>
</table>
</td></tr>
<tr><td>multiple of</td><td>Always the multiple will be formed, which will be indicated in "Rounding Dec."
Example:
Multiple order of 4
4, 8, 12, 16 is counted
At quantity 3 is rounded to 4
At quantity 4 the quantity 4 remains unchanged
At quantity 5 is rounded to 8

Example:
Multiple order of 10
10,20,30,40 is counted
At quantity 1 is rounded to 10
At quantity 10 the quantity 10 remains unchanged
At quantity 11 is rounded to 20</td></tr>
</table>

Example 1:
A palette per 100 pieces is required
Quantity of requirement corresponds 0.01 palette per piece. But at least one palette has always to be required and from 101 pieces even 2 palettes.
The BOM position will be adjusted as following for this:
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Area	Description
	Quantity: 0,01 Rounding type: multiple of Rounding Dec. 100 ***Example 2:*** A half piece is required. because there is no half piece. It must always be rounded up to 0 decimal place because there is no half piece. Thus a requirement of 0,8 will actually be rounded up to 1 piece. The following setting occurs: Rounding type: round up Rounding Dec: 0 Note: Negative statement of decimal places are not supported. Rounding results are always in Inventory UoM.

19.21 Scheduling

A production backward scheduling function is available in Beas. This function is executed automatically, unless it is disabled in the production order or in the Configuration Wizard.
The latest possible start date is calculated not taking existing work orders into consideration. This also applies to routing level, where the dates provided are always based on latest possible date. If overlaps exist, they are taken into account.
Planning date is not calculated. In terms of lead time calculation, backward scheduling results are correct. For this reason, the specified times serve only as guidelines and may not be used for planning. If a planning is required, APS must be used. A calculation of correct times is possible only by forward scheduling.
If the calculation of the latest possible start date with correct times to start and finish is required, a combined forward and backward scheduling is possible using the APS.
APS takes into account time and material reservations. APS does not provide a graphical display, but a quick and simple calculation of the start and finish times of the work sequences and in turn to determine the material requirement date.

© 2026 Boyum IT Solutions A/S

19.22 Scrap

The term scrap has several alternative expressions with different uses, depending on the industry: waste, scrap factor, additional requirement, offcut, cut-off, waste, and so on.

Beas provides various scrap and offcut factors. The difference is entered during input, not during the calculation.

Area	Name	Description
Item Master Data	Scrap	Define Scrap on Item level Only for items with Procurement Method "Make" Video: Scrap on Item Level
Item Mater Data	Scrap Table	Define Scrap by table on Item level, scrap Only for items with Procurement Method "Make" Scrap definition is defined in the Scrap / Cut-off table Video: Scrap on Item Level
Item Master Data	Cut-Off %	Define Cut-Off% on Item Level Only for items with Procurement Method "Buy" Define scrap on work order Bill of materials level, but item-related Video: Scrap on Item Level
Item Master Data	Cut-Off Table	Define Cut-Off by table on Item level Only for items with Procurement Method "Buy" Define scrap on work order Bill of materials level, but item-related Scrap definition is defined in the Scrap / Cut-off table Video: Scrap on Item Level
Bill of Materials	Scrap	Define Scrap on Bill of Materials level ***See*** Concept BoM Scrap
Routing position	Material Scrap	Define Material Scrap on Routing level. ***See*** Concept Scrap of Material
Alternative Resource	Material Scrap	Define Material Scrap based on alternative resources Use the defined Scrap of Material, if you use this alternative resource ***See*** Concept Scrap of Material
Routing position	Scrap	Define "Time scrap" on routing position level

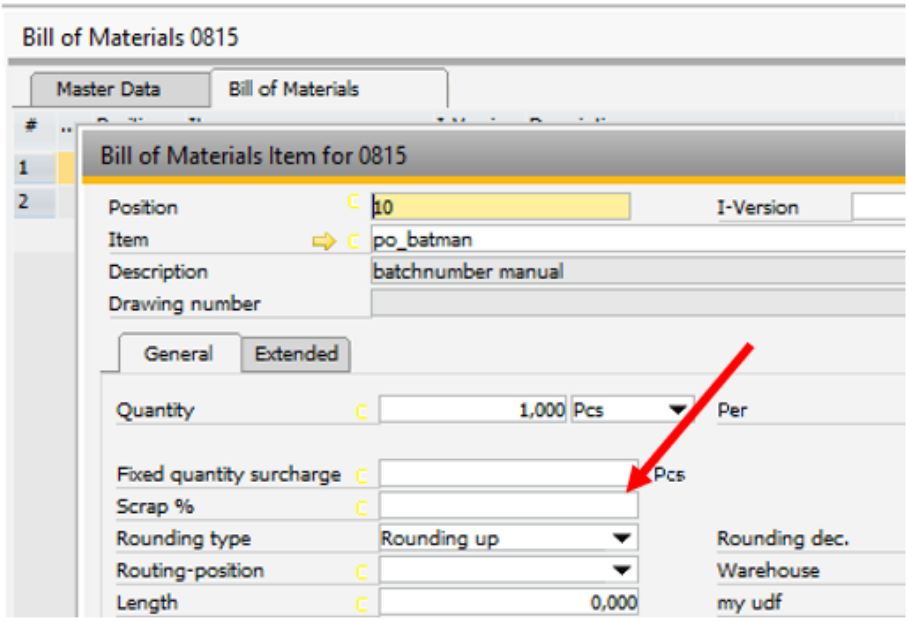
© 2026 Boyum IT Solutions A/S

Area	Name	Description
Resource	Efficiency Rate %	Define "Time scrap" on Resource level ***See*** Resource efficiency rate

Scrap factors training

19.22.1 BoM Scrap

Indicate material scrap which is added to the calculated requirement.



Note:

This field is visible in Master Data and Precalculation.

In Work orders you can see the calculated scrap.

Set the formula to be used in the Configuration Wizard.

Available formula definitions:

```
Scrap = Quantity * ( Scrap % )
```
(= default setting)

```
Scrap = Quantity / ( 1 - Scrap%/100 )
```

Example:

© 2026 Boyum IT Solutions A/S

Definition with `Scrap = Quantity * ( Scrap % )`
Requirement: 10 Pcs
Scrap: 10%
Total requirement: 11 Pcs

Definition with `Scrap = Quantity / ( 1 - Scrap% / 100 )`
Requirement: 10 Pcs
Scrap 10%
Total requirement:

19.22.2 Scrap of Material

In **Routing position > Extended** you can define the Scrap of Material related to a routing position.

Example:
You must produce and fill 6 kg of paste.
15% is lost during filling.
Now you must calculate how many liters of paste are needed.

Calculation
Correct formula is: Quantity: (100 – Scrap %) * 100

If you need 6 kg of finished product, you need
6 kg : (100 - (0.15) * 100 = 7.059 kg paste

If you see the opposite:
I fill 7.059 kg paste and lose 15% =
7.059 - (7.059 / 100 * 15) = **6 kg**

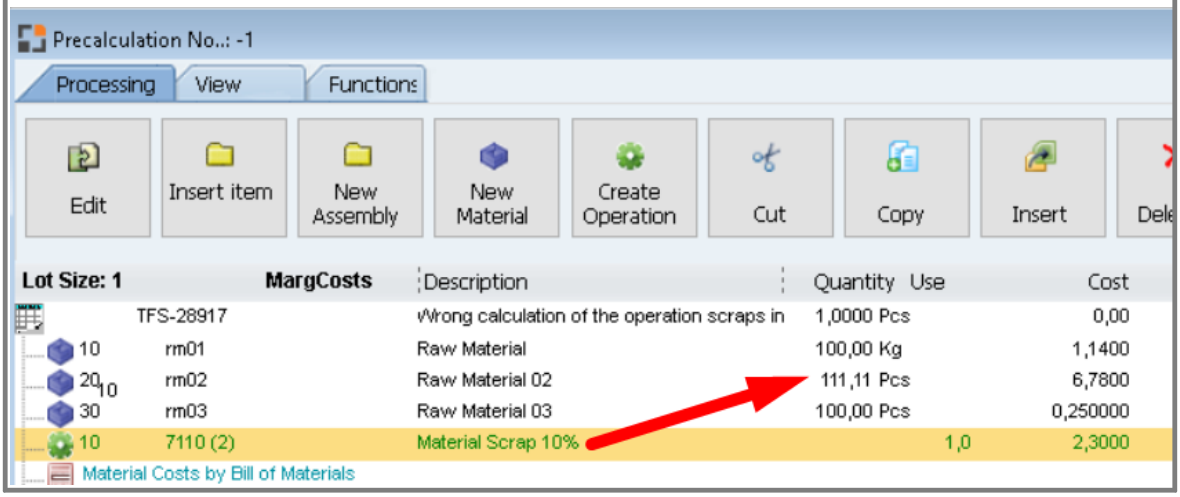
In the **Configuration wizard >** "Behavior for Routing Scrap of Material % affects" you can define how the program should work.
The "Exceeding planned quantity allowed" affects BoM position - material scrap: The Minimum/Maximum percentage is calculated based on total quantity. ***see*** Configuration setting.

© 2026 Boyum IT Solutions A/S

The following settings are available:

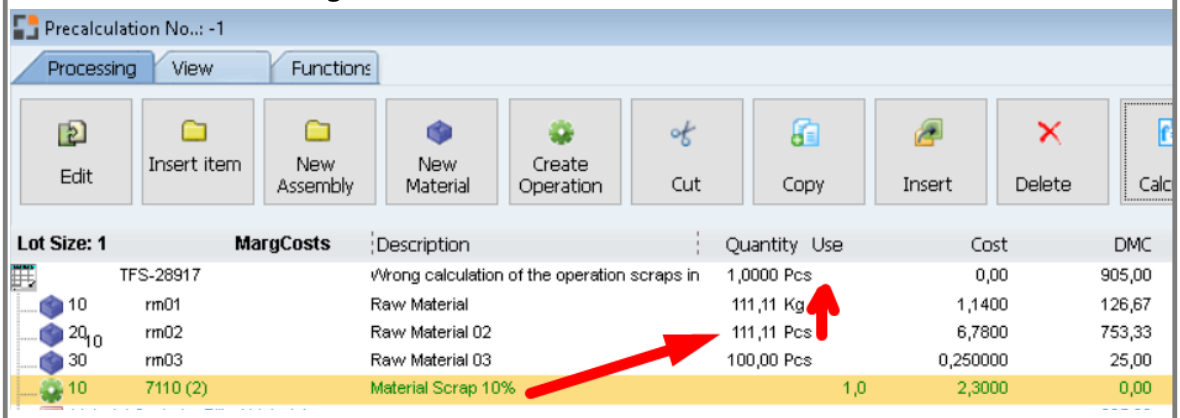
- Only the linked material is affected by the Scrap % setting

Result see this example:



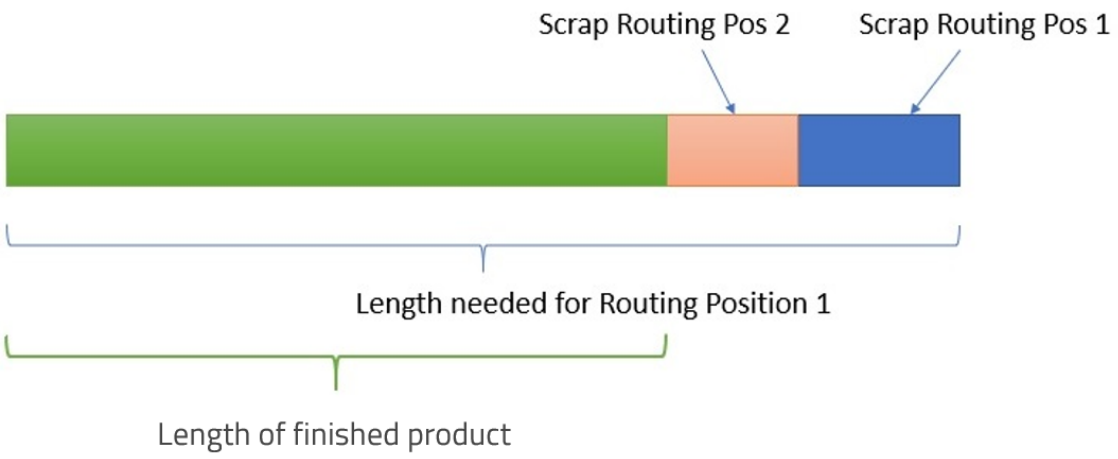
- All materials under the last linked materials are affected

This is the Standard setting



Example: When a bar is sawed, a scrap rate of 10% may incur. If the material is ground, the bar becomes even shorter, that is a longer length must be cut beforehand,

© 2026 Boyum IT Solutions A/S



Example:

We need a finished product with a length of 250 mm.

We start with 308.65 mm - sawn : scrap 10% = 277.78.

Continue with 277.78 mm - ground : scrap 10% = 250 mm.

Routing Position	Material	Quantity	Scrap %
10 sawed	bar	308.65 mm	10
20 ground		277.78	10
30 QC		250 mm	

Calculation

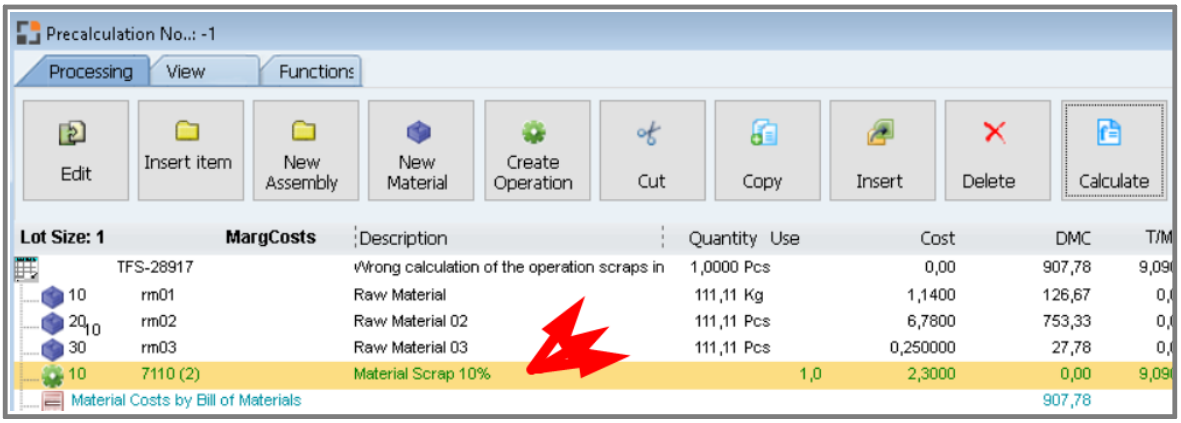
Correct formula is: Quantity : (100 – scrap%) * 100

Position 20 we need 250 : (100 – 10) * 100 = 277.78

The value is entered into the production BOM item, column "calculated scrap" as fix value.

- All materials are affected by the Scrap % setting

© 2026 Boyum IT Solutions A/S



Notes:

- This field is only visible when the parameter in **Configuration wizard > Master data > routing > "operation related material scrap**" is enabled.
- The Item Report – Item Structure report does not support Material Scrap factor on Routing Level.
- Enable this option only if absolutely necessary; the computation will take considerably longer.
- In Work orders this field is blocked, because scrap of material is determined only at the moment of creating the work order.
- When checking which routing positions are considered, the following criteria apply:
  - Validity date
  - Active (no formula, no quantity check)
  - Variants (A–Z)

  Not checked:
  - Variants formulas, Product configurations

19.23 Station name

All Beas sessions need a unique station name. The BIOS name of the current computer is read out when Beas is installed locally.

The `clientname` environment variable is read and used if it is a terminal server.
The current Windows user (`username` Environment variable) is used as the station name if the `sessionname` environment variable begins with `rdp` or `ica`.

The optimal setup for a remote server is the following:

- The `sessionname` environment variable begins with `rdp` or `ica.`
- The Windows user must be unique and stored in the `username` environment variable.

© 2026 Boyum IT Solutions A/S

19.24 Tasks

Tasks are repeated routines, for example, daily calculations of the Order Recommendation Report, various check lists, interface queries, and so on.

Beas offers several options to help automate tasks.

- The Beas-service provides a task scheduler, which can execute Beas script directly. This is mainly used for tasks that must be performed very often, for example, to query a port. This is quick and easy to set up.
- The Windows task scheduler - Beas can be started as a task. Use this option to carry out elaborate, memory-intensive calculations such as MRP, pre-calculation, and so on.
- The Beas-common-interface offers fast query access to a database table for two-way, real-time communication.
- The web interface is available for web applications or web services.

Using the Windows task scheduler

A task is created in the Windows Task Scheduler and a call to beas.exe, including the parameters, is stored. Arguments must be fully specified.

Example: entry in field "arguments":

```
mrp=1 user=manager pw=1234 db=testdb
```

Example: entry in field "start in":

C:\Program Files (x86)\beas software\beas

Starting at: Make sure to specify the directory in which the program is located

The task to be performed can be included:

- Using the Beas built-in task scheduler and entering the task, specifying its number
- Direct entry of the command to be executed

Examples:

Compute order recommendation number 1:

Beas.exe `mrp=1 user=<user> pw=<password> db=<databasename>`

Script number 5, stored in Beas-server administration > planned activities, is called:

Beas.exe `task=5 user=<user> pw=<password> db=<databasename>`

Also see :

Beas-Call up-parameters

Planned activities

© 2026 Boyum IT Solutions A/S

19.25 Terminal application

Beas can be started as a pure terminal application to use on the shop floor with a defined number of functions. The program can be operated via keyboard, touch screen or scanner.

Start Beas as a terminal application

1. Create a link on the desktop to **C:\program files\beas software\beas\beas.exe**
2. Start Beas using the link so it registers. This is to ensure that the credentials are stored correctly.
3. End Beas.
4. Edit the link by right-clicking.
5. Enter in the target filed: "**C:\Program files\beas software\beas\beas.exe" terminal db=trainingdb**" (the appropriate directory name and the correct database name need to be specified)

Also see Call-up parameters

Depending on the hardware configuration and the requirements in manufacturing, different Terminal variants are offered.

Time

The terminal always displays the client-time (that is, the time adjustment, which was carried out in SAP), independent of the local time of the PC. Logon and logoff are always carried out independently from the local time. The time displayed in the terminal is decisive.

Functions in Terminal

The employee logs on with their personnel number. After a certain time of inactivity, personnel is logged off automatically.
The applications, which have been authorized for the respective employee, are displayed. This is set in Program group administration.

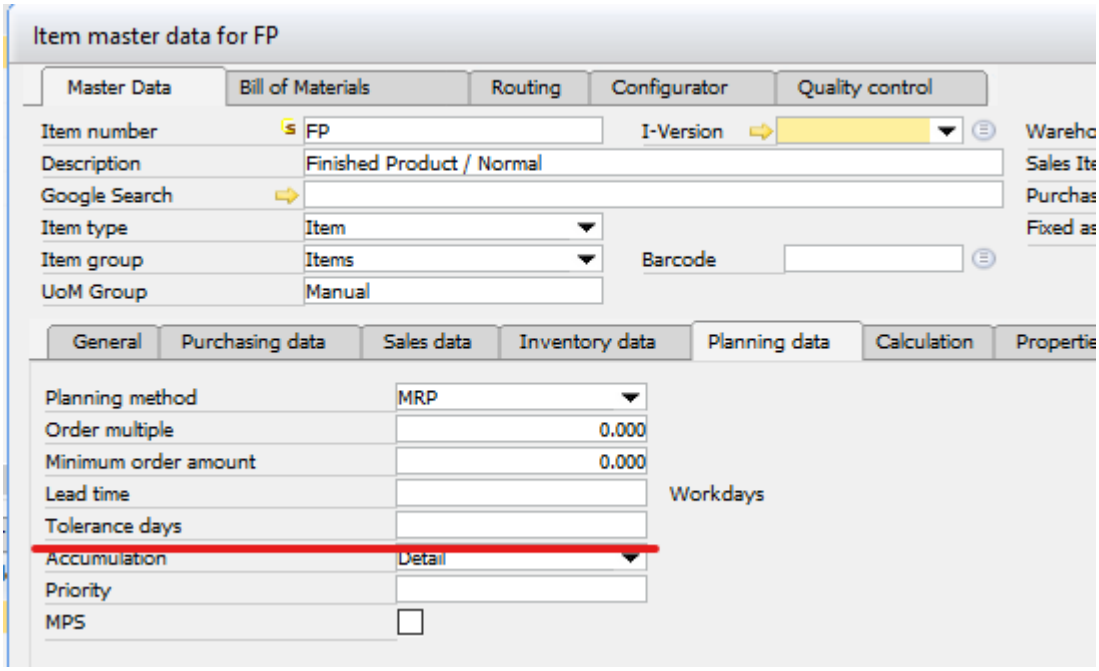
See also:

Production – Factory Data Capture – Terminal
Administration – Attendance – Terminal
Utility programs – Program group administration

© 2026 Boyum IT Solutions A/S

19.26 Tolerance Days

In **Item Master Data > Planning Data tab** you can define Tolerance days.



Related to order scheduling: If there is negative stock in the time line, the item will be shown as shortage in MRP. Here you can enter the number of days. Negative balance is tolerated.

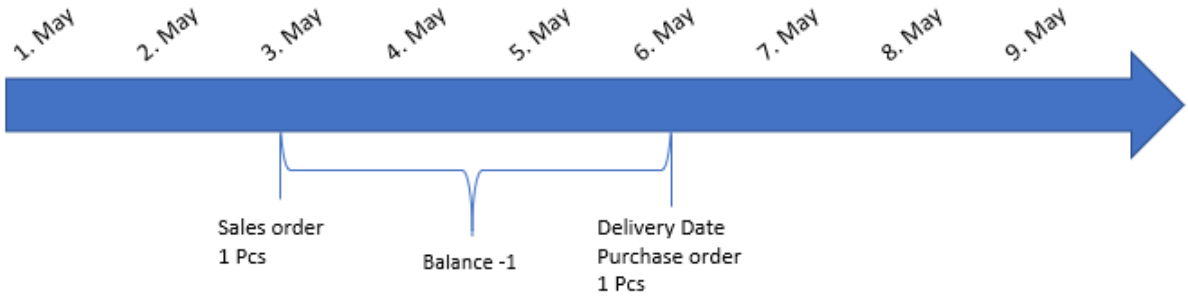
Example:

Stock = 0

Sales order = 3rd May

Purchase order delivery date = 6th May

Material comes 3 days late



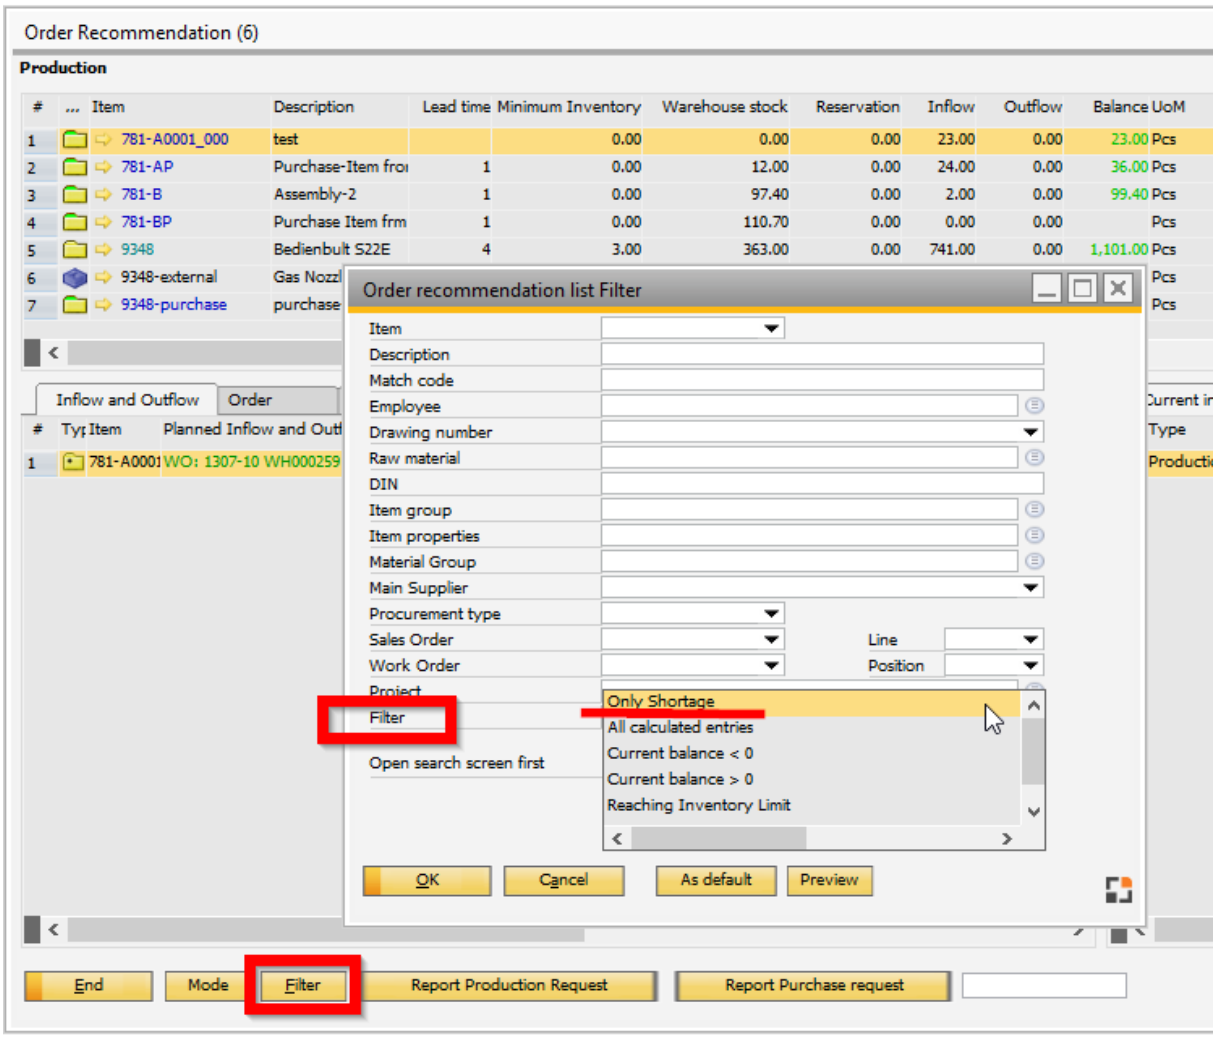
If the tolerance date for this item is defined with 3 days or more, the result is: OK

If the tolerance date is < 2, MRP must display this piece of information.

© 2026 Boyum IT Solutions A/S

In MRP the filter "Only shortage" means:

Display all entries which have a negative balance in the timeline.



(MRP Filter - Predefined Filter)

In this example the item has a balance of 0, but a negative balance between 3rd and 6th May

MRP displays this item if the item has "tolerance days" < 3 days.

MRP does not display this item if the item has a "tolerance days" > 3 days.

Negative Balance in past

Negative Balance in the past is ignored entirely.

The calculation for the time area starts from the current Date.

Example:

Today is 5th May

© 2026 Boyum IT Solutions A/S

Sales Order is 3rd May

Delivery = 6th May

The system calculates: Balance is negative from 5th – 6th May = 1 day.

19.27 Total Quantity

Describe the calculation of work order total quantity / planned quantity

Formula

(

(Qty. to produce *in Production UoM* + Cut-Off Quantity *in Production UoM*)

: Bom "Per"

* Quantity BoM *in Production UoM*

)

+ Calculated Scrap *in Production UoM*

+ Fix Quantity *in Production UoM*

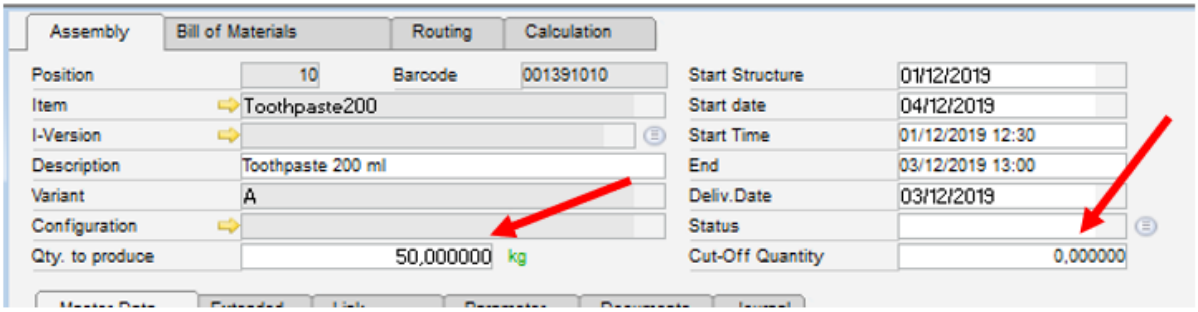
: Conversion factor to Inventory UoM

= Needed Quantity

Round up with defined Rounding types in the BoM Position.

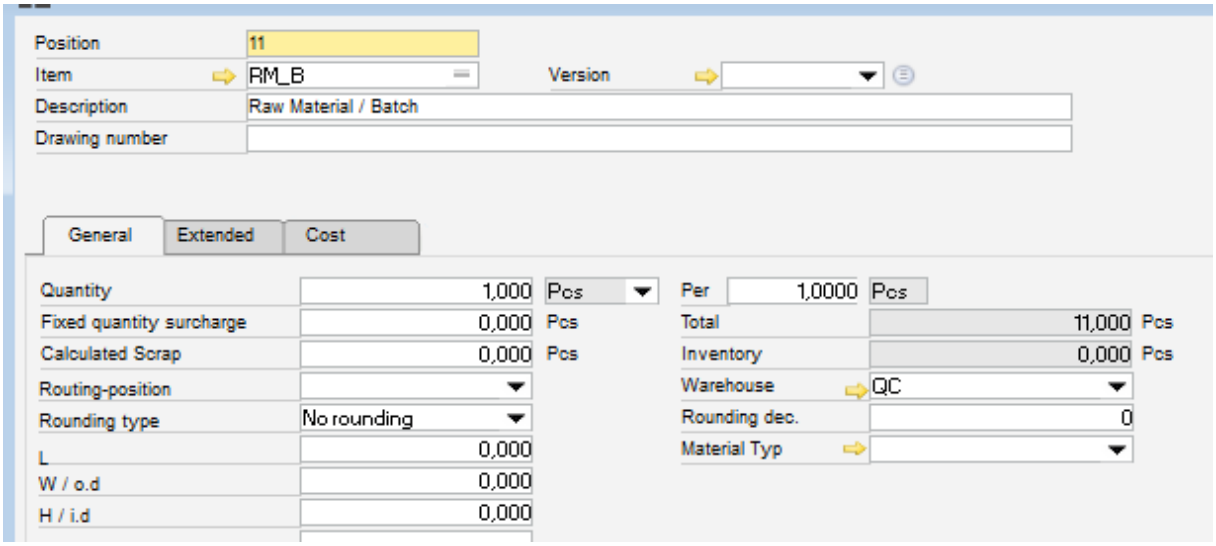
= Total Qty

Calculation details:



Field	Description
Qty. to produce	Planned Quantity in Production UoM
Cut-Off Quantity	Calculated Scrap in Production UoM

© 2026 Boyum IT Solutions A/S

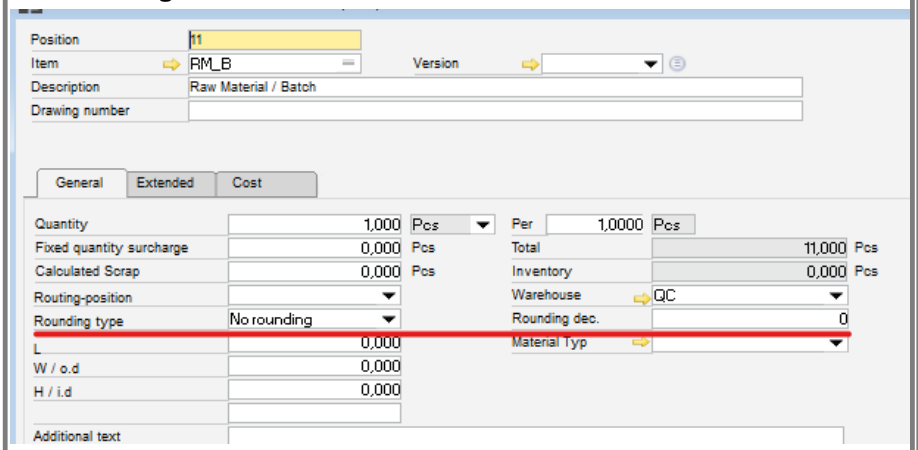


Field	Description
Quantity	Define the planned "Quantity" This Quantity is "per Input UoM" and the system calculates the Quantity in "per Production UoM" automatically.
Per	Define the Factor "per x" ***Example:*** I need 5 Pcs per 100 Assemblies. This is the same as 0.05 Pcs per 1 Assembly Special case: If "Per" = -1, then the system ignores the quantity of assemblies. The defined quantity in BoM is a Fix quantity. ***Example:*** Quantity 10 Pcs, Per=-1 Production = 200 Pcs, Quantity per 1 = 10 / 200 = 0.05 Pcs per 1 Assembly
Fixed quantity surcharge	Quantity per 1 Assembly in Input UoM
Calculated Scrap	Calculated Scrap Quantity per 1 Assembly in Input UoM
Rounding Type	Define the rounding Type

© 2026 Boyum IT Solutions A/S

Field	Description

The rounding rule can be defined here:



Available settings:

No rounding	There is no rounding defined.
Round up	The number is rounded up. The exact decimal place can be defined in "Rounding Dec." ***Example:*** You have defined 1 piece per 18: the factor is then = 0.055556 If you multiply 0.555556 x (17+1) = 1.000008 After this you apply a round up --> The final result is 2.
Round off	
Rounding at 5	From 0,5 (1 Decimal place) or 0,5 (2 Decimal places) will be rounded up. Lower will be rounded off ***Examples:***

Requirement	Decimal place	Rounded
1,45	2	1,45
1,45	1	1,50

© 2026 Boyum IT Solutions A/S

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>
<table>
<tr><th>Requirement</th><th>Decimal place</th><th>Rounded</th></tr>
<tr><td>1,45</td><td>0</td><td>1,00
Note: Only the last decimal place is considered. Thus, there is no rounding up of the second decimal place.</td></tr>
<tr><td>1,49</td><td>0</td><td>1</td></tr>
<tr><td>-1,5</td><td>0</td><td>-2</td></tr>
<tr><td>-1,45</td><td>0</td><td>-1</td></tr>
<tr><td>-1,45</td><td>1</td><td>-1,5</td></tr>
</table>
</td></tr>
<tr><td>multiple of</td><td>Always the multiple will be formed, which will be indicated in "Rounding Dec."
Example:
Multiple order of 4
4, 8, 12, 16 is counted
At quantity 3 is rounded to 4
At quantity 4 the quantity 4 remains unchanged
At quantity 5 is rounded to 8

Example:
Multiple order of 10
10,20,30,40 is counted
At quantity 1 is rounded to 10
At quantity 10 the quantity 10 remains unchanged
At quantity 11 is rounded to 20</td></tr>
</table>

Example 1:
A palette per 100 pieces is required
Quantity of requirement corresponds 0.01 palette per piece. But at least one palette has always to be required and from 101 pieces even 2 palettes. The BOM position will be adjusted as following for this:
</td></tr>
</table>

© 2026 Boyum IT Solutions A/S

Field	Description
	Quantity: 0,01 Rounding type: multiple of Rounding Dec. 100 ***Example 2:*** A half piece is required. because there is no half piece. It must always be rounded up to 0 decimal place because there is no half piece. Thus a requirement of 0,8 will actually be rounded up to 1 piece. The following setting occurs: Rounding type: round up Rounding Dec: 0 Note: Negative statement of decimal places are not supported. Rounding results are always in Inventory UoM.

19.28 Unit Of Measurement

In Beas you can define the quantity in different areas.

Type	Description
Inventory UoM	For storing goods and counting at inventory and display in inventory history *(Field OITM.InvNtryUom)*
Production UoM	This is the production Unit. Every quantity in Bill of materials and work order position is stored in production unit. Conversion between production unit and inventory unit is defined in the Conversion. Note: In BoM you can define a separate Input Unit. In this case the system calculates the production unit from input unit and the inventory unit from production unit

© 2026 Boyum IT Solutions A/S

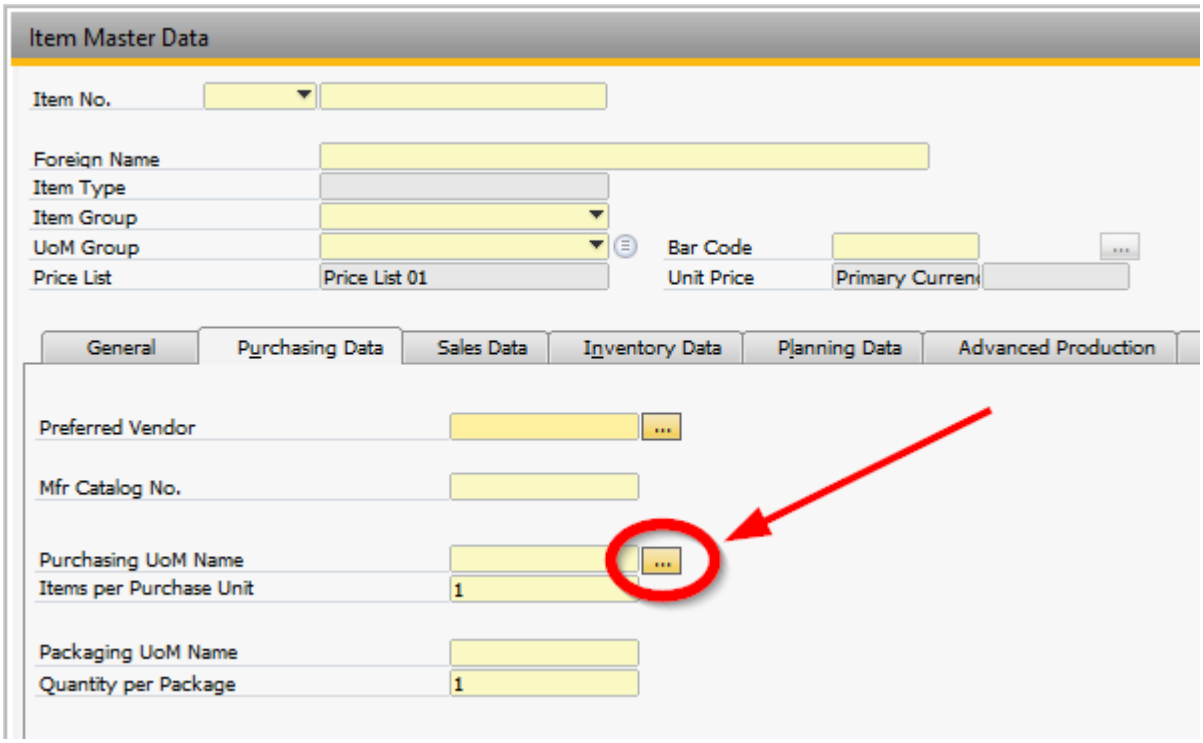
Type	Description
	(Field OITM.U_me_verbr)
Sales UoM	Used for offers, customer orders, delivery note, invoice and all other documents in area Sales. *(Field OITM.SalUnitMsr)*
Purchasing UoM	Used for purchases, delivery, purchase invoices. *(Field OITM.BuyUnitMsr)*
Inventory Counting UoM	Unit for stock counting. Currently not supported by Beas. *(Field OITM.CntUnitMsr)*
Input UoM	In the Bill of materials window you can define an own UoM. From this Unit the system calculates the production UoM and from this the inventory UoM.

Concept

In Beas, Unit of Measurement is mandatory for every Item. In SAP it is enough to work with UoM Names.
Beas uses the SAP UoM Names for saving the UoM Code.

For this, Beas inserts a button with 3 points right of the UoM field. Here you can choose the UoM.
If you insert the UoM manually, Beas checks if the UoM is correct.

© 2026 Boyum IT Solutions A/S

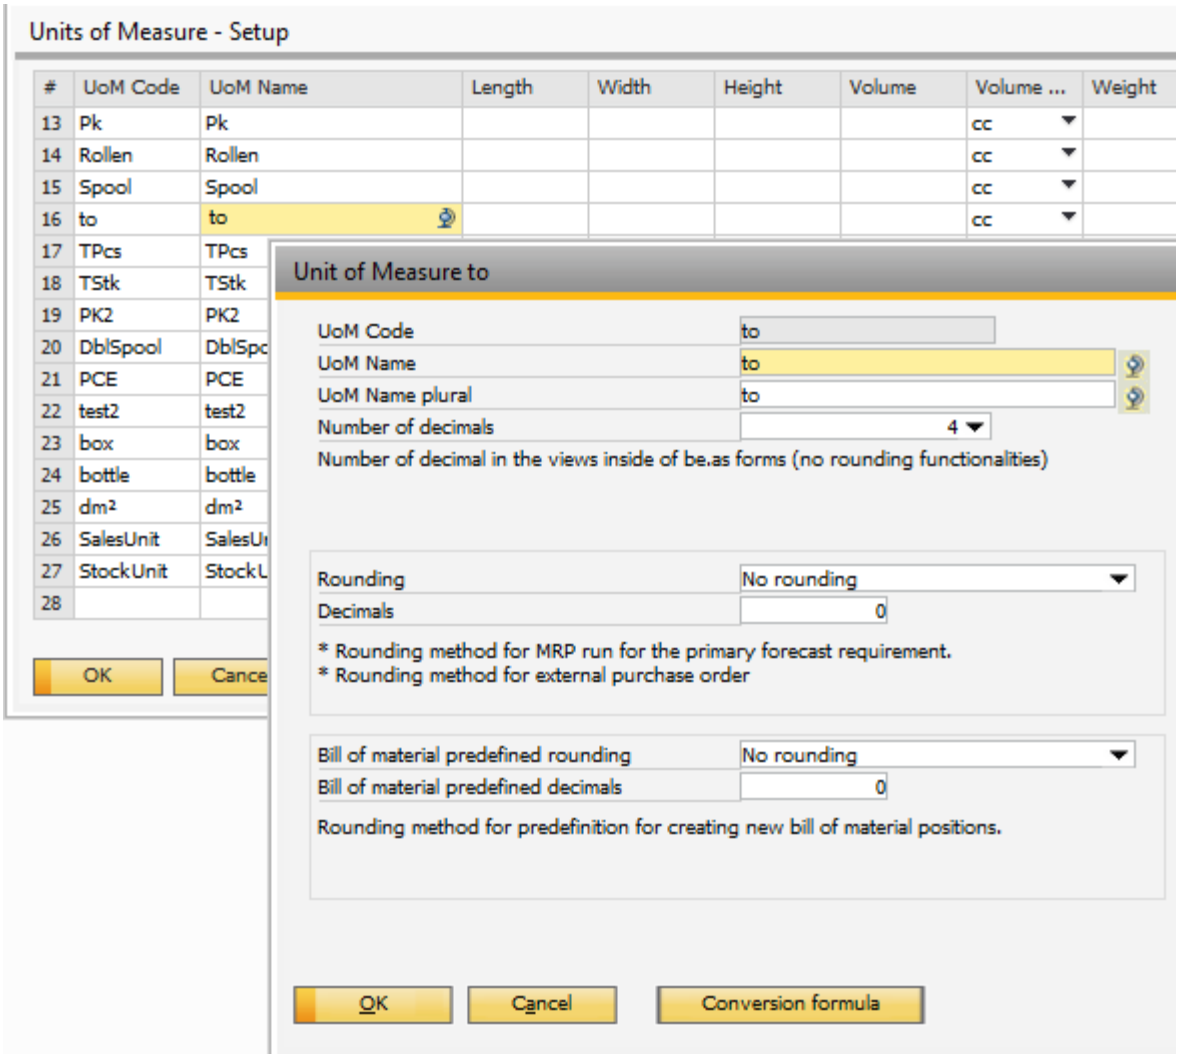


See UoM in item master data

Note: In SAP UoM Definition the UoM Name and UoM ID must be the same.

See Unit of measure

© 2026 Boyum IT Solutions A/S



beasgui_sbo.psr

You can define extended information for every UoM (right-click in UoM window)
Here it is allowed to define a UoM Name for singular and plural (e.g. for printing documents) and the count of decimal places for the view in a Beas form.)

> Note for Decimal places:
>
> This is not rounding. This only defines the view in Beas forms and the WEB Application.
> The count of decimal places for rounding is defined in General settings – View – Decimal places.

Beas allows to define different UoMs (Input/Production/Inventory UoM)
The system always converts one UoM to another automatically. For this you can define Formulas (UoM – Button "Conversion formula"). You can insert your own formula and use it for the length, width, height and density of the actual item or Bill of Materials entry.

© 2026 Boyum IT Solutions A/S

See Conversion.

Item UoM Group

Beas supports item UoM Groups.

If an UoM Group is defined for an item,

a) you can only choose the UoM in the Item Master Data and BoM which was defined in the UoM Group.

b) the system uses the conversion factor defined in the UoM Group.

See

General settings – View – Decimal places

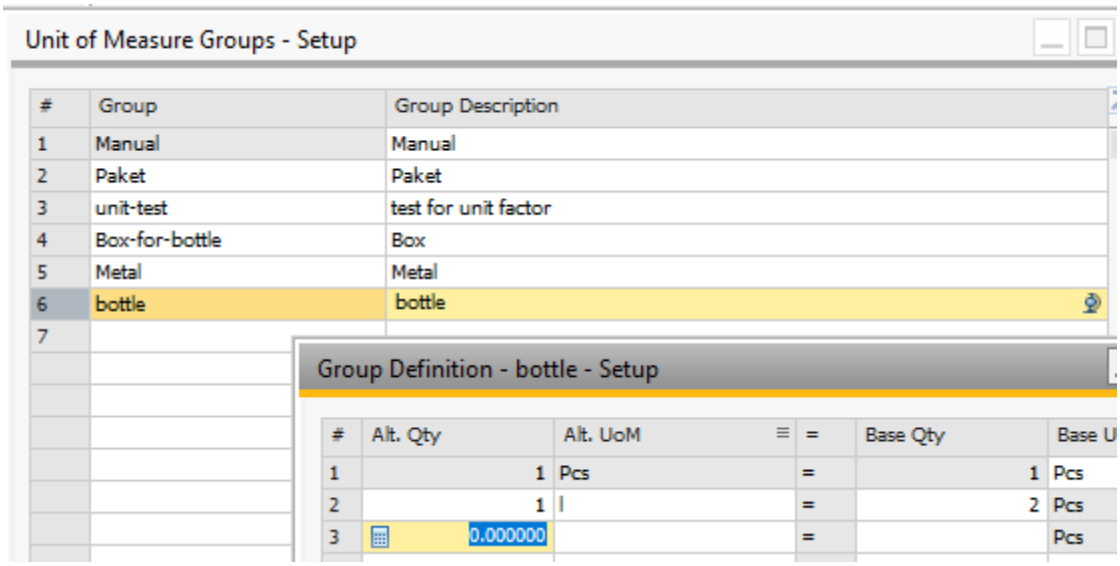
Edit units of measure

Precalculation pricing

19.28.1 UoMGroup

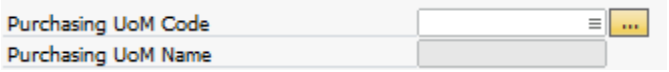
UoM Groups allow the definition of a conversion factor between different units grouped in a UoM Group.

See SAP Unit of Measurement Groups.



In an Item you can define the UoM Group for the item.

Here SAP displays the UoM ID Field and the UoM Name field locked for all fields.



Note:

© 2026 Boyum IT Solutions A/S

Beas is working with the UoM Name field. The UoM ID and the UoM Name must always be the same.
The Base Unit in UoM Group must be always the inventory UoM.

IMPORTANT: When an UoM Group is defined for an item, the UoM Conversion is applied based on SAP definitions and **not** the conversions defined in Beas.

Attention:
Beas does not support the SAP fields "Weight Factor" and "UDF factor" inside the UoM Group definition!

If a UoM Group is defined, you can only choose one of the UoM Codes defined in the UoM Group in all different UoM fields (Sales, Purchase, Production and so on)
The system uses the UoM Factor defined in the UoM Group (Alt. Qty / Base Qty)

Once a group was created, you can store prices in purchase and sales units. Beas only supports default purchase units.

For additional information ***see***
Concept Unit of Measurement
Precalculation Pricing
Units of measure
